**Ind 495-2** Under California real estate disclosure statutes, a Seller is required to disclose all known detrimental property conditions to a Buyer.[1] Unquestionably, the above cited potential impacts on nearby properties will require disclosure and will most certainly result in diminution or loss in property value.[2]

**Ind 495-3** We would ask that the proposed environmental impact report study sufficiently study and quantify the economic impact on real estate values within the geographic region that can be reasonably projected to be impacted by the proposed reopening of the Idaho Maryland Mine.

Respectfully submitted,

Linda R. Ketcham

# REAL ESTATE TRANSFER DISCLOSURE STATEMENT
## (CALIFORNIA CIVIL CODE § 1102, ET SEQ.)
(C.A.R. Form TDS, Revised 12/21)

**THIS DISCLOSURE STATEMENT CONCERNS THE REAL PROPERTY SITUATED IN THE CITY OF _____ *County* _____, COUNTY OF _____, STATE OF CALIFORNIA, DESCRIBED AS _____ *, CA* _____.**

**THIS STATEMENT IS A DISCLOSURE OF THE CONDITION OF THE ABOVE DESCRIBED PROPERTY IN COMPLIANCE WITH SECTION 1102 OF THE CIVIL CODE AS OF (date) _____. IT IS NOT A WARRANTY OF ANY KIND BY THE SELLER(S) OR ANY AGENT(S) REPRESENTING ANY PRINCIPAL(S) IN THIS TRANSACTION, AND IS NOT A SUBSTITUTE FOR ANY INSPECTIONS OR WARRANTIES THE PRINCIPAL(S) MAY WISH TO OBTAIN.**

## I. COORDINATION WITH OTHER DISCLOSURE FORMS

This Real Estate Transfer Disclosure Statement is made pursuant to Section 1102 of the Civil Code. Other statutes require disclosures, depending upon the details of the particular real estate transaction (for example: special study zone and purchase-money liens on residential property).

**Substituted Disclosures:** The following disclosures and other disclosures required by law, including the Natural Hazard Disclosure Report/Statement that may include airport annoyances, earthquake, fire, flood, or special assessment information, have or will be made in connection with this real estate transfer, and are intended to satisfy the disclosure obligations on this form, where the subject matter is the same:

☐ Inspection reports completed pursuant to the contract of sale or receipt for deposit.
☐ Additional inspection reports or disclosures: _____

☐ *No substituted disclosures for this transfer.*

## II. SELLER'S INFORMATION

The Seller discloses the following information with the knowledge that even though this is not a warranty, prospective Buyers may rely on this information in deciding whether and on what terms to purchase the subject property. Seller hereby authorizes any agent(s) representing any principal(s) in this transaction to provide a copy of this statement to any person or entity in connection with any actual or anticipated sale of the property.

**THE FOLLOWING ARE REPRESENTATIONS MADE BY THE SELLER(S) AND ARE NOT THE REPRESENTATIONS OF THE AGENT(S), IF ANY. THIS INFORMATION IS A DISCLOSURE AND IS NOT INTENDED TO BE PART OF ANY CONTRACT BETWEEN THE BUYER AND SELLER.**

**Seller ☐ is ☐ is not occupying the property.**

**A. The subject property has the items checked below: ***

| | | |

# SELLER PROPERTY QUESTIONNAIRE

(C.A.R. Form SPQ, Revised 12/21)

This form is not a substitute for the Real Estate Transfer Disclosure Statement (TDS). It is used by the Seller to provide additional information when a TDS is completed. If Seller is exempt from completing a TDS, Seller should complete an Exempt Seller Disclosure (C.A.R. Form ESD) or may use this form instead:

**NOTE TO SELLER:** YOU ARE STRONGLY ADVISED TO CAREFULLY REVIEW THE DISCLOSURE INFORMATION ADVISORY (C.A.R. Form DIA) BEFORE YOU COMPLETE THIS SELLER PROPERTY QUESTIONNAIRE. ALL SELLERS OF CALIFORNIA REAL PROPERTY ARE REQUIRED TO PROVIDE VARIOUS DISCLOSURES, EITHER BY CONTRACT, OR BY STATUTE OR CASE LAW. MANY DISCLOSURES MUST BE MADE WITHIN CERTAIN TIME LIMITS. TIMELY AND THOROUGH DISCLOSURES HELP TO REDUCE DISPUTES AND FACILITATE A SMOOTH SALES TRANSACTION.

Seller makes the following disclosures with regard to the real property or manufactured home described as ***Hill Lane*** _____, Assessor's Parcel No. _____, situated in ***County***, County of _____, California ("Property").

1. **Disclosure Limitation: The following are representations made by the Seller and are not the representations of the Agent(s), if any. This disclosure statement is not a warranty of any kind by the Seller or any agents(s) and is not a substitute for any inspections or warranties the principal(s) may wish to obtain. This disclosure is not intended to be part of the contract between Buyer and Seller. Unless otherwise specified in writing, Broker and any real estate licensee or other person working with or through Broker has not verified information provided by Seller. A real estate broker is qualified to advise on real estate transactions. If Seller or Buyer desires legal advice, they should consult an attorney.**
2. **Note to Seller, PURPOSE:** To tell the Buyer about known material or significant items affecting the value or desirability of the Property and help to eliminate misunderstandings about the condition of the Property.
   - Answer based on actual knowledge and recollection at this time.
   - Something that you do not consider material or significant may be perceived differently by a Buyer.
   - Think about what you would want to know if you were buying the Property today.
   - Read the questions carefully and take your time.
   - If you do not understand how to answer a question, or what to disclose or how to make a disclosure in response to a question, whether on this form or a TDS, you should consult a real estate attorney in California of your choosing. A broker cannot answer the questions for you or advise you on the legal sufficiency of any answers or disclosures you provide.
3. **Note to Buyer, PURPOSE:** To give you more information about known material or significant items affecting the value or desirability of the Property and help to eliminate misunderstandings about the condition of the Property.
   - Something that may be material or significant to you may not be perceived the same way by the Seller.
   - If something is important to you, be sure to put your concerns and questions in writing (C.A.R. form BMI).
   - Sellers can only disclose what they actually know. Seller may not know about all material or significant items.
   - Seller's disclosures are not a substitute for your own investigations, personal judgments or common sense.
4. **SELLER AWARENESS: For each statement below, answer the question "Are you (Seller) aware of..." by checking either "Yes" or "No." There is no time limitation unless otherwise specified. Explain any "Yes" answers in the space provided or attach additional comments and check paragraph 19.**
5. **DOCUMENTS:** **ARE YOU (SELLER) AWARE OF...**
   Reports, inspections, disclosures, warranties, maintenance recommendations, estimates, studies, surveys or other documents (whether prepared in the past or present, including any previous transaction), pertaining to **(i)** the condition or repair of the Property or any improvement on this Property in the past, now or proposed; or **(ii)** easements, encroachments or boundary disputes affecting the Property whether oral or in writing and whether or not provided to the Seller..... ☐ Yes ☐ No
   **Note: If yes, provide any such documents in your possession to Buyer.**
   Explanation: _____
6. **STATUTORILY OR CONTRACTUALLY REQUIRED OR RELATED:** **ARE YOU (SELLER) AWARE OF...**
   **A.** Within the last 3 years, the death of an occupant of the Property upon the Property ..... ☐ Yes ☐ No
   **B.** An Order from a government health official identifying the Property as being contaminated by methamphetamine. (If yes, attach a copy of the Order.) ..... ☐ Yes ☐ No
   **C.** The release of an illegal controlled substance on or beneath the Property ..... ☐ Yes ☐ No
   **D.** Whether the Property is located in or adjacent to an "industrial use" zone ..... ☒ Yes ☐ No
   (In general, a zone or district allowing manufacturing, commercial or airport uses.)
   **E.** Whether the Property is affected by a nuisance created by an "industrial use" zone ..... ☒ Yes ☐ No
   **F.** Whether the Property is located within 1 mile of a former federal or state ordnance location (In general, an area once used for military training purposes that may contain potentially explosive munitions.) ..... ☐ Yes ☐ No
   **G.** Whether the Property is a condominium or located in a planned unit development or other common interest subdivision ..... ☐ Yes ☐ No

A. Reports, inspections, disclosures, warranties, maintenance recommendations, estimates, studies, surveys or other documents, pertaining to the condition of the Property or easements, encroachments, boundary disputes or environmental conditions affecting the Property ..... ☐ Yes ☐ No
(If yes, provide any such documents in your possession to Buyer)
B. Department of Real Estate Public Report, or subdivision map ..... ☐ Yes ☐ No
C. An Order from a government health official identifying the Property as being contaminated by methamphetamine. (If yes, attach a copy of the Order.) ..... ☐ Yes ☐ No
D. The release of an illegal controlled substance on or beneath the Property ..... ☐ Yes ☐ No
E. Whether the Property is located in or adjacent to an "industrial use" zone ..... ☒ Yes ☐ No
(In general, a zone or district allowing manufacturing, commercial or airport uses.)
F. Whether the Property is affected by a nuisance created by an "industrial use" zone ..... ☒ Yes ☐ No
G. Whether the Property is located within 1 mile of a former federal or state ordnance location ..... ☐ Yes ☐ No
(In general, an area once used for military training purposes that may contain potentially explosive munitions.)
H. Whether the Property is a condominium or located in a planned unit development or other common interest subdivision ..... ☐ Yes ☐ No
I. Insurance claims affecting the Property within the past 5 years ..... ☐ Yes ☐ No
J. Matters affecting title of the Property ..... ☐ Yes ☐ No
K. Any past or present known material facts or other significant items affecting the value or desirability of the Property not otherwise disclosed to Buyer ..... ☐ Yes ☐ No

Explanation: proximity to nearby mining operation that creates Noise, truck traffic, poor air quality, ground vibrations etal

## INDIVIDUAL LETTER 495: LINDA AND DANIEL KETCHAM

### Response to Comment Ind 495-1

The commenter generally identifies a number of impacts identified in the DEIR but does not state how the DEIR is inadequate with regard to the analysis of these impacts. The commenter references traffic impacts, noise from project trucks, degradation of air quality, adverse impacts to private wells, and hazardous waste disposal. Each of these potential impacts were analyzed in the following DEIR Chapters: Chapter 4.12 (Transportation), Chapter 4.10 (Noise and Vibration), Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy). Traffic is analyzed in Chapter 4.12 of the DEIR, noise is analyzed in Chapter 4.10 of the DEIR, air quality is analyzed in Chapter 4.3 of the DEIR, impact to wells is analyzed in Chapter 4.8 of the DEIR, and hazards and hazardous waste is analyzed in Chapter 4.7 of the DEIR.

### Response to Comment Ind 495-2

The commenter is concerned the project will negatively impact property values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 495-3

The commenter requests that the DEIR include an economic impact analysis to quantify potential impacts to property values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

**Ind 496-1**

I'll keep this short and to the point.
Please count my voice in OPPOSITION to reopening the Idaho Maryland mine by Rise Gold.
I am a Nevada City resident and homeowner.

We need to be protecting our environment. This region has been irreparably damaged by extractive mining. No more.
There are many other cleaner industries that can and will enrich our economy.
Rise Gold is a foreign company lacking in competence and integrity. I am not fooled.

No. No No.

Sincerely,
Linda Meyers
Nevada City, CA

1

## INDIVIDUAL LETTER 496: LINDA MEYERS

### Response to Comment Ind 496-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 through 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

Nevada County Community Development Agency

Re: **Idaho Maryland Mine**
**Response to Draft EIR**

Dear Matt,

Thank you for your hard work on the complicated and controversial Idaho Maryland Mine project that is proposed by project applicant Rise Grass Valley. Please see my below comments to the draft Environmental Impact Report.

**Ind 497-1**

**Aesthetics**

The draft EIR does not evaluate the aesthetic impact of 24/7 use of heavy equipment at the Centennial Site. Are the hours of operation at the Centennial Site limited or are they authorized to operate 24 hours per day 7 days per week? If so, will there be light impacts at this site from heavy equipment use? The Centennial Site is proposed to be used for 5 years and the appearance of heavy equipment (and their use of lights) is not a temporary construction related impact and should be analyzed as such—a long term impact.

**Ind 497-2**

Mitigation Measure 4.1-2 is insufficient. Engineered graded fill is permanent and the 50' tall mound of soil will be visible from Highway 49 through Grass Valley forever. A landscaping plan will never sufficiently screen views of the proposed fill site because the land between the highway and the site is private property and will not be included in a landscape plan and therefore this mitigation measure does not improve the view of the site from Highway 49.

**Ind 497-3**

**Hazards and Hazardous Materials**

Diesel is not analyzed in the document. Equipment used for the proposed project will require large amounts of diesel to power the machinery. The transportation of large quantities of diesel needs to be evaluated in the document.

INSIGHT
LAND PLANNING
908 Taylorville Road, Suite 202
Grass Valley, CA 95949
530-701-7651

**Hydrology and Water Quality**

**Ind 497-4**

Much of the analysis within the referenced hydrologic studies in the EIR assume that the project applicants will utilize existing mine shafts for their mining operations but that is not specified in the project description or otherwise. Overall, exploratory mining and creating new shafts and potentially affecting the water table in unanticipated ways is not addressed in this section. The work that has been done to inform the EIR utilizes historic information and attempts to "map out" the existing conditions of the mine workings and shafts below Grass Valley. Therefore, the analysis is insufficient and analyzes operational effects based on these known shafts. Additional analysis is needed to analyze the drawdown impacts to a much larger area and mitigation measures are necessary to ensure that mining activities do not affect the water table throughout the area of the applicant's mineral rights, not only in the immediate vicinity of the Brunswick site.

**Ind 497-5**

The Well Mitigation Plan provided as an appendix by Rise Grass Valley underplays the potential for well water draw down within the Grass Valley area and uses language that does not ensure that corrective action will be taken if wells are affected outside of their expected impact area. This document needs to be re-written with pre-defined sampling locations throughout the mineral rights area and explicit corrective actions if wells in the area are affected. The Well Mitigation Plan should include parcels (to be serviced by NID) that are currently undeveloped or vacant.

**Ind 497-6**

It is not clear within the EIR the amount of water that is able to be treated prior to release into South Fork Wolf Creek. EMKO states that initial de-watering will take over 5 months to extract 385 million gallons of water from the existing shafts and associated groundwater table. Will these 385 million gallons be treated prior to entering Wolf Creek? If not, does the proposed project include sufficient water treatment facilities for this volume of water?

**Land Use**

**Ind 497-7**

The EIR utilizes data from 2018 to project housing vacancy rates. This is insufficient and needs further analysis. Vacancy rates are very low in Nevada County especially since the COVID-19 pandemic when many families and professionals migrated out of the city centers and to the foothills. The vacancy rate of 22.5% as stated in the EIR needs to be struck out out and this topic needs to be re-evaluated with the source of information provided in the document. Available housing in both the rental and real estate markets is very low and the potential for over 300 families to our area will have a significant impact which should require mitigation.

INSIGHT
LAND PLANNING
908 Taylorville Road, Suite 202
Grass Valley, CA 95949
530-701-7651

A project of this scale and nature should never be proposed, approved, constructed, or allowed within a town. Especially a beautiful and scenic rural town in Northern California whose residents will see no benefit from the heavy industrial nature of such an intense use of the land.

Sincerely,

**Ind 497-8**

Lisa McCandless
Land Planner/Owner
Insight Land Planning, LLC

## INDIVIDUAL LETTER 497: LISA MCCANDLESS

### Response to Comment Ind 497-1

The commenter states that the DEIR fails to discuss the aesthetic impacts from the use of heavy equipment at the Centennial Site and asks whether the heavy equipment would be used 24 hours a day, 7 days a week. The commenter also expresses concern over light impacts at the Centennial Site from the use of heavy equipment. Lastly, the commenter states that the aesthetic impact of heavy equipment use at the Centennial Industrial Site will occur over 5 years and should not be analyzed as a temporary construction impact.

Heavy equipment use at the Centennial Industrial Site will consist of haul trucks and equipment on-site to place, grade, and compact the engineered fill. (DEIR, p. 3-33.) The DEIR anticipates that trucks would transport engineered fill from the Brunswick Industrial Site to the Centennial Industrial Site 16 hours a day, 7 days a week, rather than 24 hours a day, 7 days a week, as incorrectly asserted by the Commenter. (DEIR, p. 3-26.) Hauling and dumping of engineered fill would occur at the Centennial Industrial Site between 6:00AM and 10:00PM, while placement, compaction, and grading of the engineered fill would occur between 7:00AM and 3:30PM. (DEIR, p. 4.1-23.)

Regarding light pollution at the Centennial Industrial Site, the project would not include the installation of any new lighting elements on the Centennial Industrial Site. (DEIR 4.1-23.) Lighting during nighttime hauling and dumping of engineered fill would be limited to haul truck headlights. On-site mobile equipment would not include the addition of substantial reflective surface that would affect the surrounding area. Therefore, the potential for the proposed project to create a new source of substantial light or glare that would adversely affect day or nighttime views in the vicinity of the Centennial Industrial Site would be less than significant. (DEIR, p. 4.1-23.)

Regarding the aesthetic impacts from the use of heavy equipment at the Centennial Industrial Site, the DEIR concludes that the project would substantially degrade the existing visual character or quality of public views and that these impacts are significant and unavoidable. (DEIR, p. 4.1-14–15.) The inclusion of additional analysis of industrial vehicles and mining equipment in the aesthetics analysis would not change the significance finding.

### Response to Comment Ind 497-2

The commenter states that Mitigation Measure 4.1-2 is insufficient, specifically with regard to the engineered graded fill piles on the Centennial Site, which the commenter asserts would be visible from Highway 49. The DEIR concurs in that it concludes that visual impacts in this regard would be significant and unavoidable even after implementation of mitigation. (DEIR, p. 4.1-14–15.)

### Response to Comment Ind 497-3

The commenter states that the DEIR fails to discuss the use of diesel fuel, which would be necessary for the project. However, the DEIR does analyze the use and transport of diesel fuel (DEIR, p. 4.7-29–30.) The DEIR states that:

> "various pieces of equipment would be used, requiring the need for diesel fuel. Diesel fuel consumption would vary between 450 to 850 gallons per day, depending on the location where engineered fill is trucked. During normal operations, an average of one 7,500-gallon fuel tanker would travel to/from the sites every nine days, using Brunswick Road to SR 20/49, over the 80-year term of the Use Permit. During any public safety power shutoff events, a maximum of two fuel tankers per day would be required due to additional fuel demands associated with backup generators." (DEIR, p. 4.7-29.)

Because the proposed project would involve the use and storage of a number of hazardous materials, the Project Applicant would be required to obtain a number of permits and approvals from regulatory agencies, as well as comply with all applicable federal, state, and local regulations for the handling, storage, and transportation of hazardous and toxic materials. (DEIR, p. 4.7-30.) Mitigation Measure 4-7-1(d) requires that prior to the transport, storage, or use of hazardous materials at the site, the mine operator shall prepare a Hazardous Materials Business Plan (HMBP). The County shall review and approve the HMBP prior to the use or storage of hazardous materials or explosives on-site, including diesel fuel. (DEIR, p. 4.7-31.)

## Response to Comment Ind 497-4

The commenter states that the DEIR's hydrologic studies are inadequate because the analysis assumes that existing mine shafts will be used for mining operations, rather than newly constructed mine shafts. As discussed on pages 3-21 and 3-22 of the DEIR, the existing Brunswick Shaft and a newly constructed Service Shaft would be used in the proposed operation. Other historic shafts would not be used.

The proposed service shaft was included in the groundwater model, and a small cone of depression is clearly shown at the proposed service shaft location on Sheet 12 of DEIR Appendix K.2 (located near the center of the Brunswick Industrial Site). All mine workings, including those within a few hundred feet of the surface, were included in the groundwater model (see Figure 2-3 of Appendix K.3).

The commenter states that the analysis of the DEIR is insufficient because operation effects beyond the historic workings (shafts) has not been conducted and that analysis of the drawdown impacts to a much larger area is necessary to ensure that mining activities do not affect the water table throughout the mineral rights area. However, Chapter 4.8 the DEIR discusses the new mine workings that would be constructed and displays the area of predicted drawdown from the construction of these new workings in Figure 4.8-11 and in Appendices K.2 and K.3 of the DEIR. The simulated drawdown is based on the modelled geology and location of underground mine workings, amongst other factors. Please see Master Response 7 – Location of Future Mining Areas and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As discussed in Master Response 7, to address public concerns regarding the scope of future mining within the mineral rights area, the applicant has agreed to an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area (shown on maps A101, A201 and A202 included as Appendix A to this Final EIR).

## Response to Comment Ind 497-5

The Well Mitigation Plan is not intended to discuss the potential for well water drawdown. Rather, it is intended to provide a plan of actions that would be taken if the groundwater monitoring plan predicted an impact to a domestic water well. The commenter is referred to the Groundwater Monitoring Plan (Appendix K.8 of the DEIR), which discusses pre-defined sampling locations through the mineral rights area. The Well Mitigation Plan has been edited to clarify the performance standards required for Well Mitigation (see Appendix D to this Final EIR). Performance standards are based on actual use of water for similar property types and not the maximum potential of domestic water wells. Please see Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

Parcels that are currently undeveloped or vacant are not users of groundwater and therefore cannot be impacted by the project. However, one vacant property in the E. Bennett area will be provided NID potable water connection. Property owners of vacant land would not be eligible for reimbursement of NID water charges. The well mitigation plan has been revised to clarify that if the groundwater monitoring plan predicts a potential impact to domestic water wells outside of the E. Bennett Road Area, then nearby properties which do not have well completion records, or a previous negative confirmation, will also be contacted to verify whether there is a well on the property. This would mitigate impacts to properties that are currently vacant but construct a well during the period before a projected impact.

## Response to Comment Ind 497-6

As stated on page 4.8-45, the maximum discharge rate permitted would be 2,500 gpm and the treatment plant is designed to be able to treat this maximum capacity (see Appendix K.4). All water discharged would be treated prior to entering South Fork Wolf Creek. Please see Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment Ind 497-7

The commenter believes that vacancy rates are currently lower due to the COVID-19 pandemic and that the significance conclusion of the DEIR would change and require mitigation. The vacancy rates shown in Table 4.9-5 of the DEIR are broken down by area and 22.5% is the average vacancy rate for Nevada County. Vacancy rates range from 8% in Grass Valley and Nevada City to 51% in Truckee. This data, derived from the 2019 Nevada County Housing Element Update, is from before the COVID-19 pandemic and is the most current information available for use in the analysis of the DEIR. The commenter does not suggest any more current source of data, or show evidence that vacancy rates are so low that the region would not have capacity for any workers moving into the area.

## Response to Comment Ind 497-8

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 500**

**Dist 3**

**Ind 500-1**

DO NOT !!!
**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 500 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials [redacted] the Idaho-Maryland Mine.

DO NOT SUPPORT!!
STOP MINE!

On Aug 24, 2020, at 6:16 AM, Matt Kelley <Matt.Kelley@co.nevada.ca.us> wrote:

Good Morning Ms. Hendriksen:

Thank you, we have received your comments on the Notice of Preparation of an Environmental Impact Report (EIR) for the Idaho-Maryland Mine – Rise Grass Valley Project and the scope of the EIR analysis and they will be forwarded to the EIR consultant and the project applicant for review and consideration into the scope of the EIR.

Below is a link to the project application materials which can provide you with additional details and supporting documents related to the proposed project:
https://www.mynevadacounty.com/2881/Idaho-Maryland-Mine---Rise-Grass-Valley

We are early in the process of reviewing and evaluating the proposed project and are just initiating the preparation of the Environmental Impact Report. As required by the California Environmental Quality Guidelines (CEQA), there are requirements which are governed by California State Law that require the EIR analyze and evaluate certain issue areas including but not limited to: Hydrology and Water Quality, Traffic and Transportation, Noise, Biological Resources, Air Quality Impacts, Greenhouse Gas Emissions, Geology/Soils, Hazards / Hazardous Materials, Cultural Resources, Wildfire, and Mineral Resources. These issue areas will be analyzed in the EIR based on technical

studies that were submitted by the applicant and that were prepared by professionals in their respective fields. These technical studies will also be peer reviewed by the outside consulting firm that the County has contracted with to prepare the EIR. Drafting of the EIR will take many months to complete and is currently anticipated to be completed in late Fall, 2020.

Once the Draft EIR is completed, a Notice of Availability (NOA) will be released which will begin a minimum of a 45-day review and comment period to provide interested individuals an opportunity to review and respond to the adequacy of the draft EIR prepared for the proposed project. During the 45 days, a public meeting will occur to accept comments on the EIR in addition to any emails or written comments that are submitted during the public review period. The public meeting will be noticed as part of the release of the NOA for the draft EIR. The EIR consulting firm will take all of the comments received and will respond to all comments in writing as part of the Final EIR. As part of the Final EIR, it will contain any additions or revisions to the Draft EIR based on the public and agency comments received as well as all of the written responses to all of the comments received during draft EIR comment period. The Final EIR will be released for a public comment period of not less than 10 days as required by California State Law and before any public hearings are held to consider the proposed project. A noticed Planning Commission hearing will be held to consider the project and the EIR and there is the potential for there to be multiple hearings before the Planning Commission. All comments received during the entire process will be part of the record for consideration by the Planning Commission. The Planning Commission will make a recommendation to the Board of Supervisors on the proposed project. After a recommendation is made on the project by the Planning Commission, a public hearing will then be scheduled before the Board of Supervisors to consider the proposed project, the Environmental Impact Report and the Planning Commission's recommendations along with all public comments received throughout the process. As required, and similar to the Planning Commission public hearing(s) the Board of Supervisor public hearing(s) will be properly noticed and will provide an additional opportunity for the public and agencies to provide comments on the proposed project. The Board of Supervisors will take action on the proposed project during their noticed public hearing.

Available application materials and supporting documents related to the proposed project including the Notice of Preparation, Project Description, and project application materials are available for public review at the Planning Department office at 950 Maidu Avenue, Suite 170, Nevada City, CA 95959 or they may be viewed at https://www.mynevadacounty.com/2881/Idaho-Maryland-Mine---Rise-Grass-Valley.

Thank you again for your comments on the Notice of Preparation of the EIR. There will be additional opportunities to comment on the proposed project throughout the EIR and public hearing processes.

If you have any additional questions, please let me know at your convenience.

Sincerely,

**Matt Kelley**

Subject: Idaho Maryland Mine public comment

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 501-2**

Dear Mr. Kelley,
Thank you for reading this public comment regarding the possible reopening of the old mine near Brunswick road. While it's unlikely I'll say anything you haven't already heard, I felt it important to write. I felt especially compelled, given the lack of communication and information regarding this project. It seems that even this public comment time was not made especially public, a lot of us caught by surprise of news of the project, including the immediate deadline for these submissions.

I have lived in the county for nearly 40 years. I have owned or been a part of many

businesses and facets of the county. In that time I have seen several companies attempt this project. There are simply too many concerns that cannot be addressed and guaranteed. Water (currently more valuable than gold), pollution of every kind, traffic, destruction of ecosystems, underfunded companies not being able to fulfill obligations. It all spells danger for our community.

While I have your attention, who do I speak with about the 174 project? It's great Cal trans is trying to make things safer. We have all heard rumors though of an increased speed limit. Making the road straighter and raising the speed limit is not the right idea. We don't want and can't turn into another 49. Please don't raise the speed limit. How about a signal at You Bet Road? How about law enforcement out there once in a while to remind people to slow down? Please help. There are too many things that are trying to be pushed through while we are all dealing with our world crisis. It will not end well if big mistakes are made. We all want to protect this beautiful place we call home.

Thank you for your time. Im sorry this got as long as it did. It's important though that we stay involved with our community, and help move forward with integrity and care. To that end, thank you for your help.
Sincerely,
Lorraine Hendriksen

Dear Committee,

**Ind 502-1** I am writing with regards to the proposed Idaho Maryland Mine. Do we need any more to worry about or guard against, no. Please do not allow this charade to go on any further, it is a waste of time, money and energy, all already stressed and unable to manage what we have. The work the mine will require will RUIN our county. It is appalling to me, after so many past attempts, that this is even considered. Please beware of greed.

**Ind 502-2** Water, noise, traffic, property value decrease, overall long and short term disruption and degradation of the environment, pollution, stress, anger, frustration. The overall cost of monitoring their operations, making sure they do the right thing, which they don't have a history of, is another added stress on every level.

**Ind 502-3** I have lived in this beautiful place for more than 40 years. I've seen a lot of change in that time, some welcomed, some not so much. Opening the Mine would change everything. Most of my friends and I would leave. Please, you cannot approve this. Stop this crazy stressful time consuming destructive project now. Our county population is overwhelmingly against it. Please start listening to us instead of your bank accounts and political aspirations. I am writing because I care about our county, our homes. We cannot afford to do this, on any level in any way. It is all too precious.

Thank you for your time,
Lorraine Hendriksen

Dear Planning Commission and Board of Supervisors:

**Ind 503-1** I am a 30+ year resident of Nevada City where I own my residential property. I also own property where I have my business located at 254 Colfax Avenue in Grass Valley. It is my business property that will be heavily impacted by the reopening of this mine.

Here are my concerns:

**Ind 503-2** There are100 miles of tunnels running beneath the boundaries of Grass Valley City that are already full of toxic water from the 1800's mining operations. Any new mining operation will necessarily be required to use millions of gallons of water with much of that water flowing back into these toxic tunnels, and back into our water sources and watershed. The use of this amount of water required for mining operations is unsustainable and arguably unethical in these times of drought and climate change. It will be getting hotter, and Nevada County residents will be using more water for their daily needs. They should not have to compete with a for-profit Canadian mining corporation which has no moral compulsion to minimize its use of our precious water.

**Ind 503-3** As a business owner in Grass Valley, I remain concerned over the level of noise, air pollution, and machinery/trucks rolling through our streets that will be caused by the mining operation. There are no mitigation devices I can imagine that would offset the negative impact these concerns will have on the quality of our lives or our population.

I am against the Rise gold Mining Operation because it has no foreseeable benefits to the local Nevada County residents.

Lorraine Reich
(530) 274-1077

Comments on the Draft Environmental Impact Report for the Idaho-Maryland Mine Project

To All Concerned:

This is to express my grave concerns about the proposal to re-open the Idaho-Maryland Mine and the clear inadequacy of the applicant's draft environmental impact report (DEIR).

**Ind 504-1**

I (Lorraine) am a seasoned environmental professional, having worked as a land use planner for local government for many years and as a watershed planner/coordinator. I am well acquainted with CEQA and the analysis of potential environmental impacts. My husband (Terry) owns several commercial properties in Grass Valley.

As was well summarized by the many expert testimonials at the recent Planning Commission hearing, the data and analyses in the DEIR fail to meet the standards of adequacy on many fronts. While I have concerns about many of the impacts the mine would certainly bring, I have chosen to focus this letter on the topic of water, because of the life-critical nature of this resource, especially at this very unstable time we are in.

Our community is in a position with regard to water resources that many across the state and nation would envy, that is we have a decent supply and quality of this precious resource. We cannot take this for granted and we should not hand this priceless asset over to a corporation with short-term interests.

I concur with the analyses that have been done of the DEIR by the Nevada Irrigation District (NID), the Wells Coalition, the Community Environmental Advocates, and other experts related to the project's potential impacts to local water supplies and water quality. Specifically:

**Ind 504-2**

**The groundwater impact assessment is flawed and inadequate.**

- The data inputs used in the analysis contradict the data of more reliable sources.
- The analysis provides no water balance assessment to justify inflow/outflow estimates.
- Seasonal variations in water levels are based on only a few years of data.

- The model omits the effect of the project's planned new access shaft, as well as other existing features that would affect groundwater levels.
- The impact of existing faults in the area was not factored in.

**The plan for groundwater monitoring is flawed and inadequate.**

**Ind 504-3**

- The DEIR tries to defer collection of needed additional groundwater data to future monitoring. Since the project's impacts to groundwater are likely to directly affect hundreds of residents living near the project who rely on groundwater, the assessment of these potential impacts cannot be deferred to the future, nor is this allowed per CEQA.
- The DEIR proposes an inadequate number of monitor wells (i.e., 15) given the large area of potential impacts and the complex, fractured bedrock nature of the hydrology.

**The proposed mitigation for groundwater impacts is woefully inadequate.**

**Ind 504-4**

- According to the Wells Coalition, there are 525 private wells within a half mile of the mineral rights boundary, yet the DEIR proposes to mitigate for only 30 potentially impacted wells. The area of potential impact has not been adequately defined, especially given the complex nature of fractured rock hydrology and the high level of uncertainty in hydrologic models. NID's request for an additional water line to be installed in the Whispering Pines area to mitigate for potentially impacted wells validates this concern.
- The Well Mitigation Plan offers no plan to track well history so that impacts to surrounding wells can be verified, leaving residents on their own to claim damages.
- As pointed out by NID, the proposed water supply mitigation measure underestimates the water supply demand of impacted properties.
- The mitigation measure to compensate impacted well owners is written to expire at the sale of the property, whereas true compensation of impacts would have the mitigation obligation attached to deed itself.
- The costs to restore water service and supply interim water to impacted well owners is not adequately addressed, nor is the loss in property values that the lack of water supply would create for residents until water service with NID could be established.
- The mitigation does not provide adequate financial assurance, such as a bond, to cover the potential water related impacts to landowners in the vicinity of the project.

**The water quality impacts to the South Fork Wolf Creek—including increases in water temperature, water volume, and toxic heavy metals—were not adequately assessed.**

**Ind 504-5**

- The number of water quality samples used for the analysis was insufficient and the location of the sampling is in question.
- Water quality sampling of the South Fork Wolf Creek by the community for over 15 years has provided fine-scale data on historic water temperature by season. These data contradict water temperature data presented by the applicant.
- The assessment of the potential for the mine's waste rock to produce poor quality water discharge over the long term was not performed pursuant to Water Board standards.

2 of 3

**Ind 504-6**

It is unfortunate that at a time of growing uncertainty on so many fronts—including the consequences of extended droughts and extreme weather events—our community members must divert their attention and resources to the topic of defeating a commercial venture that could have devasting long-term impacts.

Now is the time to be putting everything we have into becoming more locally self-reliant and resilient. And to do this well requires the most prudent use of our limited water resources.

I hope you will do all that you can to ensure this poorly designed and inadequately assessed project does not move forward and further strain the resources of our community.

Thank you for your consideration and for your service.

Sincerely,

Lorraine Walter and Terry Sullivan
Nevada County residents and local business owners

## INDIVIDUAL LETTER 504: LORRAINE WLATER AND TERRY SULLIVAN

### Response to Comment Ind 504-1
The commenter states that the DEIR is inadequate but does not provide additional information. Responses to specific comments are provided below. The commenter's opposition to the project is noted for the decisionmakers. The commenter may also refer to responses to Agency Letter 10 (NID), Group Letter 28 (Wells Coalition), and Group Letters 7 and 8 (CEA).

### Response to Comment Ind 504-2
The commenter provides a summary of various comments submitted by Community Environmental Advocates (CEA). The commenter is referred to Response to Comments Grp 7-68, 7-64, 7-65, 7-25, and 7-91.

### Response to Comment Ind 504-3
The commenter states that DEIR's groundwater monitoring is inadequate. The commenter also states that the DEIR attempts to defer an assessment of impacts to groundwater but does not state how the DEIR defers mitigation in this regard. The commenter also states the DEIR proposes an inadequate number of monitoring wells. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Ind 504-4
The commenter states that the DEIR understates the number of groundwater wells potentially impacted by the project because of the extent of the mineral rights boundary. The commenter states that the DEIR's groundwater mitigation measures are inadequate for a number of reasons. Regarding the area covered by the mineral rights boundaries, the commenter is referred to Master Response 7 - Location of Future Mining Areas. Regarding the adequacy of the groundwater mitigation measures, the commenter is referred to Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells. The commenter also states that the impacts to groundwater wells will reduce property values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts. The commenter is also referred to responses to Nevada Irrigation District Letter 10 of the Final EIR.

### Response to Comment Ind 504-5
The commenter states that the proposed discharge to South Fork Wolf Creek would result in increased water temperature, increased water volume and toxic heavy metals and states the DEIR did not adequately analyze these impacts. Specifically, the commenter states that community water sampling data contradicts the data in the DEIR but provides no evidence of this claim. The commenter is also referred to Master Response 32 - Temperature of Mine Water Discharge, Master Response 35 - Discharge to South Fork Wolf Creek, and Master Response 8 - Mine Waste Characterization.

### Response to Comment Ind 504-6
The commenter states that the County should not consider approving this project in light of the drought and climate change more broadly. The commenter is referred to Master Response 16 -

Drought and Climate Change. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 505**

Ind 505-1

**Please fill out and send back to us your support for the Idaho-Maryland Mine**

Dist 3

RECEIVED
MAR 03 2022
NEVADA COUNTY
BOARD OF SUPERVISORS

**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

DO NOT LOSE THIS!!! DO NOT LOSE THIS!!! DO NOT LOSE THIS!!!

### Response to Comment Ind 505-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 506**

Odin

January 29, 2021

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue
Nevada City, CA 94959-8617

Dear Mr. Kelley:

**Ind 506-1** I am writing in support of the proposal by Rise Grass Valley to re-open the Idaho-Maryland Mine in Grass Valley and to rehabilitate the Centennial area site for future use.

This project will yield numerous economic benefits for the local community such as new jobs and contract opportunities for small businesses. The region is in desperate need for new jobs, and the $38 million in annual new payroll is a major boost for the region.

**Ind 506-2** However, one of the lesser discussed aspects of the project that will prove to be a major community asset is the rehabilitation of the Centennial site for use of future businesses. The Rise plan to clean up the site is an enormous community benefit to Grass Valley and Nevada County, and they should be praised for their efforts to turn this site into a safe, usable area. When rehabilitated, the site will be transformed into a vital new area for industrial growth. Nevada County has a serious shortage of industrial space at present, and that makes it more difficult for local businesses to operate locally. Adding 31 acres of new industrial land potentially eliminates that problem and opens up new possibilities for the county.

**Ind 506-3** As a construction business owner that operates in Nevada County, I can tell you that it is incredibly important to address the issue of opening up areas for potential new growth, otherwise critical opportunities to protect local jobs will be lost. I urge you to support Rise Grass Valley and move Nevada County in the direction of strong economic growth.

Yours Truly,
Odin Construction Solutions, Inc.

Louay M. Owaidat, President and CEO

4740 Rocklin Road, Rocklin, CA 95677 | 916.251.5500 | odinconstruction.com

### Response to Comment Ind 506-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 506-2

The comment does not address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues.

### Response to Comment Ind 506-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 507**

**From:** Louis Jones <louisbjones@sbcglobal.net>
**Sent:** Monday, April 4, 2022 5:02 PM
**To:** Idaho MMEIR
**Subject:** Please count me as a "No."

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To Whom It May Concern:

**Ind 507-1** With regard to the Idaho-Maryland mine project, I worry about the unforeseeable consequences of de-watering. The West is a more fragile ecosystem than most realize, and especially as the century to come looks like it will be harder on the water table, I worry about hydrological issues.

**Ind 507-2** However, the more important misgiving about the mine is its financial structure and its business flim-flam. RiseGold isn't well capitalized, and in the end it offers nothing to this community. The better-paid jobs will go to specialists, probably brought in from elsewhere, and maybe for a year our local folks will get employment — but on the whole, it seems like little more than a source of noise and dust.

Thank you — Louis Jones

To Nevada County Planning Commission
Attn: Matt Kelley, Senior Planner
950 Maidu Avenue
Nevada City, CA 95959

Planning Commissioners and Staff

**Ind 508-1** I am a resident of Nevada County, living uncomfortably close to the mineral rights boundary of the proposed Idaho-Maryland Mine Project. After attending the Planning Commission meeting on March 24, 2022, I am convinced that the Draft EIR of this project does not describe, or present adequate mitigations for, the mine's impacts on the quality of life here in Western Nevada County.

**Ind 508-2** As a bicyclist and visual artist, the conditions along East Bennett, Greenhorn, Brunswick, Whispering Pines and Idaho-Maryland roads will become unbearable due to:
Construction of the pipeline along East Bennett Road
Heavy truck traffic with noxious exhaust fumes and potentially toxic dust
Unsightly development of mine structures and of fill piles up to 7 stories high which will destroy the "aesthetics" of the area.
Significant impacts on the South Fork of Wolf Creek and its associated watershed, and on Empire Mine State Historic Park.

**Ind 508-3** Air quality will be significantly affected by additional heavy traffic along local roads, and by mine construction and operations at the Centennial and Brunswick sites.

**Ind 508-4** Additional noise will severely impact the areas surrounding the mine:
New truck traffic of 100 round trips a day, 16 hours a day, 7 days a week.
Constant construction for the first year or more.
Grading, rock crushing/compacting, and excavating operations.
Underground blasting and drilling.

**Ind 508-5** Property values in my neighborhood will plummet due to the mine's significant impacts on quality of life here: traffic, noise, poor air quality, toxic hazardous waste and dust, the unsightly processing plant and fill piles.

**Ind 508-6** In addition to comments of speakers at the meeting, CEA Community Environmental Advocates, has written an extensive list of comments on behalf of many concerned Nevada County community groups.
I urge that all these comments be answered, and corrections made to the DEIR.

1

**Ind 508-7**

Rezoning is required in order to get the mining operation approved. raising the allowable limits on a variety of measures, including noise and traffic. Do not allow rezoning. Keep allowable limits to acceptable levels.

In conclusion, the presence of the proposed Idaho-Maryland Mine will make life here literally unlivable, and will consequently destroy our way of life.

Sincerely,
Louis Quaintance
10777 Banner Mine Way
Nevada City, CA 95959
email: bodyart@lmi.net

Re: Draft Environmental Impact Report (DEIR) on the Idaho-Maryland Mine Project

Dear Mr. Kelley,
Thank you for the opportunity to comment on the DEIR for the Idaho-Maryland Mine Project.

**Ind 510-1** I have major concerns about the DEIR's inadequate analysis of toxic elements, and its lack of a detailed scientific approach for sampling and testing rock, soils, and sediments for toxics such as asbestos and arsenic. My comments are relevant to the categories of Air Quality, Hazards and Hazardous Materials, and Geology, Soils, Mineral Resources.

Asbestos in rock and tailings:

**Ind 510-2** Airborne asbestos particles may represent a significant cancer risk to mine workers and the population of Grass Valley. Yet sampling and analysis of asbestos was conducted in a meager and cursory way in the DEIR. A very small number of rock samples was tested as shown in the Asbestos Sampling Memo[1] and the Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan[2]. Moreover, the sampling strategy did not use a systematic approach, and did not follow a scientific design scheme. There was no sampling grid, nor was there a spatially explicit sampling design that could designate areas of critical concern for exposure and public health.

**Ind 510-3** Only 40 rock core samples were analyzed for asbestos in the entire mining area[3]. These cores were apparently chosen from a set of exploratory cores for mining purposes, not for the intentional purpose of systematically sampling the distribution and concentration of asbestos for analyzing risks of exposure.

**Ind 510-4** Asbestos was present in more than one-third of the cores, based on analysis using Transmission Electron Microscopy (TEM). Asbestos was discovered in all of the rock types, in varying concentrations. This is quite a high frequency from the point of view of human health, since it means that precautions for exposure must be taken very seriously, both in underground mining and in the rock for engineered fill.

[1] Richard Lippoth, Idaho-Maryland Mine Project Asbestos Sampling Memo. June 16, 2020. Vergence Geo Services Inc. Reno, NV. (https://www.mynevadacounty.com/DocumentCenter/View/34999/Asbestos-Sampling-Memo---ADDED-6262020 ).
[2] Idaho-Maryland Mine Project Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan Rise Grass Valley Inc. November 2021. (https://www.mynevadacounty.com/DocumentCenter/View/41621/Appendix-E2_ASUR-Plan)
[3] APPENDIX C IDAHO-MARYLAND EXPLORATION ASBESTOS SAMPLING of the ASUR Plan (https://www.mynevadacounty.com/DocumentCenter/View/41621/Appendix-E2_ASUR-Plan).

From the entire Centennial Industrial Site, only two samples were taken from the historic tailings. Asbestos was detected in one these samples, reinforcing the need for a more complete survey of the potential asbestos contamination in this 56-acre area.

**Ind 510-5**

It should be noted that the data on asbestos in the DEIR are not up-to-date with the results of the ASUR Plan in Appendix E.2. For example, this statement is from page 4.3-80 of the DEIR: "*naturally-occurring asbestos is not known to outcrop at the surface of the Brunswick Indutrial Site or Centennial Industrial Site.*" Yet asbestos does occur based on the results described in the paragraph above. This is another indication of the need for a complete and robust documentation for the asbestos risks in the project.

**Ind 510-6**

While an Asbestos Mitigation Plan will be prepared by Rise Gold, actual implementation would require extremely careful attention at all times during the 80 years of mining. Such an example is that "*All visible track-out material (from vehicles leaving the work site) must be removed from all public roads at least once per day using wet sweeping or a HEPA-filter-equipped vacuum device*" (page 2-17 of the DEIR). If such safety procedures were overlooked, even temporarily, partially, or inadvertently, exposure would increase, especially given the apparently high frequency of asbestos in rock.

**Ind 510-7**

In the ASUR plan mentioned above, asbestos analysis of air samples will be reported as transmission electron microscopy (TEM) asbestos structures per cubic centimeter (s/cc). It is difficult to imagine how this will be performed across the mining and fill sites in a valid manner, given the current inability to even produce a sampling plan that adequately portrays the distribution of asbestos hazards in rock.

**Ind 510-8**

Over 80 years, a huge volume of rock will be processed by Rise Gold (1000 tons per day). There are many sources of asbestos emissions as rock gets blasted, crushed, and transported around the mining area. Since aerial transport and runoff can carry asbestos off site as well, more attention must be placed on asbestos risk analysis including the larger area surrounding the mine. The plan in Appendix E.2[4] has inadequate detail on mitigation measures and sampling, and it is especially weak on spatially explicit recommendations.

**Ind 510-9**

The public deserves a robust study and analysis of the risks of asbestos exposure and its health concerns for future generations. Please require that the asbestos sampling approach and protocols of the DEIR be updated to reflect the entire mining area and the huge amount of rock that will be removed during the 80-year duration of the project; re-analyze the impacts of asbestos exposure for the project and recirculate the DEIR.

**Ind 510-10**

<u>Arsenic at the mine site and in Wolf Creek drainage basin:</u>
Arsenic is a naturally occurring element that can cause serious effects on neurologic, respiratory, and gastrointestinal systems. It is also a carcinogen. My comments will focus on the inadequacy of the DEIR's analysis of the movement of arsenic in the Wolf Creek Basin, and thus on the potential exposure for people and wildlife in the area.

The DEIR recognizes arsenic as a serious pollutant and concludes that elevated arsenic in the southeastern paved area of the mine creates a significant hazard to the public and the environment

[4] Idaho-Maryland Mine Project Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan Rise Grass Valley Inc. November 2021. (https://www.mynevadacounty.com/DocumentCenter/View/41621/Appendix-E2_ASUR-Plan)

(Chapter 4.7 – Hazards and Hazardous Materials Page 4.7-35). Arsenic occurs above its maximum contaminant level (MCL) in New Brunswick drain samples (Chapter 4.8 – Hydrology and Water Quality Page 4.8-21).

To dewater the mine, Rise Gold will pump millions of gallons every day for 6 months, and dewatering will continue for 80 years. This water will inundate stream corridors, and the scouring of creek banks will move sediment downstream toward Grass Valley. The DEIR does not adequately discuss the already existing arsenic contamination in the Wolf Creek area that results from past acid-mine drainage and mining contamination[5]. I have found no mention of a 2009 study of soil samples by Wolf Creek Community Alliance showing high concentrations of arsenic in some places. These data indicate the need for a robust study on existing arsenic contamination along the waterways affected by dewatering. If dewatering mobilizes existing arsenic into waterways, it can be transported downstream toward Grass Valley where people risk exposure from water and sediment near their homes and recreational areas.

**Ind 510-11**

While the DEIR acknowledges the potential for acid mine drainage impacts on waterways, it also must address the impact of its dewatering on exposure to arsenic from movement of sediment off-site. A robust hydrologic study is needed to understand how dewatering the mine may increase the risk of exposure to arsenic as well as other toxic minerals such as chromium and lead that also are in existing sediments. This will require sampling of soils and sediments along the stream courses in a systematic approach that considers topography and mining history, along with hydrologic modeling to examine the fate of these toxics in the urban landscape and beyond. Another big concern is movement of arsenic-containing sediment when dewatering occurs during large winter storm events. These 'atmospheric rivers' are expected to become more frequent due to climate change[6].

**Ind 510-12**

The people and wildlife in the Grass Valley area should not be subjected to an increase in arsenic due to the Rise Gold mine, and they deserve thorough analysis of the effects of mining on its toxicity. Please require that a watershed sampling approach for arsenic and hydrologic modeling be included in an updated version for the DEIR; re-analyze how the project will directly or indirectly increase exposure to arsenic causing potentially significant impacts on the environment and public health.

Thank you for your consideration,

Louise Jackson

**Wolf Creek Community Alliance**
**2009 Soil Sampling Report**
**By BJ Schmitt**
**January 26, 2010**

**Introduction:**
Wolf Creek watershed is located in one of the most heavily gold-mined areas of California. Historical mining has left a toxic legacy in the soils and water of Nevada County. Wolf Creek Community Alliance received a grant from the Rose Foundation in June 2008 to start a preliminary mining-toxin survey in our watershed.

**Soil Samples:**
WCCA collected soil samples in April 2009 from targeted locations where there are visual or other indicators (e.g. yellow-boy) of possible acid-mine drainage and potential mining contamination. Figures 1 through 4 show some of the sites we tested. Figure 5 is a map that locates the sampling sites in the Wolf Creek watershed. A team collected soil samples from 21 sites in the watershed, mostly in or near Grass Valley. We sent the screened soil samples to ALS-Chemex labs in Reno, Nevada, where they were tested for levels of 33 elements in their ME-ICP 61 panel, as well as for Mercury (Hg) in their Hg-CV41 test.

**Ind 510-13**

**Toxicity Thresholds:**
Human health and environmental thresholds were researched, and both EPA and State of California values are included in this report.

- The "Friends of Deer Creek" (FoDC) thresholds are primarily taken from the California Human Health Screening Levels (CHHSL), with the exception of cobalt and arsenic.
- The cobalt decision rule is from EPA's Preliminary Remediation Goal (PRG) for Residential Soil.
- Arsenic toxicity is related to bioavailability, similar to mercury. California's Department of Toxic Substances Control (DTSC) is due to publish a report on the bioavailability of arsenic in various foothill soils. It will be more appropriate to determine thresholds for arsenic after the publication of the DTSC report. According to FoDC, background levels in our area are 20 to 30 ppm, higher than the screening levels, and the human health threshold for this study is 22 ppm.
- Thresholds listed in this report under "EPA review" include thresholds for health of plants, soil invertebrates, birds (avian herbivores, insectivores and carnivores) and mammalian herbivores, insectivores and carnivores. These values are taken from the federal EPA Ecological Soil Screening Levels (SSL) website (www.epa.gov/exotox/ecossl). This site summarizes values from volumes of research project results.

1

- A few screening levels are also reported from Lubomir Simeonov's "Soil Chemical Pollution", which are all reported at pH 6.

**Results:**

Appendix 1 delineates soil levels for 14 of the 34 elements for which we tested. Results for two elements (Aluminum (Al) and Iron (Fe)) are not included because soil levels are not correlated with toxicity. WCCA has no toxicity screening level information for a further 18 of the elements for which we have results. Results were included in the ALS-Chemex panel, but are not studied in this report. The elements that are not included are bismuth (Bi), calcium (Ca), gallium (Ga), potassium (K), lanthanum (La), magnesium (Mg), molybdenum (Mo), sodium (Na), phosphorous (P), sulphur (S), antimony (Sb), scandium (Sc), strontium (Sr) titanium (Ti), thorium (Th), thallium (Tl), uranium (U) and tungsten(W).

Soil levels for the 14 elements for which WCCA has toxicity information are reported with various thresholds. The human health threshold is perhaps the most widely accepted, although many of the ecological endpoints are much lower (plant and animal health information). Avian insectivores often appear to be the most sensitive, although the studies are somewhat controversial.

**Toxicity by element:**

**Ind 510-13**

WCCA studied the soil toxicity of 14 elements, from soil samples at targeted sites in and around Grass Valley, California. From a human health perspective, i.e. using the FoDC screening thresholds, our data points to three elements of primary concern; arsenic, chromium and lead. Tests for ten of the remaining 11 element resulted in levels of concern according to various criteria, as described below. Charts 1 through 14 delineate the results.

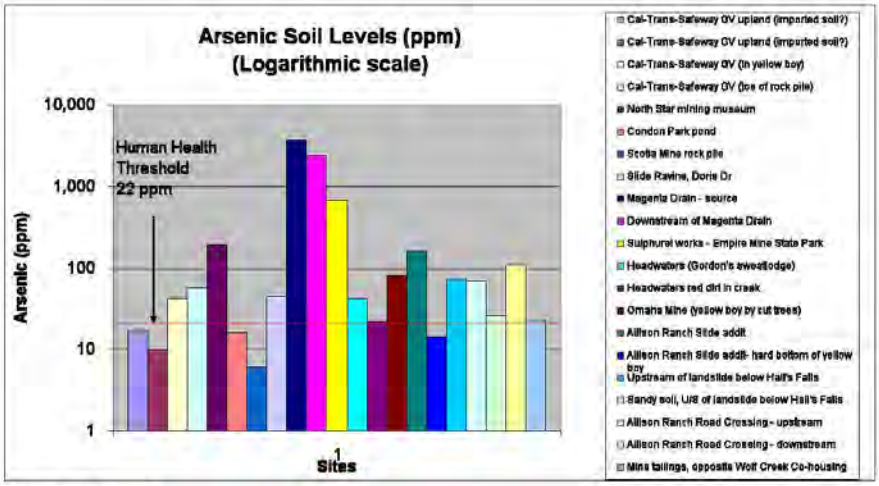

Chart 1: Arsenic

2

Ind 510-13

Arsenic levels in the soil exceed the human health threshold (22 ppm) at 16 of the 21 sites (76%). At two (2) sites the levels were over 100 times the threshold (2,360 and 3,670 ppm). "Environmental exposure to well water containing inorganic arsenic can result in skin hyperpigmentation or an eczematous dermatitis. Arsenic is listed as a presumed carcinogenic substance based on the increased prevalence of lung and skin cancer observed in human populations with multiple exposures (primarily through industrial inhalation). " (http://emedicine.medscape.com).

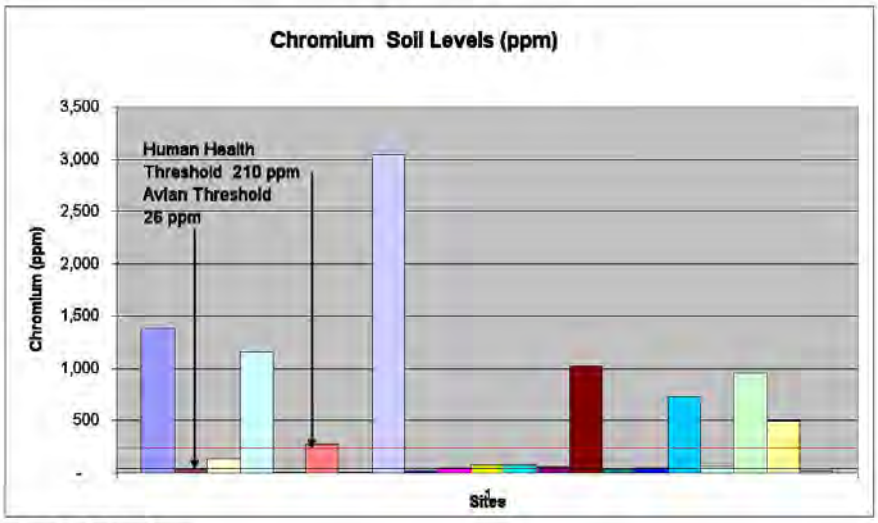

Chart 2: Chromium

Chromium levels exceeded the human health threshold (210 ppm) at eight (8) of the sites (38%). Four of these sites had levels over 1,000 ppm. Levels at an additional 9 (nine) exceeded the lowest (avian) threshold (26 ppm. The Cr(III) threshold ranges from 26 to 780 ppm (avian), and from 34 to 380 ppm (mammals). The Cr(VI) mammalian threshold ranges from 130 to 1,400 ppm. Cr(VI) degrades to Cr(III). Typical background levels in the Western US are 50 ppm. Our tests did not distinguish between Cr(III) and Cr(VI). Cr(III) is an essential dietary nutrient. Its deficiency in the body has been associated with diabetes, infertility, and cardiovascular disease. Cr(VI) is carcinogenic. Cr(VI) degrades to Cr(III).

Lead levels in the soil exceed the human health threshold (150 ppm) at one (1) of the 21 sites. An additional 16 exceeded the lowest (avian insectivore) level (11 ppm), or 17 of 21 (81%) exceeding the most sensitive threshold. "Lead content in soil may come from lead paint, gasoline or pesticides, landfills, or from industries such as foundries or smelters. Lead in soils raises concerns about the safety of urban agriculture. Poisoning by organic lead compounds has symptoms predominantly in the central nervous system, such as insomnia, delirium, cognitive deficits, tremors, hallucinations, and convulsions." (Wikipedia).

3

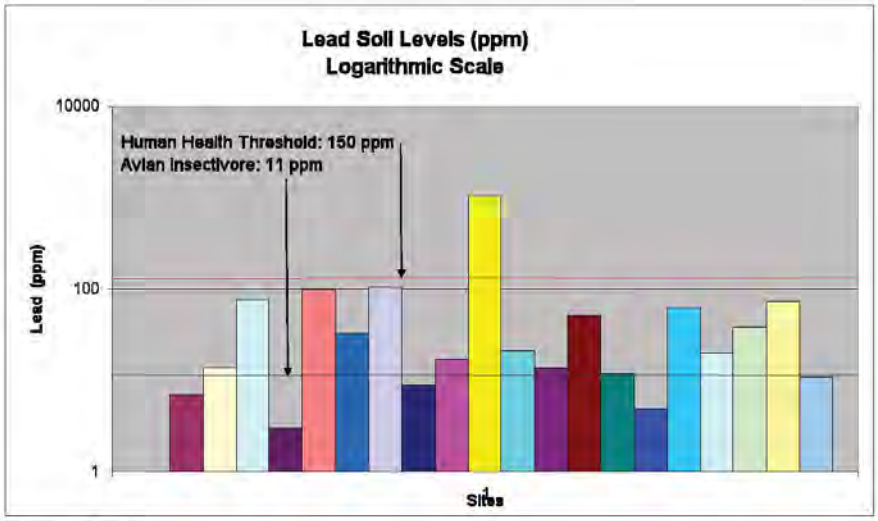

Chart 3: Lead

**Ind 510-13**

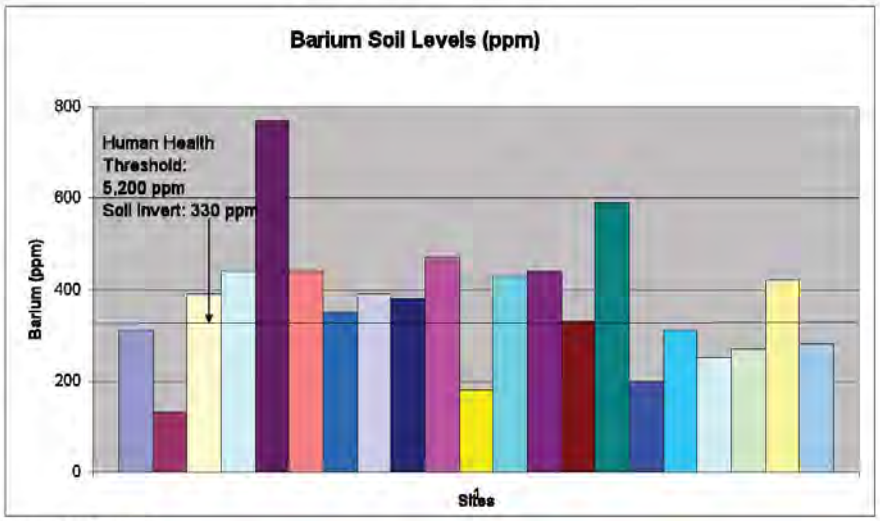

Chart 4: Barium

Barium levels were all well below the 5,200 ppm human health threshold. The most sensitive threshold of 330 ppm for soil invertebrates was exceeded in 13 of 21 samples (62%). It is of interest to note that the only other threshold found for this report is 9,100 ppm for mammalian carnivores.

4

**Ind 510-13**

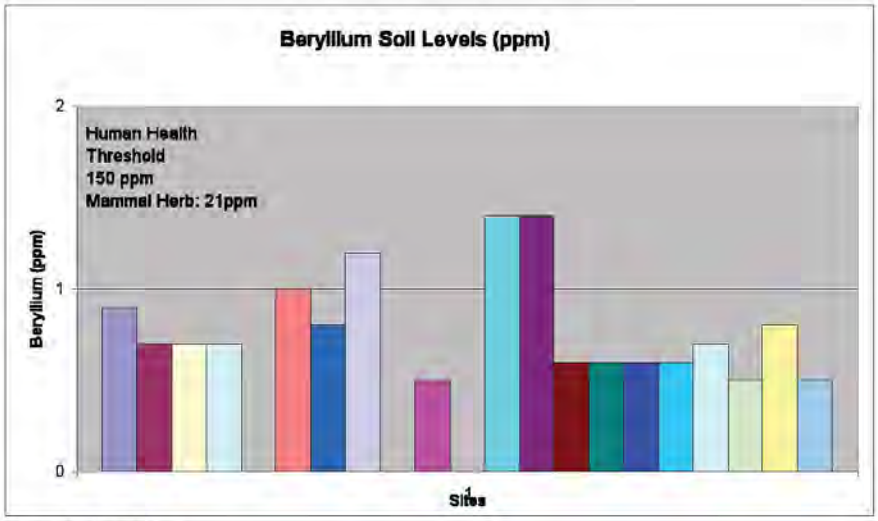

Chart 5: Beryllium

The beryllium human health threshold is 150 ppm. This was not exceeded. The mammalian herbivore threshold of 21 ppm is the lowest in this study. It was also not exceeded. This was the only element for which levels did not exceed a known threshold.

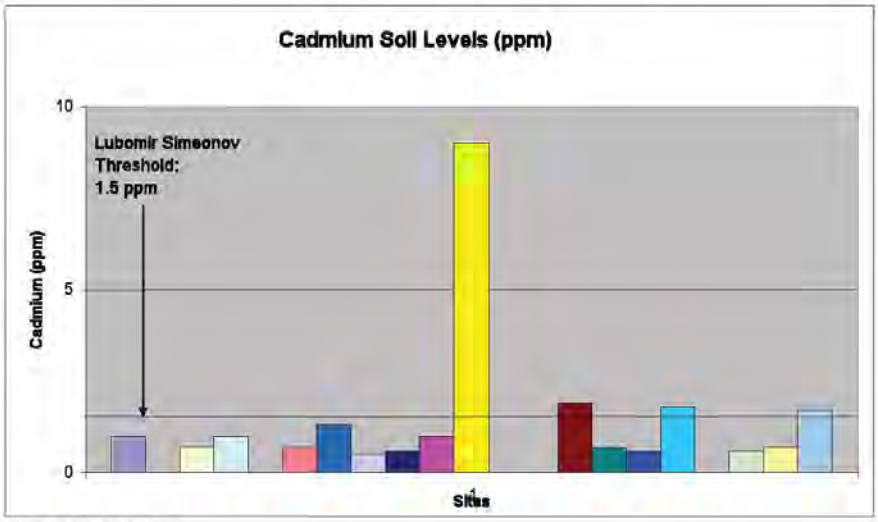

Chart 6: Cadmium

The only Cadmium threshold (2.1 ppm) came from Lubomir Simeonov. This was exceeded in four samples (19%).

5

**Ind 510-13**

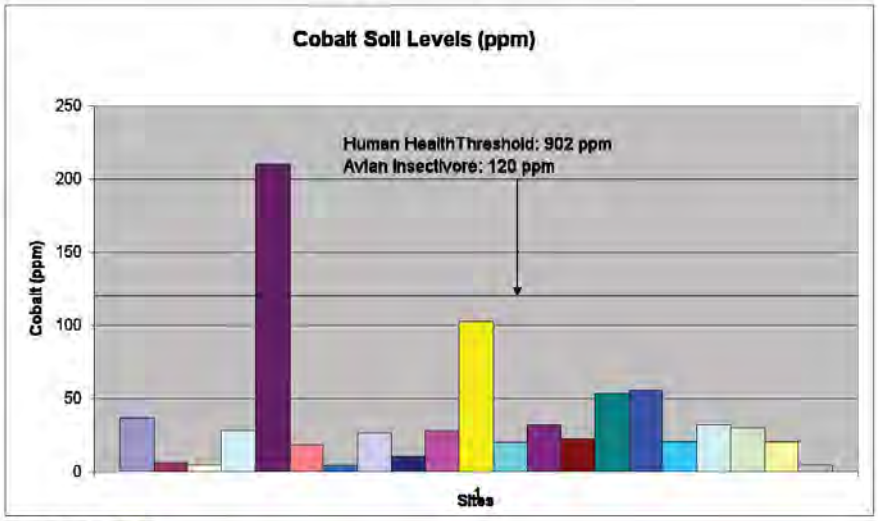

Chart 7: Cobalt

Cobalt levels in the soil did not exceed the human health threshold of 902 ppm. Levels at 1 site exceeded the most sensitive (avian insectivore) threshold of 120 ppm. Typical background levels in the Western US are 10 ppm.

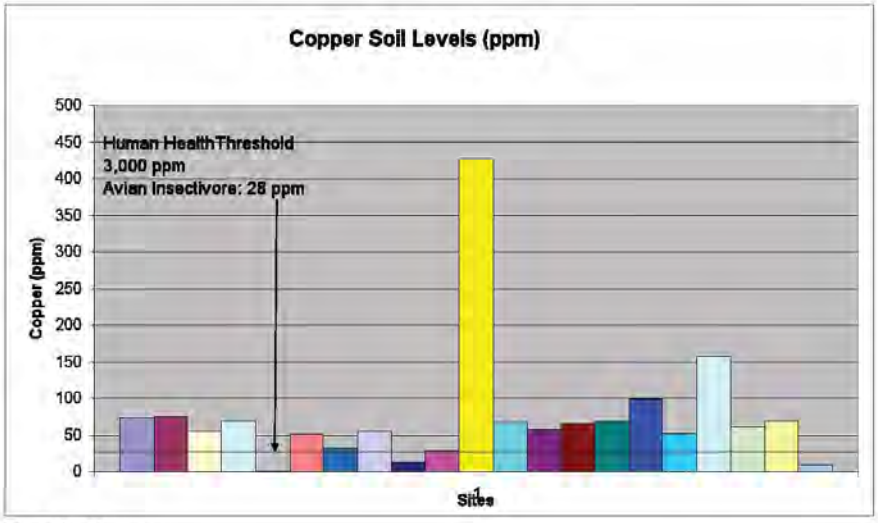

Chart 8: Copper

Copper levels in the soil did not exceed the human health threshold of 3,000 ppm. Levels at 18 sites (86%) exceeded the lowest (avian insectivore) threshold of 28 ppm.

6

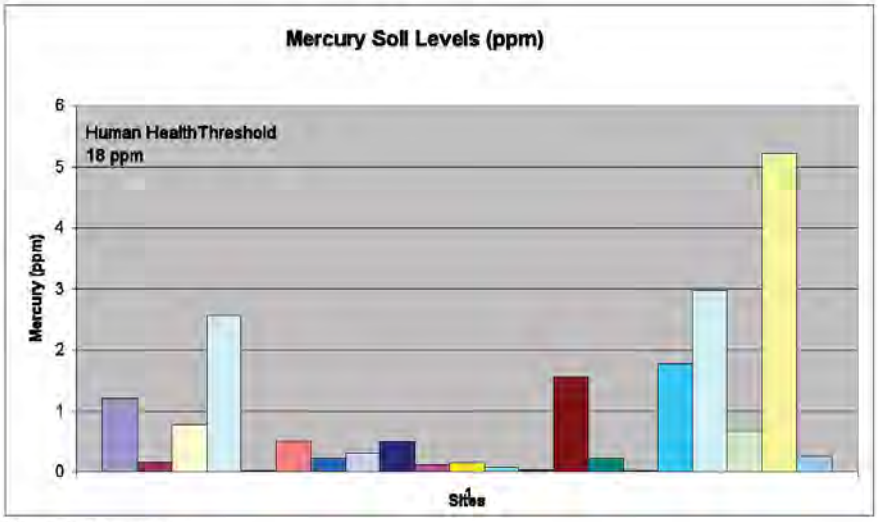

Chart 9: Mercury

Mercury levels in the soil did not exceed the human health threshold of18 ppm. Levels at 6 sites (29%) exceeded the Lubomir Simeonov threshold of 1 ppm. The toxicity of mercury depends on the bioavailability.

**Ind 510-13**

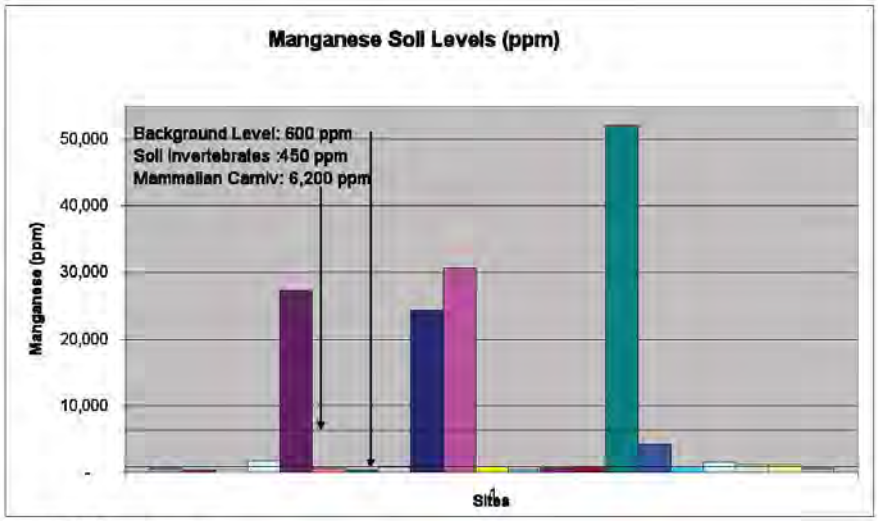

Chart 10: Manganese

This report does not contain a human health threshold for Manganese. The threshold for mammalian carnivores is 6,200 ppm. Soil levels exceeded the background level of 600

7

**Ind 510-13**

ppm at 15 sites (71%), substantially in four cases. The levels at the remaining six sites were very close to the listed background concentration. "Manganese is a very common compound that can be found everywhere on earth. It is necessary for humans to survive, but also toxic when too high concentrations are present in a human body." (http://www.lenntech.com/periodic/elements/mn.htm#ixzz0dl3YzU05). "Manganese toxicity may result in neurologic problems for people who inhale manganese dust. The symptoms generally appear slowly. Toxicity can result in a permanent neurological disorder with symptoms including tremors, difficulty walking, and facial muscle spasms. This is sometimes preceded by symptoms such as irritability, aggressiveness, and hallucinations." Linus Pauling Institute.

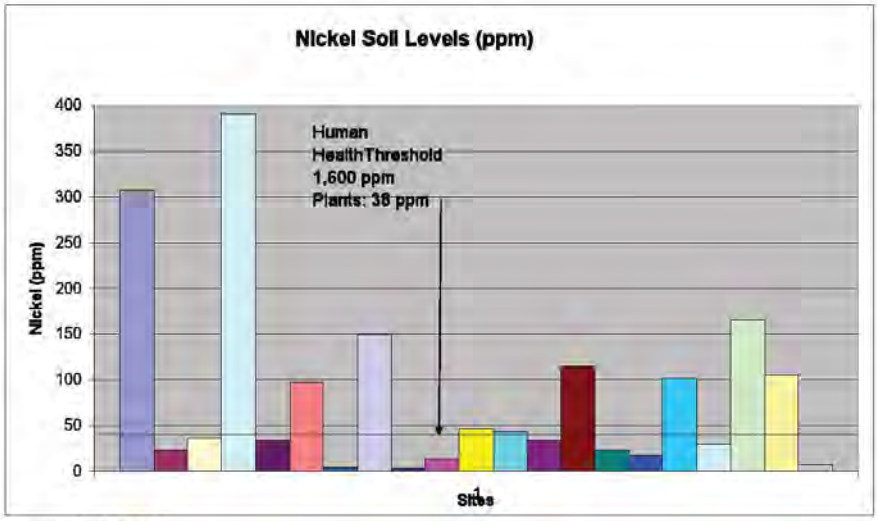

Chart 11: Nickel

Nickel levels in the soil did not exceed, nor even approach the human health threshold of 1,600 ppm. Levels at 10 sites (48%) exceeded the plant threshold of 38 ppm.

This report does not contain a human health threshold for silver. Silver levels in the soil did not exceed, nor even approach themammalian threshold of 990 ppm. Levels at 1 site (5%) exceeded the avian insectivore threshold of 4.2 ppm.
"Ingestion, inhalation, or dermal absorption of silver may cause argyria, the most common indicator of long-term exposure to silver or silver compounds in humans. Argyria is a permanent discoloration of the skin that is not toxic but is considered cosmetically disfiguring." http://cira.ornl.gov/documents/SILVER.pdf

8

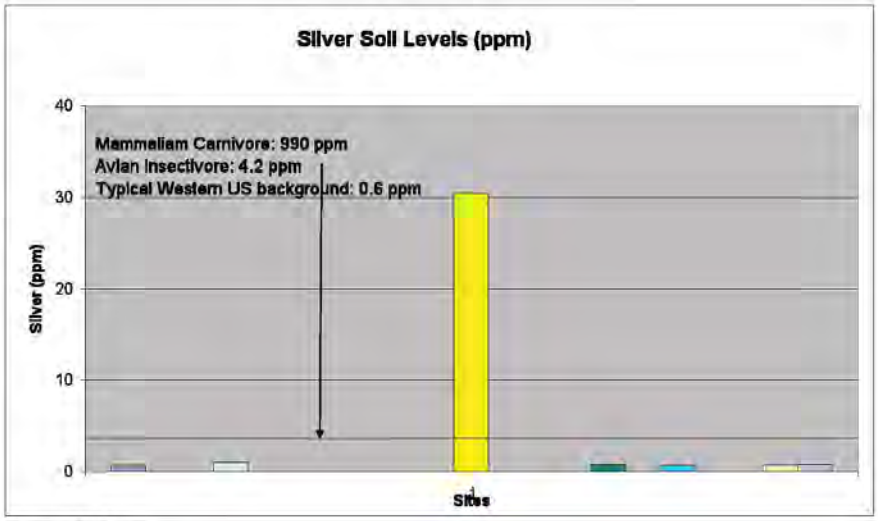

Chart 12: Silver

**Ind 510-13**

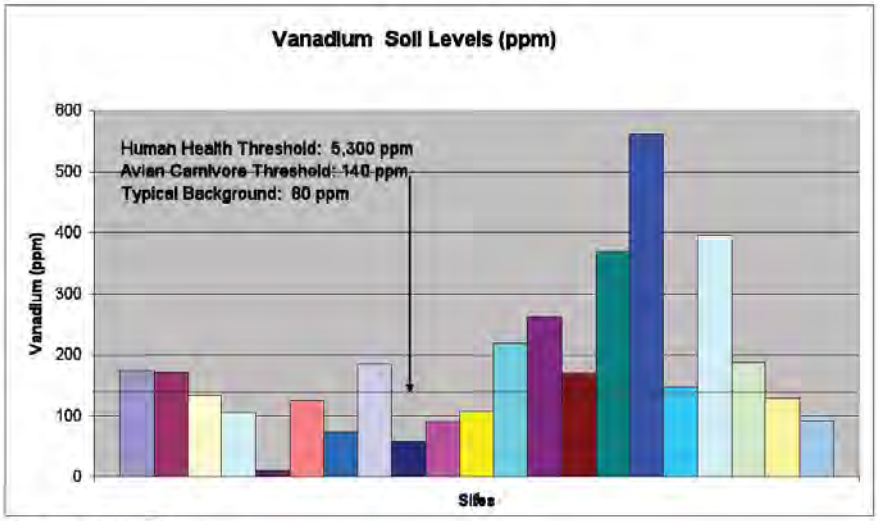

Chart 13: Vanadium

Vanadium levels in the soil did not exceed the human health threshold of 5,300 ppm. The most sensitive levels were for avian herbivores (13 ppm) and avian insectivores (7.8 ppm). These thresholds were below typical Western US levels of 80 ppm, and were therefore not scrutinized. The next most sensitive threshold is for avian carnivores, at 140 ppm. This level was exceeded at ten sites (48%).

9

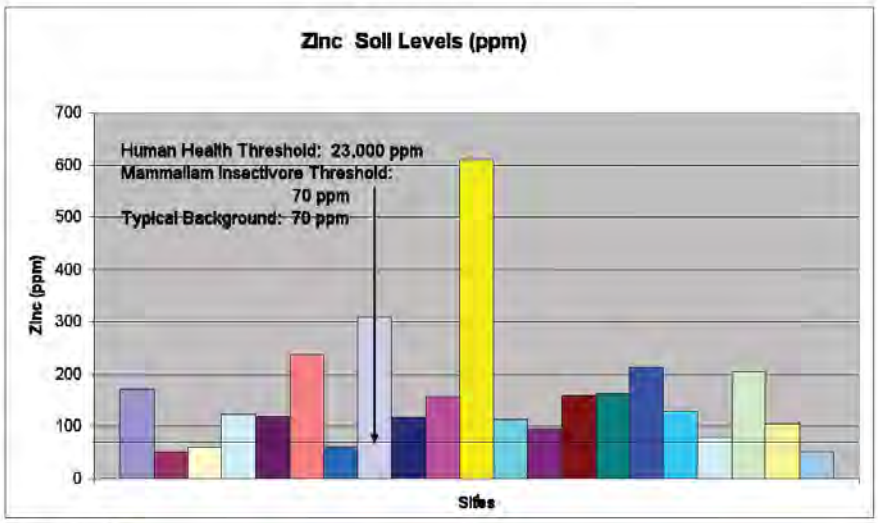

Chart 14: Zinc

**Ind 510-13**

Zinc levels in the soil did not exceed the human health threshold of 23,000 ppm. The most sensitive level is for avian insectivore (43 ppm) which is below typical Western US levels of 70 ppm, and was therefore not studied. Levels at 17 sites (81%) exceeded the next lowest (mammalian insectivore) threshold of 70 ppm.

**Toxicity by site:**

- Of the twenty-one soil test sites, eighteen sites had toxic levels of either arsenic and/or chromium above the human health threshold.
- One site had toxic levels of lead, exceeding the using the human health threshold.
- Just three sites tested below the human health thresholds for these three elements (Ar, Cr, Pb).
- All sites tested above the most sensitive toxic thresholds for between three and eight elements (in addition to arsenic, chromium and lead).

The least toxic samples are from the Cal-Trans site sampled next to the yellow-boy (#2), the Scotia Mine rock pile (#12) and the mine tailings opposite Wolf Creek co-housing (#21). The sites of most concern include the Cal-Trans site sampled at the toe of the rock pile (#4), two Magenta Drain sites (9 and 10), the Sulphuret Works at Empire Mine State Historic Park (#11), Omaha Mine (14), two sites upstream of the Allison Ranch slide addit (17 and 18) and the downstream Allison Ranch Road crossing site (20). The remaining nine sites are of concern, but not top priority at this time.

Cal-Trans property behind Safeway Grocery Store in Grass Valley (samples 1 through 4):
There is a small tributary with yellow substrate flowing into Wolf Creek from the Cal-Trans easement located across Wolf Creek from the Safeway store in downtown Grass Valley. We took four samples at this site, #1 upland as a background sample, #2 next to the yellow tributary, #3 in the yellow substrate of the tributary, and #4 upland in the toe of the large Cal-Trans rock pile. The yellow substrate material (#3) tested slightly high for arsenic (42 ppm) and slightly above thresholds for four other elements (Ba, Cr, Cu,

10

Pb). The area just adjacent (#2) tested slightly high for just two elements (Cr, Cu), and is the site with the least toxic test results of all our 21 samples. The upland soil was very high in Chromium (1,380 ppm vs. 210 ppm human health threshold), as well as having slightly elevated levels of five elements (Cu, Hg, Ni, V, Zn). Site #4, at the toe of the Caltrans rock pile tested to be the most toxic of the Caltrans sites, and one of the most toxic of all the sites we sampled. There were elevated arsenic *and* chromium levels, as well as slightly toxic levels of seven other elements (Ba, Cu, Hg, Mn, Ni, Pb, Zn). Chromium and manganese levels were of particular concern. The only consistencies in this area were non-toxic levels of beryllium, cadmium and cobalt, and all four sites had toxic levels of chromium and copper.

North Star Mining Museum Grass Valley (sample 5):
Sample #5 tested high for arsenic (197 ppm) and manganese (27,300 ppm). It was also above toxic thresholds for three other elements (Ba, Co, Zn). This is one of the least toxic sites, although the arsenic and manganese levels are of particular concern.

Condon Park Pond (sample 6):
The Condon Park pond is one of the five sites that does not have toxic levels of arsenic that exceed the human health threshold of 22 ppm. It does have slightly toxic levels of Chromium (270 ppm), and levels above the most sensitive thresholds for five other elements (Ba, Cu, Ni, Pb, Zn).

**Ind 510-13**

Scotia Mine rock pile (sample 7):
Sample 7 is one of only three sites that does not have toxin levels that exceed the human health thresholds It does have levels above the most sensitive thresholds for three elements (Ba, Cu, Pb). This is one of the least toxic sites we sampled.

Slide Ravine at Doris Drive (sample 8):
Sample 8 has arsenic and chromium levels that exceed the human health thresholds, the chromium level substantially. It also has levels that exceed the most sensitive thresholds for an additional seven elements (Ba, Cu, Mn, Ni, Pb, V, Zn). This is one of the most toxic sites we sampled.

Magenta Drain at the source (sample 9):
The Magenta Drain upstream site has the highest level of arsenic we found at 3,670 ppm. This greatly exceeds the human health threshold of 22 ppm. It also has elevated levels of Manganese at 27,300 ppm. While there is not a human health threshold listed for Manganese, the typical background level in the Western US is 600 ppm, and the threshold for mammalian carnivores is 6,200 ppm. This site has soil toxin levels above the most sensitive thresholds for two other elements (Ba, Zn). This is a site of special concern due to the very high arsenic and manganese levels.

Magenta Drain downstream from the source (sample 10):
The Magenta Drain downstream site has the second highest level of arsenic we found at 2,360 ppm. This greatly exceeds the human health threshold of 22 ppm. It also has elevated levels of manganese at 30,600 ppm. While there is not a human health threshold listed for manganese, the typical background level in the Western US is 600

11

ppm, and the threshold for mammalian carnivores is 6,200 ppm. This site has soil toxin levels above the most sensitive thresholds for five other elements (Ba, Cr, Cu, Pb, Zn). This is a site of special concern due to the high arsenic and manganese levels.

Empire Mine SHP Sulphuret Works (sample 11):
Site 11 has high levels of lead (1,030 ppm). This greatly exceeds the human health threshold of 150 ppm. The Sulphuret Works has high arsenic levels (675 ppm) that exceed the human health threshold of 22 ppm. It is the only site that was tested that has elevated Silver levels, and it has the highest cadmium levels of all the sites we tested. While there is not a human health threshold listed for cadmium, no other site had soil levels above 2 ppm, and the Lubomir Simeonov threshold is 1.5 ppm. This site has soil toxin levels above the most sensitive thresholds for five other elements (Cr, Cu, Mn, Ni, Zn). This is one of the most toxic sites we sampled.

Headwaters (Baker Property) (sample 12):
This headwaters site had arsenic levels of 42 ppm, which exceed the human health threshold of 22 ppm. This site has soil toxin levels above the most sensitive thresholds for seven other elements (Ba, Cr, Cu, Ni, Pb, V, Zn). The levels are not extremely high, although there is concern about cumulative effects of so many different toxins.

Headwaters – red dirt (sample 13):
**Ind 510-13**
This headwaters site is very similar to sample 12 and had arsenic levels of 22 ppm, which matches the human health threshold. This site has soil toxin levels above the most sensitive thresholds for seven other elements (Ba, Cr, Cu, Ni, Pb,, V, Zn). The levels are not extremely high, although there is concern about cumulative effects of so many different toxins.

Omaha Mine (sample 14):
Sample 14 has arsenic and chromium levels that exceed the human health thresholds, the Chromium level substantially. It also has levels that exceed the most sensitive thresholds for an additional eight elements (Ba, Cd, Cu, Hg, Mn, Ni, Pb, V, Zn). This is one of the most toxic sites we sampled, based on the high levels of arsenic and chromium, and concern about cumulative effects of so many different toxins.

Allison Ranch Addit (samples 15 and 16):
Just upstream of the Omaha mine is a small tributary that trickles into Wolf Creek out of an addit. This is at the landslide site on Allison Ranch Road. Two samples were taken, sample 15 in the "yellow-boy" and sample 16 below the yellow-boy in the hard substrate. Sample 15 tested high for arsenic (161 ppm) and the highest of all samples for manganese (52,100 ppm). It was also above the most sensitive toxic thresholds for six other elements (Ba, Cr, Cu, Pb, V, Zn). This site is of concern due to the cumulative effects of such a high number of different toxins, as well as the toxic arsenic and manganese levels. Sample 16 is one of the few sites that did not exceed the human health threshold for arsenic. Manganese levels are elevated (4,290 ppm), and levels are also above the most sensitive toxic thresholds for four other elements (Cr, Cu, V, Zn).
Allison Ranch Road Upstream of Addit (sample 17):
Two samples were taken upstream of the Allison Ranch Addit site in different types of soil. Sample 17 has arsenic and chromium levels that exceed the human health thresholds. It also has levels that exceed the most sensitive thresholds for an additional

12

eight elements (Cd, Cu, Hg, Mn, Ni, Pb, V, Zn). This is one of the most toxic sites we sampled, based on the high levels of arsenic and chromium, and concern about cumulative effects of so many different toxins.

Allison Ranch Road Upstream of Addit - Sandy Soil (sample 18):
The second sample taken upstream of the addit site was taken in sandy soil. Sample 18 had arsenic levels of 68 ppm that exceed the human health threshold. It also had levels that exceed the most sensitive thresholds for an additional seven elements (Cr, Cu, Hg, Mn, Pb, V, Zn).

Allison Ranch Road Crossing Upstream (sample 19):
Sample 19 has arsenic and chromium levels that exceed the human health thresholds. It also has levels that exceed the most sensitive thresholds for an additional six elements (Cu, Mn, Ni, Pb, V, Zn). This is one of the most toxic sites we sampled, based on the high levels of arsenic and chromium, and concern about cumulative effects of so many different toxins.

Allison Ranch Road Crossing Downstream (sample 20):
Sample 20 has arsenic and chromium levels that exceed the human health thresholds. It also has levels that exceed the most sensitive thresholds for an additional seven elements (Ba,Cu, Hg, Mn, Ni, Pb, Zn). This is one of the most toxic sites we sampled, based on the high levels of Arsenic and Chromium, and concern about cumulative effects of so many different toxins.

**Ind 510-13**

Mine Tailings opposite Wolf Creek Co-housing (sample 21):
Sample #21 tested high for arsenic (23 ppm). This is very slightly above the human health threshold of 22 ppm. It was above toxicity thresholds for four other elements (Cd, Mn, Pb, Zn). This is one of the least toxic sites we sampled.

**Conclusions:**
WCCA is most concerned with soil toxicity from arsenic, chromium and lead. Soil levels of these three elements were found to exceed human health thresholds. All but three of the sampling sites had toxin levels for at least one element that exceeded human health thresholds. Ten of the twenty-one sites are designated of most concern, as detailed above, due to high levels of toxins, and/or concern about cumulative affects of many different toxins.

**Next Steps:**
Since preliminary testing reveals toxic conditions in the watershed, further testing is indicated. Comparison with background conditions in nearby locations would provide important information. Outreach to landowners regarding clean-up technologies and possible funding sources will be critical in repairing this damage to our watershed.

*Thank you to the Rose Foundation for their generous funding of this work.*

## INDIVIDUAL LETTER 510: LOUISE JACKSON

### Response to Comment Ind 510-1
This is an introductory comment. Responses to specific comments are provided below.

### Response to Comment Ind 510-2
Please see Master Response 23 - Adequacy of Asbestos Sampling.

### Response to Comment Ind 510-3
Please see Master Response 23 - Adequacy of Asbestos Sampling.

### Response to Comment Ind 510-4
Please see Master Response 23 - Adequacy of Asbestos Sampling, Master Response 9 - Historical Mine Waste at Centennial Site, and Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 510-5
An outcrop refers to an outcrop of bedrock. Historic tailings are not an outcropping of rock but rather the remaining material from historic mineral processing. Accordingly, the language cited by the commenter does not indicate an inconsistency.

### Response to Comment Ind 510-6
Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring. Notably, compliance with the CARB ATCMs for naturally occurring asbestos, including development of an ADMP, is the standard approach within CEQA documents to address health concerns associated with exposure to asbestos from unpaved surfaces, construction and grading operations and quarries where asbestos is found or likely to be found in order to ensure potential health risk impacts to the public would be minimized to a less than significant impact. Multiple other projects in the NSAQMD jurisdiction, as well as throughout the state, have relied upon compliance with these naturally occurring asbestos ATCMs in order to control any potential asbestos emissions to the extent possible. As described in Mitigation Measure 4.3-2 of the DEIR, the proposed project shall also comply with all applicable criteria in the CARB ATCMs for naturally occurring asbestos. NSAQMD will have authority over implementation of the ADMP to ensure that Rise complies with the conditions and requirements of the ADMP and NSAQMD also has authority to bring an enforcement action in the event of non-compliance.

### Response to Comment Ind 510-7
Please see Master Response 23 - Adequacy of Asbestos Sampling, and Response to Comment Ind 510-6.

### Response to Comment Ind 510-8
Please see Response to Comment Ind 510-6, Master Response 23 - Adequacy of Asbestos Sampling, and Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 510-9
Please see Response to Comment Ind 510-8. The DEIR's analysis of asbestos exposure impacts was conducted in a conservative and thorough manner and the mitigation provided adequately

reduces this impact to a less than significant level. As such, recirculation of the DEIR based on asbestos impacts is not required.

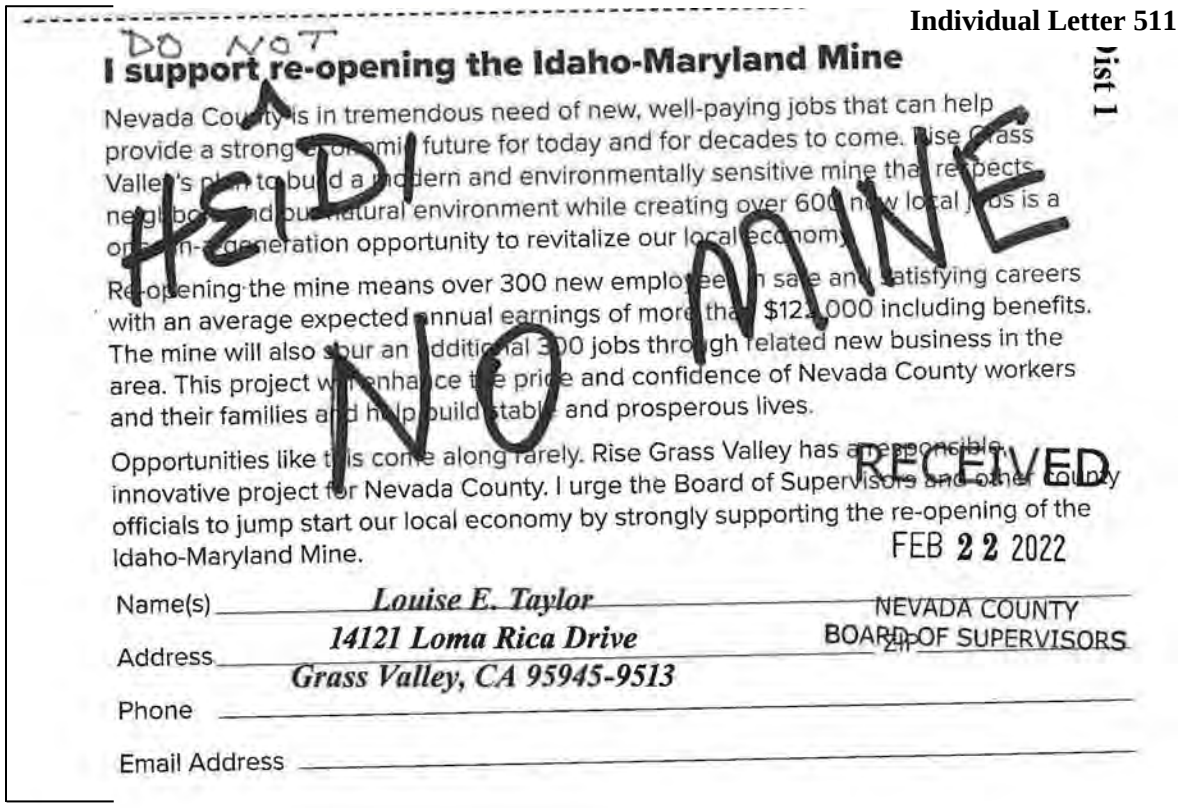
## Response to Comment Ind 510-10

The commenter asserts that Wolf Creek is contaminated with arsenic from past mining contamination and cites a 2009 study conducted by Wolf Creek Community Alliance. This report is provided in Comment Ind 510-13. The commenter asserts that mine dewatering will scour creek banks and move sediment containing arsenic towards Grass Valley. However, a review of this study reveals that no samples in the 2009 study referenced by the commenter were from the bed or bank of South Fork Wolf Creek or Wolf Creek. Page 1 of the 2009 WCAA study describes the general methodology of the sampling for that study and states that samples were collected from "the Wolf Creek watershed" but does not state that the samples were drawn from the bed or bank of the streams. The description of each sampling site on pages 10 through 13 of the 2009 WCAA study discusses soil samples and samples from historic mine sites in the Wolf Creek watershed, but does not state that any samples were actually taken from the bed or bank of Wolf Creek or South Fork Wolf Creek. Figure 5 of the 2009 WCAA study is a map that roughly identifies sampling locations, and while Sampling Site 11 appears to be on South Fork Wolf Creek, the description for sample 11 is "Empire Mine State Historic Park Sulphuret Works" which is not located adjacent to or in the bed or bank of South Fork Wolf Creek[4]. Furthermore, the analysis of the DEIR has shown that mine water discharge to South Fork Wolf Creek will not cause substantial erosion of siltation. Please see Chapter 4.8 and Appendix K.1 of the DEIR and Master Response 36 - Flows in South Fork Wolf Creek.

## Response to Comment Ind 510-11

Please see Response to Comment Ind 510-10.

## Response to Comment Ind 510-12



Please see Response to Comment Ind 510-10.

## Response to Comment Ind 510-13

This comment reproduces a 2009 study conducted by Wolf Creek Community Alliance and does not address the adequacy of the DEIR. Comment noted.

**Individual Letter 511**

DO NOT HEIDI NO MINE

**I support re-opening the Idaho-Maryland Mine**

list 1

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $121,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other County officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

### Response to Comment Ind 511-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 512**

**From:** Luke Berliner <berliner.design@gmail.com>
**Sent:** Monday, April 4, 2022 2:56 PM
**To:** Idaho MMEIR
**Cc:** DEIRcomments@cea-nc.org
**Subject:** DEIR Comment - Opposed to the Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hello,

As someone who was born and raised in Nevada City and then returned as an adult I came back for the vibrant town and natural beauty our county offers.

**Ind 512-1** The mine is our past and not our future and is directly in contrast to where I believe our community needs to head. I am much more in favor of environmental stewardship and helping to foster a recreation based economy.

Beyond my feelings I have read through the DEIR and was surprised at a number of issues this mine would bring to our community.

**Ind 512-2** Ground Water - As someone who lives very close to the proposed site and is on a well I am very concerned about the effect on the ground water around the mind and beyond. As we see more severe drought conditions every year moving forward with a project that would have long lasting negative impacts to the local water table feels like a bad idea.

**Ind 512-3** Home Value - My grandparents own a beautiful home right near the mine and our family is concerned about the reduced value this will bring to their property.

**Ind 512-4** Noise - We can already hear substantial noise from the airport and business park and the reported noise from the mine sounds inexcusable in an area as residentially dense.

**Ind 512-5** Air quality - As someone with Asthma I'm very concerned with dust from trucks, extraction from the mine and other operations. With already moderate air quality in the county on top of increasingly poor air from the extended fire season I may have to reconsider where I chose to live.

Thank you,

Luke Berliner

## INDIVIDUAL LETTER 512: LUKE BERLINER

### Response to Comment Ind 512-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 512-2

Please see Master Responses 13 through 16. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 512-3

The comment does not address the adequacy of the DEIR. Please see Master Response 2 – Social and Economic Issues.

### Response to Comment Ind 512-4

Noise is addressed in Chapter 4.10, Noise and Vibration, of the DEIR. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 512-5

Air quality is addressed in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

Dear Mr Kelly:
In college I took a class called "How to Lie With Statistics." I hated that class because math was not my super power, but the concepts served me well in my career and in how I suss out information thrown at me every day by politicians, mortgage and insurance companies, car salesmen, vitamin labels, travel brochures - you name it.

The DEIR submitted by RISE Gold for the Idaho Maryland Mine project is just such a document. It is full of positive proof that this mine makes sense via mitigations, abatements, reductions, high-tech processes and engineering practices.

**Ind 513-1**

But the real question is: Does this mine make sense for Nevada County now and 80 years out? Do we place the next almost century of our community in the hands of people and a system that *by default* impacts water, air, energy usage, noise pollution, and more disruption than I will list here because you already know all of it.

We all develop a way to make the best decisions for our lives, for our families and for our community. Here is your chance to make the best decision for Nevada County. Read this DEIR over and over, dream about it in your sleep, think about the future and tell me - does the Rise Gold Mine make sense on any level for our precious community? I know you know - it does not.

Thank you,
Lynn Forbes

## INDIVIDUAL LETTER 513: LYNN FORBES

### Response to Comment Ind 513-1

Please see Master Responses 1 and 2. The commenter expresses general concerns regarding the DEIR but does not provide specifics. Thus, a detailed response is neither possible nor required.

**Individual Letter 514**

Matt Kelley
Nevada County Planning Department

It's hard to believe that the owner of Rise Mine is even under consideration for this project. From his resume and history he is NOT a man of character or integrity.

**Ind 514-1**

And my bigger concern is a Board of Supervisors who are NOT responsive to public concern. WHY don't they put this to a vote? (NOT their vote) but a public vote. Straight forward and absolute.

ANY supervisor who is in favor of this project may well find his/her career in politics at an end. I would never vote for anyone who does not respond to the cry of their constituents.

Sincerely,

M. Nyborg

M. Nyborg

### Response to Comment Ind 514-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 515**

**Dist 1**

RECEIVED

MAR 14 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: February 22, 2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

**Ind 515-1** I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

**Ind 515-2** I do not trust them. Look at their history, which I believe you must have done yourselves. They pollute and leave a disaster. Let's find other industries to boost our

**Ind 515-3** economy. We've already driven out prior businesses, and we've done little to entice anyone to replace them.

**Ind 515-4** There are many reasons this mine should NOT be reopened. My personal reasons are:

**Ind 515-5** · The mine will pollute our air and increase lung disease.

**Ind 515-6** · Clouds of airborne toxic mining dust including asbestos will drift downwind into Grass Valley

**Ind 515-7** · If approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.

**Ind 515-8** · There is serious risk to our health, our environment, our property value, and our peace and quiet.

**Ind 515-9** · Hard rock mining is the single largest source of toxic waste in the United States.

**Ind 515-10** · Vast amounts diesel exhaust from continuous operation, including the trucking in of explosives

**Ind 515-11** · A large factory on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential)

| | |
|---|---|
| **Ind 515-12** | · Crushing of 1,500 tons of mine waste every day, all day, using massive machines |
| **Ind 515-13** | · Trucks hauling 1,000 tons of waste rock, 100 trips every day, down Brunswick Road, piling it higher than a 6-story building at the Centennial site. |
| **Ind 515-14** | · Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area |
| **Ind 515-15** | · Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells |
| **Ind 515-16** | · Waste water will be dumped into South Fork Wolf Creek and destroy habitats and stir up existing toxic residues like mercury, cyanide and lead with disastrous effects for downstream ecosystems from the past mining operations. |
| **Ind 515-17** | · Use of over 12% of Nevada County's electricity, more than all the County businesses combined |
| **Ind 515-18** | · Numerous Rise Gold violations of mining and environmental laws in Canada and here – already |
| **Ind 515-19** | · Claims that a few hundred jobs could justify the likelihood of increased lung cancer (Nevada County currently has a surplus of unfilled job positions) |
| **Ind 515-20** | · Business life that depends on tourism will be hurt |
| **Ind 515-21** | · Homeowners stand to lose an estimated 20% in property values (and more if the well is dry) |
| **Ind 515-22** | · A working mine will damage neighborhoods with shattered peace and quiet |
| **Ind 515-23** | · Underground blasting is planned for seven days a week and will be felt by those living within the 2,585 acres of underground mineral rights the mine owns. See map! |
| **Ind 515-24** | · While Rise Gold shareholders (largely Canadian) profit, the local community gets little. |
| **Ind 515-25** | · The few theoretical jobs gained are hugely offset by the harm done. And there are several excellent suggestions in the Union to promote good jobs locally. |
| **Ind 515-26** | · Where will the imported workers live when housing is already so limited in our area? ? |
| **Ind 515-27** | · 85% of vendor spending will not be local |

**Ind 515-28** · Nevada County revenue will be only from property taxes, all other taxes will go to the state

**Ind 515-29** The history and business practices of Rise Gold do not inspire trust

**Ind 515-30** · Rise Gold has never opened a hard rock mine and has never made a profit on their business ventures to date

**Ind 515-31** · Rise Gold CEO, Ben Mossman has been charged with environmental offenses in B.C. Canada courts

**Ind 515-32** · There are many questions as to the financial stability of this company.

**Ind 515-33** · The potential "breakout" from the mine's contaminated settling pond during one of our "atmospheric river" storms is enormous.

**Ind 515-34** I am resident of Nevada County and observe that Rise Gold corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

**Ind 515-35** Sincerely,
Madeleine Dowd

## INDIVIDUAL LETTER 515: MADELEINE DOWD

### Response to Comment Ind 515-1
The commenter urges the County not to approve the project. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 515-2
The commenter references the Project Applicant's reputation. The commenter is referred to Master Response 3 - Operator Responsibility.

### Response to Comment Ind 515-3
The commenter states that the County should look to other industries to do business in the County. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 515-4
The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 515-5
The commenter states that the project will pollute the air and increase lung diseases but does not provide any additional information. Air emissions from the project are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR and impacts are less than significant after mitigation. The commenter is also referred to Master Response 18 - Air Quality Thresholds.

### Response to Comment Ind 515-6
The commenter states that the project will result in toxic mining dust containing asbestos but does not provide any additional information. Air emissions from the project are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR and impacts are less than significant after mitigation. The commenter is also referred to Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 515-7
The commenter states that the Idaho-Maryland Mine would operate 24 hours a day, 7 days a week for 80 years but does not state how the DEIR is inadequate. Operating times for various activities of the project are provided in Chapter 3 (Project Description) of the DEIR.

### Response to Comment Ind 515-8
The commenter states the project poses serious risks to community's health, environment, and property values but offers not specific information regarding the physical impacts of the project. Air emissions from the project are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR and impacts are less than significant after mitigation. Regarding property values, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 515-9
This comment does not address the adequacy of the DEIR and has been forwarded to the decisionmakers.

## Response to Comment Ind 515-10

The commenter states that project will result in vast amounts of diesel exhaust from project-related traffic. Air emissions, including diesel exhaust from haul trucks, are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR and impacts are less than significant after mitigation. The commenter is referred to Master Response 18 – Air Quality Thresholds, and Master Response 19 – NSAQMD Criterion Pollution Thresholds during Operations. As stated in the Health Risk Assessment (HRA) performed for the project (see Appendix B of Appendix E.1 to the DEIR), for diesel haul trucks, estimated maximum daily trips were multiplied by 365 days to estimate annual trips. For all other trucks, daily emissions were estimated based on the anticipated maximum daily truck trips, and annual emissions were estimated based on anticipated average trips per week multiplied by 52 weeks per year. Total truck trips assumptions for the HRA are shown in HRA Table 7. Based on the HRA, which includes all construction and operational TAC sources of the project, the health risk to the maximally exposed individual resident (MEIR) would be less than significant after implementation of mitigation.

## Response to Comment Ind 515-11

This comment does not address the adequacy of the DEIR and has been forwarded to the decisionmakers.

## Response to Comment Ind 515-12

The commenter states that the project proposes to crush 1,500 tons of mine waste daily but does not comment on the adequacy of the DEIR. No crushing is proposed on surface. The commenter is referred to Chapter 3 (Project Description) of the DEIR.

## Response to Comment Ind 515-13

The commenter is concerned about the project-related traffic from the Brunswick Industrial Site to the Centennial Industrial Site but does not comment on the adequacy of the DEIR. Traffic and noise impacts are analyzed in Chapter 4.12 (Transportation) and 4.10 (Noise and Vibration) of the DEIR.

## Response to Comment Ind 515-14

The commenter is concerned about the project's underground blasting but does not comment on the adequacy of the DEIR. Blasting vibrations are analyzed in Chapter 4.10 (Noise and Vibration) of the DEIR and the impact is less than significant after mitigation. The commenter is also referred to Master Response 7 - Location of Future Mining Areas.

## Response to Comment Ind 515-15

The commenter is concerned about the dewatering of the mine but does not comment on the adequacy of the DEIR. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 515-16

The commenter is concerned about the treated water discharged to South Fork Wolf Creek but does not comment on the adequacy of the DEIR. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek and Master Response 36 - Flows in South Fork Wolf Creek.

## Response to Comment Ind 515-17

The commenter is concerned about the project's use of electricity but does not comment on the adequacy of the DEIR. As stated on page 4.11-35 of the DEIR, PG&E provided a will serve letter for the project and has confirmed that there are electric facilities available to serve the proposed project in accordance with all applicable design standards, rules, and tariffs on file with the State of California Public Utilities Commission. Please also see Master Response 25 – Nevada County Energy Action Plan, and Response to Comment Agcy 8-17.

## Response to Comment Ind 515-18

The commenter references the Project Applicant's reputation. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 515-19

The commenter states that the project will cause lung cancer but does not comment on the adequacy of the DEIR. Air emissions from the project are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR and impacts are determined to be less than significant after mitigation.

## Response to Comment Ind 515-20

The commenter states the project will negatively impact the County's tourism industry. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 515-21

The commenter states that the project will adversely affect property values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 515-22

The commenter states the project will have adverse noise impacts but does not comment on the adequacy of the DEIR. Noise impacts from project's operations are determined to be less than significant after mitigation. The commenter is referred to Chapter 4.10 (Noise and Vibration) of the DEIR.

## Response to Comment Ind 515-23

The commenter states that underground blasting will be felt by local residents but does not comment on the adequacy of the DEIR. Blasting vibrations are less than significant after mitigation. The commenter is referred to Chapter 4.10 (Noise and Vibration) of the DEIR and Master Response 7 - Location of Future Mining Areas. As noted on page 4.10-44 of the DEIR, using average blasting noise levels from a comparable underground gold mine, the worst-case maximum noise levels at the nearest noise-sensitive receptors would range from 52 to 57 dBA $L_{max}$. The range of predicted worst-case blasting noise levels of 52 to 57 dBA $L_{max}$ is below the daytime, evening, and nighttime dBA $L_{max}$ criteria at the nearest receptors.

## Response to Comment Ind 515-24

The commenter references the economic impacts of the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 515-25

The commenter references the economic impacts of the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 515-26

The commenter is concerned about available housing for workers from outside the County. As stated on page 4.9-27 of the DEIR, the project would provide employment opportunities that would result in indirect population growth. However, population growth resulting from the proposed project would not exceed the current housing stock in the area. Therefore, the project would not induce substantial unplanned population growth, and this impact would be less than significant.

## Response to Comment Ind 515-27

The commenter references the economic impacts of the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 515-28

The commenter references the economic impacts of the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 515-29

The commenter references the Project Applicant's reputation. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 3 - Operator Responsibility.

## Response to Comment Ind 515-30

The commenter references the Project Applicant's reputation. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 515-31

The commenter references the Project Applicant's reputation. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 515-32

The commenter references the financial condition of the Project Applicant. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues

## Response to Comment Ind 515-33

The commenter is concerned about the potential failure of the settling pond but does not comment on the adequacy of the DEIR. The geotechnical stability of the treatment pond is analyzed in Chapter 4.6 (Geology, Soils, and Mineral Resources) of the DEIR and required mitigations would reduce the impact to a less than significance level. (DEIR Chapter 4.6 and Appendix H.1.)

## Response to Comment Ind 515-34

The commenter's opposition to the project is noted for decisionmakers. The commenter is referred Master Response 1 - Non-EIR/Administrative Issues

## Response to Comment Ind 515-35

The commenter provides their contact information. The comment is noted.

RE: Draft Environmental Impact Report for Proposed Idaho-Maryland Mine Project

April 4, 2022

Dear Commissioners,
I am a resident of Nevada County. Here are my concerns with the current DEIR for the proposed Idaho-Maryland Mine project.

**The Centennial Industrial Site:** First, I question the proposal to use as 'environmental baseline' the future (and still hypothetical) mitigation of this site. To do so seems to assume that the mitigation can only bring about an improvement to the environmental health and wellness of the area. However, such an assumption seems premature.

**Ind 516-1**

How do we know this proposed mitigation (involving excavation, concrete mixing and engineered pad creation) will result in any net gain to the health, safety and/or wellness of the land? Will this sort of mitigation function as a benefit to the ecosystem as a whole? Have there been any environmental studies or analyses measuring the current and possible long term effects of simply leaving the site as is---continuing with passive remediation, perhaps already underway at the site through the natural regrowth of forest, mycorrhizal soil networks, and native plant communities? Could it be that we are already seeing some potential mitigation happening through 'no action,' i.e. through allowing the natural world to reclaim and rewild this once toxic mess?

Perhaps the passive mitigation, through forest regrowth is providing better entrapment and/or diffusion/nullification of toxic material over time, than the proposed disruptions of excavation, concentration/capping and engineered fill may ever do? How will we know this without some studies? Perhaps the current environmental baseline is healthier for the land and community than the mitigations proposed? Have the carbon releasing effects of the proposed deforestation associated with the proposed mitigation been factored into this DEIR?

**The Hydrology Report**

**Ind 516-2**

1

Secondly, the DEIR seems to state that the only key impact of continuously dewatering 72 miles of tunnels beneath a large residential community, is the potential loss of 30 wells on Bennet Road. Isn't the number of wells that may be affected much much larger? How can this be the only potential impact?

**Ind 516-3**

What about harmful legacy sediments being disturbed and getting into ground water or residential wells? The mitigation efforts described in section 4.7-2(a,b) do not seem to go far enough to describe how this would be discovered and regulated. Are we simply to rely on Rise Gold and their own contractor to report the discovery of possibly contaminated soil or noxious odor?

**Ind 516-4**

More importantly, the mitigations in this DEIR don't address the big picture hazards. What about the potential changes to the water table as a whole? What about climate change and drought? The report is using 2019 water data (12 inches) to make its estimates for the entire operation period, but we've been seeing temperatures rise and water resources diminish consistently for many years now. How will the report take these conditions into account?

**Ind 516-5**

How would dewatering affect soil and vegetation in the Brunswick basin? How might it affect surrounding hydrology? Possible deleterious effects from unknown or unknowable outcomes represent potential hazards that should be thoroughly outlined in the report, possibly using past events; such as the dewatering of the North Columbia Diggins Mine on the ridge---resulting in the Grizzly Flats school losing their well (and still trucking in water to this day.)

How might dewatering affect local businesses, wetlands, streams, and/or other local water resources that our community relies upon, such as the Bitney Springs?

**Ind 516-6**

Thank you for taking these factors into account to further develop this DEIR.

Sincerely,
Maile Claire McGrew-Frede

## INDIVIDUAL LETTER 516: MAILE MCGREW-FREDE

### Response to Comment Ind 516-1

The commenter questions the approach of adjusting the environmental baseline of the Centennial Industrial Site to use the post-remediation condition instead of the existing conditions at the Centennial Industrial Site. The commenter states that the "mitigation" of the Centennial Industrial Site (i.e., engineered fill placement for potential industrial pad development) is an environmentally inferior option compared to leaving the Centennial Industry Site as is and allowing "passive remediation" (i.e., natural regrowth of forest.) Lastly, the commenter asks whether the impacts of the proposed deforestation have been factored into the DEIR.

As discussed in the DEIR, the CEQA Guidelines and the courts have recognized that measuring the baseline from the existing physical conditions at the commencement of the environmental analysis does "not always provide the most accurate and understandable picture practically possible of the project's likely impacts" (see DEIR, page 1-3). CEQA Guidelines Section 15125(a)(1) states that "a lead agency may define existing conditions by referencing historic conditions, or conditions expected when the project becomes operational, or both, that are supported with substantial evidence" where necessary to provide the most accurate possible of the project's impacts (*Ibid*).

The commenter conflates the Idaho-Maryland Mine Project (placement of engineered fill at the Centennial Industrial Site) with the Centennial Industrial Site Clean-Up Project (DTSC-approved remediation). Engineered fill at the Centennial Industrial Site would only proceed if the DTSC-approved remediation is completed. The commenter is referred to Master Response 4.

Regarding the commenter's preference that the Centennial Industrial Site be left as is, the DEIR addresses this with the "No Project" alternative (see DEIR, page 6-16). This alternative assumes that Centennial Industrial Site would be remediated under DTSC oversight, but would remain undeveloped under the project (*Ibid*). The DEIR also describes the resulting environmental impacts to the Centennial Industrial Site under the No Project alternative (see DEIR, pages 6-16 to 6-21). Lastly, the loss of carbon sequestration resulting from 5.3 acres of tree removal at the Centennial Industrial Site was factored into the DEIR (see Appendix E.1 AQ – GHG Report, pages 353 to 355).

### Response to Comment Ind 516-2

The commenter questions whether the DEIR underestimates the number of private groundwater wells that would be impacted from dewatering the mine. The commenter is referred to Master Responses 14 and 15.

### Response to Comment Ind 516-3

The commenter states that the proposed project would result in harmful legacy sediments being disturbed and getting into private groundwater wells. The commenter does not describe the source of the harmful legacy sediments being disturbed and getting into groundwater and residential wells. Because the mining activities would only lead to the drawdown of groundwater and do not provide recharge to the domestic wells, the mining activities at the project site should not affect the water quality of the domestic wells (see DEIR, Appendix K.8, page 14). Please also see Response to Comment Grp 25-30 regarding legacy contaminant concerns.

The commenter asks if the applicant would be required to report the discovery of possibly contaminated soil or noxious odor but does not provide information on where this soil or odor would be derived. Sediments and deleterious constituents in mine water would be removed by the water treatment plant before discharge to South Fork Wolf Creek. The commenter is referred to Master Response 35. Chapter 4.7 of the DEIR discusses and analyzes existing contaminated soil at the Brunswick site. Odors are analyzed under Impact 4.3-3 of the DEIR, which discusses odors and concludes the project would not have the potential to result in emissions leading to odors, which could adversely affect a substantial number of people (see DEIR, pages. 4.3-84 to 4.3-86). Regarding the reliance on the operator to report contaminated soil or noxious odors, the commenter is referred to Master Response 3.

## Response to Comment Ind 516-4

The commenter states that the DEIR fails to examine several impacts, specifically the impact to the water table, and fails to take into account drought and climate change.

The DEIR analyzes the impacts to groundwater, including the potential impacts to the groundwater table. The commenter is referred to Chapter 4.8 of the DEIR (Hydrology and Water Quality) as well as Appendix K.2 (Groundwater Hydrology and Water Quality Analysis) and Appendix K.3 (Groundwater Model Report). Regarding the project's impacts on climate change, the commenter is referred to Master Response 16.

## Response to Comment Ind 516-5

The commenter asks how the dewatering of the mine would affect soil and vegetation in the area as well as the surrounding hydrology. The DEIR discusses the dewatering effect on surrounding hydrology in Chapter 4.8 (Hydrology and Water Quality) and Appendices K.2 (Groundwater Hydrology and Water Quality Analysis) and K.3 (Groundwater Model Report) of the DEIR. The dewatering effect on soil moisture and vegetation is discussed on page 4.13-21 or the DEIR. The commenter is also referred to Master Response 33. The commenter states that possible deleterious effects from unknown or unknowable outcomes represent potential hazards that should be thoroughly outlined in the report but does not specify what these outcomes or deleterious effects are. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

## Response to Comment Ind 516-6

The commenter asks how the dewatering of the mine would impact local businesses, wetlands, streams, and/or other local water resources. The dewatering of the mine and its impacts on local business, wetlands, streams, and other water resources is analyzed in the DEIR. The commenter is referred to Chapter 4.8 and Appendices K.2 (Groundwater Hydrology and Water Quality Analysis) and K.3 (Groundwater Model Report) of the DEIR. The commenter also invokes Bitney Springs as a local water resource that may be impacted by the project. However, Bitney Springs is located approximately four miles from the project site and well beyond the simulated drawdown from the project. Therefore, Bitney Springs would not be impacted by the project.

**Individual Letter 517**

**From:** Maile McGrew-Fredé
**To:** BOS Public Comment
**Subject:** Say NO to RISE GOLD
**Date:** Monday, February 28, 2022 10:49:33 AM

Dist 1

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

Thank you for serving as representatives of the people of Nevada County.

I feel certain you are each very kind, savvy and knowledgeable people, who are sincerely looking out for Nevada County, for its communities, critters, land, air, water...all of us, and our collective future.

That is why I have hope that even though Ben Mossman and his speculative company, Rise Gold have been allowed to come this far--- to purchase the land, own the mineral rights, test and explore and now propose a highly impactful hard-rock mining operation in the middle of our pastoral residential community, ***you are prepared to stand firm and simply say NO, not now, not ever, not in Nevada County.***

**Ind 517-1**

If I had to choose what I believe to be the absolute ***worst*** of the vast array of terrible, obnoxious, harmful and polluting impacts and outcomes this project is expected to have (using Rise Gold's own documents ), I would have to say it is the plan to use vast quantities of our precious groundwater as a *waste product*; set to be flushed, 'treated' and dumped, into Wolf Creek at the rate of millions of gallons each day. This won't happen just once, but is foundational to the project, and will go on each day, every day, for the next 80 years!

How can we even be considering such a thing in this moment, this current moment in which we are finally beginning to understand the depth of our environmental predicament--- deepening drought, species loss, forest loss and wildfire threat? Draining the shafts means *throwing away* our precious, *priceless* **water,**... but first, fouling it, stirring up hundred-plus year old sediment sleeves of legacy mining toxics such as lead, asbestos and mercury.

What's more, proposals like this one are now cropping up **all over the Sierra** simply because the price of gold has changed. This is unacceptable. The few jobs that Rise Gold is promising can never make up for the losses that will be sustained if we allow this project to go forward. We need *green jobs* in Nevada County, a green (and moist) future, not a slow sad extension of the toxic legacy that stains our past.

**Let's lead the way in the Sierra Nevada by stepping away from an unsustainable, extraction-based past, and stepping into a renewable future.**

Sincerely,
Maile Claire

## INDIVIDUAL LETTER 517: MAILE MCGREW-FREDE

### Response to Comment Ind 517-1

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

The commenter provides general comments on groundwater, water discharge, sedimentation erosion of creek beds (stirring up legacy mining toxics), drought, species loss, forest loss, and wildfire but does not provide specific reasons as to why the DEIR is inadequate. The DEIR analyzes these issues in Chapter 4.4 (Biological Resources), Chapter 4.8 (Hydrology and Water Quality), and Chapter 4.13 (Wildfire). Please also see Master Response 35 – Discharge to South Fork Wolf Creek, and Master Response 16 – Drought and Climate Change. In addition, please see Response to Comment Grp 25-30 regarding legacy mining concerns.

**Individual Letter 518**

Mardi Naythons
15450 S Ponderosa Way
Grass Valley, CA, 95949
March 31, 2022

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue
Nevada City, CA, 95959

Dear Mr. Kelley and Members of the Planning Department,

**Ind 518-1** I am writing to express my opposition to the Draft EIR submitted for approval by Rise Gold. The report has several points which I believe are misrepresented or conclusions reached without critical scientific data.

**Ind 518-2** My first concern is with the potential damage due to dewatering. Though the report says that the dewatering will affect only 7 (to 30) parcels, it could actually affect many more. One only has to look at the exhibit of all the mine tunnels under Grass Valley at the Empire Mine museum to realize that there is potential for wider damage from dewatering. Additionally, there are two clauses in the report that I find disturbing. First that provisions will only be allowed for the original parcel owners and that they will only cover damages occurring within the first 20 years and the mine is expected to operate for 80 years. If that isn't enough, think about the potential for sink holes under Grass Valley.

**Ind 518-3** The report says that noise will be minimal and shouldn't affect the public. Please consider that some people are sensitive to vibration in addition to actual noise. Also, some people are generally more sensitive to noise, It is going to be 24 hours a day, There won't even be the reprieve on quiet in the evenings.

**Ind 518-4** Having the trucks carrying mine tailings to be processes will create more pollution to the air. Our air quality is already amongst the worse in the state. It is not a good idea to create more pollution. All that diesel exhaust won't help the situation.

**Ind 518-5** The DEIR states that the previous accumulation of contamination at the Centennial site has already been cleaned up by Rise Gold. In fact, it has not been and there is no provision or teeth for the county to make sure it is cleaned up.

**Ind 518-6** Finally, though it is stated that Rise Gold has established a bond to be financially responsible for damages, their track record does not indicate that this will be guaranteed. They have not paid for damages at the Bank Island site in British Columbia due to bankruptcy.

**Ind 518-7** Though this letter speaks mainly to the Draft EIR, I will close by saying that this is really the wrong industry to bring back to our area. Yes, there is mining history in Nevada County, but there is also unmitigated desecration and contamination left here by mining for us to endure forever.

Please consider all of this before granting permission for the mine.

Sincerely,
M. Naythons
Mardi Naythons

## INDIVIDUAL LETTER 518: MARDI NAYTHONS

### Response to Comment Ind 518-1

The comment expresses a general opinion that the DEIR is not adequate, but does not provide specific examples that would allow for a detailed response. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 518-2

Please see Master Responses 14 and 15 regarding dewatering concerns. Please see Master Response 29 – Near Surface Workings, regarding sink hole concerns. The commenter incorrectly states that the applicant would only pay for potable water charges to impacted properties for 20 years. According to the Well Mitigation Plan, reimbursement for water charges will continue throughout the 80-year permit term of the mine unless one of the following occurs:

1) The property is sold by the owner after the NID connection is accomplished and paid for by Rise.
2) The property is annexed into the City of Grass Valley.

As discussed in Master Response 15, a new homeowner would not be impacted because the impact would have previously occurred, and the cost of purchasing water from NID for that new homeowner would be the same as buying any other home connected to NID's water supply. The provision of free water as a selling feature to a new buyer is not contemplated by the policy. If a property was annexed into the City of Grass Valley, it would be subject to the ordinances of the City which allows water wells to only be used for irrigation purposes only (Grass Valley General Ordinance Section 13.16.020) and would therefore require a property owner to connect to the potable water supply and pay for their water use. As annexation of a home into the City would already require connection to NID water supply and purchase of NID water, continuation of payment for water by the applicant after annexation would be a windfall to the property owner rather than mitigation of an impact, and is not required by CEQA or County policy.

### Response to Comment Ind 518-3

Please see Chapter 4.10, Noise and Vibration, of the DEIR, which evaluates potential groundborne vibration impacts to sensitive receptors in the project vicinity. In addition, please see Master Response 1.

### Response to Comment Ind 518-4

Diesel emissions from haul trucks were addressed in the Health Risk Assessment prepared for the project. As stated in the Health Risk Assessment (HRA) performed for the project (see Appendix B of Appendix E.1 to the DEIR), for diesel haul trucks, estimated maximum daily trips were multiplied by 365 days to estimate annual trips. For all other trucks, daily emissions were estimated based on the anticipated maximum daily truck trips, and annual emissions were estimated based on anticipated average trips per week multiplied by 52 weeks per year. Total truck trips assumptions for the HRA are shown in HRA Table 7. Based on the HRA, which includes all construction and operational TAC sources of the project, the health risk to the maximally exposed individual resident (MEIR) would be less than significant after implementation of mitigation.

## Response to Comment Ind 518-5

The DEIR does not state that the previous accumulation of contamination at the Centennial Industrial Site has already been cleaned up by the applicant. The commenter misinterprets the use of the adjusted environmental baseline for the Centennial Industrial Site, which is discussed in Chapter 1, Introduction, of the DEIR.

As explained on pages 1-4 through 1-6 of the DEIR, in accordance with CEQA Guidelines Section 15125(a)(1), substantial evidence exists to support adjusting the environmental baseline for the Centennial Industrial Site to use the post-remediation condition instead of existing conditions at the Centennial Industrial Site. Such adjustments will give the public and decisionmakers the most accurate and understandable picture of the proposed project's potential impacts for certain resource topics affected by landform alteration/soil disturbance activities, as discussed in the bullet points on pages 1-6 and 1-7 of the DEIR. For evaluation of other resource topics, the environmental baseline is existing conditions at the Centennial Industrial Site as those resource evaluations are less dependent on landform/soil disturbance. See also Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 518-6

The comment does not address the adequacy of the DEIR. Please see Master Response 3 – Operator Responsibility.

## Response to Comment Ind 518-7

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Subject:** Letter re: Opposing the re-Opening of the Idaho Maryland Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 519-1**

I'm not a resident that lives close to the mine or even in Grass Valley or Nevada City, but at the southernmost end of the county in Lake of the Pines. So, why do I oppose this mine being reopened?

First, one of the main reasons for our move into Nevada County was for the ambience of Grass Valley and Nevada City- the historical and cultural activities and atmosphere. I, and my late husband, most enjoyed shopping, dining, attending musical performances, the art walks, and the farmer's markets. Since I intend to continue this tradition, something this risky should not be allowed to happen in this lovely area.

**Ind 519-2**

I hear that the main argument for reopening the mine is "jobs." Why would a county with a housing and a worker shortage want to risk anything to provide more jobs?

**Ind 519-3**

Finally, as a tax-paying citizen of Nevada County and a customer of NID, I don't want to be a part of paying to pick up the pieces if the number of wells that would be affected is severely underestimated or disaster strikes, as it did in Canada, and the company files bankruptcy leaving us with a mess.

Nevada City, CA 95959-7902

SUBJECT: Comments addressing the Draft Environmental Impact Report (DEIR) on the Re-Opening of the Idaho-Maryland Mine

As a long time resident of Nevada County, I am most concerned about the effects on our water that the re-opening of the Idaho-Maryland Mine will have. We are going through a major drought and the DEIR does not adequately address the threat to our water. The following needs to be addressed by outside experts not just those hired but Rise Gold.

**Ind 520-1**

- 3.6 million gallons of treated wastewater will be released every day into South Fork Wolf Creek for 6 months, then 1.2 million gallons a day after that.

**Ind 520-2**

- Mine dewatering risks depletion of our region's groundwater, impacting drought-related scarcity and the future price of water.

**Ind 520-3**

- Many hundreds of private wells are at risk because groundwater impacts of mining are truly unpredictable.
  - Rise Gold's claims of "zero risk to wells" are based on a flawed, privately funded hydrology study.
  - Potential well risks include: reduced output, contaminated water, or complete failure with no clear plan for a reliable or affordable replacement source.

This project will impact our local water supply and we can not afford to lose this precious resource. Further study is required to ensure we have sufficient, quality water for our community.

**Ind 520-4**

February 17, 2022.

RECEIVED

FEB 18 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Dear Nevada County Supervisors;

Businesses, homeowners, and conservationists in Nevada County are joining together to protect our neighborhoods, our local economy, and our quality of life from the Rise Gold proposal to re-open the Idaho-Maryland Mine. We, urge the Board of Supervisors to reject this destructive proposal and instead protect our community.

**Ind 521-1**

We face new environmental challenges and this project seems to be a step in the wrong direction. Our duty is to protect our land and natural resources and not exploit them to their limit. As a mother I urge you to think about what world we want for out next generations and encourage you to look at our past and at the past of this Rise Gold. This is not what we want for our community.

In gratitude for your service,

Maria Fernanda Benner

## INDIVIDUAL LETTER 521: MARIA BENNER

### Response to Comment Ind 521-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 522**

March 21, 2022

Matt Kelley
Senior Planner, Nevada County Planning Department

*B.S. Biology; M.S. Environmental Studies. Secondary Life Science teaching credential; Licensed California Department of Pesticide Pest Control Advisor.*

Dear Matt

**Ind 522-1**

I have a concern that the Draft Environmental Impact Report (DEIR) is opaque in that there are reports hidden within reports, some of which are inaccessible. The following is a general example. Most sites as contaminated as the Centennial site are required by the state of California to adhere to guidelines under the California Surface Mining and Reclamation Act (SMARA). However, Rise Gold is "working with the California Department of Toxic Substances Control (DTSC) to develop a plan that consolidates, and caps contaminated soil…consistent with state and federal regulation." Therefore, the DEIR concludes, "The environmental cleanup work at the Centennial Site will be completed under the DTSC voluntary cleanup program and is not a component for review under SMARA."

Continuing along this line of concern is the overt obfuscation created by frequent references to the Department of Toxic Substances report (DTSR) for "remediation" of various impacts. That report is not completed, so it is impossible to reference it. Terms used in conjunction with these ambiguous statements such as "reasonably anticipated, expected, in the event, may, etc…" are projecting into the future, not based in reality. This is termed denial. They are vague and ephemeral, contributing to the obfuscation of the true impacts of this mining operation. Without this report, how are we to verify that there are no or there are minimal environmental impacts, as frequently stated in this DEIR? Claiming that work will be done under a *voluntary* cleanup program according to an *unwritten* report, is far from convincing.

For example, p. 1-6 in the introduction of the DEIR states: **"**The separate Centennial Clean-Up Project would be completed before implementation of project-related activities at the Centennial Industrial Site and would result in the alteration and/or removal of

certain habitats capable of supporting special-status species. Therefore, for the purposes of the analysis of biological resources, the environmental baseline for the Centennial Industrial Site has been adjusted to reflect the reasonably anticipated conditions of the site following the remediation activities (CEQAGuidelines Section 15125(a))" This is but one of many such references to remediation activities in the DEIR. What are those remediation activities? How can analysis of impacts to these biological resources be complete? Without complete analysis how can conclusions be justified without this information?

**Ind 522-2**

As a wildlife biologist and plant specialist I have several concerns. I question the adequacy of the survey techniques for the listed amphibians, the threatened California Red Legged Frog (CRLF) and the species of concern, the Foothill Yellow Legged Frog (FYLF). The report does not state whether the visual surveys were performed at night, which is the best time to capture and positively identify breeding CRLF. [1]

Please note that accuracy of visual surveys is weather dependent due to the breeding behavior of frogs. In 2018 three surveys were conducted by Greg Matuzak in December, which is typically breeding season and thus the best time to observe adult frogs. Rainfall history from that month indicates the following rainfall dates and amounts compared to the actual survey dates:

| SURVEY DATES | | | RAINFALL DATES/INCHES |
|---|---|---|---|
| Dec 9-12 | | | Dec 1- <0.5"; Dec 5- <0.25" |
| Dec 17-18 | | | Dec 16-17 - <3"; Dec 23-24 - 3-4" |
| Dec 30 | | | No rainfall approximate to this date |

The only rain event that produced enough precipitation to trigger significant breeding behavior in the two species of frogs was December 23-24.[2] Field surveys were conducted well before and after these dates, with the likelihood of enough water for breeding to be very low. Therefore, the survey methodology is incomplete, and neither presence/absence of adults, nor for egg masses can be verified from these minimal visual surveys.

The most accurate way to sample for amphibians is environmental DNA sampling, a definitive and inexpensive way to verify species of such importance, that has been used in wildlife sampling for the past 15 years.[3] Considering global declines of amphibians in general, and rapidly shrinking habitat for the two listed species of frogs in this region of California, this technique should be used to determine absence/presence in addition to multiple presence/absence surveys that are correctly timed.

Minimizing the likelihood of the presence of listed amphibian species does not mean they aren't there and that impacts won't be significant. Table 4,4-6 states that the

likelihood of CRLF and Foothill yellow legged occurrences in the Centennial site wetlands are "low" based on historical records of the California Natural Diversity Database (CNDDB). Appendix F.2 states that there is "marginal suitable habitat for CRLF and FYLF." The DEIR minimizes impacts by stating it is "unlikely" they occur in this area. This freshwater marsh is significant habitat to many listed fauna, whether observed or not because it is a perennial aquatic resource.

Mitigation of the significance of impacts to wetlands and thus the habitat of species that depend on them is repeatedly minimized in this DEIR. The mitigation caveat presented in the DEIR of wetland impacts is: "However, in the event that the currently proposed remediation boundary limits are modified by DTSC prior to commencement of remediation, this EIR addresses the possibility that some amount of freshwater emergent marsh wetland habitat may remain on the Centennial Industrial Site post-remediation." This is another example of manipulation of information regarding true mitigation by obscuring it. As proposed mitigation to these sensitive habitats, this is unacceptable.

**Ind 522-3**

What is the specific quantity of "some amount"? These delineated wetlands are too important ecologically to pave over, even partially, regardless of the ability to obtain Federal permits. How do the biologists justify minimizing the environmental impacts of this mine project on the delineated wetlands of both the Centennial and the Brunswick Sites that occurs throughout the DEIR? Even drainage in ditches on the Brunswick and East Bennet ROW has potential to be amphibian habitat, as I have personally observed throughout the agricultural ditches in southern Santa Clara County.

Mitigation of impacts to the Western Pond turtle (WPT), another species of concern whose life cycle is dependent on wetlands, are inadequately mitigated. Yet, the likelihood of this being WPT habitat is listed as "high" (Table 1.1, Section 1,4).

**Table 2.1, p 2-40 Summary of Impacts and Mitigation Measures states:**

**Ind 522-4**

*A pre-construction survey shall be conducted by a qualified biologist no more than seven (7) days prior to the proposed disturbance within 325 feet of perennial water sources at both the Centennial and Brunswick Industrial Sites. The survey(s) shall include a search of these suitable habitat areas for western pond turtle nests and mature adults.*

Additionally, the same table states, "During the spring or early summer, females move overland up to 325 feet to find suitable sites for egg laying".

Despite spring and summer spanning many weeks, the only requirement for determining presence/absence of the WPT is one (7) day advance pre-construction survey.

New hatchlings instinctively head toward the water. There must be continuous habitat to their upland nesting areas, or hatchlings will be crushed by the trucks. There is no mention of the significance of connectivity of habitat. This is a critical time in the turtle's life cycle.

The following mitigation measures are inadequate.

*If a western pond turtle is found, it should be allowed to move out of the way of the disturbance zone on its own or a qualified wildlife biologist with a CDFW handling permit for the species can move individuals out of the disturbance areas to avoid impacting this species.*
*If a nest is documented during pre-construction surveys, a non-disturbance buffer shall be established, as determined by a qualified biologist, based on the location of the nest until all eggs have hatched and the juveniles have dispersed out of the.*

What specific measures will be taken to allow turtles to "move out of the way?" Will operations cease temporarily, and if so, who will enforce a cessation of work?
As for the possibility of a biologist finding a nest during pre-construction surveys, if the non-disturbance buffer were to necessitate the inclusion of a roadway due to the location of the nest, what mitigation will occur?

From my experience with an active sand mine in the Bonny Doon area of Santa Cruz Mountains where critical CRLF habitat was designated by CDFW, there was simply a sign that said "Red legged frog crossing," which truck drivers ignored. I asked the on-site manager if this was a joke. He assured me this was their compliance with CEQA. How are we to trust that Rise Gold employees have any concern as to the fate of Western Pond turtles if mitigation is minimized?

**Ind 522-5**

The proposed mine will impact the important migratory corridors served by the habitat islands at both the Centennial and Brunswick sites, which help connect fragmented habitats for all types of wildlife: birds, mammals, amphibians, reptiles, as well as plants. An example of the DEIR minimizing this importance is the following regarding the California black rail, another species of concern. Appendix F.3 p. 18 states:

"Suitable habitat of this species occurs within the large marsh wetlands within the eastern section of the the Centennial Industrial Site where there is permanent ponding of water and dense vegetation. The species has not been documented within the Centennial Industrial Site but has been identified within 5 miles to the southeast and southwest of the Centennial Industrial Site."

Yet, the DEIR minimized the significance of this wetland's habitat value by following the previous statement with, "This species has a low likelihood of occurring within the Centennial Industrial Site." Has there been any consideration of the value of habitat connectivity for avian species?

Have the cumulative effects of impacts to these sites been considered when deciding the significance of the impacts? It is important to consider all such impacts to diminishing wetland species and riparian corridors in this foothill landscape of California

already severely degraded by previous mining, habitat loss, and drought. How does this DEIR align with the Nevada County General Plan which states "…vegetation management for the benefit of habitat preservation"?

**Ind 522-6**

Finally, with regards to aquatic wildlife, it should be noted that releasing large quantities of secondary treated water pumped out of the mining tunnels into Wolf Creek will have negative impacts on mollusks, invertebrates, and fish. Bio magnification will affect river otter, beaver in Wolf Creek as well as the rivers that the creek is a tributary of. These include the Bear River, Yuba River, Sacramento River, and the Delta, which is the base of the food web of one of the world's the largest fisheries. Table 4.8-2 on p 4.8-44 lists the various heavy metals and metalloids that are found in the tunnel water at current levels. However, for those that bioaccumulate such as lead, chromium, mercury, zinc, cyanide, and arsenic the column for post-treatment is left blank. Is this because secondary treatment of wastewater does not remove these? Many of them remain in the sediments removed from primary treatment, but not all. What is to prevent them from ending up in the sediments of Wolf Creek, along with other suspended metals and metalloids not removed by primary or secondary treatment? Sedimentation from runoff will also suffocate spawning gravels necessary for rainbow trout whose eggs require highly oxygenated water to survive. Metals can be ingested and absorbed by macroinvertebrates such as mollusks and insects, which are magnified up the food chain to fish, mammals, and birds. How are these conditions to be mitigated in Wolf Creek and beyond?

**Ind 522-7**

When impacts aren't minimized in the report, mitigation is. For example, the endangered Pine hill flannel bush, *Fremontodendron decumbens*, a rare species with a limited endemic range, may count fewer than 200 plants in three counties: Butte County, El Dorado County, and Nevada County. Ecologically, we cannot afford to lose any of these plants. To quote Calflora [4] "Locally rare plants play an important role in helping to preserve the diversity of the species, as well as the gene pool of local flora."

I believe the proposed mitigation measures for *Fremontodendron decumbens* (Pine hill flannel bush) on page 4.65 is inadequate as is the Habitat Management Plan (Appendix F-4)

*Transplanting;*
*Transplant the individuals of Pine Hill flannelbush that fall within the disturbance footprint to another site with similar soil, hydrologic, vegetation type and aspect. The transplantation site(s) selected shall extend the known population spatially, in other words, planting beyond the known perimeters of the existing population is preferable, to maintain population coverage. Transplanting shall occur in the season deemed to have the greatest potential for success, generally the fall, after rains have commenced.*
*4. Transplant Monitoring; and*
*Transplants shall be monitored every month for the first six months, then subsequently, every two months for the first two years. After monitoring identifies successful establishment and flowering for the second season for each of the transplants, transplanting will have*

*been deemed successful.*
*5. Alternative Measures to Transplantation and Seed Collection (if required pursuant to the criteria in the HMP)*
*If Steps 1-4 of the HMP are not successful in maintaining the Pine Hill flannelbush population numbers, then the following measures shall be taken:*

- *Individuals shall be grown from seed and transplanted out in a 100:1 ratio for those taken.*
- *Transplants of individuals grown from seed shall be planted with similar soil, hydrologic, vegetation type and aspect.*
- *Transplanting shall occur in the season deemed to have the greatest potential for success, generally the fall, after rains have commenced.*
- *Transplants shall be monitored every month for the first six months, then subsequently, every two months for the first two years.*

In my experience as a vegetation program specialist for a large water agency where I planned and implemented mitigation through vegetation (riparian and wetland) restoration, *Fremontodendron* species are difficult to propagate and impossible to transplant with any significant success rate. Though the mitigation references a nursery for propagation, based on my experience it will require 3-5 years of maintenance with irrigation, for these plants to become established after planting. Yet this plan provides for only two years of monitoring.

**Ind 522-8** Why is there no mention of irrigation in the maintenance of these plants? From experience, I can predict they will not survive without it. The mitigation measures described above are thus inadequate.

The following quotes from the California Native Plant Society (CNPS) support my conclusions about the inadequacy of the DEIR's proposed mitigation for this rare plant. The CNPS is the standard measured against by plant community specialists and botanist in California.

[5] "Monitoring rare plants and habitats during all phases of a project will help ensure that construction and operation activities do not encroach on protected habitat."

**Ind 522-9** "The Society does not endorse alteration of naturally occurring plant communities through transplantation because the methodology for most rare plants is untested and therefore unreliable and because most past attempts have ultimately failed."

[6] "In most instances off-site compensation does not fully reduce impacts to an insignificant level because a net loss of individuals or habitat that supports a natural self-sustaining rare plant population results."
There need to be clear implementation and monitoring plans which will be provided to the appropriate regulatory agencies. I did not observe these in the DEIR, therefore, the

**Ind 522-10**

mitigation is inadequate. I do not believe this plant can be mitigated to an acceptable level.

**According to the DEIR** "The EIR determined that, at both the Centennial and Brunswick Industrial Sites, implementation of the proposed project could result in potential significant adverse effects to special-status plants, foothill yellow-legged frog, western pond turtle, California red-legged frog, California black rail, coast horned lizard, special-status bats, and non-special status raptors and migratory birds. The proposed project would also result in a significant impact to mapped streams and wetlands. However, the EIR requires mitigation in order to ensure that impacts related to the aforementioned biological resources would be reduced to less-than-significant levels."

**The mitigation measures in the DEIR are INADEQUATE for this level of significant impacts. How could approving the EIR be justified in any way?**

## INDIVIDUAL LETTER 522: MARION BLAIR

### Response to Comment Ind 522-1

The California Surface Mining and Reclamation Act regulates surface mines in California with regard to surface mining activities occurring after January 1, 1976. (see California Public Resources Code Section 2776(c).) The Centennial Industrial Site does not have active, permitted surface mines; all mining activity on that site ceased prior to January 1, 1976, and therefore SMARA does not apply. If this project is approved, SMARA would apply prospectively to above-ground surface disturbance associated with approved project activities, not to historic mine waste on the Centennial Industrial Site.

The Department of Toxic Substances Control's primary purpose is to enforce hazardous waste laws and regulations and restore contaminated land. The Centennial Industrial Site is an identified contaminated site and the applicant has been working DTSC to identify an appropriate plan to clean-up the property.

Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

### Response to Comment Ind 522-2

Please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog, regarding impacts to amphibian species, and Master Response 30 - Biological Study Technical Adequacy. Foothill yellow-legged frog surveys followed CDFW protocol, including implementing VES surveys for the species. VES surveys were implemented in August 2019 and in June 2022 within three locations starting at the culvert discharge location within the Brunswick site, as well as two additional stretches downstream and no foothill yellow-legged frogs were identified within South Fork Wolf Creek. The California red-legged frog assessment within the DEIR was based on an analysis of 1) where are the closest known locations of the species from the project site (over 5 miles), 2) is there suitable upland or aquatic breeding habitat for the species within the project site, and 3) is there any likelihood that the species would move into the project site from other breeding ponds within the greater Grass Valley area. The DEIR determined that the likelihood of CRLF breeding within a highly impacted environment, such as the ponds located within the project site, is considered very low because of the historical mining impacts within the project site and the level of development within and adjacent to the project site. Given that CRLF have not been identified in the Grass Valley USGS Quadrangle, the watershed associated with the project area, or within 5 miles of the Brunswick Area, the potential for this species to occur is considered extremely low. CDFW acknowledged CRLF as a species of concern for the proposed project in their April 4, 2022 comment letter on the DEIR and did not have raise any objections to the proposed mitigation for CRLF, nor did they recommend any additional mitigation for CRLF.

### Response to Comment Ind 522-3

DEIR section 4.4 conservatively assumed a greater impact than this project proposes in the event the separate DTSC clean-up project is modified such that less surface disturbance occurs. As stated in DEIR section 4.4.2 (page 4.4-3):

> The acreage of each vegetation community type at the Centennial Site is a good-faith estimate because it cannot be precisely established for the baseline condition given that the baseline has been adjusted to account for the separate remediation efforts that will be conducted under the California Department of Toxic Substances Control (DTSC) oversight pursuant to the Remedial Action Plan (RAP) prepared for DTSC approval. The vegetation community acreage estimates included in this analysis are conservative in the event that minor changes to the RAP are made prior to final approval by DTSC. DTSC, as the CEQA

> lead agency for approval of the RAP and its associated CEQA document, will separately require the applicant to mitigate impacts to sensitive habitats and species resulting from remediation activities.

Please see Response to Comment Grp 20-8 and Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

## Response to Comment Individual 522-4

As noted in Mitigation Measure 4.4-2(b), in addition to allowing an identified western pond turtle to move out of the way on its own, an option is also provided that a qualified wildlife biologist with a CDFW handling permit may move an individual out of the disturbance area. As a result, if a western pond turtle is identified during a preconstruction survey, they can safely exit the disturbance area either through their own movement or by a qualified biologist. Additional detail has been added to this Mitigation Measure in the Final EIR (see below) regarding the cessation of work until the identified turtle has cleared the area, fencing to prevent access, and other protection measures to prevent reentry. Page 4.4-77, Mitigation Measure 4.4-2(b), is hereby revised as follows:

> *Western Pond Turtle*
>
> *4.4-2(b)* *Pre-construction Survey and Avoidance and Minimization Measures. A pre-construction survey shall be conducted by a qualified biologist no more than seven (7) days prior to the proposed disturbance within 325 feet of perennial water sources at both the Centennial and Brunswick Industrial Sites. The survey(s) shall include a search of these suitable habitat areas for western pond turtle nests and mature adults. If the pre-construction survey does not detect western pond turtle, a letter report documenting the results of the survey shall be provided to the Nevada County Planning Department, and additional measures are not required. If a western pond turtle is found, it should be allowed to move out of the way of the disturbance zone on its own or a qualified wildlife biologist with a CDFW handling permit for the species can move individuals out of the disturbance areas to avoid impacting this species. Work in the area shall cease and fencing or other protective measures shall be employed to excluded and prevent access to the area until the identified turtle has cleared the area.*

The above change is for clarification purposes, describing protective measures to be employed in the event a turtle is found on-site. The conclusions of the DEIR have not been altered.

The commenter is also concerned about encountering turtles during ongoing operation of the mine. Pre-construction surveys and avoidance are for initial ground disturbance and construction. Following construction, natural areas will not be present within the active mining area, and as a result, turtles would not be expected to occur in the mining area.

## Response to Comment Ind 522-5

The CEQA guidelines require analysis of substantial interference to "the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." Migration is defined as the seasonal movement of animals from one habitat to another. Various animal, bird, and fish species are not automatically considered migratory just because they move from one location to another. Migration serves a purpose for the species such as winter/summer habitat for foraging or breeding. It is acknowledged and analyzed in the DEIR impact analysis (see section 4.4.4) that species exist within the project site that are common to the area. Potential impacts to these species were analyzed and mitigation measures have been provided where it was determined

impacts to species could occur as a result of project activities, including the implementation of preconstruction surveys and agency permitting requirements. The only migratory species acknowledged by the County General Plan is deer migration corridors. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded the impact would be less than significant. The commenter also refers to Policy 13.1 of the Nevada County General Plan to imply that the project is inconsistent with this policy, but the commenter only cites a portion of the sentence out of context. Policy 13.1 states "Vegetation management for the benefit of habitat preservation or restoration shall be considered consistent with the intent of this policy." However, it does not say all existing vegetation must be preserved and managed, which the commenter implies. The project is not inconsistent with General Plan Policy 13.1. (see p. 4.4-46 of the DEIR.)

## Response to Comment Ind 522-6

Please see Master Response 36 - Flows in South Wolf Creek and Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Wolf Creek, regarding the impacts to fish, discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

## Response to Comment Ind 522-7

The commenter generally questions the effectiveness of Mitigation Measure 4.4-1(a), Pine Hill Flannelbush, and specifically questions the length of monitoring/maintenance and if irrigation will be required. The commenter incorrectly notes monitoring and maintenance will only last two years. Monitoring will occur every six months for the first two years. If transplantation does not meet success criteria, monitoring and maintenance will continue until those success criteria are achieved (see Appendix F.4, section 6.3.2). Irrigation is not prevented and could be utilized if determined necessary to ensure the success of transplantation. The monitoring and maintenance will continue until success criteria are achieved. If those success criteria cannot be achieved, the Mitigation Measure 4.4-1(a)(5) provides alternative maintenance transplantation measure to help achieve success criteria.

## Response to Comment Ind 522-8

Please see Response to Comment Ind 522-7.

## Response to Comment Ind 522-9

Please see Response to Comment Ind 522-7. Furthermore, as noted in Response to Comment Agcy 3-5, Mitigation Measure 4.4-1(b) now requires the Project Applicant to obtain an Incidental Take Permit (ITP) from CDFW for project-related impacts to Pine Hill Flannelbush. During the consultation process with CDFW, the Habitat Management Plan, included as an appendix to the DEIR, may be revised as required by CDFW, and must be approved by CDFW prior to implementation. The measures provided in the EIR are minimum measures, and additional measures may be required by CDFW to be included in the HMP during consultation.

## Response to Comment Ind 522-10

The commenter asserts that the biological mitigation measures are inadequate but does not specify how they are inadequate. Please Master Response 1 and the above responses to comments.

**Individual Letter 523**

Hello Mr. Kelly

I was reading this at the Planning Commission Public Hearing on March 22 when I ran up against my 3 minute deadline. The section in italics is a repeat, just to give context to the point I didn't get to make below it.

**Ind 523-1**

- *This DEIR mistakenly concludes that a few more decibels of noise in an area that is greater than what is currently tolerated seems acceptable with some "mitigating measures." Decibels are measured on a logarithmic scale, like the Richter earthquake scale, where one numeral higher on the scale is tenfold the magnification. This makes the numbers presented in this DEIR even more misleading from the start.*

  …The damage to people and to animals by noise pollution of a few decibels-- at 10 times per decimal increase-- are not insignificant. Much research has been done on the effects of noise pollution and proven that it causes stress to both humans and wildlife. In humans stress causes compromised immune systems and emotional harm, both of which can lead to illness. Noise pollution also causes physical damage to wildlife, including interrupting breeding and migration. This cannot be dismissed by manipulating simple arithmetic.

**Ind 523-2**

- Rise Gold's funded DEIR claims that noise will actually reduce over time, because it will be a smaller percentage of the overall noise caused by an increase of traffic volume over the years. How is that for misguided logic?!

**Ind 523-3**

- As a specialist in wetland ecology, I am galled by the proposal to cap over most of the fresh water marshes on these two sites, or otherwise significantly alter them. California's wetlands have already been reduced by 92% since the gold rush. Let's not allow Rise Gold to rush into decimating any more of these fragile habitats, home to rare and threatened species of reptiles, amphibians, birds, and plants.

**Ind 523-4**

- There are many such examples of minimization of impact in the Idaho-Marlyand DEIR. This report denies the **cumulative impacts** of almost all of these.

**Ind 523-5**

Best case scenario, what this DEIR minimizes and denies is incomplete and the proposed mitigations, when there are any, are inadequate start to finish of the document. Worst case scenario, the effects of allowing this mine to reopen are likely to be catastrophic even without unexpected accidents that can occur. History has shown this to be true with other mines in the area, such as the Lava Cap Mine, and the San Juan Mine.

Thank you,

Marion Blair

12183 Sunset Avenue, Grass Valley 95945

## INDIVIDUAL LETTER 523: MARION BLAIR

### Response to Comment Ind 523-1

As discussed on page 5 of the project's Noise and Vibration Assessment (DEIR Appendix L), audibility is very subjective and can vary from person to person. Thus, audibility is not used as a significance criterion in evaluating noise impacts. In addition, a noise source can be audible without a substantial increase in ambient noise levels occurring. It is important to note that residents in the general project area, including the City of Grass Valley, are currently exposed to noise from existing trucks on the area roadway network, as well as noise from automobile traffic, all of which are audible. An extensive ambient noise survey was undertaken for the project's noise impact assessment to establish baseline ambient conditions to ensure that any identified substantial noise level increases above those ambient conditions would be identified as significant and that appropriate noise mitigation measures would be developed.

The SoundPlan Model was used to predict noise levels. The SoundPlan Model has been used worldwide for 30 years and is internationally recognized by the acoustical consulting profession as being a state-of-the-art noise prediction model. In addition, the noise technical study (see Appendix L) that used the SoundPlan to conduct its analysis and identify potential project impacts, was peer reviewed by a County retained noise consultant who concurred with the use of this modeling software. The SoundPlan model used to quantify the transmission of sound from the project area to the surrounding areas accounts for topography, atmospheric conditions, ground cover, shielding by intervening buildings, noise attenuation provided by building walls and ceilings, and vegetation (see pages 5-7 of DEIR Appendix L). Local topographic survey data was imported to develop a 3-dimensional model of not only the project site but the surrounding neighborhoods as well. (DEIR 4.10-23.)

The standards of significance utilized for this DEIR were the County's adopted noise standards, the CEQA Guidelines and Appendix G criteria, which are intended to protect residents and other sensitive receptors from the harmful and annoying effects of noise and vibration. These standards are consistent with standards recommended by the State of California for the development of community noise control ordinances. Although the noise evaluation did present information pertaining to the maximum noise generation of the project, as required by County policy, it also evaluated the effects of the project in terms of the County's average hourly noise level criteria and additionally evaluated potential impacts relative to baseline ambient noise conditions, per CEQA requirements. DEIR section 4.10.4 provides a comprehensive explanation of the standards of significance used to identify project impacts, the methodology used to make this assessment, analysis of potential impacts, and recommended mitigation measures to reduce identified impacts to a less than significant level.

The commenter complains that the logarithmic method used to quantify noise in the DEIR is misleading; however, use of the decibel scale is the widely accepted standard measurement method for noise, and is fully explained in Section 4.10.2 of the DEIR. In addition, the potential effects of noise on wildlife are addressed in Chapter 4.4, Biological Resources, of the DEIR, starting on page 4.4-74.

### Response to Comment Ind 523-2

Impact 4.10-2 of the DEIR analyzed project traffic noise including onsite traffic (i.e., engineered fill placement) and off-site traffic noise (i.e., hauling material to Centennial Industrial Site.) The County General Plan Noise Element and Noise Ordinance do not have a specific policy or standard for assessing noise impacts associated with increases in off-site ambient noise levels

resulting from project-generated traffic on public roadways. As a result, the Noise and Vibration Assessment (DEIR Appendix L) and DEIR impact analysis used Federal thresholds for assessing the significance of project-related increases in off-site heavy truck traffic using federal research conducted by the Federal Interagency Commission on Noise (FICON). Based on this analysis, DEIR Impact 4.10-2 concluded all noise generated from engineered fill placement and compaction, and noise associated with haul truck operation (excepting potential jake brake use) and worker trips during this period, would remain below the applicable noise standards. Noise generated from hauling fill from the Brunswick Industrial Site to the Centennial Industrial Site could exceed local standards if jake brakes are used. Thus, Mitigation Measure 4.10-2 has been required to reduce this impact to a less than significant level.

The commenter also asserts that the DEIR is misleading because it states that project traffic noise will reduce as a percentage of overall ambient noise over time. As stated in the DEIR "future traffic volumes on the project area roadways would increase over time relative to existing levels due to general growth of the region. However, the project-generated truck traffic would remain constant, and would not increase over time. As a result, the incremental contribution to overall traffic noise levels resulting from the project would decrease over time." (DEIR p. 4.10-60.) For example, East Bennett Road, west of Brunswick Road, currently carries approximately 1,486 vehicles, and the associated noise level is 52.5 dBA. With the project contribution of 111 trucks, the noise level is expected to increase to 54.8 dBA, for a project-related change of 2.3 dB. However, if future traffic levels from cumulative development throughout the region were to increase by ten percent to 1,635 vehicles per day, and the project-related traffic remains at 111 trucks, the total transportation noise level would be 55.0 dBA, but the project-related change diminishes to 2.1 dBA. As a generic example, one truck on a road that carries 1 car per day, would be quite noticeable and would be the primary noise generator. However, if the traffic increased to 100 cars per day, or say 1,000 per day, the single truck's contribution to total noise would diminish substantially.

## Response to Comment Ind 523-3

A majority of the wetlands on the Centennial Industrial Site will be removed as a resulted of the Centennial M-1 Remedial Action Plan project. Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA. The additional wetland impacts associated with engineered fill placement at the Centennial Industrial Site were analyzed in DEIR Impact 4.4-3 and mandatory mitigation reducing the impact to a less than significant level is provided in Mitigation Measure 4.4-3(a-d).

## Response to Comment Ind 523-4

CEQA Guidelines section 15130 requires an EIR to discuss cumulative impacts of a proposed project. Cumulative impacts are considered impacts created because of the combination of the proposed project with reasonably foreseeable future projects. DEIR section 5.3 summarizes the cumulative impacts analysis, and each resource analysis includes an analysis of cumulative impacts specific to that resource. The commenter alleges that there are many examples of minimization of impact in the DEIR, but provides no specific examples. Please see Master Response 1.

## Response to Comment Ind 523-5

Please see Master Response 1.

**Individual Letter 524**

Marisa Jackson-Kinman (AKA Marisa Laursen)
myfriendmarisa@gmail.com
909.896.2004

March 29, 2022

Matt Kelly, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

Dear Matt,

Thank you for taking great care in considering what the true potential of the Rise Gold Mine would mean for our rural community.

I have spent much time reviewing and assessing the DEIR report and considering the impact on the quality of our lives here, and find it challenging to adequately express just how strongly I oppose this affront to our community. The impacts are potentially huge, serious, and long term.

**Ind 524-1**

I chose to move to this community for its rural, peaceful way of life. It's beautiful scenery. The silence. The nighttime star display. The fact that it offers what my previous life in crowded, noisy, traffic-filled Southern California did not offer. The Rise Gold Mine would negatively alter the nature of our community in countless ways, many of which would only be truly recognized if this project were to come to fruition.

More specifically, here are the bullet points of some of my chief concerns and the inadequacy of the DEIR report to address them satisfactorily:

**Ind 524-2**

1) **Surface and groundwater water impacts are inadequately addressed in the DEIR report.**
   a) Deir only has plans to address 39 wells, when there are potentially hundreds affected
   b) What impact would this have on the already extremely high forest fire hazard, and especially when we are in the midst of a multi-year drought?

**Ind 524-3**

2) **Visual impacts are unmitigated in the report**
   a) There would be what amounts to a skyscraper in our beautiful forest; engineered backfill off Brunswick that is 40+ feet tall; deforestation with minimal replanting of trees, and only along road corridors; the pristine nature of our dark nighttime sky would be gone.

**Ind 524-4**

3) **Traffic impacts would be huge, unmitigated, unavoidable**

**Ind 54-5**

4) **The mine runs counter to the need to reduce greenhouse gas emissions**

a) As the residents of Nevada County strive to live in a more ecologically-conscious manner, the progress made would be obliterated by the additional greenhouse emissions by the mine.

**Ind 524-6**

5) **Explosives** would be brought to our community as they are transported, stored, and utilized on the mine site, bringing noise and the potential for accidents which could result in calamity.

**Ind 524-7**

6) **Air quality impact is inadequate in the report**
   a) We already score an F rating in terms of air quality, and mine emissions would only serve to worsen it.

**Ind 524-8**

7) **Clean-up of the Centennial site not included in the report**

**Ind 524-9**

I live near the intersection of Greenhorn and Brunswick, and would be facing this monstrosity each and every day. What impact will that have on our property values?

**Ind 524-10**

Why would I want to continue living here, with the noise, visual impacts, water impact, traffic, etc.? And why would others want to move to our community and be faced with these same issues? This is not why people move to our community and what gives it the charm that it is known for.

**Ind 524-11**

**And if this project is approved, what would stop other mines from deciding that they can come here and do the same?**

**Ind 524-12**

Rise Mine already went bankrupt once. How can we know definitely that they wouldn't scar our land and then go bankrupt, leaving a mess behind for future generations to deal with?

**We need to consider who we are as a community. Is this mine truly in alignment with our rural lifestyle? Is this what we as a community want for our future? I say a resounding NO!**

**Ind 524-13**

Let's consider more suitable options for the land, in alignment with who we are as a community, making use of the natural setting that is in harmony with nature while creating eco-friendly jobs.

Sincerely,

**Marisa Jackson-Kinman (Laursen)**
12888 Lost Lake Road
Grass Valley, CA 95945

## INDIVIDUAL LETTER 524: MARISA JACKSON-KINMAN

### Response to Comment Ind 524-1
The commenter's opposition of the project is noted for decision makers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues. Responses to specific comments are provided below.

### Response to Comment Ind 524-2
The commenter states that the DEIR underestimates the potential number of groundwater wells impacted by the project but does not explain why. The commenter also questions how the project's hydrology impacts will affect wildfire hazards. Regarding impacts to hydrology, the commenter is referred to Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

The project's impacts to wildfire are analyzed in Chapter 4.13 of the DEIR. The commenter is also referred to Master Response 6 - Wildfire Impacts, and Master Response 33 – Groundwater Dependent Vegetation.

### Response to Comment Ind 524-3
As noted by the commenter, the DEIR has determined that the project has a significant and unavoidable aesthetics impact, in part due to the engineered fill piles. (DEIR, 4.1-15.)

### Response to Comment Ind 524-4
The commenter states that traffic impacts would be "huge, unmitigated, [and] unavoidable" but does not provide any additional detail. Traffic impacts are analyzed in Chapter 4.12 of the DEIR. With the exception of two intersection impacts, one related to LOS (SR 174/Brunswick Road) and the other related to queueing (Brunswick Road/Sutton Way), all transportation impacts would be less-than-significant after mitigation required in the DEIR.

### Response to Comment Ind 524-5
The commenter is concerned with the project's GHG emissions. The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds.

### Response to Comment Ind 524-6
The commenter is concerned about the project's use of explosives. Explosives transport, storage, and use have been found to be a less than significant impact after mitigation. The commenter is referred to Chapter 4.7 of the DEIR and Master Response 10 – Explosives, Reagents, and Brunswick Fill.

### Response to Comment Ind 524-7
The commenter states that the project would worsen the air basin's already poor quality. The commenter is referred to Master Response 18 - Air Quality Thresholds.

## Response to Comment Ind 524-8

The commenter states that the cleanup of the Centennial Site is not included in the DEIR. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 524-9

The commenter is concerned with the project's impact on property values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 524-10

The commenter expresses general concerns regarding the project but offers no information about those impacts to formulate a specific response. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 524-11

The commenter is concerned that approval of the project may lead to other mining projects being proposed in the County. Growth inducement is addressed in Chapter 5 of the DEIR and found to be less than significant. The commenter is also referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 524-12

The commenter references the Project Applicant's prior mining projects. The commenter is referred to Master Response 3 - Operator Responsibility.

## Response to Comment Ind 524-13

The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 525**

February 16, 2022

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA 95949

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Green,

**Ind 525-1** I the undersigned, a resident and registered voter in Nevada County, am opposed to the reopening of the Idaho Maryland Mine by Rise Gold Corporation. Regarding the vote to approve or not approve the project, in addition to reviewing the Environmental Impact Report I hope you will also consider the serious concerns I and many Nevada County residents have to allowing the mine be reopened particularly by a company represented by a foreign citizen, Ben Mossman, who has no investment in the wellbeing of Nevada County, its businesses, infrastructure or citizens. In addition that person and mining company and mine he was involved with in Canada has multiple serious charges for environmental damage and endangering the health of Canadian citizens during mining operations and after abandoning that project and attempting to escape liability using that countries bankruptcy laws.

Other reasons I oppose the mine include the following:

**Ind 525-2**
- Introduction of toxic substances into the air and water within and adjacent to the cities of Grass Valley and Nevada City many of which substances are likely to remain environmental and health problems for decades.

**Ind 525-3**
- 24 hour heavy mining equipment traffic on over city and county roads posing the risk of blocking evacuation routes in the event of emergencies such as wild fire.

**Ind 525-4**
- Extreme wear and tear of infrastructure, including road maintenance, drainage, water quality, air quality, and many other problems related to the already strained infrastructure of Nevada County specifically within 50 miles or so of Nevada City, Grass Valley, and other local communities within and outside of Nevada County.

**Ind 525-5**
- Interference with recreation and tourist access to recreational areas.

**Ind 525-6**
- Opening the mine will require the pumping of millions of cubic feet of ground water bringing the danger of drying out residential wells and other sources of water for residents and businesses.

**Ind 525-7**
- Releasing contaminates into ground water and pumping contaminated water into rivers and streams contaminating the water for millions of people downstream.

**Ind 525-8**

- Continuous underground blasts potentially weakening old, abandoned mine tunnels and shafts possibly creating unforeseeable sink holes and other soils problems contributing to foundation problems for residential and business building, roads, trails, and creating dangerous conditions for recreational use of trails and other recreational areas.

**Ind 525-9**

- Potential damage to wildlife habitat and forest environments.

**Ind 525-10**

- Reducing availability of water available for fighting fires.

**Ind 525-11**

- Claims of jobs and other benefits made by Rise Gold do not bear up to scrutiny. Rise Gold's CEO's demonstrated habit of litigating itself out of responsibility for damage to local communities and reneging on contractual requirements and various promises and inability to substantiate other claims of economic benefit do not instill confidence.

**Ind 525-12**

As an older citizen, property owner, disabled person and advocate for persons with disabilities I am also concerned about the accessibility and other hazardous conditions opening the mine may cause for me and the many other disabled and older citizens residing in this county.

Because of these, and many other reasons, it is my opinion that it would be fiscally and morally irresponsible to approve the proposed mining project.

Sincerely yours,

Mark Fenicle

11612 POLARIS DR., GRASS VALLEY, CA 95949

## INDIVIDUAL LETTER 525: MARK FENICLE

### Response to Comment Ind 525-1
This comment is introductory in nature. The commenter's opposition to the project and concern regarding the Applicant is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 3 - Operator Responsibility.

### Response to Comment Ind 525-2
The commenter states that the project will release toxic substances into the air and water but does not give specific information on which to formulate a specific response. The DEIR found that impacts to air and water quality would be less than significant after mitigation. The commenter is referred to Chapters 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and 4.8 (Hydrology and Water Quality) of the DEIR.

### Response to Comment Ind 525-3
The commenter states that the project-related traffic would impede an evacuation in the area. The commenter is referred to Master Response 5 - Evacuation Zones.

### Response to Comment Ind 525-4
The commenter states that the project would strain the County's infrastructure. The project's impacts to public infrastructure are analyzed in Chapter 4.8 (Hydrology and Water Quality), 4.11 (Public Services and Utilities), and 4.12 (Transportation). For example, the Project Applicant would be required to enter into agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the project driveway and Brunswick Road. (DEIR, Mitigation Measure 4.12-6(c).)

### Response to Comment Ind 525-5
The commenter states that the project will interfere with recreation and tourist access to recreational areas. The project would not interfere with recreation or access to recreational areas. The commenter is referred to Chapters 4.11 and 4.12 of the DEIR. To the extent the commenter believes the project will impact the tourism industry, the commenter is referred to Master Response 2 – Social and Economic Impacts.

### Response to Comment Ind 525-6
The commenter states that the project will have an adverse impact on private wells. The commenter is referred to Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 525-7
The commenter states that the project will have adverse impacts on water quality. The commenter is referred to Chapter 4.8 of the DEIR, and Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 525-8
The commenter states that the project's underground blasting may result in sinkholes or a collapse on the surface. The commenter is referred to Master Response 29 - Near Surface Workings.

## Response to Comment Ind 525-9

The commenter states that the project will adversely impact wildlife. The project's impact to wildlife habitat is less than significant after mitigation. The commenter is referred to Chapter 4.4 of the DEIR.

## Response to Comment Ind 525-10

The commenter states that the project will result in reduced water supplies for firefighting. The project does not reduce availability of water for fighting fires. The commenter is referred to Chapters 4.8 and 4.11 of the DEIR.

## Response to Comment Ind 525-11

The commenter claims that the DEIR overstates the project's economic benefits and references the Project Applicant's prior mining projects. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 2 - Social and Economic Impacts, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 525-12

The commenter is concerned about accessibility issues and other hazards created by the project for disabled citizens. The commenter is referred to responses to specific comments above and to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 526**

Dist 4

RECEIVED

FEB 17 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

February 16, 2022

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA 95949

Honorable Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, Hardy Bulluck

I the undersigned, a resident and registered voter in Nevada County, am opposed to the reopening of the Idaho Maryland Mine by Rise Gold Corporation. Regarding the vote to approve or not approve the project, in addition to reviewing the Environmental Impact Report I hope you will also consider the serious concerns I and many Nevada County residents have to allowing the mine be reopened particularly by a company represented by a foreign citizen, Ben Mossman, who has no investment in the wellbeing of Nevada County, its businesses, infrastructure or citizens. In addition that person and mining company and mine he was involved with in Canada has multiple serious charges for environmental damage and endangering the health of Canadian citizens during mining operations and after abandoning that project and attempting to escape liability using that countries bankruptcy laws.

Other reasons I oppose the mine include the following:

**Ind 526-1**

- Introduction of toxic substances into the air and water within and adjacent to the cities of Grass Valley and Nevada City many of which substances are likely to remain environmental and health problems for decades.
- 24 hour heavy mining equipment traffic on over city and county roads posing the risk of blocking evacuation routes in the event of emergencies such as wild fire.
- Extreme wear and tear of infrastructure, including road maintenance, drainage, water quality, air quality, and many other problems related to the already strained infrastructure of Nevada County specifically within 50 miles or so of Nevada City, Grass Valley, and other local communities within and outside of Nevada County.
- Interference with recreation and tourist access to recreational areas.
- Opening the mine will require the pumping of millions of cubic feet of ground water bringing the danger of drying out residential wells and other sources of water for residents and businesses.
- Releasing contaminates into ground water and pumping contaminated water into rivers and streams contaminating the water for millions of people downstream.

- Continuous underground blasts potentially weakening old, abandoned mine tunnels and shafts possibly creating unforeseeable sink holes and other soils problems contributing to foundation problems for residential and business building, roads, trails, and creating dangerous conditions for recreational use of trails and other recreational areas.
- Potential damage to wildlife habitat and forest environments.
- Reducing availability of water available for fighting fires.
- Claims of jobs and other benefits made by Rise Gold do not bear up to scrutiny. Rise Gold's CEO's demonstrated habit of litigating itself out of responsibility for damage to local communities and reneging on contractual requirements and various promises and inability to substantiate other claims of economic benefit do not instill confidence.

As an older citizen, property owner, disabled person and advocate for persons with disabilities I am also concerned about the accessibility and other hazardous conditions opening the mine may cause for me and the many other disabled and older citizens residing in this county.

Because of these, and many other reasons, it is my opinion that it would be fiscally and morally irresponsible to approve the proposed mining project.

Sincerely yours,

Mark Fenicle

The sound projections for the machinery operated on site of this debacle Idaho-Maryland Mine) are ludicrous and insulting to anyone, such as I, that has operated heavy machinery or that will live near the destructive enterprise.
THE DEIR MUST BE COMPLETELY REVAMPED, IN EVERY WAY.
NO MINE!!!

1

## INDIVIDUAL LETTER 535: MARK JOHNSON

### Response to Comment Ind 535-1

The comment expresses a general opinion that the sound projections in the noise analysis, completed as part of the DEIR, are inadequate, but does not provide specific examples that would allow for a detailed response. The noise analysis was independently peer reviewed by the County's third party consultant, Saxelby Acoustics, who requested certain revisions to the study prepared for the applicant by Bollard Acoustical Consultants. Saxelby subsequently determined that the revised noise analysis was adequate for CEQA purposes. In addition, based on the noise analysis, none of the individual or combined activities associated with long-term operations of the proposed project are projected to generate noise in excess of the applicable noise standards. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 is included out of an abundance of caution to ensure satisfaction with such standards and to reduce the potential for annoyance resulting from the proposed project to the maximum extent feasible. MM 4.10-2 requires implementation of an ongoing comprehensive noise monitoring program under County oversight. If operational noise levels are found to exceed the applicable County noise standards, the County shall require cessation of the mine operations until additional engineering controls can be implemented.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

The DEIR for the Idaho/Maryland Mine is flawed and extremely inadequate. This incomplete report must take all negative factors into consideration and it does not.
The recommendation to the BOS must be a negative recommendation.
The loss of value to my property will be substantial and unmitigatable. The traffic increase will be substantial and unmitigatable. The pollution to both the air we breathe and the water we drink is foreseen as substantial and unmitigatable.
PROTECT MY PROPERTY VALUES.
PROTECT MY WELL.
PROTECT OUR AIR..
PROTECT WOLF CREEK AND EVERYWHERE IT FLOWS.
NO MINE!!!

## INDIVIDUAL LETTER 540: MARK JOHNSON

### Response to Comment Ind 540-1

The commenter generally asserts that there is false information throughout the DEIR but provides no specific examples to substantiate this broad-sweeping claim. Thus, no specific response is possible nor required. Please see Master Response 1.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

EXTREME TAXATION OF OUR ELECTRICAL GRID?
NO MINE!!!

## INDIVIDUAL LETTER 541: MARK JOHNSON

### Response to Comment Ind 541-1

The comment does not directly address the adequacy of the DEIR. Energy is addressed in Chapter 4.3 of the DEIR.

**Individual Letter 542**

don't
**I support re-opening the Idaho-Maryland Mine**

ist 4

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

NO MINE

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Ind 527-1

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Dear Mr. Kelley:

Please see my comments relating to the DEIR for Rise Gold attached.

As a young, professional engineer, I had the opportunity to be a consultant on the drafting of more than one large EIR and as a developer, have generated my own EIR on a small project. Based on my somewhat limited experience, but experience nevertheless, I have found the whole EIR process to be inherently bias, to some unfortunate degree.

**Ind 544-1** Bias in not only the process of vendor selection, where the developer is involved, but also who and how consultants and experts are selected and ultimately, who pays for it all.

I feel the main task of the authority having jurisdiction, in this case the County of Nevada, is to not only see that the generation of an EIR is complete and thorough, but in the process, reduce the appearance of that inherent bias to a level completely overshadowed by the quality of the finished EIR product.

I feel the County is up to the task and I wish you well in the endeavor.....for the sake of the community I cherish.

Thanks
Mark

P.S. Would you mind providing me an indication you received this email and attachment? Thx.

**RE: Comments on DEIR – Rise Gold/Idaho-Maryland Mine project**

Dear Mr. Kelley:

**Ind 544-2** I offer the following as my comments and/or concerns about the DEIR currently under consideration by the County. The comments are not all-inclusive, but represent my main thoughts on the subject-matter:

**Chapter 4.3 Air Quality:**

**Ind 544-3** Nevada County currently claims a lung disease rate that's twice the State average. This chapter is wholly inadequate nor properly addresses the exposure to increased levels of asbestos, a naturally occurring substance in serpentine rock. This rock will be blown up, crushed, worked, re-worked, moved, loaded, transported and finally dumped, within 1 mile of downtown Grass Valley, surrounding residential communities and schools. Too many modes and opportunities of airborne asbestos escape for any effective mitigation.

**Chapter 4.8 Hydrology:**

**Ind 544-4** Totally inadequate. Needs significantly more research, based on experience in California foothill communities. California's water table is dropping. Known fact. Drought is more prevalent than ever before. Moisture levels in our local soils are reducing at rapid levels, leaving our native trees and Ponderosa Pines venerable to bark beetle infestation. Protection must be afforded to the 300+ wells that are within the known sphere of influence of the proposed mine location. The potential for the hydrology modeling outlined in the DEIR to be flawed is severe. A recent example is the modeling done for the Siskon Mine on San Juan Ridge and the resulting well

tragedy. Many of those surrounding wells are still void and/or of a water quality that makes them effectively, unusable.

**Chapter 4.10 Noise and Vibration**:

"*Based on the above, operation of the proposed mine is not anticipated to cause damage to structures in the project area".*

**Ind 544-5** *"Overall, the proposed project is not anticipated to result in the exposure of persons to or generation of excessive groundborne vibration levels".*

*"Two travelling seismographs which can change location depending on the weekly/monthly mining plan".*

Phases from the Chapters noted are highlighted above. The Chapter as written is wholly inadequate, unreliable and professionally unbelievable. Should comfort be taken that the mine blasting is "not anticipated to cause damage to structures in the project area"? Absolutely not!

**Ind 544-6** Should comfort be taken that the "proposed project is not anticipated to result in the exposure of persons to or generation of excessive groundborne vibration levels"? Absolutely not! These are model projections only. Guesstimates. At 500' below the surface, does any reasonable, rational, critical-thinking individual think vibrations will not be felt from blasting? Granted, it may not "damage" a structure, but how about the mental health of residents attempting to have a relaxing, comforting, nurturing, living experience? Three mild earthquakes in the last 12 months have shown the level of anxiety that can result from such vibration and trembling.

**Ind 544-7** Does anyone believe that for the next 80 years "two travelling seismographs……" will be in use that can "……change location depending on the weekly/monthly mining plan"? That's utter nonsense.

**Ind 544-8** Address the noise and vibration issue from a human standpoint and the adverse effects any increase in noise and vibration will have on the human psyche and resulting behavior. Get a medical professional involved.

**Chapters 4.3-5.2 Land Use and Population**:

Phases from identified Chapters below.

**Ind 544-9** *"It is anticipated that most of the jobs associated with the project would be filled by residents within the vicinity of the project sites."* Chapter 4.3

*"The total workforce when the Idaho-Maryland Mine Project reaches commercial production is estimated at 312 persons. Therefore, the number of jobs required during*

2

*operation of the proposed project could draw more people to the area and result in indirect population growth as a result".* Chapter 4.9-3

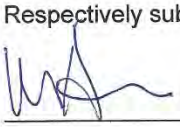
*"The majority of workers (268 employees) would work 12 hour shifts with seven days of work followed by seven days of rest. The remaining workforce (44 employees) would work regular eight hour shifts with five days of work followed by the weekend of rest".* Chapter 5.2

**Ind 544-10**

First phase: As a general contractor and developer for over 22 years in this County, I have found an underwhelming number of young people willing to learn a trade, willing to work hard or just be willing to work at all. This has been and continues to be a common issue with all the construction trades in this County, be it carpentry, plumbing, electrical, concrete, etc. Every subcontractor I know has serious difficulty finding people willing to learn a craft and become productive members of our community. Yes, it requires manual labor, just like a hard-rock miner would be expected to perform a task and learn a skill……..except orders of magnitude greater! In today's world, most notably in Nevada County, no high school graduate dreams of becoming a hard-rock miner, except in some immature fantasy fashion. That won't last.

**Ind 544-11**

Second phase: Yes, the vast majority of the estimated 312-person workforce would be from outside the area and most likely, based on the employment of individuals in the trades here locally, would be immigrants. Not locals. If locals were willing, the "Help Wanted" signs, literally epidemic throughout business storefronts in Grass Valley and Nevada City, would be non-existent or minimal at best.



**Ind 544-12**

Third phase: Again, how many "locals" are going to be willing to work 12-hour shifts, seven days a week, with an alternating week off, 3000'-4000' deep in the bowels of the earth? Really? Take a look at the photos of the miners at the Empire Mine exhibit. It's a new era. My subcontractors can't even find a person willing to learn how to be an electrician or a plumber. They can work above ground, in a healthy environment, with relatively light duty, but still the searches continue with little success.

**Ind 544-13**

Conclusion: Get real with an honest assessment of the situation. The "jobs" argument is a trojan horse promoted by a "feel good" audience and/or politicians attempting to sound politically correct with unsupported talking points, but, in reality, has no basis in truth. Investigate further. No exceptions.

Respectively submitted,

Mark A. Machado P.E.

3

## INDIVIDUAL LETTER 544: MARK MACHADO

### Response to Comment Ind 544-1
The commentor states that the DEIR is biased but provides no specifics or evidence. Responses to specific comments are provided below.

### Response to Comment Ind 544-2
This comment is introductory in nature. The comment is noted.

### Response to Comment Ind 544-3
The commenter states that the DEIR inadequately analyzes asbestos-related impacts. The commenter raises air quality concerns but does not state how the DEIR is inadequate in addressing these impacts. Dust and air pollution concerns are addressed in DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy). A Health Risk Assessment was prepared for the project as described on DEIR page 4.3-61. The Project Applicant has prepared an Asbestos, Serpentinite, and Ultramafic Rock Management Plan (ASUR) which is designed to exclude asbestos containing material from the engineered fill produced by the project and from rock mined and processed. (DEIR, Appx. E.2.) All mined materials will be tested to ensure asbestos content does not exceed applicable standards and all engineered fill used for surfacing applications would have no detectable asbestos. The commenter is referred to Chapter 4.3 of the DEIR and Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 544-4
The commenter states that the DEIR's Chapter 4.8 (Hydrology and Water Quality) is inadequate because the project will reduce moisture in soils and it underestimates the number of potentially impacted groundwater wells. The commenter is referred to Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 16 - Drought and Climate Change, and Master Response 33 - Groundwater Dependent Vegetation.

### Response to Comment Ind 544-5
As stated on page 4.10-54 of the DEIR, all groundborne vibrations calculated for blasting of both drift round and long-hole stopes, respectively, fall below the USBM recommendations and the levels at which structural damage to buildings is possible. Nonetheless, in order to ensure that actual mining operations would generate vibration levels as expected, a Ground Vibration Monitoring Program is required (Mitigation Measure 4.10-4).

### Response to Comment Ind 544-6
The commenter states that the DEIR's finding will regards to groundorne vibrations are projections only and may not be relied upon. As stated on page 4.10-54 of the DEIR, drift development blasts at the shallowest depth considered of 500 feet would be barely perceivable to the general population and undetectable by instrumentation below 900 feet in depth. Larger longhole stoping blasts at the shallowest depth considered of 500 feet would be 0.23 in/s, which is also well below the threshold level of vibration (0.4 in/s) about which less than eight percent of the population complains. The calculated ground vibration is considered insignificant. At depths below 800 feet, the ground vibration becomes unnoticeable to the general population. Untraceable vibration would occur at a depth of approximately 1,500 feet. At depths below 1500 feet, it would be expected that ground vibration would be unnoticeable. Nonetheless, as discussed above, in order to ensure that actual mining operations would generate vibration levels as expected, a Ground Vibration Monitoring Program is required (Mitigation Measure 4.10-4).

## Response to Comment Ind 544-7

The commenter questions the efficacy of Mitigation Measure 4.10-4, but does not explain why. Mitigation Measure 4.10-4 requires a total of seven seismographs during blasting above the 1,000-foot level and five after blasting above the 1,000-foot level is complete. (DEIR, p. 4.10-58)

## Response to Comment Ind 544-8

The commenter states the DEIR fails to analyze the noise and vibration impacts on humans. The DEIR considers noise and vibration issues from a human standpoint. The commenter is referred to Chapter 4.10 (Noise and Vibration) of the DEIR which found that noise impacts associated with long-term operation of the mine would be less than significant after mitigation. (DEIR, p. 4.10-31.) One significant and unavoidable noise-related impact was identified, but this is associated with the temporary noise generated during installation of potable water pipeline along East Bennett Road. (DEIR, 4.10-27.)

## Response to Comment Ind 544-9

The commenter reproduces material from the DEIR. The comment noted.

## Response to Comment Ind 544-10

The commenter speculates that young people do not want to work at the project. The comment does not address the adequacy of the DEIR. Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts. Further, CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

## Response to Comment Ind 544-11

The commenter is referred to Response to Comment Ind 544-10.

## Response to Comment Ind 544-12

The commenter is referred to Response to Comment Ind 544-10.

## Response to Comment Ind 544-13

The commenter is referred to Response to Comment Ind 544-10.

**Individual Letter 545**

**From:** Mark Seufert <maseucon@att.net>
**Sent:** Monday, April 4, 2022 8:31 AM
**To:** Idaho MMEIR

**Ind 545-1**

My name is Mark Seufert , I live in Nevada City with the love of my life , Yvonne " Ronni" Navarro. I am a member of the Gold Country Fly Fishers club which tries to keep our water ways clean and protect the fish habitat to preserve for future generations. Every year we conduct fish surveys on the local creeks , I.E. wolf creek. We have the surveys available if needed. At present , Wolf creek is already a fragile water way, With beaver ponds and slow running water , the german brown trout population is very small but thriving . Not to mention the wetlands the creek creats which supply habitat for birds and animals. The introduction of this mine can only destroy what is left of the creeks we have . The drought is bad enough but I feel this will be the " Nail in the Coffin " for our creeks and streams in the mine area. From what I've read of Rise Gold's Reputation in other coiuntries, They left a wake of destroyed habitat and land behind their last mining expedition and who's to say they will not do the same here. Being a General Contractor, I know how contractors work . I pride myself on my work but sad to say , most contractors are in it for the money .They'll cut corners and do sloppy work to get the most profit. I'm dealing with this exact issue in Paradise helping my sister rebuild from the fire of 2018, Contractors not protecting the soil from concrete run off after cleaning out their concrete trucks or not completing the job and robbing the people of their money. I feel the same will happen here.

**Ind 545-2**

Respectfully, Mark Seufert

1

## INDIVIDUAL LETTER 545: MARK SEUFERT

### Response to Comment Ind 545-1

The comment does not specifically address the adequacy of the DEIR. Please see Master Response 1. Regarding fish comments, please see Master Response 34 – Resident Fish. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 545-2

Please see Master Response 3 – Operator Responsibility.

NEVADA COUNTY
BOARD OF SUPERVISORS

March 5, 2022

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Re: Rise Gold/Idaho-Maryland Mine Environmental Impact Report

Dear Supervisors:

**Ind 546-1** I am writing in opposition to the approval of Rise Gold's permit to operate the Idaho-Maryland Mine.

Rise Gold has released its draft Environmental Impact Report and claims that it shows that its operations will have no or minimal environmental impacts on our community. It would have us believe that operating a major industrial operation next to businesses, a hospital, nursing homes, and residences will have no effect on our health or quality of life. Of course, such a claim is ridiculous.

**Ind 546-2** Although I've lived in Nevada County nearly 20 years, I was born and raised near Detroit, Michigan. I worked on the line at one of Chrysler's metal stamping plants. So I'm familiar with the debilitating effect industrial facilities have on a community and its quality of life. There is no such thing as "clean" industry. Noise, diesel exhaust, toxic solvents, trash, polluted streams, and more degrade the surrounding area despite a business's best efforts. And we have no indication that Rise Gold would make its best efforts to protect us.

**Ind 546-3** It's important to remember that promises made in an EIR are just that—promises. Rise Gold is a penny stock with no experience in mining. The track record of their CEO, Ben Mossman, is horrific. The Canadian government had to shut down his operation in British Columbia in less than two years because of gross safety and environmental violations. Workers were left unpaid and cleanup costs well exceeded those needed to clean up their mess. Today, Mr. Mossman wants to operate a mine in Grass Valley for as long as 80 years, and the human and environmental health of the residents and wildlife of the Grass Valley/Nevada City area are on the line. We all know how unique the natural beauty of this area is. This mine will change it for the worse, forever.

I strongly urge you to turn down Rise Gold's application to operate the Idaho-Maryland mine. Please preserve the beauty and vibrancy so everyone living here can continue to enjoy and prosper in the area for generations to come.

Regards,

Mark Wilson

Mark Wilson
11650 Forest View Drive
Nevada City, CA 95959

## INDIVIDUAL LETTER 546: MARK WILSON

### Response to Comment Ind 546-1
The comment does not address the adequacy of the DEIR. Please see Master Response 1.

### Response to Comment Ind 546-2
The comment does not address the adequacy of the DEIR. Please see Master Response 1.

### Response to Comment Ind 546-3
The mitigation requirements identified in the DEIR are included in the mitigation monitoring and reporting program for the project (Chapter 4 of this Final EIR), and enforceable by state law. Regarding operator concerns and the generally noted concerns related to environmental health, wildlife, and natural beauty of the area, please see Master Responses 1, 2, and 3. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 547**

March 5, 2022

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Re: Rise Gold/Idaho-Maryland Mine Environmental Impact Report

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno:

As a twenty-year resident of Nevada County, and a homeowner, I am writing to express my opposition to the approval of Rise Gold's permit to operate the Idaho-Maryland Mine.

**Ind 547-1** Rise Gold has released its draft Environmental Impact Report and claims that it shows that its operations will have no or minimal environmental impacts on our community. It would have us believe that operating a major industrial operation next to businesses, a hospital, nursing homes, and residences will have no effect on our health or quality of life. Of course, such a claim is ridiculous.

**Ind 547-2** It's important to remember that promises made in an EIR are just that—promises. Rise Gold is a penny stock with no experience in mining. The track record of their CEO, Ben Mossman, is horrific. The Canadian government had to shut down his operation in British Columbia in less than two years because of gross safety and environmental violations. Workers were left unpaid and cleanup costs well exceeded those needed to clean up their mess. There is no evidence that Mr. Mossman is capable of operating a mine in Grass Valley for as long as 80 years (or even much less) without creating the same environmental destruction that he did in Canada. But we do know that when he does, it will be up to us to clean up the mess and pay for it.

**Ind 547-3** Specific to the accuracy of the EIR, the air monitoring data is questionable. The air monitoring data for ozone and small particulate matter is from monitoring equipment located about a mile northwest of the project site. Rise Gold did not conduct air monitoring at the project site, or in any other direction emissions from their operations will travel. Years ago, citizen ozone monitoring conducted at various locations around the Grass Valley/Nevada City area confirmed that ozone levels vary widely here due to our topography. So it's clear that Rise Gold's use of data from a single air quality monitor is insufficient to characterize at least the ozone in our area. For other air pollutants, the EIR references a monitoring station in Yuba City—31 miles away. Conflating air quality data from a city in the Central Valley with a topographically diverse town in the Sierra foothills does not present a true picture of our current air quality.

**Ind 547-4** I strongly urge you to dig deep into Rise Gold's claims in the EIR and recommend to the supervisors that they turn down Rise Gold's application to operate the Idaho-Maryland mine.

Regards,

Mark Wilson
11650 Forest View Drive
Nevada City, CA 95959

## INDIVIDUAL LETTER 547: MARK WILSON

### Response to Comment Ind 547-1

The commenter notes that Rise Gold claims the DEIR shows the project's operations will have no or minimal impacts on the community. The commenter is directed to the actual DEIR and its findings, which reflect the County's review of the proposed project. As indicated in the DEIR, the proposed project would result in several adverse environmental impacts, some of which would remain significant and unavoidable, even after implementation of the mitigation measures identified in the DEIR. Because significant and unavoidable impacts have been identified in the DEIR, the County, should it decide to approve the proposed project, would be required to adopt a Statement of Overriding Considerations.

Pursuant to CEQA Guidelines Section 15093, CEQA requires the decision-making agency to balance, as applicable, the economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project against its unavoidable environmental risks when determining whether to approve the project. If the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposed project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable." Such an outcome would necessitate a Statement of Overriding Considerations.

### Response to Comment Ind 547-2

Please see Response to Comment Ind 546-3.

### Response to Comment Ind 547-3

The commenter states that the DEIR utilized Yuba City as a location for air quality data, which the commenter states is not representative of Nevada County. As stated on page 4.3-10 of the DEIR, because the Grass Valley station only monitors ozone (O3) and PM2.5, additional measurements were taken from the Yuba City monitoring station (773 Almond Street, Yuba City, CA 95991), approximately 31 miles west of the project sites. The data collected at these stations are considered generally representative of the air quality experienced in the project vicinity. Further, this information is not used to model the project's emissions, and thus, has no bearing on the findings of the analysis.

### Response to Comment Ind 547-4

The comment does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

RECEIVED
MAR 02 2022
NEVADA COUNTY
PLANNING DEPARTMENT

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Ave, Suite 170
Nevada City, CA 95959

Dear Matt Kelley,

This is a written comment regarding the DEIR on the proposed Idaho-Maryland Mine Project. I will focus my comments on **Chapter 4.13 WILDFIRE**.

**Ind 548-1**

I am a long-time resident of Nevada County with a professional background in women's health care and birth. In my young adult years I was a seasonal firefighter on both the Tahoe National Forest and the Stanislaus National Forest. I built a house and lived in the woods outside of Nevada City for 30 years. I have always been fire aware. In 2015, just two months after moving to Middletown, California, to be with my partner, we were burned out in the Valley Fire. In the years following we have seen even bigger and more devastating wildfires in California. We moved back to Nevada County after the fire and decided to live in town and our property happens to have a fire hydrant on corner which is abstractly comforting. It is an indescribable experience to lose everything one has ever had except one car and a suitcase. But we have our lives while others have been lost.

At present I am on a team working to organize our church members into what we call "Fire Clusters" to help one another in the event of a fire and an evacuation order is received. The input from ZoneHaven, the NC Fire Safe Council and the NC Office of Emergency Services have been supportive and informative. We utilized this action plan for the Bennett Fire, the River Fire and the Jones Fire in 2021.

1

I have studied Chapter 4.13, pages 1-28, and I am not reassured. I understand this DEIR was written by a reputable company with many qualified and skilled writers and there are still unanswered questions, unasked questions and, I believe, conclusions that are not supported by the information in this report. The deficiencies are listed below and "mitigations", which I believe are inadequate, and conclusions which I find to be unsupported, will be noted.

## Chapter 4.13 EXISTING ENVIRONMENTAL SETTING

Page 4.13.2

The fire protection agencies are described and it is not clear what the relevancy of who is the responsible service for structural fires when the concern of this chapter of the DEIR is wildfire. Yet the community has been informed that Rise Gold has promised Ophir Hill Fire Department a new fire truck and salaries for three additional fire fighters. I find this unethical when it is not known if this company will be allowed to even build this heavy industrial complex. In fact, both the Brunswick and Centennial sites are under the responsibility of the state CAL FIRE and designates both sites as Very High Fire Hazard Severity Zones (VHFHSZ). The map of Figure 4.13-1, shows the Brunswick site contiguous with the VHFHSZ of the entire region, and the Centennial site with approximately half its borders in the VHFHS Zone.

**Ind 548-2**

In the discussion of **Wildland Fire Hazards** the Topography and Vegetation and Prevailing Winds is described which states the closest slopes are 3-4 miles away. In fact, the gentle hills of Grass Valley begin to climb within a mile of the Brunswick site when heading up Greenhorn Road. While the fact that fire can move up a slope more readily is accurate, wildfires burn in the direction the wind blows and by currents produced by the fire itself. The mine sites are not immune to burning as the report suggests. The references to Deer Creek Canyon and Greenhorn Creek and Steep Hollow Creek are questionable, all which are miles away and have no bearing.

**Ind 548-3**

The "Large Fire History" states that "relatively few larger wildfires have occurred within the region over the past three years." This is FALSE. The

2

fires were not the mammoth conflagrations on the scale of the Caldor Fire or the Mendocino Complex or the Valley Fire but, as spelled out in the DEIR on pages 4.13-3 and 4.13-4, there were 16 wild fires that burned Nevada County since 2015 with three in the last two years. What is considered "relatively few"? The Bennett Fire came near to burning our town while the River Fire and the Jones Fire burned forest and homes. The local Grass Valley evacuation experience during the Bennett Fire was severely impacted by traffic congestion. A person I know who lives in a mobile home park in the Brunswick basin was unable to get out of because of traffic congestion. She was told she could try walking out by fire officials. This problem will be seriously compounded by the movement of mine trucks hauling waste rock through the basin.

The next discussion is under the title of **Fuel Treatment Efforts**. While fuel reduction is an important remedial step to reduce fire hazards, the relatively small amount that is described within the 1.5 mile radius will have little impact if there is a fire storm and spot fires preceding the front of a fire.

**Ind 548-4** The map of Figure 4.13-2 shows a large section of western Nevada County and the areas of Fuel Treatment Projects. It is evident that there is only a very small percentage of land that has been treated or is planned to be treated anywhere near the project sites. The DEIR report then goes on to say where the fuel treatment projects are, which are in fact, miles away from the project sites. What is the relevance of these fuel treatment projects to the mine properties?

**Ind 548-5** **Grass Valley Air Attack Base** (one of 13 in California) is noted along with **Wildfire Dispatch** that covers 12 operational areas. What is the relevancy?

**Ind 548-6** Page 4.13-13 **Nevada County Emergency Operations Plan (EOP)** is noted. However, the second paragraph addresses a Mass Evacuation Annex (Annex B), yet to be approved by the Board of Supervisors. It described a plan for disasters that have been caused by and incidents *outside of Nevada County* and how to support a mass vehicular evacuation moving within or through Nevada County. Where in EOP is the evacuation of the mine employees or truck drivers addressed? According to Rise, there will be 200-300 hundred employees of which only the underground people will be doing shift work. How many workers and vehicles and trucks will be

3

evacuating along with residents at the time of a fire? This section needs critical review and reconsideration.

**4.13.4 IMPACTS AND MITIGATION MEASURES**

This is the heart of this chapter of the DEIR which purports to discuss the impacts of reopening of the IMM related to Wildfire and the astonishing conclusion that states ALL IMPACTS ARE LESS THAN SIGNIFICANT. The reference to both the Standard of Significance and the Method of Analysis gives the impression the analysis will be impartial and non-biased. I find this to be far from accurate regarding the following matters:

The greatest concern regarding WILDFIRE is the impact of the trucking and traffic that this heavy industrial complex would add to the evacuation of the populace in the event of a fire in the region of the mine. This concern is included as one of the three impacts that are Significant after mitigations noted elsewhere in the DEIR.

**Ind 548-7**

How can the statements found on 4.13-1, page 4.15-15 that state 50-100 trucks per day, carrying 20 tons of rock per truck, that will be driving on Brunswick Road, which is classified as a "Minor Arterial" road and not be considered to have an impact on an evacuation order to that area? Plus "up to 18 additional truck trips could occur per day for various operations" for five years, 16 hours a day, seven days a week. This is 118 trips per day of trucks and does not include personnel in their own vehicles. As stated in this DEIR, this will constitute approximately 7.4 haul truck round trips per hour on Brunswick Road. This is an enormous amount of additional traffic coming into the basin and intersection of Brunswick Road and State Route 20/49 where, in an evacuation situation in the area of the mine will have people in their vehicles coming from all points east of Highway 20/49 if Hwy. 174 is closed. As I stated above, this area was a serious bottle neck with the Bennett Fire last year.

Most disturbing in the extensive discussion on evacuation in the case of Wildfire and an evacuation order in the vicinity of the mine is this: " ...the incident command center would contact dispatch and direct them to contact the mine and REQUEST the mine operator to shut down the mine and cease all truck hauling operations". REQUEST? What sort of authority and

**Ind 548-8**

4

enforcement is in the word REQUEST? Evacuations for the public are ORDERS and are enforceable. Why would we think that this giant industrial complex, whose purpose is mining 24 hours a day and making as much money as possible, will shut down if it were "requested" to shut down and not ordered to do so? An evacuation order doesn't "request" that people leave their properties but orders them to do so. They are not allowed back in until the order is lifted. What if the mine operators were to say "No, we will not shut down our mine"? Many large companies are known to pay fines for infractions of laws as part of the cost of doing business…at what cost to our community?

**Ind 548-9**

I cannot believe that this item is being considered to "have a less than significant impact related to substantially impairing an adopted emergency response plan or emergency evacuation plan" and no mitigation is required as stated on page 4.13-17. This must be reconsidered as it is also a complete contradiction to the "Significant and unavoidable" impact this project will have on Transportation in spite of mitigations on the Brunswick and SR20/49 intersection. This section needs careful review and reconsideration.

**Ind 548-10**

**Chapter 4.13-2** further discusses the matter of topography and wildfire risk. The second paragraph spells out that there are four acres and seven acres that have steep slopes of 30% or greater between the two sites, yet also states these steep slopes will not have an impact on fire behavior. This is totally contradictory from the discussion of fire behavior on slopes and prevailing winds which "could burn through the Sites" of both Brunswick and Centennial sites. This matter needs careful review and reconsideration.

The report goes on to say that on the Brunswick site, 18.5 acres of the 58 acres of forest will be cut down. On the Centennial site, 6.5 acres of the 10 acres of forest will be cut down. This is called "vegetation reduction" which sounds like a clear-cut. Has the environmental impact of a 25-acre clear cut been considered?

The report goes on to reiterated the fuel treatment projects far and wide in western Nevada County, which I have already commented on as to the

5

irrelevancy of these distant projects (some of which have been seeking funding for years).

**Ind 548-11**

Why is there an inclusion in the description, in this section of the DEIR, to install a potable water line for residents along East Bennett Road as an example of roadside fuel reduction? There is already a Right of Way on the road to install such a pipeline so what fuel reduction will be done in digging up the road? This potable water line has been proposed to be installed by N.I.D. and paid for by Rise Gold as the wells along this road are anticipated to be negatively impacted.. At the same time Rise Gold has said repeatedly that the wells in the area will not be impacted. If this is true, why is a water line needed? Why is putting a water line in being used as an example of "fuel reduction" to reduce wildfire hazard? This section needs careful review and reconsideration.

**Ind 548-12**

Rise Gold's Fire Protection Plan for the proposed project has both 30-foot and 100-foot defensible space zones. This seems to be adequately described and no dead trees, leaves or firewood piles will be allowed. Tiny plots of landscape greenery are shown in Figure 4.13-3 to beautify the industrial complex. Is this part of their Aesthetics mitigation? Most of Zone 2 will be asphalt so there will be no combustible materials. The building materials will be compliant with ignition-resistant materials. It seems that should a wildfire approach, the project property and buildings will be safe, unless the explosives that are being trucked in during a wildfire explode or the diesel tanks ignite.

Why does the DEIR include a "fire flow system" as support of this project having "less than significant" impacts? Then go on to state, page 4.13-20 paragraph 3, that it is not known if the old fire flow infrastructure used by the lumber mill, even meets CFC requirements? Please review this for validity.

**Ind 548-13**

Has a "comprehensive vegetation management plan required by the County Fire Marshall's Office been provided? If so, how will the plan be adhered to "in perpetuity" if the company goes bankrupt (which this company did on its last project in British Columbia)? If not, how can it be included in this DEIR and give support to the DEIR conclusion that this

project's impacts will be mitigated to "less than significant" regarding Wildfire impacts?

**Ind 548-14** Another questionable assertion by the DEIR is that the CAL FIRE station on Ridge Road could reach a theoretical fire at the mine within the 5-minute response time goal. The DEIR acknowledges the response time is "depending on local traffic conditions". Once again, the unmitigable and significant impact of traffic at Brunswick Road and SR 20/49 comes into focus.

**Ind 548-15** I am alarmed by the second paragraph on page 4/13-21 that states the transportation, storage and use of explosives will comply with Federal and State laws and states "given that storage and use of explosives would only occur underground at the Brunswick Industrial Site, an unexpected explosive event would not be likely to exacerbate above-ground wildfire risks". Does this address the matter of trucks carrying the explosives to the mine through our town or the time of transferring these explosive materials to be stored underground? What ensures these trucks will not be involved in a vehicle accident during transit between where the explosives are purchased and to the mine? The risk will be increased during the high tension of a mass vehicular evacuation. Please review the following link: https://www.nytimes.com/2022/01/20/world/africa/ghana-explosion-mining-truck.html

**Ind 548-16** If I am reading the long third paragraph on page 4.13-21 correctly, we can be assured that the dewatering of the mine is at deeper levels than where the roots of the trees and plants are. This makes sense. Then details describe the depth of groundwater varies considerably depending on the topography and that there is seasonal fluctuation. This too makes sense. What is not at all clear is the assertion that the water discharged into South Fork Wolf Creek from the mine, which we have been told by Rise Gold to be over 3.6 million gallons a day for the initial six months followed by 1.2 million gallons a day for 80 years, would "prevent the lowering of the groundwater levels along the reach of that creek whereas only a small fraction of the groundwater that was removed from the subsurface would come from that area". What is this saying? Is it saying groundwater is being removed? The mine claims the dewatering will have no effect on groundwater yet this report says "only a fraction… that was removed".

7

What is accurate? The report then makes a vague reference to NID's releases into Wolf Creek during the dry season. What does this have to do with the impact of dewatering of the mine and wildfire hazards? The statements add to the questionable quality of this DEIR and needs careful review.

**Reclamation**, page 4.13-21

Reclamation certainly is an important consideration to this mine closing before 80 years. There is notation of removal of "The tallest structures on-site" along with the covered conveyor system and the above ground 20,000-gallon diesel fuel tanks…". Why is this number not consistent with what is stated to be two 12,000 tanks on the Brunswick site and 1,200 gallon tank on the Centennial site? Who will pay for this part of the reclamation if Rise Gold goes into bankruptcy? Who will pay for the reclamation of the damage to the ground water and the ecosystems of the North Fork Wolf Creek? Who will pay for the loss of property value if the private property owners wells are dry or contaminated? The people will pay. The people of Nevada County and state of California and the people of the United States is who will pay. Bankruptcy was claimed by Rise Gold on their last project and the posted bond for clean-up is a small fraction of what is needed. The Canadian courts are still battling for financial accountability of Rise Gold.

**Ind 548-17**

The **Conclusion** of this section of the DEIR states the proposed project could have a significant impact related to exacerbation of wildfire risks without a vegetation management plan. A vegetation management plan would theoretically reduce the Wildfire risks. Still there is NO mention of the need to evacuate in the case of a wildfire. This is after detailed description of the 118 round trips of truck which the "Conclusion" ignores completely.

**Ind 548-18**

Next in the report comes the **Mitigation Measures** starting on page 4.13-22, where every impact noted in this chapter is mitigated to a "*less-than-significant level*". The report contends that a vegetation management plan and the creation of defensible space, wildfire danger becomes insignificant.

**Ind 548-19**

8

Is this to suggest that wildfire danger becomes insignificant to property owners if they create defensible space around their homes? While this may help save their home it does not make the risk "insignificant". Homeowner's insurance has sky rocketed because of fire danger in our state and elsewhere, yet this report says wildfire danger is insignificant for the mine property simply with a vegetation management plan. Our home had well maintained defensible space and it burned to the ground in the Valley Fire.

**Ind 548-20** On page 4.13-24 we are asked to have confidence that PG&E will eliminate the fire danger from the power poles and lines that will service the mine complex. Recent history tells us that regardless of what PCR 4292 and PCR 4293 says about firebreaks and tree/branch removal, fires do still start from trees and branches falling on PG&E power lines. I am not reassured and I ask that this be carefully reviewed and reconsidered.

**Ind 548-21** The presence of two 12,000-gallon tanks of diesel fuel, for a total of 24,000 gallons of fuel, will be transported and stored in tanks on site. The report suggests that with the use of Chapter 23 of the CFC and Fire Marshall's inspections, there will be NO potential for fire danger and environmental catastrophe. However, human errors happen. Another tank, containing 1,200 gallon of diesel fuel will be located on the Centennial Site which is surrounded by our town.

**Ind 548-22** The item 4.13-4 yet again suggests there will be "less-than-significant" impacts of post-event hazards such as flooding or landslides following the "less-than-significant" impact of a wildfire involving this project. I appreciate the discussion of the post-fire debris-flow hazard assessment of the 2017 McCourtney Fire in our community. However, as noted in this DEIR, the difference is the presence of mine tailings and the presence of North Fork Wolf Creek. Mine tailings will not allow rains to soak into the ground and the creek will be impacted by runoff. In light of the differences, how does the McCourtney Fire assessment apply to this project? Have the homes that are located along Wolf Creek, which are already prone to flooding, been considered? We have all seen those modest homes being flooded in times of high water and how will the addition of 1.2-3.6 million gallons a day

9

do to the flooding when the creek rises with natural heavy rain runoff? Again, this is a matter that needs further review and analysis.

**Cumulative Impacts and Mitigation Measures 4.13-5**

The final page of this chapter is the ultimate statement that with the mitigations proposed by the mine owners, there will be **no significant cumulative impact** related to the exacerbation of wildfire risk. How can this be? My focused analysis of this chapter of the DEIR, along with common sense tells me otherwise. Wildfire is ALWAYS a risk to our rural county. The combination of a heavy industrial complex in a VHFHSZ, the added heavy trucking traffic on our roads, the transportation of explosives and fuel on our roads and through our communities, the storage of explosives and fuel on the site, the history of PG&E caused fires, the questionable reputation of Rise Gold, the potential of human errors and accidents, does little to reassure me that this project will not have a negative impact on life in our community in spite of the findings of this report.

**Ind 548-23**

I respectfully ask that all my concerns and comments be reviewed and considered by the Planning Department of Nevada County, before a recommendation is made to the Board of Supervisors.

Respectfully submitted,

Martha Turner.

## INDIVIDUAL LETTER 548: MARTHA TURNER

### Response to Comment Ind 548-1
This is an introductory comment. Responses to specific comments are provided below.

### Response to Comment Ind 548-2
As discussed on page 4.13-7 of the DEIR, CAL FIRE has primary responsibility for wildfire suppression on lands within SRAs, wherein the Centennial and Brunswick Industrial Sites are located. The CAL FIRE Nevada-Yuba-Placer Unit serves the project area. Notwithstanding, depending upon the incident, other fire agencies may provide response during a wildfire incident through mutual and/or automatic aid agreements. These agencies are discussed in Chapter 4.11, Public Services and Utilities, of the DEIR.

As stated in page 4.13-17 of the DEIR, with regard to the wildfire analysis, significant slopes are those in steep-walled canyons or mountainous valleys. The DEIR does not suggest the project sites are immune to wildfire and states on page 4.14-17 that that a fire burning in the forested terrain southwest of the Centennial and Brunswick Industrial Sites could burn through the Sites due to prevailing southwesterly winds. As stated on page 4.13-18 of the DEIR, CEQA Guidelines Appendix G indicates that additional factors must be considered to determine the potential for a project to exacerbate wildfire risk. Among these other factors is the extent and nature of on-site vegetation.

### Response to Comment Ind 548-3
As stated on page 4.13-3, the definition of "larger wildfires" occurring within the region is according to CAL FIRE. The project truck traffic would not substantially interfere with an evacuation plan. Please see Master Response 5 - Evacuation Zones.

### Response to Comment Ind 548-4
The purpose of Section 4.13.2 of the DEIR is to describe the existing wildfire setting in the project region as stated on page 4.13-1 of the DEIR.

### Response to Comment Ind 548-5
The purpose of Section 4.13.2 of the DEIR is to describe the existing wildfire setting in the project region as stated on page 4.13-1 of the DEIR.

### Response to Comment Ind 548-6
The Nevada County Emergency Operations Plan does not address any specific projects. As stated on page 4.13-13 of the DEIR, the Nevada County Emergency Operation Plan (EOP) delineates responsibilities of first responders (fire and law) and other response support organizations, e.g., Department of Public Works, Environmental Health, etc. for natural disasters and manmade emergency incidents in Nevada County. The EOP is intended to mitigate future disasters and emergency incidents. Project traffic would not substantially interfere with an evacuation plan. Please see Master Response 5 - Evacuation Zones.

### Response to Comment Ind 548-7
Please see Master Response 5 - Evacuation Zones.

### Response to Comment Ind 548-8
Please see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 548-9

Please see Master Response 5 - Evacuation Zones. For clarification purposes, as demonstrated in Chapter 4.12 of the DEIR, the project would not have any significant and unavoidable impacts to intersections near the SR20/49 intersection.

## Response to Comment Ind 548-10

The DEIR does not state that the on-site slopes over 30% will not have an impact on fire behavior, but rather the amount of 30% slopes is not a substantial factor in influencing on-site fire behavior, as would be the case for the more fire risk topographical areas in the region, such as Deer Creek canyon and Greenhorn Creek canyon. Whereas the project site has some limited steep slopes, these other areas in the region are marked by *both* topographic characteristics (i.e., steep slopes) and topographic features contributing to fire risk (e.g., canyons, ridges, chutes and saddles).[1] The impact to vegetation communities, including those mentioned by the commenter (e.g., on-site tree removal), is analyzed in Chapter 4.4 of the DEIR.

## Response to Comment Ind 548-11

The project does not propose to conduct fuel treatment along E. Bennett Road. As stated on page 4.13-5 of the DEIR, with respect to planned but not yet funded fuel treatment projects in the immediate vicinity (i.e., grant application submitted but award not yet confirmed), the primary project is roadside vegetation management (to create defensible space) along East Bennett Road, where the potable water pipeline would be installed, as well as the portion of Brunswick Road along the frontage of the Brunswick Industrial Site. Similar roadside vegetation management is also proposed along Greenhorn Road, east of the Brunswick Industrial Site.

As stated on page 4.8-66 of the DEIR, the proposed mining operations could result in adverse effects to seven domestic water supply wells in the East Bennett area during the life of the mining operation. After reclamation, when the mine is allowed to flood, groundwater levels in the wells would recover to their approximate pre-project levels. As discussed in the Project Description chapter, pursuant to Nevada County General Plan Policy 17.12, the project would address this by installing a potable water supply line in East Bennett Road and providing individual well owners with a connection to the potable water line. While only seven wells are projected to be adversely affected, the applicant has prepared a Well Mitigation Plan (February 2, 2021) that would connect up to 30 properties in the East Bennett area to the NID potable water system.

## Response to Comment Ind 548-12

The landscaping shown in Figure 4.13-3 is part of the planned landscaping as further described in Chapter 4.1 of the DEIR. The fire flow system is not constructed yet. As stated on page 4.13-20, two existing fire service lines extend into the Brunswick site. The installation of the fire flow system for the project would be required to meet California Fire Code (CFC) requirements.

## Response to Comment Ind 548-13

A Vegetation Management Plan is not required to be submitted until improvement plans, such as grading or building permit applications are submitted. Mitigation Measure 4.13-2 requires that in conjunction with submittal of Improvement Plans, the applicant shall submit a comprehensive Vegetation Management Plan, inclusive of the Centennial and Brunswick Industrial Sites, for the review and approval by the County Fire Marshall's Office. The mitigation measure is legally adequate pursuant to CEQA in that it has sufficient performance standards to ensure that the

[1] E.g., see https://www.nwcg.gov/sites/default/files/training/docs/s-190-ig04.pdf.

future management plan will reduce the potential wildfire impact to a less-than-significant level. As stated in CEQA Guidelines, Section 15126.4(a)(1)(B):

> The specific details of a mitigation measure, however, may be developed after project approval when it is impractical or infeasible to include those details during the project's environmental review provided that the agency (1) commits itself to the mitigation, (2) adopts specific performance standards the mitigation will achieve, and (3) identifies the type(s) of potential action(s) that can feasibly achieve that performance standard and that will considered, analyzed, and potentially incorporated in the mitigation measure.

The applicant shall implement all provisions of the Vegetation Management Plan during the project's construction, operations, and reclamation activities.

Please also see Master Response 3 - Operator Responsibility.

## Response to Comment Ind 548-14

The commenter appears to question information obtained from the County's personal communication with local fire agencies. As stated in the DEIR, depending on local traffic conditions, a wildland engine from Station 20 could potentially reach the Centennial and/or Brunswick sites within 5 minutes. This would assume the most direct route using Old Tunnel Road to Brunswick Road. The project does not have a significant and unavoidable traffic impact to any roadways or intersections on Brunswick Road and Highway 20/49. Please see Chapter 4.12 of the DEIR and Master Response 5 - Evacuation Zones.

## Response to Comment Ind 548-15

The transportation of explosives in the United States has an excellent safety record. A review of DOT incident reports for highway transportation of class 1.1B, 1.4B, 1.1D, and 1.5D materials shows 149 incidents over the past 30 years in the United States. The majority of these incidents were vehicle accidents resulting in no release or spillages. No fatalities were reported in any incidents and only 1 incident resulted in injuries. Please also see Master Response 10 - Explosives, Reagents, and Brunswick Fill, and Master Response 5 - Evacuation Zones.

## Response to Comment Ind 548-16

Please see Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 548-17

No reference to 20,000-gallon tanks is made on page 4.13-32 of the DEIR. As stated on page 2-3 of the DEIR, a Reclamation Plan and Financial Assurance Cost Estimate (FACE) will be required for the project. As stated on page 4.6-24 of the DEIR, to ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably determines are adequate to perform reclamation in accordance with the surface mining operation's approved Plan. The Reclamation Plan is provided in Appendix C of the DEIR.

The mine water discharge would have a less than significant impact after mitigation on the ecosystem of South Fork Wolf Creek. Please see Chapters 4.4 and 4.8 of the DEIR, Master Response 35 - Discharge to South Fork Wolf Creek, and Master Response 36 - Flows in South Fork Wolf Creek.

The project would have a less than significant impact after mitigation to domestic water wells. Please see Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

With regard to property values, please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

Please also see Master Response 3 - Operator Responsibility.

## Response to Comment Ind 548-18

Please see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 548-19

As stated on page 4.13-2, the Centennial and Brunswick Industrial Sites have limited steeply-sloping topography that is known to exacerbate wildfire risk and spread. Prevailing wind conditions within the surrounding area are from the North-East and South-West directions, both of which have forest lands. The incorporation of defensible space around proposed structures at the Brunswick Industrial Site, as well as designing buildings in conformance with Chapter 7A of the CBC, would help to slow the spread of wildfire moving through the area. In addition, proposed improvements at both Sites would reduce the vegetation fuel load in the area. Nevertheless, vegetation would remain on both Sites and would need to be managed on an ongoing basis. In addition, use of hydrocarbon-powered heavy-equipment on-site could exacerbate wildfire risk. Without implementation of a vegetation management plan, the proposed project could have a significant impact related to exacerbating wildfire risks, and thereby exposing project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Mitigation Measure 4.13-2 of the DEIR mitigates this risk.

## Response to Comment Ind 548-20

The commenter asserts that the project could result in wildfire impacts due to branches falling on PG&E infrastructure and PG&E's failure to follow legal requirements for firebreaks and tree/branch removal. PG&E infrastructure exists throughout the County regardless of the project. Nonetheless, wildfire risk due to the placement of limited power conveyance lines on the project sites and PG&E's failure to follow legal requirements for firebreaks and tree/branch removal is speculative. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

## Response to Comment Ind 548-21

Page 3.13-24 of the DEIR states the project would install two, 12,000-gallon above-ground diesel fuel storage tanks on the Brunswick Industrial Site. The tanks would be located in the industrial building complex area, away from existing and proposed vegetation. Diesel fuel is considered a Class II liquid, and as such, the tanks would be regulated in accordance with Chapter 23 of the CFC. Chapter 23 of the CFC includes robust design requirements for above-ground fuel storage tanks to minimize fire hazard to the maximum extent feasible, including but not limited to requirements for overfill protection, spill containment, and dispenser emergency shutoff valve. Compliance with CFC requirements, as determined by the Fire Marshall's Office, at time of improvement plan review, would reduce fire hazards related to on-site fuel storage tanks. The proposed 1,200-gallon temporary diesel fuel tank at the Centennial Industrial Site would also

comply with CFC standards related to siting and maintenance of clearance space (i.e., removal of grass and weeds).

## Response to Comment Ind 548-22

As stated on page 4.13-26 of the DEIR, although runoff from both Sites flows into creeks, the project includes drainage facilities to capture runoff prior to entering the creeks. Should a fire occur on one or both of the project sites, the proposed drainage facilities would capture and slow post-fire runoff, thus minimizing flooding potential downstream. As stated on page 4.8-70 of the DEIR, the proposed detention basins would hold back the peak flows and release the water at a lower rate and at a later time than currently occurs from those site areas. As a result, the project would reduce peak storm flows in both Wolf Creek and South Fork Wolf Creek.

## Response to Comment Ind 548-23

This comment is a summary of the commenter's previous statements. Responses to specific comments are provided above in Responses to Comments Ind 548-1 through Ind 548-22.

**Individual Letter 549**

Pg 1

Spoken Comment for Planning Commission Special Meeting March 24, 2022

My name is Martha Turner and I live at 10860 Dolores Drive, Grass Valley, Supervisor District 3. I am a retired Nurse Practitioner and Nurse Midwife, I am not, as Don Rogers referred to, a "busybody", and have mostly lived in Nevada County since 1960. I was a Forest Service firefighter as a young adult and in 2015 we lost our home to a WILDFIRE, which makes this subject near to my heart.

**Ind 549-1**

My DEIR comment today is on Chapter 4.13 titled WILDFIRE and request that the following matters be further reviewed by the Planning Commissioners before a recommendation is made to the Board of Supervisors. I was NOT reassured by what I learned.

- The report suggests the mine site will be immune to the danger of a wildfire. Yet, there is forest on both sites.
- The report minimizes the risk of fire in our region. In fact, there have been 16 wild fires that burned in Nevada County since 2015.

**Ind 549-2**

- The report does NOT adequately address how the mass evacuation of residents, along with an additional 312 mine employees, will be handled.

**Ind 549-3**

- Quite disturbing is the statement, that in the event of a wildfire, fire officials would "REQUEST" the mine to shut down. What sort of authority and enforcement is in the word REQUEST?

**Ind 549-4**

- While truck traffic is recognized elsewhere in the DEIR as "Significant", this part of the DEIR states the impact of truck traffic is "Less than Significant" in the event of a wildfire. This makes no sense.

**Ind 549-5**

- There is no discussion in relation to WILDFIRE about the trucks carrying explosives through town or the transferring of these explosive materials before they are stored underground.

**Ind 549-6**

- The report contends that with a "vegetation management plan" wildfire danger becomes "Insignificant". Our home had a well-maintained defensible space and still burned to the ground.

**Ind 549-7**

RECEIVED
MAR 24 2022
NEVADA COUNTY
PLANNING DEPARTMENT

pg 2

**Ind 549-8**

- The report states that the presence 24,000-gallons of diesel fuel on site will have NO potential for fire danger and environmental catastrophe. NO POTENTIAL?

**Ind 549-9**

- It is also stated there will be a "less-than-significant" risk of flooding, even though it acknowledges mine tailings DO increase water runoff. What happens to the homes located on Mill Street along Wolf Creek? We have all seen those back yards being flooded when the creek rises. There is no consideration of the impact of an additional 1.2-3.6 million gallons of water a day going into the creek and added to heavy rain fall.

**Ind 549-10**

The final page of this chapter is the statement that this mine will cause **no significant cumulative impact** related to wildfire risk. My focused analysis of this chapter, along with common sense, tells me otherwise.

Thank you very much for hearing my comment.

## INDIVIDUAL LETTER 549: MARTHA TURNER

### Response to Comment Ind 549-1
The comment expresses a general opinion that the discussions and analyses in Chapter 4.13, Wildlife, of the DEIR are inadequate, but does not provide specific examples that would allow for a detailed response. Such examples are provided in subsequent comments.

### Response to Comment Ind 549-2
The DEIR does not state the project is immune to wildfire danger. Chapter 4.13 of the DEIR assesses the project's impacts related to Wildfire. Page 4.13-22 of the DEIR states, the Centennial and Brunswick Industrial Sites have limited steeply-sloping topography that is known to exacerbate wildfire risk and spread. Prevailing wind conditions within the surrounding area are from the North-East and South-West directions, both of which have forest lands. The incorporation of defensible space around proposed structures at the Brunswick Industrial Site, as well as designing buildings in conformance with Chapter 7A of the CBC, would help to slow the spread of wildfire moving through the area. In addition, proposed improvements at both Sites would reduce the vegetation fuel load in the area. Nevertheless, vegetation would remain on both Sites and would need to be managed on an ongoing basis. In addition, use of hydrocarbon-powered heavy-equipment on-site could exacerbate wildfire risk. Without implementation of a vegetation management plan (VMP), the proposed project could have a significant impact related to exacerbating wildfire risks, and thereby exposing project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Mitigation Measure 4.13-2 requires implementation of a VMP on an ongoing basis.

**Dist 1**

RECEIVED
MAR 0 3 2022
NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Ave. Suite 200
Nevada City, CA. 95959

Dear Supervisors,

**Ind 550-1** I live on Greenhorn Road, close to the site of the proposed reopening of the Idaho-Maryland mine. I've been following closely what opening this mine is likely to do to our community. I've read the summary DEIR and followed the letters and commentary written by many informed residents. My concerns have NOT been mitigated.

**Ind 550-2** First of all, switching 31 residents from wells to NID is a laughable solution to the risks of the mine using millions and millions of gallons of water. This water is a public resource, not for the use of one company - a foreign company - to make a profit. We are currently in the worst drought in 1200 years and absolutely no one is suggesting that this will end soon. Given climate change it is more likely to worsen over time. Giving this resource away prioritizes a foreign company's profit over the well being of local residents.

**Ind 550-3** I have many, many more concerns. Air and water pollution, noise, traffic, a degradation of local aesthetics. I found the mitigation proposals in the DEIR to be weak and unconvincing. But even more concerning is the past record of Rise Gold. They violated multiple environmental and safety

**Ind 550-4** standards in their last project, claimed bankruptcy and walked away leaving polluted waters and hundreds of thousands of dollars in costs to the community. Rise Gold has shown us who they are. Shame on us if we ignore that.

**Ind 550-5** Yes, we need jobs in Nevada County. Filling in gaps in broadband, expanding infrastructure in our current industrial areas are potential starts. Let's look to a sustainable future, not our polluting mining past.

Thank you,
Marv Hoffman

## INDIVIDUAL LETTER 550: MARV HOFFMAN

### Response to Comment Ind 550-1
The commenter expresses general project-related concerns. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 550-2
Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 550-3
Please see the discussions and analyses in Chapter 4.1, Aesthetics, of the DEIR.

In addition, the commenter expresses a general opinion that the mitigation measures set forth in the DEIR are "weak and unconvincing," but does not provide specific examples that would allow for a detailed response. Please see Master Response 1.

### Response to Comment Ind 550-4
Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 550-5
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 551**

Matt Kelley
Nevada County Planning Commission
950 Maidu Ave. St. 170
Nevada City, Ca. 95959

Dear Mr. Kelley,

**Ind 551-1** I have read the summary of the DEIR for the proposed opening of the Idaho-Maryland mine. I have also been paying close attention to the opinions of many qualified and informed members of our community. It is obvious that there would be many serious impacts if the mine were to reopen.

**Ind 551-2** I'm very concerned about aesthetics, noise, traffic and potential pollution of our air and water. But my primary concern is the amount of water that the mine will use. We are currently in the worst drought of 1200 years. No one seems to think that this drought will be over soon, or if climate change will worsen the drought and make it permanent. Allocating massive amounts of water to a foreign company so that they can make a profit is likely to be at the cost of local residents. I live on Greenhorn Road and fear for my well. Transferring 31 homeowners from wells to NID will not solve this problem. These risks are real and cannot be mitigated.

**Ind 551-3** Though water is my primary concern I am also worried that the proposals for other mitigations are weak and that enforcement is vague. We are dealing with a company that went bankrupt on it's previous project and left the community with the costs. They were charged with many violations of environmental and safety standards. Why would we believe that this project will be any different? How can you mitigate risks with a company whose own track record shows that they are not trustworthy?

Thank you for hearing my concerns.
Marv Hoffman

## INDIVIDUAL LETTER 551: MARV HOFFMAN

### Response to Comment Ind 551-1

The comment does not address the adequacy of the DEIR, but expresses general concerns related to the project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 551-2

The commenter expresses general concerns regarding aesthetics, noise, traffic, air and water pollution, and groundwater impacts. These topics are addressed in detail throughout the DEIR - please see Master Responses 1. Regarding well impact and climate change concerns, please see Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 551-3

The comment expresses a general opinion that the mitigation measures set forth in the DEIR are "weak and that enforcement is vague," but does not provide specific examples that would allow for a detailed response.

Please also see Master Response 3 – Operator Responsibility. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

Matt Kelley
Planning Commission
Nevada County

Mr. Kelley,

I live off of Beaver Drive and share a property line with the Brunswick mine site. I have lived here for thirty years and this is the third time we have been faced with the possibility of reopening the mine. I am completely opposed to this proposal and feel that any benefit to the community is far outweighed by the risks involved. I believe the DEIR mitigation measures to be inadequate in addressing my concerns—mainly water, air and noise pollution, and truck traffic.

**Ind 553-1**

1) The hydrology report does not address the possibility of water loss to private wells in the area other than the thirty wells on East Bennett. Ten plus years ago when Emgold was applying to reopen the mine, I believe our wells were designated as being at risk. Why are they no longer at risk? Also, there is no assurance that we would be supplied water by NID in the event that this happens—no bond in place to cover the cost and no guarantee that NID would even have enough water supply to provide for us. When we are in a wildfire area and a period of significant drought, does it really make sense to pump millions of gallons from the mine, allowing more water to flow into it, thus reducing the amount of groundwater available to all of us? I think not.

**Ind 553-2**

2) I believe air pollution is a significant risk to the health of our community that cannot be adequately mitigated. What is less than significant to one person can be quite significant to another. Contaminants from asbestos, silica, and diesel emissions produced by mining activity can become airborn and as such would likely contribute to serious illness like lung cancer, asthma, and other acute or long term disease. The air quality in Nevada County already receives a poor rating. Does it really make sense to make that rating even worse? I think not.

**Ind 553-3**

3) Noise from blasting, rock grinding and dumping into steel truck beds to be hauled away, even the constant back-up beeping from the trucks—all to be occurring 24/7–will not likely be mitigated to a less than significant level. And again, less than significant differs from one person to another. What is "less than significant" anyway? It is definitely not "insignificant".

**Ind 553-4**

4) As far as traffic, it's not just about the number of trucks on the road at any given time. It includes traffic congestion at the Loma Rica/Brunswick signal at peak times with workers entering and exiting the Loma Rica Business Park area—with trucks traveling at slower speeds on the uphill grade in that area. It includes wear and tear on the roads, diesel

1

truck exhaust fumes, and noise from those trucks all 16 hours/day (6 a.m. to 10 p.m.) 7 days per week! I don't think all this can be adequately mitigated.

**Ind 553-5**

As I stated earlier, these are just some of the concerns I have about moving forward with this project. Others have addressed significant and valid concerns regarding environmental issues, aesthetics, electrical energy consumption, greenhouse gas emissions, and monitoring and enforcement of regulations. I urge you to give serious consideration to all of these concerns when weighing your decision. We are a vibrant community, we love this area, and we are deserving of that consideration.

Sincerely,
Mary Anderson

## INDIVIDUAL LETTER 553: MARY ANDERSON

### Response to Comment Ind 553-1

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues. The commenter also states that the DEIR does not discuss the potential impact to groundwater wells outside of the East Bennet Road private wells.

The DEIR and previous hydrogeologic assessments consider the groundwater wells in the Beaver Drive area to "low risk." The commenter is referred to Master Response 13 - Historic Hydrogeologic Assessments. The DEIR's current assessment and analysis of domestic water wells for the Beaver Drive area is provided in Chapter 4.8 and Appendix K.2 (Groundwater Hydrology and Water Quality Analysis.) As shown in Table 4.2 of Appendix K.2, project drawdowns in the Beaver Drive area are projected to be minimal, ranging up to 3 feet or 4.3% of the well water column. Groundwater monitoring and well mitigation, if necessary, is required for the project. (see DEIR, Appendix K.8, Idaho-Maryland Mine Groundwater Monitoring Plan.) Groundwater monitoring is designed to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. The commenter is referred to Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

The DEIR discusses the dewatering effect on soil moisture and vegetation as it pertains to wildfire risk on page 4.13-21. The DEIR states that groundwater typically exists below the rooted vegetation and tap roots for trees and thus would not impact vegetation and increase fire risk. (DEIR, p. 4.13-21.) The commenter is also referred to Master Response 33 – Groundwater Dependent Vegetation and Master Response 16 - Drought and Climate Change.

### Response to Comment Ind 553-2

The commenter is concerned with impacts to air quality and states that what is "less to significant" can vary throughout the population but does not identify why the DEIR is inadequate. The DEIR's Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) examines air pollution including asbestos, silica, and diesel emissions. The commenter is referred to Master Response 18 - Air Quality Thresholds.

### Response to Comment Ind 553-3

The commenter states that noise from blasting, grinding (mineral processing), and noise from loading trucks is not likely mitigable to a less than significant impact but does not state by the DEIR is inadequate. In assessing the impacts from blasting, the DEIR utilizes data from a long-term blasting noise level survey from the Sutter Gold Mine in Amador County, CA from 2013. (DEIR, p. 4.10-44.) Based on that data, the DEIR concludes that any blasting-related noises would fall below the applicable daytime, evening, and nighttime criteria. (DEIR, p. 4.10-44–45.) The DEIR states that the noise impacts associated with mineral processing would be less than significant. (see DEIR, p. 4.10-37–38; Table 410-17.) The DEIR states that the dumping of rock or sand tailings into truck beds would take place in three locations. Barren rock is loaded into trucks inside a building at the Brunswick shaft by a conveyor (DEIR, Appendix L, p. 35.) and sand tailings are loaded into trucks inside the process building (DEIR, Appendix L, p. 35.) The

placement of these loading points inside buildings allows for reduction of noise from these sources. Sand tailings are loaded into trucks outside of the process plant, but only from 7:00AM to 7:00PM, as shown in Table 3-7 of the DEIR and discussed on page 36 of Appendix L. Noise generated from proposed operations (excluding temporary construction of the water pipeline) has been found to be less than significant after mitigation. Mitigation Measure 4.10-3 of the DEIR requires a comprehensive noise monitoring program and requires all on-site mobile equipment to be fitted with broad-band "growler" type back-up warning devices rather than conventional "beeper "devices.

## Response to Comment Ind 553-4

Existing traffic and road maintenance are analyzed in the DEIR. Please see Chapter 4.12 of the DEIR. The Project Applicant would be required to enter into agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the project driveway and Brunswick Road. (DEIR, Mitigation Measure 4.12-6(c).)

Air quality impacts, including diesel truck exhaust fumes are analyzed in the DEIR. Please see Chapter 4.3 of the DEIR. As stated in the Health Risk Assessment (HRA) performed for the project (see Appendix B of Appendix E.1 to the DEIR), for diesel haul trucks, estimated maximum daily trips were multiplied by 365 days to estimate annual trips. For all other trucks, daily emissions were estimated based on the anticipated maximum daily truck trips, and annual emissions were estimated based on anticipated average trips per week multiplied by 52 weeks per year. Total truck trips assumptions for the HRA are shown in HRA Table 7. Based on the HRA, which includes all construction and operational TAC sources of the project, the health risk to the maximally exposed individual resident (MEIR) would be less than significant after implementation of mitigation.

Noise impacts, including from on-road trucks, are analyzed in the DEIR. Please see Chapter 4.10 of the DEIR.

## Response to Comment Ind 553-5

The commenter summarizes various concerns regarding environmental issues all of which are analyzed in the DEIR. Regarding aesthetics concerns, please see Chapter 4.1 of the DEIR. Regarding electrical energy concerns, please see Master Response 25 – Nevada County Energy Action Plan, and Response to Comment Agcy 8-17. Regarding greenhouse gas emissions, please see Master Response 27 – Greenhouse Gas Emissions.

**Individual Letter 554**

Matt Kelley – Senior Planner 04/01/2022

Nevada County Planning Department

950 Maidu Avenue

Nevada City, CA 95959

To Whom it May Concern,

**Ind 554-1** My name is Mary Bennett and I own the home located at 13376 Noel Lane, Grass Valley. My home is less than a mile from the proposed mine site off Brunswick and Bennett Street.

I strongly oppose Rise Mine operation. Having a Foreign operator who has little to no experience running a mine operation is not in anyone's best Interest. I firmly believe after seeing all the toxic problems that revolve around mining operation from former years still waiting on Clean Up that the Board would have the best interest in the surrounding Residental community vs some Corporation rounding up investors to move forward.

**Ind 554-2** Rise has "NO VIABLE Interest in the Community", where as most land and Homeowners do. I also find the need greater for housing or open space for the community to utilize rather than trucks running 24/7 on several busy streets.

The County just approved a large housing development on Brunswick do you think that a having a mining up the street will be a selling point? I would think not. There are better options than mining to move this country forward. Look to the Future and not the past.

Sincerely

**Ind 554-3**

Mary and Stan Bennett

13376 Noel Lane, Grass Valley, CA

## INDIVIDUAL LETTER 554: MARY AND STAN BENNETT

### Response to Comment Ind 554-1

The comment does not address the adequacy of the DEIR, but rather expresses general concern regarding the project. Please see Master Responses 1 through 3. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 554-2

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 through 3.

### Response to Comment Ind 554-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 555**

Matt Kelley, Senior Planner
950 Maidu Ave, Suite 170
Nevada City, CA 95959

April 2, 2022

Nevada County Board of Supervisors and Planning Department

I am writing because I have major concerns about the safety of reopening of the Idaho-Maryland Mine. Many of the concerns I have are not addressed in the DEIR or are not comprehensive in addressing them. Well Mitigation Plan is not adequate.

**Ind 555-1**

I am a homeowner who lives in the mineral boundary. I'm very concerned that the mine will change the flow of ground area through the watershed and my well will be contaminated, have less production or go dry. Because of this, last summer I had a 2600-gallon water storage tank connected to my well. If the water does fail or becomes less productive, I'd have a way to purchase and store potable water immediately. An event and an expense (about $6000) I don't think I should have had to plan for just in case the mine blasting, tunneling and dewatering removes available ground water or changes where it flows underground.

My background is teaching, science related topics mostly. I have taught 4th grade, middle school science, high school sciences including biology, earth science and environmental science. With this basic core knowledge, the reopening of the mine is something I think would be very harmful to the environment and to the citizens of the county. I completely support the DEIR conclusion that the Environmentally Superior Alternative is **"No project (No Build) Alternative would be considered the environmental superior alternative."** (Section 2.4 page 2-7)

**Ind 555-2**

If your decision is "to proceed with a project that would have significant unavoidable impacts... the decision to balance the benefits of the project against unavoidable environmental impacts must be adopted." (Section 2.4 page 2-4 page pdf 55) DEIR section 4.0.4 (Introduction to Analysis) defines "significant effect is defined as a substantial or potentially substantial adverse change in the environment." At best Table 2-1 (pdf pages 134-135) says: "If significant impact is found in any well" for example 10% reduction in the East Bennett group of home wells; then Rise would provide potable water. Nowhere else in the water section does it say what would happen if another significant effect was to develop on the Brunswick/Centennial Drive sites or the bigger 2585-acre mineral boundary area or the larger area that surrounds the mine workings above and below the ground. I couldn't find any criteria for stopping the mine temporarily or permanently dependent on the severity of the effect and its short- and long-term impacts. Why isn't this criteria part of the document?

**Ind 555-3**

Some of the concerns about water and hydrology include (section 1.8 Comments PDF page 44):

- Damage to aquifer and watershed
- Lowering of ground water table (*impacting wells*)
- Decrease in water quality
- Blasting damage causing draining of surface water and ground water
- Fire Protection
- Impact of climate change

**Ind 555-4**

The agricultural and Forestry resources (1.8 pdf page 40) raise concerns about the forest health from reduced ground water and pest infestation to the stress.

**Ind 555-5**

Nevada County General Plan Policy 17.24 (pdf page 552) says subsurface mining can be conditionally permitted with CEQA passage. The CEQA classifies these significant impacts involving water:

- Violates water standards or waste discharge
- Decreases ground water supplies or interferes substantially with ground water recharge
- Substantially alter existing drainage patterns of the site.

All of these are important concerns for me but the area of possible impact in the DEIR are too narrow in their focus. The scope of the DEIR concerns addressed is the least/minimal amount that Rise chose to consider and not deal with **all** the possible impacts that re-opening might incur.

**Ind 555-6**

First, I want to focus on the word "site" regarding the possible water impacts. The county policy 17.24 states "subsurface mining shall be conditionally permitted … only after impacts on the environment and affected surface land uses have been adequately reviewed and found to be in compliance with CEQA. Of particular importance shall be the impact of operation on surface land uses, water quantity and quality, noise and vibration, land subsidence and traffic associated with surface access. All other related impacts shall also be addressed." I understand "the environment" is the entire mine site where the business is located and involved in above and below the surface. In the DEIR, Rise continually limits the "site" to the area on Brunswick where the shaft is, holding ponds, business offices and processing buildings are proposed to be built above ground. The RISE use of the word "site" also includes the Centennial Road "site" where waste will be dumped. But what the DEIR ignores is the rest of the "site". Why doesn't the "site" include at the least all the 2585 acres contained in the mineral boundary? Why aren't the areas the ground water flows downward prior to being pumped out with dewatering the mine shaft and tunnels included? Why isn't the watershed(s) from the recharge areas higher in the smaller watersheds that contribute to the groundwater in the 2585 acre mineral boundary included? Why isn't the entire "environment and affected surface land uses") included in monitoring and evaluation and mitigated solutions if needed?

**Ind 555-7**

Section 4.8.1 proposes quarterly Rise-generated reports to monitor the significant water related issues. The monitoring will be in a few wells installed in locations of their choice. Where in the DEIR is a list or label map of the wells that are to be monitored? Figure 4.8-4 Map of Domestic Supply Wells and Underground Mine Workings (page 4.8-9 pdf page 632) indicates the wells that have been identified using the State Database and Emgold identification, some which have pump test data. These wells are in the Brunswick and Centennial site, in the mineral boundary and beyond. Peer reviewers found that 15 monitoring wells would be "adequate" to observe for 1 year prior to de-watering (page 4.8-41). That may be considered adequate by Rise's standards to **minimally** assess but it doesn't address what is happening in the entire mineral boundary area and adjacent properties. **Why aren't numerous monitoring wells located throughout the entire mineral boundary site? Why aren't all domestic wells monitored with real time gaging equipment and regular water quality sampling, not just the ones on or near East Bennett?** I can imagine that my well begins to be less productive and quicky goes dry after dewatering and mining has begun. I report it and the response will be – "How do you know its mining related?" How do I prove it? How do other domestic well owners prove related damages unless the wells are monitored with real time gaging equipment that is interpreted by experts. Would Rise hire

truly independent experts in this area to install the equipment, monitor it and draw conclusions from it? If the County is responsible – where will money for salaries and equipment come from? Surely not out of the current budget, these expenses are over and above the general needs covered in budget. It would make sense that monitoring **all** wells in the mineral boundary is necessary for a year plus for baseline measurements and then regularly during construction and initial and continuing dewatering begins. The needed monitors and expert personnel would be employed by the county, but salary costs paid by Rise.

**Ind 555-8**

If the well production is slowed or stopped or the water quality degraded, who will pay for alternative sources of potable water? Rise is installing NID lines for potable water or digging deeper wells for about 30 houses only located on or near East Bennett. (Table 2-1, 4.8-2, page 2-82 pdf page 132) Water use of 400 gallons per average day is paid for by RISE until they are annexed into the city or other termination clauses take effect. Then the cost of the water is the responsibility of the home or business owner, water that was once available on the property at no cost other than well maintenance. But I don't live on East Bennet or the adjacent streets or in an area that already has NID water. I was so concerned and worried that I withdrew funds from my retirement and installed a 2600-gallon water storage tank connected to my well. Should I lose the use of my domestic well, I have a place to store purchased water and it is connected to the pipes to the house. Some of my neighbors could install one should their water source be lost but others couldn't afford the cost. In my part of the county, NID is not available, and it is my understanding that there isn't enough future water available to connect beyond the first mile of Greenhorn that is already connected. Why wouldn't Rise treat all landowners with wells the same as the homeowners in the East Bennett cluster should there be a change in the production and quality of the domestic wells? Will Rise be required to set aside enough money prior to begin the project in case there is an issue with any well related to the mining in the mineral boundary zone at a minimum? (Money to monitor all wells and money to supply a comparable supply of water that their expense)

**Ind 555-9**

I have spent some time researching how ground water enters recharge areas and flows underground until it eventually is pumped out from a well or surfaces in a spring, creek or lake. The IMWA proceedings report: Underground mining Drainage, State of the Art, (1998, www.IMWA.info) states "Underground mining may provoke changes on in-situ permeability and on underground and sink holes, inside the angle of draw, causes the increasing of amount of water inundation and the possibility of mine water and mud invasion". These are negative impacts that affect the internal mine workings but also the ground and groundwater in the surrounding area.

**Ind 555-10**

Much of the focus in the DEIR's hydrology section is on specifically named areas in larger survey type reports such as the Basin Plan for the Sacramento River and San Joaquin River Basins. (4.8-13 pdf 654) The Rise DEIR points out that Wolf Creek and its tributaries is not specifically mentioned in this report. But it does include the Bear River. Yet the Bear River system includes the Wolf Creek Watershed as a source of some of its water. Why does specifically identifying areas like surrounding watersheds make them valuable and worthy of water quality objectives, recreation uses and habitat while not naming them makes them unimportant and not useful? The Basin plan calls for looking at 1) water's beneficial uses 2) water quality objectives 3) prohibitions and policy issues 4) monitoring. These objectives should be part of any review regardless of size or naming of the watershed system.

Addressing the concern of

- Damage to aquifer and watershed
- Lowering of ground water table (*impacting wells*)

I was surprised to find the DEIR mostly only examined water issues that were "downhill" from the Brunswick site and not the entire watershed (s). My understanding is that rain and snowmelt are the primary sources of groundwater in the area. Water enters the ground in various recharge areas higher in elevation, soak into the ground and water fills the pores (empty spaces) between soil particles, sands, rocks. The water percolates downward due to gravity and moves laterally down a slope. The water movement may be impacted by less permeable rocks and soils with no to very small pore spaces. The ground water may flow easily if the soil is considered loam or the sub surfaces are highly fractured rock.

This area is a result of former metamorphic processes. The Sierra Nevada mountains and foothills formed as 2 tectonics plates pushed against each other 100 million years ago. Granite and basalt deposits rose through the crust and cooled underground as huge batholiths. As tectonic forces continued, in time the pressure cracked the rocks and quartz and then gold filled some of the cracks before cooling. Not only did dikes of intrusive rock form the gold/quartz veins but also probably other magma-based molten rocks created dikes that also direct the way water flows underground. The tectonic forces cracked and faulted rocks. Layers were probably folded and re-arranged. How the intrusions, faults and fracturing of subsurface igneous and metamorphic layers make predicting how ground water flows unknowable. Section page 4.6-1 (pdf page 530-1) of the DEIR describes the regional geography as an "assemblage of igneous and metamorphic rocks" and "characterized by the N-NW trending Foothills fault system". Yet most the assumptions that Rise uses in its discussion assume the underground strata is mostly homogeneous. That is an unproven assumption. The DEIR should re-assess that assumption with on-site research and not make comparisons to other regions as their model for what the underground formations look and act like in relation to ground water.

DEIR states "According to this geologic map, four *rock units* are mapped as underlying the Site. The eastern portion of the Site is mapped as early Mesozoic Lake Combie metavolcanic rock; the northern and western sloping flanks are mapped as early Mesozoic Lake Combie massive diabase; the lower valley portions encompassing the South Fork of Wolf Creek are mapped as Quaternary Alluvium (i.e., water lain sediments); and tertiary clastic strata of the volcanic Mehrten formation is mapped in the south and southwestern portions of the Site." What about the rest of the mineral boundary site? Having identified the basic types of rocks- volcanic, basaltic (diabase), gravels and sands (alluvium) what does it say about their arrangement underground? I would expect groundwater to easily flow through the alluvium. groundwater would be blocked by the diabase unless it is fractured by the tectonic compression forces, volcanic clastic strata may be from lava flows (? maybe Banner Lava Cap) or lava thrown from the volcanic activity high in the Sierras in the Miocene. Are these layers neat flat strata like you would see in Highway cuts in the Midwest? Highly unlikely based on what can be seen after hydraulic mining stopped eroding away huge hill sides. We don't know just how these are all arranged, where all the faults are found although one is suspected in the Brunswick site. We don't know how far ground water percolates down and how fast or slow it moves laterally down from recharge zones. We don't know if there are contained aquifers, perched water. Where does the underground water actually flow? Considering the loss of wells in North San Juan's recent gold mining experience, the drilling unexpectedly hit a fault and caused the water to flow differently ruining wells. These dry and/or contaminated wells were a mile from the site. Are we willing to take the chance? I am not, my neighbors and I depend on the water in the ground and from our wells. The loss of water/ damage to

wells/ and shift in how the water flows underground probably won't be exclusive to the Brunswick site. The change in water flow could affect portions of the 2585 acres in the mineral boundary. What happens if the ground water in the areas surrounded by the mineral boundary but not owned by RISE is negatively impacted? What happens if the impact is outside the mineral boundaries? Are these businesses and property owners just out of luck?

IMWA article stated, "Often the wells drainage provokes a significant drawdown of the water table over large areas, producing significant changes on the natural hydrologic balance that can oblige to modify the land usage" (Underground Mining Drainage, State of the Art. IMWA Proceedings, p. 96). Dewatering the mine, draining the water level from 260' bgs to 3200'bgs is the same as "wells drainage" and will act in the same way as the described.

I imagine that the top of the water "table" in the 2585-acre site is mostly slanting downward as water enters higher up in the watershed and due to hydraulic pressure (percolates) and gravity moves through pores, along faults and moves generally from high to lower levels. It's an *equilibrium* as a certain amount of water soaks in from the melting snowpack and it percolates down though the soils and underground matrix and eventually enters streams and springs coming to the surface in a similar amount (with seasonal fluctuations). In 2018 EMKO observed seepage into the New Brunswick shaft (pdf page 642) and it ***assumes*** seepage in is equal to the amount leaving the drains. But is this balance going to continue once the tunnels and shaft are emptied as projected for the maintenance dewatering for the life of the mine? On page 4.3-103 (pdf 395) the DEIR states: "*Ground water continually flows into the underground mine. If the water is not pumped out, the water would very quickly flood the lowest tunnels.*" The snowpack will continue to melt and drain into the recharge areas but adding the constant pumping out water in the shaft and in the tunnels in addition to the current natural amounts of water drifting downward, equilibrium no longer exists. As excessive amounts of water are pumped out then the water table will be drawn down. The drawdown impacting wells along Bennett have already been identified as at risk. But what about wells that are outside this small area? As water table drops in the assemblage of mixed layers, fractured rocks and soil and pebble mixes, different areas can be affected differently. The shallower the well, probably the more affected change due to the underground water flow and/or the water table vertical height is lowered. Table 4.8-10 (pdf page 679) indicates that 99% of the ground water inflow into the mine is estimated to occur within 600 feet of the ground surface. My well ends before 600 feet below the surface. Will people like me lose their water source because as the mine water is pumped, groundwater will more easily flows into the dewatered tunnels to be pumped out quicker Dewatering is a risk to changing the ground water supply, lowering the water table and damaging the watershed.

**Ind 555-11**

The estimated amount of water in the current mine is about 385 million gallons (pdf page 665). The initial dewatering will drop the water in the shaft (and surrounding areas) from 250 feet bgs (below ground level) in the shaft to 3200 ft bgs. As this water is pumped out, more groundwater will flow in and collect to be pumped out. As the tunnels and shaft are pumped out, water from the upper levels will continue to flow in but deep waters stored in the base of water table are also drawn into the emptying mine workings to be pumped out and lowering the water table even more. Consider that historically the rate of dewatering the Brunswick Mine was 720 gpm (gallons per minute) to 800 gpm over 90 days. Rise wants to pump 3,600,000 gallons per day at the rate of 2500 gpm. What effect will this have on how the ground water flows through the surround land and enters the mine openings? What is the effect on the water table height not only under the Brunswick site but throughout the 2585-acre mineral boundary

**Ind 555-12**

area? How will this rapid removal affect the rebound/refill rate of the soils close to the underground mine workings and throughout the mineral boundary? How will this affect the dynamics of the cone of depression that is created when the water leaves existing higher-pressure areas in the underground surfaces and then creates lower-pressure areas as it flows out of the mine workings? Will the flow increase in speed as now there isn't any water in the shaft and tunnels to push back on entering water? There is no longer an equilibrium of water in and out of the mine workings? The North San Juan mining disaster created an ever-widening cone of depression and drew more and more water into it and away from the natural pathways. Many lost their wells. Are we willing to risk this?

**Ind 555-13**

Seismic stability in tunnels is a concern cited in the Geology, Soils, Mineral Resources section 1.8 (pdf page 43). Significant risk comes from the impact of blasting, creating new fissures and cracks in the walls of the new and old tunnels. Groundwater flowing into the mine may find new and different drainage pathways leaving former areas with less water available. The blasting and removal of rock may open new pathways flooding the mine and draining surrounding upper ground water levels in the watershed, not just under the Brunswick Industrial Site. What provisions have been developed for this loss of groundwater below the ground for wells and above the ground for habitat?

**Ind 555-14**

With the mining in this area since 1860s, there has been no observable movement of any faults (4.6-4) pdf page 533) but with the new blasting that will occur with reopening, will faults be shifted? DEIR (pdf page 534) states there is an *inferred* fault within 600 ft of shaft. How long is it? How deep is it? what type of fault is it? Does it affect or direct the underground water flow? If it "slips", what will be the range of changes in subsidence and in underground water flow? There are so many un-answered questions not asked or addressed in the report. The DEIR reports that it shows no recent movement. But with the pressure of the ground water removed as the dewatering drops the water table about 2500 feet will it continue to be stable? Will it be stable as blasting begins even at deep depths? There is not any mention of how to monitor this potentially dangerous situation.

**Ind 555-15**

Because of the complex geologic nature of this area, conceptual models are difficult to use. It is necessary to have a "full understanding of the lithological, structural, metalgenetic and hydrogeologic information (IMWA proceedings, p. 109). As I read the first EIR and now the second DEIR, I find that often the data is **limited** historic data or limited representations of focused recently collected data that often doesn't include much of the 2585-acre site. The Predictive simulations of Underground mine workings only estimate what might happen for the next 25 years (pdf page 661). What about the next 55 years? How much of the simulations are rough estimates from other mining experiences and how much is best guess because what is exactly structures and formations underground is only a guess. I wonder how my neighborhood will look with water table much lower; people drilling for wells much deeper but finding that they are now in the 1000' deep drilling areas that are contaminated by blasting residual materials that are miscible in water.

**Ind 555-16**

Why did Balance Hydrologic Inc test discharge samples for water quality only 3 times – Sept 2019, Dec 2019 and Jan 2020 and EMKO on Dec 2018 and 2019? (4.8-39 pdf page 661) Why so few? Why not have tests indicating year-round results over at least several years with seasonal variation? IMWA proceedings state, "to implement confident mathematical models, it is extremely important to have sufficient hydrogeologic data and hydraulic parameters" (page 109).

**Ind 555-17**

Similarly Graph 4.8.5 (page 4.8-13 pdf page 636) is a comparison of New Brunswick shaft levels with rainfall. Having taught science and the importance of data as evidence I wondered why there is so little data?

Only 2 rainfalls in such a short data collection period? I wanted to know if the ground had been dried out at the end of the long summer causing much of the rainwater to seep in and fill the pores or if the ground had been saturated so that the rainwater flowed into the shaft? Is this lack of details and clarity about the data used typical of RISE and its "experts"? Is there enough data collected and is collected using high standard in collection and interpreting the data? Even if it doesn't necessarily support RISE's point of view?

For all these reasons and more, the dismissal of the concern about decreasing ground water supplies or interfering substantially with ground water recharge with mitigation is less than significant is inappropriate (4.8.2, page 4.8-54 pdf page 677). Given the mine's operation probably won't disturb recharge because that happens higher up with snowpack melt and seasonal rains. But decreasing ground water across the entire 2585-acre site is complicated and its cumulative. The concern is how much will be removed and how the water table height will be impact. The concern centers on having less well productivity to total loss of the well to contamination. These aren't even addressed by Rise. Their focus highlighted that the project is not in a "basin" that's identified by DWR so continual quality groundwater to neighbors isn't an issue. Reducing soil groundwater is not addressed either. With a dropping water table, soil moisture that plants depend on is likely to be drawn down causing plants to be negatively impacted. Stressed trees are more likely to develop insect infestations like Bark Beetle. Stressed and dead vegetation significantly add to the risk of wildfire.

**Ind 555-18**

The water related issues are enough to not approve the re-opening of the mine. The kind of environmental damage that dewatering could cause is not "fixable". It takes water out of the surrounding area and risks draining wells and drying out the natural environment causing vegetation and trees to be stressed and die. This area is already high risk for wildfire, this would increase that risk substantially.

If your vote is to downplay these risks and more, then the EIR and authorizations concerning water should include:

- The entire 2585-acre site should be the minimum that is tested and monitored at Rise's expense for water quality, recharge, well production and ground water heights.
- Action Plans should be indicated if there are negative impacts in areas that are surrounded by or adjoin the mineral boundary as well.
- Fully assess the underground structure of the 2585-acre site to better determine the flow of ground water and how dewatering will impact the habitat and wells.
- State what damages will cause the mining authorization to be halted and be revoked permanently.
- Collection of more baseline data is needed for at least 1 to 3-year prior to granting permission to reopen so seasonal changes can be verified and more locally collected data can be collected and analyzed. This includes monitoring all wells throughout the entire mineral boundary for productivity, water quality and water table height of well water; soil moisture as it impacts vegetation in seasonal changes; discharge to the Wolf Creek watershed system including close to the drains openings and intervals downstream. This is not a complete list of the data that should be collected and reviewed.
- Cause Rise to set aside sufficient financial resources to **truly** pay for damaged wells and environmental cleanup should there be a negative impact due to mining. Bankruptcy would not

**Ind 555-19**

be an option should a disaster occur nor would selling the mine to another entity. Financial resources would have to continue beyond the 80-year proposed life of the mine operation.

- Instruct the County to seek out and hire hydrology related experts to install all types of monitoring equipment (such as gaging monitors, piezometers, thermologs, water quality assessments at drains, etc) across entire site, develop an action plan for routine monitoring- daily, weekly, monthly depending on instrument; and develop an action plan for shutting down part or all the mining process should significant changes be identified. Although the County hires and directs this department, Rise is responsible for all associated costs.

**Ind 555-20**

I think the adage: Hope for the best and plan for the worst is critical to regional environment is to survive should the re-opening be somehow approved. But this DEIR is inadequate. It's a case of hope for the best and don't plan for anything else.

Respectfully,

Mary Ann Coleman
14063 Greenhorn
Grass Valley, CA 95945

## INDIVIDUAL LETTER 555: MARY COLEMAN

### Response to Comment Ind 555-1

The commenter states that the Well Mitigation Plan is inadequate and is concerned about well production and groundwater quality. Please see Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

The commenter's opposition to the project is noted for decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 555-2

The commenter asks what actions would be taken if another significant effect (related to water) was to develop on the Brunswick or Centennial sites or above and below the mineral rights area and what criteria would stop the mine temporarily or permanently. Please see Master Response 7 - Location of Future Mining Areas, Master Response 8 - Mine Waste Characterization, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 32 - Temperature of Mine Water Discharge, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 36 - Flows in South Fork Wolf Creek, and Master Response 3 - Operator Responsibility. The County has authority to enforce all conditions of approval and mitigation measures that are included in the DEIR. In the case of a violation, such as an impact to water wells where the operator failed to immediately replace water supply, as required under Mitigation Measure 4.8-2(b), the County would have authority to force compliance and/or to suspend or revoke the Mine's permits.

### Response to Comment Ind 555-3

As discussed on pages 15-19 of Appendix M, numerous holes must be drilled and blasted sequentially into a void (the free face) in order to fracture rock and create mining excavations. Any blast damage to surround rocks, such as cracks, would be limited to a few feet surrounding the excavation. Therefore, blasting cannot "damage the aquifer" or cause draining of surface water and groundwater.

With regard to groundwater and watershed impacts, please see Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 8 - Mine Waste Characterization, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 32 - Temperature of Mine Water Discharge, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 36 - Flows in South Fork Wolf Creek, and Master Response 16 - Drought and Climate Change.

With regard to fire protection, please see Chapters 4.7, 4.11, 4.13 of the DEIR and Master Response 6 - Wildfire Impacts. The project's emission of greenhouse gasses and incremental contribution to climate change is addressed in Chapter 4.3 of the DEIR.

### Response to Comment Ind 555-4

The commenter refers to pdf page 40, which is Page 1-10 of the DEIR. This page summarizes concerns brought forth in comment letters received during the Notice of Preparation of the DEIR, including potential insect infestations due to stress of local forests. The commenter provides no evidence that mine dewatering would result in stress to local forests which would result in insect infestations. Mine dewatering would not significantly impact groundwater dependent vegetation. Please see Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 555-5

The commenter states that the DEIR does not address all possible impacts that re-opening of the mine might incur, but provides no specifics on what impacts they believe were not analyzed in the DEIR. Please see Responses to Comments Ind 555-3 and 555-4.

## Response to Comment Ind 555-6

The groundwater model considers an area much larger than the mineral rights boundary. As stated on page 13 of Appendix K.3, the groundwater model domain encompasses approximately 2,810 square miles, and the finite-element grid contains 324,448 nodes and 626,386 elements within 31 layers. Please see Appendix K.3 and Figure 4-5 of Appendix K.3 of the DEIR. The model also considers the hydraulic conductivity of regional and local geological units (please see Figure 4-1 of Appendix K.3). In addition, please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

Nonetheless, to address public concerns regarding the scope of future mining within the mineral rights area, the applicant has agreed to an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area (shown on maps A101, A201 and A202), as shown in Appendix A to this Final EIR.

## Response to Comment Ind 555-7

Appendix K.8 of the DEIR provides a map of proposed monitoring well locations. Please see Figure 1 of Appendix K.8. Monitoring wells specially constructed for this purpose are proposed rather than domestic water wells and monitoring includes “real time” gauging equipment and regular water quality sampling. The applicant is required to fund all required well monitoring, which would be conducted by qualified hydrologists. Mitigation Measure 4.8-2(a) requires submission of reports to the Nevada County Environmental Health Department. With regard to the commenter’s request that the area of well monitoring be expanded and that domestic wells be monitored, please see Chapter 4.8 and Appendix K.8 of the DEIR, 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells, inclusive of water level and water quality, within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

## Response to Comment Ind 555-8

The applicant would pay for any required well mitigation under the Well Mitigation Plan, Mitigation Measure 4.8-2(b) of the DEIR, and General Plan Policy 17.12. The Well Mitigation Plan has been modified to clarify the range of actions which would be taken outside of the E. Bennett Road area – Please see Appendix D to this Final EIR. Please also see Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 555-9

The report referenced by the commenter discusses underground coal mines in Spain. Underground mining would not change the permeability of the rock surrounding the mine workings (please see Response to Comment Ind 555-3) and the increased permeability due to the creation of new mining voids is specifically analyzed in the groundwater model and DEIR. Please see Appendix K.3 and Figure 5.1 of Appendix K.3 of the DEIR. Underground mining would not cause "sinkholes", see Master Response 29 - Near Surface Workings.

## Response to Comment Ind 555-10

The Regional Water Board adopted a Water Quality Control Plan, Fifth Edition, for the Sacramento and San Joaquin River Basins (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. The Basin Plan at page 2.3 states that the "…beneficial uses of any specifically identified water body generally apply to its tributary streams." The Basin Plan does not specifically identify beneficial uses for South Fork of Wolf Creek but does identify present and potential uses for the Bear River, to which the South Fork of Wolf Creek and Wolf Creek are tributary. Please see page 4.8-31 of the DEIR. The DEIR considered the beneficial uses for the Bear River with regard to potential impacts to South Fork of Wolf Creek and Wolf Creek.

With regard to the consideration of the regional groundwater flow, please see Response to Comment Ind 555-6. The groundwater model does not assume the underground strata is homogenous. Please see Appendix K.3 of the DEIR and Master Response 14 - Adequacy of Groundwater Model.

With regard to the adequacy of the groundwater model and mitigation, please see Chapter 4.8 and Appendix K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. The mine operator would be responsible for replacing water for impacted water wells even if they are beyond the limit of the mineral rights area, if such impacts are caused by the mine pursuant to Mitigation Measure 4.8-2(b) and General Plan Policy 17.12.

## Response to Comment Ind 555-11

The analysis in the DEIR determined that 7 wells would be impacted by dewatering in the East Bennett Road area, and that other wells throughout the region would not be significantly impacted. With regard to the adequacy of the groundwater model and mitigation please see Chapter 4.8 and Appendix K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment 555-12

The analysis in the DEIR determined that 7 wells would be impacted by dewatering in the East Bennett Road area, and that other wells throughout the region would not be significantly impacted. With regard to the adequacy of the groundwater model and mitigation please see Chapter 4.8 and Appendix K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 555-13

Please see Responses to Comments Ind 555-3 and 555-9. Please also see Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 555-14

The commenter asserts that the DEIR should have evaluated the project's potential to activate local faults and induce seismic activity due to the removal of rock and mine dewatering. However, the magnitude of the mine rock excavation and placement is far smaller than the magnitude of the mass of bedrock underlying the site. The magnitude of the energy released during mining excavations by rock removal and rock placement is much smaller than the magnitude of energy activation required to trigger the release of a local pre-Holocene fault. No analysis was performed nor is necessary, as there is no potential for inducement of seismic activity on these faults from the proposed mining activity. Please see NV5 Memo attached to the Final EIR as Appendix P.

## Response to Comment Ind 555-15

The commenter asserts that the DEIR is flawed because the data used to analyze impacts is limited and a "full understanding" is necessary. However, it can always be argued that more data should be obtained, and the data used for any analysis is by definition "limited" to the scope of that data. In this case, the data used to assess dewatering impacts included historic and current data points, which were peer-reviewed by the County's independent expert and found to be adequate as a basis for the analysis. As stated by California courts, "the need for thorough discussion and analysis is not to be construed unreasonably… to serve as an easy way of defeating projects. Absolute perfection is not required." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d at p. 406.) With regard to the adequacy of the groundwater model and mitigation, please see Chapter 4.8 and Appendix K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 555-16

Please see Master Response 35 - Discharge to South Fork Wolf Creek, with regard to the number of samples taken. Please also see Response to Comment Ind 555-15 regarding the request for more data.

## Response to Comment Ind 555-17

Figure 4.8-5 of the DEIR shows a graph of rainfall for entire water years which aggregates all rainfall events in each water year.

In regard to the adequacy of the groundwater model and mitigation, please see Chapter 4.8 and Appendix K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 555-18

Please see Chapter 4.8 and Appendix K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 16 - Drought and Climate Change, and Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 555-19

Please see Chapter 4.8 and Appendix K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 16 - Drought and Climate Change, and Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 555-20

The commenter generally states the DEIR is inadequate. Responses to specific comments are provided above.

**Individual Letter 556**

**From:** Mary Good <coachspirit@yahoo.com>
**Sent:** Monday, April 4, 2022 9:38 AM
**To:** Idaho MMEIR
**Subject:** I oppose the Idaho-Maryland Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To: Matt Kelley, Senior Planner, Nevada County Planning Department:

**Ind 556-1** I am against reopening the Idaho-Maryland Mine, for a variety of reasons. As a resident who chose to retire to this county especially for it's beauty and tranquility, I am appalled that the County would be considering entering into an agreement with Rise Gold to open the mine.

**Ind 556-2** The history of gold mining has demonstrated that the resulting environmental degradation is not worth the undertaking. This mine poses numerous potential risks to the water table, to our pristine creeks, as well as the ensuing noise and increase in air pollution are alarming to me. The threat to the water table makes no sense during our historic drought.

**Ind 556-3** As many have noted, the allure of our County and its primary economic driver is tourism. People are drawn to our beautiful foothills to escape the noise of the city. But we are not the only foothill community they can choose to visit. I believe an active mine is a risk to this tourist trade.

Please note my opposition to this endeavor. Thank you.

Mary Good
Grass Valley CA

1

## INDIVIDUAL LETTER 556: MARY GOOD

### Response to Comment Ind 556-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2 for the commenter's social concerns. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 556-2

For concerns related to water table and drought, please see Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change. Air pollution is addressed in Chapter 4.3 of the DEIR, and Noise is addressed in Chapter 4.10. Based on the project-specific noise analysis, none of the individual or combined activities associated with long-term operations of the proposed project are projected to generate noise in excess of the applicable noise standards. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 is included out of an abundance of caution to ensure satisfaction with such standards and to reduce the potential for annoyance resulting from the proposed project to the maximum extent feasible. MM 4.10-2 requires implementation of an ongoing comprehensive noise monitoring program under County oversight. If operational noise levels are found to exceed the applicable County noise standards, the County shall require cessation of the mine operations until additional engineering controls can be implemented.

Please see Master Response 35 – Discharge to South Fork Wolf Creek, for concerns related to creeks.

### Response to Comment Ind 556-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 557**

2/25/2022

Nevada County Planning Department

950 Maidu Ave.

Nevada City, CA 95959-8617

**Ind 557-1** Dear Matt Kelley,

I wrote to you in 2020 and my concerns for the proposed re-opening of the Idaho Maryland Mine by Rise Gold have only increased over the last 2 years!

My concerns are as follows:

**Ind 557-2** *The dewatering of the existing underground mine workings and the hydrologic threat that it poses to domestic/residential wells, the impact on existing waterways/creeks, and the negative impact on water quality. The "treated" water entering the south fork of Wolf Creek will contain contaminants.

**Ind 557-3** *The creation of new underground mine workings which will require drilling and blasting that may result in the destabilization of rock fissures that are currently providing water to wells. Not to mention the strong potential for a catastrophic explosion and potential loss of life!

**Ind 557-4** *The processing of gold mineralization and rock will cause noise and air pollution in nearby residential areas.

**Ind 557-5** *The placement of engineered fill that is unstable will require utilization of compaction equipment and that in turn will create more noise pollution and ground disturbance.

**Ind 557-6** *The off-site export of fill will create traffic and noise problems and the idea that the fill will support local construction projects is ludicrous. In addition, during a wildfire evacuation, the residents attempting to leave will be dramatically impacted if they are forced to intermingle with the trucks using the same route!

**Ind 557-7** *The limited construction of a potable water pipeline to residences ONLY on a portion of East Bennet is narrow in scope! The real impact could be damaging for miles. A bond would have to be floated and NID would have to address the water needs-is NID prepared to take this on? Residences could go without water for years!

**Ind 557-8** *Identified wells on the Groundwater Hydrology and Water Quality Analysis Report, particularly Section 4.2.2.3 and Table 4-4 appears narrow in scope. Once again many wells outside the defined areas in this report could be effected and even a slight drawdown of one's well water is significant, especially in drought years.

**Ind 557-9** *The reports use qualifying verbiage such as "predicted, largely confined, average, base flow rates, light-industrial, minimize potential etc." is that verbiage being used meant to minimize Rise Gold's responsibility when damage occurs? The answer is a resounding yes!

**Ind 557-10** *The U.S. Department of Labor Fatality Reports: Mine Safety and Health Administration under Metal/Non-metal Fatalities that in 2020 there were 24 deaths of the 231,185 miners working in that field. That number indicates that there's obvious danger, is Rise Gold ready for fatalities? Many of the deaths were in the haulage process, in other words, driving fatalities!

**Ind 557-11** *Rise Gold requested a variance on building height from the current 45 feet to 165 feet. That will be an eye sore to everyone!

**Ind 557-12** *The damaging effect on home values will be incalculable. Home values will drop overnight by hundreds of thousands of dollar, especially within a 10 mile radius of the mine. Tax revenue will be impacted.

**Ind 557-13** We have lived in Nevada County for 50 years and love this community, however, in speaking with many of our neighbors, between the fire danger and rising home owner insurance costs, Rise Gold will be the last straw that will force us to move.

Please consider your current tax paying residents as your most important asset, not Rise Gold!

Thank you,

Mary Lee

PO Box 782

Cedar Ridge, CA 95924

530-272-1651

## INDIVIDUAL LETTER 557: MARY LEE

### Response to Comment Ind 557-1
This comment is introductory in nature and does not discuss the adequacy of the DEIR. Comment noted.

### Response to Comment Ind 557-2
The commenter is concerned about the dewatering of the Idaho-Maryland Mine and impacts to the South Fork Wolf Creek due to the discharge of treated water. The commenter is referred to Chapter 4.8 of the DEIR (Hydrology and Water Quality), which found that the impact to groundwater wells from the dewatering of the mine to be less than significant after mitigation. (DEIR, p. 4.8-54.) The DEIR also found that any impacts associated with the discharge of treated water into South Fork Wolf Creek would be less than significant after mitigation. (DEIR, p. 4.8-41.) The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 557-3
The commenter states that the creation of new underground mine workings will result in the destabilization of rock fissures providing water to wells and that the underground blasting may result in the loss of life. As discussed on pages 15-19 of Appendix M (Blasting Report), numerous holes must be drilled and blasted sequentially into a void (the free face) in order to fracture rock and create mining excavations. Any blast damage to surround rocks, such as cracks, would be limited to a few feet surrounding the excavation. Therefore, blasting cannot "damage the aquifer" or cause draining of surface water and groundwater.

The hazard from the use of explosives is analyzed in Chapter 4.7 of the DEIR and the impact is less than significant after mitigation. (DEIR, p. 4.7-22.) Specifically, the DEIR found that numerous state and federal regulations have made the use of explosives underground mining projects extremely safe two incidents in the past 25 years. (DEIR, p. 4.7-28.)

### Response to Comment Ind 557-4
The commenter states that the gold mineralization process will cause noise and air pollution but does not provide further information. The DEIR analyzes air quality impacts in Chapter 4.3 and noise impacts in Chapter 4.10. Impacts for both categories (with the exception of one temporary noise related impact) are less than significant after mitigation. For example, mineral processing noise is evaluated on page 4.10-38 of the DEIR and found to be less-than-significant (i.e., below the County's applicable noise standards). The only noise-related impact that would be significant and avoidable would be the installation of the potable water pipeline along East Bennett Road. (DEIR, p. 4.10-30.)

### Response to Comment Ind 557-5
The commenter states that the placement of engineered fill will create noise pollution. The DEIR found that noise from compaction of engineered fill is less than significant after mitigation. (DEIR, p. 4-10-31.) The DEIR also found that disturbance of ground (vegetation communities, wildlife, wetlands) from placement of engineered fill is less than significant after mitigation. (DEIR, p. 4.4-57.)

### Response to Comment Ind 557-6
The commenter states that the hauling of engineered fill will create adverse noise impacts. The commenter also claims that it is "ludicrous" to assume engineered fill will be used for local

construction projects but does not provide additional information. The commenter also states that truck traffic from the project would impede an evacuation during a wildfire. The DEIR found that noise-related impacts resulting from traffic would be less than significant after mitigation. (DEIR, p. 4.10-31, 37.) For example (DEIR, p. 4.10-37,38):

> As part of the Noise and Vibration Analysis prepared by BAC, maximum heavy truck traffic noise levels were assessed for the delivery of engineered fill material to off-site vendors via SR 20/49. The analysis assumed 200 heavy truck trips per day (100 round trips) and employee trips, as previously discussed.
>
> Table 4.10-16 presents the existing ambient noise levels and anticipated existing plus-project traffic noise levels at the nearest residences to each roadway segment, as well as the project-related increase in traffic noise levels and the impact assessment threshold for each roadway segment based on the criteria presented in Table 4.10-5.
>
> As shown in Table 4.10-16, the traffic noise level increase from the transport of fill from the Brunswick Industrial Site to the highway and from employee commutes would not exceed the applicable thresholds of significance at any of the receptors. Therefore, noise-related impacts from off-site heavy truck and employee traffic would be less than significant.

Regarding the assertion that engineered fill would not be used in local construction projects, the commenter is referred to Master Response 11 - Engineered Fill Utilized in Local and Regional Construction Markets. The commenter is also referred to Master Response 5 - Evacuation Zones regarding the impact of the project on evacuations.

## Response to Comment Ind 557-7

The commenter states that the DEIR is too narrow in scope by only proposing NID service to 30 residences on East Bennet Road. The commenter is referred to Master Response 7 - Location of future mining areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 557-8

The commenter states that the DEIR underestimates the number of private wells that could be impacted by the dewatering of the mine, especially in times of drought. The commenter is referred to Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 557-9

The commenter asserts that certain language within the DEIR is intended to insulate the Project Applicant from liability. The DEIR provides an analysis of project impacts in accordance with the requirements of CEQA. The DEIR does not minimize or otherwise insulate the Project Applicant from liability. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

## Response to Comment Ind 557-10

The commenter cites statistics from the federal Mine Safety and Health Administration. This comment does not address the adequacy of the DEIR. Please see Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 557-11

The commenter states that the project will result in a 165-foot structure with adverse aesthetic impacts. The DEIR analyzed aesthetic impacts in Chapter 4.1. The DEIR found that the 165-foot-tall headframe for the Brunswick Site would contribute to a significant and unavoidable aesthetics impact. (DEIR, p. 4.1-15.)

## Response to Comment Ind 557-12

The commenter states that the project will adversely impact home values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 557-13

The commenter states that the fire danger and rising homeowner insurance costs as a result of the project will force longtime residents to leave the area. The DEIR analyzed wildfire impacts in Chapter 4.13 and found the impacts to be less than significant with one impact requiring mitigation (DEIR, p. 4-13.2.) Regarding property values, the commenter is referred to Master Response 2 - Social and Economic Impacts.

Nevada City , Ca 95959

Regards: Idaho Maryland Mine Project

Dear Sirs:

This letter is support of NOT approving the Idaho Maryland Mine Project.

**Ind 558-1** We are such a drought right now and the use any water to towards mining should be nixed right now . Our community is a scary place of many of us losing our wells to lack of water .

**Ind 558-2** The truck loads of waste from this project will impact our roads and well being of the community safety.

If you decide to vote yes for this project to continue , I would be terrified to see the out come the future holds , for this little community who loves where live.

**Ind 558-3** I beg of you to please please do not let this crime happen here in our beautiful community.

With Respect for our future

Mary Padua

marypadua@yahoo.com

## INDIVIDUAL LETTER 558: MARY PADUA

### Response to Comment Ind 558-1

The comment does not address the adequacy of the DEIR. Please see Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 558-2

Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the Project Driveway and Brunswick Road. (DEIR, p. 4.12-91.)

### Response to Comment Ind 558-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 559**

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

April 3, 2022

Dear Mr. Kelley,

I am writing today in opposition of the propsed re-opening of the Idaho Maryland Mine in Grass Valley. I have lived and worked in the county for 20 years including raising my family here. I will address my concerns from the DEIR about the proposed impacts on Air Quality, Section 4.3 in the county.

**Ind 559-1**

My understanding is that the DEIR substantially underestimated emmissions of air pollutants and green house gases from trucks hauling engineered fill from the Bruswick site to offsite locations. Remediation of the Centenial Site was not included in the CEQA analysis for the project, so it cannot be used to understand the impact of daily truck hauls with engineered fill. The haul trucks will have to go to farther away dump sites. The NOx emmissions would be substantailly higher than what is stated in the DEIR and exceed the Northern Sierra Air Quality Managment Districts threshold.

Additionally, the mitigation measures in the DEIR only address the first year during construction of the project, not the entire 80 years of the project. Therefore, longterm mitigation of NOx, ROG, and PM10 is not addressed for the 80 year proposed life of this project.

**Ind 559-2**

The air quality in Western Nevada County is already bad enough at certain times of year with the upwind drift from Sacramento and summer forest fires. Adding any additonal air poluution will wreak furher havoc on the lungs of NevadaC ounty residents.

These two aspects of the degradation of air quality in the county need to be adequately addressed.

Thank you,

Mary Peterson
311 Park Ave.
Nevada City, CA

## INDIVIDUAL LETTER 559: MARY PETERSON

### Response to Comment Ind 559-1

Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 559-2

The comment expresses a general opinion that the mitigation measures only apply to the first year of project construction.

Please see Master Response 19 – NSAQMD Criteria Pollutant Thresholds During Operations.

**Individual Letter 560**

Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Ave. Suite 170
Nevada City, CA. 95959-7902

Dear Matt Kelley,

We are all very lucky to live in Nevada County with its fresh mountain air, beautiful forests and the Yuba River running through it. It is very precious and we need to do all we can to preserve it. I am very concerned about the planned reopening of the Idaho Maryland Mine. The DEIR report that was submitted has several flaws and issues that do not tell the true impact that the mine will have on Grass Valley and Nevada County. How can the mine be approved with all of these mistakes in the report?

**Ind 560-1**

**Ind 560-2** The ground water model has flaws in the initial start point and baseline data assumptions. The entire analysis is thrown off because of this.

**Ind 560-3** There needs to be more management than is in the report regarding dealing with the mine waste. Asbestos is a huge problem, the report needs to state how it will be dealt with.

**Ind 560-4** The report does not include any information on cleaning up the Centennial Mine site. This is the site where the mine waste will be dumped. It is required by the California Environmental Act to be included in the DEIR report.

**Ind 560-5** Missing construction times estimates throw off the entire analysis of noise, traffic and air.

**Ind 560-6** There is a significant threat to the water supply for wells in a much larger area then is in identified in the DEIR report. How could pumping out one million gallons of water a day not have a negative impact on the community? Besides many wells running dry what impact will this have on Wolf Creek and the aquatic life? The change in water temperature and the loss of stream bed and stream bank habitat will have a big impact. The draw down of the local water table has not been studied. What impact will it have on wet land, meadow and forest habitats?

These are just a few of the flaws in the DEIR report. The Idaho Maryland mine's reopening should not be approved for many reasons. This flawed report is one major reason. The county needs to know what the consequences of opening the mine would be. This report does not give an accurate analysis of opening the mine.

**Ind 560-7** A concerned resident of Nevada County,

Mary Lou Swagerty
14296 Tahoe View Drive
Grass Valley, CA 95945
mlswagerty@gmail.com

## INDIVIDUAL LETTER 560: MARY SWAGERTY

### Response to Comment Ind 560-1
The commenter is generally opposed to the project and notes that the DEIR contains numerous mistakes. The commenter's opposition to the project is noted for the decisionmakers. Responses to specific comments are provided below.

### Response to Comment Ind 560-2
The commenter states that the DEIR's Groundwater Model is flawed due to initial start date and inaccurate baseline assumptions but does not provide additional detail. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model.

### Response to Comment Ind 560-3
The commenter states that the DEIR must discuss how asbestos will be managed. The DEIR states that asbestos-related impacts would be less than significant after mitigation. (DEIR p. 4.3-80.) The commenter is referred to Master Response 22 - Conservatism of Asbestos Assumptions, and Master Response 23 - Adequacy of Asbestos Sampling.

### Response to Comment Ind 560-4
The commenter states that the DEIR must include a discussion of the remediation cleanup of the Centennial Industrial Site. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 560-5
The commenter states that missing construction time estimates from the DEIR skew the analysis of several project impacts. The commenter is referred to Master Response 24 - Project Construction Schedule.

### Response to Comment Ind 560-6
The commenter states that project will adversely impact groundwater wells in areas beyond those identified in the DEIR, that the discharge of treated water will impact aquatic resources, and that discharge will affect the temperature of surface water. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 36 - Flows in South Fork Wolf Creek, and Master Response 33 - Groundwater Dependent Vegetation. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Ind 560-7
The commenter states that the project should not be approved. The commenter's opposition to the project is noted for decision makers. The Commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Planning Commission and Board,

I am a real estate broker as well as a lawyer.

**Ind 562-1** The application at issue is an 80- year plan to mine gold within claimed mineral boundary rights. Yet, the DEIR does not address what happens to the neighborhoods and commercial developments within those alleged and claimed rights if they are explored by the mining company.

So, the picture would be mining under developed commercial and residential neighborhoods since the mid 20th Century which may even involve the airport and Dignity Health.

How many buyers do you think would buy a home or business with 365 days per year 24/7 gold mining going on under the property.

**Ind 562-2** Can you see a fire insurer insuring property with abnormally dangerous activity and product beneath it? I think the insurance risks are insurmountable. Consider the Colfax fire of last year. Just having a nearby fire threat to such an operation would need to consider expanding the scope of community evacuations.

**Ind 562-3** We live in a densely populated area where nearly 1/3 of the people in the County reside as between the 3 communities of Penn Valley, Grass Valley, and Nevada City. The success of this mine will change the character of the Brunswick basis and displace neighborhoods as we know it and in any event reduce the marketability, insurability and value of property.

Right now, Nevada County enjoys good revenues from real estate activity. The 2020-2021 budget for the county expected growth to continue from these revenues. If you put this 80 year mine in place, I that that growth will likely stop and likely reverse itself as the character of a successful mining operation takes over.

*Maryanne Murphy, Esq.*
Nevada City, CA 95959
direct (408) 921-2338

Sent with ProtonMail secure email.

## INDIVIDUAL LETTER 562: MARYANNE MURPHY

### Response to Comment Ind 562-1

The commenter asserts that the DEIR does not address what happens to the land uses within the mineral rights zone, but does not provide specific examples that would allow for a detailed response.

Please see Master Response 7 – Location of Future Mining Areas.

### Response to Comment Ind 562-2

The comment does not address the adequacy of the DEIR. Please see Master Responses 5 and 6.

### Response to Comment Ind 562-3

The comment does not address the adequacy of the DEIR. Property values is a concern outside the scope of CEQA - please see Master Responses 1 and 2. The commenter provides no evidence to support the assertion that the project will displace neighborhoods. Currently, no residences are located on the Brunswick and Centennial Industrial Sites, so direct displacement would not result from the project. It is otherwise speculative to conclude that the project's impacts to the physical environment would indirectly displace neighborhoods.

From: maryannemurphyesq<themislaw@protonmail.com>
Date: On Thu, Mar 17, 2022 at 1:11 PM
Subject: Fwd: Public Comment: Planning Commission -Special Meeting for Nevada County 3/24/2022 Re: Application of RiseGold to Reopen the Idaho Maryland Mine
To: Planning <Planning@co.nevada.ca.us>
Cc: Matt Kelley <Matt.Kelley@co.nevada.ca.us>

Dear Planning Commission:

As a homeowner in Nevada County, I request a review of the status of RiseGold's mineral rights, notice under RiseGold's Plan ( hereinafter "Plan), and a review of the County General Plan before any further granting of activity on RiseGold property can be considered or provided. The granting of activity which RiseGold proposes for 80 years is a serious exercise of the County's police power over the lives and assets of its property owners should a conditional use permit be granted to it in order to operate its mine.

**Ind 563-1**

It is my position that the granting of a heavy industrial conditional use permit or any past permit, if any, to Rise Gold may have been in error, under California and or US law. In addition, given the issue of surface property rights versus mineral rights as explained below, the notice of Plan is insufficient on this basis alone and should have been forwarded to each property owner within the claimed mineral boundary rights under the Plan especially in light of the fact that RiseGold seeks an 80 year permit. Sufficient notice would then be required to allow a landowner to take steps consistent with its rights which may not just involve a claim for abandonment of mineral rights.

I believe that the owner of the Mine may have abandoned any mineral rights and transferred nothing to RiseGold. I base this position in part on the fact that the mine has been closed since the mid 20th century and on the overwhelming development of our area since with anything but gold mining under the County's General plan. **A thorough legal review of RiseGold's deed and filings by previous owners would be necessary at a minimum to determine if mineral rights exist.**

Also, a thorough legal review of the rights of property owners as they relate to the alleged mineral boundary rights of the mine would need consideration, which of necessity would include confirmation of the mineral boundary rights by survey.

As you may know, US laws regulating mining and mineral rights typically prohibit the mineral owner from damaging or interfering with the use of any homes or other improvements on the land when extracting minerals. This is in part to protect the homeowner from development of mining activity in densely populated areas. See generally, USC 43 section 299. Has anyone also looked at California laws in this context which I think may be similar.

**Ind 563-2**

Thank you for considering this email, I appreciate a response to my questions as follows:

**Ind 563-3** 1. Does RiseGold have mineral rights for the activity proposed under its plan?
**Ind 563-4** 2. Is the proposed RiseGold plan ( hereinafter " Plan") and its land use and activity appropriate under the County general plan?
**Ind 563-5** 3. Is the proposed Plan and its land use and activity appropriate under the County general plan or other County regulations in the densely populated, agricultural, residential, and commercial areas of Grass Valley and Nevada City?
**Ind 563-6** 4. Were property owners who are located in the proposed mineral rights under the Plan sufficiently and/or adequately notified of the proposed RiseGold Plan?
**Ind 563-7** 5. Does the proposed mineral boundary rights under the Plan in fact reflect RiseGold's actual mineral boundary rights?
6. Under California and/or US law, do the property owners within the proposed mineral boundary rights have a potential or actual claim for abandonment of the mineral rights under the Plan?
7. **Under California and/or US law, do the property owners within the proposed mineral boundary rights prohibit the mineral owner from damaging or interfering with the use of any homes or other improvements on the land when extracting minerals?**

**Ind 563-8**

Thank you for your consideration

Maryanne Murphy, Esq.
4089212339
Nevada city, CA

https://www.easylawlookup.com/California-Law/Civil-Code/pg-102/_easylookup.blp?data=CIVILCODE&sidfw=&site=EASY&location=78232&spon=&stype=P&sterm=+&smode=AND&sexact=ON&pgno=102&par=2219&dlevel=5#par_2219

I am also aware of the following summary under mineral property rights by another lawyer.

**Ind 563-9**

## Regaining Lost Mineral Rights

In California, the law allows the owner of real property to recover lost mineral rights provided that the mineral right is dormant for at least 20 years. A dormant mineral right is one where no exploration, mining, drilling or other operations are present on the property. There must also be no property taxes assessed or paid on the separate mineral right and no notice of intent to keep the mineral right filed by the owner in the past 20 years.

## INDIVIDUAL LETTER 563: MARYANNE MURPHY

### Response to Comment Ind 563-1
This comment is similar to Comment Ind 565-1. Please see Response to Comment Ind 565-1.

### Response to Comment Ind 563-2
Rise Gold purchased the mineral rights from the previous owner. Property ownership issues are not considered an environmental issue under CEQA. Please see Responses to Comments Ind 565-1 and Ind 565-2.

### Response to Comment Ind 563-3
Land use impacts were addressed in Chapter 4.9 of the DEIR, which concluded that the project is generally consistent with the County General Plan. In addition, County staff will conduct a detailed General Plan consistency review as part of the staff report to the decisionmakers. General Plan consistency is ultimately within the purview of the Nevada County Board of Supervisors.

### Response to Comment Ind 563-4
Land use impacts were addressed in Chapter 4.9 of the DEIR, which concluded that the project is generally consistent with the County General Plan, including consideration of different nearby land uses and densities.

### Response to Comment Ind 563-5
The County provided notice to property owners and the community consistent with applicable local and state law.

### Response to Comment Ind 563-6
The mineral rights boundary as presented in the DEIR corresponds to the mineral rights owned by Rise, as disclosed in the deeds available for public review in the Official Records of Nevada County. Property ownership issues are not considered an environmental issue under CEQA.

### Response to Comment Ind 563-7
Please see Response to Comment Ind 565-2.

### Response to Comment Ind 563-8
In California, where mineral rights are severed from surface ownership, the mineral estate is considered the “dominant” estate and may make use of the property as reasonably incident for extraction of minerals. (*Bourdieu v. Seaboard Oil Corp. of Delaware* (1940) 38 Cal.App.2d 11, 17.) However, such use of the surface estate is subject to reasonable accommodation of surface uses. Nonetheless, property ownership issues are not considered an environmental issue under CEQA.

### Response to Comment Ind 563-9

## IDAHO-MARYLAND MINE PROJECT
## DRAFT EIR COMMENT FORM

To document the author of comments received, please provide the following information. Thank you.

Name: MARYANNE MURPHY

Address: 13268 Woodstock Drive, Nevada City, CA 95959

Organization (if applicable): member, Nevada County Association of Realtors

Please provide us with your written comments on the Idaho-Maryland Mine Draft EIR by **5:00 PM, April 4, 2022**. Comments may be placed in the comment box located in the back of the Board of Supervisors Chambers during the Special Public Meeting of the Nevada County Planning Commission. Written comments may also be submitted (email or hardcopy) to the address below:

**Matt Kelley, Senior Planner**
**Nevada County Planning Department**
**950 Maidu Avenue**
**Nevada City, CA 95959-8617**
**Idaho.MMEIR@co.nevada.ca.us**

**Ind 564-1**

The DEIR does not address what happens to the properties within the mineral rights boundary and to the impact to quality of air, water, and land, as well as a fire hazard. If Rise Gold explores it's mineral rights instead it refers generally to no divided responsibility. So the picture would be to examine the effects from mining under the developed and existing commercial and residential properties that may even include the airport - Dignity Health.

**Ind 564-2**

As to fire specifically, the DEIR seems to say that no very high fire risk exists in the plan. But we know that the plan includes blasting and other heavy industrial products that have been assessed for storage, use or risk. For example the Cottrell Trucking advancing down Highway 174 - last year I heard fire heard hit the mine - what could be the potential devastation to the area from storing dynamite with premises.

**Subject:** RiseGold's application re: notice of and permitting process

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Board, Mr. Kelly and Ms. Hall:

It is my position that the granting of a heavy industrial permit or any permit to RiseGold may have been in error under California and or US law. In addition, given the issue of surface property rights versus mineral rights as explained below, the notice of plan is insufficient on this basis alone and should have been forwarded to each land owner within the claimed mineral boundary rights of RiseGold especially in light of the fact that RiseGold seeks an 80 year permit. Sufficient notice was required to allow a landowner to take steps consistent with its rights.

I believe that the owner of the Mine may have abandoned any mineral rights and transferred nothing to RiseGold. I base this position in part on the fact that the mine has been closed since the mid 20th century and on the development of this area with anything but gold mining under the County's General plan.

A thorough legal review of the deed and filings of previous owners would be necessary at a minimum to determine if mineral rights exist.

**Ind 565-1**

Also, a thorough legal review of the rights of residents and businesses and other habitants as they relate to the alleged mineral boundary rights of the mine would need consideration, which of necessity would include confirmation of the mineral boundary rights by survey.

As you may know, US laws regulating mining and mineral rights regulating mining and mineral rights typically prohibit the mineral owner from damaging or interfering with the use of any homes or other improvements on the land when extracting minerals. This is in part to protect the homeowner from development from mining activity in densely populated areas. See generally, USC 43 section 299. Has anyone also looked at California laws in this context which I think may be similar.

As a homeowner in Nevada County, I think these answers should be secured before any further granting of activity on RiseGold property can be considered or provided. The granting of activity such as this for 80 years is a serious exercise of the County's police power over the lives and assets of its residents.

Thank you for considering this email. If there is any information that you have in response to my specific issues above, I would appreciate the same.

Maryanne Murphy, Esq.

## INDIVIDUAL LETTER 565: MARYANNE MURPHY

### Response to Comment Ind 565-1

The commenter asserts that the mineral rights owned by Rise may have been abandoned but provides no evidence or legal citation for that assertion. Property ownership issues are not considered environmental impacts under CEQA. The commenter cites United States Code, Title 43, Section 299 for the proposition that federal law limits the proposed project's operations; however, this statute relates to a reservation of coal rights on land owned by the federal government, and mining operations on federal lands subject to unpatented mining claims. This statute is not applicable to the project, because the project sites consist of private mineral estates on privately held land, and do not involve federally owned land. Notice has been provided to the community consistent with CEQA and applicable state and local laws. The commenter's opposition to the project is noted for the decisionmaker's consideration.

### Response to Comment Ind 565-2

The commenter implies that the mineral rights are "dormant" under the California Dormant Mineral Right Act and are therefore invalid. However, under the California Dormant Mineral Right Act, mineral rights are only considered "dormant" when there has not been mining activity, a separate tax assessment, or a transfer of those rights in the last 20 years. (see California Civil Code Section 883.220.) The mineral rights were transferred to Rise within the last 20 years; thus, the minerals are definitionally not "dormant." Moreover, mineral rights cannot be extinguished under the California Dormant Mineral Right Act unless a court action is filed by the surface owner, such that mineral rights do not automatically extinguish. (see California Civil Code Section 883.221 through 883.270.) Finally, even where the mineral rights to a property are indeed "dormant" and an action is filed by the surface owner, California law permits the mineral rights owner to simply record a notice evidencing its intent to preserve the mineral right, which results in dismissal of the case. (see California Civil Code Section 883.250.) In this case, Rise's mineral rights are not dormant and Rise intends to preserve its mineral rights.

CIVIL CODE - CIV

DIVISION 2. PROPERTY [654 - 1422] ( Heading of Division 2 amended by Stats. 1988, Ch. 160, Sec. 13. )

PART 2. REAL OR IMMOVABLE PROPERTY [[755.] - 945.5] ( Part 2 enacted 1872. )

TITLE 5. MARKETABLE RECORD TITLE [880.020 - 887.090] ( Title 5 added by Stats. 1982, Ch. 1268, Sec. 1. )

CHAPTER 3. Mineral Rights [883.110 - 883.270] ( Chapter 3 added by Stats. 1984, Ch. 240, Sec. 2. )

ARTICLE 2. Termination of Dormant Mineral Right [883.210 - 883.270] ( Article 2 added by Stats. 1984, Ch. 240, Sec. 2. )

883.210. The owner of real property subject to a mineral right may bring an action to terminate the mineral right pursuant to this article if the mineral right is dormant.

*(Added by Stats. 1984, Ch. 240, Sec. 2.)*

883.220. For the purpose of this article, a mineral right is dormant if all of the following conditions are satisfied for a period of 20 years immediately preceding commencement of the action to terminate the mineral right:

(a) There is no production of the minerals and no exploration, drilling, mining, development, or other operations that affect the minerals, whether on or below the surface of the real property or on other property, whether or not unitized or pooled with the real property.

(b) No separate property tax assessment is made of the mineral right or, if made, no taxes are paid on the assessment.

(c) No instrument creating, reserving, transferring, or otherwise evidencing the mineral right is recorded.

*(Added by Stats. 1984, Ch. 240, Sec. 2.)*

883.230. (a) An owner of a mineral right may at any time record a notice of intent to preserve the mineral right.

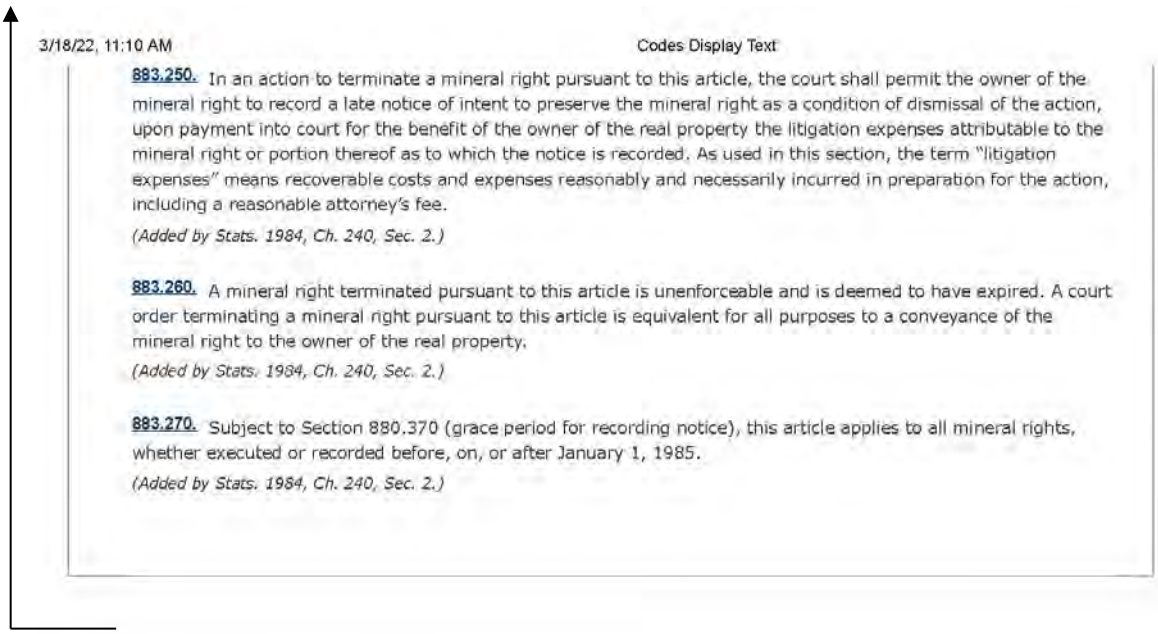
(b) In lieu of the statement of the character of the interest claimed and the record location of the documents creating or evidencing the mineral rights claimed as otherwise required by paragraph (2) of subdivision (b) of Section 880.330 and in lieu of the legal description of the real property in which the interest is claimed as otherwise required by paragraph (3) of subdivision (b) of Section 880.330 and notwithstanding the provisions of Section 880.340 or any other provision in this title, a notice of intent to preserve a mineral right may refer generally and without specificity to any or all mineral rights claimed by claimant in any real property situated in the county.

(c) A mineral right is not dormant for the purpose of this article if:

(1) A notice of intent to preserve the mineral right is recorded within 20 years immediately preceding commencement of the action to terminate the mineral right.

(2) A notice of intent to preserve the mineral right is recorded pursuant to Section 883.250 after commencement of the action to terminate the mineral right.

*(Added by Stats. 1984, Ch. 240, Sec. 2.)*



883.240. (a) An action to terminate a mineral right pursuant to this article shall be brought in the superior court of the county in which the real property subject to the mineral right is located.

(b) The action shall be brought in the same manner and shall be subject to the same procedure as an action to quiet title pursuant to Chapter 4 (commencing with Section 760.010) of Title 10 of Part 2 of the Code of Civil Procedure, to the extent applicable.

*(Added by Stats. 1984, Ch. 240, Sec. 2.)*

https://leginfo.legislature.ca.gov/faces/codes_displayText.xhtml?lawCode=CIV&division=2.&title=5.&part=2.&chapter=3.&article=2. 1/2

**Ind 567-1**

3/18/22, 11:10 AM Codes Display Text

**883.250.** In an action to terminate a mineral right pursuant to this article, the court shall permit the owner of the mineral right to record a late notice of intent to preserve the mineral right as a condition of dismissal of the action, upon payment into court for the benefit of the owner of the real property the litigation expenses attributable to the mineral right or portion thereof as to which the notice is recorded. As used in this section, the term "litigation expenses" means recoverable costs and expenses reasonably and necessarily incurred in preparation for the action, including a reasonable attorney's fee.

*(Added by Stats. 1984, Ch. 240, Sec. 2.)*

**883.260.** A mineral right terminated pursuant to this article is unenforceable and is deemed to have expired. A court order terminating a mineral right pursuant to this article is equivalent for all purposes to a conveyance of the mineral right to the owner of the real property.

*(Added by Stats. 1984, Ch. 240, Sec. 2.)*

**883.270.** Subject to Section 880.370 (grace period for recording notice), this article applies to all mineral rights, whether executed or recorded before, on, or after January 1, 1985.

*(Added by Stats. 1984, Ch. 240, Sec. 2.)*

California Laws | Civil Code
EFFECT OF THE 1872 CODES (23-23.6)
DIVISION 2. PROPERTY

pg. 102

882.030. Expiration of the lien of a mortgage, deed of trust, or other security interest pursuant to this chapter or any other statute renders the lien unenforceable by any means commenced or asserted thereafter and is equivalent for all purposes to a certificate of satisfaction, reconveyance, release, or other discharge of the security interest, and execution and recording of a certificate of satisfaction, reconveyance, release, or other discharge is not necessary to terminate or evidence the termination of the security interest. Nothing in this section precludes execution and recording at any time of a certificate of satisfaction, reconveyance, release, or other discharge. (2215)

882.040. (a) Subject to Section 880.370 (grace period for recording notice) and except as otherwise provided in this section, this chapter applies on the operative date to all mortgages, deeds of trust, and other instruments that create a security interest in real property to secure a debt or other obligation, whether executed or recorded before, on, or after the operative date. (2216)

(b) This chapter shall not cause the lien of a mortgage, deed of trust, or other security interest in real property to expire or become unenforceable before the passage of five years after the operative date of this chapter. (2217)

CHAPTER 3. MINERAL RIGHTS (2218) (Text)

Article 1. General Provisions (883.110-883.140) (2219) (Text)

883.110. As used in this chapter, "mineral right" means an interest in minerals, regardless of character, whether fugacious or nonfugacious, organic or inorganic, that is created by grant or reservation, regardless of form, whether a fee or lesser interest, mineral, royalty, or leasehold, absolute or fractional, corporeal or incorporeal, and includes express or implied appurtenant surface rights. (2220)

883.120. (a) This chapter does not apply to a mineral right reserved to the United States (whether in a patent, pursuant to federal law, or otherwise) or to an oil or gas lease, mining claim, or other mineral right of a person entitled pursuant thereto, to the extent provided in Section 880.240. (2221)

(b) This chapter does not apply to a mineral right of the state or a local public entity, or of any other person, to the extent provided in Section 880.240. (2222)

883.130. Nothing in this chapter limits or affects the common law governing abandonment of a mineral right or any other procedure provided by statute for clearing an abandoned mineral right from title to real property. (2223)

883.140. (a) As used in this section: (2224)

(1) "Lessee" includes an assignee or other successor in interest of the lessee. (2225)

(2) "Lessor" includes a successor in interest or heir or grantee of the lessor. (2226)

(b) If the term of a mineral right lease has expired or a mineral right lease has been abandoned by the lessee, the lessee shall, within 30 days after demand therefor by the lessor, execute, acknowledge, and deliver, or cause to be recorded, a deed quitclaiming all interest in and to the mineral rights covered by the lease. If the expiration or abandonment covers less than the entire interest of the lessee, the lessee shall execute, acknowledge, and deliver an appropriate instrument or notice of surrender or termination that covers the interest that has expired or been abandoned. (2227)

(c) If the lessee fails to comply with the requirements of this section, the lessee is liable for all damages sustained by the lessor as a result of the failure, including, but not limited to, court costs and reasonable attorney's fees in an action to clear title to the lessor's interest. The lessee shall also forfeit to the lessor the sum of one hundred fifty dollars ($150). (2228)

(d) Nothing in this section makes a quitclaim deed or other instrument or notice of surrender or termination, or a demand therefor, a condition precedent to an action to clear title to the lessor's interest. (2229)

**Our Mission Objective**

Our mission is to provide citizens free access to the laws and codes of their state utilizing a unique search engine that matches clients with qualified legal professionals who can help with specific issues.

Our goal is to do this in a manner that promotes open government and freedom of information, while providing attorneys with valuable tools to connect with qualified prospects in need of professional services.

**Ignorance Is No Excuse Your Right To Know The Law**

All citizens have a right to have access to the laws that govern them. Citizen awareness and participation in government is fundamental to ensuring a sound democracy.

Although unfettered access to the law is a fundamental right to all citizens, there is **no substitute for experienced legal counsel.**

We do not recommend self-representation. We do, however, recognize that in an age where people routinely research legal matters online using everything from a smartphone to their xbox, both attorneys and clients alike can benefit from this resource.

3/18/22, 11:10 AM California Law - Civil Code - (pg. 102) Chapter 3. Mineral Rights

**Article 2. Termination of Dormant Mineral Right (883.210-883.270) (2230) (Text)**

883.210. The owner of real property subject to a mineral right may bring an action to terminate the mineral right pursuant to this article if the mineral right is dormant. (2231)

883.220. For the purpose of this article, a mineral right is dormant if all of the following conditions are satisfied for a period of 20 years immediately preceding commencement of the action to terminate the mineral right: (2232)

(a) There is no production of the minerals and no exploration, drilling, mining, development, or other operations that affect the minerals, whether on or below the surface of the real property or on other property, whether or not unitized or pooled with the real property. (2233)

(b) No separate property tax assessment is made of the mineral right or, if made, no taxes are paid on the assessment. (2234)

(c) No instrument creating, reserving, transferring, or otherwise evidencing the mineral right is recorded. (2235)

883.230. (a) An owner of a mineral right may at any time record a notice of intent to preserve the mineral right. (2236)

(b) In lieu of the statement of the character of the interest claimed and the record location of the documents creating or evidencing the mineral rights claimed as otherwise required by paragraph (2) of subdivision (b) of Section 880.330 and in lieu of the legal description of the real property in which the interest is claimed as otherwise required by paragraph (3) of subdivision (b) of Section 880.330 and notwithstanding the provisions of Section 880.340 or any other provision in this title, a notice of intent to preserve a mineral right may refer generally and without specificity to any or all mineral rights claimed by claimant in any real property situated in the county. (2237)

(c) A mineral right is not dormant for the purpose of this article if: (2238)

(1) A notice of intent to preserve the mineral right is recorded within 20 years immediately preceding commencement of the action to terminate the mineral right. (2239)

(2) A notice of intent to preserve the mineral right is recorded pursuant to Section 883.250 after commencement of the action to terminate the mineral right. (2240)

## INDIVIDUAL LETTER 568: MARYANNE MURPHY

### Response to Comment Ind 568-1

The comment is an attachment related to Individual Letter 566. Please see comments and responses to Individual Letter 566.

**Individual Letter 569**

**From:** maryannemurphyesq
**To:** BOS Public Comment
**Cc:** Heidi Hall; Matt Kelley
**Subject:** RiseGolds claim of making $122,000 per year.
**Date:** Tuesday, March 1, 2022 11:37:58 AM

Dist 1

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Recently, RiseGold sent out a mailing to the community claiming wages in the amount of $ 122,000 per year as Miner among other things.

We don't know who would make those wages and when.

The wage position it took is inflated. The information below is consistent with that of the Department of Labor Statistics.

Also, If you were to research " mining jobs" in Nevada where mining is in full force by Neumont and others you would find 400 jobs available for the entire State in mining in general.

So I don't know when or what jobs it is talking about creating thru Rise Gold and for how long as it is an exploratory company only. It's stated number of jobs available also appears to be inflated.

Anyway, here is the wage report that I mentioned. Located at comparably.com. Also check out information at bls.gov.

**Ind 569-1**

**Salary Ranges for Gold Miners**

The salaries of Gold Miners in the US range from $30,880 to $70,360 , with a median salary of $48,550 . The middle 60% of Gold Miners makes $48,550, with the top 80% making $70,360.

**How much tax will you have to pay as a Gold Miner**

For an individual filer in this tax bracket, you would have an estimated average federal tax in 2018 of 22%. After a federal tax rate of 22% has been taken out, Gold Miners could expect to have a take-home pay of $42,547/year, with each paycheck equaling approximately $1,773*.

** assuming bi-monthly pay period. Taxes estimated using tax rates for a single filer using 2018 federal and state tax tables. Metro-specific taxes are not considered in calculations. This data is intended to be an estimate, not prescriptive financial or tax advice.*

**Quality of Life for Gold Miner**

With a take-home pay of roughly $3,546/month, and the median 2BR apartment rental price of $2,506/mo**, a Gold Miner would pay 70.68% of their monthly take-home salary towards rent.

** *This rental cost was derived according to an online report at Apartment List*
**** *Average cost of living was acquired from Numbeo's Cost of Living Index*

## INDIVIDUAL LETTER 569: MARYANNE MURPHY

### Response to Comment Ind 569-1

This comment is in regard to wages and economic issues which are not required under CEQA to be analyzed in the DEIR. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 570**

**From:** Shannon Cotter
**To:** Idaho MMEIR
**Subject:** Mine Comments
**Date:** Thursday, February 24, 2022 3:58:08 PM

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Dear Mr. Kelly,

I'll keep this brief as I'm sure you are inundated with comments on the matter.

**Ind 570-1**

As a Grass Valley resident, living along Wolf Creek at 415 Mill Street, I have seen firsthand the rise and fall of the creek on our property. Additionally, our property has a drainage pipe that empties into Wolf Creek, or in the case of flooding, back floods our property. I understand that Wolf Creek is the proposed discharge route for the water that will be expelled from the mine. I'm concerned for our own property and that of our lower-lying Mill Street neighbors even more prone to flooding. But perhaps more concerning is the proposed drain on one of our most precious resources; water. I don't understand how this project can even be considered given our historic drought situation. Perhaps I have been misinformed, but the amount of water I hear will be used and discharged through Wolf Creek is astounding. Local residents, state residents, and even nationally, are being asked to conserve water due the drought, yet the mine will be using all that water?

Thank you for your time and consideration.
Matt & Shannon Cotter
(530)798-1192

## INDIVIDUAL LETTER 570: MATT AND SHANNON COTTER

### Response to Comment Ind 570-1

Please see Master Response 35 – Discharge to South Fork Wolf Creek and Master Response 36 – Flows in South Fork Wolf Creek. Regarding groundwater and drought concerns please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 571**

**Ind 571-1**

Dist 3

**I [redacted] re-opening the Idaho-Maryl**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine will bring over 300 quality employees full-time satisfying careers with an average estimated annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

NO MINE!

From: Maureen Cuthbert
To: Matt Kelley
Date: 4/1/2022
Subject: Rise Mine

RECEIVED
APR 07 2022
NEVADA COUNTY
PLANNING DEPARTMENT

Dear Mr. Kelley,

I do not support the Rise mine and don't agree that it is good for Nevada County.

**Ind 573-1**

Rise Gold is a Canadian company with a questionable track record. Profits will end up in Canada with Nevada County taking an environmental hit.

**Ind 573-2**

Toxic waste generated by mine operations put residential communities at risk.

**Ind 573-3**

Air pollution due to dust from processing exacerbates existing Nevada County issues with air quality

**Ind 573-4**

Energy consumption will stress an already strained power grid.

**Ind 573-5**

And finally, most importantly, water usage required for their mining operations is completely irresponsible for consideration. Many wells are already going

dry in our communities. We do not have adequate water reserves to support existing residential and business communities. To allow massive and wasteful water usage to line the pockets of a Canadian company during severe drought conditions is just frivolous and reckless.

Please do what you can do to stop the Rise Idaho-Maryland mine.

Signed: Maureen Cuthbert

## INDIVIDUAL LETTER 573: MAUREEN CUTHBERT

### Response to Comment Ind 573-1
The comment does not address the adequacy of the DEIR. Please see Master Response 3 – Operator Responsibility. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 573-2
The comment does not address the adequacy of the DEIR, but rather expresses general concerns related to toxic waste; without further specificity a detailed response is not possible. Hazards and hazardous materials associated with the project are addressed in Chapter 4.7, Hazards and Hazardous Materials, of the DEIR.

### Response to Comment Ind 573-3
The comment does not address the adequacy of the DEIR, but rather expresses general concerns related to air pollution, specifically dust. Without further specificity a detailed response is not possible. Fugitive dust is addressed in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR.

### Response to Comment Ind 573-4
The comment does not specifically address the adequacy of the DEIR, but rather provides general energy-related concerns. Energy is addressed in Chapter 4.3 of the DEIR.

### Response to Comment Ind 573-5
Regarding water concerns, please see Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 573-6
The comment does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 574**

Nevada County Planning Dept
Matt Kelley Senior Planner
Feb 5,2022

CC: Board of Supervisors:
Heidi Hall (Dist 1)
Ed Scofield (Dist 2)
Dan Miller (Dist 3)
Susan Hoek (Dist 4)
Richard Anderson (Dist 5)

CC: Cea NC. Org

To Whom it may concern:

We Oppose the RE-OPENING of the IDAHO MARYLAND MINE.

We have been residents of Grass Valley, living off Greenhorn Rd for the past 40 years. We vehemently oppose the proposal to open the Idaho Maryland Mine, that is being spearheaded by Ben Mossman of Rise Gold Co.

**Ind 574-1** We believe that the re-opening of this mine, if granted would have devastating and catastrophic effects on this community.

The environmental affects it would have on our water, atmosphere and wildlife, through the emissions of chemicals in the mining process, would result in the contamination of ground water, surface water and soil. The atmosphere will have significant detrimentals effects on humans, animals and vegetation.

**Ind 574-2** Should the mine be allowed to re open the endangered species cohabitating in this area, in particular, the yellow leg frog and the pacific ficher will become extinct .

**Ind 574-3** Statistically mining kills and injures more workers than any industry, nearly 15,000 per year.

**Ind 574-4** There are estimations of 47,000 abandon mines spread throughout every county in California, leaving the land decimated, contaminated, and abandoned.

**Ind 574-5**

Mining is currently responsible for 4-7% of Green house gases.
Consider the impact of radioactive gases, such as the radon that is emitted from the sludge in a tailing pond.

Other concerns , would be the possibility of sink holes and earthquakes.

**Ind 574-6**

"Mining accounts for the high number of human induced earthquakes worldwide. The removal of the earth can cause instability, leading to sudden collapses that trigger earthquakes".National Geographic 2017.

Furthermore , tectonic earthquakes can also collapse mine openings and tunnels with weak infrastructure.

**Ind 574-7**

Mining would impact and lower the water table causing the overlying rock and soil to collapse.
As is well known, sink holes are appearing more frequently each winter in Nevada County. Brunswick Rd, adjacent to the mine site, had a massive sink hole several years ago. There have been several others as well.

How is it that , Mr. Ben Mossman, CEO of Rise Gold Co. was able to acquire permits to potentially re-open this mining project, with.
NO investigation of his previous business history?

Records show that he abandoned the Hechate Strait Mining project on Bank Island in Canada and then filed Bankruptcy .
He has many violations and fines according to the Canadian Fisheries Environmental Management and Water Acts.

**Ind 574-8**

The investigation of that project shows again ,that he violated the environmental management act by dumping mine debris in the woods at the site. He was also sited for failure to report spills that affected the safety of fish and food.

Consequently , Ben Mossman is facing charges for damages caused. Mr Mossman has already shown his disdain and disregard for this community by not complying with the Timber Harvest Plans rules and regulations.
Mr Mossman also ignored riparian set back requirements for streams in Nevada County at his East Bennett project site.

**Ind 574-9**

Property values in the vicinity of East Bennett, Brunswick, Idaho Maryland and Greenhorn will decrease drastically.
If we should have a fire disaster such as the devastating fire that happened in Paradise Ca, a sufficient water supply will not be available .

**Ind 574-10**

DRAINS OUR WATER. "Water is one of the most precious resources we have, but Rise Gold plans pump out 3.6 million everyday for 6 months and another 1.2 for up to 80 years - flooding creeks, destroying habit, and putting 300 plus private wells at risk." CEAF

**Ind 574-11**

Traffic congestion , noise pollution and damage to roads (that will be continuous for 24 hours a day, 7 days a week, for a projected 80 years). Are crucial issues as well.

**Ind 574-12**

This proposal with all the toxic chemicals involved, the explosive materials being trucked shipped and stored, is simply an accident waiting to happen.

Rise Gold estimates 70 jobs will be provided for local residents.

The Gold profits leave this community , but the decimated quality of life will remain.

This community will gain nothing in return for the environmental destruction it will be left with.

This horrendous plan of reopening this mine with all the detrimental damage it will cause is Unthinkable and Unacceptable .

**Ind 574-13**

Please STOP the CARNAGE that the proposed re-opening of this mine will bring to this community.

Thank you for your attention to this very important matter.

Deborah Shriver

Maureen Miranda
Email: mozophoto1@yahoo.com

## INDIVIDUAL LETTER 574: MAUREEN MIRANDA

### Response to Comment Ind 574-1
The commenter believes the project would have adverse impacts to the community. The commenter lists a variety of environmental concerns but does not provide any specific comments. The commenter's opposition to the project is noted for the decisionmakers. Please see Master Response 1 – Non-EIR/Administrative Issues.

### Response to Comment Ind 574-2
The commenter asserts that project implementation would result in endangered species in the project area becoming extinct, including the foothill yellow-legged frog and the pacific fisher. Potential impacts to special status plant and wildlife species are evaluated in DEIR Chapter 4.4 (Biological Resources) and are each mitigated to a less than significant level. With regard to foothill yellow-legged frog, the commenter is referred to Master Response 38 - Foothill Yellow-Legged Frog and California Red-Legged Frog. The pacific fisher does not inhabit the project area.

### Response to Comment Ind 574-3
The commenter states that mining accidents cause 15,000 injuries or deaths per year. The comment is noted for the decisionmakers but does not address a specific environmental concern or the adequacy of the DEIR.

### Response to Comment Ind 574-4
The commenter states that California has approximately 47,000 abandoned mines, leaving land decimated and contaminated. The comment is noted for the decisionmakers but does not address a specific environmental concern or the adequacy of the DEIR.

### Response to Comment Ind 574-5
The commenter states that the project will emit radioactive gases, such as radon, from the sludge in a tailings pond. The project does not include a tailings pond. The project's potential to emit greenhouse gas emissions is addressed in DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy). The impacts were found to be less than significant after mitigation.

### Response to Comment Ind 574-6
The commenter states that the project would result in ground collapse or sinkholes. Ground collapse is discussed in Chapter 4.6 (Geology, Soils and Mineral Resources) beginning on DEIR page 4.6-44. As described in this section, "sink holes" occur within limestone environments and are caused by the dissolution of the stone itself creating a cave just below the ground surface. This type of ground collapse would not be expected in the project area which is granitic. Instead, mine-related collapse in the project area could occur where a vein outcrops on the surface and around mineshafts and other near surface mining features. A Geotechnical Assessment of Near Surface Mine Features conducted for the project recommended closure of several near surface features prior to development. Mitigation Measure 4.6-3(c) requires closure of these features under the direction of licensed geotechnical engineer and would reduce the potential for collapse to a less than significant level. The commenter is also referred to Master Response 29 - Near Surface Workings.

### Response to Comment Ind 574-7
Please see Response to Comment Ind 574-6.

## Response to Comment Ind 574-8

This comment concerns the reputation and prior mining projects of the Project Applicant. The comment is noted for the decisionmakers but does not address a specific environmental concern or the adequacy of the DEIR. The commenter is referred to Master Response 3 – Operator Responsibility.

## Response to Comment Ind 574-9

The commenter states that the project would have adverse impacts on property values. CEQA does not require the EIR to consider economic impacts such as decreased property values. The commenter is referred to Master Response 2 - Social and Economic Impacts.

The commenter states that a sufficient water supply will not be available to fight a devastating fire if the project is implemented. The commenter provides no substantial evidence that the project will result in a lack of sufficient water supply for firefighting purposes. Water used for firefighting in the project area would be provided by Nevada Irrigation District which obtains its water supply from surface waters. The commenter is further referred to Master Response 6 - Wildfire Impacts.

## Response to Comment Ind 574-10

The commenter states that dewatering the mine would have a number of adverse impacts to the community. Project impacts related to drainage and potential flooding are addressed under Impact 4.8-3, beginning on DEIR page 4.8-69. Project impacts on wildlife habitat are addressed under Impact 4.4-2, beginning on DEIR page 4.4-68. Project impacts on groundwater levels and recharge are addressed under Impact 4.8-2, beginning on DEIR page 54. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 36 – Flows in South Fork Wolf Creek.

## Response to Comment Ind 574-11

The commenter states that the project will result in traffic and noise pollution but does not state how the DEIR is inadequate. Project impacts related to traffic congestion and noise pollution are addressed in DEIR Chapter 4.12 (Transportation) and Chapter 4.10 (Noise and Vibration), respectively. Mitigation Measure 4.12-6(a) requires the project's construction phase traffic control plan to include monitoring for roadbed damage and specify timing for completing needed repairs. Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between project driveway and Brunswick Road.

## Response to Comment Ind 574-12

The commenter states that the project is an accident waiting to happen because of the project's use of "explosive materials" and "toxic chemicals", but the commenter does not state why the DEIR is inadequate with regard to analyzing potential hazards. Further, the commenter's reference to "toxic chemicals" is unclear. For example, it is noted on page 3-25 of Chapter 3 that mercury or cyanide would not be used in gold mineral processing. Potential hazards associated with the use, transport, and storage of hazardous materials and explosives during project operation are addressed in detail in Chapter 4.7 (Hazards and Hazardous Materials).

## Response to Comment Ind 574-13

The commenter states that the project's adverse impacts outweigh its benefits. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Comment 2 - Social and Economic Impacts.

**Ind 575-1**

To whom it may concern,

My name is Megan Hart. I have lived in Nevada County for 20 years. This place has formed me as a person and I am better for it. I oppose this mine in every way. Living, for most of my years here, out near the Malakoff Diggins, dealing with water table issues and other environmental problems, it is astounding to me that in 2022, we have not learned from our mistakes. To even entertain the idea again is absurd. The money is not worth the long term effects this shortsighted and neglectful premise. Absolutely no mining. Period.

Megan Hart
Hart House Wine Company
@harthousewinecompany

## INDIVIDUAL LETTER 575: MEGAN HART

### Response to Comment Ind 575-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 576**

**From:** Mama Melanie
**To:** bdofsupervisors
**Subject:** Public comment
**Date:** Wednesday, January 19, 2022 9:30:32 AM

**Unable to identify**

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Dear Board of Supervisors Across All Districts,

My name is Melanie Bright and it is irrelevant which district I'm in as everyone would be equally effected by the opening of the mine. There are no borders between districts where the terrible dust, noise and other pollutions would magically stop and disappear. We're all equally at risk.

People who have chosen to live in this area do so because it's healthier to live out here versus a city. We come for the clean air and quiet ambiance.

The company seeking to open the mine has a history of financial failure and a history of not putting communities first. This company has a pocketbook in mind, not the welfare of others. It has already been proven. So what will you chose? Fatten the pocketbook of the mining company and risk all of our resources in doing so? — or protect our resources and the people?

Lastly, you may think this is a good idea, but what if you're wrong? What if you have doomed an entire county to horrific air quality, water loss and pollution, noise pollution, and more? Would you be able to sleep at night knowing you caused tens of thousands of people to develop serious health issues? Could you live with yourself knowing people died because of the air pollution you agreed to? For example, my son is eight years old and had two open heart surgeries at birth. Air pollution could literally cut his life span down. We moved here in order to HELP him and give him the longest chance at life. Could you vote yes knowing there are hundreds or thousands of other people at risk already? Is the mine opening more important than human life?

Could you look into the faces of the families of those who lost someone to lung cancer? Are you okay for everyone to lose value on their homes? Are you okay knowing your choice to agree drove people out of Nevada County?

**Ind 576-1**

If you agree to open the mine, you have not voted for the wellbeing of those who elected you to protect them. You will have failed the people for your own gain— whatever that may be. Maybe you want to look productive or maybe your ego likes to see others beg for you to spare us. Not all gain is financial.

You have seen the evidence of how destructive this choice would be and you cannot unsee it.

Thank you,
A concerned citizen

Sent from my iPhone

Hey Matt and the Planning Commission,

Attached is my written response to the DEIR for the Idaho Maryland Mine Project.
Like almost everyone I've encountered in the County I am opposed to the re-opening of such an enormous industrial project with unknown consequences.

**Ind 577-1** Although not a part of my official statement (attached) I was privy to the Bear Yuba Land Trust making an offer to Rise Gold to purchase the Brunswick Site property listed in the Proposal. That alternative is the kind of development our County should encourage, our residents desire and our real estate agents would do backflips for :)

Thank you all in advance for considering my statements, the time and energy you are putting into reviewing and understanding our concerns.

Sincerely,

Menkin Nelson
(530) 955 -3129

April 4, 2022

To: Attn: Matt Kelley
Nevada County Planning Commission

Regarding: PLN19-0176; CUP19-0014; RZN19-0002; MGT19-0039; MGT19-0040; VAR19-0003; EIR19-0001; MGT20-0009; MGT20-0010; MGT20-0011; MGT20-0012; MGT20-0013; LLA20-0006; AAM21-00002
Proposal to Re-Open the Idaho Maryland Mine Underground Mining and the Associated Draft Environmental Impact Review SCH# 2020070378

Prepared By: Menkin Nelson

**Ind 577-2**

Proposed Project Description:
The proposed project's surface components would be located on approximately 175.64 acres consisting of the Brunswick Industrial Site, the Centennial Industrial Site, and a 0.30-acre portion of East Bennett Road for off-site improvements associated with a potable water pipeline easement. The project would also involve underground mining within an approximately 2,585- acre mineral rights boundary owned by the applicant. The potable water pipeline easement would be located along East Bennett Road, and would be contained within the existing right-of-way. Both the Brunswick Industrial Site and the Centennial Industrial Site are located within unincorporated western Nevada County and are owned by Rise Grass Valley. The approximately 119-acre Brunswick Industrial Site is located southwest of the intersection of East Bennett and Brunswick Roads, and is comprised of Assessor's Parcel Numbers (APNs): 006-441-003 (12503 Brunswick Road), 006-441-004 (12625 Brunswick Road), 006-441-005 (12791 Brunswick Road), 006-441-034 (12381 Brunswick Road), 009-630-037 (12369 East Bennett Road), and 009-630-039 (12301 Millsite Road). The approximately 56.41-acre Centennial Industrial Site is located southwest of the intersection of Idaho Maryland Road and Centennial Drive and is comprised of APNs: 009-550-032, 009-550-037 (10344 Centennial Drive), 009-550-038 (10350 Centennial Drive), 009-550-039 (10344 Centennial Drive), 009-550-040, and 009-560-036 (10350 Centennial Drive).

The much larger mineral rights boundary encompasses approximately 2,585 acres and generally contains properties surrounding the Brunswick and Centennial Industrial Sites, with the majority of additional land area located north of the Brunswick Industrial Site and east of the Centennial Industrial Site. This generally includes most of the Nevada County Airport and surrounding Air Park, as well as property along both sides of Brunswick Road, Greenhorn Road, and Idaho Maryland Road.

The proposed project would reinitiate underground mining and gold mineralization processing for the Idaho-Maryland Mine over an 80-year permit period with gold

mineralization processing and underground exploration and mining proposed to operate 24 hours a day, 7 days a week during full operations. Following completion of mining and processing activities, the project sites would be reclaimed to open space and land suitable for future development of industrial uses. Generally, the proposed project would include the following components:

- Dewatering the existing underground mine workings;
- Underground mining at a depth of 500 feet or more in areas underlying the mineral rights
- properties;
- Construction and operation of aboveground processing and water treatment facilities at
- the Brunswick Industrial Site;
- Engineered fill placement for potential future industrial pad development at the Centennial
- and the Brunswick Industrial Sites;
- Installation of a potable water pipeline for residential potable water supply; and
- Reclamation of the project sites in accordance with a proposed Reclamation Plan.

The majority of the aboveground facilities, access to the underground mining, and a portion of the engineered fill would be located on the Brunswick Industrial Site. The aboveground facilities would be located within a 29-acre industrial area that would include but not be limited to, a headframe building around the existing concrete silo used to hoist rock from the Brunswick shaft; covered conveyor system used to transport a) barren rock to a truck hauling area within an adjacent enclosed building, and b) gold concentrate to the processing plant; a processing plant to grind rock and recover gold minerals through various processes; and other appurtenant structures such as office and warehouse space. An above-ground water treatment plant would also be built at the Brunswick Industrial Site to treat groundwater associated within initial and ongoing ("maintenance") dewatering of the underground mine workings. A new aboveground pipe would convey treated water from the water treatment plant along an existing dirt road to the planned discharge point at South Fork Wolf Creek. The pipe and discharge point are located entirely within the property boundaries.

Engineered fill generated by the proposed mining activities would be placed on approximately 31 acres of the Brunswick Industrial Site to create a level pad of approximately 21 acres for potential future industrial use. In total, up to approximately 60 acres of the 119-acre site could be subject to surface disturbance and/or development for the aboveground facilities and fill placement. The remaining 59 acres would remain undeveloped and would not be subject to surface disturbance or infrastructure improvements.

Engineered fill would also be placed on the Centennial Industrial Site, provided that the separate DTSC cleanup project has been approved and completed on the Centennial Industrial Site. In that case, engineered fill would be transported by truck from the

Brunswick Industrial Site and placed on approximately 44 acres of the Centennial Industrial Site to create approximately 37 acres for potential future industrial use. The remaining approximately 12 acres would remain as a private driveway for site access and open space. The open space area would include Wolf Creek, a 100-foot setback for riparian area on Wolf Creek, and an undisturbed area providing protection for identified special-status plant species.
After full placement of fill at the Centennial and Brunswick Industrial Sites to the pad design elevations, the need for hauling of engineered fill would continue due to ongoing mining over the Use Permit term of 80 years, and thus, hauling would shift entirely to local and regional markets for sale as construction aggregate and fill. If the separate DTSC cleanup project is not approved by DTSC and completed within the term of the Idaho Maryland Mine Project use permit, engineered fill would be placed on the Brunswick site, but not the Centennial site, and the remainder would be hauled to local and regional markets.

A buried potable water pipeline would be constructed as part of the proposed project to provide water to residences along a portion of East Bennett Road. The pipeline would extend an existing NID potable water pipeline along an approximately 1.25-mile segment of East Bennett Road to provide potable water service to residential properties currently on wells that may be affected by the project's dewatering of the mine. NID would be the water supplier for the potable water service.

---

Statement for consideration:
Thank you for taking the time to read my response to the Draft Environmental Impact Review (DEIR) prepared by Raney Planning and Management Inc, 2021. I am regularly in the Planning Department trying to get new development and projects approved because I support development and expansion that benefits our local community and the economy. I do not believe that the re-opening of the Idaho Maryland Mine qualifies as a beneficial project to our community. Based on the DEIR and associated documents; it's frustrating that this project still has to be considered by our environmentally aware and community minded staff, but understand that you are required to do your due diligence prior to denial of such a project and hope to assist in shedding a light on several areas that seem insufficiently addressed by the DEIR.

**Ind 577-3**

First, I would like to formally request that another *Draft* Environmental Impact Review be prepared and be re-circulated through the public as the existing version is grossly negligent and jumping directly to a Final Environmental Impact Review does not allow an opportunity for the community to verify that the great number of concerns expressed regarding the released DEIR during the March 24th 2022 Planning Commission hearing, as well as in writing during the hearing period, are being addressed to an appropriate and satisfactory degree.

The Initial DEIR (Raney Planning and Management Inc 2021) section 1.1 states '*As provided in the CEQA Guidelines Section 15021, public agencies are charged with the duty to* ***avoid or minimize environmental damage where feasible****. The public agency has an obligation to balance a variety of public objectives, including economic,*

*environmental, and social issues*.' In consideration of this guideline, we'd like any conclusions by the department to be reserved until the Economic Impact Review has also completed both the Draft public circulation with hearing period and adjusted to a Final Economic Impact Review in addition to a much more thorough Draft Environmental Impact Review.

Section 1.3 – Approach to Centennial Site Baseline

**Ind 577-4**

The Initial DEIR (Raney Planning and Management Inc 2021) states '*The CEQA Guidelines, and the courts, have noted that in some situations, the physical conditions existing at the time the environmental analysis commences (e.g., for an EIR, the Guidelines describe this as publication of the Notice of Preparation [NOP]) do not always provide the most accurate and understandable picture practically possible of the project's likely impacts. For example, Guidelines Section 15125(a)(1) states that, "…where necessary to provide the most accurate picture practically possible of the project's impacts, a lead agency may define existing conditions by referencing historic conditions, or conditions expected when the project becomes operational, or both, that are supported with substantial evidence."*

The terminology of the CEQA guidelines specifically states that in order to provide the most accurate picture possible it either needs to be based on already existing conditions or must be supported with substantial evidence. Therefore, we can safely conclude that either the Voluntary Cleanup Agreement (VCA; Docket No. HSA-FY18/19-014) with the Department of Toxic Substances Control (DTSC) for the voluntary cleanup of soil contamination on the Centennial Industrial Site be considered within the EIR or should be fully completed with written project approval, including final soil samples and environmental evaluations, from the DTSC prior to the DEIR removing it from consideration.

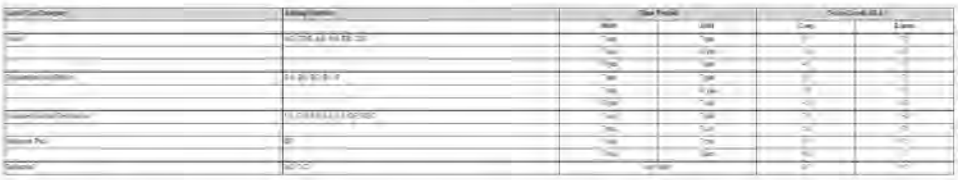
Section 1.4 Independent Utility

**Ind 577-5**

The Initial DEIR (Raney Planning and Management Inc 2021) states '*The utility and purpose of the Centennial Clean-Up Project is to ensure timely and efficient cleanup of the Centennial Industrial Site due to existing site conditions, and is required under both California and federal environmental regulations—not because it would benefit the Idaho-Maryland Mine Project. Similar to the holding of Banning Ranch, the Centennial Clean-Up Project would happen whether or not an underground mine is approved by Nevada County for the Brunswick Industrial Site. As stated above, the Centennial Industrial Site was identified by the EPA for cleanup purposes long before Rise purchased either the Centennial or Brunswick properties, and long before the Idaho-Maryland Mine Project was proposed. Consequently, under the holding in Banning Ranch, the Centennial Clean-Up Project should be analyzed separately from the Idaho-Maryland Project under CEQA.*'

The statement 'not because it would benefit the Idaho-Maryland Mine Project.' is completely outlandish considering that Rise Grass Valley clearly states their intention to utilize the Centennial site and purchased both the Centennial site and the Brunswick site in conjunction. They claim that there is 'sufficient flexibility in the project design such that waste rock could first be deposited at the Brunswick Industrial Site.' If the

Centennial cleanup is not considered within the DEIR, then the entire DEIR should ONLY consider waste rock being deposited at the Brunswick Industrial site or an alternative. Additionally, Rise Grass Valley voluntarily entered into the Remediation Action Plan (RAP) independently of the Idaho Maryland Mine project so the company should be moving forward with that agreement regardless of the Idaho Maryland projects' progress and their lack of efforts towards that commitment shouldn't be rewarded by overlooking it.



Section 4.10 Noise and Vibration
The Nevada County noise ordinance states dB readings at project property lines must adhere to the limitations set forth in the Nevada County Ordinance No. 1853, adopted by the Board of Supervisors on January 18, 1994. Digging into the DEIR's continued short comings, on page 4.10-4 under Existing Sensitive Receptors it states '*For the purposes of this analysis, 30 receptors were selected as representative of the nearest potentially affected receptors to the project sites (see Figure 4.10-2). The receptors consist of the following locations:*

- *17 residences surrounding the Brunswick Industrial Site.*
- *3 residences near the Centennial Industrial Site.*
- *1 residence along Whispering Pines Lane between Brunswick Road and Centennial Drive.*
- *5 residences along Brunswick Road, north of East Bennett Road.*
- *4 residences along East Bennett Road.'*

**Ind 577-6**

Please notice that NONE of these receptors are at the adjacent property line, in fact ALL of them are some great distance further, some multiple parcels away even. Although several of these off-site receptors, particularly where truck traffic noise is considered, are valid noise monitoring locations there should additionally be sounds tests taken at all parcel boundaries in the revised Draft Environmental Impact Review.

Pursuant to Nevada County Land use and Development Code (NCLUDC), Section L-II 4.1.7 Noise, A. defines its purpose '***Purpose***- *The purpose of these regulations is to ensure that future development* ***minimizes unnecessary and annoying noise****, by establishing maximum noise levels and standards for evaluating potential noise impacts.*'

(NCLUDC), Section L-II 4.1.7. D. 5. sates '*The above standards shall be measured only on property containing a noise sensitive land use, including residences, schools,*

*hospitals, nursing homes, churches, and libraries, and may be measured anywhere on the property containing said land use. However, this measurement standard may be amended to provide for measurement at* ***the boundary of a recorded noise easement*** *or as determined in a recorded letter of agreement between all affected property owners and approved by the County.*' This clearly specifies either on the land itself or its boundary.

Further down Section L-II 4.1.7. D.7. states '*Because of the unique nature of sound, the County reserves the right to provide for a* ***more restrictive standard*** *than shown in the Exterior Noise Limits Table. The maximum adjustment shall be limited to be not less than the current ambient noise level and shall not exceed the standards of this Section. Imposition of a noise level adjustment shall only be considered if one or more of the following conditions are found to exist:*

a. *Unique characteristics of the noise source:*

**Ind 577-7**

*1) The noise contains a very high or low frequency, is of a pure tone (a steady, audible tone such as a whine, screech, or hum), or contains a wide divergence in frequency spectra between the noise source and ambient level;*

*2) The noise is impulsive in nature (such as hammering, riveting, or explosions), or contains music or speech;*

*3) The noise source is of a long duration, defined as a cumulative period of more than thirty minutes in any hour.*'

Given the projects proposal of noise sources of a long duration (more than 30 minutes in any hour) we would like to request the County exercise their right to provide for a more restrictive standard than shown in the Exterior Noise Limits Table.

**Ind 577-8**

The Occupational Safety and Health Act (OSHA) has declared excessive noise levels a recognized hazards to safety and health, influencing NCLUDC Section L-II 4.1.7.D.4. enough to clearly state '*Where 2 different zoning districts abut, the standard applicable to the lower, or more restrictive, district plus 5 dBA shall apply.*' Unfortunately, our applicants seem unaware of the NCLUDC when the DEIR Section 4.6 Geology, Soils and Mineral Resources (page 4.6-23) Policy 17.24 states '***Regardless of the General Plan designation****, subsurface mining shall be conditionally permitted throughout the County.*' The DEIR neglects to clarify the depths of any of this subsurface mining and the mitigation measures to assure that the minimum noise levels during night time hours under 900 privately owned parcels, including many residences, shall be adhered to, particularly as they pertain to the zoning of the parcel being effected. Their abrasive statement 'regardless of general plan designation,' implies that Rise Grass Valley has no intention of adhering to the sound standards adopted by the County's Board of Supervisors while conducting the anticipated '*257 detonators per day to facilitate Rise's mining operations at the Brunswick Industrial Site*' or as stated later '*on a single delay, for a total of 26.6 lbs of explosive being detonated*'.

**Ind 577-9**

It's also worth noting that according to table 14.10-1 (page 4.10-8) the ambient noise levels were tested greater than 3 years ago, some over 5 years ago. A sound analysis utilizing data from an irrelevant time period is not applicable to science and the entire sound analysis should have to be re-created using verifiable, current and accurate data.

**Ind 577-10**

**DEIR - Missing Sections and Items**

The Draft EIR is missing any effects of this project as they pertain to the ever-intensifying fire season, along with many other absences. Please see some of those concerns below.

Explosives vs. Fire Risk

Nowhere in the DEIR is there data referencing the transportation of explosives against vehicle crash statistics, specifically along hwy 174. It is imperative that we apply some basic math and statistics before agreeing to send a bi-weekly (sometimes weekly) deliveries of the 28 tons of explosive material down a roads pass near residences and through highly flammable natural vegetation. The ignition force of 28 tons of explosive (ammonia nitrate fuel oil [ANFO] and packaged or bulk emulsion explosives) should be considered with calculations about the distance of potential flame and explosive force with an overlay of the vegetation, homes and business along the transportation route. Additionally, these calculations should be considered at the unloading and loading areas in case of an accidental ignition. This review should be overseen by CalFire, Pearldale Chicago Park, Ophir and Nevada County Consolidated Fire Districts as the leading experts in what would be a realistic expectation of fire expansion and the resources required to control it. In a county where we do not allow generator use, unless as a backup system that has been tied into a fully engineered and permitted power grid, we clearly understand fire risk and the rapidity of ignition in a dry climate. To not even consider the resources that would be required to quickly neutralize the effects of an accidental car crash carrying 28 tons of explosives is grossly negligent. With expected bi-weekly transport for an 80 year period we would need to consider over 2000 truck loads. There is also a continued drought and the predicted decline in watershed should be considered in all calculations. In the case of an explosive load, even a small portion of the load igniting will ignite the remaining load for the full qty being transported to cause the full devastating effects of the maximum capacity.

**Ind 577-11**

Not considering the effects or mentioning the possibility of an explosion within the DEIR can only be interpreted as an attempt to shield the subject from the reviewing committee, knowing the risk associated with the proposal is well beyond any reasonable level. When the DEIR states '*Additionally, the explosives supplier will have a sufficient insurance policy*' (Chapter 3.0 Project Description, Page 3-28, Other Truck Transport, Explosives) it should further be clarified that the aforementioned insurance policy is considered sufficient to rebuild the homes and businesses that are directly threatened by this proposal and compensate the local fire jurisdictions for resources pulled from other locations due undue risk on a continuously arduous fire season. And lastly, we can all agree that no insurance policy is ever sufficient to cover the loss of life or loved ones.

**Ind 577-12** Given the public and official reaction to one 'possible stick of old dynamite' that shut down Nevada City's downtown area to traffic and businesses on March 30th, we Nevada County Residents take the threat of explosives slightly more seriously than Rise Gold does.

**Ind 577-13** Section 4.11 Public Services and Utilities makes a brief mention of the staffing requirements of local Fire Districts, but there is no mitigation suggested for additional staffing or equipment that this project warrants with the power usage of approximately 6000 homes, transportation of explosives and assorted industrial buildings and equipment.

**Ind 577-14** Explosive vs. Legal Shipping Route
*See Reference Link at Bottom of Letter*
According to the Highway Patrol Handbook 84.3, Section 3. CALIFORNIA VEHICLE CODE, SECTION 31602. LICENSE: ROUTES TO BE USED (d) '*It is a* ***misdemeanor*** *for the owner, or authorized agent of the owner, of any vehicle transporting explosives to drive, or to permit the driving of the vehicle, or for the driver to drive such vehicle, upon any public highway ,* ***not designated in regulations adopted by the Department of the California Highway Patrol as a route for the transportation of explosives****, unless the use of the highway is required to permit delivery of, or the loading of, explosives at a point not on a highway designated as a route for the transportation of explosives, or unless the use of the highway is required to permit the vehicle to proceed to, and return from, a point designated as an inspection stop pursuant to this division.*' However, if you look at map 6 (including the greater Grass Valley area) Hwy 174, access to the Brunswick site, is not even listed as a route for transportation explosives. Overlooking this detail is once again, gross negligence.

**Ind 577-15** Collapsed Tunnels and Sink Holes
The CEO and sole member of Rise Grass Valley, Benjamin Mossman, proudly proclaimed in an interview on 'Nevada County Now, August 2020' that all the '*all the land is privately owned, so the resources belong to Rise Gold.*' Unfortunately, Ben is correct about the mineral rights included within 2600+acres, however the DEIR does not address how this could affect the 900 privately owned parcels above the mineral rights and interlaced tunnels that not only weave through private neighborhoods and crucial water reserves, but also under a portion of Grass Valley's city limits including the Grass Valley Airport.

Searching no further than the Wolf Creek Park walking trail, located in Grass Valley, you can see the devastating effects of a massive sink hole behind the Les Schwab and Tripp's Auto Body. The DEIR does not address the depths at which mineral rights are available, therefor there is no valid evidence that underground blasts wouldn't affect assorted private parcels from foundation damage to sound annoyance.

**Ind 577-16** Additionally, there is no geotechnical underground data with regards to the subsurface tunnels under the airport. Nor are there any mitigation measures to offsite fire

protection, should an unfortunate tunnel collapse damage the Grass Valley Airport runway that doubles as the Grass Valley Interagency Air Attack Base for local and statewide, fire spotting and suppression aircrafts.

**Ind 577-17**

There is no doubt that Nevada County is filled with known faults, and even less doubt that California is a seismic region. Rise Grass Valley is proposing that there is no risk to blast explosives underground within 200 feet of a known fault.

**Ind 577-18**

Section 4.9 Land Use and Population and Housing, on page 4.9-22 states '*The project also includes a request to amend the Final Map for the formerly proposed Bet Acres Subdivision recorded in February 1987, in Book 7 of Subdivision Maps at Page 75, to remove the "200' Building Setback from Fault", as shown on Sheet 4 of Final Map #85. Sheet 4 of the Final Map includes a portion of the Brunswick Industrial Site. The Final Map shows the location of where Anderson Geotechnical Consultants had believed a fault to be, based on their previous site investigations, and depicted it as a straight dashed line with two parallel lines located 200 feet either side, presumably showing Anderson's suggested setback distances for building construction. Substantial evidence is provided in the Geology, Soils, and Mineral Resources of this EIR (Chapter 4.6, see Impact 4.6-1), indicating that the area is not seismically active, and thus, building setbacks are not required. Sec. L-IV 2.18 of the County Subdivision Ordinance allows for corrections and amendments to an approved tentative map, recorded final map or a parcel map, if the amendments have a cumulatively minor effect on the subdivision and its impacts. The proposed changes to the map or to conditions of approval must be considered at a public hearing by the original approval body.*'
There are two very important take aways from the DEIR's own wording. The first and possibly most crucial is their statement '*Substantial evidence is provided in the Geology, Soils, and Mineral Resources of this EIR (Chapter 4.6, see Impact 4.6-1), indicating that the area is not seismically active*' is wildly unpredictable and probably erroneous. Perhaps it's not an active fault today, however a few blasts of dynamite could quite easily change that. If we start ignoring setbacks as they pertain to fault lines, then where and with who do we draw the line. We already have hundreds of existing sink holes within Nevada County from fault shifts and collapsed mining tunnels. There should be additional data in regard to the effects of explosions near known faults and their consequences included within the DEIR.
The second take away is the '*The proposed changes to the map or to conditions of approval must be considered at a public hearing by the original approval body,' Which signifies that the rezoning and map amendments must be considered at a public hearing, entirely separate to the Proposal to reopen the Idaho Maryland Mine.*

**Ind 577-19**

<u>Water Usage vs. Discharge</u>
Rise Gold claims the settling ponds are sufficient for the qty of water discharged daily, however the math is non-complete. Continuously filling and draining bodies of water do not 'settle'. The DEIR should include calculations that show there is enough time to elapse to allow for the weekly output to settle prior to adding or circulating additional water.

The maximum daily water output should be conjoined with the 100 yr. flood calculations the length of the discharge route. Additionally it should be overlayed with the FEMA flood map from Wolf Creek all the way to the Bay to confirm that should a 100 year flood happen in conjunction with a maximum rate of discharge Wolf Creek, or the continued bodies of water, won't adversely affect surrounding areas.

Economic Impact Review

This project is undeniably incomplete without an Economic Impact Review. Although we can see that Rise Gold has already spent over $634,000 in permit fees directly paid to Nevada County it is hard to see how the economic influx could continue after operation begins. With the bulk of taxes for gold mining going to the state and federal agencies I fear Nevada County will be left in the dust, with additional housing needs and no real new jobs for existing residents.

Currently employment is at a record high and a quick walk around Nevada County displays more 'Help Wanted' signs than one could count. The Economic Impact Review should include the qualification requirements for the available positions as they relate to the unemployed in Nevada County. Almost assuredly they will not align.

**Ind 577-20**

Additional calculations should include the approximate cost of water per gallon ($2 per gallon at your local supermarket) vs. the amount of 'potable' water being discharged and flushed down Wolf Creek. And the average cost of purchasing land per SF on an average throughout the 2600+ acres of mineral rights vs. the 'high yielding' 27 grams of gold per metric ton of earth. 27 grams of gold is slightly less than an ounce, which today retails for approximately $2,000 once minted. The immediate $2,000 value seen would have to deduct the costs of mining, taxes, minting and retail to get the actual value as it relates to blowing up a section of earth that is larger than my front yard. I'd rather have my yard, as would my realtor.

Water discharged from Rise Grass Valley is stated to be 'potable' however there is also proposed water usage at the mining sites. The water discharged should go into a reservoir system to not only supply the mining operations but also to have a large reserve for fire suppression, potential city usage in an emergency, and available to all residents who are at risk of losing their well for no additional cost. If an additional cost is proposed for water rights to the residents the cost of water purification and distribution should additionally be considered within the Economic Impact Review.

Please Consider

**Ind 577-21**

General Plan Policy 17.14 states that '*existing development - commercial, residential, and community - as well as undeveloped private lands, shall be protected from adverse environmental effects caused by mining through enforced use permit conditions and mitigations measures, or denial of the projects.*'
I would like to emphasize that last option, denial of the projects.

In 2018 permit CC18-0025 shows us that during the ownership of Rise Gold there was a code compliance violation 12301 Mill Site Rd in Grass Valley. A parcel that buts up

against Wolf Creek and numerous active businesses within the Grass Valley city limits. There were several missteps from Rise Grass Valley during that time, the negligence regarding 100' setback around streams and waterways, namely the 'protected' Wolf Creek and a timber harvest without a permit. These are two of the most standardized and basic requirements across the county and include oversight by several statewide governing agencies, namely CalFire, the CDFW and the Waterboard. Please consider those code violations as an indication of how little this company understands or respects the local ordinances, regulations, and community. Or perhaps the unthinkable is true and Ben was right, he, the sole member of Rise Gold, does indeed own all the resources throughout 900 private Nevada County parcels, along Wolf Creek and under our only Fire Base Airport?

I thank the Matt Kelley, Nevada County Planners and the Planning Commission for taking the time to consider my letter.

Sincerely,

Menkin Nelson

High Pockets LLC

## INDIVIDUAL LETTER 577: MENKIN NELSON

### Response to Comment Ind 577-1
The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 577-2
The commenter reproduces portions of the Project Description. No response is required.

### Response to Comment 577-3
The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

The commenter states that the DEIR is grossly negligent but provides no further information. Therefore, no response is necessary. The commenter requests that the DEIR be revised and recirculated. The County has determined that recirculation of the DEIR is not required as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met.

### Response to Comment Ind 577-4
Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 577-5
Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 577-6
The commenter states that no sensitive receptors for the noise analysis are adjacent to the property boundary of the project sites. The commenter states there should be sound tests taken at all parcel boundaries for the analysis of the DEIR, and that pursuant to Section L-II 4.1.7 of the Nevada County Land Use and Development code, noise levels and standards should be determined either on the land itself or its boundary.

Please see Response to Comment Ind 617-5.

### Response to Comment Ind 577-7
The commenter's request has already been considered in the DEIR. As discussed on page 4.10-16, as described in Footnote B of Table 4.10-4, a +5 dB adjustment to the noise standards would be applicable at all residential receptors due to the differing zoning districts. However, the +5 dB adjustment would be negated by a -5 dB adjustment due to the project noise sources occurring for long durations. As a result, the only adjustment applied to the Table 4.10-4 standards were based on ambient conditions.

### Response to Comment Ind 577-8
No blasting noise would propagate through the solid rock between the underground mine to properties on surface. Please see Master Response 7 - Location of Future Mining Areas. The noise from underground blasting, at the shaft headframe, has been analyzed in the DEIR and was found to be less than significant (see page 4.10-44 of the DEIR).

### Response to Comment Ind 577-9
Please see Response to Comment Ind 617-4.

## Response to Comment Ind 577-10

The project does not propose any trucking along Highway 174. Please see Master Response 10 - Explosives, Reagents, and Brunswick Fill.

The commenter speculates that trucks carrying explosives may explode along Highway 174. However, there is no evidence of a significant risk of this occurring. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

## Response to Comment Ind 577-11

Mitigation measure 4-7-1(c) requires the mine operator to ensure, through the enforcement of contractual obligations, that all contractors or suppliers transport explosives in a manner consistent with all applicable regulations and guidelines. Proof of the agreement between the operator and contractor or supplier transporting explosives shall be provided to the Nevada County Planning Department before transporting explosives to the site. Insurance for explosives transport is regulated by 49 CFR 387 as shown in Table 4.7-2 of the DEIR. Please see Master Response 10 - Explosives, Reagents, and Brunswick Fill. As stated in Response to Comment Ind 577-10, explosion of trucks, which is highly regulated by the government, is speculative and not required to be analyzed in an EIR.

## Response to Comment Ind 577-12

Comment noted.

## Response to Comment Ind 577-13

As discussed on page 4.11-19 of the DEIR, consistent with Appendix G of the CEQA Guidelines, determination of significant impacts for public services is based on whether the proposed project would result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services.

The approach to analyzing a project's impacts on fire protection services, pursuant to CEQA, is often misunderstood. Industry practice has often focused on any type of demand upon a fire department or district that may be generated by a project, such as an increased need for staffing, or the need for new firefighting equipment. These are important considerations, but they are not CEQA considerations per se. This important point can be seen by a careful reading of the language in Appendix G of the CEQA Guidelines (Section XV. Public Services). As discussed above, the language focuses on whether a project's increase in demand is such that a fire service provider would need to build new or expand existing governmental facilities in order to maintain acceptable service ratios, response times, or other performance objectives. The reason for this focus is that building new facilities, or expanding existing facilities, requires construction activities and disturbance of the physical environment, which is the focus of CEQA.

According to CEQA Guidelines Section 15002(g), a significant effect on the environment is defined as a substantial adverse change in the physical conditions which exist in the area affected by the proposed project. "Environment" means the physical conditions that exist within the area

which will be affected by a proposed project, including land, air, water, minerals, flora, fauna, noise, or objects of historic or aesthetic significance (PRC Section 21060.5).

The courts have affirmed this understanding. In the case *City of Hayward v. Board of Trustees of the California State University,* the First District Court of Appeal affirmed that the focus of CEQA analysis should be limited to physical environmental impacts related to a project.[2] The court held that, "The need for additional fire protection services is not an *environmental* impact that CEQA requires a Project Proponent to mitigate."

The commenter does not explain how the project's power consumption or transportation of explosives would result in public services demand that would necessitate the need for new or physically altered governmental facilities, thus potentially causing an environmental impact.

## Response to Comment Ind 577-14

The project does not propose any trucking along Highway 174. Please see Master Response 10 - Explosives, Reagents, and Brunswick Fill.

## Response to Comment Ind 577-15

Please see Chapter 4.6 of the DEIR and Master Response 29 – Near Surface Workings, and Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 577-16

Please see Chapter 4.6 of the DEIR and Master Response 29 – Near Surface Workings.

## Response to Comment Ind 577-17

Please see Chapter 4.6 of the DEIR regarding seismicity of the project area.

The magnitude of the energy released during mining excavations by rock removal and rock placement is much smaller than the magnitude of energy activation required to trigger the release of a local pre-Holocene fault. No analysis was performed nor is necessary, as there is no potential for inducement of seismic activity on these faults from the proposed mining activity. Please see NV5 Memo attached to the Final EIR as Appendix P.

## Response to Comment Ind 577-18

As discussed in Section 4.5-1 of the DEIR, based upon this substantial evidence in the record, the project includes a request to amend the Final Map for Bet Acres recorded in February 1987 in Book 7 of Subdivision Maps at Page 75 to remove the "200' Building Setback From Fault", as shown on Sheet 4 of Final Map #85.

In addition, a management plan was prepared pursuant to Nevada County LUDC Section L-II 4.3.8 to address potential seismic hazards associated with the previously-identified inferred fault alignment. It is NV5's professional opinion that the subject fault, identified on the property in Map 85-7, does not qualify as a seismically active area as defined by Nevada County LUDC Section L-II 4.3.8.B, and the proposed project development within the designated building setback fault zone is generally feasible from a geotechnical engineering standpoint. ECM, the County's independent peer review consultant for this project, concurred with NV5's professional opinion, after reviewing the data.

[2] First District Court of Appeal. *City of Hayward v. Board of Trustees of the California State University*. (November 30, 2015) 242 Cal.App.4th 833.

While the analysis shows that an active fault likely does not exist, out of an abundance of caution, the County has concluded that a significant impact could occur without mitigation. Mitigation Measure 4.6-1 requires that prior to approval of Improvement Plans, the design recommendations from the Brunswick Industrial Site Geotechnical Report (November 18, 2019) shall be incorporated into the Plans to the satisfaction of the Nevada County Building Department. The rezoning and map amendments would be considered at the same hearing as the other entitlements for the project, and contrary to the commenter's suggestion, there is no requirement that such approvals be heard at a separate hearing.

## Response to Comment Ind 577-19

In addition to settlement in the water treatment pond, the water treatment plant includes media filtration. Please see Appendix K.4 of the DEIR. The treated mine water discharge will be required to meet regulatory requirements for total suspended solids. Please see Master Response 35 – Discharge to South Fork Wolf Creek.

As stated on Page 4.8-70 of the DEIR, at the Brunswick Industrial Site, a detention basin would be constructed at the downstream toe of the engineered fill placement slopes, above South Fork Wolf Creek. The detention basin for the Brunswick Industrial Site is sized to detain storm flows to compensate for the quantity of treated mine water discharged to South Fork Wolf Creek, in addition to compensating for increased runoff from potential future industrial development of the site. During larger storm events, the proposed detention pond on the Brunswick Industrial Site would reduce the peak flows within South Fork Wolf Creek by much more than 5.6 cfs, as shown in Table 4.8-4. Thus, under project conditions, the overall peak storm flows would be lower than they are under existing conditions and therefore would not contribute to increased flooding downstream.

## Response to Comment Ind 577-20

Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

As discussed on page 10 of Appendix N of the DEIR, the proposed project will have a surplus of water from the natural groundwater flow into the ground workings. Once the initial dewatering is completed, approximately 1,224,000 gallons per day are estimated to be pumped to the surface on an on-going basis to maintain the dewatered mine. The groundwater consumed during operations is estimated to be 84,000 gpd. As stated on page 2 of Appendix N, the mine would have a positive effect on water supply. NID could adjust its flows upstream to use the extra water available downstream if it desired to. The construction of a reservoir large enough to impound this quantity at the project site is not realistic nor feasible and would likely cause additional environmental impacts due to disturbance of other resources on the surface.

## Response to Comment Ind 577-21

Please see Master Response 3 – Operator Responsibility.

**Subject:** I Vote No on the Rise Gold Idaho Maryland Mine

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Board of Supervisors

Ind 578-1 **This letter is to inform you that I do not approve of the opening of the Rise Gold Idaho Maryland Mine.**

**I agree with all of the top concerns listed below:**

Ind 578-2 • The groundwater model has fundamental flaws in the initial start point and baseline data assumptions – all of which throw off the entire analysis.

Ind 578-3 • Dealing with mine waste – Asbestos will be a huge and expensive problem that requires far more comprehensive management than described in the report.

Ind 578-4 • Greenhouse gas emissions - The report excluded elements that would put the project over an arbitrary threshold limit, but recent climate change goals say the threshold should be "net zero".

Ind 578-5 • Cleanup of the toxic, pre-superfund Centennial site that would be used to dump mine waste is not included in the DEIR but is required by the California Environmental Quality Act (CEQA).

Ind 578-6 • Missing construction time estimates throw off the entire analysis of noise, traffic, and air.

Ind 578-7 • The DEIR incorrectly assesses nighttime noise and underestimates the noise of dumping mine waste near established residential neighborhoods.

Ind 578-8 • Air traffic hazards and aesthetic impacts need to be studied further due the likelihood of a moisture cloud plume that could be created by warm, saturated air ventilation.

Ind 578-9 • Blasting plans don't follow U.S. mining guidelines that restrict blasting during evening hours.

Ind 578-10 • The plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant.

Ind 578-11 • Meteorological data used to assess the health risk of airborne pollutants doesn't fit Grass Valley's profile or accurately reflect local conditions.

Ind 578-12 :Thank you,
Michael Brisson

## INDIVIDUAL LETTER 578: MICHAEL BRISSON

### Response to Comment Ind 578-1
The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 578-2
The commenter states that the groundwater model has fundamental flaws and assumptions but does not provide specific reasons and only includes vague references to the "initial start point" and "baseline data assumptions."

The DEIR examined groundwater-related impacts extensively. That analysis may be reviewed at DEIR Chapter 4.8 – Hydrology and Water Quality, the Groundwater Hydrology and Water Quality Analysis (Appendix K.2), the Groundwater Model Report (Appendix K.3), the Preliminary Drainage Analysis (Appendix K.5), and the West Yost Peer Review (Appendix K.7.) The commenter is also directed to Master Response 13 – Historic Hydrogeologic Assessments, and Master Response 14 – Adequacy of Groundwater Model.

### Response to Comment Ind 578-3
The commenter states that the DEIR should include more comprehensive management of asbestos but the commenter does not explain how the DEIR is inadequate in this regard. The commenter is directed to Chapter 4.3 of the DEIR which analyzes asbestos in the context of air quality impacts and Master Response 4 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 578-4
The commenter states that the DEIR excluded elements that would cause the project to exceed the GHG emissions threshold, but does not explain what elements were excluded. A net zero threshold for GHG emissions is not required for the project. Please see Master Response 27 - Greenhouse Gas Thresholds.

### Response to Comment Ind 578-5
Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 578-6
The commenter states that the DEIR does not discuss construction time estimates which impacts the noise, traffic, and air analyses. Please see Master Response 24 – Project Construction Schedule. As discussed in Master Response 24, the project assumes a compressed construction schedule where many activities overlap to provide the most conservative estimate of air quality, traffic, noise and other impacts. An increase in the duration of construction activities and/or the completion of activities sequentially would serve to reduce estimates of environmental impacts in many areas. As such, the approach taken by the DEIR overestimates impacts as compared to a longer construction schedule with less overlapping activities.

### Response to Comment Ind 578-7
The commenter states that the DEIR incorrectly assesses nighttime noise and underestimates noise from dumping of mine waster but does not provide specific reasons as to how the DEIR is inadequate. The DEIR discusses noise impacts in Chapter 4.10, Noise and Vibration. In addition, please see Responses to Comments Grp 21-130 and Grp 21-131.

## Response to Comment Ind 578-8

The commenter states that the DEIR must discuss the potential for moisture cloud plumes and associated impacts to aesthetics or air traffic hazards. Moisture clouds from mine ventilation are not expected to occur and would not cause air traffic hazards or change the significance conclusion of the DEIR for aesthetics. Please see Response to Comment Grp 7-95.

## Response to Comment Ind 578-9

Please see Response to Comment Grp 21-144.

## Response to Comment Ind 578-10

The commenter states that the DEIR does not demonstrate that the impacts to biological and aquatic responses would be less than significant, but fails to provide specific reasons why the DEIR is inadequate. The DEIR discusses impacts to biological resources in Chapter 4.4 and impacts to hydrology and water quality in Chapter 4.8.

## Response to Comment Ind 578-11

The commenter states that meteorological data used to assess the health risk of airborne pollutants does not fit Grass Valley's profile or accurately reflect local conditions. The dispersion model in the Health Risk Assessment used the most appropriate data for the HRA. Please see Master Response 17 - Meteorological Data Used in HRA**.**

## Response to Comment Ind 578-12

This comment is the signature line of the comment letter. A response is not required.

**Individual Letter 579**

To whom it may concern: 3/9/2022

The Idaho-Maryland Mine Project is a bad idea for the community. I am writing from Philadelphia, PA, and am the son-in-law of a Grass Valley resident, Caroline Courtright. I have been a corporate bond analyst for 16 years, covered the metals and mining sector for roughly 5 years, and that included gold miners. So, my perspective is from a financial analyst. That said, I am writing you on a personal level and not from my employer's perspective. I assume you will hear significant doubts about the negative environmental impacts the mine will have from other concerned citizens. Even though I agree with the opponents of the mine reopening on an Environmental, Social, and Governance (ESG) basis, I wanted to provide doubts on a financial basis.

**Ind 579-1**

Caroline told me about the potential of the mine reopening about 10 years ago following gold prices rising during that time. I thought it would be a near impossible act to reopen the mine in the middle of two cities then, largely because it would be too expensive to restart and operate the mine among an area that values the environment the way Nevada County residents do. Recently, I learned of the EIR that supports the mine reopening, so I wanted to learn more about the project as a potential investment, after all, Rise Gold is a publicly traded company.

I am appalled by the fact that there is so little financial information available from Rise Gold. Other investable gold miners utilize a metric called "All-In Sustaining Costs" (AISC) to describe the cost to produce one ounce of gold. AISC's line items include cost of sales excluding depreciation and amortization, royalties, and production taxes but includes treatment and refinement charges. In addition, AISC's additional costs include sustaining capital expenditures, leases, general and administrative costs, and minesite exploration and evaluation costs. The lowest cost gold miner can operate in the $1,000/ounce area (Barrick Gold) and other higher cost operators (New Gold) operate in the $1,500/ounce range. This variance is largely due to by-product credits (Barrick's mines contain copper as well as gold). Simply put, if gold prices fall below $1,500/ounce, New Gold would stop mining gold because it would be losing money. Rise Gold has not published its expectations for AISC. I think this information is pertinent because that metric would inform Grass Valley and Nevada City citizens and the potential employees of Rise Gold when the mine can be expected to operate.

**Ind 579-2**

Rise Gold has not published a feasibility study for the Idaho-Maryland mine. The goal of a feasibility study is to demonstrate the project is economically viable if it is designed, constructed and operated in accordance with the concepts set forth in the study. The feasibility study will define the Ore Reserves, the mining methods, the mineral processing concepts, and the scale of the project. To my knowledge, Rise Gold has commented on the mining methods, mineral processing concepts, and some aspects of the scale (1,000 tons/day). Every other gold miner I covered performed a feasibility study in order to convince investors the investment in a new project was a good one. The process can take up to 7 years. The fact Rise Gold has not performed a feasibility study is concerning not only for potential investors but also the community does not know if the mine can operate profitably. If Rise is promising 300 jobs once the mine is fully operational, we do not know the time frame of the mine opening, the time to full production, nor do we know how long the mine can operate. Every gold miner publishes in its 10-K and Annual Report its Reserves and Resources. Those numbers provide the mine life to investors (the calculation is simply Reserves/Annual Production). The fact Idaho-Maryland operated from 1866-1955 would suggest the Reserves and/or the Resources might be minimal. This should be disclosed to everybody. Here, I note that the Reserves and Resources change every year with the price of gold. Some gold reserves at different mines are more costly to extract than others; therefore, a gold miner has to annually adjust its Reserves and Resources.

**Ind 579-3**

Aside from the lack of AISC, the lack of Reserves, and the lack of a total project cost, which makes Rise Gold a poor investment, Rise Gold has a complete lack of capital for a full scale mine. Rise Gold stated it would pay 300 people an average of $90,000/year during full production. Those would be

**Ind 579-4**

nice jobs to have in Nevada County, but how can Rise Gold pay those people $27 million/year when its market capitalization is $15.8 million? Rise's most recent equity financing totaled $2.4 million. I do not know what that Use of Proceeds are, but this financing as well as recent other investments in Rise Gold amount to kicking the can down the road. Due to Rise Gold's poor capital position, I would question the Company as a going concern and its ability to fund the operations.

**Ind 579-5**

On the ESG front, I do not see how one could invest in Rise Gold. On an environmental basis, it is impossible for the environment to benefit with a gold mine operating in the populated area. There are too many operational risks that could occur even for an experienced miner, let alone the CEO of Rise Gold. Local high paying jobs is the only social benefit. On governance, the CEO appears to be untrustworthy based on his previous experiences with trying to mine gold in other parts of North America. The CEO is the only employee of the Company according to Rise Gold's 10-K, so he has no checks and balances. He has little expertise on operating a mine which does not bode well for the likely failure of mining operations in an area where catastrophe could occur and create unwanted or unexpected fallout.

**Ind 579-6**

In sum, Rise's inability to produce basic gold mining fundamental operating costs, reserves, and project cost forecasts should limit its ability to produce from Idaho-Maryland forever. If history is any guide, gold prices will remain volatile, and Rise Gold will over promise and under deliver. It would be a disgrace to allow Rise Gold the opportunity to mine anything from Nevada Country over 5 years, let alone 80 years.

Sincerely,
Mike Frey

Idaho.mmeir@co.nevada.ca.us

## INDIVIDUAL LETTER 579: MICHAEL FREY

### Response to Comment Ind 579-1
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

### Response to Comment Ind 579-2
The comment does not address the adequacy of the DEIR. The financial concerns of the comment are outside the scope of CEQA. Please see Master Responses 1 and 2.

### Response to Comment Ind 579-3
The comment does not address the adequacy of the DEIR. The financial concerns of the comment are outside the scope of CEQA. Please see Master Responses 1 and 2. The commenter also states that the reserves and resources within the project area might be minimal; however, no evidence is provided to substantiate this speculative claim. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." Since 2018, Rise has been conducting exploration drilling to characterize underground resources in anticipation of future mining. Earlier exploration drilling as part of the former Emgold application has confirmed presence of gold resources.[3]

### Response to Comment Ind 579-4
The comment does not address the adequacy of the DEIR. The financial concerns of the comment are outside the scope of CEQA. Please see Master Responses 1 and 2.

### Response to Comment Ind 579-5
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 through 3.

### Response to Comment Ind 579-6
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

April 4, 2022

Matt Kelley, Senior Planner

(Sent electronically to Idaho.MMEIR@co.nevada.ca.us)

Nevada County Planning Department

950 Maidu Avenue, Suite 170

Nevada City, CA 95959-8617

Subject: Idaho-Maryland Mine Project Draft EIR (SCH # 2020070378)

Dear Mr. Kelley,

**Ind 580-1**

Thank you for the opportunity to review and comment on the Draft Environmental Impact Report (Draft EIR) for the proposed Idaho-Maryland Mine Project (proposed project). The proposed project would reinitiate underground mining and gold mineralization processing for the Idaho-Maryland Mine over an 80-year permit period with gold mineralization processing and underground exploration and mining proposed to operate 24 hours a day, 7 days a week during full operations. The operations of the proposed project would allow for unmitigable impacts on our community for 80 years resulting in significant and unavoidable environmental impacts as well as damage the character and vitality of the community.

**Significant and Unavoidable Impacts**

The Draft EIR has determined that the following project impacts would remain significant and unavoidable, even after implementation of the feasible mitigation measures:

**Ind 580-2**

• Aesthetics

The Draft EIR determined that the proposed project would result in a significant impact related to substantially degrading the visual character or quality of the site and its surroundings. Even after mitigation, the impact would remain significant and unavoidable. The Draft EIR also determined that the project's incremental contribution to the significant cumulative impact related to substantial degradation of visual character or quality would be cumulatively considerable and significant and unavoidable.

• Noise

1

**Ind 580-2**

The Draft EIR determined that during construction activities, the project could result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity (i.e., residents along East Bennett Road during construction of the potable water line). Even with implementation of mitigation, the impact would remain significant and unavoidable.

• Transportation and Circulation

The draft EIR determined that the proposed project would result in a significant impact at three study intersections under the EPAP Plus Project scenarios, one of which would be significant and unavoidable even after mitigation (Brunswick Road/SR 174). The Draft EIR also determined that the proposed project would have a cumulatively considerable incremental contribution to two intersections under both Cumulative Plus Project scenarios, one of which would be significant and unavoidable Draft EIR Idaho-Maryland Mine Project December 2021 Chapter 6 – Alternatives Analysis Page 6-8 even after mitigation (Brunswick Road/SR 174). In addition, the project's incremental traffic would cause a significant impact at one intersection queue during both Cumulative Plus Project scenarios (Brunswick Road/Sutton Way). Mitigation measures are identified and required for the aforementioned cumulative impacts, but it cannot be guaranteed that the measures would reduce the incremental impacts to a less than cumulatively considerable level.

**Preference of the No-Build Alternative**

Preference of the Environmentally Superior Alternative, which is Alternative 1: No Project (No-Build) Alternative. The No-Build ensures that the project area and the public would not result in project related impacts in the following CEQA Appendix G sections:

- Aesthetics
  - The proposed project would result in a significant impact related to substantially degrading the visual character or quality of the site and its surroundings. Even after mitigation, the impact would remain significant and unavoidable. The proposed project would result in tailings, the reduction of vegetative cover, the erection of industrial use buildings, mining equipment, engineered fill, and frequent trucks to transport materials. The No-Build would not impact the visual character or quality of the site and its surroundings.
- Air Quality
  - The proposed project would result in more truck traffic to the project area resulting in more air quality emissions, which may affect the health of the community even with the implementation of mitigation measures. The No-Build would not disturb naturally occurring asbestos as could possibly occur during underground mining.

**Ind 580-3**

- Biological Resources
  - The No-Build would not have the potential to impact special-status plants, foothill yellow-legged frog, western pond turtle, California red-legged frog, California black rail, coast horned lizard, special-status bats, and non-special status raptors and migratory birds. In addition, the Alternative would not result in any substantial adverse effects on riparian habitat and/or other sensitive natural communities and/or have a substantial adverse effect on federal or State protected aquatic resources.
- Cultural Resources
  - The No-Build would not substantial adverse effect would not occur to the underground mine workings, which were determined to be historically significant pursuant to the National Register of Historic Places (NRHP) and California Register of Historic Resources (CRHR). The No-Build would not impact any unknown cultural and tribal cultural resources should they be encountered during construction.
- Energy
  - The No-Build would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. The No-Build would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.
- Geology/Soils

- The No-Build would not include underground mining and generation of engineered fill, grading or other ground-disturbing activities, substantial soil erosion would not occur. In addition, the near-surface geotechnical features identified for closure due to dewatering of the mine would not be adversely impacted, though they may currently pose some level of risk that would continue under the Alternative. Other geotechnical issues that could pose a significant effect under the proposed project, but would not pose an adverse effect under the Alternative, include potential seismic hazards at the Brunswick Industrial Site and slope stability associated with temporary steep cut slopes at the new service shaft collar. However, the proposed project would fix a few existing geotechnical issues that would remain under this Alternative, including the safety concern related to the presence of the South Idaho Shaft on the Centennial Industrial Site, and an unstable portion of the clay-lined pond dam on the Brunswick Industrial Site.

- Greenhouse Gas Emissions
  - The No-Build would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment or conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.
- Hazards & Hazardous Materials
  - The proposed project could result in a significant impact related to creating a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials, specifically, the transport and underground storage and use of explosives at the Brunswick Industrial Site. Compliance with applicable federal (MSHA, OSHA), State (CCR), and local regulations, and the additional mitigation measures in the Draft EIR, would reduce the significant hazard related to transport, underground storage and use of explosives to a less-than-significant level. Because the use of explosives would be eliminated under the No-Build, the significant impact would also be eliminated. The Draft EIR determined that the proposed project could result in a significant impact related to creating a significant hazard through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment related to the Brunswick Industrial Site, given the presence of elevated arsenic in the southeastern paved area, potential residual petroleum contamination in a few locations, and presence of groundwater monitoring wells of unknown status. The No-Build would result in fewer
  - impacts related to hazards and hazardous materials.
- Hydrology/Water Quality
  - The No-Build would not result in on-site construction disturbance or above-ground operations such that the following project-related significant impacts to water quality would not occur: Centennial Industrial Site: engineered fill pad construction; Brunswick Industrial Site: operations within industrial area, underground placement of Cement Paste Backfill, use of clay-lined pond for water treatment process purposes, engineered fill pad construction, and treated water discharge in South Fork Wolf Creek. In addition, the No-Build would not necessitate dewatering of the mine; thus, there would not be a substantial reduction in groundwater supplies resulting in effects to nearby wells, though the proposed project includes mitigation to offset impacts to wells (i.e., provision of potable water service). Further, due to the lack of on-site operations, the No-Build would not result in the substantial alteration of drainage patterns, and for the Centennial Industrial Site, risk release of pollutants in a flood hazard area.
- Noise
  - The No-Build would not result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity, nor a substantial permanent increase in ambient noise levels in the vicinity of the project due to haul truck traffic. In addition, the Draft EIR concludes that the combined operational noise sources at the Brunswick Industrial Site could result in a significant noise impact. With respect to vibration, the Draft EIR determined that while blasting is not projected to exceed applicable thresholds, a ground vibration monitoring program should be implemented to determine the actual levels of ground vibration at commencement of mining. These operational noise and vibration impacts would not occur under the No-Build.
- Tribal Cultural Resources

3

- The No-Build would not impact any unknown cultural and tribal cultural resources should they be encountered during construction.

- Transportation
  - The No-Build would not generate construction traffic or operational vehicle traffic on local roadways and, thus, unlike the proposed project, the Alternative would not result in a significant construction traffic impact, nor would General Plan LOS policy conflicts occur under the EPAP Plus Project conditions to the intersections of Brunswick Road/Idaho Maryland Road, Brunswick Road/SR 174, and Idaho Maryland Road/Centennial Drive; and under the Cumulative Plus Project scenarios to the intersections of Brunswick Road/SR 174 and Sutton Way/Dorsey Drive. The proposed project would also result in a significant effect to the intersection queue during the Cumulative Plus Project scenarios (Brunswick Road/Sutton Way), which would not occur under this Alternative. Further, the Draft EIR determined that proposed project (Brunswick Industrial Site operations) would have an impact related to truck turn movements at the Millsite Road/E. Bennett Road project egress at the Brunswick Industrial Site; this effect would not occur under this Alternative. The Draft EIR determined that some of the above-noted impacts would be considered significant and unavoidable due to the uncertainty concerning certain mitigation measures. The subject impacts are the EPAP Plus Project and Cumulative Plus Project intersection impacts to Brunswick Road/SR 174 and the Cumulative Plus Project intersection queue at Brunswick Road/Sutton Way. These significant and unavoidable impacts would be eliminated under this Alternative.

- Wildfire
  - The No-Build would not result in a significant impact related to exacerbating wildfire hazards, as compared to the proposed project. For example, above-ground machinery would not be operated at both project sites. Therefore, potential vegetation fires associated with on-site equipment operations would be substantially reduced under the No-Build.

**Beyond the Scope of CEQA**

CEQA can be narrow in scope and does not address various issues such as social or economic issues.

The Draft EIR notes relevant caselaw on how impacts on private views are not studied under CEQA. Although this is true and accurate under CEQA, the property owners for those that would be impacted by the next 80 years of constant operation and construction would surely face a reduction in property value. Overall, the operations of the mine may act as a deterrent for the community and reduce the overall appeal of tourism as well as the demand for property within the area.

**Ind 580-4**

California droughts are affecting the entire state and the dewatering of our ground water supplies are going to exacerbate the issue. The area is highly prone to wildfire and the existence of the proposed project will exacerbate the wildfire risk within the project area which would affect the community at large. The permit period of 80 years is far too long, that is longer than most individuals may live and could have devastating effects on the community that would go unchecked for 80 years. The jobs the proposed project may bring into the area do not offset the potential impacts to the community and the environment. This is a quaint and appealing town, please do not decimate the positive aspects of this town for big business.

Thank you for the opportunity to review and comment on the Draft EIR. If you have any questions or would like clarification, please contact me here, mlhabeeb338@gmail.com.

Sincerely,

P lfkdhd#K dehlhe

Michael Habeeb

## INDIVIDUAL LETTER 580: MICHAEL HABEEB

### Response to Comment Ind 580-1

The comment does not directly address the adequacy of the DEIR. The commenter states that the DEIR identifies impacts that are considered significant and unavoidable.

The DEIR states that, before approving a project, the lead agency shall certify that the Final EIR has been completed in compliance with CEQA, and that the Final EIR has been presented to the decision-making body of the lead agency, which has reviewed and considered the EIR. (DEIR, p. 1-9.) The lead agency shall also certify that the Final EIR reflects the lead agency's independent judgment and analysis. (*Ibid.*) The findings prepared by the lead agency must be based on substantial evidence in the administrative record and must include an explanation that bridges the gap between evidence in the record and the conclusions required by CEQA. (*Ibid.*) If the decision-making body elects to proceed with a project that would have significant unavoidable impacts, then a Statement of Overriding Considerations explaining the decision to balance the benefits of the project against unavoidable environmental impacts must also be adopted. (*Ibid*.)

### Response to Comment Ind 580-2

The comment restates content from the DEIR and does not address its adequacy. No further response is required.

### Response to Comment Ind 580-3

The commenter indicates a preference for the No Project Alternative and does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 580-4

The comment expresses property value concerns, which are outside the scope of CEQA. Please see Master Responses 1 and 2. The commenter also expresses concerns regarding drought and wildfire. Please see Master Response 6 – Wildfire Impacts and Master Response 16 – Drought and Climate Change. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

RE: Idaho-Maryland Mine DEIR Deficient

The Idaho-Maryland Mine DEIR is deficient as it contains incomplete analysis of individuals whose wells will fail due to mine operations. As a proposed mitigation measure, persons whose wells fail will be forced to connect to and use NID water as their source of potable water.

**Ind 581-1** According to the NID Annual Water Quality Report 2020, treated water delivered by NID contains both haloacetic acids and trihalomethanes. Both haloacetic acids and trihalomethanes are known and real carcinogens. To fully analyze impacts on persons whose wells fail due to Idaho-Maryland Mine operations, it is necessary to include the procedures and costs necessary to remove haloacetic acids and trihalomethanes from the water provided by NID to persons forced to use NID water. This analysis is required due to the exposure to carcinogens as a result of mine operations – an exposure to which they are not currently subjected.

**Ind 581-2** According to the NID Annual Water Quality Report 2020, treated water delivered by NID also contains chlorine. Chlorine is emerging as a suspected carcinogen and is the subject of much research regarding its impact on health, particularly regarding its effects on those suffering from chronic respiratory disease (including asthma), those with food allergies, and other at-risk groups. Consequently, the Idaho-Maryland Mine DEIR must also identify those groups who may be negatively impacted by being forced to consume and use chlorinated water and the procedures and costs to remove chlorine from the water provided by NID to these groups.

**Ind 581-3** According to the NID Annual Water Quality Report 2020, treated water delivered by NID contains numerous other substances all of which must be analyzed for their potential impacts to determine the necessity of removing such substances from the water to be delivered to those forced onto NID water usage as a result of Idaho-Maryland Mine operations. For those substances requiring removal, the DEIR must present an analysis of the procedures and costs to NID of attaining effective removal.

Thank You,
Michael Leydon

## INDIVIDUAL LETTER 581: MICHAEL LEYDON

### Response to Comment Ind 581-1

Please see Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding the commenter's treated water concerns, it is noted that drinking water supplied to Nevada Irrigation District (NID) customers continues to meet and exceed state and federal public health standards, based on testing results that serve as the basis for the District's Water Quality Report.[4] As noted in the Water Quality Report, the reported haloacetic acids are below the maximum contaminant level, and therefore, no violation is reported. The same is true for trihalomethanes.

### Response to Comment Ind 581-2

The NID Annual Water Quality Report (Reporting Year 2021) indicates that reported chlorine levels are below the maximum contaminant level, and therefore, no violation is reported. Please also see Response to Comment Ind 581-1.

### Response to Comment Ind 581-3

As noted in Response to Comment Ind 581-1, drinking water supplied to Nevada Irrigation District (NID) customers continues to meet and exceed state and federal public health standards, based on testing results that serve as the basis for the District's Water Quality Report.

**Ind 582-1**

I read today that a few hundred postcards in support of the mine proposal went to the board today. I'm sure the board will realize that this is a massive minority view.

Just wanted to formally comment my opposition to this proposed renewed mine.

Thanks

## INDIVIDUAL LETTER 582: MICHAEL MALAKIAN

### Response to Comment Ind 582-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1.

**From:** MICHAEL SHAW
**To:** Matt Kelley; bdofsupervisors
**Subject:** Opening the Mine
**Date:** Monday, February 28, 2022 5:01:33 PM

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Matt and Board of Supervisors,

I am writing to you about my concerns regarding the mine. I have read the draft of the Impact Report and find it to be deceptive in so many areas that I could write a book about it. I will only address one issue in this email though, ground water.

**Ind 583-1**

Removal of the water from the mine, or "dewatering" as it is casually refers to it as being. The models used are incorrect according to hydrologists that are not paid for by the mine. Per hydrologists with no skin in the game, the report is not accurate and assumes a lot that is not proven. For one thing the source of the water on Banner Mountain and the surrounding areas for miles in all directions, comes from Mount Lassen. Tests prove that this is a fact. Another fact about this is that it takes the water about 40 years to arrive here from Mount Lassen. Removing the water from the mine will not only remove the water in the mine but it will eventually remove the water in every well above the level of the pumps, with the higher elevations of course, being the first to lose water. Not only will the wells dry up but so will the ground. The removal of the water will also remove the hydraulic pressure the water creates in the groundwater. The hydraulic pressure is what drives the water through the billions of small openings allowing it to spread throughout the area. Wells drying up is only part of the problem. The forests will suffer as well. What about the residents? Where will our water come from? There is no other water service in our area. There are numerous homes with no access to NID water currently. Who will install the water infrastructure to these homes and who will be forced to pay for it? How long would that take and when would it begin? What would we do for water in the mean time? Is NID going to pay for the installation and absorb the costs? I doubt this very much. More likely it could cost each resident tens of thousands of dollars to have water mains and service to their homes installed. We don't have that sort of money to spend on water. Our property values would drop to zero. We could not sell our home for market value if we wanted to move away. Fire insurance which is already much too high would be even more unaffordable if it was even available. And who knows what else could be in the nasty details of this bad prospect as a result.

**Ind 583-2**

**Ind 583-3**

**Ind 583-4**

**In 583-5**

I urge you to please say no to this fraudulent scheme.

Thank you for taking a moment to read my email.

Sincerely,
Michael Shaw

## INDIVIDUAL LETTER 583: MICHAEL SHAW

### Response to Comment Ind 583-1

The commenter states that the DEIR is inadequate with regard to groundwater impacts because independent hydrologists that the DEIR is inaccurate. However, the County's independent consultant, West Yost, peer reviewed the DEIR's Groundwater Hydrology and Water Quality Analysis and Groundwater Model Reports for the project. (DEIR, p. 4.8-40; Appx. K.7.) The commenter is also referred to Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 583-2

The commenter states that the dewatering of the mine will result in adverse impacts to groundwater supplies. The DEIR found that impacts to groundwater supplies would be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 583-3

The DEIR found that impacts to groundwater supplies would be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 583-4

The DEIR found that impacts to groundwater supplies would be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 33 – Groundwater Dependent Vegetation.

### Response to Comment Ind 583-5

The commenter is concerned that the project's potential impacts to groundwater supplies would have an adverse effect on property values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

**Individual Letter 584**

**From:** MICHAEL SHAW <ten9t7mike@aol.com>
**Sent:** Monday, April 4, 2022 1:50 PM
**To:** Idaho MMEIR
**Subject:** Negative Impact Vote

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hello, I have written to the supervisors and planning commission on numerous occasions expressing my opposition to this proposal. I have read the Draft EIR and I have read the comments by those in favor of the mine. What I have not read, however, is where the people that are in favor of the mine reside. It is my bet that they live in areas that are not negatively impacted by the mine's operations. They do not have a well that will be effected, nor will they be in an area of the constant noise, or have to feel the rumbling and blasting day and night, or breathe the air that will have cancer causing pollution blowing for miles around, or deal with the trucks and diesel fumes. In fact, I would bet they live where nothing changes for them, and they only see the promised benefits that is Rise Grass Valley is telling will be the payoff.

**Ind 584-1**

I am happy that this is an issue that an important board of informed and reasonable people will decide on. If it were to be put to a vote of the public, where most likely, many of the non impacted people live, they would likely vote to pass this measure. And why not? If it goes wrong, who cares? What can go wrong?

Thank you for taking a moment to read this.

Sincerely,

Michael Shaw

## INDIVIDUAL LETTER 584: MICHAEL SHAW

### Response to Comment Ind 584-1

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 585**

Certified Number 7021 0350 0002 0513 5112
Return Receipt Requested

March 23, 2022

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Ave Ste 170
Nevada City CA 95959-7902

**Ind 585-1**

This contains my comments on some of the inadequacies present in the Draft Environmental Impact Report. And while I appreciate the extra time you allowed, I did not have time to review the entire 1070-page document, appendixes, technical reports, plans, etc., that took the Raney Planning and Management firm nearly two years to review and prepare.

**Noise**

**Ind 585-2**

I take strong issue with the findings of the Noise and Vibration Study. The study's predictions shown for my home are impossible to believe. Noise and Vibration Study Figure 3 shows my house as number 28. For my location, Table 6 lists the baseline ambient daytime noise at 51 db and nighttime noise at 44 db, which according to Figure 2, is the sound of a refrigerator hum or electrical transformer. I've lived at this location for 13 years and, based on my experience, know that both of these figures are overstated. Although I cannot afford a sound study to prove my point, please consider the following:

**Ind 585-3**

According to the Noise and Vibration Study, the **engineered fill operation** will take place 500' behind my house. Currently, there is just a forest back there with no mechanical or other human noise-producing activity of any kind. Yet Table 17 predicts the fill operation will only be 47 db at my location – less than what the study says is the current ambient daytime noise (51db). This means that 50-100 runs by diesel haul trucks dumping rock out of steel bed trailers, then being graded and compacted by heavy earthmoving equipment emitting backup beeps, will be quieter than no activity at all. **This makes no logical sense.**

**Ind 585-4**

According to the Noise and Vibration Study, mineral processing will take place 2,000' from my house. Table 22 has the predicted cumulative noise from all nighttime mine operations as being 26 db at my location. This means the study predicts that hoisting 1000 tons of soil and rock 85' above the surface and dropping it into a steel chute, then transporting it 335' on a conveyor and grinding it down, will be quieter than no activity at all (44 db). It predicts that at my house, all this activity, running 24 hours a day, will be quieter than rustling leaves. **I fail to see how any logical person could come to this conclusion and believe this demonstrates the inadequacy of the sound study.**

Ind 585-5

**In my August 11, 2020 letter I asked that the county ensure the Draft Environmental Impact Report addressed how such a situation could exist. It did not. The draft EIR is incomplete because it does not explain how a mine operating 24 hours a day can possibly be quieter than having no mine at all.**

**Air Quality**

Ind 585-6

In my August 11, 2020, scoping letter I asked "What contaminants will be in the air exhausted from the mine shaft; where will the wind carry them; and where will the contaminants come down? What impact on the environment will these contaminants have during the 80 years the mine is expected to be open?" **My questions were not answered in the draft EIR.**

Ind 585-7

I see that in the draft EIR, toxic air contaminants [TACs] are addressed under the section on air quality and greenhouse gas emissions. The direction of prevailing winds and pollutant concentrations from a wildfire are discussed and we are told the TAC emissions associated with blasting and crushing would include asbestos and silica emitted from the fugitive dust produced and would also result in emissions of heavy metal TACs including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium. Appendix E.1 says, "These emissions could result in elevated concentrations of TAC emissions at nearby receptors, which could lead to an increase in the risk of cancer or other health impacts." However, the applicant's "Proposed Emissions Reduction Measures" only discusses vehicle exhaust emissions and surface fugitive dust control. It does not address TAC emissions from the air exhausted from the mine. I do not see any mention of where the prevailing winds will carry the asbestos, silica, arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium released from the air exhausted from the mine or where these contaminants will come down. Although health impacts are discussed in Appendix E.1, after checking the draft EIR, Appendix E.1, and the Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan, I can find no mention or discussion of the effects of the exhausted contaminants over the 80-year life the mine is expected to be open.

The draft EIR is incomplete because it does not address where the wind will carry the contaminants **exhausted from the mine** (not from mine vehicles), where the contaminants will come down, and what impact on the human health and the environment these contaminants will have during the 80 years the mine is expected to be open. Nor does the draft tell us how far vehicle tires will carry contaminants that have been exhausted from the headframe and come down on roadways away from the mine site.

**Mineral Rights**

Ind 585-8

The description of the mineral rights owned by Rise Grass Valley are too vague to be of any value: "The much larger mineral rights boundary encompasses **approximately** 2,585 acres and **generally** contains properties surrounding the Brunswick and Centennial Industrial Sites, with the **majority** of additional land area located north of the Brunswick Industrial Site and east of the Centennial Industrial Site. This **generally** includes most of the Nevada County Airport and

surrounding Air Park, as well as property along both sides of Brunswick Road, Greenhorn Road, and Idaho Maryland Road [emphasis added]."

The map provided in the draft EIR Figure 3-2 outlining the mineral rights areas, does not provide enough information to determine whether an individual's property lies within the mineral rights boundary. Only a few major roadways are identified.

**A more detailed map, showing street names along the mineral rights boundary is needed. A more complete description of the mine's mineral rights area also is needed. Such a description should list the parcel IDs of the properties the mineral rights are under.**

The map provided in the draft EIR Figure 3-2, Project Location Map, identifies two detail maps – 3b and 3c, however nowhere in the draft EIR are maps identified as detail 3b and 3c available. **These two detail maps need to be included.**

**Emergency Evacuations**

DEIR Section 4.7-4 states that the mine's impact would be less than significant with an adopted emergency response plan or emergency evacuation plan.

**Ind 585-9**

The analysis contained in Section 4.7-4 of the mine's effect on emergency evacuations is **incomplete as it only discusses the impact haul trucks would have on evacuations**. The section **does not** examine the effect the evacuation of **mine employees** would have on the emergency evacuation of area residents. The draft EIR, Table 3.8, "Operations Workforce" shows there will be 111 employees per shift, thus there will be many vehicles - up to an additional 111 - exiting on Brunswick Road during an emergency evacuation. The draft EIR points out that, "According to Table 4.1 of the Circulation Element of the General Plan, Brunswick Road is considered a Minor Arterial, and thus, is not a primary evacuation route for the County." (Note that Brunswick Road will be the major road for trucks and other mine-related vehicles to use.) There may be no way to mitigate the mine adding up to 111 additional vehicles onto a minor arterial during an emergency evacuation. In addition, there is no mention of what action would be taken if an emergency evacuation took place while a truck carrying explosives was en route to the mine on Brunswick Road or was being unloaded at the mine site at the time of an evacuation. **These two omissions could change the impact under Section 4.7-4 to "significant" and need to be reviewed.**

**Ind 585-10**

**Explosives**

**Ind 585-11**

Draft EIR section 3.7 states that "Explosives would be transported to the Brunswick Industrial Site a maximum of once a week to a minimum of once every three weeks." Section 4.7-1 states "During operations, explosives would be transported to the Brunswick Industrial Site a maximum of once a week and a minimum of once every three weeks. **During initial underground construction, explosives may be transported to the site more frequently** [emphasis added]."

However, Section 4.7-1 also tells us, "The Hazardous Material Inventory Statement for Brunswick provides that a maximum of 28,000 pounds of explosives will be stored underground. Rise intends to use approximately 0.93 tons of explosives and approximately 257 detonators per day...."

By dividing the total pounds of stored explosives by the number of pounds used per day, it is apparent that the entire stock of explosives would be depleted in 15 days – 0.93 tons/2,000 pounds per ton=1,860 pounds used per day. 28,000/1,860=15 days. Thus, it is **not operationally feasible** that delivery of explosives would take place only once every three weeks.

As shown above, Sections 3.7 and 4.7-1 need to be recalculated to show an increase in explosives delivery to more accurately reflect that – at a minimum – explosives would have to be transported to the site every two weeks**. Since more frequent transportation and above-ground handling of explosives increases risk, it would be logical to assume that the level of significance would also change.**

**Ind 585-12**

Rise Grass Valley says they will use 257 detonators a day, however, there is no information on how many detonators or detonating cords will be stored in the explosives magazines or how often they will be transported through Grass Valley. Only ammonium nitrate is included in the 28,000 pounds of explosives shown on the "The Brunswick Industrial Site Nevada County Department of Environmental Health Hazardous Materials Inventory Statement Form" submitted by Rise Grass Valley. Draft EIR Table 4.7-1, "Explosives Proposed to be Used at Project" lists the following Detonators - Digishot, Driftshot, NONEL EZ, NONEL LP, i-kon, Exel, Handidet. However, none of these are listed on the Hazardous Materials Inventory Statement Form mentioned above. In addition, Table 4.7-1 lists hazard classes of 1.1b or 1.4b for the detonators. Since hazard class 1.1b includes "Explosives that have a mass explosion hazard" and 1.4b includes "Explosives that present a minor explosion hazard," **the draft EIR needs to provide the names of the actual detonators that will be used, their hazard class, the quantity of each type kept in the explosives magazines and the frequency of transportation**. Without this information, the draft EIR cannot be adequately evaluated.

**Diesel Fuel Tanks**

**Ind 585-13**

Table 3-5 of the Draft EIR maintains there will be two 12,000-gallon diesel fuel tanks at the Brunswick Site, yet both the initial Project Description (Tables 5 and 9) and the draft 3.0 Project Description (Tables 3-4 and 3-8) list one 30,000-gallon diesel fuel tank. **Which is it – two 12,000-gallon tanks or one 30,000-gallon tank?** Please provide the correct number and capacity of the diesel fuel storage at the Brunswick Site and reissue either the Draft EIR or Project Description with the correct information so it can adequately be reviewed.

**Asbestos**

**Ind 585-14**

Draft EIR section 4.3-2 Asbestos Dust Mitigation Plan does not address the following:

*"All visible track-out material (from vehicles leaving the work site) must be removed from all public roads at least once per day using wet sweeping or a HEPA-filter-equipped vacuum device."*

Since employee vehicles will exit on Brunswick Road, how will traffic on Brunswick Road be managed during the wet sweeping or vacuuming? How will traffic on East Bennet Road be managed? Will traffic be stopped during the operation? **None of this was considered in the traffic study.**

*"A gravel pad designed and maintained to effectively clean tires of exiting vehicles, a wheel wash system, or a minimum of 50 feet of pavement must be placed between the construction area and any public road, and must be used by all exiting vehicles (including personal vehicles and delivery trucks) throughout the duration of the project."*

**Ind 585-15**

Since the gravel pad or 50 feet of pavement are used to capture dust containing asbestos, it seems logical that the concentration of asbestos would be much greater in this area, yet there is no discussion of what happens to the asbestos dust captured in these areas during rainstorms or snow melts. **Where will the dust end up - will it wash into the south fork of Wolf Creek?**

*"All active storage piles shall be adequately wetted or covered with plastic to ensure that no visible dust crosses the property boundary."*

**Ind 585-16**

Since the piles of engineered fill will fall under this provision, this means **44 acres at the Centennial Site and 31 acres at the Brunswick Site would have to be kept adequately wetted around the clock or covered with an immense amount of plastic.** Yet Table 3.7, Hours of Operation only provides staffing for the Placement, grading, and compaction of engineered fill from 7:00 am to 3:30 pm Monday to Friday. There are no provisions for keeping the piles of fill adequately wetted outside of those hours. **Obviously, the wind does not stop blowing at 3:30 or on weekends.** Furthermore, the draft EIR section "Water Supply and Other Utilities" only provides water for compacting fill at the Centennial Site eight hours per day, five days per week. **If the Centennial fill piles need to be kept wetted after 3:30 pm or over a weekend, more water will be required. This has not been taken into consideration.**

**Methane**

**Ind 585-17**

There is a concern that the draft EIR incorrectly assessed the possibility of methane in the mine. The 1931 US Department of Commerce Bulletin 347, "Gasses that Occur in Metal Mines" tells us that methane is likely to be present: "In the Grass Valley (Calif.) gold-mining district, where carbonaceous shales are found in conjunction with or close to the gold-bearing measures, some rather extensive and troublesome accumulations of methane have been found." Yet the Air Quality and Greenhouse Gas Emissions Analysis Technical Report shows zero methane released from underground blasting/mining in Table 22. **It appears the author of the report assumed no methane is present in the mine. Bulletin 347 makes it clear more research is needed.**

**Brunswick Site Native Resident Wildlife**

This concerns draft EIR section 4.4, Biological Resources. According to the Brunswick Industrial Site and East Bennett Road Right of Way (ROW) Biological Resources Assessment (Brunswick BRA), the scope of the report was limited to evaluating the Brunswick and Centennial Areas for the presence of any sensitive biological resources including special-status plant and wildlife species. Out of the 133 pages in the report, only 185 words dealt with deer habitat on the Brunswick site and there was no discussion of any other native resident wildlife. As will be established below, draft **EIR section 4.4-4, which covers native resident wildlife rather than special status plants and animals, has an incorrect conclusion concerning the impact the mine will have on native wildlife at the Brunswick site.**

The biologist contracted by Rise GV says he "conducted reconnaissance-level wildlife surveys..." Based on these limited surveys and the "Migratory Deer Ranges Nevada County General Plan map," the biologist preparing the Biological Resources report stated, "The field surveys did not record any observations of deer. The Centennial Industrial Site and Brunswick Area do not contain any known major deer migration corridors, known deer holding areas, nor critical deer fawning areas." Because he did only a preliminary survey and did not observe any deer, he incorrectly concluded in draft EIR section 4.4-4, "Given the above, the proposed project would not interfere substantially with the movement of any wildlife and a less-than-significant impact would result."

**Ind 585-18**

Without observing any deer, the biologist decided that "The primary movement corridor within the Brunswick Industrial Site is South Fork Wolf Creek and its associated riparian zone." According to the two paragraphs devoted to Critical Deer Habitat in the Brunswick BRA, the biologists came to this decision by reviewing the Nevada County General Plan. The General Plan section on deer habitats was based on a 1991 California Department of Fish and Game study. A lot has changed at the Brunswick site since 1991 including the shutting down and removal of the Bohemia Sawmill which ran 24 hours a day. **The biologist was not hired to provide updated information concerning deer and other native wildlife and thus relied on 30-year-old information.**

Thirty-one acres of the 119-acre Brunswick site will be covered with engineered fill. To accommodate the fill, 18.7 acres of forested area will be clear cut. **This area is covered with game trails that the biologist chose not to investigate further or mention in his report.** I have lived next to the Brunswick site for 13 years and know that the site holds not only deer but contains other wildlife as well. To demonstrate this point, I purchased and placed a trail camera along obvious game trails (trails the biologist must have seen) in the site's forested and future fill areas from February 2021 through February 2022.

Exhibit A has screenshots from the trail camera, showing deer in different locations throughout the year and throughout the forest, including several of does and their fawns. I have many more examples of deer, some showing deer active at nighttime, but am limiting my exhibit to a

single page of daytime shots as it illustrates my point that the Brunswick site holds a year-round native deer population where doe give birth to their fawns.

Exhibit B shows that the forest is also home to many other species of animals that the biologist failed to mention or consider. These include, but are not limited to, black bears, mountain lions, bobcats, turkeys, opossums, and foxes. (Exhibit C shows the approximate locations where the trail camera was placed.) Exhibit B further shows that many of the animals inhabiting the Brunswick site are active at nighttime when it is dark and quiet. Yet even though the Brunswick site will create noise 24 hours a day and be illuminated by a total of 110 outdoor lights that will shine all night long, the biologist concluded, "...noise and nighttime lighting related to proposed operations would not be anticipated to result in adverse impacts to wildlife behavior." **Based on the many animals active at night this conclusion needs to be revisited.**

The Standards of Significance section of the draft EIR says, " a significant impact would occur if the proposed project would...Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." Exhibits A and B prove the operation of a mine and clear-cutting the forest would have a **significant effect** on established native resident wildlife. These pictures also demonstrate the limited scope of the biological study, which should put the entire study in question.

## INDIVIDUAL LETTER 585: MICHAEL SHEA

### Response to Comment Ind 585-1

This comment states that the DEIR is inadequate and the review period was not long enough for review. Responses to specific comments are provided below. CEQA requires a minimum 45-day public review period for DEIRs submitted to the State Clearinghouse (PRC 21091). The County elected to provide an extended DEIR review period of 91 days from January 4, 2022, to April 4, 2022. Thus, this extended review period is substantially longer than typically provided for a public comment period.

### Response to Comment Ind 585-2

The commenter disagrees with the findings of the Noise Study. The level of 47 dBA predicted for this receptor (Receptor #28) during daytime engineered fill operations at the Brunswick site is the noise-generation of the engineered fill operations alone. (DEIR pp. 4.10-5; 4.10-18 and Table 4.10-6.) When added to the existing average ambient daytime noise level of 51 dB at this receptor, the existing plus project noise exposure at this receptor computes to 52.5 dBA, or an increase of 1.5 dBA over existing average ambient conditions at this receptor. (Id.) An increase of 1.5 dBA is not considered significant relative to the project's standards of significance. The noise analysis was not intended to imply that the project would result in an overall decrease in existing ambient noise levels at any sensitive receptors in the project vicinity. Rather, it was intended to imply that the noise generation of the project by itself would be below existing ambient noise levels experienced at the nearest residences.

The commenter states that earthmoving equipment would emit backup beeps. However, Mitigation Measure 4.10-1, requires that all mobile equipment shall be fitted with broad-band “growler” type back-up warning devices rather than the conventional “beeper” devices, which “growler” type devices are known to be much less annoying.

### Response to Comment Ind 585-3

Please see Response to Comment Ind 585-4 below.

### Response to Comment Ind 585-4

The predicted level of 26 dBA Leq at this receptor during nighttime hours reflects the fact that engineered fill operations would not occur during nighttime hours. During engineered fill operations at locations closest to this residential receptor, the difference between cumulative project daytime and nighttime noise levels is substantial (25 dBA difference in average levels). The predicted level of 26 dBA during nighttime hours reflects the noise attenuation provided by intervening distance to the processing area noise sources (2,000 feet), intervening vegetation, atmospheric absorption, any shielding of project noise sources by proposed buildings or topography, and ground cover. It should be noted that the predicted nighttime level of 26 dBA Leq at this receptor is the noise-generation of the project operations alone. When added to the existing average ambient nighttime level of 44 dBA at this receptor, the existing plus project nighttime noise exposure at this receptor would still be equivalent to baseline ambient conditions. The noise analysis was not intended to imply that the project would result in a decrease in existing ambient noise levels at any sensitive receptors in the project vicinity. Rather, it was intended to imply that the noise generation of the project by itself would be below existing ambient noise levels experienced at the nearest residences.

## Response to Comment Ind 548-5

The noise analysis was not intended to imply that the project would result in a decrease in existing ambient noise levels at any sensitive receptors in the project vicinity. Rather, it was intended to imply that the noise generation of the project by itself would be below existing ambient noise levels experienced at the nearest residences. Please see Response to Comment Ind 585-4.

## Response to Comment Ind 585-6

A detailed analysis of airborne contaminants, modelled concentrations at receptor locations, and resulting health risk is provided in Chapter 4.3 and Appendix E.2 of the DEIR. The analysis in the DEIR concluded that air quality impacts from the project would be less than significant after implementation of required mitigation measures. (see DEIR Chapter 4.3.)

## Response to Comment Ind 585-7

The commenter states that the DEIR does not explain what direction the project's air emissions, including toxic air contaminants, will be carried. The commenter also states that the DEIR does not address contaminants carried by vehicle tires and exhausted from the headframe.

The health risk assessment (HRA) provides the health risk at the maximally exposed individual resident (MEIR) and has determined the health impact at the MEIR is less than significant. Prevailing wind speed and direction were accounted for in the HRA to determine where and how far emissions from the project would travel. (Appendix E.1 of the EIR.) As stated on page 27 of the HRA (Appendix E.1 of the DEIR), the MEIR would be the nearest existing residence to the north of the Brunswick Industrial Site. Emissions would be dispersed as distance increases from the emission source. Since the HR A presents the health risk levels at the maximally exposed individual, all other receptors in the vicinity of the project would have less exposure and consequently less potential health risk than the MEIR. Several commenters identified not being able to see the risk of the HRA visually. Isopleth figures were developed in response to these comments, which show where the project's emissions would travel. Please see Dudek Memo – Isopleths attached to the Final EIR as Appendix K.

The commenter asserts that the ASUR plan does not show the effects of the project's emissions. However, the ASUR Plan is a management plan and discusses how rock will be managed (including sampling and testing) in the future during operations to minimize the public's exposure to asbestos and is not an impact analysis. The project's emissions, impacts and mitigation are analyzed in Chapter 4.3 of the DEIR. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP.

The commenter states that the DEIR is incomplete because it does not state how far vehicle tires will carry contaminants that have been exhausted from the headframe and come down on roadways away from the mine site. Notably, CEQA requires a good faith effort to estimate emissions from the project during construction and operation. As such, estimation of emissions during the construction and operation of the project are based on project-specific information and industry-standard emission factors and models. Mitigation Measure 4.3-2 requires that "All visible track-out material (from vehicles leaving the work site) must be removed from all public roads at least once per day using wet sweeping or a HEPA-filter-equipped vacuum device." Further, the project design incorporates mobile tire washing plants. As such, the DEIR includes project features designed to prevent track-out and also requires mitigation for any track-out impacts and

consequently found the related impact to be less than significant. (see DEIR, p. 4.3-82.) The HRA prepared for the project (see Appendix E.1 of the DEIR) accounted for toxic air contaminant emissions from the headframe based on the AERMOD dispersion model. Results of the health risk modeling are conservative and based on the best available data currently available, as described in Appendix E.1 of the DEIR:

> The results determined in this analysis reflect reasonable estimates of source emissions and exhaust characteristics, available meteorological data near the project site, and the use of currently approved air quality models. Given the limits of available tools for such an analysis, the actual impacts may vary from the estimates in this assessment. However, the combined use of the AERMOD dispersion model and the health impact calculations required by OEHHA and NSAQMD tend to overpredict impacts, such that they produce conservative (i.e., health-protective) results. For this reason, the estimated cancer risks and noncancer hazard indices reported in this analysis are likely upper-bound estimates for potential exposure to project-related emissions. In addition, the estimated cancer risks and noncancer hazard indices represent the maximum exposed individual (resident) and do not represent the risk over a broad area. The actual risks of cancer or noncancer effects from the project are likely to be lower than presented herein.

## Response to Comment Ind 585-8

The commenter requests a map showing the individual parcels within the mineral rights area, but does not explain why this is necessary for the environmental analysis in the DEIR. Figure 3-2 of the DEIR shows the names of major roads and provides an air photo where most individual homes can be seen in relation to the mineral rights boundary.

Detail Maps 3b and 3c are shown in Figures 3-3 and 3-4 of the DEIR. Please also see Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 585-9

The commenter states that the DEIR's analysis of impacts to emergency evacuations is inadequate because it does not account for employee trips. With regard to employee vehicles during an evacuation, please see Master Response 5 – Evacuation Zones.

## Response to Comment Ind 585-10

The commenter questions what would happen if a truck carrying or unloading explosives was involved in an evacuation. The project truck traffic accounts for only approximately 1% of typical traffic on Brunswick Road and would not affect an evacuation. Please see Master Response 5 – Evacuation Zones. Trucks used for transportation of explosives would be evacuated similarly to any other vehicle during an evacuation.

## Response to Comment Ind 585-11

The commenter asserts that the frequency of explosives deliveries discussed in the DEIR is not accurate, and therefore the significance conclusion should be changed. As stated in the DEIR, explosives deliveries would take place from 1 to 3 weeks. (DEIR, p. 4-7.24.) The average of 2 weeks (15 days as calculated by the commenter) is implied from this range. As discussed on pages 14 and 15 of Appendix M of the DEIR, tunneling (drift) blasts would take place daily but production longhole blasting would take place once every 3-4 days. At certain times explosives may be consumed immediately upon delivery underground when loading larger production longhole blasts. Therefore, explosives consumption is not uniform over every day. As discussed in Chapter 4.7 of the DEIR, the transportation of explosives in the United States is highly regulated and has an excellent safety record. The analysis of explosives transport in Chapter 4.7 of the DEIR does not depend on the precise frequency of explosives delivery to determine the

significance of hazards. Therefore, an increase in frequency would have no effect on the DEIR's conclusion that a less than significant impact would result from explosives transport, storage, and use, after implementation of mitigation.

## Response to Comment Ind 585-12

The commenter asserts that the names of the actual detonators to be used, the hazard class and quality of each type of detonator, along with frequency of transportation must be disclosed in the DEIR. The analysis of explosives transport in Chapter 4.7 of the DEIR does not use the frequency of explosives delivery to determine the significance of hazards. As shown in Table 4.7-1 of the DEIR, the detonators used may be classified as either 1.1B or 1.4B but both are in Compatibility Group B, meaning they may be transported and stored together. The ratio of types of detonators would not result in any change to the conclusion of the DEIR and therefore specific details on brands and types of similar detonators, are not necessary or required for the DEIR. Engineering level detail, such as actual brands of detonators or the exact ratio of types, is not required in an EIR. (Dry Creek Citizens Coalition v. County of Tulare (1999) 70 Cal.App.4th 20, 26.)

## Response to Comment Ind 585-13

The commenter requests clarification regarding the DEIR's statements on a 30,000-gallon diesel tank, and other references to two 12,000-gallon diesel tanks. As stated in the DEIR (Table 3-5, Table 3-9, Table 3-10), the project proposes two 12,000-gallon tanks for storage of diesel. Chapter 3.0 of the DEIR is the project description. It is noted that page 1-14 of the DEIR references a 30,000-gallon diesel tank because this section summarizes comments from the public during the NOP scoping process, at which time a single 30,000-gallon tank was proposed; thus, there is no error or contradiction.

## Response to Comment Ind 585-14

The commenter asks how traffic will be managed during wet sweeping or vacuuming activities that are required to control dust. As shown in Table 3-9 of the DEIR, mobile tire washing plants are proposed to be used to wash truck tires of vehicles leaving non-paved areas where engineered fill would be placed. As shown in Figure 3-8 of the DEIR, all roads outside of the engineered fill piles are proposed to be paved. Therefore, vehicle tires will not require washing as they leave the Brunswick site onto public roads and would not leave visible track-out material on public roads. If necessary, the onsite paved roads could be cleaned to ensure employee and other vehicles do not track dust onto public roads. Mitigation Measure 4.3-2 requires an Asbestos Dust Mitigation Plan and the minimum requirements of the Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations are provided in the mitigation measure, which include the removal of visible track-out material. While the project by design is intended to prevent such track out material from occurring in the first place, any necessary wet sweeping or vacuuming activities would be accomplished during off-peak traffic hours and would only take several minutes to accomplish; therefore, no traffic impact from such cleaning would occur. As shown in Response to Comment Ind 648-4, Mitigation Measure 4.3-2, on page 4.3-83 of the DEIR, has been clarified to require that any necessary wet sweeping or vacuuming activities on public roads will be conducted so as to avoid peak AM and PM traffic hours.

## Response to Comment Ind 585-15

The commenter asserts that high concentrations of asbestos will result in the gravel pad or pavement areas used to clean exiting vehicle tires, and asks where the associated dust will go. Mitigation Measure 4.3-2 provides several options based on Section e(4)(A)(2) Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations. The project proposes

mobile tire washing plants to be used to wash truck tires of vehicles leaving non-paved areas where engineered fill would be placed and not rely on gravel pads or 50 feet of pavement to capture dust. Any sediment from tire washing would be captured onsite by the washing plant and disposed of onsite alongside the engineered fill being placed. It would not be washed into South Fork Wolf Creek or other waterbodies. As shown in Response to Comment Ind 648-4, Mitigation Measure 4.3-2 has been edited to add the word "or" in bullet point 3 to clarify that a gravel pad is not required if a wheel wash system is employed.

## Response to Comment Ind 585-16

The commenter asserts that the DEIR does not account for the hours of operation and water demand necessary for wetting of active storage piles, as required under Mitigation Measure 4.3-2, with respect to the engineered fill piles. However, the engineered fill piles are not considered active storage piles for the purposes of Mitigation Measure 4.3-2, because the compacted surface of the engineered fill is much more resistant to wind erosion than a loose storage pile from typical construction. Dust is generated from active disturbance (such as digging and dumping) of storage piles, while engineered fill surfaces that are not actively worked have no such disturbance and consequently are not an active source of dust emissions. Once material is placed and compacted it would not be removed again. Side slopes would be vegetated concurrently with construction and the surface would be vegetated after reaching final grade. Constant wetting of the entire site or covering of large areas with plastic is not proposed. As stated in Mitigation Measure 4.3-2, more practical and effective options, such as application of chemical stabilizers are available to control dust of inactive surface areas, if necessary (see Master Response 12 - Chemical Dust Stabilizers). Nevertheless, pursuant to Mitigation Measure 4.3-2 and the minimum requirements of the Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations, the project must ensure that visible dust does not cross the boundary of the property and that the project is in compliance with the approved Asbestos Dust Mitigation Plan and would be required to take whatever necessary measures to ensure compliance.

## Response to Comment Ind 585-17

The commenter asserts that the DEIR should consider impacts from methane in the mine and provides a historic document that states methane is associated with shale in the Grass Valley gold mining district. However, there is very little sedimentary rock or shale in located in the area of the Idaho-Maryland Mine (see Sheet 4 of Appendix K.2). Any mine gases that occurred underground would be heavily diluted by modern mine ventilation flows, which is much greater than those used in 1931. Furthermore, the US Mine Safety and Health Administration regulates the safety in underground mines and regulations include CRF 30 Part 57 Subpart T - Safety Standards for methane in Metal and Non-metal Mines. Methane from the underground mine therefore poses no risk to either the mine or the public**.**

## Response to Comment Ind 585-18

The CEQA guidelines require analysis of substantial interference to "the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." Migration is defined as the seasonal movement of animals from one habitat to another. Various animal, bird, and fish species are not automatically considered migratory just because they move from one location to another. Migration serves a purpose for the species such as winter/summer habitat for foraging or breeding. It is acknowledged and analyzed in the DEIR impact analysis (see section 4.4.4) that species exist within the project site that are common to the area. Potential impacts to these species were analyzed and mitigation measures have been provided where it was determined

impacts to species could occur as a result of project activities, including the implementation of preconstruction surveys and agency permitting requirements. The only migratory species acknowledged by the County General Plan is deer migration corridors. Per the Migratory Deer Ranges Nevada County General Plan map, the project site is located in an area of potential Deer Winter Range. The project site does not contain any known major deer migration corridors, known deer holding areas, nor critical deer fawning areas. Any deer within or adjacent to the project site would move outside the project site and would be uninhibited to move into and out of the project site and the areas outside the project site. Thus, substantial interference, which is the operative language in Appendix G of the CEQA Guidelines, would not occur to deer movement. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded it would be less than significant.

Hello,

I hope this message finds you well.

Our biggest concern is the de-watering of the mine.

**Ind 586-1** We live at the top of the banner and our well is 400 feet deep and is barely good enough to keep up with our household needs. There are lots of dry wells in our neighborhood and there is no other place on our property to drill a well. Our most recent verbal quote from NID is somewhere in the range of $50k, which would only get us a meter on banner lava cap. We would still need to pipe across several properties and install an intermediate tank on someone else's property.

Perhaps the risk would be justified if the mine was going to extract a mineral that is critical to our future, like lithium, nickel or cobalt.

Please let me know if you have any questions.

Thanks,
Mike

**Ind 587-1**

Hello,

I am a local resident of Nevada County of 25 years. I am a business owner as well in the downtown area. My family has a home located off Hwy 174. The mining history in this is County is nothing short of amazing. I have spent many days enjoying The Empire Mine and all that this towns Mining History has to offer. I would like to express my opinions about the Petition to reopen the Idaho Maryland Mine. I believe that the historic site should remain HISTORIC. I DO NOT WANT the project to BEGIN OR THE MINE TO REOPEN. The ecological damage that is sure to come if reopened would be devastating. Our water sources would be at risk , what little of it we have left. There are many reason why we should NOT reopen this mine. Including the lack of jobs it would present, the financial gain our community would NOT have and the 24 hr 7 day a week 80 year lease that would impact our community negatively. Thank you for Listening.
Michelene Bowman

## INDIVIDUAL LETTER 587: MICHELENE BOWMAN

### Response to Comment Ind 587-1

The comment does not directly address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project that do not enable a more specific response. For concerns related to water sources, please see Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 588**

~~I support re-opening the Idaho-Maryland Mine~~

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment will create over 600 new local jobs as a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employee-owned, family-supporting careers with an average expected annual earning of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families as they rebuild stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

I DO NOT SUPPORT RE-OPENING THE MINE!

**Ind 589-1**

Given years of drought, groundwater resources being over-utilized by more development, numerous wells already going dry, the idea of exploiting our limited water resources to benefit a foreign company with little cash reserves and no history of mine operation seems…the height of insanity.

Please vote against this ill-conceived proposal.

Thank you,
Michelle Lewis

## INDIVIDUAL LETTER 589: MICHELLE LEWIS

**Ind 590-1**

PLEASE DO NOT ALLOW THIS MINE PROJECT TO MOVE FORWARD IN NV COUNTY.

Through past employment, I have learned about and seen the destruction a major "modern" mining operation like the one proposed can produce in any environment.

Nevada County does NOT need and CANNOT support the disastrous environmental degradation of such an operation. If money or more jobs are needed in the county, we can promote much, much safer options, such as developing a world-class technology hub, among other things.

Thanks for your consideration.

**Ind 593-1**

Hello,
I understand you are receiving public comment from Nevada county residents about the proposed reopening of the Idaho Maryland gold mine. I'm a homeowner who has lived here for 10 years, and I operate two businesses in this county. I am strongly opposed to this mine project, and am in full solidarity with the concerns of the minewatchnc.org group.

**Ind 593-2**

This mine would pollute our water and air, drain our water table and hurt local wells, cause noise pollution, and risks our community's health. Gold mining has already had its run through this county, and the damages it's done to our local environment are plenty. Let's not go backwards on this.

Thank you for considering our concerns.

**Ind 594-1** Mines of any kind are environmentally unfriendly.

**Ind 594-2** 1) You risk our water table in a terrible drought

**Ind 594-3** 2) Toxic chemicals introduced to the air and ground

**Ind 594-4** 3) Air pollution

**Ind 594-5** 4) Noise pollution

5) Traffic congestion in an already heavily congested area with more residential housing to come.

**Ind 594-6** The jobs that will be created don't even come close to the negative benefits that they will bring. This is not a good idea whatsoever. I can't believe it was even considered from its very inception. Extremely poor decision.

**Ind 594-7** How about a logging industry that would allow community residents to actually help the fire situation and give the common unskilled person a job. Between logging , trucking and milling you could really help in many aspects. Rather than a greed based foreign company with a bad track record to profit.

Don't you feel your integrity might be at risk on this decision.

Please give me the positive side of this decision other that some jobs?

Mike Frasu

## INDIVIDUAL LETTER 594: MIKE FRASU

### Response to Comment Ind 594-1
The comment does not directly address the adequacy of the DEIR. For water table and drought concerns, please see Master Responses 15 and 16.

### Response to Comment Ind 594-2
The comment does not directly address the adequacy of the DEIR. For concerns related to toxic chemicals and effects on air and ground, please see the analyses in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy; and Chapter 4.7, Hazards and Hazardous Materials, of the DEIR.

### Response to Comment Ind 594-3
The comment does not directly address the adequacy of the DEIR. For concerns related to air quality, please see the analysis in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy; and Master Response 18 – Air Quality Thresholds.

### Response to Comment Ind 594-4
The comment does not directly address the adequacy of the DEIR. Please see Master Response 1. Chapter 4.10, Noise and Vibration, contains a detailed discussion of the project's potential noise impacts.

### Response to Comment Ind 594-5
The comment does not directly address the adequacy of the DEIR. Please see Master Response 1. Chapter 4.12, Transportation, contains a detailed discussion of the project's potential transportation impacts.

### Response to Comment Ind 594-6
The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Responses 1 and 2.

### Response to Comment Ind 594-7
The comment does not address the adequacy of the DEIR, but rather appears to propose an alternative logging industry use for the project site. The DEIR evaluates alternatives to the proposed project in Chapter. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers.

Please see Master Response 3 regarding the comments about the applicant.

**Individual Letter 595**

30 Mar 22

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Mr. Kelley,

**Ind 595-1**

I am writing in opposition to the Idaho-Maryland Mine project. I have received a solicitation for support from Rise Grass Valley, Inc. It suggests there is strong support throughout the community for the re-opening of the mine and that the mine will be safe for the community and the environment. Further, that it will bring jobs and money to our area with careers yielding average earnings of $122,000 per year.

Based on what I have read and in speaking to individuals who live in the immediate area of the mine, I think the benefits of this project and the level of local support have been grossly overstated and the risks underestimated. I think the risk to the environment is great and will last for many years after the mining company has packed up and left and taken the lion's share of the profits with it.

The rhetoric here reminds me of what other large corporations say when selling their plans in smaller communities – they don't live in the area and will not have to live with the difficulties they create. The best jobs do not go to local folks nor does most of the money stay in our community.

I am not what you would typically call an environmentalist, but I am opposed to this project.

Mike French
10838 Alta Sierra Drive
Grass Valley, CA 95949

## INDIVIDUAL LETTER 595: MIKE FRENCH

### Response to Comment Ind 595-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 596**

Matt Kelley, senior planner, Nevada county Planning Dept. 4-2-2002

Idaho Maryland Mine re-opening, Draft Environmental Impact Report

**Ind 596-1** I have been farming organically with NID water for 36 years. My water would be tainted with any mistakes in monitoring that Rise Gold make. This mine would monitor itself with only occasional reports from Government monitoring. This is inappropriate. The fox watching the hen house is what it would be. The fox would be Rise gold making big money by sneaking polluted water down Wolf creek to the Tarr ditch to my farm. If my produce is polluted by this mine it would be on me to prove and take legal action for. A large corporation against a small farmer is what would result. The proposed EIR doesn't deal with this problem or many others appropriately.

Thank you Mike Pasner Owner Indian Springs Organic Farm

## INDIVIDUAL LETTER 596: MIKE PASNER

### Response to Comment Ind 596-1

The commenter expresses concerns that any mistakes at the mine may taint water that could affect their farming operations. Please see Master Response 35 – Discharge to South Fork Wolf Creek.

**Individual Letter 597**

Way more than 2.4 million ounces when you consider the hedging that had to have went on!! 20% at least! a good thing

**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Ind 597-1

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

## INDIVIDUAL LETTER 597: MIKE AND MARY PETERSON

### Response to Comment Ind 597-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

**Individual Letter 598**

**From:** Jan and Mike Weaver <jm.mp31@hotmail.com>
**Sent:** Friday, April 1, 2022 12:03 PM
**To:** Idaho MMEIR; Matt Kelley
**Subject:** Idaho Maryland Mine
**Attachments:** Addendum Rise Gold Letter 2.2022.docx

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 598-1**

We are against the opening of this mine. We live approximately 4 miles from the mine and are opposed to its re-opening. Attached you will find some of our concerns.

Mike and Jan Weaver
10818 Gunsmoke Road
Grass Valley, CA 95945

1

County Board of Supervisors:

I have several concerns regarding the Rise Gold Mine.

**Ind 598-2**

1. **Well Water:** Although we are 3.5 miles down Greenhorn, we may also be impacted by the voluminous amount of (possible contaminated) water that will be extracted from the mine. We are still in a drought and the snow disaster we had in December, reflects that. Trees had shallow roots because of the lack of water The enormous amount of water that will be then sent down the South Folk Wolf Creek, perhaps overflowing its banks.

**Ind 598-3**

2. **Traffic:** As I left this morning at 8:45 a.m. to make my right onto Brunswick from Greenhorn I noted that there had to be a least 30 cars lined up at the flashing red light to enter the city or freeway. They were as far back as the exit from the mine on Brunswick. To add 100 trucks coming up from Bennett will probably put this line as far back as the "Y". Many people from outside of GV area, are probably unaware of the extra time it will take them each day to get either into our city or out of it.

**Ind 598-4**

3. **Toxicity:** Hard rock mining is extremely toxic. Our property was deemed an EPA Superfund in 1998 because of the tailing overflow from the 1997 storms. Because the County could not afford the clean-up, the federal agency stepped in and spent thousands of dollars to correct the toxic waste flowing down the Little Clipper Creek. Taxpayers from all over the country fund EPA. EPA continues to monitor this site and I understand it will always be deemed a Superfund site.

**Ind 598-5**

There are so many other reasons NOT to have this mine. Perhaps consider having it a permanent green waste space and build a cogeneration (cogen) plant, creating our own clean energy.

We are no longer a Mining Town and anything built in that area should reflect 2022 ideas and not 1849 ideas.

## INDIVIDUAL LETTER 598: MIKE AND JAN WEAVER

### Response to Comment Ind 598-1

The comment does not address the adequacy of the DEIR, but expresses general opposition to the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 598-2

The comment does not directly address the adequacy of the DEIR. Regarding well water and drought concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change. Regarding concerns about flow in South Fork Wolf Creek, please see Master Response 36 – Flows in South Fork Wolf Creek.

### Response to Comment Ind 598-3

The comment does not directly address the adequacy of the DEIR, but expresses concerns regarding the Brunswick Road/E. Bennett Road/Greenhorn Road intersection. According to the project's transportation analysis, the intersection of Brunswick Road/E. Bennett Road/Greenhorn Road currently operates acceptably at level of service (LOS) B and C during the "Project Traffic Hours". As discussed on page 4.12-8 of the DEIR,

> Specific time periods were studied based on direction from Nevada County, which included the "standard" AM and PM peak hours and at the three time periods when project employee trips are expected to occur. Under the proposed work periods there is negligible traffic to and from the site during the AM and PM peak hours. The majority of project traffic occurs in the periods surrounding mining shift changes and the end of the administrative personnel work day as identified above; the end of the day for administrative personnel does occur during some peak periods, and this was reflected in the level of service analyses during the 3:30-4:30 PM analysis period. Based on these project-specific characteristics, the CEQA traffic analysis focuses on the three time periods when project employee trips would occur, as these time periods are expected to have the most project-related traffic impacts. The standard peak hour analysis is provided in the Traffic Impact Analysis for informational purposes (see Appendix O).

As shown in Tables 4.12-10 and 4.12-11, with inclusion of project traffic and traffic from 11 other near-term projects (for a listing, see pages 4.12-35 and 4.12-48 of the DEIR), the Brunswick Road/E. Bennett Road/Greenhorn Road intersection is projected to still operate acceptably at LOS B and C.

### Response to Comment Ind 598-4

The comment does not directly address the adequacy of the DEIR. It is unclear whether the commenter believes the project is an EPA superfund site. For clarity, neither the Brunswick nor the Centennial Industrial Site is an EPA superfund site. Toxic concerns are addressed in Chapter 4.7, Hazards and Hazardous Materials, and Chapter 4.8, Hydrology and Water Quality, of the DEIR.

### Response to Comment Ind 598-5

The comment does not address the adequacy of the DEIR, but rather appears to propose an alternative logging industry use for the project site. The DEIR evaluates alternatives to the proposed project in Chapter. As summarized in DEIR section 6.2, and provided in CEQA

Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers.

Regarding the commenter's opposition to the proposed project, please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 599**

Mikos Fabersunne•508 Redbud Way•Nevada City, CA 95959-2156•530-362-7007•*msfabersunne@sonic.net*

March 24, 2022

County of Nevada
Community Development Agency
Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-8617
Attn: Mark Kelley, Senior Planner

Subject: my comments on Idaho-Maryland Mine Project, Draft EIR

Dear Mr. Kelley:

**Ind 599-1** I am writing to comment on the Draft EIR (DEIR) for the above project. I am a retired engineer, having last worked for the California Department of Toxic Substances Control (DTSC) in 2011 as a Hazardous Substances Engineer. During my service with the State I reviewed numerous environmental documents, including Preliminary Assessments/Initial Studies and EIR/EISs. I waited to submit comments on the subject project document, expecting that this project would be recognized for what it is--an attempt to deceive the public into believing that the project offers true public benefits to the community when the reality is that there will only be detriments--in the hope that the project proponents would cease further promotion of the project. However, apparently that was not the case, and so I am submitting my comments now.

**Ind 599-2** I have read the prior comments on the NOP and the executive summary of the DEIR, as well as the tabulation of likely impacts and proposed mitigation measures delineated in Table 2-1. On its face, this project has so many unmitigable, detrimental impacts upon air quality caused by dust and equipment exhaust produced by digging and hauling operations from 24-hr/day, 7-day/week operation over the projected term of 80 years, and the resulting potential exposure of the public to lead, arsenic and mercury; the depletion of the sub-surface soil-water matrix from the continuous extraction of groundwater and the consequent impact of continuous discharge of the treated water to the environs, that it is folly to proceed with this project. The proponents would be better off to withdraw now, rather than making additional expenditures on preparing a final EIR.

**Ind 599-3** There are many others who have seen through the fog of this project and have commented upon the expected adverse impacts on the soils and groundwater, and the threat to human and environmental health that it poses, that there is near universal opposition to this project by the residents of Grass Valley, Nevada City and the unincorporated areas near the project. I add my name to that list.

**Ind 599-4** This project should be stopped as soon as possible to avoid the expenditure of additional county staff time and the public's effort in providing further review and analysis.

Thank you for your consideration,

Mikos Fabersunne, P.E.

Comment_DEIR_Mine_24Mar22.docx

## INDIVIDUAL LETTER 599: MIKOS FABERSUNNE

### Response to Comment Ind 599-1

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 599-2

The commenter expresses general concerns related to project air quality impacts. Air quality emissions and potential project health effects are evaluated in detail in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. Please also see Master Response 18 – Air Quality Thresholds, Master Response 19 – NSAQMD Criteria Pollutant Thresholds During Operations, Master Response 20 – Conservatism Used for Metals in Dust, Master Response 21 – Silica Health Risk, and Master Response 22 – Conservatism Used for Asbestos Assessment.

### Response to Comment Ind 599-3

Regarding groundwater extraction concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding concern related to continuous discharge of treated water, please see Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 599-4

The commenter expresses general opposition to the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 601**

**Dist 4**

Dear Board of Supervisors, March 2, 2022

Pardon the profanity on the enclosed card. I was going to just drop it in the mail and let the mine advocates know how I feel.

**Ind 601-1**

Instead, I was told by some politically wise friends that Rise Grass Valley will most likely not read it, but add it to a pile of postcards and make it look like the returning of postcards affirms the community's desire for the mine to open.

Their tactics are appalling, including the brochure that included this postcard.

**Ind 601-2**

If you have any desire to protect this beautiful area of ours, you must know how destructive this mine will be to our environment, disrupt many residents' wells, tremendously increase traffic in the Brunswick Basin, etc.

**Ind 601-3**

I've been a resident for over 40 years. I volunteered for over 10 years for Meals on Wheels, raised money for Hospitality House, and have brought 2 free health care clinics to our community. In other words, I've been a big contributing member of our community. Should this mine be allowed to open, I am seriously considering moving.

I implore you to not let this mine open.

Sincerely, Mindy Oberne

Mindy Oberne

The comment does not address the adequacy of the DEIR. Please see Master Response 1.

### Response to Comment Ind 601-4

The comment does not address the adequacy of the DEIR, but rather expresses opposition to the project. Please see Master Response 1.

**Individual Letter 602**

**From:** Mira Clark <existinspired@gmail.com>
**Sent:** Sunday, April 3, 2022 9:08 PM
**To:** Idaho MMEIR
**Subject:** Comments on (DEIR)

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Matt,

**Ind 602-1** I am writing a letter as a concerned resident of Nevada County. I was born here and have lived all over Nevada County, and Grass Valley and have called this place home for the past 31 years.

I am not convinced by the DEIR that adequate measures would be taken by RISE to ensure that toxic Heavy Metal Contamination & Leaching into groundwater would not occur to groundwater, neighboring wells and nearby waterways. I am also not convinced of the mitigation measures described in the DEIR to protect special-status wildlife species. The proposed mitigation measures do not appear to be realistic and disruption to wildlife described in Chapter 4.4 – (Biological Resources) would likely still occur to a significant level. Accounting for mitigation of noise and work/construction disturbances seems impossible to mitigate to a level that would not cause a significant negative impact on wildlife AND still allow RISE to construct and operate the mine feasibly.

**Ind 602-2** This is an opinion-based argument, however still valid; How can we trust a foreign company with no local stake in the wellbeing of our local environment and community to do a good job at ensuring safety? Their main motive is extraction-based profit and that overshadows any significant environmental commitment the Rise company has in keeping this land safe and healthy for the current and future generations, I find this to be abundantly evident. If the state of our current world shows anything, it is that corporate greed knows no bounds in its manipulation and ability to cut corners for more profits. It harkens back to the devastation caused by colonial settler Gold Mining extraction which caused a near genocide of the Nisenan People and a huge negative environmental impact. Which our local rivers and wells and lands and Indigenous Peoples are still recovering from... As a volunteer of the local Nisenan Tribe's non-profit CHIRP for over 5 years, I am all too aware of this horrific legacy and history. WE must do better in 2022!

Thank you,

**Mira Clark**

## INDIVIDUAL LETTER 602: MIRA CLARK

### Response to Comment Ind 602-1

The commenter expresses general concerns regarding water quality impacts from operation of the mine. The DEIR addresses water quality in Chapter 4.8, Hydrology and Water Quality, and concluded that impacts would be less than significant after mitigation. Regarding potential impacts to special-status wildlife species, please see Master Response 31 – Rare Plants, Master Response 37 – Birds and Raptors, and Master Response 38 – Foothill Yellow Legged Frog and California Red Legged Frog. The potential effect of noise on wildlife is addressed in Impact 4.4-2 (p. 4.4-74) of the DEIR.

### Response to Comment Ind 602-2

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the applicant and project. Please see Master Responses 1 through 3. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 603**

**From:** Molly Harrison <harrisonmolly@yahoo.com>

April 4, 2022
Nevada County Planning Department
950 Maidu Avenue, Ste 170
Nevada City, CA. 95959-790

Attn: Planning Commission/Board of Supervisors

To Whom It May Concern:

**Ind 603-1** My family has lived here in Nevada County since 1994. I fear this beautiful place and habitat for so much wildlife is now in jeopardy with the proposed mine. I am very much against it due to its effect on the environment. I am concerned about the mine's potential impact on our air, land and water quality. I do not believe the Draft EIR. It seems very likely that mining will drain our ground water sources which may affect our wells that are already being threatened by droughts. I am also troubled by the thought of the diesel fumes and constant noise the equipment will make. This mine will definitely affect our quality of life in many ways in Nevada County. We live close enough to Highway 20 and 49 so we will be impacted by this noise and pollution, as do many other residents.

**Ind 603-2** As I understand this proposal, there is no independent monitoring of any of these issues and I would like this inadequacy to be addressed. I would also appreciate a response to my concerns as they are the same as just about everyone I know around this area. We already have so many reasons to flee California with the drought, fire and tax issues, and we don't need another reason to leave. Furthermore, the history of Rise Gold does not instill confidence. I am very unhappy with the idea of bringing in a non-local company with no track record of success in this area. We should not be a test case!!!

**Ind 603-3** According to Ralph Silberstein, President of CEA Foundation, "This DEIR is riddled with errors, omissions, and legal flaws. We'll see many more impacts listed as significant and unavoidable. Beyond the EIR, our Supervisors will be faced with making the final decision. In the long run, it will very simply come down to whether the mine is good for our community."

Some of the top concerns include:

The groundwater model has fundamental flaws in the initial start point and baseline data assumptions – all of which throw off the entire analysis.

1

**Ind 603-4** Dealing with mine waste – Asbestos will be a huge and expensive problem that requires far more comprehensive management than described in the report.

**Ind 603-5** Greenhouse gas emissions - The report excluded elements that would put the project over an arbitrary threshold limit, but recent climate change goals say the threshold should be "net zero".

**Ind 603-6** Cleanup of the toxic, pre-superfund Centennial site that would be used to dump mine waste is not included in the DEIR but is required by the California Environmental Quality Act (CEQA).

**Ind 603-7** Missing construction time estimates throw off the entire analysis of noise, traffic, and air.

**Ind 603-8** The DEIR incorrectly assesses nighttime noise and underestimates the noise of dumping mine waste near established residential neighborhoods.

**Ind 603-9** Air traffic hazards and aesthetic impacts need to be studied further due the likelihood of a moisture cloud plume that could be created by warm, saturated air ventilation.

**Ind 603-10** Blasting plans don't follow U.S. mining guidelines that restrict blasting during evening hours.

**Ind 603-11** The plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant.

**Ind 603-12** Meteorological data used to assess the health risk of airborne pollutants doesn't fit Grass Valley's profile or accurately reflect local conditions.

Our environment is so special; we cannot take these kinds of risks with it.

Sincerely

Pro#Kduuc#dg#Mqlq#Zdug#Sdkdo

JW Pfahl and Molly Harrison

15240 Lewis Road

Nevada City, CA. 95959

## INDIVIDUAL LETTER 603: MOLLY HARRISON

### Response to Comment Ind 603-1

The commenter is opposed to the project due to a variety of impacts pertaining to groundwater, air quality, and noise but provides no additional detail as to why the DEIR is inadequate. Regarding impacts to air quality and noise, the commenter is referred to Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and Chapter 4.10 (Noise and Vibration). Regarding impacts to groundwater, the commenter is referred to Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. The commenter's opposition to the project is noted for decision makers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 603-2

The commenter states that no independent monitoring program is proposed for the project. The commenter also references prior mining projects by the Project Applicant. Among the many mitigation measures required in the DEIR are monitoring programs for noise (Mitigation Measure 4.10-3), vibration (Mitigation Measure 4.10-4), and groundwater (Mitigation Measure 4.8-2), all of which will have oversight from Nevada County. In addition, Chapter 4 of this Final EIR contains the mitigation monitoring and reporting program that will need to be adopted by the Nevada County Board of Supervisors, if the project is approved. The MMRP includes all of the project mitigation measures, identifies timing for completion of mitigation requirements, and identifies local and state agencies responsible for monitoring. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 3 - Operator Responsibility.

### Response to Comment Ind 603-3

The commenter states that the DEIR's groundwater model is flawed but does not explain how. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 603-4

The commenter states that the project will produce asbestos-related impacts. The commenter is referred to Chapter 4.3 of the DEIR, Master Response 22 - Conservatism of Asbestos Assumptions, Master Response 23 - Adequacy of Asbestos Sampling, and Master Response 18 - Air Quality Thresholds.

### Response to Comment Ind 603-5

The commenter states that the DEIR's analysis of GHG emissions is flawed because the threshold should be net zero. A net zero threshold is not required for the project. The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds.

### Response to Comment Ind 603-6

The commenter states that CEQA requires a discussion of the remediation of the Centennial Industrial Site to be included in the DEIR. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 603-7

The commenter states that the DEIR's absence of a construction schedule skews the analysis of several project impacts. The commenter is referred to Master Response 24 - Project Construction Schedule.

## Response to Comment Ind 603-8

The commenter states that the DEIR incorrectly assesses nighttime noise and the dumping of mine waste. Nighttime noise including dumping of mine waste is analyzed in Chapter 4.10 of the DEIR and is less than significant after mitigation. Please also see Responses to Comments Grp 21-130 and 21-131.

## Response to Comment Ind 603-9

The commenter states that the DEIR must include analysis of aesthetics and air traffic hazards caused by a moisture cloud plume. The commenter is referred to Response to Comment Grp 7-95.

## Response to Comment Ind 603-10

The commenter states that the project does not follow federal mining guidelines. The commenter is referred to Response to Comment Grp 21-144.

## Response to Comment Ind 603-11

The commenter states that the DEIR does not adequately demonstrate that the impacts to biological or aquatic resources are less than significant, but does not state why. The commenter is referred to Chapter 4.4 (Biological Resources) and 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 30 - Biological Study Technical Adequacy, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment Ind 603-12

The commenter states that the Health Risk Assessment does not use appropriate data for local conditions. The commenter is referred to Master Response 17 - Meteorological Data Used in HRA.

**Individual Letter 604**

March 23, 2022

Nevada County Planning Department
950 Maidu Avenue, Ste 170
Nevada City, CA. 95959-790

Attn: Planning Commission/Board of Supervisors

To Whom it May Concern:

**Ind 604-1**

My name is Molly Harrison and my family has lived here in Nevada County since 1994. I fear this habitat is now in jeopardy with the proposed mine and I am very much against it due to its effect upon it. I am concerned about its impact on our air, land and water quality. It very likely will drain our ground water sources which may affect our wells that are already being threatened by droughts. I am also troubled by the thought of the diesel fumes and constant noise the equipment will put out. This mine will definitely affect our quality of life in many ways in Nevada County. We live close enough to Highway 20 and 49 to be impacted by this noise and pollution, as do many other residents, as it is impossible to avoid.

As I understand this proposal, there is no independent monitoring of any of these issues and I would like this inadequacy to be addressed. I would also appreciate a response to my concerns as they are the same as just about everyone I know around this area. We already have so many reasons to flee California with the drought, fire and tax issues, and we don't need another reason to leave. Furthermore, the history of Rise Gold does not instill confidence. I am very unhappy with the idea of bringing in a non-local company with no track record of success in this area. We should not be a test case!!! Our environment is so special; we cannot take these kinds of risks with it.

Sincerely

Molly Harrison and Warren Pfahl
15240 Lewis Road
Nevada City, CA. 95959

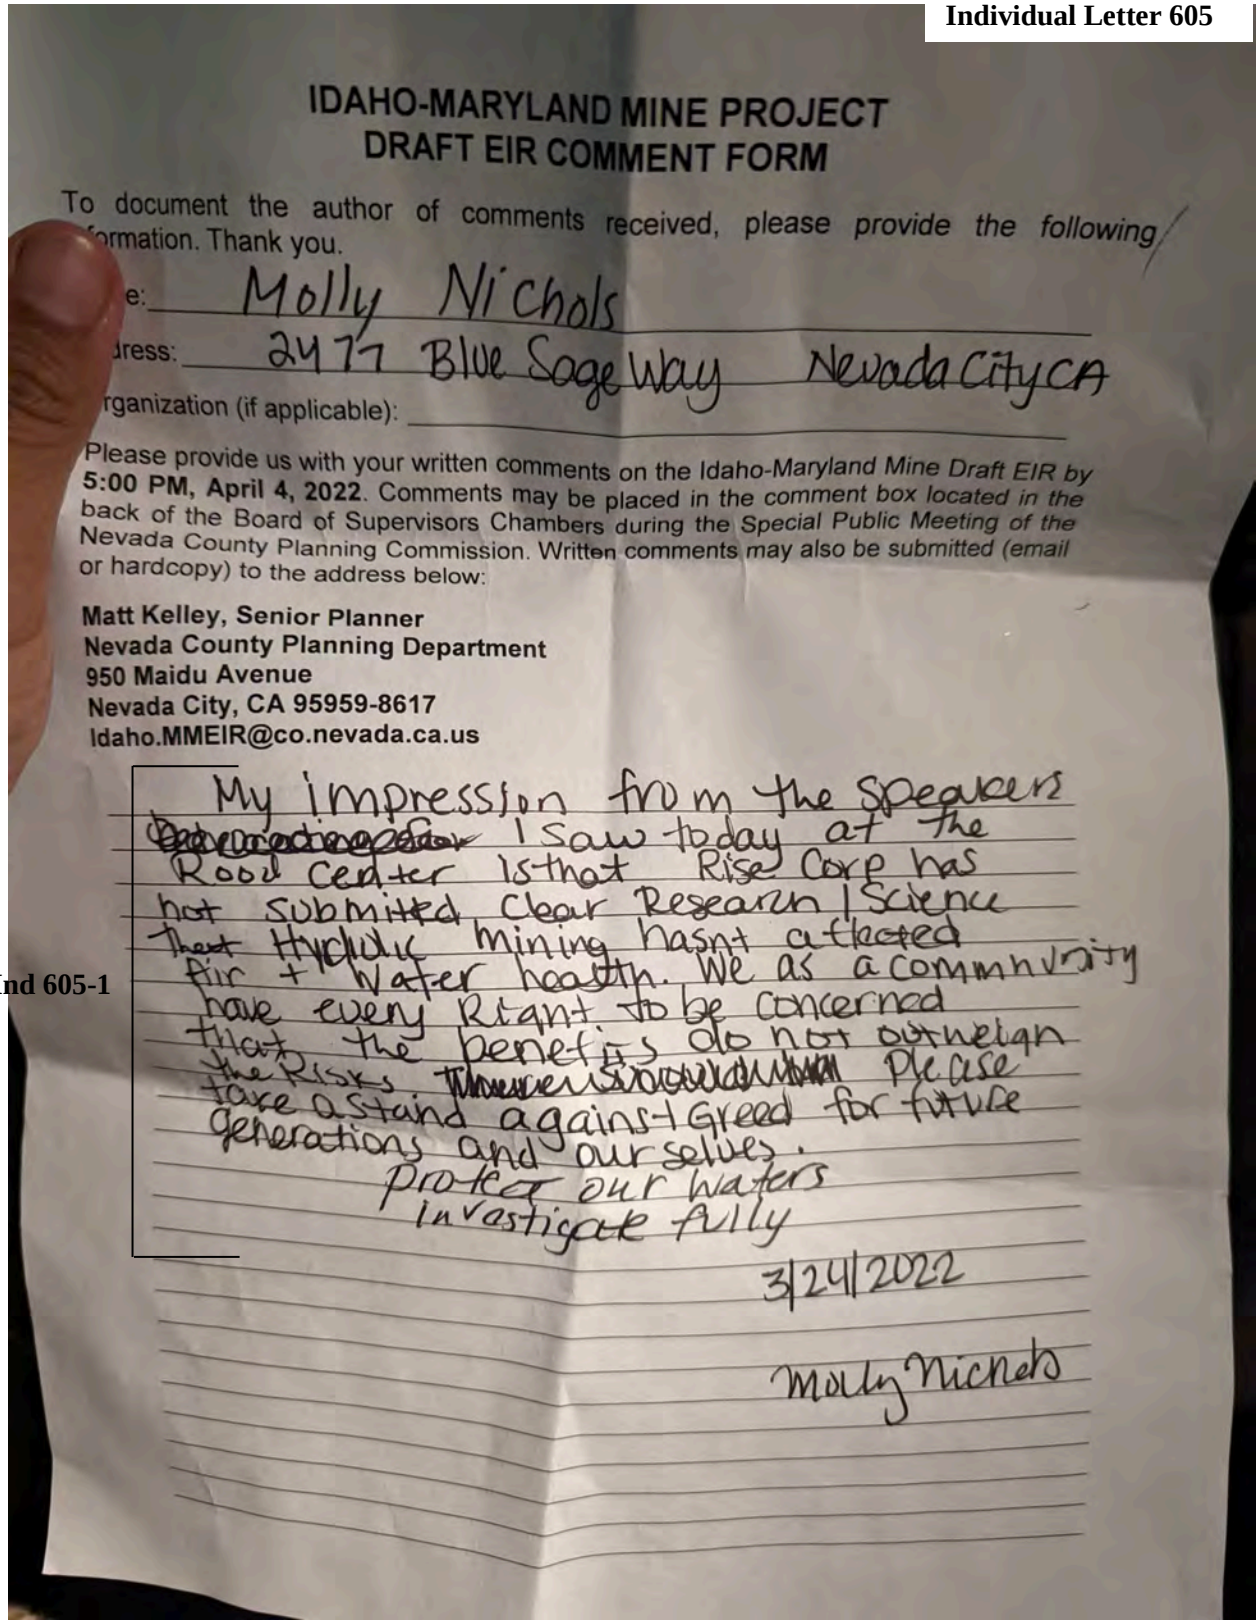
PLANNING DEPARTMENT

## INDIVIDUAL LETTER 604: MOLLY HARRISON AND WARREN PFAHL

### Response to Comment Ind 604-1

The comment does not directly address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project that do not enable a more specific response. For concerns related to air, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. For concerns related to water quality, please see Chapter 4.8, Hydrology and Water Quality. For concerns related to well impacts and drought, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change. Regarding diesel fume concerns, please see Response to Comment Grp 21-66. For noise concerns, please see Chapter 4.10, Noise and Vibration.



The commenter incorrectly states that there will be no independent monitoring of any of the issues that they are concerned with. For example, Mitigation Measure 4.10-2 of the DEIR requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

Mitigation Measure 4.10-2 also requires quarterly noise monitoring by the County's third-party noise consultant during the first five years of project operation, and once per year thereafter for the life of the project.

In addition, the mitigation measures set forth in the DEIR to reduce the severity level of potential impacts specify the monitoring agency responsible for ensuring the mitigation is implemented as written in the DEIR. The Mitigation Monitoring and Reporting Program (MMRP) prepared as part of this Final EIR (Chapter 4) includes a column that summarizes the monitoring agency required by each mitigation measure.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 605**

IDAHO-MARYLAND MINE PROJECT
DRAFT EIR COMMENT FORM

To document the author of comments received, please provide the following information. Thank you.

Name: Molly Nichols

Address: 2477 Blue Sage Way Nevada City CA

Organization (if applicable): _____

Please provide us with your written comments on the Idaho-Maryland Mine Draft EIR by **5:00 PM, April 4, 2022**. Comments may be placed in the comment box located in the back of the Board of Supervisors Chambers during the Special Public Meeting of the Nevada County Planning Commission. Written comments may also be submitted (email or hardcopy) to the address below:

**Matt Kelley, Senior Planner**
**Nevada County Planning Department**
**950 Maidu Avenue**
**Nevada City, CA 95959-8617**
**Idaho.MMEIR@co.nevada.ca.us**

My impression from the speakers ~~[illegible]~~ I saw today at the Rood center is that Rise Corp has not submitted clear Research / Science that Hydraulic mining hasn't affected Air + Water health. We as a community have every Right to be concerned that the benefits do not outweigh the Risks ~~[illegible]~~ Please take a stand against Greed for future generations and ourselves.
Protect our waters
investigate fully

3/24/2022

## INDIVIDUAL LETTER 605: MOLLY NICHOLS

### Response to Comment Ind 605-1

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 606**

**From:** Mykola Kindrat <m.kindrat@gmail.com>
**Sent:** Friday, April 1, 2022 9:31 AM
**To:** Idaho MMEIR
**Subject:** I oppose Idaho Mine reopening!!!

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Matt Kelley,

I've been a resident of Nevada County for almost 10 years now. I love this rural community and value its peaceful lifestyle. I know the history of gold mining in this area and the ecological damage it has done. We still, a century later, can't eat the fish from our rivers and ponds - because of pollution from mining!

**Ind 606-1**

Reopening the Idaho-Maryland mine, right in the heart of the city, is extremely dangerous and will cause trouble for decades or even centuries in the future. Re-evaluation of the impact reports presented by Rise shows multiple errors, omissions, not to mention their manipulation of the public with a flashy mailer they sent out, which is a red sign in itself.

I believe that the only people that are to benefit from this "project" are the shareholders of the company and those they try to bribe. But not the Community, not the people who live here, not our water, air and soil!

I strongly oppose the reopening! Don't let that happen!!!

Sincerely,
Mykola Kindrat

## INDIVIDUAL LETTER 606: MYKOLA KINDRAT

### Response to Comment Ind 606-1

The commenter refers to multiple errors and omissions in "impact reports presented by Rise" but does not identify specific documents, nor specific alleged errors and omissions. Without such evidence, no further response is possible. The commenter's opposition of the proposed project is noted and forwarded to the decisionmakers. Please see Master Response 1.

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

via email: Idaho.MMEIR@co.nevada.ca.us

Mr Kelly,

First, thank you for your service to our community. I know there are strong feelings about a lot of current issues and some in our community are not treating our elected officials and public agency employees with the respect they deserve. I am strongly opposed to the Idaho-Maryland Mine Project for a multitude of reasons and have significant concerns about the findings and inadequacies of the Draft Environmental Impact Report (DEIR). I will focus on one area of concern in this letter, traffic impacts. I hope my sincere and strongly held beliefs about the negative impacts of this proposed project are presented in a constructive manner.

**Ind 607-1**

Approval of this project, according to the DEIR, will add up to a maximum of 100 round trips per day and an average of 50 round trips per day, over a 16-hour period (6:00 AM to 10:00 PM), transporting engineered fill. Thus, over the life of the project, up to 118 haul truck round trips would occur on Brunswick Road during the hours from 6:00 AM to 10:00 PM, seven days a week. On an hourly basis, this equates to approximately 7.4 haul truck round trips per hour on Brunswick Road. Up to 18 additional truck trips could occur per day for various operations (gold concentrate shipping, materials deliveries, etc.).

As stated in the DEIR there will be significant and unavoidable impacts to traffic, most notably in the following areas: Bennett Road at Tinloy Street, Brunswick Road at Idaho Maryland Road, Brunswick Road at Whispering Pines Lane, Brunswick Road at E. Bennett Road, and Brunswick Road at SR 174. Some of these intersections are already poorly designed and dangerous intersections with accidents occurring on a regular basis. Approval of this project without adequately addressing and mitigating the impact to local citizens driving these roadways is unacceptable. In addition to the traffic impacts, running an industrial mining operation utilizing trucks in a neighborhood means additional noise, dust, vibrations to the citizens in these neighborhoods, facts the DEIR does not adequately address.

When the Mine is in operation the 400-600 "local" employees Rise Gold claims they will

employ will add further traffic to these roadways. We know these workers will not be living in Grass Valley, as the lack of affordable housing is already an issue for our community. So, that will mean an additional 400-600 cars on the already identified significant and unavoidable impacts to traffic, a key factor the DEIR failed to adequately address.

In addition to these already identified issues, what concerns me even more is the impact to evacuation routes in the event of fire. As stated in the DEIR, "According to CAL FIRE, relatively few larger wildfires have occurred within the region surrounding the project sites over the past three years". I disagree with this statement as I am sure those that lost their homes in the River Fire and the Jones Fire also would. In addition to these fires, the DEIR needs to address the potential environmental impact the Whispering Pines Fire, would have created if this project was in operation. In the DEIR there are some statements that we could "ask" the mine operations to discontinue the truck routes in the event of a fire. Ask?

**Ind 607-2**

As we are in another year of drought and increased fire danger, I find it unconscionable that the County would approve a project that would that would add significant and unavoidable impacts to traffic along the evacuation routes people would need to use. The DEIR seems to imply there are other evacuation routes, but I assure you, our current residents and 400-600 additional vehicles and large trucks will be using Brunswick to get to 174 and 49/20, and Brunswick will be at a standstill trying to get on 174. This is a significant and real potential disaster for this community.

In the 20 years we have lived in this community, that we love, I have served for 8 years as a Board member and President of the the Chicago Park School District and 8 years as a member of the Board of the Center for the Arts. We are significant financial donors to numerous local non profit organizations. If this project is approved, we will sell our Cedar Ridge home and regrettably move out of the area, where we will contribute our time and substantial financial charitable contributions to our new community.

**Ind 607-3**

Respectfully,

Nancy Dewey

13035 Somerset Drive
Grass Valley, CA 95945
nancy@deweys.org

## INDIVIDUAL LETTER 607: NANCY DEWEY

### Response to Comment Ind 607-1

The commenter incorrectly identifies the significant and unavoidable traffic impacts identified in the DEIR. Chapter 4.12, Transportation, concludes that the project's traffic impacts would be less than significant after mitigation, with the exception of traffic at the SR 174 and Brunswick Road intersection and the northbound left lane at the Brunswick Road and Sutton Way intersection, which would be significant and unavoidable due to the uncertainty of the mitigation measures identified in the DEIR.

For the commenter's general concerns about noise and vibration, please refer to Chapter 4.10, Noise and Vibration, of the DEIR. Dust effects from mining operations are addressed in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy.

The commenter also expresses concern regarding employee trips. Employee trips are already accounted for in the transportation analysis presented in Chapter 4.12 of the DEIR. See Table 4.12-8, Project Trip Generation.

### Response to Comment Ind 607-2

Regarding the commenter's evacuation route concerns, please see Master Response 5 – Evacuation Zones. Regarding drought concerns, please see Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 607-3

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Subject:** DEIR comments

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr. Kelley,

I have been a resident in the Grass Valley/Nevada City area for about 40 years and raised my two children here. I was an employee of the Nevada County Public Health Department for 22 years and remain interested and concerned about the health and welfare of all Nevada County residents.

I have comments about two areas of the DEIR about the proposed re-opening of the Idaho-Maryland Mine. The first area is that of **Hazardous Materials**. Chapter 4.7 page 35 states that **significant impacts are possible** for release of arsenic or other harmful chemicals. I think proposed mitigation measures are inadequate in that no procedures are stated regarding supervision of Rise Gold employees if they encounter potentially hazardous soil. The mitigation measure (4.7-2(b) lays responsibility squarely on Rise Gold workers, stating that "**work shall stop**" in "an area of possible contamination" if "unidentified or suspected contaminated soil evidenced by..."

**Ind 610-1**

Would Rise Gold employees be given any **training** on how to recognize potentially hazardous soils or materials? There is no mention of this in the DEIR. Would a site **supervisor be observing** onsite as workers uncover new areas of soil**? I am concerned that depending on Rise Gold employees to "stop work" is an unreasonable and inadequate mitigation measure.** Stopping work and calling in a Registered Environmental Assessor (REA) or other "qualified assessor" may be unlikely unless employees are conscientiously supervised. And how inconvenient would it be to call in an REA? Very inconvenient. So a "qualified assessor" would likely be used, if any, and how "qualified" would that person be in assessing toxic risk?

**Rise Gold's CEO does not have a good track record in containing hazardous materials**, based on his toxic waste spill in B.C., Canada in 2015. **Should we trust him and his employees to identify toxic materials in Nevada County?**

I am also concerned about **Air Quality (AQ)** monitoring. I noted that the DEIR is inaccurate in stating that construction would be occurring from Jan.-Dec. 2021**, last year**. I also noted that **air quality impacts could be significant**. Given that, I think mitigation measures are **inadequate** because they do not state a **minimum frequency** of AQ monitoring. Page 84, Chapter 4.7 states that NSAQMD "may require air quality monitoring at any time", but **how often** would monitoring occur? Once a year? Once a month? Since AQ impacts could be significant, an appropriate monitoring frequency should be stated in the final EIR and tracked carefully by a stated regulatory agency.

**Ind 610-2**

1

I appreciate this opportunity to comment on the DEIR, and I thank you for your diligent work on this document.

Sincerely,

Nancy C. Piette

Registered Dietitian, Master of Science, Public Health

## INDIVIDUAL LETTER 610: NANCY PIETTE

### Response to Comment Ind 610-1

The commenter expresses concern regarding arsenic or other harmful chemicals at the project site and states that the mitigation measures to address Impact 4.7-2 are inadequate. Primarily, the commenter questions whether on-site employees would be adequately trained in order to recognize hazardous materials and take appropriate actions. The commenter also raises concerns regarding past projects of the Project Applicant's CEO.

Regarding training, the federal Occupational and Safety Health Act (OSH) requires hazardous materials operators to receive an initial 40 hours of training, as well as an annual eight-hour refresher course, which includes training regarding personal safety, hazardous materials storage and handling, and emergency response. (DEIR, p. 4.7-12.) Additionally, Mitigation Measure 4.7-2(a) requires the project contractor, in the event that the portion of the Brunswick Site containing arsenic is disturbed, to retain a Certified Industrial Hygienist to develop specific handling procedures for mine waste and dust mitigation. (DEIR, p. 4.7-35.)

Comments regarding past projects of the Project Applicant's CEO are not relevant to the adequacy of the DEIR; however, the commenter is referred to Master Response 3 – Operator Responsibility.

### Response to Comment Ind 610-2

The commenter is concerned about air quality monitoring because mitigation measures do not state a minimum frequency of monitoring. The commenter appears to be referencing Mitigation Measure 4.3-2 on page 4.3-82 of the DEIR, which requires an Asbestos Dust Mitigation Plan (ADMP). As stated in the mitigation measure, air monitoring requirements and frequency of air monitoring are provided in the approved ADMP and the NSAQMD may require air monitoring at any time. The minimum frequency of air sampling is not known at this time and not required for the analysis of the DEIR. Notably, compliance with the California Air Resources Board Airborne Toxic Control Measures for naturally occurring asbestos, including development of an ADMP, is the standard approach within CEQA documents to address health concerns associated with exposure to asbestos from unpaved surfaces, construction and grading operations and quarries where asbestos is found or likely to be found in order to ensure potential health risk impacts to the public would be minimized to a less than significant impact. Multiple other projects in the NSAQMD jurisdiction, as well as throughout the state, have relied upon compliance with these naturally occurring asbestos ATCMs in order to control any potential asbestos emissions to the extent possible. As described in Mitigation Measure 4.3-2 of the DEIR, the proposed project shall also comply with all applicable criteria in the CARB ATCMs for naturally occurring asbestos.

The starting year presumed in the Air Quality study has already passed but that does not affect the analysis of the DEIR. The project assumes a compressed construction schedule where many activities overlap to provide the most conservative estimate of air quality, traffic, noise and other impacts. An increase in the duration of construction activities and/or the completion of activities sequentially would serve to reduce environmental impacts in many areas. As such, the approach taken by the DEIR overestimates impacts as compared to a longer construction schedule with less overlapping activities. Please see Master Response 24 - Project Construction Schedule.

**Individual Letter 611**

Feb. 20, 2022

Matt Kelley, Senior Planner,

After reviewing the Draft Environmental Impact Report, I am publicly voicing my opposition to the re-opening of the Mine Project.

**Ind 611-1**

I have lived on Greenhorn Road since 2004. My husband and I intend to live out our final years on the beautiful 40 acres we own. We came to this property, to enjoy the peace, beauty and quality of life we have created for ourselves. This quality of life will come to an end for us if the mine is allowed to reopen in our rural residential area.

**Ind 611-2**

There have been 83 negative impacts illuminated by the report, with many ***significant*** enough to stop the project by themselves. We came here to retire and have our custom home be our final stop before turning over the property to our children who will inherit at our demise. If the mine is re-opened, property values will decrease up to 20%. *Who wants to live next to a heavy, extractive, toxic industry?* There are hundreds of my neighbors who will be similarly affected by heavy industry in our midst. Changing the zoning from light industry to heavy would be criminal in the midst of so many people living in the area.

**Ind 611-3**

Our main concerns are:

- Our water wells will be further dewatered (already our extreme climate change has dried up 3 of our 5 wells), and the likelihood of toxic pollutants used in mining will be dumped into South Fork Wolf Creek destroying the ecosystem.

**Ind 611-4**

- Our air quality will be further degraded ( already we have poor air quality rating due to our topography and relation to smog from the valley ). The mining project would spew clouds of airborne toxic mining dust and toxic diesel exhaust from heavy trucking. This is an extreme risk to our health.

**Ind 611-5**

- The noise of operations at the mine will destroy our peace. At our age, we relish the gift of the sounds of trees soughing and the birds singing.

**Ind 611-6**

- Traffic will be hazardous to negotiate with so many heavy trucking trips on our rural roads to the Centennial site to dump waste rock. Greenhorn Road is a one way in, and one way out road, with hundreds of residents along (and off) it's 7 miles. In a wildfire evacuation, the risk of a deadly outcome for the hundreds of residents along the 7 miles of Greenhorn road would be increased if big trucks were clogging the roadway.

**Ind 611-7**

- It does not make sense to reopen a mine that has been closed for 66 years; while in the meantime, our population has grown into the area that has become residential with *hundreds of people living on top* of old, toxic, best left alone, 2585 acres of Rise Gold's underground mineral rights.

**Ind 611-8**

I believe it is more important to our future health as a community ***to not allow hard rock mining***, which is the single largest source of toxic waste in the United States, back into our now beautiful area that is a tourist destination and desirable place to live.

Sincerely,
Nancy Rojo & Armando D. Rojo

Nancy Rojo
17150 Greenhorn Road, Grass Valley, CA 95945 (Mailing address: P.O. Box 47, Cedar Ridge, CA 95924)
1-530-274-7336
email to: nancytrojo@gmail.com

## INDIVIDUAL LETTER 611: NANCY ROJO

### Response to Comment Ind 611-1
The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 611-2
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

### Response to Comment Ind 611-3
For concerns related to water wells and climate change, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change. For concerns related to pollutants being dumped into South Fork Wolf Creek, please see Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 611-4
The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment specifically addresses health impacts to children. The commenter is referred to Master Response 18 – Air Quality Thresholds.

### Response to Comment Ind 611-5
Based on the project-specific noise analysis, which was independently reviewed by the County's third-party noise consultant, none of the individual activities associated with long-term operations of the proposed project would generate noise in excess of the applicable noise standards. Furthermore, combined project noise impacts are not anticipated for the proposed project. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 of the DEIR requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

## Response to Comment Ind 611-6

Please see Master Response 5 – Evacuation Zones.

## Response to Comment Ind 611-7

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1. Regarding the commenter's reference to the 2,585-acre mineral rights boundary, it is recommended to review Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 611-8

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Ind 612-1**

After reviewing the Draft Environmental Impact Report, I am publicly voicing my opposition to the re-opening of the Mine Project.

I have lived on Greenhorn Road since 2004. My husband and I intend to live out our final years on the beautiful 40 acres we own. We came to this property, to enjoy the peace, beauty and quality of life we have created for ourselves. This quality of life will come to an end for us if the mine is allowed to reopen in our rural residential area.

**Ind 612-2**

There have been 83 negative impacts illuminated by the report, with many ***significant*** enough to stop the project by themselves. We came here to retire and have our custom home be our final stop before turning over the property to our children who will inherit at our demise. If the mine is re-opened, property values will decrease up to 20%. *Who wants to live next to a heavy, extractive, toxic industry?* There are hundreds of my neighbors who will be similarly affected by heavy industry in our midst. Changing the zoning from light industry to heavy would be criminal in the midst of so many people living in the area.

**Ind 612-3**

Our main concerns are:

- Our water wells will be further dewatered (already our extreme climate change has dried up 3 of our 5 wells), and the likelihood of toxic pollutants used in mining will be dumped into South Fork Wolf Creek destroying the ecosystem.

**Ind 612-4**

- Our air quality will be further degraded ( already we have poor air quality rating due to our topography and relation to smog from the valley ). The mining project would spew clouds of airborne toxic mining dust and toxic diesel exhaust from heavy trucking. This is an extreme risk to our health.

**Ind 612-5**

- The noise of operations at the mine will destroy our peace. At our age, we relish the gift of the sounds of trees soughing and the birds singing.

**Ind 612-6**

- Traffic will be hazardous to negotiate with so many heavy trucking trips on our rural roads to the Centennial site to dump waste rock. Greenhorn Road is a one way in, and one way out road, with hundreds of residents along (and off) it's 7 miles. In a wildfire evacuation, the risk of a deadly outcome for the hundreds of residents along the 7 miles of Greenhorn road would be increased if big trucks were clogging the roadway.

**Ind 6112-7**

- It does not make sense to reopen a mine that has been closed for 66 years; while in the meantime, our population has grown into the area that has become residential with *hundreds of people living on top* of old, toxic, best left alone, 2585 acres of Rise Gold's underground mineral rights.

**Ind 612-8**

I believe it is more important to our future health as a community ***to not allow hard rock***

***mining***, which is the single largest source of toxic waste in the United States, back into our now beautiful area that is a tourist destination and desirable place to live.

Sincerely,
Nancy Rojo

To whom it concerns:

The evidence of mining harms to a place surround us.

**Ind 613-1** Mercury poisoning, sink holes, toxic waste byproducts, damage to the ecosystem and all within it.

Just now we're all dealing with the destruction of bird habitats during nesting season — big corporations who funnel profits out of the county don't live here and won't care when those problems start coming home. But we'll be living with them. Every day, and every night.

There are big problems with the environmental impact report including:

**Ind 613-2** The groundwater model has fundamental flaws in the initial start point and baseline data assumptions – all of which throw off the entire analysis.

**Ind 613-3** Dealing with mine waste – Asbestos will be a huge and expensive problem that requires far more comprehensive management than described in the report.

**Ind 613-4** Greenhouse gas emissions - The report excluded elements that would put the project over an arbitrary threshold limit, but recent climate change goals say the threshold should be "net zero".

**Ind 613-5** Cleanup of the toxic, pre-superfund Centennial site that would be used to dump mine waste is not included in the DEIR but is required by the California Environmental Quality Act (CEQA).

**Ind 613-6** Missing construction time estimates throw off the entire analysis of noise, traffic, and air.

**Ind 613-7** The DEIR incorrectly assesses nighttime noise and underestimates the noise of dumping mine waste near established residential neighborhoods.

**Ind 613-8** Air traffic hazards and aesthetic impacts need to be studied further due the likelihood of a moisture cloud plume that could be created by warm, saturated air ventilation.

**Ind 613-9** Blasting plans don't follow U.S. mining guidelines that restrict blasting during evening hours.

**Ind 613-10** The plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant.

1

**Ind 613-11**

Meteorological data used to assess the health risk of airborne pollutants doesn't fit Grass Valley's profile or accurately reflect local conditions.

Our peace is priceless.

We can invest in jobs in this county in many more fruitful ways. We have a flourishing tech television and broadcast industry, and could create a jobs magnet by offering TV tech education locally. Just an example of the kind of smart investment that pays long-term returns.

**Ind 613-12**

Let's put our heads together and figure out better options, ones that build a future for us, instead of destroying our present.

Say no and vote no on the Idaho Maryland mine.

Our future is at stake.

Nancy Shanteau
Grass Valley resident and local business owner.

## INDIVIDUAL LETTER 613: NANCY SHANTEAU

### Response to Comment Ind 613-1

The commenter states that historical mining in the area has led to harmful environmental impacts and that community is currently dealing with the destruction of bird habitats. Note that the DEIR clearly states that mercury would not be used during mineral processing (DEIR, p. 3-25).

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 613-2

The commenter states that the groundwater model has fundamental flaws and assumptions but does not provide specific reasons and only includes vague references to the "initial start point" and "baseline data assumptions."

The DEIR examined groundwater-related impacts extensively. That analysis may be reviewed at DEIR Chapter 4.8 – Hydrology and Water Quality, the Groundwater Hydrology and Water Quality Analysis (Appendix K.2), the Groundwater Model Report (Appendix K.3), the Preliminary Drainage Analysis (Appendix K.5), and the West Yost Peer Review (Appendix K.7.) The commenter is also directed to Master Response 13 – Historic Hydrogeologic Assessments, and Master Response 14 – Adequacy of Groundwater Model.

### Response to Comment Ind 613-3

The commenter states that the DEIR should include more comprehensive management of asbestos but the commenter does not explain how the DEIR is inadequate in this regard. The commenter is directed to Chapter 4.3 of the DEIR which analyzes asbestos in the context of air quality impacts and Master Response 4 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 613-4

The commenter states that the DEIR excluded elements that would cause the project to exceed the GHG emissions threshold, but does not explain what elements were excluded. A net zero threshold for GHG emissions is not required for the project. Please see Master Response 27 - Greenhouse Gas Thresholds.

### Response to Comment Ind 613-5

Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 613-6

The commenter states that the DEIR does not discuss construction time estimates which impacts the noise, traffic, and air analyses. Please see Master Response 24 – Project Construction Schedule. As discussed in Master Response 24, the project assumes a compressed construction schedule where many activities overlap to provide the most conservative estimate of air quality, traffic, noise and other impacts. An increase in the duration of construction activities and/or the completion of activities sequentially would serve to reduce estimates of environmental impacts in many areas. As such, the approach taken by the DEIR overestimates impacts as compared to a longer construction schedule with less overlapping activities.

### Response to Comment Ind 613-7

Please see Responses to Comments Grp 21-130 and Grp 21-131.

## Response to Comment Ind 613-8

The commenter states that the DEIR must discuss the potential for moisture cloud plumes and associated impacts to aesthetics or air traffic hazards. Moisture clouds from mine ventilation are not expected to occur and would not cause air traffic hazards or change the significance conclusion of the DEIR for aesthetics. Please see Response to Comment Grp 7-95.

## Response to Comment Ind 613-9

Please see Response to Comment Grp 21-144.

## Response to Comment Ind 613-10

The commenter states that the DEIR does not demonstrate that the impacts to biological and aquatic responses would be less than significant, but fails to provide specific reasons why the DEIR is inadequate. The DEIR discusses impacts to biological resources in Chapter 4.4 and impacts to hydrology and water quality in Chapter 4.8.

## Response to Comment Ind 613-11

The commenter states that meteorological data used to assess the health risk of airborne pollutants doesn't fit Grass Valley's profile or accurately reflect local conditions. The dispersion model in the Health Risk Assessment used the most appropriate data for the HRA. Please see Master Response 17 - Meteorological Data Used in HRA**.**

## Response to Comment Ind 613-12

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 614**

**From:** Natalie Wengryn <waxgoddess@yahoo.com>
**Sent:** Monday, April 4, 2022 8:57 PM
**To:** Idaho MMEIR
**Subject:** To whom it may concern

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To whom it may concern,

I have had many years ,leading up to this point, of watching this proposed mine project evolve. I live two miles up Geenhorn Road. My mothers preschool she ran for over 30 years is on East Bennett. Going back in time, to the point when Mr Mossman was just investigating or "looking" in just one of the shafts on East Bennett several years ago, it was apparent to me that this wanted to be somewhat discreet. The tall barrier walls (not being able to see what was going on behind them) struck an interest. I take East Bennett into town every single time, I would drive by there in the morning, mid day and sometimes at midnight or later and the work never stopped. Talking to those homeowners who lived near that site, they informed me what was going on and told me that their homes shook 24 hours a day. Knowing what I know now, I wonder where the contaminated water and debris went those many months of being excreted... and was it treated properly before doing so?

**Ind 614-1**

I am a simple woman. I never did well in science, but I do feel like I am pretty streetsmart and my gut is telling me something just isn't right here. I am a proud Nevada County native myself, born and raised here I know what this county was built on. My husband's great grandfather was a Nor-Star miner and died in that mine. His grandfather had to take over their dairy farm at a very young age and become a miner himself to support his family. Looking at the big picture, it is apparent to me that it is always the man with the money sitting back reaping all the benefits while everyone else around him puts their lives at risk. I am not going to sit here and copy and paste the same questions everybody else is sending to you. When we first bought our home 12 years ago, it was never disclosed to me (or any of my neighbors or friends that live even closer to the site) that it could potentially re-open. So the fact that I NOW have to disclose this to any potential buyer of MY home, making the value of MY home drop... makes me livid. The fact it could affect my water, quality of life.... We already have to be so careful with the water we already have here from the mining that happened so many years ago. I have filtration systems and do not let my children or family drink any of the water from the tap. I haven't in any home we have lived in in Nevada County knowing what I know. Living so close this should have been disclosed from the very beginning of every home sale or kept a commercial zone so many years ago. Living within 2 miles of the actual site, and only 1000 feet away from where the shafts end, my biggest concern is the water table. We do not have pipe treated water and just had to

**Ind 614-2**

drill a whole new well. It is baffling they think it will only affect the 30 homes on E Bennett, when the shafts go for miles and miles. When I read information about this project it seems as though they have to dig deeper to get to the actual gold that hasn't been mined. If that is the case, knowing how shafts tunnel farther "out" not "down" concerns me. If that is the case, wouldn't the mineral rights go beyond the thousands of acres? For an 80 year project where will they be in 10, 20, 30 years? I have also heard these horror stories of sinkholes and cave in shafts in Colfax and surrounding areas here. It

**Ind 614-3** seems to me going and disturbing extremely old mine-shafts that have been sitting full of rain and our well water for the last 70 years ... that Just disturbing it would cause vibrations that could do this? Are they going to re build the whole infrastructure down there? I wish that all of these worries I have could be explained to the ACTUAL PEOPLE living in such a close range, so that we don't go down these

**Ind 614-4** rabbit holes of worry. Like really, lay it all out on the table to those living right there. I shouldn't have to dig deep into the internet when this shit is happening in my backyard and so close to affect so many quality of lives. This information should be GIVEN to us freely, not some propaganda bandwagon newsletter to "stimulate the economy and bring more jobs" ... that's it, really?!

Having a small business here myself I know that this economy is stimulated and people move here every day with money. Wether retired or working remotely from the city, or growing marijuana. There are so many jobs here ready to hire, so that is a huge cop out to me as well. I really and honestly feel like nobody is being our advocate and it scares me. Yes this will affect this whole county

**Ind 614-5** but living so extremely close I am just baffled how this has been handled. Everyone I talk to seems shocked... it's up to five board of supervisors? Its self regulated? Oh that could never be put through!? It's not voted on?! And the further I read it doesn't put my mind at ease. Filling the shafts with some kind of man-made paste after being done? Where does the water go after that? What is in this paste can at leach into the water? Is that even environmentally safe? Having to keep sprinklers on the

**Ind 614-6** property to keep the amount of dust down does not match up with the fact they're saying it creates minimal dust. Watching and hearing I see him letting every nonprofit use this property, wood chipping and firewood programs, PG&E during the power outages and storms, buys the local fire department a brand new fire truck?! Silently donating to the widening project on 174... To me looks like "remember what I did for you". I could be wrong on some of these things and I would love to be

**Ind 614-7** enlightened on this and how exactly this whole process will go down. There are so many facets to this topic, and every time I talk about it I am shocked that it is even on the table. It would be one thing if it was out in the middle of nowhere, but this is in a housing community, my hometown that I am so proud to say...up until this point. Have our backs, be our advocate I am begging you.

Sincerely,
Natalie Browning

## INDIVIDUAL LETTER 614: NATALIE BROWNING

### Response to Comment Ind 614-1
The comment does not address the adequacy of the DEIR, but rather expresses concerns related to already completed exploratory drilling. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 614-2
Regarding the commenter's groundwater concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding quality of life concerns, which are outside the scope of CEQA, please see Master Responses 1 and 2. Please also refer to Master Response 7 – Location of Future Mining Areas.

### Response to Comment Ind 614-3
For sink hole concerns, please see Master Response 29 – Near Surface Workings.

### Response to Comment Ind 614-4
The existing underground workings would be utilized to the maximum extent practicable. As discussed in the Project Description chapter of the DEIR (chapter 3), new underground tunnels and raises would be created as necessary to access gold-quartz veins or provide the necessary underground infrastructure to transport rock and provide ventilation and escape routes. The location, size, and depth of new underground workings would depend on surface and underground drilling and mineral testing. New underground workings, except for the service shaft and new ventilation raise, would be below 500 feet of the ground surface.

### Response to Comment Ind 614-5
The commenter expresses concerns related to the use of cemented paste backfill (CPB) in the underground mine. CPB is addressed in detail starting on page 4.8-46 of Chapter 4.8, Hydrology and Water Quality, of the DEIR.

### Response to Comment Ind 614-6
The DEIR does not state that the project would create minimal dust. As discussed on page 4.3-65 of the DEIR, as part of implementation of APM-AQ-2, during construction, operation, and reclamation, all exposed soil surfaces would be adequately wetted to ensure that no visible dust crosses the property boundary, except when rains are occurring during construction, operation, and reclamation to reduce surface fugitive dust emissions. In addition, as an alternative to watering, inactive soil piles would be covered to minimize wind erosion. Such measures would be implemented to reduce surface fugitive dust emissions.

### Response to Comment Ind 614-7
The comment does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 615**

**From:** Nathan Collins

**Ind 615-1**

Hello,

I am a resident of grass valley and I wanted to say I am against re-opening the mine. The way forward for this county is not by going backwards in time. Not to mention the negative impacts to our air and water. We also do not need a significant amount of noise pollution to fill the air. Please do not reopen this mine. I can't believe we are talking about this in 2022, but here we are. Thank you for your time.

**Ind 615-2**

-Nate Collins

Sent from my iPhone

## INDIVIDUAL LETTER 615: NATE COLLINS

### Response to Comment Ind 615-1

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Responses 1 and 2. Regarding the general air quality concerns, please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. Regarding the general water concerns, please see Chapter 4.8, Hydrology and Water Quality.

### Response to Comment Ind 615-2

The comment does not address the adequacy of the DEIR, but rather expresses general concerns and opposition regarding the proposed project. Please see Master Response 1. Regarding the general noise concerns, please see Chapter 4.10, Noise and Vibration. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 616**

TO: Matt Kelley, Senior Planner April 4, 2023
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902
FROM: Nathan Helm-Burger, Scientist (MA Biological Psychology, MS Neuroscience)
12810 Woodpecker Way
Nevada City , CA 95959
Subject:
DEIR Comment on: AIR QUALITY AND GREENHOUSE GAS EMISSIONS ANALYSIS TECHNICAL REPORT FOR THE IDAHO-MARYLAND MINE PROJECT (IMMP)

""Potential cancer risk, as well as chronic and acute health risks would be less than significant without mitigation. However, implementation of MM-AQ-2 would further reduce health risk. Also, since asbestos was found in lab samples from the mine, an Asbestos Dust Mitigation Plan (MM-AQ-3) would be required to limit potential exposure". (page v, Air Quality and Greenhouse Gas Emissions Analysis Technical Report).

Re: I conclude that the most important impact is air pollution because it will endanger people many miles from the mine operations, just as wildfire smoke affects the whole region. While diesel exhaust will have unmitigable negative impacts, it is asbestos and silica that are most dangerous to us. Airborne asbestos can lead to cancer and eventual death.

**Ind 616-1**

The DEIR (Appendix E2) finds asbestos in about 32% of drill hole samples representing rock that will be brought to the surface. But, 19 drill holes providing 40 samples cannot represent 2,585 acres of mineral rights (1 sample per 65 acres). That's generalization from insufficient sampling—there's probably more.

Unfortunately, asbestos fibers are very small, approximately 0.5 microns. In this case, being sub-microscopic leads to harm: the asbestos cannot easily be filtered, can remain suspended a very long time in the air because , and penetrates deeply into our lungs.

The EPA's highest filter rating on the MERV scale is 16. This highest rated filter is only expected to filter out 75% of particles 0.3 to 1 microns, such as asbestos fibers. In other words, even using the highest quality industrial filter, it is possible that 25% of the asbestos will pass through. And even that level of filtration is far above what they could afford to do at that scale.Since it should be expected that more than 25% of the asbestos dust will escape mitigation entirely, their impact plan should include an analysis of the airborne spread of asbestos particles and expected dosage levels for the impacted communities.

**Ind 616-2**

The DEIR mitigations (4.3-2) treat asbestos as dust that can be kept out of the air by spraying water, washing vehicles, tarping the hauling trucks, etc. The proposed mitigations are copied from the CA Asbestos Airborne Toxic Control Measure which is for "visible dust emissions" -- there isn't any Asbestos Dust Mitigation Plan. Asbestos fibers are 1 millionth of a meter long, and can be harmful in quantities too small to be easily noticed in the hazing of the air. Mitigation intended for general rock dust is not sufficient or appropriate for asbestos fibers.

The DEIR does not contain an Asbestos Dust Mitigation Plan (ADMP) and therefore this vital part of mitigation cannot be used to determine DEIR adequacy. Thus, the DIER cannot be certified until action is taken. Quote: "Prior to the initiation of any clearing, grading, or

construction activities, Rise Grass Valley Inc. [sic] shall submit an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD)." This plan should be done before the project can be considered for approval.

**Ind 616-3**

"""Exposure of Sensitive Receptors: Project construction and operation activities would produce TAC emissions due to equipment, haul truck trips, and mining and soil movement. These emissions could result in elevated concentrations of TAC [Toxic Air Contaminants] emissions at nearby receptors, which could lead to an increase in the risk of cancer or other health impacts. In an abundance of caution, the health risk assessment conducted conservatively included emergency generator use based on Pacific Gas & Electric's (PG&E's) recent Public Safety Power Shutoffs during high winds for 24 hours per day, for up to 9 days per year, during construction and operations to reflect potential power outages. Potential cancer risk, as well as chronic and acute health risks would be less than significant without mitigation. However, implementation of MM-AQ-2 would further reduce health risk. Also, since asbestos was found in lab samples from the mine, an Asbestos Dust Mitigation Plan (MM-AQ-3) would be required to limit potential exposure."""

There are also other unaddressed issues such as the need for adequate testing of the 3 million pounds of rock excavated every day.

## INDIVIDUAL LETTER 616: NATHAN HELM-BURGER

### Response to Comment Ind 616-1

Diesel exhaust, silica, and asbestos have been analyzed in the Health Risk Assessment included in the DEIR and were found to be less than significant after mitigation. (see DEIR Impact 4.3-2.)

The commenter asserts that sampling for asbestos is insufficient. Please see Master Response 23 - Adequacy of Asbestos Sampling.

As stated on page 10 of Appendix E.2, ASHRAE Standard 52 MERV rating 16 specifies removal of greater than 95% of +0.3-micron particles. The particle size efficiency for particles sizes from 0.3 to 1.0 microns is greater than 75%. However, this fraction of particles size (0.3 to 1.0 micron) represents only a small portion of $PM_{10}$ (10 micron) dust; therefore, 25% of asbestos fibers would not pass-through filtration as the commenter asserts. Small fibers of naturally occurring asbestos are also less likely to become airborne as they would be enclosed in dust particles and therefore not be counted as asbestos in an air sample. Please see Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 616-2

Small fibers of naturally occurring asbestos are also less likely to become airborne as they would be enclosed in dust particles and therefore not be counted as asbestos in an air sample. Please see Master Response 22 - Conservatism of Asbestos Assumptions.

The minimum requirements of the Asbestos Dust Mitigation Plan are provided in Mitigation Measure 4.3.2. This plan must be approved by the Northern Sierra Air Quality Management District before commencement of clearing or grubbing. The preparation and approval of the ADMP is not required during the CEQA process. ADMPs are typically prepared and approved after the CEQA process is complete. CEQA regulations state that compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards (see CCR § 15126.4.) Mitigation Measure 4.3-2 of the DEIR requires the submission of an ADMP to NSAQMD for review and approval. The ADMP has minimum requirements as described in the mitigation measure. The requirements for the ADMP are regulated by the Asbestos ATCM for Construction, Grading, Quarrying and Surface Mining Operations [17 CCR 93105]). Notably, compliance with the CARB ATCMs for naturally occurring asbestos, including development of an ADMP, is the standard approach within CEQA documents to address health concerns associated with exposure to asbestos from unpaved surfaces, construction and grading operations and quarries where asbestos is found or likely to be found in order to ensure potential health risk impacts to the public would be minimized to a less than significant impact. Multiple other projects in the NSAQMD jurisdiction, as well as throughout the state, have relied upon compliance with these naturally occurring asbestos ATCMs in order to control any potential asbestos emissions to the extent possible. As described in Mitigation Measure 4.3-2 of the DEIR, the proposed project shall also comply with all applicable criteria in the CARB ATCMs for naturally occurring asbestos.

### Response to Comment Ind 616-3

The commenter states that adequate testing of rock proposed to be excavated daily is unaddressed in the DEIR. However, testing of rock is thoroughly discussed and analyzed in the DEIR. See chapters 4.3, 4.6, and 4.8 of the DEIR.

**Individual Letter 617**

**From:** Nathan W.

**Ind 617-1**

Hey there, wanted to share some thoughts on the mine. As a permanent resident of Nevada County I feel like the proposed mine is a bad idea.

The noise is discussed below. The impacts to air and water outlined in the EIR are unacceptable.

**Ind 617-2**

Also: The traffic analysis has some significant and unavoidable impacts that are reported as such in the DEIR. The traffic effects will be horrible for a long time. Also, at my initial glance, there is no clear analysis of the increase in traffic along segments of highway 49, which appears to be a flaw in the analysis.

**Ind 617-3**

The recently published DEIR for the proposed reopening of the old Idaho Maryland mine needs careful scrutiny.

Taken at face value, it concludes that the project would have no impact on the community that could not be mitigated.

The report was written by Raney Associates, a reputable firm chosen by the County, but it is based on language and measurement values provided to it by Rise Gold, and is correct in its conclusions only to the degree that that language and those measurement values are correct. Rise Gold has clearly chosen the language and measurement values to reflect the best possible outcome. Consequently, the real-life conditions would likely be quite different from the conclusions in the DEIR. Evaluating the level of impact should be based on worst case conditions, not best possible conditions.

**Ind 617-4**

Examples follow:
The ambient noise levels used in the study are currently four to five years old. Since the operations at issue will not start occurring for several years in the future after building construction and tunnel re-construction have been completed, these noise levels will likely not reflect the actual ambient noise at the time operations actually start, so the conclusions are questionable.

**Ind 617-5**

Noise is referenced with respect to 1) the source, and 2) the distance to "The Nearest Receptor". According to the County General Plan, Table 4.10-4 notes:

"[The noise] standards shall be measured only on property containing a noise sensitive land use as defined in Policy 9.8 and may be measured anywhere on the property containing said land use. However, this measurement standard may be amended to provide for measurement at

the boundary of a recorded noise easement."
Rise Gold has chosen to measure and compute noise levels at what they call 'The nearest receptor', which in the case of the multi-acre parcels surrounding the mine operations, is the residence on the property, located at the greatest distance from the mine operations. To provide a realistic level of the impact on the property, those measurements and computations should be made at the property boundary, rather than the far end of those properties.

**Ind 617-6**

The study describes in detail how the sound mitigation by terrain and ground cover will contribute to the mitigation of sound in the local neighborhood, and relies on these values for its conclusions, but does not address the time when the engineered fill rises above the surrounding foliage and subjects the neighborhood to the direct, unobstructed noise of the fill and compacting operation. And incidentally, puts the subsequent use of the property (probably an industrial park) 93 feet higher than it now is, an altitude that will block the now unobstructed view of the surrounding parcels.

**Ind 617-7**

The DEIR also says: "Assuming a bulldozer, grader, excavator, front-end loader and compactor were operating concurrently at the Brunswick and Centennial Industrial Sites during site preparation, the combined noise exposure from the effective noise center of those operations would be 85 dBA Leq and 85 dB Lmax at a distance of 50 feet from the operations. However, the earthmoving equipment would be at various locations on the project sites rather than grouped in a small portion of the sites. To provide a conservative but reasonable assessment of project construction noise generation at the Brunswick and Centennial Industrial Sites, it was assumed that all of this equipment could be operating concurrently, but that the equipment would be spread out over the sites during the site clearing/construction operations. As a result, average noise levels were predicted for the Brunswick and Centennial Industrial Sites preparation activities assuming the noise sources were distributed throughout the sites, whereas maximum noise levels were predicted based on the closest proximity of the equipment to the sensitive receptor locations."

This combined sound level would also be true of the later fill and compact operations at the Centennial and Brunswick sites, therefor this seems is a false assumption, since these machines work jointly to accomplish their task, and would sometimes be operating in close proximity.

The DEIR is full of statements that use "it is assumed" and "is projected to be" as given fact in arriving at their conclusions.

These are red flags.

**Ind 617-8**

Additionally, the suggestion that both the average and the maximum sound levels would be the same, 85 dBa. says that the noise would be ongoing and continuous from 6AM to 10PM 7 days a week. Acceptable daytime noise levels of 75dBa would still be like standing next to a busy freeway. This is a major change to a quiet neighborhood, even if it lies within the County's defined noise limits.
Sound level calculations for the DEIR Tables are based on values for construction noise from The FHWA Roadway Construction Noise Model (RCNM), and shown in Table 4.10-10. These values differ substantially from sound levels shown in the Noise Navigator Sound Level Database, published by the University of Michigan Department of Environmental Health Science.

For example, where the RCNM shows Compactor and Front End Loader sound levels at

80dBa, the Noise Navigator chart lists them as 92 and 93dBa. An Earth Scraper in Table 4.10-10 is listed at 85dBa. In the Noise Navigator chart, it is 107 to 111 dBa. The noise level values on the Noise Navigator chart are twice and four to five times those on the RCNM chart used by Rise.

This calls into question the integrity of the analysis, since the actual machines to be used, the true sound levels of those machines, the real numbers of those machines in use at any given time, and their locations around the working locations at any given time are not actually known.

**Ind 617-9**

The DEIR describes a sound monitoring plan to evaluate the mitigation results of the operation. It says:
"If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed."

At this point, Rise will have sunk several million dollars into construction and development costs prior to starting operations. Are we to believe that they will just shut down until they can solve the problem, or will they continue to operate and pay fines levied as 'the cost of doing business'? These issues must be resolved before any permit is issued!
For those curious to know what the sound levels in your own lives are, there are several excellent sound meter apps available for your phone. Search 'noise level meter'. Although I have a professional sound level meter, I find the NOISH Sound Level Meter to be surprisingly accurate.

Because calculating cumulative sound levels involves dealing with the logarithmic dB scale, the online tool NOISE CALCULATOR may be handy:
[https://noisetools.net/decibelcalculator](https://noisetools.net/decibelcalculator...)
All the info above to be credited to Robert Hubbard

So for all these reasons including air water noise traffic and other issues I ask you to please vote against the mine.

Thanks.

## INDIVIDUAL LETTER 617: NATHAN W

### Response to Comment Ind 617-1

The commenter's opposition to the project is noted for the decision-makers. No specific comments are provided related to the adequacy of the DEIR and no further response is warranted. Please see Master Response 1.

### Response to Comment Ind 617-2

The commenter references the project's anticipated significant and unavoidable impacts related to traffic. The commenter's opposition to these impacts is noted for the decisionmakers. Regarding the supposed increase in traffic along segments of Highway 49 and where to find it in the DEIR; as stated in the DEIR, the quality of traffic flow is typically governed by the operation of major intersections and the daily volume of traffic along the roadways. (DEIR 4.12-1.) Many of the Study Roadway Segments either directly connect to SR 49 or provide access to SR 49. As explained on page 4.12-16 and 4.12-17, while levels of service were used to demonstrate County roadway impacts consistent with the General Plan, CEQA requires a Vehicle Miles Traveled approach, accounting for the number of vehicle trips generated and the length or distance of those trips. This includes both commuting employees, fill trucks and other vehicles using VMT as the primary metric used to identify transportation impacts under CEQA. (DEIR 4.12-28.) Table 4.12-9 details the Project Trip Distribution on every route, including SR 49 for both average daily trips and maximum daily trips for the Brunswick and Centennial Industrial Sites for employee traffic, engineered fill trucks and other vehicles.

### Response to Comment Ind 617-3

Commenter questions the accuracy of the data used for the DEIR. Although Bollard Acoustical Consultants, Inc. (BAC) has prepared numerous CEQA-level DEIR noise analyses directly for Raney over the years, the commenter is correct that the noise study prepared for this project by BAC was completed under contract with the applicant, not directly for Raney. However, in such cases it is common practice for the EIR preparer (Raney), to retain a qualified, third-party, consulting firm to conduct a thorough peer review of technical studies provided directly by the applicant. For this project, Raney retained Saxelby Acoustics to conduct such a peer review of BAC's noise study. The independent peer review is described on page 4.10-26 of the DEIR. The Saxelby peer review identified areas of the original noise study where additional detail or analysis was recommended. The noise study was revised in response to the peer review comments and suggestions, and the revised noise study was reviewed again by Saxelby Acoustics and determined to be adequate.

This comment is incorrect as all ambient noise level data collected for this project was reported without alteration and represent actual baseline ambient conditions at the nearest sensitive receptors to the noise-generating areas of the project. In addition, all assumptions regarding proposed operations and the noise-generation of those operations were clearly presented in the DEIR noise study (see DEIR Appendix L). Because the project would be conditioned to require extensive noise-compliance testing upon project start-up and thereafter, and required to implement additional sound control measures if the applicable noise standards are exceeded, utilizing unrealistic or understated assumptions to assess potential noise impacts for project noise sources would be counter-productive. CEQA does not require evaluation of absolute worst-case conditions or worst-case scenarios. If this were the case, all new residential developments within the State of California would be required to implement extensive noise mitigation measures (i.e., very tall sound walls around neighborhoods), for atypical noise conditions such as the passage of a very loud motorcycle group adjacent to a proposed residential development on a Sunday

afternoon, for example. Similarly, CEQA studies should also not be prepared using best-case conditions. An evaluation of the typical noise generation of the project is required, not absolute worst-case or best-case conditions. For this project, the goal was to identify noise impacts associated with typical operations using reasonably conservative assumptions.

## Response to Comment Ind 617-4

The commenter states that the noise data is too old to use. As the CEQA Guidelines make clear, ordinarily the appropriate baseline will be the actual environmental conditions existing at the time of the Notice of Preparation. The noise studies in question were conducted over time to give complete information leading up to the Notice of Preparation, which was publicly issued on July 17, 2020. Given the exponential nature of the decibel scale, a considerable change in traffic volume is required prior to an appreciable change in ambient noise conditions occurring. Specifically, a doubling of traffic volume is required to achieve a 3 dB change in ambient conditions. Because traffic volumes rarely double within the span of 20 years, and because the baseline ambient noise environment in the project vicinity is defined almost exclusively by local traffic, minor changes in traffic volumes in the past 4-5 years would result in negligible changes in ambient noise conditions. It should be noted that the evaluation of the project's noise impacts is directly related to baseline ambient conditions. As a result, comparison of project's noise generation against a lower ambient condition provides the greatest protection for noise-sensitive receptors than comparison of project noise generation against a higher ambient condition. Although no substantive changes in ambient conditions are believed to have occurred since the completion of the ambient surveys for this project, had such minor changes occurred the ambient data used to establish the project standards of significance in the project DEIR would result in a conservative assessment of the project's noise impacts.

## Response to Comment Ind 617-5

The commenter suggests noise monitoring at the property's edge instead of at the nearest receptor as suggested by the DEIR and the County General Plan. DEIR Table 4.10-4 was included as Table 5 in the noise analysis prepared by BAC for the project (DEIR Appendix L). As a result, the noise study preparers were familiar with the specific requirements of the County's General Plan Noise Element. The intent of the noise study was to evaluate potential noise impacts only at properties containing noise-sensitive land uses and at locations on those properties where noise-sensitivity actually exists, not at the extreme edge of the property containing the noise-sensitive use. Nonetheless, Figure 4.10-2 of the DEIR clearly indicates that the receptors evaluated in this study are very close to the Brunswick site boundaries, not at the "far end" of the properties as asserted by the commenter. Two exceptions occurred at Receptors 1 and 2 located near the Centennial Site where the residences are set back from Idaho-Maryland Road. Had the receptors on these properties been placed at the southern boundary of the sites, immediately adjacent to Idaho-Maryland Road, ambient conditions for those receptor locations would have been substantially higher. Because the noise standards are tied to ambient conditions, the result of locating the receptors at the south end of those properties would be much higher standards of significance for Receptors 1 and 2. The higher predicted noise levels associated with the project (due to the closer proximity of the receptors to the Centennial site), would have been more than offset by the significantly higher ambient conditions at the locations adjacent to the roadway. As a result, the finding of a less than significant noise impact at those receptors would not have changed.

## Response to Comment Ind 617-6

Commenter suggests that an analysis was not made of the engineered fill at elevation later in the project timeline. On the contrary, the ultimate elevations of the engineered fill areas were included

in the three-dimensional noise modelling conducted for the environmental noise analysis, as described on page 6, last paragraph, of the Noise and Vibration Analysis. As a result, the condition referenced in this comment was accounted for in the DEIR impact assessment.

## Response to Comment Ind 617-7

The commenter questions the adequacy of the County's defined noise limits and ordinance and the DEIR's use of scientific modeling. Because maximum noise levels typically result when equipment is operating at the nearest positions to sensitive receptors, the noise evaluation prepared for this project appropriately analyzed impacts relative to maximum (Lmax) noise level standards while the equipment would be operating at the closest positions relative to residences. However, given the variability of the locations of mobile equipment while operating on the sites, average (Leq) noise levels associated with the operations of such equipment are similarly variable. As a result, an evaluation of potential noise impacts conducted by placing all of the equipment at the closest positions to the nearest residences would be both atypical and would result in overstatement of project's average noise generation. While it is true that heavy equipment will sometimes operate in close proximity to the engineered fill boundaries, it would be incorrect to assume that all of the on-site heavy equipment would be simultaneously operating at the extreme edges of the site nearest the sensitive receptors. As mentioned above, CEQA does not require analysis of a worst-case scenario.

It is both a necessity and common practice to conduct modelling of a project's likely noise generation prior to the commencement of operations at a proposed project site. This is because those operations and equipment used to conduct those operations would not be operating until such time as the project is approved and operations at the site commence. As a result, it is necessary to utilize both reasonable and appropriate assumptions in that modelling. Furthermore, by virtue of the fact that project noise levels are modelled, the results are, in fact, "projected". The authors of the DEIR noise analysis have modelled the potential noise impacts associated with projects for over 30 years, including multiple EIRs which have regularly and routinely been certified by the local jurisdiction as being adequate per CEQA guidelines. Each of those studies utilized scientific assumptions to project noise levels at sensitive receptors, with mitigation being required in each case where significant noise impacts were identified. The same approach was taken with this project. Impacts were identified for some aspects of this project and related noise mitigation measures identified. Although some assumptions were required for the analysis of impacts for this project due to the fact that various options exist for the selection of certain equipment types, the majority of the modelling was based on information provided by the Project Applicant where specific information pertaining to the noise generation of the proposed equipment was known. Because the project will be conditioned to require extensive noise-compliance testing upon project start-up and thereafter (a recommendation made by the noise study preparers), and because the project will be required to implement additional sound control measures if the applicable noise standards are exceeded upon commencement of those operations, utilizing unrealistic or understated assumptions for project noise-generation would be counter-productive to the objectives of the analysis. Approval of the project does not waive the applicability of the County's noise standards or the applicant's responsibility to satisfy those standards and in order to operate, the project must comply with those standards.

## Response to Comment Ind 617-8

Commenter would rather use the Noise Navigator Sound Level Database published by the University of Michigan instead of the Federal Highway Administration's (FHWA) approved national model. It is important to understand that maximum noise levels received at a sensitive receptor seldom result from the simultaneous generation of maximum noise levels from multiple types of

heavy earthmoving equipment. As a result, there is often very little difference in measured average and maximum noise levels associated with the operations of heavy earthmoving equipment. In addition, the average noise generation of heavy equipment is a function of the duration of the hour in which the equipment is operating, the noise generation of the individual equipment types, and the distance between the nearest sensitive receptor and that equipment.

The Roadway Construction Noise Model (RCNM) is the Federal Highway Administration's (FHWA) approved national model for the prediction of construction noise. The RCNM is a national model based on the noise calculations and an extensive construction equipment noise level database. The basis for the national model is a spreadsheet tool with predictions originating from Environmental Protection Agency (EPA) noise level work, which utilizes an "acoustical usage factor" to estimate the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during a construction operation. The noise levels listed in the RCNM database represent the A-weighted maximum sound level (Lmax), measured at a distance of 50 feet from the construction equipment. By comparison, the Noise Navigator Sound Level Database does not differentiate between whether the sound levels are presented in terms of maximum, average, or some other acoustical descriptor. Furthermore, many of the sound levels presented in the Noise Navigator database do not include the distance at which the reported levels were measured, making the data unusable for the purposes of evaluating construction noise impacts. Many of the reported levels are at the position of the equipment operator, which has no bearing on the evaluation of construction noise at the nearest residences. The Noise Navigator's spreadsheet reports noise levels ranging from 82 to 102 dBA for front loaders, but no distances are provided for those reported levels. As such, they cannot be compared against the extensive database of equipment noise levels reported at a reference distance of 50 feet in the RCNM database. In addition, there is no information provided at the Noise Navigator website regarding the adequacy of the equipment used to measure the noise levels, the experience of the individuals conducting the noise level measurements, or the conditions present when the noise surveys were conducted. Because the Noise Navigator website states only that, "The tabled values are primarily A-weighted sound levels, as opposed to time-weighted average levels or Leqs. To determine exposures, the user will have to factor in the total exposure time as well as the actual sound level that is present at the ear", and "The values are for representative sources at typical distances. When available, the distance at which the measurement was recorded is listed in the appropriate column". However, no distances are provided for any of the Front End Loader noise level data included at the Noise Navigator Site. Finally, no distances were provided for 5 of the 7 reported sound levels for "Earth Scrapers" at the Noise Navigator site and the distances provided for the other two sites ranged from 3 to 20 meters. Due to the inconsistency and lack of supporting information for the data provided at the Noise Navigator site it cannot reasonably be relied upon for use in predicting construction noise impacts. By comparison, the FHWA RCNM is industry-recognized as a reliable prediction tool for construction noise and has been used in numerous CEQA EIR evaluations prepared by the authors of this project's noise evaluation which have been certified as adequate.

## Response to Comment Ind 617-9

The commenter expresses skepticism that violation of the County's Noise Ordinance can result in stopping the project and again suggests using a phone noise calculator. First, Mitigation Measure 4.10-3 of the DEIR is legally binding and enforceable by the County. This mitigation measure requires the mining operation to cease until additional engineering controls can be implemented, as needed. The mine will not be allowed to continue operating until such time that the applicant provides proof demonstrating the operational noise levels comply with the County noise level standards.

Commenter is correct that smart-phone sound level meter (SLM) applications are becoming increasingly popular. And while such applications can provide data which may match data collected by state-of-the-art sound level meters under certain circumstances, care must be taken in interpreting and understanding the results provided by such applications as there are many circumstances when such applications will provide erroneous information. For example, smart-phones do not have a wind-screen, cannot be calibrated, and the microphone has a very small diaphragm, thereby severely limiting the frequency response of the SLM applications, introducing pseudo noise from wind, and inaccuracies in general. Furthermore, because SLM applications do not meet either Type 1 or Type 2 requirements without the use of an external, calibrated, microphone (verified at website: https://www.cdc.gov/niosh/topics/noise/app.html), they do not meet American National Standards Association requirements for accuracy (ANSI S1.4). As a result, such applications should be used with care and an understanding of the limitations of the application.

BAC is familiar with this site and concurs with the commenter that this site provides accurate decibel computations.

**From:** Nathan W.
**To:** bdofsupervisors; Heidi Hall
**Subject:** The mine EIR is woefully incomplete
**Date:** Friday, March 25, 2022 7:50:40 AM

Dist 1

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

I wasn't able to attend the meeting in person but have previously shared via e-mail my concerns with the EIR.

Here is another: it has come to my attention that Hydrology experts have found serious flaws in the analysis included in the Draft Environmental Impact Report for the Idaho-Maryland Mine, raising major concerns about negative impact on wells and the area's groundwater in a time of drought.

**Ind 618-1**

To be fair, since I live north of Nevda City in district one, I probably don't have to worry about my well! But we are a community, we are all in this together, and when things go wrong, we are all going to be impacted.

And things will go wrong. That's why we have this process. To make sure that is taken account of with mitigation steps in place.

The EIR says the mining company will address well issues…… but ONLY for the 30 wells identified in the report. It does not acknowledge ANY risk for wells beyond that, and there lies the rub. It also does not actually set aside money in escrow for mitigation, leaving them the easy out they have used before by declaring bankruptcy when the issues exceed their optimistic projections.

**Ind 618-2**

If those wells fail, there are ZERO mitigations proposed of any kind. Fractured rock hydrology is a very imperfect science. There is no way to say with certainty that other homes won't be affected. Those other homes needs to have protections too.

This plan doesn't even propose well monitoring for those other homes, which means that if something fails, there would be NO way for homeowners to prove that the mine was at fault and they would have to bear the costs and timeline themselves.

It currently takes years to install NID water so that means those homeowners would be out of luck for a very long time. And to replace wells across all of Rise Gold's mineral rights area would literally costs millions. Personal costs for each homeowner would be in the 10's of thousands. This is a HUGE risk for both homeowners and the County.

But what is worse, this company tends to pull up stakes when bad things happen. They just file bankruptcy and pack up and leave and don't honor any of their agreements. They did this on one of their last projects in Canada

**Ind 618-3**

It's not that I don't trust Rise Gold, it's just that they haven't lived up to previous agreements, and left the community holding the bag for the cleanup of a project that they were supposed to do. And even if they pay, the hardship in the process and impact to the community greatly outweighs the benefit to us.

I absolutely, unequivocally DO NOT support re-opening the Idaho-Maryland mine. Nevada County is in tremendous need of brave stewardship that can provide a strong, healthy future for today and for decades to come. Rise Grass Valley's plan to build a mismanaged, short-sighted mine that badly disrupts neighbors and our natural environment while creating irreversible harm for at least 80 years is a crossroads to revitalize our local priorities. Re-opening the mine assumes that their employees want unsafe, short-term careers with a negative impact that is immeasurable, including devastating pollution. The mine will spur a bottleneck of massive truck traffic, intolerable noise, increased dust magnitudes, damage to both our area water sources and private wells combined with depleting electric power resources in a drought region. THIS PROJECT IS UNSAFE and significantly affects the health, security, and peace of Nevada County residents and their families and will disrupt locals' prosperous lives.

Rise Grass Valley has an outdated, unwanted, self-serving project for Nevada County. I URGE THE BOARD OF SUPERVISORS AND OTHER COUNTY OFFICIALS TO PROTECT OUR LOCAL COMMUNITY BY STRONGLY CONDEMNING THE RE-OPENING OF THE IDAHO-MARYLAND MINE.

Thank you for your time.

—Nathan off Rock Creek Road.

## INDIVIDUAL LETTER 618: NATHAN W

### Response to Comment Ind 618-1

The commenter claims that hydrology experts have found flaws in the analysis in the DEIR. However, the commenter does not describe these supposed flaws, identify the experts, nor reference any alternative studies. The project's technical studies related to hydrology were prepared by experts in the field of hydrology and peer reviewed by a third-party consultant to ensure adequacy. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model.

### Response to Comment Ind 618-2

The commenter incorrectly characterizes the mitigation measures provided in the DEIR to address potential impacts to groundwater supplies and domestic wells in the project area. Mitigation Measure 4.8-2(c) on DEIR page 4.8-68 requires the applicant to implement a Well Mitigation Plan for the 7 wells which are expected to be adversely impacted by proposed dewatering according to the groundwater modeling conducted for the project, as well as 23 other properties along E. Bennett Road. In addition, Mitigation Measures 4.8-2(a) and (b) require the applicant to implement a groundwater monitoring program and to provide a comparable alternative water supply should project dewatering significantly impact any additional wells in the area not previously identified. Implementation of these measures would be financed by the Project Applicant.

Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, for an updated description of the proposed monitoring approach, which now also includes a proposal by the applicant to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

With regard to the project's financial assurance mechanism, the comment is noted for the decisionmakers, and the commenter is referred to Master Responses 1 and 2.

### Response to Comment Ind 618-3

The commenter's opposition to the project is noted for the decisionmakers – Please see Master Response 1. With regard to the Project Applicant and previous mining projects, the commenter is referred to Master Response 3 - Operator Responsibility. With regard to the project's effect on residents' peace and quality of life, the commenter is referred to Master Response 2 - Social and Economic Impacts.

The commenter broadly lists several environmental concerns but does not provide any specific comments. Each of the environmental topics raised is evaluated in the appropriate chapter of the DEIR.

**Individual Letter 619**

Matt Kelley,
Senior Planner
Nevada County Planning Department
950 Maidu Avenue
Nevada City, CA 94959-8617

Mr. Kelley:

**Ind 619-1**

Rise Grass Valley's proposal to reopen the Idaho-Maryland Mine will pump $38 million in direct payroll into our local economy by creating 312 jobs that today do not exist in Nevada County. Who among the Board of Supervisors will be foolish enough to say no to that idea?

Nevada County is in a recession. Our average wage is $45,000 a year, $23,000 lower that the statewide average. They are offering an average annual wage of $94,000 (NOT INCLUDING BENEFITS), and two-thirds of the new hires can come from existing Nevada County residents.

Think about what that means for the small businesses in this county. The benefits to the local building and contracting industry are obvious, but what does it mean to an independent restaurateur in Grass Valley or a small shop owner in Nevada City? To have 15-20 more customers a week because there are more people with strong incomes working locally. What does it mean to the school districts to have an influx of tax base and new students rather than worrying about school closures and budgets being cut?

My company has worked with Rise Grass Valley, and we're confident in their plan. I urge the Board of Supervisors to support jobs and economic growth in the county by supporting the Idaho Maryland Mine and recapturing our strong history of responsible mining locally.

Neal Siller
Siller & Siller
PO Box 430,
Penn Valley, CA 95946

## INDIVIDUAL LETTER 619: NEAL SILLER

### Response to Comment Ind 619-1

The comment does not address the adequacy of the DEIR, but rather expresses general support for the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 620**

**From:** Nelson Foster <graypine2@hughes.net>
**Sent:** Monday, April 4, 2022 6:04 AM
**To:** Idaho MMEIR
**Subject:** Idaho-Maryland Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Friends,

I want to join fellow Nevada County property owners registering concern about the EIR presented by Rise Gold pursuant to its application to reopen the Idaho-Maryland Mine.

**Ind 620-1**

Professional reports that support mines — Siskon Gold, in my neighborhood — are custom-made to understate risks and overstate benefits and protections. A lot of people better qualified than I have given the County many reasons to read the Rise Gold argument skeptically. I'm particularly concerned about dewatering and greenhouse gas emissions.

Please rule against reopening the Idaho-Maryland Mine.

Thank you,
Nelson Foster
17973 Tyler-Foote Rd., Nevada City, CA 95959

1

## INDIVIDUAL LETTER 620: NELSON FOSTER

### Response to Comment Ind 620-1

The comment expresses a general opinion that the DEIR understates the risks and overstates the benefits and protections of the proposed project, but does not provide specific examples that would allow for a detailed response.

Pursuant to the requirements set forth by CEQA Guidelines Section 15121, the DEIR assesses all potential project impacts that could occur to all environmental issue areas required for analysis under CEQA. As part of such assessment, the DEIR evaluates the proposed project's consistency with applicable policies, regulations, and standards established at the federal, State, and local levels and incorporates analyses from the County's expert consultants, which includes independent peer reviews of the applicant-provided reports. Where potential impacts are identified, the DEIR sets forth mitigation measures to reduce the severity level of the identified impacts to the extent feasible and discloses the level of impact that would occur subsequent to incorporation of mitigation. As such, the analysis within the DEIR is adequate and meets the requirements set forth by the CEQA Guidelines. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project.

Regarding the commenter's general dewatering and greenhouse gas emissions concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 27 – Greenhouse Gas Thresholds.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 621**

**From:** Nicki Hansen-Dix
**To:** BOS Public Comment
**Subject:** To be read at BOS meeting: Deny Rise Gold mining operation
**Date:** Tuesday, January 18, 2022 4:52:50 PM

**Unable to identify**

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 621-1** My name is Nicki Hansen-Dix. I am a retired architect and project manager for both county and Federal governments. I reviewed and made decisions based on EIR findings and managed small and large design and construction projects from concept to completion. I live just off Bennett in Grass Valley and so have a personal stake in the impacts of this proposed project.

**Ind 621-2** I urge you to deny the opening of this mine. The negative effects regarding water supply and contamination alone should be enough to convince you of the harm to the environment and the community. But reduction in already poor air quality, the addition of noise pollution and disruption to the rural life of residents of our county need also be considered.

**Ind 621-3** In addition, with the history of unmitigated pollution and damage caused by the entity proposing this project, this company would never have been approved for any of the government projects I managed. Their past performance raises huge red flags for the health and safety of our county.
Mining has historically damaged and poisoned much of our county. Please do not allow this to happen again. Do not let this project go forward.
Thank you for your consideration.

## INDIVIDUAL LETTER 621: NICKI HANSEN-DIX

### Response to Comment Ind 621-1

The comment does not address the adequacy of the DEIR, but rather summarizes the commenter's qualifications.

### Response to Comment Ind 621-2

The comment does not directly address the adequacy of the DEIR. Regarding water supply concerns, the commenter is referred to Chapter 4.8, Hydrology and Water Quality, Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding contamination concerns, please see Chapter 4.7, Hazards and Hazardous Materials, as well as Master Response 8 – Mine Waste Characterization. Regarding the general noise concerns, please see Chapter 4.10, Noise and Vibration. Regarding general air pollution concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, as well as Master Responses 18 – Air Quality Thresholds. Concerns related to quality of life are outside the scope of CEQA - please see Master Responses 1 and 2.

### Response to Comment Ind 621-3

The comment does not address the adequacy of the DEIR. Regarding operator concerns, please see Master Response 3 – Operator Responsibility. The commenter's opposition to the proposed project has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 622**

Matt Kelley, Senior Planner
Nevada County Planning Department
Idaho.MMEIR@co.nevada.ca.us

Comments on Draft Environmental Impact Report for proposed reopening of Idaho-Maryland Gold Mine

My name is Nicki Hansen-Dix. I am a retired architect having worked as an architect and project manager for federal and county governments (General Services Administration Design and Construction Division in San Francisco and Los Angeles, Sonoma County Architects Office and Placer County Architects Office). I have lived in Nevada County for twenty years. My parents lived here beginning in 1979. My great-great-grandparents were married near Chalk Bluff in this county and my great-grandfather was born here. I now live at 115 Union Jack Street, #38, Grass Valley, in the zone that is within 1 - 1,000 feet from the Idaho-Maryland mine mineral rights, less than two miles from the mine property and less than one-half mile from the Centennial site.

I attended a portion of the meeting on March 24th and heard many of the issues I have with the DEIR report addressed there. In light of that, I will not detail all of my own concerns here knowing others have already gone on record to communicate those to you. But I agree with the consensus that this DEIR is inadequate:

**Ind 622-1**

- in the scope of the impacts (e.g., where does it fully address the changes to quality of life or impact on community mental health that will be caused by this project),
- in the suggested mitigations that miss entire elements of an impact (e.g., the proposed NID extension impact on property owners described below), or
- by downplaying impacts (e.g.,
    - admitting temporary noise levels 4.10-1 will be Significant and Unavoidable (SU) for construction of potable water line, but permanent increases of excess noise levels of the project 4.10-3 will be Significant (S) mitigated to Less Than Significant (LS) despite 24/7 construction and mine operations involving explosions, rock crushing and other mechanical and equipment noise, and inescapable truck traffic, or
    - determining impacts to be LS and therefore no mitigation needed when impacts are actually significant (e.g., creating a new source of substantial light or glare associated with the proposed project 4.1-3, which is definitely a larger than LS impact in a rural area with a new 24/7 operation).

I will address aspects of the NID pipeline, noise, air quality, housing, emergency egress in evacuations, climate change and carbon offsets.

**The proposal to extend NID pipeline to potentially impacted well owners, 4.8-2(c)**

I am only pointing out two of the issues relating to the proposed NID line extension to well owners. And as the NID representative who spoke at the March 24th meeting said, the number of potential wells impacted will far exceed those listed in the DEIR.

**Ind 622-2**

- Not addressed is the loss of the ability to live "off the grid" by having an independent source of water. One reason for living rurally is the commitment to sustainable living. Providing NID access does not solve this issue. Land owners with wells have already worked and paid for their water supply and should not be forced to depend on public infrastructure.
- Many people do not consider "treated" water to be the healthiest option for themselves or that of their animals/stock or landscape/crops/gardens. This is illustrated by the large number of

households using filtering systems for tap water, from single filtering pitchers to whole house filtration systems, in order to eliminate chemicals such as the chlorine routinely added to the public water supply.

***Can a property owner who declines NID connection opt to have their well deepened at Rise's cost?**

**Ind 622-3**

An observation regarding **Figure 4.8-13 Potential Expansion of Future Mine**: I find it interesting that potential mining expansion extends significantly beyond the mineral rights boundary in several areas.

**Ind 622-4**

**Noise and Vibration 4.10** as it will impact residences, businesses, wildlife, livestock, pets, families, and vegetation within and near the proposed mine site, along the truck route to the Centennial site—including the Whispering Pines Businesses Park and nearby businesses such as Peaceful Valley Farm & Garden Supply[1]—and also the truck routes to and traveling along SR 20/49 extending throughout county and state.

Despite the fact that Nevada County Zoning Ordinance exempts construction activities from the noise standards, and despite DEIR's tables listing decibel levels being within allowable ranges, and despite five plus six years being considered "temporary", the unrelenting seven-day-a-week noise onslaught will cause damage to the health of humans, pets, livestock and wildlife. This impact to health cannot be mitigated. Allowing this project to proceed will cause harm to several generations over the 80-year period of this project. See Note 1 at the end of these comments for some of the specific detrimental health effects caused by noise.

***4.10-1 Generation of a substantial temporary increase in ambient noise levels ... even with the implementation of mitigation, the impact would be considered significant and unavoidable. ...***

***4.10-2 Generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, due to fill placement, compaction, off-site traffic, and related activities. Based on the analysis below, with the implementation of mitigation, the impact is less-than-significant.***

**Ind 622-5**

*Placement and compaction of engineered fill at the Centennial Industrial Site would occur over approximately five years, and placement and compaction of engineered fill at the Brunswick Industrial Site would occur over approximately six years. Movement of fill from the Brunswick Industrial Site to the Centennial Industrial Site would involve an increase of heavy truck traffic along off-site roadways, which could increase local noise levels. The aforementioned activities would lead to a temporary increase in ambient noise levels in the project vicinity*

"Less Than Significant"? Just look at the truck traffic trip frequency, Haul/Transport Truck Operations, per Chapter 3 - Project Description:

| | |
|---|---|
| 1. engineered fill: | 50-100 round trips/day. For the first five plus six years (eleven total), limited to the project site and to and from the Centennial site. Subsequently transported to "local markets", which would impact a much larger area of roads and their adjacent |

[1] Question: How will 100 passing trucks/day with their diesel exhaust and dust from mining products affect Peaceful Valley's organic products and plant life? Will it affect their "organic" designation?

| | |
|---|---|
| | residences/businesses/recreational or wildlife areas, extending far beyond the immediate area of the mine project.** |
| | ****Has this extended area impact been addressed in the DEIR?** |
| 2. gold concentrate: | 1-5 trips/day, over the 80-year term of the use permit, 145-mile one-way trips to the Port of Oakland** |
| 3. diesel fuel tankers: | 1 every 2 weeks, to and from the project site, using Brunswick Road to SR 20/49, over the 80-year term of the use permit, through residential, business, natural environments and fire danger zones<br>2 tankers/day in times of inevitable PSPS shut-offs for additional fuel demands of back-up generators |
| 4. cement trucks: | 9 trucks/week, max. 2/day |
| 5. freight trucks: | 3/week, max. 3/day, Brunswick Rd. to and proceeding along SR 20/49 over the 80-year term of the use permit |
| 6. explosives via semi-trucks: | 1/week, max., min. 1 every 3 weeks (during initial underground construction, explosives may be transported to the site more frequently)<br>These trips will be through rural—including fire danger zones—and heavily populated traffic areas over the 80-year term of the use permit. |
| 7. personal employee vehicles: | 217 vehicle parking spaces are provided. Some of these trips would be local, but a minimum of 99 workers would be from outside the local area.** |
| | Haul trucks, freight trucks, explosive trucks, and cement delivery trucks are anticipated to have a 60-mile one-way trip length (4.3-71)** |

So, somewhere between 370 and 785 truck trips per week, plus however many personal vehicles fill up to 217 parking spaces daily—should we multiply 217 times the number of shifts per day times seven days per week? Even using 2 shifts per day when there are certain jobs which have three shifts per day, that is 217x2x7=3,038 round trips of personal vehicles per week? That's hard to believe; I really hope my math is wrong on that!

These truck and personal vehicle trips not only contribute to **4.10 Noise and Vibration**, but also **4.3 Air Quality, Greenhouse Gas Emissions, and Energy**, **4.7 Hazards and Hazardous Materials**, **4.12 Transportation** (Traffic), **4.13 Wildfire**, and overall quality of life.

**Ind 622-6**

In terms of wildfire danger—notwithstanding the potential for accidents involving explosives transport and diesel transport—the project would add a considerable number of trucks, other project vehicles, and employees' personal autos to the community. Despite the statement in 4.7-4 that this impact would be Less than Significant in the event of an emergency evacuation, this added number of vehicles would exacerbate any emergency evacuations in an area where there are limited evacuation routes. We had two such evacuation orders in this vicinity last year and I can tell you, having been part of those evacuations, that directing the hauling vehicles to "pull off the road to enable residents to evacuate" is not a solution. No doubt, in an active fire situation, those drivers are going to want to leave the vicinity, as will the workers at the mine who fill the 217 parking spaces on the project site.

Page 3 of 6

**Ind 622-7**

As to **4.3 Air Quality**, I will mostly defer to the comments made by Dr. Jeff Kane at the Public Hearing as he addressed the already "F-grade" quality of air in our county and spoke about the list of toxic airborne substances that will degrade that further (8.5 million tons known to be toxic over 80 years) saying "We can't take this!" He also pointed out that requisite mitigation measures are too numerous to enforce.

**Ind 622-8**

**Chapter 4.5 – Cultural and Tribal Cultural Resources** Page 4.5-28 ... *the project applicant possesses a private library of information that describes the underground mine workings of the Idaho-Maryland Mine in its entirety.*
*4.5-1(a) Following initial mine dewatering, and prior to commencement of underground mining, the project applicant shall share the historical documentation of the Idaho-Maryland Mine Company in their possession with the public through one of the following libraries: the California State Library, the California Geology and Mining Library, or the Searls Library. The library shall consist of the following information:* nine descriptions follow of maps (388) and documents, photos and drawings dated from 1919 through 1956.
I am just curious, if "*A significant public and historic preservation benefit may be gained from sharing the library with the public,*" why wait until the mine is dewatered? Why not donate those significant documents now?

**Ind 622-9**

**4.9 Land Use and Population and Housing**
Page 4.9-26, *It is anticipated that approximately 99 workers (32 percent of workforce) would be recruited from outside the local area; these positions require extensive experience in underground mining which are less likely to be possessed by persons currently residing in the immediate local area.*
*The addition of 240 persons as a result of the proposed project would not impact the existing housing stock for Nevada County, given the existing vacancy rates.*

Despite tables showing vacant housing, it is well known that housing in our county is not easy to come by. My own personal experience and that of friends in the last few years illustrates how difficult it is to find quality affordable housing. With an anticipated <u>minimum</u> of 99* workers recruited from outside the local area, that is a strain on our housing infrastructure, not a less-than-significant impact on people in this county already having trouble finding adequate housing.

*Rise may say they anticipate hiring 68% of the workforce locally but can they be held to that number?

**Ind 622-10**

**Climate Change**
Did the DEIR consider the affects of climate change—change in weather patterns, temperature increases, extended drought, etc.—in its calculations and mitigations for each of the impact categories? If climate change effects are not addressed in the DEIR, then its conclusions cannot be relied on over the extensive timeline of this proposed project. The subject of climate change was discussed in detail in 4.3, but I did not see it specifically addressed in the project impacts and mitigations portions of the DEIR chapters.
As just one instance, the effects on changes to the water table caused by climate change and/or prolonged drought combined with the impacts of the mine project, how could that cumulatively affect health of the landscape and habitat above the dewatered mining areas over 80 years? Potential loss of trees? Tree loss due to drought and the pine bark beetle is already here. Potential increase in fuel for wildfires if landscape dries/dies out? This is just one element that could be impacted. Almost every other chapter in this DEIR could be impacted by climate change as it progresses.

**Ind 622-11**

**4.3 Air Quality, Greenhouse Gas Emissions, Energy**
The DEIR may detail the mitigations of numerous fuel saving measures or procedures that lessen pollutants, but that does not address the massive amounts of diesel fuel (and gasoline) that will be sourced and burned 24/7 over 80 years—just refer to the above-mentioned vehicle trip frequencies—nor the sum total of pollutants over the 80 years. No matter what mitigation techniques are in effect, the cumulative detrimental effects to air quality and the creation of greenhouse gas emissions in an era of climate catastrophe is not adequately addressed in this report. In this time when we need to address and reverse the danger to our planet, the microcosm that is this proposed project does just the opposite.

Because state regulations regarding air quality and greenhouse gas emissions may well become more stringent as the climate crisis evolves, will this proposed project be liable to follow new regulations as they arise or will it be required to follow only those in force at the time the permit is approved?

**Ind 622-12**

**4.3-7(b) Carbon Offsets – Construction Emissions.**
*Rise Grass Valley Inc. (Rise) shall retire carbon offsets in a quantity sufficient to offset the project's construction greenhouse gas (GHG) emissions*
What specific offsets are proposed? Instead of a financial transaction of retiring carbon offsets, can these be actual project site physical rectifications such as creating a clean renewable energy source like solar to meet the project's energy demand, or planting trees along the trucking route as well as replacing those trees lost as a result of the project, or requiring employees to carpool or bike to work with a majority of parking spaces allocated to electric vehicles rather than just a few spaces—something to benefit the community where the construction related emissions actually take place?

**Ind 622-13**

There are so many areas I have issues with and questions about. I have only addressed a portion in this letter. I do not see many positive effects that will result from this project going forward; overwhelmingly negative impacts to our environment and community.
Those copious impacts that the report declares will be mitigated, are dependent on massive amounts of regulations and oversight. Who will be watching to ensure all these regulations are followed and met? The Planning Department? Independent investigators? Regulatory representatives? Rise Gold itself? Who pays for that? As Jeff Kane said at the March meeting, the requisite mitigation measures are too numerous to enforce. Even a small number of these mitigations, if not followed, could be devastating to our county.

Thank you for your work on this. You have a tremendous job ahead of you.

Nicki Hansen-Dix
115 Union Jack St, #38, Grass Valley, CA 95945
530-320-9647

Note 1
As stated in an Atlantic article November 2019, Why Everything Is Getting Louder, By Bianca Bosker

> Scientists have known for decades that noise—even at the seemingly innocuous volume of car traffic—is bad for us. "Calling noise a nuisance is like calling smog an inconvenience," former U.S. Surgeon General William Stewart said in 1978. In the years since, numerous studies have only

> underscored his assertion that noise "must be considered a hazard to the health of people everywhere." Say you're trying to fall asleep. You may think you've tuned out the grumble of trucks downshifting outside, but your body has not: Your adrenal glands are pumping stress hormones, your blood pressure and heart rate are rising, your digestion is slowing down. Your brain continues to process sounds while you snooze, and your blood pressure spikes in response to clatter as low as 33 decibels...
> Experts say your body does not adapt to noise. Large-scale studies show that if the din keeps up—over days, months, years—noise exposure increases your risk of high blood pressure, coronary heart disease, and heart attacks, as well as strokes, diabetes, dementia, and depression. Children suffer not only physically—18 months after a new airport opened in Munich, the blood pressure and stress-hormone levels of neighboring children soared—but also behaviorally and cognitively. A landmark study published in 1975 found that the reading scores of sixth graders whose classroom faced a clattering subway track lagged nearly a year behind those of students in quieter classrooms—a difference that disappeared once soundproofing materials were installed.

Alex Brown's article on how noise pollution hurts wildlife for Pew Trusts, October 22, 2019 states, "Increasingly, research shows that human-caused noise can be harmful to many species."

> The literature has shown that noise fundamentally changes behavior, distributions and reproductive success [for wildlife]," said Jesse Barber, who runs the Sensory Ecology Lab at Boise State University.
> Several years ago, Boise State's Barber and a team of scientists installed 15 speakers in an Idaho woodland and played traffic noises to create a "phantom road" over half a mile of terrain. They found that 30% of songbirds moved elsewhere once the noise began, and many other species that remained struggled to gain weight.

[Human generated noise]...has been linked to decreases in species diversity, bird populations, and tree growth.

Page 6 of 6

## INDIVIDUAL LETTER 622: NICKI HANSEN-DIX

### Response to Comment Ind 622-1

Regarding quality of life concerns, please see Master Response 1 - Non-EIR/Administrative Issues.

The commenter states that the DEIR is missing elements of an impact such as proposed NID pipeline impact on property owners. However, the commenter provides no information as to which elements are missing from the DEIR. The impacts of the proposed NID pipeline are analyzed throughout the DEIR (see Chapters 3 and 4 of the DEIR).

The commenter states that noise impacts are "downplayed" in the DEIR, but provides no specific information as to why these impacts are downplayed. The commenter is referred to Chapter 4.10 of the DEIR. As stated on page 4.10-45 of the DEIR:

> Based on the above [analysis], none of the individual activities associated with long-term operations of the proposed project would generate noise in excess of the applicable noise standards. Furthermore, combined project noise impacts are not anticipated for the proposed project. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 is included out of an abundance of caution to ensure satisfaction with such standards and to reduce the potential for annoyance resulting from the proposed project to the maximum extent feasible. It is conservatively concluded that the proposed project could result in a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, and the project's noise impacts could be ***significant***.

Mitigation Measure 4.10-2 requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

Mitigation Measure 4.10-2 also requires quarterly noise monitoring by the County's third-party noise consultant during the first five years of project operation, and once per year thereafter for the life of the project.

The commenter states that impacts that the DEIR determined to be less than significant are actually significant and provides light and glare as an example due to its location in a rural area and the 24/7 operations proposed by the project. As discussed on pages 4.1-23 through 4.1-29 of the DEIR, the proposed project would not create a new source of substantial light or glare which

would adversely affect day or nighttime views in the area. The determination of less than significant is based on substantial evidence provided in the form of a photometric plan for the Brunswick Industrial Site, inclusive of lighting types and projected lumen intensities across the site. As stated on page 4.1-24 of the DEIR, based on the photometric plan:

> […] the lighting intensities at the northern property line, near East Bennett Road, are at 0.0 foot-candles[5], and thus, light spillover is not projected to occur off-site. The nearest proposed pole-mounted LED, which is International Dark Sky Association compliant, would be located approximately 100 feet from East Bennett Road. Thus, the existing sensitive receptor along New Brunswick Court would not be impacted by light spillover from the proposed on-site lighting. Similar conclusions can be made for the remainder of the property boundaries, based on the Photometric Plan; no light spillover is projected to occur at the property boundaries.

## Response to Comment Ind 622-2

Please see response to Nevada Irrigation District comments – Agency Letter 10 of the Final EIR.

Regarding quality of life, please see Master Response 1 - Non-EIR/Administrative Issues.

Drinking water supplied to Nevada Irrigation District (NID) customers continues to meet and exceed state and federal public health standards, based on testing results that serve as the basis for the District's Water Quality Report. See https://www.nidwater.com/files/1e68c2c9b/NID+WQR+2021.pdf

The Well Mitigation Plan has been modified to clarify the range of actions that would be taken if necessary for well mitigation outside of the E. Bennett Road area, if unanticipated well impacts occur. Connection to NID potable water would be one of many options available for well mitigation. Please see modified Well Mitigation Plan attached to the Final EIR as Appendix D. Any cost of well mitigation, including deepening of wells, would be the responsibility of the applicant.

## Response to Comment Ind 622-3

No mining would be done outside of the mineral rights boundary. Figure 4.8-13 shows sensitivity scenario 6 from the groundwater model, where planned mining is extended for an additional 40 years past the 25-year base-case. As discussed on pages 27 and 28 of Appendix K.3, the expansions in Scenario 6 would represent a major discovery of parallel veins, similar to those mined historically in the Brunswick Mine, within the known mineralized system. These expansions are modeled to depth below the Idaho and Brunswick Mines and below the "Mitchell Crosscut," which extends past the main mine workings to the north on the 1,000-ft level. As can been seen in the figure the existing Brunswick mine workings were copied in order to generate the conceptual mine workings for the sensitivity scenario, which results in some mine workings outside of the mineral boundaries that would not occur in reality and therefore provides conservatism to the analysis of groundwater impacts. Nonetheless, to address public concerns regarding the scope of future mining within the mineral rights area, the applicant has agreed to an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area (shown on maps A101, A201 and A202), and will also prohibit blasting closer than 500 feet below ground surface except for construction of the service shaft. Please see Appendix A to the Final EIR for the aforementioned maps.

[5] One foot-candle is a unit of illumination equal to that given by a source of one candle at a distance of one foot.

## Response to Comment Ind 622-4

The commenter states that noise and vibration from the project would affect people, animals and vegetation at the project sites and local and state roads and highways and these impacts are unmitigable. The commenter references "Note 1", which is excerpted from several newspaper articles. Noise and vibration impact thresholds used in the impact analysis, in accordance with CEQA guidelines, is provided in Chapter 4.10 of the DEIR. Note that heavy trucks and lighter vehicles already exist on local roadways as a source of traffic noise, and the project would only add an incremental increase to existing noise levels. Wildlife disturbance is discussed on page 4.4-74 of the DEIR.

The commenter asks if diesel exhaust and dust will affect Peaceful Valley's organic products for "organic" designation. Numerous trucks already travel on Whispering Pines Lane, and the project would add an incremental increase to existing traffic volumes. Please see Table 32 of Appendix O of the DEIR. Please also see Master Response 18 - Air Quality Thresholds.

## Response to Comment Ind 622-5

Employee schedules are shown in Table 3-8 of the DEIR. Noise impacts from project traffic has been analyzed in the DEIR. Please see Chapter 4.10 and Appendix L of the DEIR. Specifically, please refer to Impact 4.10-2 of the DEIR, which evaluates traffic noise level increases attributable to all project traffic. The traffic noise analysis determined that the project's incremental traffic would not exceed the applicable traffic noise increase thresholds along surrounding roadways.

However, the analysis determined that noise generated from hauling fill from the Brunswick Industrial Site to the Centennial Industrial Site could exceed local standards if jake brakes are used. Therefore, the project could result in the generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, and a significant impact could occur. Mitigation Measure 4.10-2 would reduce the potential jake brake noise impact to a less than significant level.

## Response to Comment Ind 622-6

Regarding quality of life, please see Master Response 1 - Non-EIR/Administrative Issues.

Please see Master Response 5 - Evacuation Zones.

Regarding truck and personal vehicle trip noise and emissions, these are evaluated Chapter 4.10 (see Impact 4.10-2) and Chapter 4.3 (see Impacts 4.3-1 and 4.3-2), respectively.

## Response to Comment Ind 622-7

Please see Master Response 18 - Air Quality Thresholds.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. The County has adequate staff and expertise for enforcing permit conditions, and routinely enforces similar conditions and mitigation measures on other projects in the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

## Response to Comment Ind 622-8

The mitigation measures of the DEIR are designed to mitigate impacts from the proposed project. The proposed project has not been approved or implemented at this time; thus, the mitigation is not yet required and the County has no present legal authority to request the referenced private documents.

## Response to Comment Ind 622-9

As discussed on page 4.9-25 of the DEIR, Nevada County has 53,745 total housing units with a 22.5 percent vacancy rate (12,098 vacant housing units). The unincorporated area of Nevada County has a total of 32,182 housing units with 4,645 vacant housing units (14.4 percent vacancy rate). Therefore, it is reasonably anticipated that the addition of 312 persons to the County as a result of increased employment generated by the proposed project could be accommodated by existing housing stock in Nevada County.

The County cannot enforce local hiring. However, as stated on page 4.9-26 of the DEIR, substantial economic incentives exist to maximize employee recruitment from the local Nevada County area.

## Response to Comment Ind 622-10

Please see Master Response 16 - Drought and Climate Change.

## Response to Comment Ind 622-11

The air emissions and greenhouse gas emissions for project activities and cumulative impacts have been analyzed for the project. Please see Chapter 4.3 of the DEIR.

The project would be subject and required to comply with any new state regulations regarding air quality and greenhouse gas emissions imposed throughout the life of the project that are applicable to vehicle standards or other operational aspects to which those standards apply.

## Response to Comment Ind 622-12

The commenter suggests that onsite improvements or local tree-planting be used to offset the Greenhouse Gas emissions of the project. However, climate change is a global impact, so purchase of carbon credits from off-site sources would have the same global mitigation impact as compared to onsite or local mitigation. The commenter's suggested mitigation would not avoid or lessen a significant project impact, so it is not required to be implemented under CEQA.

As discussed on page 4.12-82 of the DEIR, because the Proposed project is anticipated to employ approximately 312 direct employees during full operations, pursuant to Section L-II 4.1.9 of the Nevada County LUDC, the Project Applicant would be required to submit a detailed analysis of transportation alternatives, documenting feasible measures for reducing auto dependence. Although the overall project site is not currently served by transit and the Nevada County Transit Services Division does not have plans to bring service to the project area, the nearest bus route to either the Brunswick Industrial Site or Centennial Industrial Site is Route #3, which operates between the Tinloy Street/Bank Street Transit Center and the Nevada County Airport and passes directly by the Centennial Industrial Site. The proposed project would incorporate an area for bicycle racks at the Brunswick Industrial Site, which would provide a minimum of 11 racks (44 bicycle spaces). Pursuant to Nevada County LUDC, additional potential transportation reduction alternatives for the proposed project were identified in the Traffic Impact Analysis prepared for the proposed project, based on the Transportation Demand Management strategies included in the Vehicle Miles Traveled Implementation report prepared by Fehr & Peers for the NCTC.

## Response to Comment Ind 622-13

Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. The County has adequate staff and expertise for enforcing permit conditions, and

routinely enforces similar conditions and mitigation measures on other projects in the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

**Individual Letter 623**

## IDAHO-MARYLAND MINE PROJECT
## DRAFT EIR COMMENT FORM

To document the author of comments received, please provide the following information. Thank you.

Name: Nicki Hansen-Dix

Address: 115 Union Jack St #38 GV 95945

Organization (if applicable): _____

Please provide us with your written comments on the Idaho-Maryland Mine Draft EIR by **5:00 PM, April 4, 2022**. Comments may be placed in the comment box located in the back of the Board of Supervisors Chambers during the Special Public Meeting of the Nevada County Planning Commission. Written comments may also be submitted (email or hardcopy) to the address below:

NEVADA COUNTY
PLANNING DEPARTMENT

**Ind 623-1**

There are so many "Impacts" with No mitigation specifics identified but still state the Impact listed as Significant (S) as being reduced to Less than Significant (LS) post mitigation.

Ie, mitigation measure says must provide plan, proposed plan, proposed tests, shall submit, plan will be required, etc.

There is no way to verify in this DEIR that S will go to LS post mitigation based on no mitigation methods currently submitted.

All Impacts that rely on future plans should not be termed LS without a mitigation described.

## INDIVIDUAL LETTER 623: NICKI HANSEN-DIX

### Response to Comment Ind 623-1

The comment expresses a general opinion that the DEIR contains potentially significant impacts that are mitigated to less-than-significant levels without providing mitigation measures to reduce the severity of such impacts; however, the commenter does not provide specific examples that would allow for a detailed response.

The DEIR includes mitigation measures to reduce potentially significant impacts to the extent feasible, with most mitigation measures reducing identified potential impacts to less-than-significant levels. Where the mitigation measures set forth therein do not reduce identified impacts to a less-than-significant level, the DEIR discloses that such impacts would remain significant and unavoidable.

In instances where mitigation measures require future preparation of plans to prevent potential impacts, such measures include specific standards with which the future plans must comply. For example, Mitigation Measure 4.6-3(a) requires that the Project Applicant have a final geotechnical engineering report prepared by a State-registered civil engineer that shall be incorporated into the project improvement plan submittals. Mitigation Measure 4.6-3(a) further requires that the recommendations from the final geotechnical engineering report be incorporated into the project improvement plans. Finally, the mitigation additionally requires that grading plan review and construction monitoring shall occur in accordance with the recommendations from the Geotechnical Engineering Reports (Geotechnical Engineering Report, Idaho-Maryland Mine Project – Brunswick Industrial Site. November 18, 2019; and Geotechnical Engineering Report, Idaho-Maryland Mine Project – Centennial Industrial Site. December 20, 2019). Through compliance with the above, potential impacts related to unstable geological units or soil would be reduced to less than significant.

RECEIVED

MAR 14 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Ave., Suite 200
Nevada City, CA 95959

March 9th, 2022

Dear Supervisor Heidi Hall, Ed Scofield, Dan Miller,Susan Hoek, and Hardy Bullock,

I see no benefit coming to the County from the opening of the Idaho-Maryland Mine by Rise Gold.

**Ind 624-1**

From the DEIR I see that water availability for the mine project is based on past years, not on current extreme drought years. Rise Gold has grossly underestimated the impact water use and water removal will have on the water table and adjacent homes, while offering a paltry mitigation time period within the 80 years of their lease. The noise and vibration from trucks and blasting, and diesel and heavy metal mine dust pollution are all dangerous to our health and businesses. Dumping massive amounts of water into Wolf Creek will stir up past mining toxins in the stream channel and destroy habitat. We already live in a cancer hot spot. We have already experienced the toxic effect of the past mining era. New safety technologies can not mitigate all this. And why does anyone trust Ben Mossmen of Rise Gold? His Banks Island Gold, polluted tribal waters, went bankrupt and left a mess for Canadians to clean up. He and others involved have 18 pollution charges that are going to trail in April.

**Ind 624-2**

My business is located in the town of Grass Valley. I already am negatively impacted from the noise, vibration and bad air along the 49/South Empire corridors. I DO NOT WANT an industrial gold mine at my front door and I don't know a single person, no matter their political persuasion, who thinks this mine is a good idea. For God's sake please find another source of tax dollars that will actually benefit the community instead of polluting our County and making us sick.

**Ind 624-3**

Thank you for you dedication to Nevada County,

## INDIVIDUAL LETTER 624: NINA CUNNINGHAM

### Response to Comment Ind 624-1

Please see Master Responses 13 through 16 regarding the commenter's water and drought concerns.

### Response to Comment Ind 624-2

The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment specifically addresses health impacts to children. The commenter is referred to Master Response 18 – Air Quality Thresholds.

Regarding general noise concerns, please see Chapter 4.10, Noise and Vibration.

The commenter also appears to raise legacy contaminant concerns from past mining. Please refer to Response to Comment Grp 25-30.

Please also see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 624-3

The commenter's opposition to the proposed project has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project. Please see Master Responses 1 and 2.

**Subject:** NO GOLDMINE MINE...PLEASE READ!
**Date:** Thursday, February 3, 2022 7:49:06 PM

Cannot confirm residency

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Dear BOS,

**Ind 628-1** I am against the reopening of the old Idaho Maryland Mine site reopening by Rise Gold. They purchased the property with its current zoning which prohibits a gold mine operation. Please do not approve a conditional use permit for Rise Gold and change zoning. Residents purchased properties around the site with the assurance that a heavy industrial operation would not be allowed. Many residents like me looked at the Nevada County General plan before we purchased in this county. You can't just rip it up, change it and make it up as you go!

**Ind 628-2** If you allow the goldmine and your best efforts to mitigate fail, we have so much to loose:

- Unacceptable noise levels and destruction of quiet enjoyment of surrounding taxpayer properties
- **Ind 628-3** Trucking of toxic waste causing pollution, traffic and destruction to our residential roadways
- **Ind 628-4** Huge Increase in energy consumption, pollution and noise due to the massive diesel generators and additional electrical needed
- **Ind 628-5** Drinking water/well water integrity and possibility of dry wells to neighboring community (Look at our history please. Look at San Juan Ridge and Lost Lake where a US Federal Superfund to clean up is STILL in place DECADES LATER!)
- **Ind 628-6** Unacceptable water toxin levels dumped into the Wolf Creek. There are sensitive wetland area in certain areas where you have already allowed at least one large scale commercial cannabis grow on an active wetland with nesting and breeding species. Unbelievable!
- **Ind 628-7** Uncertain underground tunnel integrity leading to a whole new slew of ground issues
- **Ind 628-8** 80 years, 24/7 operation
- **Ind 628-9** Loss of property values
- **Ind 628-10** Rise Gold history of litigation of toxic dumping in their homeland of Canada and history of insolvency / bankruptcy
- **Ind 628-11** 70 or so underground mining jobs created for all of our sacrifice? High level jobs have been spoken for according to Rise Gold.
- **Ind 628-12** Is Nevada County receiving anything of monetary value for approving the goldmine? As constituents, we must be made aware of all promised to you or the county.

**Ind 628-13** Please ask yourselves in honesty, does Nevada County really have the people power to oversee this HUGE Goldmine operation which YOU WILL BE RESPONSIBLE FOR, with all the commercial cannabis already approved among other day to day operations? Already we are seeing violations of cannabis operations you have made agreements with and they have failed to comply. I have written to you about these.

NO MINE! It would be a catastrophe of epic proportions in so many ways. Please do your part

and vote NO on the mine.

Our HEALTH before their WEALTH.
WE ARE MORE VALUABLE THAN GOLD!

Nora Risen

## INDIVIDUAL LETTER 628: NORA RISEN

### Response to Comment Ind 628-1
The commenter opposes the project and urges the County not to approve a Conditional Use Permit. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 628-2
The commenter states that the project will result in unacceptable noise levels but provides no additional information and does not state how the DEIR is inadequate. The commenter is referred to Chapter 4.10 (Noise and Vibration). The only unacceptable noise levels would occur during the temporary construction of the potable water pipeline along East Bennett Road. "Unacceptable" in this context is defined as exceeding the applicable County noise thresholds after implementation of feasible mitigation.

### Response to Comment Ind 628-3
The commenter is concerned about the transport of engineered fill, traffic impacts, and damage to local roadways. The commenter does not provide any additional information and does not state how the DEIR is inadequate. Air emissions from trucks are analyzed in Chapter 4.3 of the DEIR, traffic and roadway impacts are analyzed in Chapter 4.12 of the DEIR.

### Response to Comment Ind 628-4
The commenter states that the project's use of diesel generators will have negative impacts to noise, air quality, and energy consumption but does not state how the DEIR is inadequate in analyzing and mitigating these impacts. Noise impacts from backup diesel generators is less than significant after mitigation. (DEIR p. 4.10-43.) Air emissions from the use of backup diesel generators are provided on page 4.3-104 of the DEIR. As noted in the DEIR, because the use of emergency generators is speculative and beyond the reasonable control of the Project Applicant, the emissions presented in Table 4.3-25 are for informational purposes only. Finally, it is important to note that while the use of emergency generators during power-outages such as PSPSs is outside of the scope of CEQA, the regular use of generators for routine maintenance and testing has been considered throughout the entirety of the analysis of the chapter, as such use is not speculative.

### Response to Comment Ind 628-5
The commenter is concerned about the water quality and water quantity impacts to groundwater wells but does not state how the DEIR is inadequate. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 8 - Mine Waste Characterization, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 628-6
The commenter states that the treated water being discharged to South Fork Wolf Creek contains unacceptable toxin levels. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 628-7
The commenter is concerned about the integrity of the underground mine workings. The commenter is referred to Chapter 4.6 (Geology, Soils, and Mineral Resources) of the DEIR and Master Response 29 - Near Surface Workings.

## Response to Comment Ind 628-8

The commenter states “80 years, 24/7 operation.” There is not enough information to formulate a specific response. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 628-9

The commenter states the project will result in the loss of property values. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 628-10

The commenter references the reputation of the Project Applicant. The commenter is referred to Master Response 3 - Operator Responsibility.

## Response to Comment Ind 628-11

The commenter states that the high paying jobs from the generated from the project should come from other industries. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 628-12

The commenter asks what economic benefits the project is bringing to the County. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 628-13

The commenter urges the County not to approve the project. The commenter’s opposition to the project is noted for decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

PLANNING DEPARTMENT

Re: Comments on EIR for Rise Gold Mining Project

*Dear Mr. Kelley,*

I am a retired attorney who has lived in Nevada City for 14 years. I have reviewed the Draft EIR and have the following comments.

**Ind 629-1**

1. As noted in the EIR, "The much larger mineral rights boundary encompasses approximately 2,585 acres" this land is under our little mountain community, where we live, work and recreate. The vast size of the proposed project will inevitably have many negative effects on the daily lives of the people that live here. This fact places on you the obligation tomake a thorough, independent review of everything presented by Rise Gold.

**Ind 629-2**

2. First, as to the Centennial Cleanup Project—there are many representations made in this section. However, the underlying issue is: what will our local and county government do if Rise Gold is unable or unwilling to fulfill these promises? What will be the cost to clean up the current hazardous conditions and any future hazardous conditions caused by the proposed mining operation. We know all too well what the consequences are when mines close and the hazardous waste is left for the local government to deal with! Only a multi-million-dollar bond could provide the funds necessary for the County to clean up after this disaster this would cause.

**Ind 629-3**

3. An essential issue that isn't addressed in the EIR is: what have the consequences been with respect to Rise Gold's projects in other areas? Did they meet all of their obligations? This is a critical question which requires an independent investigation.

**Ind 629-4**

4. Next, regarding the mining operation there is no doubt based on information in the EIR that this will be a noisy, dirty, industrial operation. Not only will they be mining underground which involves drilling and blasting, but they will be crushing and processing the ore. This proposal presents plans for the construction of "a commercially viable, financeable, major underground gold mine operation that will produce 1,000 tons per day (365,000 tons per year) of gold mineralization." Careful reading of the EIR reveals the many major destructive consequences this mine will have on of native flora and fauna, and more! The weak suggestions regarding possible mitigation are not enough to protect this community. This project will have a more profound affect on our community than any project proposed during my many years as a resident.

**Ind 629-5**

5. I have read Rise Gold's self-serving promises regarding mitigation of these environmental effects and it is obvious that Rise Gold has no clear plan that could possibly protect the local area from damage. Rise Gold will "monitor" all of these destructive conditions and make "feasible" changes. Even then, their suggested mitigation efforts are insufficient to actually protect the community from the many negative effects of this project. Rise Gold promises to mitigate, when possible, but the truth is, most of the negative effects on our way of life will be impossible to mitigate. For example, they promise to cover their trucks. But that will not stop the negative affects of the noise, traffic, and excessive road wear caused by those trucks! Also, if you want to

see how unsuccessful we have been with covering loads to reduce pollution—just look at the road leading to the Transfer station—all of those loads are required to be covered, but the littering never stops.

**Ind 629-6**

6. Likewise, Rise Gold represents that it will monitor the ground water in the area, but that doesn't overcome the problem of the extensive water use proposed when we are in a continuing drought with no end in sight! They say that Rise Gold will take measures to provide another source of water for those with wells affected by the project. Exactly what will that consist of? Is that really feasible? What about the local residents that rely on well water for all of their household needs? What will the Board of Supervisors do if Rise Gold finds in impossible to actually supply an alternative water source when their wells dry up? Rise Gold suggests the alternative of giving residents who need water some monetary compensation. How will money help them if there isn't any alternative way for them to replace the water. Furthermore, this will not only affect wells. Our reservoirs have not been sufficiently supplied by snowpack for many years. Our residents need our precious water resources!

**Ind 629-7**

7. With respect to the "Generation of a substantial temporary increase in ambient noise levels in the vicinity of the project" the EIR doesn't deny that there will be a lot of noise and underground vibration in all areas where the mining and processing will occur. Also, there will be a continuing stream of very heavy, noisy trucks on our roads for years to come. Over and over in the "mitigation" suggestions, Rise Gold promises to monitor these problems and implement unspecified "engineering controls" to correct them. What if it is impossible to mitigate these problems? Has Rise Gold submitted any evidence that these conditions have been successfully removed has been in similar mining operations in other jurisdictions? If it can't be mitigated, Rise Gold promises to cease operations. Then what will the Board do? Will it make exceptions so the mine can continue to operate, or will they insist on fulfillment of these promises, causing Rise Gold to go out of business and leave the local government entities to deal with this defunct project and all of its unmitigated environmental destruction?

**Ind 629-8**

8. The EIR is full of promises, what if these promises are not kept? What will be the true cost of this project to the people of Nevada County then? I can tell you what will happen if Rise Gold contends that it has sufficiently mitigated the problems because further efforts are not economically feasible. There will be multiple law suits. How much will that cost the County? If we lose these cases—which as a retired lawyer I assure you is always a possibility--what will be the affect on our little town then? If mitigation is either impossible or economically unfeasible how will the Board of Supervisors clean up the remaining mess?

**Ind 629-9**

9. As you are aware, As **provided in the CEQA Guidelines Section 15021, public agencies are charged with the duty to avoid or minimize environmental damage where feasible. The public agency has an obligation to balance a variety of public objectives, including economic, environmental, and social issues.** In view of the many issues I have raised in this short summary and the numerous other environmental, economic and social issues surrounding this project, there is only one feasible way to prevent this environmental damage and only one responsible conclusion available to the Planning Department. **Reject this project!**

Thank you for your consideration.

Sincerely,

Noremak Strongin

## INDIVIDUAL LETTER 629: NOREMA STRONGIN

### Response to Comment Ind 629-1
The commenter references the extent of the mineral rights boundary and states that the project will have many negative impacts but does not identify which impacts and does not state how the DEIR is inadequate. The commenter is referred to Master Response 7 - Location of Future Mining Areas.

### Response to Comment Ind 629-2
The commenter references the Centennial Industrial Site cleanup. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 629-3
The commenter references the Project Applicant's prior mining projects. The commenter is referred to Master Response 3 - Operator Responsibility.

### Response to Comment Ind 629-4
The commenter references the project's noise-related impacts and impacts to biological resources but provides no additional information needed to formulate a specific response. Noise impacts from the project are analyzed in Chapter 4.10 of the DEIR. Impacts to flora and fauna are analyzed in Chapter 4.4 of the DEIR. The commenter also states that the mitigation measures in the DEIR are not enough to protect the community but provides no specifics or evidence. The commenter is referred to Chapter 4 of the DEIR.

### Response to Comment Ind 629-5
The commenter states that the Project Applicant will fail to implement the mitigation measures described in the DEIR but offers no additional information. A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 3 - Operator Responsibility. In addition, the Project Applicant would be required to enter into agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the project driveway and Brunswick Road. (DEIR, Mitigation Measure 4.12-6(c).)

### Response to Comment Ind 629-6
The commenter is concerned about the project's impacts to groundwater wells, especially in light of the current drought. Chapter 4.8 analyzed impacts to groundwater supplies and the impacts were found to be less than significant after mitigation. The commenter is also referred to Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

### Response to Comment Ind 629-7
The commenter is concerned about noise produced from operations at the Brunswick site and from project-related trucks. Chapter 4.10 (Transportation) analyzed noise-related impacts and found the impacts associated with the Idaho-Maryland Mine operations and trucking to be less than significant after mitigation. The commenter references the "engineering controls" in Mitigation

Measure 4.10-3 and asks what will happen if the project is not able to mitigate a particular impact. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

Regarding the commenter's concerns that the Project Applicant will not mitigate significant impacts consistent with the DEIR, a mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement. The commenter is referred to Master Response 3 - Operator Responsibility.

## Response to Comment Ind 629-8

The commenter is concerned that the Project Applicant will not implement the DEIR's mitigation measures. A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 2 - Social and Economic Impacts, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 629-9

The commenter urges the County not to approve the project. The commenter's opposition to the project is noted for decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Ave,
Nevada City, CA 95959-7902
February 23, 2022

Re: Comments regarding Rise Gold Mining Project

Dear Supervisors

**Ind 630-1** This is the first time we have ever written to any Supervisor, but we think the proposed Rise Gold Mining Project is of such critical importance to the people of Nevada County, especially those in Grass Valley, Nevada City, and the surrounding area, that we must let our voices be heard. We cannot remain members of the "silent majority" any longer.

**Ind 630-2** Please make a careful, independent study of the track record of Rise Gold in other mining operations and the effect this mine would have on the quality of life in this area. Don't be fooled by Rise Gold ridiculous claim that it will employ the local people. There are no unemployed miners, mine managers, ore processors etc. in our local area. All but a small handful of these jobs will go to outsiders who will further strain our already stressed residential resale and rental markets. Local people could find themselves priced out of the local market for residential properties for sale or lease.

**Ind 630-3** Please do an independent investigation of the actual environmental impact of this project on the local community: road congestion; wear and tear on our roadways, air pollution, use of precious water resources in this time of continuing drought, water pollution, toxic waste from the mine etc. etc. etc. We have personally spoken to about 50 people in our neighborhood and not one of them favors this mine!

**Ind 630-4** BEWARE, THE BOARD OF SUPERVISORS IS BEING GIVEN MISLEADING INFORMATION FROM RISE GOLD! Make an independent investigation of all of their representations and we think you will see for yourselves the terrible consequences this project would have on our lovely mountain community. PLEASE DENY THIS APPLICATION!!

Thank you for your consideration.

Sincerely,

Norema Strongin

Norema Strongin

Edward Strongin

## INDIVIDUAL LETTER 630: NOREMA STRONGIN

### Response to Comment Ind 630-1
This comment is introductory in nature. The comment is noted.

### Response to Comment Ind 630-2
The commenter references the reputation of the Project Applicant and claims that the project will not employ local people, but will bring employees from outside the region and increase competition for housing. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 2 - Social and Economic Impacts, and Master Response 3 – Operator Responsibility.

### Response to Comment Ind 630-3
The commenter urges that an independent investigation be done for the project's various impacts. The DEIR is an independent investigation of the project impact's and was prepared by Raney Planning & Management under direct contract with the County of Nevada. In addition, Raney hired a team of technical experts to peer review the technical studies prepared by the Applicant's team of experts, and the technical studies were revised, as needed, in response to those comments. The commenter references a number of project impacts but does not provide any additional information. Traffic is analyzed in Chapter 4.12 (Transportation) of the DEIR, air quality is analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR, and water quality is analyzed in Chapter 4.8 (Hydrology and Water Quality) of the DEIR.

### Response to Comment Ind 630-4
The commenter urges the County to not approve the project. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 631**

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

January 17, 2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

My name is Norma Solarz, I live in Grass Valley. I'm writing to state that I am OPPOSED to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation.

**Ind 631-1** I understand that the Nevada County Planning Commission will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on approving or denying Rise Corporation. I am familiar with the the reasons given to allow the project or to deny it. I have come to the conclusion that the Rise Gold Mine information, and putative "survey," is intentionally misleading.

**Ind 631-2** There is insufficient assurance that the significant negative impacts from re-opening the mine can be adequately mitigated now or in the future. There *will* be unmitigated significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

**Ind 631-3** There are many reasons this mine should NOT be reopened. Despite the "assurances" given by Rise Corporation there will be permanent problems from de-watering the mine, excessive noise from trucks moving debris 24 hours a day will impact the quality of our lives, there will be damage to public infrastructure due to increased traffic on roads. In the end I do not believe that a "modern" mining operation will provide many jobs for local citizens. I believe the wealth will be taken from the land and our local community will be left again with little if any gain.

**Ind 631-4** I am a Nevada County resident and see that the biased "survey" that Rise Gold Corporation touted demonstrates a lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from other Nevada County residents. Please be counted among the people who will stand against the well-funded project and misinformation scheme Rise Gold Mine is putting forth as good faith research. VOTE NO!

Sincerely,

Norma Solarz DDS

## INDIVIDUAL LETTER 631: NORMA SOLARZ

### Response to Comment Ind 631-1

The comment expresses a general opinion that the information pertaining to the proposed project, but does not provide specific examples that would allow for a detailed response or specifically address the adequacy of the DEIR. Please see Master Response 1.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 631-2

The comment expresses a general opinion that there is "insufficient assurance that the significant negative impacts…can be adequately mitigation now or in the future" and that there "will be unmitigated significant negative impacts" associated with the project, but does not provide specific examples that would allow for a detailed response or specifically address the adequacy of the DEIR. As noted in Chapter 5 of the DEIR, the proposed project would result in significant and unavoidable impacts related to aesthetics (substantial degradation of the existing visual character or quality of the site and its surroundings), and transportation (intersections of SR 174/Brunswick Road and Brunswick Road/Sutton Way). The DEIR provides substantial evidence that all other impacts would either be less than significant or less than significant with implementation of the mitigation measures incorporated into the DEIR. These mitigation measures will be made enforceable by state law through adoption of the mitigation monitoring and reporting program, included as Chapter 4 of this Final EIR.

### Response to Comment Ind 631-3

For concerns regarding dewatering of the mine, please see Master Responses 14 and 15. For the general noise concerns, please see Chapter 4.10, Noise and Vibration. Haul truck noise is addressed in Impact 4.10-2 of the DEIR. Regarding damage to roads, Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the project driveway and Brunswick Road.

For the commenter's opposition to the proposed project, please see Master Response 1.

### Response to Comment Ind 631-4

The commenter's opposition to the proposed project has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 632**

**Dist 3**

RECEIVED

FEB 01 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

January 17, 2021

My name is Norma Solarz, I live in Grass Valley. I'm writing to state that I am OPPOSED to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation.

**Ind 632-1** I understand that the Nevada County Planning Commission will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on approving or denying Rise Corporation. I am familiar with the the reasons given to allow the project or to deny it. I have come to the conclusion that the Rise Gold Mine information, and putative "survey," is intentionally misleading.

**Ind 632-2** There is insufficient assurance that the significant negative impacts from re-opening the mine can be adequately mitigated now or in the future. There *will* be unmitigated significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

**Ind 632-3** There are many reasons this mine should NOT be reopened. Despite the "assurances" given by Rise Corporation there will be permanent problems from de-watering the mine, excessive noise from trucks moving debris 24 hours a day will impact the quality of our lives, there will be damage to public infrastructure due to increased traffic on roads. In the end I do not believe that a "modern" mining operation will provide many jobs for local citizens. I believe the wealth will be taken from the land and our local community will be left again with little if any gain.

**Ind 632-4** I am a Nevada County resident and see that the biased "survey" that Rise Gold Corporation touted demonstrates a lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from other Nevada County residents. Please be counted among the people who will stand against the well-funded project and misinformation scheme Rise Gold Mine is putting forth as good faith research. VOTE NO!

Idaho.MMEIR@co.nevada.ca.us

Attn: Matt Kelley,

Please include these comments to the Idaho-Maryland Mine DEIR.

# ASUR PLAN ANALYSIS

## PREPARATION OF ASUR PLAN

**Ind 634-1**

This plan has been developed by Rise Gold, Inc, in response to the comments from the Northern Sierra Air Quality Management District, NSAQMD: "Pursuant to Health and Safety Code section 41511 and the ATCMs (discussed below), the NSAQMD will require that an asbestos sampling plan be developed and approved by the NSAQMD prior to its implementation. It should at least meet the requirements and specifications of ARB Method 435 (see https://ww3.arb.ca.gov/toxics/asbestos/tm435/tm435.htm). This has not been done. No sampling plan has been developed and approved by the NSAQMD." (*Letter between Air Pollution Control Officer of NSAQMD and Matt Kelley, Senior Planner Nevada County, February 10, 2021*)

**Ind 634-2**

Rise Gold is listed as the author- no credentialed expert is credited even though they have a PhD Geologist on their team along with several Technical Advisors who are also geologists.

Rise Gold Inc. is incorporated in the state of Nevada. The state of Nevada does not require a license for geologists.

The sampling plan seems to be derived from "Air Resources Board Method 435, Determination of Asbestos Content of Serpentinite Aggregate (1991)". CARB also published the "*IMPLEMENTATION GUIDANCE DOCUMENT Air Resources Board Test Method 435 Determination of Asbestos Content of Serpentine Aggregate*" in April 2017 to further elucidate the complexities of asbestos testing in an effort to increase consistency and reliability between laboratories. The document states that: "If all parties involved in the collection, processing, and analysis of potential asbestos containing aggregate follow the guidelines specified in this document, more accurate and repeatable M435 asbestos content measurements will result." (*IMPLEMENTATION GUIDANCE DOCUMENT Air Resources Board Test Method 435 Determination of Asbestos Content of Serpentine Aggregate, April 2017, pp i-ii*)

Determine what, if any of these recommendations were implemented

**Ind 634-3**

The sampling and testing will be done by Rise. "Sampling and analytical testing will be done on or off-site by trained and qualified persons under the direction of a State Licensed Geologist" (*ASUR Plan, Item #6, document pg 14 or pg 16 of 131*). Laboratories analyzing asbestos are accredited by NLVAP (National Laboratory Voluntary Accreditation Program). A licensed geologist can work with an Air Pollution Control Officer to identify naturally occurring asbestos (NOA) and create a management plan.

Was the author of the ASUR Plan a California licensed geologist?

So, the parties involved in sampling and testing are not well established as written in the ASUR Plan.

Can the geologist perform testing themselves, train analysts to perform testing or supervise testing? Will any of this work be accepted in a court of law? TBD from a regulatory agency

1

Mossman is not a licensed Professional Geologist or Certified Engineering Geologist in the state of California. None of the following members of the Rise Gold management team could be found in DCA database for licensure: Thomas Vehrs, Bob Gallagher, Mike Andrews, John Carlile or Alan Edwards (all listed as directors or technical advisors: searches performed under EG-Certified Engineering Geologist, GEO-Professional Geologist, GP-Professional Geophysicist, HG- Certified Hydrogeologist, and MT-Metallurgical Engineer categories). They all have extensive experience in mining, especially international work.

Andrew Kopania (author of the *Groundwater Hydrology and Water Analysis for the Idaho-Maryland Mine Project*) along with Vieira and Kull (NV5 authors of the *GeoTechnical Reports for Centennial and Brunswick Industrial Sites*) were located in the DCA database in order to validate search abilities.

The *Asbestos Sampling Memo (June 2020)* was prepared by Richard Lippoth. He collected the samples from Rise, analyzed the laboratory data and prepared the report. No California licensure is found for him under the Board for Professional Engineers, Land Surveyors and Geologists, DCA.ca.gov He is a one man show at Vergence Geo Services, Inc. with his resume listing work with Freeman-McMoRan and Alexco, a shared history with the Rise management team. His qualification described in the *Asbestos Sampling Memo* June 2020 is listed as geologist, Mr. Richard Lippoth, Reg. SME. SME is a professional organization: the Society for Mining, Metallurgy and Exploration.

## COMPARISON OF PCM TO PLM TO TEM MICROSCOPY TECHNIQUES

Multiple types of microscopy techniques will be used to analyze asbestos content depending on the application of the results. For instance, airborne asbestos monitoring for miners' exposure will use air filtration capture followed by phase contrast microscopy analysis.

**Ind 634-4**

Bulk materials will be screened for asbestos using polarized light microscopy followed by transmission electron microscopy analysis for rolling inventory maintenance.

"TEM is the preferred analytical method for outdoor asbestos samples because of its ability to detect small fibers (greater than or equal to 0.0002 microns in diameter) and to distinguish between asbestos fibers and non-asbestos fibers. The term "TEM structures" is often used to describe asbestos fibers detected by this method. TEM is the method recommended by the California Office of Environmental Health Hazard Assessment (OEHHA). However, TEM measurements cannot be directly related to the cancer potency factors because the studies upon which OEHHA's risk assessment was based used PCM analysis. Thus, the TEM measurements must be converted to PCM-equivalent units (OEHHA 2015.)" (*ASUR Plan, document pp 7 or pp 9 of 131*)

"Asbestos content by TEM structures will be converted into equivalent Phase Contrast Microscopy (PCM) units in accordance with the California Office of Environmental Health Hazard (OEHHA) 2015 Air Toxic Hot Spot Guidance Manual." (*ASUR Plan, Item #3, document pp 8 or pp 10 of 131*)

These different analyses each require unique sampling methods, sample preparation, sample sizes, and microscopy techniques. The results are not directly comparable between the methodologies.

### PHASE CONTRAST MICROSCOPY (PCM)

**Ind 634-5**

"The most common methodology used for asbestos air testing is Phase Contrast Microscopy (PCM). This testing method involves using a PCM microscope to count the fibers present on the cassette filter in order to determine if the total fiber concentration is less than the EPA clearance level of 0.01 fibers/cc (fibers per cubic centimeter) "Asbestos sampling protocol cannot be used for objective data – OSHA." https://www.osha.gov/laws-regs/regulations/standardnumber/2015-10-07. Phase contrast microscopy enhances the contrast of transparent materials, while also filtering out background light. The air cassettes used for PCM contain a cellulose ester filter with a pore size of 0.8 um. Once the air sampling is complete, the sample is sent to an accredited laboratory. Alternatively, the samples can be analyzed on-site with a microscope for expediency, but these results will not be accredited. Whether in a lab or on-site, the filter is cut into a pie shape and prepped using a mix of vaporized acetone and triacetin. The sample is then placed on a PCM microscope where the fibers are counted up to 100 fields of view." (www.indoorscience.com, PCM vs TEM Asbestos Air Testing - Indoor Science, March 27, 2018)

Advantages:

- Technique is specific for fibers. It is a fiber counting technique which excludes non-fibrous particles from the analysis
- Technique is inexpensive and does not require specialized knowledge to carry out counts
- Analysis is quick and can be performed on-site for rapid determination of air concentrations of asbestos fibers
- Technique has continuity with historical epidemiological studies so that estimates of expected disease can be inferred from long-term determinations of asbestos exposure

Disadvantages:

- Test does not positively identify asbestos fibers. Other fibers may be included unless differential counting is used
- The smallest visible fibers are about 0.2µm in diameter while the finest asbestos fibers may be as small as 0.02 µm in diameter. For some exposures, substantially more fibers may be present than are actually counted.
- Cannot distinguish fibers less than 5 microns in length and 0.25 microns in width

This method is used for airborne fiber determination, not bulk material. It will probably be used for workers' exposure testing. Since OEHHA asbestos risk assessment has used studies involving PCM analysis, TEM results from bulk testing will be converted to PCM equivalent units.

**POLARIZED LIGHT MICROSCOPY (PLM)**

The following method description is excerpted from the Asbestos TEM Laboratories, Inc. cover letter dated Sep/17/2019 found in the *Asbestos Sampling Memo June 2020, pp 26 of 32*: "Sample preparation follows a standard CARB 435 prep method. The entire sample is dried at 135-150 C and then crushed to ~3/8" gravel size using a Bico Chipmunk crusher. If the submitted sample is >1 pint, the sample was split using a 1/2" riffle splitter following ASTM Method C-702-98 to obtain a 1 pint aliquot. The entire 1 pint aliquot, or entire original sample, is then pulverized in a Bico Braun disc pulverizer calibrated to produce a nominal 200 mesh final product. If necessary, additional homogenization steps are undertaken using a 3/8" riffle splitter. Small aliquots are collected from throughout the pulverized material to create three separate microsope slide mounts containing the appropriate refractive index oil. The prepared slides are placed under a polarizing light microscope where standard mineralogical techniques are used to analyze the various materials present, including asbestos. If asbestos is identified and of less than 10% concentration by visual area estimate then an additional five sample mounts are prepared. Quantification of asbestos concentration is obtained using the standard CALARB Method 435 point count protocol. For samples observed to contain visible asbestos of less than 10% concentration, a point counting technique is used with 50 points counted on each of eight sample mounts for a total of 400 points."

**Ind 634-6**

This is a generalized description of the PLM analysis method, actual processes are not documented in the Asbestos Sampling Report June 2020 for the individual samples.

Advantages:

- Basic identifications were first performed by light microscopy so there is a large base of published information against which to check analysis and technique
- Analysis is specific to fibers
- Analysis is quick, requires little prep time and can be performed on-site if equipment is available

Disadvantages:

- Not all fibers present may be seen. This is a problem for very low asbestos concentrations where agglomeration or large bundle of fibers may not be present to allow identification by inference.
- Method requires a great degree of sophistication on the part of microscopist. An analyst is only as useful as his mental catalog of images. Therefore, a microscopist's accuracy is enhanced by experience. The mineralogical training of the analyst is very important. It is the basis on which subjective decisions are made.
- The method uses only a tiny amount of material for analysis. This may lead to sampling bias and false results (high or low). This is especially true if the sample is severely inhomogeneous. (heterogeneity)
- Fibers may be bound in a matrix and not distinguishable as fibers so identification cannot be made

**TRANSMISSION ELECTRON MICROSCOPY (TEM)**

The following method description is excerpted from the Asbestos TEM Laboratories, Inc. cover letter dated Aug/15/2019 found in the *Asbestos Sampling Memo June 2020, pp 21 of 32:* "Sample preparation followed a standard CARB 435 prep method. The entire sample was dried at 135-150 C and then crushed to ~3/8" gravel size. If the submitted sample was >~1 quart, the sample may have been split using a 1/2" splitter following ASTM Method C-702-98 to reduce the sample volume for pulverization. The remaining aliquot, or entire original sample, was then pulverized in a Bico Braun disc pulverizer calibrated to produce a nominal 200 mesh final product. A representative ~60 mg aliquot of material was weighed out, and then placed into solution in a 500 ml beaker filled with distilled water. A known volume of the liquid suspension was filtered onto a 0.2 micron pore size Millipore mixed cellulose ester filter. The filter was then dried in HEPA filtered, Class 100 air on a clean bench. The filter was placed onto a glass microscope slide, sectioned, and collapsed in acetone. The collapsed filter was plasma-etched to remove10% of the filter surface and then carbon coated. The carbon coated filter was sectioned

**Ind 634-7**

and the sections placed onto 200-mesh copper TEM sample grids in dimethyl sulfoxide and acetone wick washers. After sufficient time to dissolve the filter material, the TEM sample grids were removed from the baths and placed into labeled sample containers.

TEM analysis was performed on a Philips CM-12 or JEOL 1200 transmission electron microscope operating at 80 or 100 kV. The sample was placed into the microscope where it was first scanned at low magnification to confirm that the distribution of material was reasonably homogeneous. High magnification analysis was performed using a two tier approach: 1) A relatively large area of several TEM grid openings for large asbestos fibers or fiber bundles, and 2) a relatively small area of a number of fields of view for individual asbestos fibers (fibrous particles exhibiting an aspect ratio greater than or equal to 3 to 1, and a length greater than or equal to .5 um). Detected asbestiform structures were subjected to detailed morphological and/or selected area diffraction analysis. If necessary, energy dispersive X-ray analysis was also performed. The length and width of each asbestos fiber was measured. From this data, a total volume and mass of asbestos observed in the scanned area is calculated, and extrapolated to a total weight percent asbestos for each sample."

At the top of the same letter is the statement: "Please find below the results for the TEM analysis of one or more bulk material samples. The analytical procedures were performed according to the EPA Test Method For the Determination of Asbestos in Bulk Building Materials - TEM method (EPA 600/R-93/116) modified for quantitative bulk soil sample analysis."

How was this method for bulk building materials modified for bulk soil sample analysis? These are rock cores.

---

In these analyses, an ~60 mg sample was suspended in 500 ml distilled water. Then a 0.5 ml aliquot was filtered for analysis. While TEM can identify fibers too small to be seen with PLM, the sample size is reduced by order of magnitude, 10 $^{6}$.

"Samples are first analyzed using PLM because a much larger (and likely more representative) mass of sample powder is analyzed using PLM than when using TEM. The mass of a M435 sample analyzed by PLM is approximately one million times greater than the mass of a TEM sample, but TEM has a resolving power of 500 to 20,000X magnification (compared to 50 to 1000X magnification by PLM). This higher resolving power enables TEM microscopists to distinguish and identify finer particles and fibers not seen with the use of PLM. For example, the California Department of Toxic Substances Control has used PLM, followed by TEM, as part of a tiered analytical approach to verify the absence of asbestos fibers determined by M435 PLM analyses in its Schools Program." (*IMPLEMENTATION GUIDANCE DOCUMENT Air Resources Board Test Method 435 Determination of Asbestos Content of Serpentine Aggregate, April 2017 pp 23-24*)

**Ind 634-8**

This is a "potential" quantity of mass available for analysis by PLM vs TEM, not the actual mass analyzed.

Advantages:

- Fibers can be accurately identified-ability to distinguish between asbestos and non-asbestos fibers
- Small fibers can be detected

Disadvantages:

- High resolution may be selective for a specific size fiber and exclude others
- Actual amount of material examined is magnitudes less than quantity examined by PLM
- Sample heterogeneity impacts overall representativeness

Bottom line is that these methods are not comparable due to differences in sample preparation and microscopy techniques. These analyses contain inherent bias due to sample variability (lack of homogeneity), differences in sample quantities tested, magnification levels and individual microscopists' expertise.

---

COMPARISON OF RESULTS FROM ASBESTOS SAMPLING MEMO (June 2020) TO ASUR PLAN TEM RE-TEST (Nov 2021).

**Ind 634-9**

For the 42 samples analyzed during August and September 2019, asbestos was detected in 4 samples, 9.5% of total samples. This included two blanks, two Centennial site tailings and 38 rock core samples. Two samples were analyzed by TEM and the remaining 40 samples by PLM. Asbestos was found in the two TEM samples and two of the PLM samples.

"In 2021, Rise requested the 40 samples previously submitted to be reanalyzed using the TEM method." (*ASUR Plan, document pp 7 or pp 9 of 131*).

Actually, the TEM reanalyses were performed at the urging of the air district: ["As the NSAQMD wrote in its July 10, 2020 comments "The NSAQMD recommends additional TEM analyses of the above rock types (serpentinite, weakly ankeritized diabase/serpentinite, weakly ankeritized serpentinite and ankeritized serpentinite) in order to facilitate refinement of the preliminary risk assessment". The NSAQMD still sticks to this recommendation"]. (Letter between Air Pollution Control Officer of NSAQMD and Matt Kelley, Senior Planner Nevada County, February 10, 2021)

In retesting of the 40 samples (two tailings and 38 pulp samples) analyzed by TEM, asbestos was detected in 14 samples. Unfortunately, the August 2019 samples tested by TEM were not retested by TEM in 2021. Thus, there is no quality control data regarding variability and reproducibility of results regarding TEM analysis between those two samples. The following chart is a comparison of asbestos found by TEM vs PLM. Detection limit for PLM is 0.25 weight% and the detection limit for TEM is 0.001 weight %. Non-detect samples from TEM re-testing have been excluded.

4

| Sample Number | Date Reported | PLM Result weight % Detection Limit 0.25 | TEM Result weight % Detection Limit 0.001 | % Difference PLM vs TEM | Location and sample drill core length (inch) | PCM equivalent units weight % |

| | Nov 10, 2021 | | 0.01 | | 4.8 | 0.038 |

Overall, 16 samples, 40%, had asbestos greater than the TEM detection limit of 0.001 weight %.

Eight of the 40 samples, 20%, had asbestos >0.01 PCM equivalent units Weight %.

NOTE: sample Y962994 had a TEM result of 0.13 weight % yet zero result for PCM equivalent units. Data was notated: "Actinolite asbestos detected. Concentration per Millions of Fibers per gram: 29 for fibers >5µm in length. Possible contamination." This same situation occurs for samples Y962828, Y962833, Y962835, Y962836 and Y962843.

Two samples for TEM analysis originally sent to the laboratory on Aug 8, 2019 were described as rock cores with date analyzed as Aug 15, 2019. The 40 samples for PLM analysis were described as rock cores and were originally sent to the laboratory on Sept 3, 2019 with date analyzed as Sept 17, 2019. For retesting, 40 samples described as pulverized rock were submitted to the laboratory on Sept 14, 2021 with date analyzed as Nov 10, 2021. The two samples originally tested by TEM, Y962980 and Y962981, were not retested in November 2021. All of these samples were stored somewhere for two years before being retested. The actual age of the samples is unknown since drill core logs are not available. Rise performed exploratory drilling between 2017-2019.

SAMPLE POPULATIONS

**Ind 634-10**

Not counting the two grab tailings samples from the Centennial Site and the two blanks (carbonate landscape rock), the average overall length of the sample cores tested was 5.34 inches. Samples were from 6 of 19 (32%) of total cores drilled by Rise: 9 samples from I-18-11, 1 sample from I-18-12, 9 samples from I-19-13, 7 samples from I-19-13A, 8 samples from I-19-14 and 4 samples from I-19-14A. Drilling was stopped when asbestos was detected. Drill logs are not available; therefore, it is impossible to determine the depth or width of serpentinite deposits encountered. Asbestos sampling was extremely limited. Centennial tailings were only identified by a grid number-no information as to quantity, location, depth, etc. There are labeling errors: 1) *Asbestos Sampling Memo June 2020, Appendix A*- First photo is mislabeled Y962880 instead of the correct label Y962980 and 2) sample Y962838 is located on drill hole I-19-12 on Sheet 2

Mine Geology and Asbestos Samples (*Asbestos Sampling Memo June 2020*) but is listed as being from drill hole I-18-12 in the *ASUR Plan, Appendix C, pp 55 of 131.*

DUPLICATE ANALYSIS

Y962847 and Y962981 are duplicate samples. How does a result of 0.44 TEM weight % and 2.0 TEM weight % calculate out to the same PCM equivalent unit result of 0.028 weight%? (*ASUR Plan, Appendix C, document pp 57 of 131*)

These two separate samples Y962981 and Y962847 were quality control duplicates. These were two different samples, Y962981 was initially received as a rock core sample and was only analyzed by TEM on 8.15.19. The results yielded 22 chrysotile structures <5µm and 17 structures ≥ 5µm with a calculated asbestos concentration (weight %) of 2.0 (*Asbestos Sampling Memo, June 2020, Appendix B, pp 23 of 32*).

The duplicate sample, Y962847 was initially received as a pulps sample and was tested by PLM on 9.3.19 with <0.25% result. This sample was retested by TEM on 11.10.2021 and yielded 233 chrysotile structures <5µm and 10 structures ≥ 5µm with a calculated asbestos concentration (weight %) of 0.44 (*ASUR Plan, Appendix B for Asbestos TEM Laboratories Report, pp 110 of 131*).

**Ind 634-11**

Yet, the ASUR Plan lists these results as identical with the same Structures/nanogram at 3.0 and the same PCM Weight % at 0.028% (*ASUR Plan, Appendix C, pp 57 of 131*)

The weights used for sample preparation are 62.5 mg for Y962981 and 58.9 mg for 962847, a difference of 5.9%. But the difference in calculated asbestos weight concentration is 128%. Sample Y962847 has more than 10 times the number of chrysotile structures.

A 6% lower weight yields a 10 times higher structure count but the same PCM equivalent units????

Only one of these samples was included in the four total samples used to calculate the content in serpentinite samples. Which one? Who picks which one? Can the quality control sample, as a separate sample, be excluded from the analyses? (*ASUR Plan, Appendix C, pp 57 of 131*)

Comparing the results for the duplicate sample, Y962847, by TEM analysis yields 0.44% by weight compared to sample, Y962981 at 2.0% by weight, again yielding a 128% difference. Even using the same analytical test procedure (TEM analysis) yields unsatisfactory QC results.

NOTE: The only definitive conclusion from all of the asbestos testing is that:
asbestos was found in all of the serpentinite samples in addition to being found in samples of weakly ankeritized diabase/serpentinite, weakly ankeritized serpentinite, diabase and porphyrite at levels >0.01% PCM equivalent units (*ASUR Plan, Appendix C, pp 55-57 of 131*).

Grouping the samples by lithology in an effort to dilute the overall asbestos content of the group does not negate the asbestos content of the individual sample and its potential for harm. (*ASUR Plan, Appendix C, pp 54 of 131*)

QUALITY CONTROL ISSUES

The laboratory report for retesting of 40 sample by Asbestos TEM Laboratories, Inc. is labelled Report NO. 375516 rev.1

Why was the report revised? Where is the original for comparison?

**Ind 634-12**

Per documentation provided, no blind blanks or blind duplicates were performed. No documented cross check verifications from second analyst or second microscope were performed on individual samples. Two analysts performed the 40 sample TEM re-tests. The first analyst tested the first 18 samples, followed by the second analyst for next 13 samples, first analyst again for one sample, second analyst for remaining 8 samples. No time stamp for each sample, thus unable to determine if samples were analyzed in the order listed according to laboratory sample ID.

Two of the TEM samples had grid opening damage, Y962984 and Y962988.

Eight of the 40 samples were notated as having "possible contamination" with two types of contamination listed, chrysotile for two samples and actinolite for 6 samples. Twenty percent of the samples had "possible contamination", 5% by chrysotile and 15% by actinolite.

TOXICITY

**Ind 634-13**

CHRYSOTILE VS AMPHIBOLE ASBESTOS

What if these samples did not have "possible contamination" but contained actual naturally occurring actinolite (amphibole) asbestos?

6

Upon retesting by TEM, ten samples (25%) indicated amphibole asbestos which has a much higher cancer potency than chrysotile asbestos.

Particularly controversial is the question of whether chrysotile asbestos is less potent for the induction of lung cancer than the amphibole forms of asbestos (e.g. crocidolite, amosite and tremolite), which has sometimes been referred to as the "amphibole hypothesis" (Cullen, 1996; Stayner et al., 1996; McDonald, 1998). This argument is based on the observation from experimental studies that chrysotile asbestos is less biopersistent (i.e. has a shorter half life) in the lung than the amphiboles... [The Working Group noted that the lower biopersistence of chrysotile in the lung does not necessarily imply that it would be less potent than amphiboles for lung cancer.] https://www.ncbi.nlm.nih.gov/books/NBK304374/

"The amphiboles are more likely to be associated with mesothelioma than is chrysotile, or white asbestos, which has a two to four times less potent risk of mesothelioma: however, the risk for development of lung cancer is equipotent for all types of asbestos. Chrysotile accounts for more than 99% of the world production of asbestos and commonly is contaminated with tremolite and other asbestos fibers." (Walker MD, Christopher, Pleural Neoplasms, Muller's Imaging of the Chest, 2019 Retrieved from ScienceDirect.com 02.22.2022)

POTENTIALLY TOXIC ELEMENTS

Potentially toxic elements (PTEs) hosted in asbestos elongate mineral particles is one of the factors that determines their toxic/pathogenic effects. Metals such as Fe, Mn, Cr, and Be are known to induce toxicity and contribute to asbestos related diseases. "...it is essential to quantify the toxic elements present in asbestos elongate mineral particles in order to prevent asbestos-related diseases." https://doi.org/10.1016/j.chemgeo.2020.119896

**Ind 634-14**

"Iron ions on amphibole types of asbestos react with epithelial lining fluid in the lung and generate reactive oxygen species that induce toxicity, and oxidant stress may lead to DNA damage. There is a direct relationship between biopersistence, which is determined by fiber length and chemical composition, and toxicity. Longer, thinner fibers are more toxic because they are not cleared by the AMs and therefore persist in the lung. Fibers longer than 15μm are particularly toxic and bioactive. They are not completely engulfed by the macrophages, leading to release of lysosomal contents, cytotoxicity, oxidant stress, and stimulation of inflammatory and growth factor pathways." (Harkema...Haschek, Fundamentals of Toxicologic Pathology, Chapter 14-Respiratory System (Third Edition), 2018 pp 351-393. Retrieved from ScienceDirect 02.22.2022 https://doi.org/10.1016/B978-012-809841-7.00014-9)

Many of these samples have high metals content, especially iron. Chart this

**Ind 634-15**

The data used for heavy metal toxic air contaminants in the Health Risk Assessment are all notated by the laboratory as being received and tested beyond the EPA recommended hold times of 28 days for mercury and 6 months for all remaining metals. Exploratory drilling began in 2017. Since the drill logs are unavailable, the exact sample dates for each core are unknown, but all samples were submitted and received by the gold assay laboratory on February 20, 2019. (Inorganic Extended Qualifier Reports pp. 389-407 and 458-484, Appendix D, Groundwater, Hydrology and Water Quality Analysis Report-Appendices)

After assays were performed, samples were then submitted to ACZ Laboratories for metal analyses. These analyses were performed in November 2019. This means that all samples were tested at least 9 months beyond their expiration date, probably more.

Shouldn't valid data be used when evaluating the health risks to the community from these TACs, especially when these metals have to ability to potentiate the effects of asbestos?

MATERIAL SAMPLING LOGISTICS

"The sampling will be done from the transfer point between the skip and silo and may be taken either manually or with an automated sampler." Illustrated by Figure 2 (*ASUR Plan, document pp 14 or pp 16 of 131*)

**Ind 634-16**

According to correspondence between the Air Pollution Control Officer of NSAQMD and Matt Kelley, Senior Planner of Nevada County on February 10, 2021, the APCO states: "A key component of method 435 is the protocol for collecting representative samples. It is improper to simply pull out the laboratory portion of Method 435 and say that Method 435 is being used. Method 435 states, "1.2 Applicability. This method is applicable to determining asbestos content of serpentine aggregate in storage piles, on conveyor belts, and on surfaces such as roads, shoulders and parking lots." Then it specifies even more clearly, "3 APPLICABLE SOURCES. This method can be used to obtain bulk material sources from three types of sources: 1. Serpentine aggregate storage piles. 2. Serpentine aggregate conveyor belts 3. Serpentine aggregate covered surfaces...In aggregate, a large degree of homogeneity has already been achieved during the aggregate's production."

Does pulling samples at the skip drop point into the silo meet the above stipulated criteria for Method 435 sampling, does this method qualify as a conveyor belt?

**Ind 634-17**

Who would be in the silo at point 3 in diagram as shown on document pp 14. (*ASUR Plan*) to obtain a sample manually?

**Ind 634-18**

"It is recommended that sampling be done at point closest to end of processing." (*IMPLEMENTATION GUIDANCE DOCUMENT Air Resources Board Test Method 435 Determination of Asbestos Content of Serpentine Aggregate, pg ii*).

7

This point in the silo may be adequate for barren rock samples but not tailings samples comprised of ore rock regarding the "point closest to end of processing," as stated above.

What will be the timing/spacing of the individual 3 samples taken for each composite per 1000 tons? Beginning, middle, end or every 333 tons? Beginning and end sampling method would mean that samples would overlap (beginning, end) and (end, beginning) samples per 1000 tons. Weighting sampling at these points would not be representative of the entire batches.

Will barren rock and ore rock be analyzed separately or combined in a composite (3 samples will be composited per 1000 tons of rock each day (*ASUR Plan, document pp 13 or 15 of 131*)? If barren rock and ore rock are to be placed in different compartments of the concrete silo, how will you be able to determine which material is contaminated, if asbestos content >0.01% PCM equivalent units is later found in the rolling inventory?

**Ind 634-19**

The concrete silo is divided into three compartments, one 1000 tons area and two 400 tons containment areas. The ore rock would flow through the larger compartment and then be conveyed to the ore processing plant for pulverization into tailings, while the barren rock would be loaded into haul trucks for transport.

How would you determine if the contaminated material was from the ore rock or the barren rock if the composited sample contains both materials? Rise would have to assume that all material from last non-detect test (per 1000 tons batch) to the next non-detect test (per 1000 tons batch) is contaminated.

Using a weighted average taken over three months of 1000 tons per day ore rock (90,000 tons) and 500 tons per day barren rock (45,000 tons) allows for significant dilution of asbestos per batch. Will an individual batch that fails TEM analysis be allowed to remain among the passing TEM analyses batches?

## ROLLING INVENTORY MAINTENANCE LOGISTICS

Pg 13 (pp 15 of 131), ASUR Plan item 4: "Analytical determination of a materials status as Asbestos Containing Material would be done using Polarized Light Microscopy (PLM) in accordance with ARB Method 435 pursuant to 17 CCR 93106 (h)(2) with a detection limit of 0.25% asbestos"

Pg 13 (pp 15 of 131), ASUR Plan item 5: "Analytical determination of asbestos content, for the purposes of maintaining an Asbestos Inventory, would be done using Transmission Electron Microscopy (TEM) method in accordance with the EPA/600/R-93/116 method. Sampling for the Asbestos Inventory would be done by compositing at least 3 random grab samples from the barren rock or sand tailings for every 1000 tons of material."

**Ind 634-20**

But on page 8 (pp 10 of 131) of the ASUR Plan are the statements:

4) An Asbestos Inventory of all mined materials will be maintained and include a 3-month rolling average of asbestos content in equivalent PCM units.

5) An Engineered Fill Placement Plan will be maintained to ensure that adequate non-Asbestos Containing Material, as determined by PLM testing, is available for Surfacing Applications.

If all mined material is tested by TEM and converted to PCM equivalent units, then how can Rise maintain an Engineered Fill Placement Plan based just on PLM testing? There is no comparison or conversion factors of PLM measurements to TEM measurements. (Only TEM measurements are used to convert to PCM equivalent units)

"A rolling three-month weighted average of asbestos content of mined materials brought to surface and materials used as Engineered Fill will be maintained in the Asbestos Inventory. (*ASUR Plan, document pp 15 or 17 of 131*)."

"Arrangements will be made to ensure that analytical data is received and entered into the inventory within 2 weeks of sampling" (*ASUR Plan, pp 15 or 17 of 131*)

**Ind 634-21**

Will a new weighted average be calculated with each 1000 tons of material added to the inventory? WHERE WILL THIS MATERIAL BE STORED? WILL 1000 TON INDIVIDUAL BATCHES OF ORE ROCK ALONG WITH 500 TONS INDIVIDUAL BATCHES OF BARREN ROCK BE MAINTAINED? HOW MUCH MINING WILL BE PERFORMED DURING THAT TWO WEEKS OF TURN AROUND TIME? HOW WILL THE AMOUNT OF "POSSIBLY CONTAMINATED" MATERIAL BE DETERMINED?

For example, Y962847, would have initially passed the screening PLM method of testing. However, the material would have failed when tested by TEM during rolling inventory. Material surrounding this sample in the 90-day rolling inventory would be unfit for engineered fill or aggregate transport.

8

WILL THE SAME SAMPLE ANALYZED BY PLM BE RE-TESTED USING TEM OR WILL RANDOM SAMPLES FOR EACH TEST (PLM and TEM) BE UTILIZED?

FUGITIVE DUST EMISSIONS ABOVEGROUND

**Ind 634-22**

The 3-month rolling inventory will consist of 1000 tons of tailings for engineered fill per day multiplied by 90 days equals 90,000 tons plus 500 tons of barren rock for engineered fill per day multiplied by 90 days equals another 45,000 tons. 500 tons of tailings will be deposited underground in CPB.

How will the 500 tons designated for CPB be determined? How will this material be culled from the rolling inventory? (Assuming that any tailings containing asbestos would be the most suitable for underground CPB placement)

**Ind 634-23**

Where will this 135,000 tons of materials be stored and how will it be loaded for transport to Centennial, Brunswick or outside vendors? Have the fugitive dust emissions for the storage and loading been calculated and included in PM emissions analysis and incorporated into Health Risk Assessment model?

**Ind-24**

The Air Quality Report calculates emissions based on loading from an enclosed area: "Barren rock will be transported from the concrete silo using a series of chutes and conveyors to a fully enclosed truck loading building." (*Air Quality and Greenhouse Gas Emissions Analysis, Appendix B, Health Risk Assessment, Earthwork and Material Handling Nov 2021, document pp 24*) This statement does not account for rolling inventory procedures.

**Ind 634-25**

On document page 35, *Noise and Vibration Report, Rock Bin Conveyors and Barren Rock Loading* is the statement:
"The existing concrete rock silo will be reused. A chute and conveyor system will transfer barren rock from the silo into trucks for transport as engineered fill. The conveyor system and truck loading area will be inside a building adjacent to the headframe. A chute and covered conveyor system, approximately 335 feet long, will transfer gold mineralization from the silo to the process plant."

On document page 11, *Centennial GeoTechnical Report*: "The conveyor system and truck loading area will be inside a small building adjacent to the headframe."

On document page 14, *Centennial GeoTechnical Report, Table 4, Buildings* lists the Rock Truck Loading building as 1700 square feet with a maximum height of 20 feet.

Is the building large enough to accommodate the 45,000 tons of barren rock rolling inventory and room for front-end loading into haul trucks from that inventory? What is the ventilation system for this building?

**Ind 634-26**

On document page 36 *Noise and Vibration Report, Process Plant* is the statement:
"Gold mineralization hoisted from the Brunswick shaft will be placed in the existing concrete silo located on the Brunswick property before processing begins. Gold material will be transported from the concrete silo using chutes and conveyors to a fully enclosed process plant....Sand tailings (waste) from the gold recovery process will be dewatered and used for either backfill for the underground mine or stockpiled for transport and use as engineered fill. Sand tailing during backfilling will be transferred to the paste backfill plant, where particles will be dewatered and mixed with cement into a paste....Sand tailings not used for backfill will be either directly loaded into trucks in the process plant or stockpiled inside the building. Stockpiled sand tailings will be loaded into transport trucks with a front-end loader during daytime hours. Sand tailings not used as underground backfill will be transported for use as engineered fill."

(Document pp 39, *Noise and Vibration Report, Table 9 Hours of Operation*):
"Outside Truck Loading by Loader 7:00 AM-7:00 PM, 7 Days a Week, 80 years"

(Document pp 17, *Applicants Project Description, Table 7, Hours of Operation*):
"Outside Truck Loading by Loader 7:00 AM-7:00 PM, 7 Days a Week, 80 years"
This is confirmation of "outside loading" across documents.

Will this loading occur inside or outside? Will it be stockpiled inside or outside? If these procedures change due to maintenance of rolling inventory storage: will noise levels increase, will amounts of fugitive dust increase? What is the potential for all equipment and storage areas to be contaminated with asbestos? What level of asbestos found by TEM testing in the 90 day rolling inventory will trigger decontamination of all equipment: conveyor belts, processing plant, cement plant, etc.?

**Ind 634-27**

Will these two components of the engineered fill be kept separate? Otherwise, how will the engineering firm determine correct ratios for mixing to ensure stability upon engineered fill placement?

Recommendations from NV5:
"2. Crushed blast rock with a maximum dimension of 6 inches may be blended into the sand tailings to produce engineered fill material at a ratio of up to 2 parts blast rock to 1 part sand tailings. A rock and sand ration greater than 2:1 may be feasible but would not likely be testable using nuclear methods.
4. Onsite blending of blast rock and sand tailings may be performed by earthwork equipment (e.g., windrowing and spreading the rock and sand together in thin lifts). Specific procedures for onsite blending should be developed in conjunction with an NV5 representative during initial fill placement." *Centennial GeoTechnical Report*, document pp 13

9

Document pp 16. *Centennial GeoTechnical Report*: "Engineered fill may be mixed on site using mobile equipment to ensure uniformity and meet specifications for compaction."

FUGITIVE DUST EMISSIONS UNDERGROUND

**Ind 634-28**

"The walls and roof of tunnels composed of rock containing significant asbestos will be covered with shotcrete and the floor with be covered with either concrete or 3 inches of non-Asbestos Containing Material. Shotcreting would be done as part of the tunneling cycle or after completion of tunneling. Floor covering would be done after completion of tunneling (*ASUR Plan, document pg 10 or pp 12 of 131*)."

How much cement does this add to mine operations and subsequent GHGs? Hexavalent chromium deposition? What level of asbestos is considered significant to warrant shotcrete?

**Ind 634-29**

DEIR pg 3-38 Lists a "Shotcrete Machine" that will "Spray concrete into the walls of the galleries to prevent rockfall." Is shotcrete to be used on all tunnels and not just significant asbestos areas?

"Water generated from drilling and dust suppression during tunneling in Asbestos Containing Material shall be collected in sumps or tanks and shall not be used for Surfacing." (*ASUR Plan, document pp 11 or pp 13 of 131*)

**Ind 634-30**

(*ASUR Plan, document pp 12 or pp 14 of 131*): "#6. Rock loads will be wetted for transit between the tunnelling and dumping area and equipment will be washed regularly to prevent dust from being tracked out into other areas of the mine."

How will this water be treated to remove asbestos? What will be the volume of asbestos contaminated water?

MERV 16 filters will remove 95% of fibers...that still leaves 5 % ... Rise claims that only 1% of material mined will be serpentinite.

Will MERV 16 filters be limited to serpentinite mining only? What type of filters will be utilized in main ventilation system? What is the quantity of asbestos in the 5% of what total mined quantity of serpentine/serpentinite?

**Ind 634-31**

The *Air Quality and Greenhouse Gas Emissions Analysis Technical Report: Earthwork and Material Handling Fugitive Dust: Construction Activity Fugitive Dust Nov 2021 pp 300* of 1938 states that the Serpentinite Content of Mine Fill will be 14.3% with an Asbestos content of serpentinite at 0.20%.

The final total is 0.03% (14.3% x 0.20% = 2.86% ÷ 100 = 0.03%) ???????

HOW CAN THE MINE FILL BE 14.3% SERPENTINITE IF ONLY 1% OF MINED MATERIAL IS SERPENTINITE?

ENFORCEMENT OF ROLLING INVENTORY ASBESTOS CONTENT

"If the three-month rolling Asbestos Inventory for materials hoisted to the surface exceeds 0.01% asbestos by mass of PCM equivalent units the geology department will immediately investigate the source of the asbestos containing material and halt mining in the area of concern until a revised mine plan is prepared in compliance with the ASUR Plan (*ASUR Plan, document pp 20 or pp 22 of 131*)."

Document page 9. ASUR Plan needs further interpretation/clarification:

**Ind 634-32**

"If planned mining is projected to result in the Asbestos Inventory 3-month rolling average to exceed 0.01% by mass equivalent PCM units (1.07 TEM structures per nanogram)

i. Gold mineralization (intended for processing) will <u>not</u> be mined
ii. Barren rock from tunneling will either not be mined or mined using an auxiliary ventilation and dust collection system, as described in Section 6.1, designed to capture dust generated during the mining of these materials and prevent this dust from entering the main ventilation system and exhausting from the underground mine and a location for the underground disposal of this material will be specified and annotated on mine development plans."

SO, IF YOU ARE NOT GOING TO REMOVE THE GOLD MINERALIZATION, WHY WOULD YOU REMOVE THE BARREN ROCK SURROUNDING IT?

(*ASUR Plan, document pp 14 or pp 16 of 131*): "Records of all analytical testwork conducted will be retained for the life of the operation or a minimum of 7 years."

**Ind 634-33**

Once in the environment, asbestos does not degrade and will continuously be released into ambient air by wind or any soil disturbance.

Records must be kept on exposure monitoring for asbestos for at least 30 years, and worker medical surveillance records retained for the duration of employment plus 30 years (OSHA).

Worker exposure occurs only during employment hours; however, community exposure occurs 24 hours per day. Workers choose to work in this environment with financial compensation. Workers are also provided training, respiratory protection, monitoring and health benefits while the community has none of these advantages.

10

The life of the operation or 7 years of record retention is not an adequate retention period since disease caused by exposure may not manifest for 20 years-these are human lives at stake NOT TAX RECORDS!

DUE TO IMPLICATIONS FROM LONG TERM EXPOSURE TO ASBESTOS, RECORDS OF ALL ANALYTICAL TESTWORK MUST BE RETAINED INDEFINITELY.

(*ASUR Plan, document pp 19 or 21 of 131*): #10; If required by the NSAQMD, the plan must include an air monitoring component."

(*ASUR Plan, document pp 20 or pp 22 of 131*): "A geological report will be prepared annually with a summary of all materials mined. The report will include a summary of quantities of rock mined by lithology. The report will include analytical asbestos sampling data and all receipts issued for Engineered Fill. The report will include any dust sampling taken during operations. The report will include the results of any air monitoring or asbestos bulk sampling conducted at the request of NSAQMD."

**Ind 634-34**

A team of third-party licensed geologists should be monitoring and recording the above data every day to be utilized for reporting. The majority of this work is being performed underground...who will know the difference after the material is extracted, crushed and placed as engineered fill or hauled away?

BESIDES A REPORT, WHAT ACTIONS WILL BE TAKEN? ARE THERE ANY PENALTIES FOR EXCEEDENCES?

Is this plan legally enforceable? What if Rise obtains all the necessary permits to begin mining and decides to sell those permits to a third party or what if Rise sells the mine itself to a third party in the future...will the plan be required for the new operator?

Rise has stated that they will leave the infrastructure at the Brunswick site.

What assurances does the county have that the infrastructure will be clean and free from asbestos, heavy metals and silica contamination?

CONCLUSIONS:

The addition of the 3-month rolling inventory complicates downstream processes tremendously. It has the potential to affect air quality through increased fugitive dust emissions which increase the quantities of the TACs (asbestos, silica and heavy metals) being released directly impacting the Health Risk Assessment results. The health of the community is at stake.

**Ind 634-35**

Asbestos emissions are now being calculated on the assumption that rock material will contain 0.01% asbestos as described by the ASUR Plan. However, the ASUR Plan cannot control the actual asbestos content in the material being mined, the plan can only try to control the distribution of material being used for engineered fill to a 0.01% asbestos content. The actual asbestos content of rock being mined is unknown and highly variable.

CAN YOU ASSUME THAT ALL MATERIAL (BARREN ROCK AND ORE ROCK) WILL BE ONLY 0.01% ASBESTOS WHEN CALCULATING EMISSIONS?

CLASSIFICATION AND QUANTIFICATION IS NOT POSSIBLE UNTIL AFTER TESTING BY TEM OCCURS, AND THAT INFORMATION MAY NOT BE KNOWN UNTIL TWO WEEKS AFTER EXTRACTION AND TRANSPORT TO THE SURFACE.

"The average asbestos content of the total mined material is of primary concern since asbestos does not have established acute noncancer effects (OEHHA 2020). Therefore, only the average asbestos emissions that could be generated over the long-term (per year), and associated long-term health risk, has been evaluated herein." (*Air Quality and Greenhouse Gas Emissions Analysis Nov 2021, document pp 36*) Rise now estimates these emissions at 0.01%.

This is the same logic regarding acute vs long term exposure for the community. "Asbestos is classified as a known human carcinogen by the US state, federal, and international agencies, as well as by the World Health Organization" (Walker). There is no safe level of asbestos exposure (*WHO*).

ANY asbestos released to the ambient environment regardless of an immediate quantity released has the potential for long term implications because asbestos does not readily degrade once in the environment. "It is one of the most pervasive environmental hazards in the world. (Walker) "We know very little about the rates of weathering and leaching of asbestos in soil environments, but the available information suggests that substantial reductions in the amount of chrysotile may take hundreds or thousands of years, depending on the soil environment, and somewhat longer for amphibole asbestos." (*GUIDELINES FOR GEOLOGIC INVESTIGATIONS OF NATURALLY OCCURRING ASBESTOS IN CALIFORNIA, Special Publication 124, 2002 pp 24*)

HEALTH RISK ASSESSMENT CRITIQUE:

Community Health Risks from Exposure to Toxic Air Contaminants

**Ind 634-36**

"As explained in Section 2.1.2.2, Non-Criteria Air Pollutants, of the AQ-GHG Technical Report, a TAC is an air pollutant, identified in regulation by CARB, which may cause or contribute to an increase in deaths or serious illness, or which may pose a present or potential hazard to human health...Health effects to TACs may occur at extremely low levels and it is typically difficult to identify levels of exposure which do not produce adverse health effects. "(*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B Memorandum, Subject: Idaho-Maryland Mine-Health Effects from Criteria Air Pollutants, pg 10, 2021*)

"A dispersion modeling analysis was conducted for DPM emitted from diesel vehicles and off-road equipment, blasting emissions, as well as for TACs from fugitive dust sources on the proposed project site for the HRA to assess the health risk impacts of the project's construction and operation on proximate off-site sensitive receptors." (*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pg 8, 2021*) "The cancer risk calculations were performed by multiplying the predicted dispersion modeled output data by the TAC emissions and the appropriate risk values...The noncancer health impact of an inhaled TAC is measured by the hazard quotient, which is the ratio of the ambient concentration of a TAC in units of µg/m3 divided by the reference exposure level (REL), also in units of µg/m3." (*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pg 4, 2021*)

"For evaluating health risk, the HRA was based on the assumption that exposure from construction and operational TAC emissions would generally occur up to 20 hours per day, 7 days per week for construction and up to 24 hours per day, 7 days per week, for 30 years for operation. This is consistent with OEHHA's guidance for performing operational HRAs.1" (*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pg 1, 2021*)

The Idaho-Maryland Mine Project permit is for 80 years, almost three times the 30 years of exposure used in the health risk assessment.

WHAT WILL BE THE IMPACT ON HEALTH AFTER THOSE 30 YEARS OF EXPOSURE AND BEYOND?

1

This critique will examine input data points used in the AERMOD dispersion model whose output data then predicts the health risk impacts to the community from exposure to toxic air contaminants.

AERMOD MODEL

Regarding the selected dispersion model and its inputs is the statement -"Principal parameters of AERMOD for the project operations included the following:

- Dispersion Model
- Meteorological Data
- Urban and Rural Options
- Terrain Characteristics
- Sensitive Receptors
- Source Release Scenario
- Buildings" (*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pp 8-12, 2021*)

Several of these principal parameters require additional scrutiny with regards to the actual inputs used in the model and their applicability to the Grass Valley community in terms of future health risks.

**Ind 634-37**

Air pollutant dispersal is dependent on several factors: wind speed, wind direction, atmospheric stability and topography. (Transport and Dispersion of Air Pollution, Chapter 3, www.3epa.gov)

Atmospheric stability is dependent on the forces that relate to the vertical movement of air such as air density, air pressure, temperature and relative humidity. These forces dynamically interact on a constant basis to affect turbulence and the subsequent dispersal patterns of pollutants. It becomes critical to obtain the most accurate meteorological data available for input into these models which then estimate the health risks for cancer along with acute and long-term illness from exposures.

METEOROLOGICAL DATA

From the EPA Support Center for Regulatory Atmospheric Modeling (SCRAM) Air Modeling-Observational Meteorological Data: "Observed meteorological data for use in air quality modeling consist of physical parameters that are measured directly by instrumentation and include temperature, dew point, wind direction, wind speed, cloud cover, cloud layer(s), ceiling height, visibility, current weather, and precipitation amounts. These data are used in air quality models to capture the atmospheric conditions occurring at a source and/or receptor location, and therefore, play an important role as they effect the concentration of pollutants at receptors of interest." (www.epa.gov/scram/air-modeling-observational-meteorological-data, retrieved 1.27.2022)

The HRA states: "The nearest stations with processed meteorological data for use in AERMOD are Blue Canyon (17 miles away), Auburn (18 miles away) and Beale (22 miles away). The predominant wind direction at the project site is from the North-East and South-West direction (Meteoblue 2020). The Blue Canyon met station has a predominant wind direction from the North-East and South; the Auburn met station from the East; and the Beale station from the South-East and North-West (CARB 2020)." (*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pg 12*)

"Blue Canyon was selected since it is the closest station and is the most representative of the project site. "(*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk*

2

*Assessment, Appendix B, pg 12, 2021*) There are multiple reasons why Blue Canyon is NOT representative of the project site in terms of meteorological conditions.

Blue Canyon is in the Sierra Nevada Mountains at an elevation of 4695 ft. This elevation creates a very different climate and weather patterns than what Grass Valley experiences in the foothills at an elevation of 2411 ft. Simply changing the terrain elevation data input does NOT correct for the differences in air density, air pressure, solar heating and dry/wet adiabetic lapse rates that result from the significant disparities between Grass Valley and Blue Canyon meteorological conditions.

The website, MeteoBlue states: "Climate Grass Valley 39.22°N 121.06°W The meteoblue climate diagrams are based on 30 years of hourly weather model simulations and available for every place on Earth. They give good indications of typical climate patterns and expected conditions (temperature, precipitation, sunshine and wind). The simulated weather data have a spatial resolution of approximately 30 km and may not reproduce all local weather effects, such as thunderstorms, local winds, or tornados."(Meteoblue. 2020. Climate Grass Valley. (Accessed September 2020. https://www.meteoblue.com/en/weather/historyclimate/climatemodelled/grass-valley_united-states-of-america_5353775.)

NOTE: 30 km=18.641 miles The MeteoBlue site is not specific to Grass Valley with a spatial resolution of 30 km. A comparison of downloads in Meteoblue from both locations, Blue Canyon and Grass Valley, shows identical graphic measurements for ALL parameters:

- Average temperatures and precipitation
- Cloudy, sunny and precipitation days
- Maximum temperatures
- Precipitation amounts
- Wind speed
- Wind rose

Because of the 30 km resolution, Meteoblue makes zero distinction between Grass Valley and Blue Canyon weather patterns.

In the Air Quality Report, the consultant utilizes multiple quotes from various county documents, agencies and websites to substantiate his climate and weather claims. For the sake of argument, this critique uses data downloaded from WeatherSpark.com to compare Grass Valley to Blue Canyon meteorology. This website uses the same databases to compare the two locations.

The data for Grass Valley CA is based on a statistical analysis of historical hourly weather reports and model reconstructions from January 1, 1980 to December 31, 2016 (36 years total). The stations contributing to this reconstruction are: Nevada County Air Park (/y/149703/Average-Weather-at-Nevada-County-Air-Park-California-United-States-Year-Round) (67%, 5.0 kilometers, east); Auburn Municipal Airport (/y/145263/Average-Weather-at-Auburn-Municipal-Airport-California-United-States-Year-Round) (24%, 29 kilometers, south); and Beale Air Force Base (/y/145271/Average-Weather-at-Beale-Air-Force-Base-California-United-States-Year-Round) (9%, 33 kilometers, west).

The WeatherSpark data source for Blue Canyon illustrates the typical weather at Blue Canyon-Nyack Airport, based on a statistical analysis of historical hourly weather reports and model reconstructions from January 1, 1980 to December 31, 2016.

3

OTHER DATABASE COMMONALITIES FOR WEATHERSPARK

All data relating to the Sun's position (e.g., sunrise and sunset) are computed using astronomical formulas from the book, Astronomical Algorithms 2nd Edition (https://www.amazon.com/Astronomical-Algorithms-Jean-Meeus/dp/0943396611), by Jean Meeus.

All other weather data, including cloud cover, precipitation, wind speed and direction, and solar flux, come from NASA's MERRA-2 Modern-Era Retrospective Analysis. This reanalysis combines a variety of wide-area measurements in a state of-the-art global meteorological model to reconstruct the hourly history of weather throughout the world on a 50-kilometer grid.

Land Use data comes from the Global Land Cover SHARE database, published by the Food and Agriculture Organization of the United Nations.

Elevation data comes from the Shuttle Radar Topography Mission (SRTM), published by NASA's Jet Propulsion Laboratory.

Names, locations, and time zones of places and some airports come from the GeoNames Geographical Database.

Time zones for airports and weather stations are provided by AskGeo.com.

Maps are © Esri, with data from National Geographic, Esri, DeLorme, NAVTEQ, UNEP-WCMC, USGS, NASA, ESA, METI, NRCAN, GEBCO, NOAA, and iPC

**THE NEVADA COUNTY AIR PARK REFERENCED AS THE WEATHERSPARK SOURCE IS 4000 FEET NE OF THE BRUNSWICK SITE AS THE CROW FLIES.**

GRASS VALLEY

There is an average 10°F higher temperature differential every month of the year in Grass Valley. This conclusion has been verified on WeatherSpark and the Western Regional Climate Center databases. For example, the hot season lasts for 3.1 months in Grass Valley, from June 15 to September 18, with an average daily high temperature above 81° F. In Blue Canyon there is no hot season. The warm season there lasts for 2.9 months, from June 20 to September 18, with an average daily high temperature above 72°F. Average hourly temperatures also vary dramatically between the two locations.

Regarding precipitation: annually Grass Valley receives 53.2 inches rainfall vs 67.5 in Blue Canyon; and annually Grass Valley receives 8.4 inches snowfall vs 240.40 inches snowfall in Blue Canyon.

Wind directions also display wide variances between the two locations. This section discusses the wide-area hourly average wind vector (speed and direction) at 10 meters above the ground. The wind experienced at any given location is highly dependent on local topography and other factors, and instantaneous wind speed and direction vary more widely than hourly averages.

The average hourly wind speed in Grass Valley does not vary significantly over the course of the year, remaining within 0.5 miles per hour of 5.7 miles per hour throughout.

The predominant average hourly wind direction in Grass Valley varies throughout the year. The wind is most often from the south for 7.4 months, from February 10 to September 21, with a peak percentage of 55% on August 11. The wind is most often from the east for 4.6 months, from September 21 to February 10, with a peak percentage

of 49% on January 1. (https://weatherspark.com/y/1178/Average-Weather-in-Grass-Valley-California-United-States-Year-Round)

BLUE CANYON

In Blue Canyon, the average hourly wind speed at Blue Canyon-Nyack Airport experiences *mild* seasonal variation over the course of the year.

The *windier* part of the year lasts for *4.3 months*, from *November 19* to *March 30*, with average wind speeds of more than *5.2 miles per hour*. The *windiest* month of the year at Blue Canyon-Nyack Airport is *December*, with an average hourly wind speed of *5.7 miles per hour*.

The *calmer* time of year lasts for *7.7 months*, from *March 30* to *November 19*. The *calmest* month of the year at Blue Canyon-Nyack Airport is *May*, with an average hourly wind speed of *4.8 miles per hour*.

The wind is most often from the **south** for 3.7 months, from January 31 to May 21; for 3.4 weeks, from August 18 to September 11; and for 1.1 months, from November 3 to December 7, with a peak percentage of 48% on March 2. The wind is most often from the **west** for 2.9 months, from May 21 to August 18, with a peak percentage of 41% on July 18. The wind is most often from the **east** for 1.7 months, from September 11 to November 3 and for 1.8 months, from December 7 to January 31, with a peak percentage of 41% on October 20. (weatherspark.com/y/145297/Average-Weather-at-Blue-Canyon-Nyack-Airport-California-United-States-Year-Round#)

The Brunswick Industrial site is located just southeast of Grass Valley. This means that the winds will transport all pollutants to the north and west toward the Brunswick Basin and downtown.

It is interesting to note that in Blue Canyon, the wind is blowing east during the hottest part of the year, May 21 to August 18. This input into AERMOD would not correlate with Grass Valley wind data under any circumstances.

These differences in weather variables must be taken into account during HRA modeling since the project will be located in Grass Valley not in Blue Canyon. Using Blue Canyon meteorological data is NOT representative of Grass Valley.

The meteorological input data, AERMET, is designed to accept data from any of the following sources: 1) standard hourly National Weather Service (NWS) data from the most representative site; 2) morning soundings of winds, temperature, and dew point from the nearest upper air station; and 3) on-site wind, temperature, turbulence, pressure and radiation measurements. AERMET can process commercially available or custom on-site meteorological data. (www.weblakes.com/guides/aermod/section8/8_1

SHOULDN'T METEOROLOGICAL DATA MORE REPRESENTATIVE OF GRASS VALLEY BE USED FOR THE HEALTH RISK ASSESSMENT?

**Ind 634-38**

WINDBORNE PARTICULATE MATTER

The following tables are based on Stoke's Law for Fluid Particle Forces and EPA Inhalable Dust definitions and calculations:

5

Table 1: 10-micron particle

| Wind Speed (mph) | Distance Traveled (miles) |
|---|---|
| 3.1 | 0.55 |
| 6.2 | 1.1 |
| 12.4 | 2.3 |
| 24.8 | 4.6 |
| 37.3 | 6.9 |
| 49.7 | 9.2 |

Table 2: 5-micron particle

| Wind Speed (mph) | Distance Traveled (miles) |
|---|---|
| 3.1 | 2.2 |
| 6.2 | 4.5 |
| 12.4 | 9 |
| 24.8 | 18 |
| 37.3 | 27 |
| 49.7 | 36.1 |

(http://toxsci.oxfordjournals.org/content/65/1/7.full (including impacts/effects of airborne sulfur (SO2) and silica particulates/particles)

The average wind speed in Grass Valley is 5.7 mph. The Brunswick Site is located 2 miles from downtown Grass Valley. As evidenced above, the smaller the particle, the greater the distance travelled. Grass Valley currently monitors PM 2.5 at the Litton Building. Nevada County is currently classified as nonattainment status for PM10.

The International Agency for Research on Cancer of the World Health Organization has classified PM2.5 as a human carcinogen (*IARC: Outdoor Air Pollution a Leading Environmental Cause of Cancer Deaths; Technical Report; International Agency for Research on Cancer (IARC): Lyon, French,27 2013)*

On September 22, 2021 the World Health Organization revised air quality guidelines decreasing criteria air pollutants, especially the recommended exposure levels for PM10 and PM2.5. (https://www.iqair.com/us/blog/air-quality/2021-WHO-air-quality-guidelines

Has a baseline scenario for Grass Valley PM2.5 emissions or PM10 emissions been created since Nevada County is in nonattainment status for PM10? Were background PM2.5 concentrations from long range sources added to the HRA model?

A baseline concentration must be established in order to measure the TRUE impact from the addition of this project to existing air quality and the cumulative impacts on community health.

DPM, silica and asbestos fugitive dust will be emitted under two different categories: criteria air pollutants and as Toxic Air Contaminants. Yet in each situation, their health impacts to the community will be minimized.

**Ind 634-39**

As a criteria air pollutant, emission levels are not related to the immediate geographical area: "Notably, as detailed in Appendix C, there are numerous scientific and technological complexities associated with correlating criteria air pollutant emissions from an individual project to specific health effects or potential additional nonattainment days, such as the disconnect between mass emissions and concentrations due to secondary pollutant (such as O3) generation and pollutant transport, as well as the inaccuracy of applying regional and population-wide models to a local level in order to estimate health effects, and there are currently no modeling tools endorsed by an expert agency (i.e. NSAMQD) that could provide reliable and meaningful additional information regarding health effects from criteria air pollutant generated by individual projects." ***(Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project, pg 46, 2021)***

As a toxic air contaminant, asbestos and respirable crystalline silica will fall under the non-criteria air pollutant category. There are no established limits for monitoring emissions of non-criteria pollutants into the ambient

6

environment. The HRA is based on 30 years of exposure, thus the cumulative effects of the 80-year permit are not addressed.

**Ind 634-40**

**Ind 634-41**

HOW WILL THE RELEASE OF THESE TOXIC MICROSCOPIC PARTICULATES TO THE AMBIENT ENVIROMENT BE MONITORED?

SENSITIVE RECEPTORS

**Ind 634-42**

When listing *Receptors Used for Evaluating Modeled Impacts* are the following statements: "There are existing residences in all directions of the project site, with the nearest located north of East Bennett Road at approximately 100 feet from the project boundary. The nearest hospitals and schools to the project sites are the Sierra Nevada Memorial Hospital on Glasson Way (approximately 1800 feet north of the Centennial Industrial Site) and the Montessori House of Children on The Burma Road (approximately 2,500 feet south of the Brunswick Industrial Site boundary). However, residential receptors are the most conservative to evaluate as discussed further in Section 4.3." (*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pg 7, 2021*)

What about the impacts to the following receptors?

The Durham School Bus Depot is located 1.74 Miles west of the Brunswick Industrial Site on Bennett Road. These buses transport our children throughout the county. Will we be delivering asbestos and silica dust along with the children?

Within a 2-mile arc north of the Brunswick Industrial Site are 5 Skilled Nursing Facilities (Golden Empire, Wolf Creek, Atria Memory Care, Spring Hill Manor, and Crystal Ridge), at least 6 Assisted Living Facilities, 10 low-income housing apartment complexes, Hospitality House and Brunswick Commons housing for the homeless. All supportive services are located here as well: Pride Industries, FREED, Alta Regional Center, DaVita Dialysis, Nevada County Public Health offices and Connecting Point. Chapa-De Indian Health and multiple physicians' offices serving Medi-Cal patients are located here too.

**Ind 634-43**

According to the 2020 US census, 28.6% of Nevada County is 65 years or older as compared to the statewide rate of 14.3% for that population. Under age 65, the disability rate is 14.4% and 32.4% of the population have Medicaid coverage. The mortality rate from Chronic Lung Disease is double the state wide rates (69.26 deaths/100,000 people vs 34.92/100,000). There are also elevated rates for Heart Disease Mortality, Hypertension Mortality, Stroke Mortality and All-Cause Cancer Mortality vs state wide rates.

The demographics of our community must be considered in the context of this project. We already have elevated baselines for high levels of the criteria air pollutants ozone and particulate matter, radon, aging population, chronic disease, and poverty.

WILL THE COUNTY'S EXISTING BASELINES BE TAKEN INTO ACCOUNT?

SOURCE RELEASE SCENARIO

**Ind 634-44**

Table 2. Emission Source Parameters

DIESEL FUEL

These parameters are used to input data into the AERMOD dispersion model. On Page 10 of the HRA, the generators are listed at a Base Elevation of 2,748.39 m. This calculates to a height of 9017 feet. The Brunswick

7

Diesel Storage Tank is listed at a Base Elevation of 2,757.74 m which equals a height of 9048 feet and the Centennial Diesel Storage Tank is listed with a Base Elevation of 2,491.44 m which equals 8174 feet. These measurements are used to estimate carcinogenic volatile organic compound emissions from breathing and working losses from storage tanks which include benzene, hexane, toluene and 2,2,4-trimethylpentane. *Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, Pg 23, 2021)*

All data entry inputs should be verified in AERMOD model due to these errors, especially units of measure, which may be affected for other source parameters (i.e. plume height/plume width of 25/25 meters for line sources).

Diesel fuel combustion from generator use will exhaust gases and DPM. These estimated emissions have been included for only 100 hours per year during testing/maintenance. Any emissions from actual use have been categorized as speculative. During a Public Safety Power Shutoff (PSPS), it is anticipated that 15,000 gallons of diesel fuel combustion per day will be required to maintain mining operations.

**Ind 634-45**

Will diesel fuel consumption be monitored? Will there be any provisions to mitigate the impacts from PSPS generator use contributing to increased criteria air pollutants, GHGs and DPM emissions affecting the community and environment?

Will there be any penalties if Tier 4 Final engines are not used exclusively due to "commercially available" status exemptions?

FUGITIVE DUST

SILICA

Silica will be released from on-road vehicles, underground blasting and crushing, ore processing along with earthwork and material handling.

All of the consultants have stated in their reports that they are using information provided by Rise to generate their conclusions. A prime example is the silica emissions. The following table shows the anticipated rock types and amounts expected to be mined:

**Ind 634-46**

| Rock Type | Percent of Total |
|---|---|
| Meta-Andesite | 96% |
| Altered Meta-Andesite | 2% |
| Diabase | 1% |
| Serpentinite | 1% |

This chart represents the anticipated barren rock ratios to be mined, approximately 500 tons per day. It does not account for the 1000 tons of mineralized ore rock to be mined each day. (*Groundwater Hydrology and Water Quality Analysis, EMKO, pg 93)*

"The applicant estimates that the ore processed would be quartz veins hosted primarily within andesite rock and an assumed 60% silica content."( *Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pg 35, 2021)*

8

Regarding rock composition, this is meta-andesite rock not just andesite…it has undergone metamorphosis becoming altered in composition. Johnston (1940) stated: "The degree of metamorphism may vary in this unit, such that parts of it have been referred to as amphibolite schist, porphyrite, diabase, and quartz porphyrite." (*The Gold Quartz Veins of Grass Valley, referenced in Groundwater Hydrology and Water Quality Analysis EMKO pg 9)*

The laboratory that Rise used for all metals analyses, ACZ Laboratories, is certified to perform both silica and silicon dioxide tests yet not a single sample was analyzed for this parameter. *(ACZ Analytical Capabilities 2017).*

The engineering firm, NV5, stated in the *Centennial Geotechnical Report* (pg 12) that: "We understand that the sand tailings will likely have a gradation similar to the historical gradation presented in the table below, and will typically have a large proportion of quartz."

| Mesh Size | Particle Size (mm) | Particle Size (micron) | Percent Passing | Description |
|---|---|---|---|---|
| 48 | 0.300 | 300 | 97.7 | Medium Sand |
| 65 | 0.212 | 212 | 87.5 | Fine Sand |
| 100 | 0.150 | 150 | 63.9 | Fine Sand |
| 200 | 0.075 | 75 | 32.3 | Silt |
| 325 | 0.044 | 44 | 12.1 | Silt |

Quartz is 100% silicon dioxide AND "1000 tons of ore" rock will be processed into tailings each and every day, *Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix, B pg 21, 2021*).

These tailings will contain respirable crystalline silica, a toxic air contaminant. Rise has assumed that the ore rock is 98% andesite with a silica content of 60%. There is no data to substantiate this assumption. Minimizing the levels of this TAC to be generated from the excavation of material and milling of quartz greatly diminishes its' impact in the HRA considering the vast amounts, 1500 tons of barren and ore rock, to be mined each day.

HOW WILL THE COMMUNITY PROTECT ITSELF FROM UNKNOWN QUANTITIES OF SILICA?

ASBESTOS

Asbestos will be released from on-road vehicles, during underground blasting and crushing, ore processing and along with earthwork and material handling.

**Ind 634-47**

The rock composition chart above lists total serpentinite mined at 1% yet the *Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Earthwork and Material Handling Fugitive Dust: Construction Activity Fugitive Dust* assumes *Serpentinite Content of Mine Fill* at 14.3%. Based on the given information, daily mine fill content is composed of 500 tons of tailings and 500 tons of barren rock at 1% serpentinite.

With these ratios, how can engineered fill contain 14.3% serpentinite?

**Ind 634-48**

Rise has developed an Asbestos, Serpentinite and Ultramafic Rock management plan with the goal of minimizing asbestos release. A 90-day rolling inventory will be maintained in an effort to prevent asbestos contaminated material from being used as aggregate and engineered fill. A three-grab composite sample will be obtained for every 1000 tons mined. The sampling point is located mid drop in the silo. Inventory material will then be screened using Polarized Light Microscopy (PLM), followed by Transmission Electron Microscopy (TEM) testing with results to be mathematically converted to Phase Contrast Microscopy (PCM) equivalent units. These tests are not comparable since they utilize different preparatory methods, sample amounts and microscopy techniques. The detection limit for PLM testing is 0.25% and the detection limit for TEM testing is 0.001%. Conversion of TEM to PCM equivalent units yields a detection limit of 0.01%.

9

Under this plan, Rise is using the PCM equivalent units limit of 0.01% to calculate emissions levels for fugitive dust. "A conservative approach for the modelling of TAC emissions is used, with the asbestos content in mined materials assumed at the maximum of 0.01% by mass of PCM equivalent units. The average asbestos content of the mined material is of primary concern since asbestos does not have established acute noncancer effects (OEHHA)"(*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, pg 22, 2021*).

Initial asbestos sampling of 42 samples (*Asbestos Sampling Memo June 2020*) resulted in two samples at 0.075% and 2.5% by PLM analysis along with two samples at 2.0% and 3.1% by TEM analysis. The remaining 38 samples were non-detect (<0.25%) by PLM. Re-testing of these PLM samples by TEM yielded 6 samples with results greater than the PCM equivalent units detection limit of 0.01% in addition to the original 2 TEM samples that were not re-tested. Thus, **twenty percent** of the samples had asbestos levels greater than 0.01% PCM equivalent units.

Excluding the two grab tailings samples from Centennial and the two blanks, the average overall length of a sample core tested for asbestos was 5.34 inches. Samples were from 6 of 19 (32%) of total cores drilled by Rise: 9 samples from I-18-11, 1 sample from I-18-12, 9 samples from I-19-13, 7 samples from I-19-13A, 8 samples from I-19-14 and 4 samples from I-19-14A. Drilling was stopped when asbestos was detected. Drill logs are not available, no information available as to quantity, location, depth, etc. These cores appear to be in close proximity to each other as viewed on geological maps (*Asbestos Sampling Memo June 2020 pp 11-13*).

DEIR pg 3-20: "The ASUR plan incorporates routine asbestos testing by Transmission Electron Microscopy (TEM) and an Asbestos Inventory to ensure that average mined material and engineered fill contains less than 0.01% asbestos by mass of Phase Contrast Microscopy (PCM) equivalent units."

Just because Rise believes that they will be able to control the distribution of material to 0.01% asbestos content does NOT mean that they can control the amount of asbestos in the actual mined material. The content of asbestos in the serpentinite is unknown until tested-this requires blasting, excavation, crushing, skipping, conveyance to the surface, deposition and storage to then be followed by testing. Ventilation from the mine during these underground processes will emit asbestos to the ambient environment. This quantity of asbestos emissions is unknown and CANNOT be assumed to be only 0.01%.

**Ind 634-49**

The ASUR Plan dictates the use of water curtains and an auxiliary fan system when mining serpentinite material. According to Rise, this system uses MERV 16 filters that will trap particles to 0.03 microns reducing asbestos fibers by 95% before the fibers enter the main ventilation system. How much asbestos will be in the remaining 5% if the initial asbestos content of the rock is unknown along with the unknown quantities of rock mined?

Maintenance of the 0.01% inventory will not be attemptable until AFTER the material is mined, brought to the surface and tested twice- requiring up to two weeks before the results are known.

These asbestos emissions are not accounted for in fugitive dust estimations.

**Ind 634-50**

In 1986, asbestos was identified by the Board (CARB) as a toxic air contaminant: the Board also determined that there is not enough scientific evidence to identify an asbestos threshold level below which no significant adverse health effects are anticipated (17 CCR 93000). (*Implementation Guidance Document 2017, CARB pg 1*)

The World Health Organization (WHO) concurs that there is no safe level of asbestos exposure. Any asbestos released to the ambient environment will create chronic exposure risk for the community since asbestos does not readily degrade. Protecting mine workers from acute exposure when mining material "rich in asbestos" does not equate to the same level of community protection. Under these circumstances, miners will work a short-shift, wear respirators, be monitored for exposure, and decontaminate themselves before going home. They have the freedom of choice to work in that environment, financial compensation, training in exposure control and health care benefits. The community has none of these protections.

By using the detection level of 0.01% mass by PCM equivalent units to calculate emissions used in the HRA, the levels of this TAC have been grossly underestimated.

10

HOW WILL THE COMMUNITY PROTECT ITSELF FROM UNKNOWN QUANTITIES OF ASBESTOS?

HEAVY METALS

"Blasting and crushing would also result in emissions of dust with trace heavy metals TACs including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium. Concentrations of each heavy metal within the barren rock and mineralized rock was taken from Table 4-7 of the *Groundwater Hydrology and Water Quality Analysis Report for the Idaho-Maryland Mine Project* (EMKO Environmental, Inc. 2020)"

Heavy metals will be released: from off-road equipment, on-road vehicles, during underground blasting and crushing, ore processing along with earthwork and material handling-all phases of operations.

The data used for heavy metal toxic air contaminants in the Health Risk Assessment are all notated by the laboratory as being received and tested beyond the EPA recommended hold times of 28 days for mercury and 6 months for all remaining metals. Exploratory drilling began in 2017. Since the drill logs are unavailable, the exact sample dates for each core are unknown, but all samples were submitted and received by the gold assay laboratory on February 20, 2019. (*Appendices: Groundwater Hydrology and Water Quality Analysis EMKO, pp 515-516*) and (Appendices: *Groundwater, Hydrology and Water Quality Analysis Report: Inorganic Extended Qualifier Reports pp. 389-407 and 458-484)*

**Ind 634-51**

After assays were performed, samples were then submitted to ACZ Laboratories for metal analyses. It is not clear where the samples were located between the assay lab, ALS Laboratories in Reno, Nevada and submission to ACZ Laboratories in Steamboat Springs, Colorado. The Chain of Custodies describe these 47 samples as Tailings (assay pulp). All list a sample date of 3/5/19:12:00 pm. Under the Sampler's Name were the initials, BM (Ben Mosssman?) Ben Mossman and Andrew Kopania of EMKO both received copies of the laboratory reports as listed on the CoCs. The laboratory received by date for all samples is 11.11.2019. Twenty samples were digested on 11.22.2019 and the remaining twenty-seven samples were digested on 11.26.2019. (The digestion dates would be used for endpoint hold time calculations).

These samples may have been collected at that time but they were NOT sampled at that time. These metals analyses were performed in November 2019 in two batches. This means that all samples were tested at least 9 months beyond their hold time expiration date, probably more.

Potentially toxic elements (PTEs) hosted in asbestos elongate mineral particles is one of the factors that determines their toxic/pathogenic effects. Metals such as Fe, Mn, Cr, and Be are known to induce toxicity and contribute to asbestos related diseases. "...it is essential to quantify the toxic elements present in asbestos elongate mineral particles in order to prevent asbestos-related diseases." (https://doi.org/10.1016/j.chemgeo.2020.119896Get rights and content)

SHOULDN'T VALID DATA BE USED WHEN EVAUATING THE HEALTH RISKS TO THE COMMUNITY FROM THESE TOXIC AIR CONTAMINANTS, ESPECAILLY WHEN THESE METALS HAVE THE ABILITY TO POTENTIATE THE EFFECTS OF ASBESTOS?

CONCLUSION

**Ind 634-52**

"Based on the PM10 emissions estimated, emissions of asbestos, silica, and heavy metals were estimated for the purposes of this HRA." (*Air Quality and Greenhouse Gas Emissions Analysis Report for the Idaho-Maryland Mine Project: Health Risk Assessment, Appendix B, Pg 22)*

11

Estimations of estimates...estimates of estimations

IS THERE ANY VALIDITY IN ANY OF THESE ASSUMPTIONS, ESTIMATIONS OR DATA REGARDING THE EMISSIONS OF SILICA, ASBESTOS, HEAVY METALS OR DPM?

IS THERE ANY VALIDITY TO THIS HEALTH RISK ASSESSMENT OF OUR COMMUNITY?

Thank you,

Attn: Matt Kelley,

Please include these comments to the Idaho-Maryland Mine DEIR. as an Addendum to my Health Risk Assessment Critique.

## Health Risk Assessment Critique Addendum

### ANFO EXPLOSIVES

Other emissions of TACs from blasting pertain to the detonation of ANFO, which were estimated based on emission factors from *AB 2588 Combustion Emission Factors* (Ventura County Air Pollution Control District 2001). (*Air Quality and Greenhouse Gas Emissions for the Idaho-Maryland Mine Project, 2021 Pg 36)*

**Ind 634-53**

These TACs are listed found in Underground Blasting and Crushing in Table 10. Project Annual On-Site Operational TAC Emissions *(Air Quality and Greenhouse Gas Emissions for the Idaho-Maryland Mine Project, 2021 Appendix B, Health Risk Assessment, pg 386)*

Explosive use is estimated at 0.93 tons per day. ANFO contains ~6 % diesel fuel #2. Rise also plans to use emulsion-based explosives and the emissions for emulsion-based explosives are currently unknown.

The diesel fuel in ANFO will release TACs upon combustion and include: acetaldehyde, acrolein, benzene, 1,3 butadiene, formaldehyde, naphthalene, polycyclic aromatic hydrocarbons (PAHs) and toluene, etc.

However, in Table 10, these compounds are only estimated for Underground Blasting and not for the diesel fuel used in Off-Road Equipment, On-Road Vehicles, and Diesel Generators. Only DPM emissions have been included for Off-Road Equipment, On-Road Vehicles and Diesel Generators.

HAVE ALL OF THE TACs FROM DIESEL FUEL COMBUSTION BEEN INCLUDED BEYOND JUST THE DPM EMISSIONS?

### HEXAVALENT CHROMIUM

**Ind 634-54**

EXPLOSIVES

Hexavalent chromium is also found in the detonation of explosives. It is released from the combustion of diesel fuel and is also often used as a catalyst in ANFO composition. An estimate for the hexavalent chromium from underground blasting was included in Table 10. Project Annual On-Site Operational TAC Emissions *(Air Quality and Greenhouse Gas Emissions for the Idaho-Maryland Mine Project, 2021 Appendix B, Health Risk Assessment)*

PORTLAND CEMENT (This topic is more germane to groundwater contamination but there will be some airborne exposures from delivery, mixing, etc.)

Hexavalent chromium is toxic air contaminant found in Portland cement in varying ratios. The Cemented Paste Backfill study investigated the paste process with the conclusions that more work must be done regarding:

- Identify a cement supplier to provide cement with low hexavalent chromium content
- Perform leachate analysis to ensure minimal leaching of hexavalent chromium in CPB
- Experiment with CPB rheology to determine proper ratios of cement, fill, etc.

Regarding hexavalent chromium content of cement: "Itasca (2020a) recommends that additional testing and engineering be conducted prior to implementation to select the proper source for the Portland Cement Binding agent to minimize the presence of $Cr^{+6}$ in the mixture, and identify the minimum time that should be allowed for the mixture to cure before allowing it to become inundated in the mine workings."*(Groundwater Hydrology and Water Analysis for the Idaho-Maryland Mine Project EMKO pg 103)*

**Ind 634-55**

"Prior to use of CPB, additional documentation would be needed to verify that $Cr^{+6}$ levels in the Portland cement used for the mixture are minimal and will not leach." "The Conditional Use Permit, either as a mitigation measure or as a condition of approval, should require that the source of the Portland cement to be used for the CPB be specified and that testing data showing the $Cr^{+6}$ levels do not leach above the water quality standards must be provided to the County prior to the use of CPB. In addition, the County should require that a RoQWD for use of CPB be submitted to RWQCB at least six months prior to the proposed initial use of CPB and that the WDR be received prior to initiating any mine backfilling using CPB." *(Groundwater Hydrology and Water Analysis for the Idaho-Maryland Mine Project EMKO pg 115)*

"The presence of chromium in cement has been identified as a potential water-quality concern related to the use of CPB. Hexavalent chromium (Cr[VI]) is an oxidized form of chromium that is more soluble and mobile in the environment than reduced forms of chromium. Notably, less Cr (VI) leaches from cured cement than from unhydrated cement; Estokova et al. (2018) demonstrated that less than 0.5 of total chromium leached from a range of cured cement composites compared to 0.8% to 1.8% of total chromium from the Portland cement binder itself. Thus, selecting a supplier with low Cr (VI) content cement and ensuring the CPB is not inundated before it sets can minimize the potential for issues with Cr (VI) leaching."(*Cemented Paste Backfill Study, pg 3*)

"Itasca understands that Rise plans to complete more extensive strength, rheological, and geochemical testing on their ultimate CPB mixture at a later stage in the IMM project."(*Cemented Paste Backfill Study pg 6)*

There is no evidence that any of this work has been completed.

**Ind 634-56**

What type of ventilation will be used in the cement processing plant?

**Ind 634-57**

HOW CAN YOU ESTIMATE THE AMOUNT OF HEXAVALENT CHROMIUM WHEN YOU DO NOT KNOW THE AMOUNT OF CEMENT TO BE USED, DO NOT HAVE A SUPPLIER OR KNOW THE COMPOSITION OF THE CEMENT REGARDING HEXAVALENT CHROMIUM AND SILICA CONTENT?

RADON

**Ind 634-58**

Radon is a toxic air contaminant that needs more consideration regarding community impacts. There are only two mentions of radon throughout all the consultants' reports. In the NV5 reports are the disclaimer sentences: "Our scope of services did not include a groundwater flow analysis nor an evaluation of the Site for the presence of hazardous materials, mold or radon gas." *(Geotechnical Engineering Report Idaho-Maryland Mine Project-Centennial Industrial Site, pg 2)* and "Our scope of services did not include a groundwater flow analysis nor an

evaluation of the Site for the presence of hazardous materials, historic mining features, asbestiform materials, mold or radon gas." *(Geotechnical Engineering Report Idaho-Maryland Mine Project-Brunswick Industrial Site, pg 2)*

- According to the world Health Organization (WHO), "Radon is a radioactive gas that emanates from rocks and soil and tends to concentrate in enclosed spaces like underground mines and homes".
- It is generated from the decay of radium. Radium is a decay product of uranium and thorium which are naturally occurring in rocks and soils.
- Because it is a gas, it moves freely in the air spaces between rocks and in soils.
- Factors that can affect radon levels include local geology, construction materials and how the home was built.
- Levels can vary from home to home, it's very unpredictable.
- You cannot see it, smell it or taste it
- After smoking, radon is the second leading cause of lung cancer in the United States
- For non-smokers, Radon is the leading cause of lung cancer
- US EPA estimates that radon causes about 21,000 lung cancer deaths each year.
- There is a linear relationship between radon and lung cancer: As radon levels increase, the risk of lung cancer increases

RADON LEVEL AVERAGES: US vs STATE vs COUNTY

- The national average of radon is 1.3 pCi/L
- California average is 0.85 pCi/L
- Nevada County average is 3.1 pCi/L

The EPA action level is 4.0 pCi/L. Twenty six percent of home in Nevada County have radon levels greater than 4 pCi/L (county-radon.info/CA/Nevada.html)

According to the California Department of Health, in Grass Valley,

- Testing of 315 homes in 95945 resulted in 66 tests (21%) of homes ≥ 4.0 pCi/L with a maximum result of 29.5 pCi/L.
- Testing of 232 homes in 95949 resulted in 22 tests (9.5%) of homes ≥ 4.0 pCi/L with a maximum result of 14.3 pCi/L
- Testing of 340 homes in 95959 resulted in 59 tests (17.4%) of homes ≥ 4.0 pCi/L with a maximum result of 28.6 pCi/L

The Brunswick Site is located in the zip code 95945.

Since radon seeps into your home from several sources: fractured bedrock, groundwater, soil and well water…

WILL THE REOPENING OF THE IMM AFFECT RADON LEVELS IN GRASS VALLEY?

Rise did test groundwater from some drains and the New Brunswick shaft for radionuclides: uranium, Ra226, Ra228, and gross alpha emitting particles. Ra226 and Ra228 are precursors for radon. The maximum contaminant level for both combined is 5 pCi/L (3 for 226 and 2 for 228). The detection level is 1 pCi/L. All test results were below the maximum contaminant level.

However, in 2006, the state of California adopted new Public Health Goals for Ra226 and Ra228. The new goal for Ra226 is 0.05 pCi/L and the new goal for Ra228 is 0.019 pCi/L. The combined values at 0.069 are below the current detection level of 1 pCi/L but these new goals demonstrate that the state recognizes the health risk for lung cancer from radionuclides exposure. Now looking at the groundwater test results under these criteria, all Ra226 and Ra228 results meet or exceed these PHGs.

Over the last decade, several studies have concluded that elevated radon concentrations could be a sign of an imminent earthquake. Radon is released from cavities and cracks in the rocks and soil due to "a slight compression of pore volume that causes gas to flow out of the soil".

1900 pounds of explosives will be detonated every day!

WILL THE CONTINUOUS EXPLOSIVES USE AND TUNNEL EXCAVATIONS LEAD TO INCREASED ROCK FRACTURES AND FISSURES THEREBY INCREASING RADON LEVELS IN OUR COMMUNITY?

HOW WILL THE COUNTY MONITOR RADON LEVELS AT THE MINE AND THROUGHOUT THE COMMUNITY?

Thank you,

Pam Heard RRT

Attn: Matt Kelley,

Please include these comments to the Idaho-Maryland Mine DEIR.

MISCELLANEOUS PURSUITS

**DEIR pg 2-74 section 4.6-7 "potential for geologic related impacts and hazards"**

**Ind 634-59** Inclusion of hexavalent chromium (from unknown quantities in cement) and radon as TACs (toxic air contaminants). Emissions have not been calculated or included in the Air Quality Report, particularly in the Health Risk Assessment.

**Ind 634-60** What is the potential of unknown quantities of cement utilized in the CPB placed in the mine stopes to leach hexavalent chromium into groundwater or surface water supplies? Especially after reflooding occurs after reclamation?

**Ind 634-61** ANFO is classified as a TAC and is hazardous to aquatic life. Since water will be used to control fugitive dust released from explosions, how will this water be recovered and treated? Is there potential for any of this contaminated water to enter the groundwater or surface water systems? Will impacts increase when flooding occurs after reclamation?

**Ind 634-62** Asbestos is classified as a TAC. Asbestos will be found in water used for fugitive dust control, water curtains, equipment decontamination (ASUR Plan), shower and laundry effluents (pg 2-73). How will this water be recovered and treated? Is there potential for any of this contaminated water to enter the groundwater or surface water systems?

**Ind 634-63** **DEIR pg 3-40**: "Underground mining service water: Such uses include water use for dust suppression in rock drills and blasted rock piles, which is piped into the mine workings. Net consumption of water would not result from such activities, because water in underground workings is pumped to the surface for reuse."

Is there potential for these contaminants to enter the groundwater or surface water systems, if not immediately then when mine is flooded during reclamation?

1

**Ind 634-64**

**DEIR pg 2-18 Table 2.1 item (b)**

What dust suppressants and chemical stabilizers will be used, and in what quantities?

Investigate dust suppressants and chemical stabilizers for their impacts on vegetation (premature death) resulting in:
- -Lack of forage for wildlife, impact on wildlife from decreased food supplies
- -Increased flammability

Investigate impact on wildlife from ingestion of:
- -Contaminated forage
- -Contaminated groundwater/surface water

Investigate dust suppressants and chemical stabilizers for their impacts on aquatic systems
Investigate dust suppressants and chemical stabilizers for their impacts on soil ecology

**Ind 634-65**

**DEIR pg 3-40**: "Lighting during nighttime hauling and dumping of engineered fill would be limited to haul truck headlights."

How can dust suppression be monitored in the dark?

**Ind 634-66**

**DEIR pg 2-19 (d) and (e)**
Installation of wind barriers:
What are the aesthetic impacts from wind barriers: height, width, color, location?
What are the impacts on noise pollution?
What is impact on wildlife, especially birds?
What is impact on pollutant stream direction?

**Ind 634-67**

**Application Documents-Project Information Questionnaire-Revision 1**
Security Fencing will be used to restrict access to portions of the Brunswick site. Fencing will be metal chain link and range in height in accordance with Nevada County Code Sec. L-II 4.2.6

No mention of fencing or signage required around capped toxic soil (5.6 acres) on Centennial site as mentioned in RAP.

What impacts will these fences have on aesthetics and wildlife?

**Ind 634-68**

**Initial Applications Documents-Brunswick Industrial Site-Hazardous Materials Inventory Statement**

Investigate flotation compounds. The Air Quality Report Nov 2021 (pg 297, Idaho-Maryland Mine Project Reagent Use lists the following:
Promoter 100 pounds per day Aerophine 3418A Note: no information is available online (only by direct request from manufacturer) but it is a phosphine-based collector
Promoter 50 pounds per day Aerofloat 208
Frother 80 pounds per day Aerofroth 70 - MIBC
Flocculant 80 pounds per day Magnafloc 10
Descaling 264 gallons per month Scaletrol PDC9401

2

However, Applications Documents: Brunswick Industrial Site-Hazardous Materials Inventory Statement lists the following:
Promoter-Aero 407
Frother Aerofroth 70
Flocculant Magnafloc 10
Descaling Scaletrol PDC9333
Collector Aero Maxgold 900

These are two very different lists. What reagents in what quantities will actually be used? This information is necessary for safety (i.e. hazard class designation) as well as potential environmental impacts.

**Ind 634-69**

The collector and promoter, AERO MAXGOLD 900 and AERO 407 respectively, are especially toxic to aquatic life with long lasting effects. What quantities will be used and what residual amounts will contaminant the tailings used for engineered fill? Calculate amounts that will leach from tailings platforms into storm drainage system with exits to waterways. This situation will occur at both the Centennial and Brunswick sites and wherever engineered fill utilizing sand tailings is transported.

**Ind 634-70**

**DEIR pg 4.7-29** states that these chemicals will be removed using filter presses during water removal. How is this verified? Will the tailings be tested for residual reagents contamination?

What will be the cumulative effects on terrestrial and aquatic environments from these agents? Are these compounds monitored by waterboard as a condition of discharge?

Notably, the effects of the promoters have been left out of the descriptions under *Use and Storage of Various Chemicals* DEIR pg 4-7.28 & 29 while the effects of the less toxic chemicals (flocculant, frother) are included.

(CuSO4.5H2O, PAX potassium amyl xanthate, AERO 208, Aerofroth 65 and Soda Ash were used in flotation study by McClelland Laboratories, pg 556 Appendices)

**Ind 634-71**

**DEIR pg 2-78 Section 4.7-4 "Impair implementation of or physically interfere with adopted emergency response plan or emergency evacuation plan"**

Investigate flammability of all Hazardous Materials Inventory. Verify accuracy of listed materials.

**Ind 634-72**

Review evacuation routes and perform mock scenarios for community preparedness. Study interagencies dependence/access to Air Park.

**Ind 634-73**

Grass Valley Air Attack Base and Grass Valley Emergency Command Center are both located at the Nevada County Air Park (DEIR pg 4.13-8). These critical facilities are located in a Very High Fire Hazard Severity Zone.

**Ind 634-74**

In August 2021, the Bennett Fire burned approximately 59 acres, comprising most of the Centennial Industrial Site. (DEIR pg 4-13.3) Sierra Nevada Memorial Hospital and Skilled Nursing Facilities were told to "shelter in place" as others in the surrounding area were evacuated. The majority of these "others" consisted of seniors in low-income apartment complexes just north of Centennial site.

3

DEIR pg 4-7.10: "Shelter-In-Place - Advises people to stay secure at their current location by remaining in place as evacuation will cause a higher potential for loss of life."

DEIR pg 4-13.13

**Ind 634-75**

Does the new proposed Nevada County Emergency Operations Plan-Mass Evacuation Annex include incidents of fire caused by accidents related to Rise operations to include potential transportation (off-site), explosives use (off-site), storage of flammable hazardous materials (on-site), etc.?

DEIR pg 4-13.15 "Due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire."

DEIR pg 4-13.3 "Prevailing Winds: The predominant wind direction at the project site area is from the North-East and South-West directions. This suggests, for example, that a fire burning in the forested terrain southwest of the Centennial and Brunswick Industrial Sites could burn through the Sites due to prevailing southwesterly winds."

**Ind 634-76**

Challenge with WeatherSpark data model weighted 67% from Nevada County Air Park showing wind is from the south 7.4 months of the year and from the East 4.6 months of the year. The Nevada County Air Park is 4000 ft from the Brunswick Site. These wind directions confirm that a fire burning from the southwest forested terrain would not only burn through the sites but through the entire town of Grass Valley.

And an isolated fire burning on the Brunswick site has the potential to ignite numerous flammable materials releasing hazardous pollutants which would then be transported by prevailing winds into Grass Valley and environs. This fire would then have the potential to ignite a wildfire too.

DEIR pg 4-13.26: "In addition, although runoff from both Sites flows into creeks, the project includes drainage facilities to capture runoff prior to entering the creeks. Should a fire occur on one or both of the Sites, the proposed drainage facilities would capture and slow postfire runoff, thus minimizing flooding potential downstream."

**Ind 634-77**

What about the runoff of pollutants entering the creeks postfire?

DEIR pg 4-13.11 "Policy FP 10.7.3: Projects requiring a traffic study shall include in such study an assessment of the current emergency evacuation capacity of the public and/or private roads that serve the proposed project, and recommended mitigation that will increase the evacuation capacity, if needed."

DEIR pg 4-13.17 "Operation of the approximately 7.4 haul trucks per hour attributable to the proposed project could either be temporarily ceased and/or these trucks could pull off the road to enable residents to evacuate as quickly and expeditiously as possible."

**Ind 634-78**

There is no room for any truck or car to pull off the road. Brunswick Road is a narrow two-lane road with limited shoulder widths (if available at all) and embankments on both sides. In the event of an evacuation, both lanes should be one-directional. With trucks travelling on both lanes, evacuation will

be unable to occur in either direction. Also, truck deliveries that occur via SR49 through narrow congested intersections leading to the primary evacuation route may be compromised.

**Ind 634-79**

How can Brunswick Road be considered a minor arterial road when 118 haul truck round trips per day are warranted for Rise operations? DEIR pg 4-7.38 This does not include the additional (up to) 18 semi-truck deliveries per day. DEIR pg 4-7.37

Yet, Brunswick Road has been defined as a minor arterial road, a secondary evacuation route only used by residents for evacuation. DEIR pg 4-7.37

**Ind 634-80**

DEIR pg 4-7.39: "While the proposed project would involve haul of hazardous materials to and from the Brunswick Industrial Site via Brunswick Road, no other cumulative projects are anticipated to similarly haul hazardous materials along Brunswick Road on an ongoing basis."

What about the Loma Rica Business Park on Loma Rica Drive? There is only one-way ingress/egress via Brunswick Road. This business park contains all of the county propane suppliers, Apria Healthcare (delivers oxygen to county residents) and multiple auto businesses using welding gases. (Hazmat Class 2) The signal at Brunswick Road and Loma Rica Drive intersection currently has a right turn on red for traffic entering Brunswick Road northbound onto Brunswick Road. There is a steep decline in elevation from this point. How will a haul truck or semi-trailer decelerate to prevent collisions with a vehicle turning right on red from this intersection?

**Ind 634-81**

DEIR pg 4.12-21: "Goal MV-4.1 Provide for the safe and efficient movement of people and goods in a manner that respects the rural character of Nevada County."

How will this goal be achieved on Brunswick Road given increased amounts of truck traffic?

DEIR pg 4-13.24 and pg 3-39: "The project would install two, 12,000-gallon above-ground diesel fuel storage tanks on the Brunswick Industrial Site.

**Ind 634-82**

This is the first mention of two diesel fuel storage tanks. All other consultant documents refer to one 30,000 gallon storage tank at the Brunswick site.

**DEIR pg 2-85**

Rise will pay for monthly fixed service charges of use of up to 400 gallons per day. What about drought surcharges? What about drought limitations on volumes in the future?

**Ind 634-83**

...Until sold or annexed into city of Grass Valley. Why should the homeowner with a pre-existing well that was destroyed by Rise now have to pay for water just because of annexation? They would have had a well water supply regardless of annexation status. If these rights don't transfer with a sale, then the homeowner should be paid for loss of the well. The existing well is a component of the property value. NID connection is part of the property value as well, however the water from the well itself has been excluded in this valuation.

**Ind 634-84**

DEIR pg 3-21 & 22 There is much discussion regarding the ventilation system including a Main ventilation fan and secondary fans-no mention of any type of filtration.

"Once the service raise is completed and the permanent ventilation system is constructed, the primary ventilation fans would be located underground and the temporary ventilation fan on the surface at the Brunswick shaft would be removed."

This sentence mention primary ventilation fans, plural. The Air Quality and Greenhouse Gas Report lists the quantity of main ventilation fans as 3 on page 27. Booster and auxiliary fans are mentioned on page 26 in addition to the 3 main ventilation fans.

How many main/primary fans are there?

The number of fans is critical since the fan(s) is (are) emission source(s) in the Health Risk Assessment. (Pg 8, HRA, Appendix B, AQ Report 2021)

**Ind 634-85**

DEIR pg 3-28: "During normal operations, an average of one 7,500-gallon fuel tanker would travel to/from the sites every two weeks, using Brunswick Road to SR 20/49, over the 80-year term of the use permit. During any public safety power shutoffs (PSPS) events, a maximum of two fuel tankers per day would be required due to additional fuel demands associated with backup generators."

While predicting a PSPS event may be speculative, the emissions from the combustion of 15,000 gallons of diesel fuel per day is not speculative. These generators release emissions at 855°F to the ambient environment. There must be some accountability for the additional GHGs and carcinogenic DPM released from these emissions.

What will be the consequences of excess diesel fuel usage not accounted for in estimated emissions?

**Ind 634-86**

DEIR pg 3-28 What is a sufficient insurance policy regarding explosives transport?

For the first 6 months of construction, explosives will be delivered multiple time per week DEIR pg 4-7.26

**Ind 634-87**

**DEIR pg 2-96** How long will the mine be blasting above the 1000 ft level?

**Ind 634-88**

DEIR pg 4.7-2: "Recognized Environmental Conditions (RECs) associated with the project sites. A REC indicates the presence or likely presence of any hazardous substances in, on, or at a property due to any release into the environment, under conditions indicative of a release to the environment, or under conditions that pose a material threat of a future release to the environment."
"Similar to the cleanup of Areas B and C, the USTs would likely be considered HRECs provided that regulatory closure records are found."

Records have not been found for closure of Area B (drum spill) or Area C (disposal site) along with a 1000 gallon gasoline tank installed in 1977, a 12,000 diesel fuel tank installed in1977 and a 1000 gallon tank with unknown installation date. DEIR pg 4.7-7 & 8

**Ind 634-89**

DEIR pg 4-7.18: "The hazardous materials business plan program requires businesses in Nevada County to prepare plans detailing facility information, a hazardous materials inventory, and an emergency response plan if hazardous materials storage equals or exceeds minimum reportable quantities, which are: 55 gallons of a hazardous liquid; 500 pounds of a hazardous solid; or 200 cubic feet of a compressed gas. The NCEHD provides access to the information in the hazardous materials business plans to emergency response agencies, including fire and police."

Has this plan been submitted?

**Ind 634-90**

DEIR pg 4.12-23: "The LTMF is based on total thousand square feet of buildings. The project proposes 126,000 square feet of industrial buildings and will be required to pay the LTMF. The current fee would be calculated as 126 TSF x $442.44 = $55,747.44. The actual fee paid will depend on the mitigation fee in place at the time of construction.

How is the Mitigation fee calculated? What actual amount will be paid?
DEIR pg 4.12-24: "The GVTIF is based on total thousand square feet of industrial buildings. The project proposes 126,000 square feet of industrial buildings and will be required to pay the required GVTIF. The current fee would be calculated as 126 TSF x $666.66 = $83,999, and an administration fee of 1% = $839.99. The actual fee paid will depend on the mitigation fee in place at the time of construction.

Why is the City of Grass Valley entitled to more revenue when the most impacted road, Brunswick Road, is located in the County?

DEIR pg 4.12-25: "The project proposes 126,000 square feet of industrial buildings and will be required to pay the required RTMF. The current fee would be calculated as 126 TSF x 5.33 x $79.37 = $53,303.30. The actual fee paid will depend on the mitigation fee in place at the time of construction.

Who receives this money? Are these funds sufficient?

SAMPLING PROCEDURES

**Ind 634-91**

Page 93 of the *Groundwater Hydrology and Water Quality Analysis Report*, EMKO states that Rise completed 19 drill core holes, totaling 67,500 linear feet, from 2017-2019. The sampling pattern was to drill 90 feet, pull a 10-foot sample segment, drill another 90 feet, etc. The drill logs are not available for review; the actual dates, precise locations, drift angles, widths, final depths, etc. are unknown.

"The cores were sawed in half in zones of interest and sent to ALS in Reno, Nevada to be assayed. ALS Laboratories crushed and homogenized the sample to ~2 mm size, split a 1 kg sample, pulverized the split sample, and assayed a split of the pulverized sample." (*Groundwater Hydrology and Water Quality Analysis Report* pg 93) Samples were received on 02.20.2019 with a finalized date of 03.05.2019. (*Appendices: Groundwater Hydrology and Water Quality Analysis Report pp 515-516*)

After assay for gold, the samples were subjected to additional testing at different laboratories.

**Ind 634-92**

METALS ANALYSES, DI-WET, ABA, WET CHEMISTRY PARAMETERS

FLOTATION COMPOSITE- McClelland Labs

"A composite sample was prepared from 76 samples of the ~2 mm material remaining from assaying. A portion of the material was weighted to represent the interval length and merged to make the metallurgical sample. Sufficient material was available for most samples, except for five samples where no material was available from the assay lab. The 76 samples created a composite metallurgical sample of approximately 46 kilograms (kg) (100 pounds)". (*Groundwater Hydrology and Water Quality Analysis Report pp 95-96*). This composite was sent to McClelland Labs in July 2019 which then homogenized the sample and split it into 4 sub-samples, F1-F4 flotation tailings samples. Page 537 of *Appendices: Groundwater Hydrology and Water Quality Analysis Report* states: "A total of 7 buckets containing 6 separate samples were received from the Maryland mine on July 10, 2019. The

1

samples weighed 4 to 47 kg, and appeared to be approximately -6 mm in size. The largest sample ("flotation composite") was intended for analysis..."

Is the material 2 mm or 6 mm in size? What is the exact provenance of the 76 samples that comprise the composite as it relates to the 47 cores submitted for assay?

After flotation testing, these samples were shipped from McClelland Labs to a geologist at Benchmark Resources in Folsom, CA during November 2019 who then submitted the samples to ACZ Laboratories in Steamboat CO. These samples, F1-F4, were then analyzed by ACZ for total metals, DI-Wet metals, Static Acid-Based Accounting and wet chemistry parameters.

BARREN ROCK-ACZ Laboratories

**Ind 634-93**

On October 29, 2019 a geologist with Benchmark Resources selected barren rock samples: MA-1, MS-1, MA-2, MAA-1, S-1 and MA-3 from Rise Grass Valley. These samples were from 3 different cores [1 sample from I-18-10, 1 sample from I-18-11 and 4 samples from I-19-13 (*Groundwater Hydrology and Water Quality Analysis Report, EMKO pg 93)*], with combined segments equaling 34.1 linear feet. This represents only 0.05% of 67,500 total linear feet.

They were submitted to ACZ Laboratories in November 2019 to be tested for total metals, DI-WET metals, Static ABA and wet chemistry parameters.

METALS ANALYSES-BARREN ROCK CRUSHED CORES-ACZ Laboratories

Samples submitted for metals testing with identifiers can be found in Table 4-9 Barren Rock Crushed Core Samples: Total Metals Results in *Groundwater Hydrology and Water Quality Analysis Report, EMKO pp 101-102*.

**Ind 634-94**

Regarding the barren rock crushed core metals analyses, only 5 cores were tested which means that only 26% of the 19 total cores were sampled [1 sample from B-18-02, 3 samples from I-18-10, 1 sample from I-18-11, 2 samples from I-18-12 and 40 samples from I-19-13 (*Groundwater Hydrology and Water Quality Analysis Report, EMKO pp 101-102*)]. All five core segments combined length equal a total of 456.5 linear ft. These combined 10 ft segments represent only 0.68% submitted for testing compared to total of 67,500 ft. In general, each sample represents 10 linear feet. The diameter of the cores is not given. It is not stated how much material, weight wise or volume, is contained in each segment or specifically how that material is "homogenized" to obtain a representative sample for testing.

After assay at ALS Laboratories, the samples were labelled as "Pulp-2, Tailings= (assay pulp)". These 47 samples were then analyzed by ACZ Laboratories for total metals. The final weight used in metals analysis is 1-2 grams of material per sample.

**Ind 634-95**

The reference for this "Crush and Pulverize" step is EPA 600/2-78-054 3.1.3 (Field and Laboratory Methods Applicable to Overburdens and Minesoils, March 1978 pp. 43-45). The Foreword states "This report provides chemical, physical, mineralogical, and microbiological procedures for the analysis of coal overburdens and the resultant minesoils. These step-by-step methods identify and measure rock and soil properties that influence advance planning, mining efficiency, post-mining land and water quality and long-range land use."

Procedure (3.1.3):

1. Pour field sample onto a large square of brown paper. Spread material evenly and allow to air dry. NOTE: Sample may have to be mixed periodically to speed drying.
2. After drying, the field sample is split into two representative subsamples. One subsample is placed in a container, labeled, and stored for physical analyses or individual preference tests.
3. The other subsample is placed between two sheets of brown paper and crushed by moderately rolling over the top sheet with a rolling pin. This process is continued until the entire field sample has been processed. NOTE: Do not allow paper fragments to become incorporated with the soil sample. Do not crush rock fragments.
4. Pass the crushed material through a sieve with 19 mm openings and discard material retained on the sieve.
5. All material passing the 19 mm sieve is crushed to pass through a sieve with 6.35 mm openings.
6. Place sieved sample in a 1 liter container and cover. NOTE: Container should not be more than two-thirds full or mixing (step 7) will be impaired.
7. Tumble container end-over-end until material is thoroughly mixed.
8. Place three heaping teaspoons of the mixed material in the pulverizer. Material is pulverized until it passes a 0.25 mm (60 mesh) sieve. NOTE: A cast iron mortar and pestle can be substituted for the pulverizer.
9. Place pulverized material in a plastic vial for laboratory use.
10. Label vial with the sample identification shown on the field container.
11. Mix sample thoroughly by tumbling the vial end-over-end before subsampling for laboratory procedures (primarily chemical analyses).

After a sample is obtained, according to test method, M3050B (SW-846) Acid Digestion of Sediments, Sludges and Soils, a 1 gram (dry weight) of sample is digested for ICP-MS metals analyses testing. The digestate is then diluted to a final 100 ml volume. Flow injection volumes generally range from 20µl-200µl (microlilter) from the 100 ml prepared volume. A µl (microliter) is equal to 0.001 milliliter(ml) or 1/1000$^{th}$ of ml. Analyses dilution factors range from 1 to 500. For reference: There are 1 million grams in a metric tonne.

All metals were digested using EPA Method 3050B. The results should be defined as the "Total acid soluble/recoverable metals" fraction since this method does not use hydrofluoric acid, thus it is unable to break down silicates. (EPA SW-846 Revision VI December 2018, Chapter 3, pg 4)

ACZ Laboratories did receive "pulp" samples, residual material after ALS gold assay analyses. "In addition to the barren rock samples, Rise provided 48 crushed core samples, taken from ~2 mm assay rejects, for trace element test work." (*Groundwater Hydrology and Water Quality Analysis Report, EMKO, pg 95*) The actual number of samples was 47.

The barren rock samples must be pulverized prior to acid digestion just as the 47 "pulp" samples were pulverized prior to analysis for metal analyses. Any conclusions comparing metals content, leachate capacity, ABA, etc. between pulp results and barren rock results is moot since the sample preparation (pulverization) is identical.

**Ind 634-96**

TESTING TIMELINES

3

After exploratory drilling, cores were sent to ALS Laboratories which were received on 02.20.2019. Date finalized 03.05.2019. "The cores were sawed in half in zones of interest and sent to ALS in Reno, Nevada to be assayed. ALS Laboratories crushed and homogenized the sample to ~2 mm size, split a 1 kg sample, pulverized the split sample, and assayed a split of the pulverized sample." (*Groundwater Hydrology and Water Quality Analysis Report* pg 93)

Then the composite sample was prepared and sent to McClelland Labs for flotation testing from July 2019- November 2019. Samples F1-F4 were then sent to ACZ Laboratories for metals testing, DI Wet testing, ABA and wet chemistry parameters. The Flotation Results Report from McClelland Labs was not submitted to Rise until January 29, 2020.

Also in November, 2019, the 47 crushed core samples were sent to ACZ for metals testing along with the six barren rock samples to be tested for metals, DI WET metals, ABA and wet chemistry parameters.

It is difficult to understand how the composite sample was prepared and analyzed months before the individual samples (barren rock and barren rock crushed core) were submitted to ACZ in November 2019. The chains of custodies do not reflect the written account. Other than the out-going COC from McClelland to Benchmark Resources regarding F1-F4 samples, all sample shipments originate from Rise Grass Valley. The transitions between the various laboratories are not documented regarding dates, amounts, sample containers, etc.

SAMPLE POPULATIONS

FLOTATION COMPOSITE

"A total of seven buckets containing six separate samples were received from the Maryland Mine on July 10th, 2019. The samples weighed 4 to 47 kg, and appeared to be approximately 6 mm in size. The largest (flotation composite") was intended for analysis and metallurgical testing as well as environmental characterization of the testing products... The five remaining samples were indicated to be waste rock samples of various types for environmental characterization. Preparation and analysis of the waste rock samples will be discussed in a separate report." (*Appendices*: *Groundwater Hydrology and Water Quality Analysis Report: Appendix H, pg 2)*

**Ind 634-97**

"The rougher tailings from two selected tests were also subjected to environmental characterization (discussed in a separate report)." (*Appendices*: *Groundwater Hydrology and Water Quality Analysis Report: Appendix H, pg 4)*

The flotation composite arriving in a bucket is not a very specific provenance considering that these tailings will be used to determine heavy metal leachates. What material was in this bucket?

What is environmental characterization of the testing products? What is the environmental characterization of the waste rocks? Where is the separate report that describes the preparation and analysis of the waste rock and rougher tailings for "environmental characterization"? Is the environmental characterization part of the Cement Paste Backfill study?

4

BARREN ROCK SAMPLES

The three cores represent a 15.8% sample population when compared to 19 total cores. Samples MA-1(I-19-13), MS-1(I-19-13), MA-2 (I-19-13), MAA-1(I-19-13), S-1(I-18-11) and MA-3 (I-18-10) were each tested for barren rock total metals, barren rock leachate DI-WET, barren rock Static Acid-Based Accounting, and Wet Chemistry parameters. In addition, samples MA-1, MS-1 and MA-1 were assayed for gold determination.

BARREN ROCK CRUSHED CORE SAMPLES

Metals analyses for forty out of forty-seven representing 85% of the total rock core samples were from a single drill core, I-19-13, at various depths (167 ft bgs to 4774.6 ft bgs = 4607.6 total feet). These samples represent 6.8% sample population when compared to 67500 total linear feet. In addition, 25% of this core is missing between depths 3227.0-3583.0 = 356 ft, 3969.7-4313 = 343.3 ft and 4323.0-4767.9 = 444.9 ft. These missing sections total 1144.2 ft out of 4607.6 feet. The remaining 3463.4 feet represent a 5.1% sample population compared to the 67500 total linear feet.

CONCLUSION

**Ind 634-98** It is obvious that very limited sampling and testing has been done. Only one sample, B-18-02, was analyzed from the "Brunswick" area- metals analyses were performed on the barren rock crushed core sample. Rise plans to mine in this area immediately along with the installation of major infrastructure.

**Ind 634-99** There are egregious issues with the Chains of Custody regarding sample dates, locations and quantities. Samples from only 5 cores are represented out of 19 total cores. Eight five percent of total metals analyses (barren rock crushed cores) were performed on one core, I-19-13, while 67 % of barren rock total metals, leachate Di-WET testing, wet chemistry along with ABA testing were performed on this same core.

**Ind 634-100** There are inconsistencies and omissions within this limited sampling as well. For example, S-1 is taken from core I-18-11 at a depth of 4725.6'-4725.7'. This is a total of 0.1 feet or 1.2 inches. The diabase sample above it (Y973586) is taken at 4107.8-4117.55'. What is between these two samples with 608.05 feet missing? Where did the serpentinite layer begin? How deep is the serpentinite layer beneath since sampling stopped after 1.2 inches?

**Ind 634-101** Sample (Y973596) from core I-19-13 at 4767.9'-4772.7' is listed as MA in the Hydrology report but as Meta volcanic serpentinite on ALS COC. Sample (Y973597) from core I-19-13 taken from 4772.7'-4774.6' is serpentinite also. What is below this level where sampling stopped after 1.9 feet? This is known serpentinite containing asbestos.

QUALITY CONTROL ISSUES

**Ind 634-102** Regarding static acid-base-accounting, page 510 of the *Appendices: Groundwater Hydrology and Water Quality* states that the following parameters are not offered for certification or are not covered by NELAC certificate #ACZ:

| | |
|---|---|
| Neutralization Potential as CaCO3 | M600/2-78-054 NV Modified Sobek Procedure |
| pH, Saturated Paste | EPA 600/2-78-054 section 3.2.2 |
| Sulfur HCl Extractable | M600/2-78-054 3.2.4 & 3.2.6 Modified Sobek Procedure |

5

| | |
|---|---|
| Sulfur HNO3 Extractable Procedure | M600/2-78-054 3.2.4 & 3.2.6 Modified Sobek |
| Sulfur Hot H2o Extractable Procedure | M600/2-78-054 3.2.4 & 3.2.6 Modified Sobek |
| Sulfur Residual Procedure | M600/2-78-054 3.2.4 & 3.2.6 Modified Sobek |
| Sulfur Total Procedure | M600/2-78-054 3.2.4 & 3.2.6 Modified Sobek |

Lack of certification impacts validity of acid-base-accounting results for all samples: MA-1, MA-2, MA-3, MAA-1, MS-1, S-1, F-1, F-2, F-3 and F-4 (pp 495-504, Appendices: *Groundwater Hydrology and Water Quality Analysis Report*).

---

SILICA

Toxic air contaminants, silica and asbestos, will be produced daily in massive quantities. Silica content is assumed as 60% quoting a textbook definition of andesite rock composition. But 98% of the total rock mined is assumed to be meta-andesite. Regarding rock composition, meta-andesite rock is not just andesite....it has undergone metamorphosis becoming altered in composition. Johnston (1940) stated: "The degree of metamorphism may vary in this unit, such that parts of it have been referred to as amphibolite schist, porphyrite, diabase, and quartz porphyrite." (*The Gold Quartz Veins of Grass Valley, referenced in Groundwater Hydrology and Water Quality Analysis EMKO pg 9)*

**Ind 634-103**

500 tons of barren rock will be mined each day.

Mineralized ore rock, gold in quartz (100% silicon dioxide) veins, has not been accounted for in silica calculations.

1000 tons of ore rock will be mined each day.

Silica content was not tested on any samples even though the methods utilized, ICP-MS, can analyze for both Silicon (Si) and Silica ($SiO_2$) and more specifically can be performed by their contracted laboratory-ACZ Laboratories (*ACZ Analytical Capabilities 2017*).

What is the actual silica content of the barren rock and ore rock?

---

ASBESTOS

Forty-two samples were analyzed for asbestos: two blanks, 2 Centennial tailings and 38 drill core samples. The core samples were from 6 of 19 (32%) of total cores drilled by Rise: 9 samples from I-18-11, 1 sample from I-18-12, 9 samples from I-19-13, 7 samples from I-19-13A, 8 samples from I-19-14 and 4 samples from I-19-14A. The average overall length of the sample cores tested was 5.34 inches. Drilling was stopped when asbestos was detected. Drill logs are not available, therefore unable to determine depth or width of serpentinite deposit encountered. Asbestos sampling was limited. Centennial tailings were only identified by grid number-no information as to quantity, location, depth, etc.

**Ind 634-104**

Rise states that 1% of material mined each day will be serpentinite (*Groundwater Hydrology and Water Quality Analysis Report*, pg 93). Yet all of the geological maps located in the *Technical Report for the Idaho-Maryland Mine Project* show the quartz veins running with the

6

contact points of the faults along the serpentinite deposit (AMEC 2017 pp 7-17, 7-23, 9-9, 9-11, 9-26).

The *Air Quality and Greenhouse Gas Emissions Analysis Technical Report: Earthwork and Material Handling Fugitive Dust: Construction Activity Fugitive Dust* Nov 2021 pg 300 states that the serpentinite concentration of Mine Fill will be 14.3%. How can the mine fill concentration be seven parts serpentinite when it comprises only 1 % of material mined?

"Exploration drilling was designed to test a variety of mineralization throughout the deposit in areas where mining is expected to occur." (pg 93, Hydrology Report) "Rise selected mineralized samples for metallurgical testwork by reviewing drill logs and maps. Samples were selected to represented (sic) materials representative of future mining. Factors considered in selection were gold grades, minimum mining widths, mineralization style, and locations throughout the potential mining areas." (pg. 95 Hydrology Report)

CONCLUSIONS

**Ind 634-105** How can the actual ratios of rock mined be known based on this work? This information is necessary to determine emissions of toxic air contaminants such as heavy metals, silica and asbestos.

**Ind 634-106** Why wasn't more testing done on the Brunswick area since mining is anticipated to begin there immediately along with the installation of major infrastructure?

**Ind 634-107** How can the data from this limited sampling be extrapolated to 2585 acres being mined to unknown depths for the next 80 years?

Thank you,

## INDIVIDUAL LETTER 634: PAM HEARD

### Responses to Comments Ind 634-1 through Ind 634-35

These comments are a duplicate copy of content in Group Letter 7. Please see Responses to Comments Grp 7-103 through Grp 7-137.

### Responses to Comments Ind 634-36 through Ind 634-52

These comments are a duplicate copy of content in Group Letter 7. Please see Responses to Comments Grp 7-138 through Grp 7-154.

### Response to Comment Ind 634-53

The commentor asks whether all TACs from diesel fuel consumption have been included beyond just the DPM emissions. The commenter also noted that diesel fuel is comprised of various toxic air contaminants. As stated in Appendix D of the OEHHA 2015 Air Toxics Hot Spots Program Risk Assessment Guidelines, the surrogate for whole diesel exhaust is diesel PM. $PM_{10}$ (particulate matter, ten microns or less in size) is the basis for the risk calculations. The health risk assessment calculates health risk from diesel exhaust emissions based on estimated $PM_{10}$ diesel particulate emissions. Therefore, based on OEHHA unit risk factors and guidelines, the health risk assessment conducted for the project accounts for all toxic air contaminants present in diesel exhaust. The cancer and chronic risk from exposure to project-generated construction and operational TAC emissions is adequately addressed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy), Impact 4.3-2, of the DEIR. The DEIR included an HRA (see Appendix E.1 of the DEIR) to estimate the Maximum Individual Cancer Risk, Chronic Hazard Index, and Acute Hazard Index for residential receptors as a result of project emissions from the diesel trucks and offroad equipment; diesel-fueled generators; benzene, toluene, and xylene working and breathing loss emissions from the diesel fuel storage tank; underground blasting; ore processing; earthwork and material handling; and truck idling emissions. The HRA assessed the health risk from TAC emissions from project construction and operation and concluded that the cancer risk would be less than significant with implementation of mitigation. Furthermore, the chronic and acute risk are considered less than significant.

### Response to Comment Ind 634-54

The comment notes that hexavalent chromium is found in the detonation of explosives and in Portland cement. As noted on page 4.8-47 of the DEIR, hexavalent chromium is present in cement in small quantities and usually at a concentration of about 40 ppm. Hexavalent chromium is a toxic air contaminant included in the OEHHA Air Toxics Hot Spots Program. Hexavalent chromium emissions from the project were estimated from blasting emissions underground and was included in the HRA.

### Response to Comment Ind 634-55

The commenter notes that further testing of the cement paste backfill formulation is required before it will be placed in the underground mine, including locating a cement supplier with low hexavalent chromium content, leachate testing and strength testing. A cement processing plant is not proposed for the project. Cement will be delivered to the Brunswick site and loaded into a silo adjacent to the processing plant. This cement then will be mixed with partially dewatered tailings in the paste backfill plant, inside the process plant, to create cemented paste backfill. The processing plant utilizes filtration baghouses for dust control as disclosed on page 295 of Appendix E.1.

The comment asks how the amount of hexavalent chromium can be estimated when a supplier or known composition of the cement is not known. CEQA requires a good faith effort to estimate emissions from the project during construction and operation. It is common that details such as particular suppliers or vendors for a project are unknown during the drafting of documents in support of CEQA. As such, estimation of emissions during the construction and operation of the project are based on project-specific information and industry-standard emission factors. However, as discussed in Response to Comment Ind 634-59 of the Miscellaneous Pursuits Letter, when accounting for the additional hexavalent chromium, no changes to significance thresholds would occur. Additionally, Mitigation Measure 4.8-1(d) requires the mine operator to submit a Report of Waste Discharge to the Central Valley Regional Water Quality Control Board, to ensure that the selected cement paste backfill formulation meets water quality standards. In response to the commenter's question, the requirement to submit a RoWD and obtain WDRs from the CVRWQCB will ensure that the level of hexavalent chromium will meet applicable standards. Please see Master Response 21 - Conservatism of Silica Assumptions.

## Response to Comment Ind 634-56

The commenter asks what type of ventilation will be used in the cement processing plant, and then asks how the DEIR can estimate the amount of hexavalent chromium when the supplier and composition of cement regarding hexavalent chromium and silica is unknown. A cement processing plant is not proposed for the project, so this would not be a source for Hexavalent chromium emissions. Cement will be delivered to the Brunswick site and loaded into a silo adjacent to the processing plant. This cement then will be mixed with partially dewatered tailings in the paste backfill plant, inside the process plant, to create cemented paste backfill. The processing plant utilizes filtration baghouses for dust control as disclosed on page 295 of Appendix E.1. Please refer to Response to Comment Ind 634-59 of the Miscellaneous Pursuits Letter for a complete response on Hexavalent Chromium.

## Response to Comment Ind 634-57

The commenter further asks how the DEIR can estimate the amount of hexavalent chromium when the supplier and composition of cement regarding hexavalent chromium and silica is unknown. Please refer to Responses to Comments Ind 634-55 and Ind 634-59 of the Miscellaneous Pursuits Letter for a complete response on Hexavalent Chromium.

## Response to Comment Ind 634-58

The commenter asks whether the use of explosives would cause increased Radon levels in the community and how the County would monitor Radon levels at the mine and throughout the community. The project does not have any potential to increase levels of radon present in homes near the project site and therefore no analysis of radon related impacts is required. Radon is not considered a toxic air contaminant by the OEHHA or CARB and does not have an associated reference exposure level. Please see Response to Comment Grp 8-15.

## Response to Comment Ind 634-59

The commenter asserts that air emissions related to hexavalent chromium and radon are not analyzed in the DEIR. Hexavalent chromium is a toxic air contaminant included in the OEHHA Air Toxics Hot Spots Program. Dust emissions from cement loading of the storage silo is estimated at 8.5E-3 pounds per day (3.86 grams per day) as shown on page 295 of Appendix E.1. As noted on page 4.8-47 of the DEIR, hexavalent chromium is present in cement in small quantities and usually is at a concentration of about 40 ppm in typical cement. Dudek prepared a memo which is attached to the Final EIR as Appendix R to clarify that hexavalent chromium content in cement does not present a risk to public health. Hexavalent chromium was evaluated by Dudek consistent

with the methodologies presented in the DEIR. Based on the quantity of dust emissions from cement loading and an assumption of 40 ppm hexavalent chromium content in cement, total air emissions of hexavalent chromium would be approximately 154 micrograms per day. There would be no change to the cancer impacts. The mitigated chronic non-cancer health risk would not change from the results in the DEIR. The mitigated acute non-cancer health impacts would increase from 0.004 in the DEIR to 0.1; however, this would remain well below the NSAQMD significance threshold of 1.0. As such, there would be no change to impact determination in the DEIR.

The project could not have any effect on radon present in homes near the project and therefore no analysis of radon related impacts is required. The commenter does not provide any evidence indicating that there is any potential for the project to result in Radon exposure. Please see Response to Comment Grp 8-15. Radon is not a toxic air containment in the Hot Spots Program, as such no reference exposure level is available to evaluate the health risk associated with radon.

## Response to Comment Ind 634-60

As discussed on page 4.8-48 of the DEIR:

> Nevertheless, it is only during the mining phase that $Cr^{+6}$ could have any potential to leach from CPB, because that is when there would be air (oxygen) in the mine workings ($Cr^{+6}$ can only form under oxidizing conditions). Once the mine re-floods, reducing conditions (very low dissolved oxygen levels creating a negative oxidation reduction potential) would return in the mine workings, which would prevent any leaching of $Cr^{+6}$. However, during mining, if there were any $Cr^{+6}$ in the water within underground workings due to groundwater inflow, it would be reduced to $Cr^{+3}$ (due to low oxygen levels in the water), which is relatively immobile in water and has a much lower impact on water quality than $Cr^{+6}$.[24] Once the water was pumped from the mine any $Cr^{+3}$ would generally precipitate out of the water in the pond or be removed by the physical filtration unit in the WTP.

In addition, as discussed above, Mitigation Measure 4.8-1(d) requires the mine operator to submit a Report of Waste Discharge (RoWD) to the Central Valley Regional Water Quality Control Board, to ensure that the selected cement paste backfill formulation meets water quality standards. The requirement to submit a RoWD and obtain WDRs from the CVRWQCB will ensure that the level of hexavalent chromium will meet applicable standards.

## Response to Comment Ind 634-61

The commenter asks whether the project would have water quality impacts related to Ammonium Nitrate Fuel Oil (ANFO). As discussed on page 4.8-48 of the DEIR, the primary residual components of the ammonium nitrate-fuel oil (ANFO) used for blasting, ammonia and nitrate, are very soluble and mobile in water. This means that any blasting residuals would be continually removed from the mine over time through the dewatering system. The proposed WTP is designed to treat ammonia and other blasting residuals that might occur due to incomplete detonation. Thus, when the mine is allowed to flood again following the completion of mining, there is no reasonable potential that residuals from former blasting activities would cause a violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.

## Response to Comment Ind 634-62

The commenter asks whether the project will result in impacts due to asbestos in water and asks how the water will be treated to remove asbestos. Water treatment at the project site will be conducted by removal of solids from water. The sumps or tanks used underground to collect water

are designed to remove the majority of solids from the water. The water would then be pumped to main underground sumps located on various levels, then to the surface water treatment pond. Solids would be removed from water at all these stages. Under the requirements of Order R5-2022-0006 the final discharge must have less than 10 ppm total suspended solids (Average monthly) and 7 MFL (millions fibers per liter) asbestos in water.

## Response to Comment Ind 634-63

Please see Responses to Comments Ind 634-61 and Ind 634-62.

## Response to Comment Ind 634-64

The commenter asks what dust stabilizers will be used and in what quantities, and generally asks what impacts could result to wildlife, fire risk, and groundwater/surface water. Please see Master Response 12 – Chemical Dust Stabilizers. The chemical stabilizers would be non-toxic, non-flammable and would therefore not result in impacts to wildlife, fire risk or groundwater/surface water.

## Response to Comment Ind 634-65

The commenter asks how dust suppression can be monitored in the dark. Dust generation from hauling and dumping of engineered fill during nighttime are limited to vehicle traffic on unpaved access roads and material handling of the truck drop onsite. As stated on page 38 of Appendix E.1, unpaved roads shall be treated with chemical stabilizers in order to control fugitive dust. This treatment is only done every few weeks[6] and therefore it is unlikely that it would be applied in the dark. Any dust control used on materials dropped by the truck at night would be from water sprays and does not require sunlight. Any air monitoring devices that are in place during operations would not require sunlight to function.

## Response to Comment Ind 634-66

The commenter asks what the aesthetic, noise, wildlife and pollutant stream direction impacts would be from installation of wind barriers. Wind barriers are one of several possible methods for dust control of inactive disturbed surface areas and storage piles that will remain inactive for more than seven days under the Asbestos Dust Mitigation Plan (ADMP). (see Page 2-19 of the DEIR.) The details of the ADMP will be determined during the submission and approval process with the Northern Sierra Air Management District. Only one of these methods is required and wind barriers may not be proposed in the ADMP. The commenter does not provide any evidence that wind barriers, if required by the NSAQMD as part of the ADMP, would have the potential to cause any significant impact, and there is no evidence that such impact could result. As such, the analysis of aesthetics, noise, wildlife, and pollutant stream impacts for wind barriers would be speculative and is not required under CEQA.

## Response to Comment Ind 634-67

The commenter asserts that the DEIR does not mention the fact that fencing will be installed around the Centennial Site, and asks what impacts will occur to wildlife due to fencing on both project sites. As stated on page 3-42 of the DEIR, all access locations at the project sites are gated and secured. Additional fencing around the aboveground facilities may be installed as part of the proposed project, if deemed necessary for security and safety. Additionally, private security services would be provided by the Project Applicant. Generally, this fencing would be along the Brunswick and E. Bennett Roads to discourage trespassers and around the paved areas of the main site where the mine entrances and facilities are located. Animals would be excluded from the operational areas of the site, but no barricades prevent them from using the undeveloped

[6] See Table 11.1 of NIOSH Dust Control Handbook 2nd edition

areas of the site, including the South Fork Wolf Creek and the forest and meadows remaining on the property.

Proposed fences have been included in renderings prepared for the aesthetics report (Appendix D of the DEIR). Therefore, the aesthetics impact of the fencing has been evaluated.

## Response to Comment Ind 634-68

Please see Master Response 10 - Explosives, Reagents, and Brunswick Fill.

## Response to Comment Ind 634-69

AERO MAXGOLD 900 and AERO 407 are not proposed to be used by the project.

## Response to Comment Ind 634-70

Please see Master Response 10 - Explosives, Reagents, and Brunswick Fill.

CuSO4, PAX, Aero 208, Aerofroth 65, and Soda Ash are not proposed to be used in mineral processing. Regarding the latter, pages 4.7-28 and -29 of the DEIR are hereby revised for clarification purposes, as follows:

> The warehouse building would include storage of common reagents, such as collectors, promoters, frothers, and flocculants, all of which would be used in the gold recovery process conducted in the process plant. These reagents are needed in the gold recovery process to provide a more environmentally friendly alternative to cyanide, which will not be used. According to the Hazardous Material Inventory Statement for the Brunswick Industrial Site, common names of the proposed reagent chemicals include Aerophine, Methyl Isobutyl Carbinol (MIBC), and Magnafloc 10~~, and Soda Ash~~. Aerophine is known as a promoter or collector, used in flotation to increase the floatability of minerals in order to effect their separation from the undesirable mineral fraction. Flotation is an industrial process for selectively separating valuable minerals from non-valuable minerals. The applicant has selected Aerophine over xanthates as the latter can generate carbon disulfide upon decomposition, which is known to be a highly toxic and flammable compound with potential risks to the health and the environment. Magnafloc 10 is known as a flocculant, which help aggregate fine suspended particles to form larger flocs so that the solids can more easily be separated from the water. Magnafloc 10 is not expected to bioaccumulate in organisms, its chemical family (polyacrylamide) is relatively non-toxic, and it is not readily biodegradable into more environmentally problematic chemicals.[16] MIBC is a frother used to create foam to facilitate froth flotation of gold minerals in the gold recovery process. Based on available data, MIBC has a low bioaccumulation potential and exhibits low toxicity to aquatic organisms.[17] ~~Soda Ash is used in gold flotation to control alkalinity.~~ These reagents have various properties, some of which are described above. Whereas some are flammable (e.g., MIBC), others are not ~~(e.g., Soda Ash)~~. The reagents would be removed from the concentrate and sand tailings during the dewatering stage conducted in the process plant using filter presses. All reagents have specific storage requirements that would need to be met on-site, as verified by the Fire Marshall's Office prior to commencement of operations.

The above minor changes are for clarification purposes and do not alter the conclusions of the DEIR.

## Response to Comment Ind 634-71

The flammability of reagents to be used in mineral processing is generally discussed in pages 4.7-28 and -29 of the DEIR.

## Response to Comment Ind 634-72

Evacuation routes are adequately assessed in Chapter 4.13, Wildfire, of the DEIR, in particular, Impact 4.13-1. Performing mock scenarios for community preparedness is beyond the scope of the EIR and not required pursuant to CEQA.

## Response to Comment Ind 634-73

The comment does not address the adequacy of the DEIR, but notes that Grass Valley Air Attack Base and Grass Valley Emergency Command Center are both located at the Nevada County Air Park, in a Very High Fire Hazard Severity Zone. The commenter's concern is unclear. The proposed project would not impact the Air Park.

## Response to Comment Ind 634-74

The comment does not address the adequacy of the DEIR but has been forwarded to the decisionmakers for their considerations. Please see Master Response 1.

## Response to Comment Ind 634-75

The Nevada County Emergency Operation Plan – Annex B – Mass Evacuations does not include incidents of fires caused by accidents related to Rise operations or any other project. As stated in Annex B, the purpose of the plan is to establish County, City and other agency responsibilities and concept of operation for support of a mass vehicular evacuation moving within or through the County that has been caused by a disaster or incident occurring outside of Nevada County.

https://www.nevadacountyca.gov/DocumentCenter/View/15704/Annex-B---Mass-Evacuation-PDF

The commenter's other statements in this comment do not relate to the adequacy of the DEIR. Comment noted.

## Response to Comment Ind 634-76

The commenter states that an isolated fire burning on the Brunswick site has the potential to ignite numerous flammable materials releasing hazardous pollutants which could then be transported by prevailing winds into Grass Valley and environs. The commenter does not identify these "flammable materials." As stated on page 4.13-20 of the DEIR:

> The County Fire Marshall's Office has indicated that a comprehensive vegetation management plan will be necessary for the Centennial and Brunswick Industrial Sites. Once approved, the plan shall be adhered to, in perpetuity with the project. While the applicant has prepared an FPP to address, among other things, the long-term on-site management of fuels, initial construction activities and the use of heavy equipment on-site for vegetation removal could exacerbate wildfire risk. The vegetation management plan component shall be inclusive of both the Centennial and Brunswick Industrial Sites, as well as construction and operational activities, and be reviewed and approved by the Fire Marshall's Office. According to the local fire agencies, including CAL FIRE, whose primary responsibility it is to provide wildland fire suppression for both Sites, ongoing implementation of a vegetation management plan would reduce wildfire risk at the Sites to a less-than-significant level.[9]

Mitigation Measure 4.13-2 of the DEIR requires ongoing implementation of a Vegetation Management Plan for the project and would reduce the project's potential impact to a less than significant level.

## Response to Comment Ind 634-77

The commenter asks what pollutants may enter the creeks should there be a fire on one or both of the project sites; however, the commenter does not provide any details as to what pollutants would enter the creek should a fire occur at the project site. The future effects of a fire, location of such a fire, or equipment or materials involved is speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As the impact of a fire is speculative, this impact need not be analyzed in an EIR. Nonetheless, the DEIR requires that the mine operator obtain coverage under the Industrial General Permit, prepare and implement a Stormwater Pollution Prevention Plan (SWPPP). Implementation of the SWPPP will ensure that pollution from industrial activities on the site, pre- and post-fire, would not impact surface waters.

## Response to Comment Ind 634-78

The project truck traffic accounts for only approximately 1% of typical traffic on Brunswick Road and would not affect an evacuation. Please see Master Response 5 – Evacuation Zones. If an evacuation were taking place on Brunswick Road, the project's trucks would be redirected along with other traffic on Brunswick Road or would be parked at either the Brunswick or Centennial sites. It is approximately 2.3 miles from the Brunswick site to Highway 49/20 along Brunswick Road, with an approximate 4-minute driving time. Therefore, it is only a short drive for the one or two project trucks to return to the site if requested to do so by local authorities.

## Response to Comment Ind 634-79

Brunswick Road is classified as a Minor Arterial Road in the Nevada County General Plan. See Table 4.1 of the Circulation Element. Minor Arterials are defined in the General Plan as roadways providing primary access from freeways and principal arterials to major origins and destinations (e.g., Brunswick Road and Donner Pass Road); https://www.nevadacountyca.gov/DocumentCenter/View/12576/Chapter-4-Circulation-2010-PDF

## Response to Comment Ind 634-80

The DEIR (page 4.12-89) analyzed loaded trucks on the downhill section of Brunswick Road, approaching the Loma Rica Drive signals during poor weather. This portion of Brunswick Road is already regularly used by heavy-duty haul trucks. As is currently the case, it is incumbent upon individual truck drivers to drive with caution during periods of inclement weather. Mitigation Measure 4.12-6(e) requires the applicant to install a sign just south of the crest of the grade, warning truck drivers of the transition in grade and presence of the downgrade Loma Rica Drive intersection.

## Response to Comment Ind 634-81

Truck traffic from the project would not interfere with the safe and efficient movement of people and goods. Please see Chapter 4.12 of the DEIR which discusses transportation and traffic issues.

## Response to Comment Ind 634-82

Two 12,000-gallon above ground diesel fuel tanks are proposed for the project as stated in the DEIR (e.g., Table 3-5, Table 3-9, page 4.13-24). The original application proposed a single large tank, but this was revised during the DEIR preparation.

## Response to Comment Ind 634-83

As stated in the Well Mitigation Plan (Appendix K.9), the applicant would pay for both the monthly fixed service charges and volumetric service charges. This reimbursement would be for the price of water incurred and would include any "drought surcharges" if NID billed such a surcharge to the property owner. A property owner would be subject to the same drought limitations imposed similar to any other NID customer.

The commenter states that the applicant should pay for water for any parcel connected to NID water supply for the life of the mine, even after the parcel is sold or annexed into the City of Grass Valley. The Well Mitigation Plan (Appendix K.9 of the DEIR) takes a conservative approach and presumes that an owner who decides to connect to the NID system has been impacted by and at the fault of the mining operation, even if no impact to groundwater well supply has occurred. As such, the Well Mitigation Plan was designed to be even more conservative than Nevada County General Plan Policy 17.12, which requires an impact as a prerequisite to the obligation to pay for water, which policy states "If it is determined that the operator is at fault, impacted owners shall be compensated by the operator." A new homeowner would not be impacted because the impact would have previously occurred, and the cost of purchasing water from NID for that new homeowner would be the same as buying any other home connected to NID's water supply. The provision of free water as a selling feature to a new buyer is not contemplated by the policy. If a property was annexed into the City of Grass Valley, it would be subject to the ordinances of the City, which allows water wells to only be used for irrigation purposes only (Grass Valley General Ordinance Section 13.16.020) and would therefore require a property owner to connect to the potable water supply and pay for their water use. As annexation of a home into the City would already require connection to NID water supply and purchase of NID water, continuation of payment for water by the applicant after annexation would be a windfall to the property owner rather than mitigation of an impact, and is not required by CEQA or County policy.

## Response to Comment Ind 634-84

The electricity use estimate includes 3 main ventilation fans, 2 booster ventilation fans, and 10 auxiliary ventilation fans. All fans would be located underground once the service shaft is constructed. There is only one emission source from the underground mine at the Brunswick shaft where mine ventilation air is exhausted. The ventilation fans distribute air throughout the mine workings and are not themselves emission sources in the HRA since the fans are powered by electricity, rather than diesel engines.

## Response to Comment Ind 634-85

The emergency generator emissions during a 24-hour power outage are shown in Table 4.3-25 on page 4.3-104 of the DEIR. Since the use of emergency generators is speculative and beyond the reasonable control of Rise Grass Valley, Inc., the emissions presented in Table 4.3-25 are for informational purposes only. Nonetheless, the Health Risk Assessment prepared for the DEIR assumed emergency generators operated for up to 100 hours per year, as stated on page 23 of the HRA (page 384 of Appendix E.1).

## Response to Comment Ind 634-86

As shown in Table 4.7-2 of the DEIR, insurance for explosives transport is regulated by 49 CFR 387, which specifies the minimum levels of financial responsibility for motor carriers.

## Response to Comment Ind 634-87

The timing of mining in areas above the 1000-foot level has not been estimated and will depend on exploration success, operational priorities and mining schedules. However, as shown on Sheet

15 of Appendix K.2, most of the known mineralization is greater than 1000 feet below ground surface (bgs).

## Response to Comment Ind 634-88

The commenter's concerns are addressed through Mitigation Measure 4.7-2(b) of the DEIR, which states:

> *4.7-2(b)* *If unidentified or suspected contaminated soil or groundwater evidenced by stained soil, noxious odors, or other factors, is encountered during site improvements, work shall stop in the area of potential contamination, and the type and extent of contamination shall be identified by a Registered Environmental Assessor (REA) or qualified professional. The REA or qualified professional shall prepare a report that includes, but is not limited to, activities performed for the assessment, summary of anticipated contaminants and contaminant concentrations, relevant Environmental Screening Levels for identified contaminants, whether the contaminants exceed Environmental Screening Levels, thus warranting remediation, and recommendations for appropriate handling and disposal. Site improvement activities shall not recommence within the contaminated areas until any necessary remediation identified in the report is complete. The report and verification of proper remediation and disposal shall be submitted to the Nevada County Planning Department for review and approval.*

## Response to Comment Ind 634-89

A Hazardous Materials Business Plan (HMBP) has not been submitted and is not required to be submitted for the CEQA process. Mitigation Measure 4.7-1(c) requires the HMBP to be submitted and approved by the County prior to the use or storage of hazardous materials or explosives on-site.

## Response to Comment Ind 634-90

The mitigation fee for the Nevada County Local Traffic Mitigation Fee (LTMF) is calculated through the preparation of a nexus study that is updated every five years and approved by the Nevada County Board of Supervisors.

The various traffic improvement mitigation fees do not consider project-specific traffic routes. These fees are designed to pay for planned roadway improvements throughout the County based on priorities and budgets presented in the nexus studies prepared for each fee program.

In regards to Brunswick Road, Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the project driveway and Brunswick Road.

The Regional Transportation Mitigation Fee (RTMF) development impact fees are collected by the County and deposited into the account specific to the RTMF, to help fund construction of the regional system of roads, streets, and highways needed to accommodate growth in western Nevada County. These fees are "sufficient" to fund the project's impacts to projects that are included in the RTMF. However, the intersection at Brunswick Road / SR 174, is currently not

included in the RTMF and therefore the project's impact to this intersection has been found to be significant and unavoidable despite the requirement to pay the project's fair share to the improvement of this intersection under Mitigation Measure 4.12-1(c).

**Ind 635-1** Dear Folks, who will be making a decision which will have tremendous impact on our health, our families' livelihood, our children's future, our environment and wildlife, our property value, and our overall quality of life...I don't envy you.

**Ind 635-2** This decision regarding the opening of the Idaho-Maryland mine is monumental in it's potentially negative impact on so much we hold dear. I cannot personally see EVEN ONE redeeming benefit to re-opening the mine. After reading everything I can find about the situation for the past few months, and watching videos regarding the impact of previous re-openings, I believe we have nothing to gain and everything to lose by allowing Rise Gold to invade our home and cause such devastating damage to us.

**Ind 635-3** Being the recipient of dishonest and misleading advertisements from Rise Gold, I imagine that they are not above Bribery to get what they want - Free access to our land without the need for due diligence, following the rules, keeping their empty promises, or having any regard for us or our land.

Thank you for listening to the many voices in Nevada County protesting this re-opening.

Sincerely,
Pam Kissler

## INDIVIDUAL LETTER 635: PAM KISSLER

### Response to Comment Ind 635-1

The comment does not address the adequacy of the DEIR, but expresses general concern regarding the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 635-2

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

### Response to Comment Ind 635-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 through 3. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 636**

SCIENCE IS CLEAR

Science is clear but Rise Gold's most recent mailing is anything but. Rather, it is an intentionally misleading attempt to skew the facts regarding the mine reopening.

Has the mine reopening been approved?
No, Nevada County has NOT just completed anything regarding approval of the mine reopening. The county Board of Supervisors has yet to conduct its first meeting to discuss the contents of the draft environmental study. They have not yet fully considered nor approved the contents of the study. No final determination has been made as to the accuracy of the scientific analysis, anticipated impacts, or adequacy of the proposed regulation of a reopened mine.

**Ind 636-1**

The DEIR (DRAFT Environmental Impact Report) has not laid to rest anything. Rather, the report enumerates 83 impacts, 32 of which are considered significant enough that they will require some measure of intervention so as to make them not as bad as they actually are anticipated to be. Some impacts are so severe, there is nothing that can be done, we will just have to live with them. We are being asked to accept a lower quality of life in Grass Valley.

**Ind 636-2**

None of these concerns have been "put to rest". There remains grave concerns about drained wells, spoiled aquifers, polluted water ways, destroyed habitats, dust, exhaust, noise, and airborne chemicals associated with the transportation of waste and by gold extraction. There is no confirmation that there will not be spills, seepage, accidents, oversight, or callous disregard of regulations or safety practices.

What is the DEIR?
The DEIR's only purpose is to lay out the ways in which the reopened mine will impact our environment and the possible ways some of these impacts could be dealt with. This report was compiled for and paid for by Rise Gold. It is important to note that this report was limited by and relied exclusively on information provided to the consulting firm by Rise Gold, and many of the conclusions reached in the report are based on assumptions and best case scenarios. The report does not guarantee in any way what will be the actual outcome. The fact remains, the mining industry is the single largest source of toxic waste and one of the most destructive industries in the country. Today's industrial mining involves the blasting, deep excavating, and crushing of acres of land and the use of huge quantities of toxic chemicals such as cyanide and sulfuric acid.

**Ind 636-3**

But what about the new jobs?
Rise Gold states we can expect 612 new jobs, 312 of which are directly related to the mine

**Ind 636-4**

operation. The other 300 are presumed to be increases in our current employment base, in response to the estimated 50 million new dollars being poured into our community. Two thirds of the 312 mine employees are to be current local residents. The remaining 104 employees, would be the top paid technical and managerial positions. Are any of these highly trained specialized employees already a part of our local community? Or will these positions more likely be outsourced? Will adding 104 new Grass Valley residents really induce a new local spending increase of $50M each year?

**Ind 636-5**

Do mine workers really earn $122,000 a year?
When Rise Gold says "average", they are including all salaries, including the top 1/3 salaried positions in the calculation of that average. This includes the CEO's anticipated very generous salary. Furthermore, Rise Gold's estimated worker earnings includes company-paid benefit costs that the employee never sees in their paycheck. The reality is an entry-level Miner can expect to earn an average total compensation (includes bonus and overtime pay) of $18.55/hour, based on a survey of typical existing salaries. An early career Miner earns $20.26, and an experienced Miner with 10-19 years of experience earns $27.56. (source: payscale.com). Truck drivers, janitors, front load operators, security staff, etc. will all be making the current going rate, with or without a mine.

**Ind 636-6**

Do we get to keep the gold? No, we don't. All of the gold and all of the profits will be leaving Grass Valley. The city of Grass Valley and Nevada County will not be receiving a piece of the gold pie. Any profits will go to the owners and shareholders of Rise Gold.

**Ind 636-7**

So what's in it for us?
That is a very good question. Grass Valley assumes all of the risks, and for what? It's a case of trading the family cow for a handful of magic beans. We would be risking so much for so very little; throwing away our beautiful quiet community, our neighbors, our scenery, our streams and rivers, our air quality, our water quality and habitat, our well paved traffic free streets, our peace and quiet, and our tax dollars for mitigation and reparation—24/7 for the next 80 years; for what?

Please let the Board of Supervisors know what you want for your community. email: BOS.PublicComment@co.nevada.ca.us

## INDIVIDUAL LETTER 636: PAM KISSLER

### Response to Comment Ind 636-1

The commenter expresses general concerns regarding the DEIR but does not identify specific issues. Thus, a detailed response is neither possible nor required. Please see Master Response 1. Quality of life concerns are outside the scope of CEQA – Please see Master Response 2.

### Response to Comment Ind 636-2

For concerns regarding well impacts, please see Master Responses 14 and 15; for concerns regarding polluted waterways, please see Master Response 35; for concerns regarding habitat loss, please see Chapter 4.4, Biological Resources; for concerns related to dust and airborne chemicals, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy; for concerns related to exhaust, please see the health risk assessment (DEIR Appendix E.1), the results of which are incorporated into Chapter 4.3; for concerns related to noise, please see Chapter 4.10, Noise and Vibration; and for concerns related to spills, please see Chapter 4.7, Hazards and Hazardous Materials.

### Response to Comment Ind 636-3

The DEIR evaluates the proposed project's consistency with applicable policies, regulations, and standards established at the federal, State, and local levels and incorporates analyses from the County's expert consultants, which includes independent third-party peer reviews of the technical reports provided by the applicant team. Where potential impacts are identified, the DEIR sets forth mitigation measures to reduce the severity level of the identified impacts to the extent feasible and discloses the level of impact that would occur subsequent to incorporation of mitigation. As such, the analysis within the DEIR is adequate and meets the requirements set forth by the CEQA Guidelines.

In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project. Because significant and unavoidable impacts have been identified in the DEIR, for which feasible mitigation measures cannot reduce the potential impact to a less-than-significant level, the County, should it decide to approve the proposed project, would be required to adopt a Statement of Overriding Considerations.

The commenter's generally noted concerns related to the proposed project are noted for the record and forwarded to the decisionmakers for their consideration. Please see Master Response 1.

### Response to Comment Ind 636-4

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

### Response to Comment Ind 636-5

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

## Response to Comment Ind 636-6

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

## Response to Comment Ind 636-7

The comment does not address the adequacy of the DEIR. Please see Response to Comment Ind 636-2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 637**

**From:** Pamela Biery <pamela@pamelab.com>
**Sent:** Wednesday, March 23, 2022 9:30 AM
**To:** Idaho MMEIR; Dan Miller; Heidi Hall; Ed Scofield; Hardy Bullock; susan.hoek@nevada.ca.us
**Subject:** MMEIR Comments

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Nevada County Planners and Board of Supervisors,

Please stop Rise Gold's Mine Idaho-Maryland mine proposal.

**Ind 637-1** 1. The re-opening of the Idaho-Maryland Mine would mean opening 360,000 gallons of toxic water which are now contained underground, possibly returning it to the local rivers and streams. No adequate plan is in place for the unquantified problems that may arise from this hazardous waste, which is now contained.

**Ind 637-2** 2. Having 24/7 heavy equipment moving the waste from one site to another on a route that passes 4 nursing homes and a hospital, as well as a planned commercial corridor.

**Ind 637-3** 3. Mining activity puts local homeowners at risk of losing water and immediately devalues their homes.

**Ind 637-4** 4. The company proposing the project is Canadian and is barred from mining in Canada currently due to ongoing litigation.

5. Grass Valley is on a pathway of supporting tourism and local business. This activity endangers millions in tourism income. This tourism income is local and benefits thousands of Nevada County residents.

These factors don't even account for the mine itself and other possible negative outcomes of ongoing operations.

**Ind 637-5** Please follow Canada's example: do not let Rise Gold mine in Nevada County.

Sincerely,

Pamela Biery
Grass Valley, CA

## INDIVIDUAL LETTER 637: PAMELA BIERY

### Response to Comment Ind 637-1

As discussed in Section 3.4.1.1 of Appendix K.2, the water in the mine contains only iron and manganese above state water quality guidelines. The proposed on-site water treatment plant has been designed to adequately treat iron and manganese to state standards. The water treatment plant will be permitted by the State prior to its approval and operation. For further detail, please see Mitigation Measure 4.8-1(a).

### Response to Comment Ind 637-2

The specific concern of the commenter is unclear. Nevertheless, the following response is offered. Health risks from diesel equipment, including haul trucks, is addressed in Chapter 4.3 of the DEIR. The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment specifically addresses health impacts to children. The commenter is referred to Master Response 18 – Air Quality Thresholds.

### Response to Comment Ind 637-3

The comment does not directly address the adequacy of the DEIR. Property value is outside the scope of CEQA. For groundwater concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 637-4

Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 637-5

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 through 3. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 638**

**From:** Pam Jung <pfjung65@gmail.com>
**Sent:** Saturday, March 19, 2022 10:04 AM
**To:** Idaho MMEIR

**Subject:** The Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 638-1**

Have you folks been paying attention to the comments in The Union? All against the mine (I think it might have been Jeff Kane who said a survey showed 80% at least say NO TO THE MINE ).
In light of this what more will it take for the Planning Commission and Board of Supes to shoot down this project once and for all. It's been a stupendous waste of time, as it's been before when this issue has surfaced.
Just say NO to reopening any mine now and in the future.
We'll save ourselves time, energy and tempers.
Pam Jung
Grass Valley
P.S. I've saved all the articles in The Union about this issue...so If anyone want me to wheelbarrow them into chambers, let me know.

**Subject:** Community input regarding Rise Gold Id-Md Mine DEIR

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To Matt Kelley, Senior Planner, the Planning Commission and Nevada County Board of Supervisors,

I have been a resident of Grass Valley for almost 24 years and love and appreciate the rural quality of our environment. We live off of You Bet Rd, near Hwy 174, and use Brunswick Rd as our main route to town. I have been working to grasp the big picture of the potential impact of the Rise Gold Mine on our community and want to share with you some thoughts based on my research.

**Ind 639-1**

I have reviewed the DEIR for Rise Gold's proposed reopening of Idaho-Maryland Mine. The fact of 83 negative impacts to our small rural community, only 32 of which have proposed mitigation, is unacceptable in itself, but the 'significant and unavoidable impacts' are enough to stop this project in its tracks now! We also have to keep in mind that this report was paid for by the mining operation and was based on their information, so it in no way can be presumed to be the final word nor represent the complete picture. Their claim that "The Science is Clear" is in itself not scientific! As a graduate of MIT with a background in science (and humanities), I take issue with such cavalier use of the term 'science.' This should raise a red flag for us from the start.

**Ind 639-2**

In particular, with regard to Aesthetics (4.1-2), there would be substantial damage to scenic resources and conflicts with several applicable zoning requirements (including building height limits, steepness of slopes, required set-backs, etc.). Section 4.1-4 lists cumulative long-term changes to the visual character of our community. If this operation were in the middle of a desert, instead of in the middle of our community, these issues might not be so pressing, but given our situation, this already makes it a non-starter. This would forever be 'the elephant in the room' that we would have to live around.

**Ind 639-3**

Traffic (4.12-1) would be significantly impacted on Brunswick Rd, a major road (not a 'minor arterial') in our community that I frequently use. Adding 100 roundtrips of trucks per day would totally change the character of this area. As stated above, inserting a major industrial operation in the midst of our rural town is inconsistent with the nature of our community.

**Ind 639-4**

Noise levels (4.10) have already proven to be unacceptable during the exploratory drilling. Despite whatever levels may be officially deemed 'acceptable,' they are not acceptable to the community. When this is put in the perspective of a 24/7 operation over 80 years, there can be no justification or benefit to the community to warrant this forfeiture of our basic right to peace and quiet. It is interesting to recall the story that most of us probably have heard, how the owners of Empire Mine only stopped their 24hr a day operation of the stamp mills for a period of 24 hours when their daughter got married on the grounds. This isn't the life we want to return to. This is our past, not our future. The toxic waste

from Empire Mine is still being dealt with, and there are areas where it is cordoned off, since it is still not safe to walk there.

**Ind 639-5** Given the challenges of climate change and the historic drought conditions in California, perhaps the most daunting question relates to water. The Hydrology report relied on very limited data, not taking into account outflow rates that were higher than reported and operating on the faulty assumption that there is no seasonal variation in groundwater levels. Over 300 wells could be immediately impacted, with the possibility of many more. Water is our most precious resource—*more so than gold!* We can't afford to squander it, threatening groundwater as well as creeks, aquifers and habitats. We can see how the failed San Juan Mine permanently damaged wells in the 1990's. Since the mineral rights extend over 2500 acres from 200' below the surface, there is no guarantee that wells throughout our area (over 1800 properties) might not also be affected. No matter how beautiful our home, without water it loses all value.

**Ind 639-6** Our air quality is already often poor. We shouldn't even be considering a project that has the potential to add even more toxic pollution from various sources. It would also create even more greenhouse gases (estimated at 13 metric tons/yr) that would completely undo our County Environmental Action Plan.

**Ind 639-7** Power consumption is projected to be 12% of the current NC usage, the equivalent of adding 5000 new homes to our area! We already struggle with power outages, and the increase use of fossil fuels would offset our plan to combat climate change.

**Ind 639-8** Despite their slick advertisements, we are not fooled. Rise Gold offers little to our community but asks so much from us. Mining creates the fewest jobs of any industry, especially downstream in the local community. If they get approval for this project and fail (as is in their history!), they could pull out and sell the rights to another company. In the past, they reportedly failed to report leakages of toxic material (https://s3.documentcloud.org/documents/3539874/Banks-Island-Gold-Charges-March-2017.pdf), or to clean up the site. See also https://www.canlii.org/en/bc/bcca/doc/2020/2020bcca299/2020bcca299.html?searchUrlHash=AAAAAQASImJlbmphbWlulG1vc3NtYW4iAAAAAAE&resultIndex=1 and https://www.bccourts.ca/jdb-txt/sc/20/01/2020BCSC0167.htm. We don't want to risk being left in this situation here. Rise Gold has demonstrated it is not a good-faith partner for a business that would transform our community in so many negative ways.

**Ind 639-9** To me, the big picture is: This is a toxic business that poses significant and unavoidable risks to our community. It creates many unmitigated impacts that we would be expected to bear. We are being asked to carry the risk, lower our standards, bend the rules, renege on our climate change efforts, forfeit the character of our community and the quality of our environment—but for what? Money from the endeavor would not stay here—and no amount of money could bring back what was lost in the process. Home values would inevitably drop, so we would actually lose revenue.

**Ind 639-10** How can our Planning Commission confidently make recommendations—and our Board of Supervisors make decisions— that will negatively affect literally every aspect of our community life 24/7 for the next 80 years? I urge you to reject this proposal, as it is inconsistent with our needs, values and the future we would like to create.

Thank you for your thoughtful consideration,
Pamela Whitman

## INDIVIDUAL LETTER 639: PAMELA WHITMAN

### Response to Comment Ind 639-1

The commenter states that the many impacts listed in the DEIR should be grounds to disapprove the project. The commenter also appears to suggest that the DEIR is biased because it was paid for by the Project Applicant and based on their information. The CEQA Guidelines allow a Project Applicant to prepare a DEIR as long as the lead agency, in this case Nevada County, independently reviews the DEIR. (14 CCR 10584(d)(3); (e).) Not only did the County independently peer review the information provided by the applicant, but the County hired Raney Planning and Management to prepare the DEIR. The commenter's opposition to the project is noted for decision makers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues. Responses to specific comments are provided below.

### Response to Comment Ind 639-2

The commenter is concerned about the project's adverse impacts to aesthetics. As stated on page 4.1-22 of the DEIR, the project would substantially degrade the existing visual character or quality of public views of the project sites or the site surroundings. Implementation of Mitigation Measure 4.1-2 would reduce the significant impact by requiring more dense plantings along the project frontages to screen project structures to the maximum extent feasible. However, given the proposed heights of the structures and the permanent alteration of the views, the impact would remain significant and unavoidable. As stated on page 4.1-29, long-term changes in visual character associated with the project in combination with cumulative development, is cumulatively considerable and significant and unavoidable.

### Response to Comment Ind 639-3

The commenter states that Brunswick Road would be significantly impacted by project-generated traffic and that Brunswick Road is a major road, not a "minor arterial." The DEIR identifies Brunswick Road as a minor arterial road. (DEIR, p. 4.13-15.) The commenter also states the project is inconsistent with the surrounding community. As stated on page 4.13-15 of the DEIR, according to the Table 4.1 of the Circulation Element of the Nevada County General Plan, Brunswick Road is considered a Minor Arterial. The DEIR found that all traffic-related impacts of the project would be less than significant after mitigation, with the exception of the impact to the intersection at Brunswick Road and State Route 174 (LOS impact) and Brunswick Road and Sutton Way (queueing impact), which would be significant and unavoidable. Regarding the project's consistency with the surrounding community, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 639-4

The DEIR appropriately focuses solely on the impacts of the Idaho-Maryland Mine Project and not prior exploratory drilling. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues. The commenter states that the project's noise-related impacts are unacceptable. The DEIR found that the installation of the potable water pipeline would produce a temporary significant and unavoidable impact. (DEIR, p. 4.10-30.) For all other noise-related impacts, the DEIR found that the project impacts would be less than significant, in some cases after implementation of mitigation measures identified in the DEIR. (DEIR, p. 4.10-31, 37, 59.) Lastly, the commenter states that a prior operator of the mine utilized stamp mills and produced toxic waste. The project does not propose to use stamp mills and the scope of the DEIR does not address actions by prior operators of the Idaho-Maryland Mine. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

## Response to Comment Ind 639-5

The commenter states that the DEIR's analysis of groundwater impacts is based on limited data and faulty assumptions, and that the DEIR underestimates the number of potentially impacted groundwater wells. The commenter also implies that the Project Applicant could expand operations within the mineral rights boundary and affect more groundwater wells. The commenter is referred to Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 639-6

The commenter is concerned that the project would adversely impact air quality. The commenter is referred to Master Response 18 - Air Quality Thresholds, Master Response 25 - Nevada County Energy Action Plan, and Master Response 27 - Greenhouse Gas Thresholds.

## Response to Comment Ind 639-7

The commenter is concerned about the project's energy consumption. The commenter is referred to Master Response 25 - Nevada County Energy Action Plan, and Master Response 27 - Greenhouse Gas Thresholds. As stated on page 4.11-35 of the DEIR, PG&E provided a will serve letter for the project and has confirmed that there are electric facilities available to serve the project in accordance with all applicable design standards, rules, and tariffs on file with the State of California Public Utilities Commission.

## Response to Comment Ind 639-8

The commenter states that jobs produced by the project would be of little value to the community and that the Project Applicant is not trustworthy based on past mining projects. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 2 - Social and Economic Impacts, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 639-9

The commenter is generally opposed to the project but does not discuss specific inadequacies with the DEIR. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 2 - Social and Economic Impacts, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 639-10

The commenter urges the County to not approve the project. The commenter's opposition to the project is noted for decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

**Ind 640-1**

I doubt that you, the Board of Supervisors will live another eighty years to witness the complete devastation of our beautiful community if you vote to reopen the mine. It is very evident that an overwhelming majority of the people do not want this to happen. Please vote in favor of the people! I personally would like the people to vote and not the Board of Supervisors. The Board has the power to make this change and you should consider doing it. It really is the right thing to do for such a serious matter.
Pat Henderson
Grass Valley

## INDIVIDUAL LETTER 640: PAT HENDERSON

### Response to Comment Ind 640-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition regarding the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 641**

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 641-1**

I own property quite near the Idaho Maryland Mine and am STRONGLY oppose to the reopening for a myriad of reasons, not the least of which is my water supply. I have already been negatively affected by the purposed project. During the exploratory drilling the deeded spring, which has served 4 homes for 90 years, went dry. My neighbors and myself had to scramble to drill wells at considerable personal cost. Of course there is no proof that the drilling is what caused the spring to go dry, but it happened co-incidentally with the action, and pursuing legal action is cost prohibitive. Although Rise Gold says they will supply water through NID if wells go dry. Are they planning on paying the monthly costs? I think not! There's also issues with noise, traffic on small roads and infrastructure, and housing for personnel. I feel it's a bad idea all around.

Please DO NOT give them a permit

Thank you, tax payer Patricia Bennett 11273 Lava Rock Ave. Grass Valley CA 530-366-5615

### Response to Comment Ind 641-1

For the commenter's well concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 642**

**From:** Patrick Johnson <patrickpuppet@gmail.com>
**Sent:** Saturday, April 2, 2022 8:03 PM
**To:** Idaho MMEIR; DEIRcomments@cea-nc.org
**Subject:** DEIR woefully inadequate and overly optimistic

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Nevada County Planning Commission,

**Ind 642-1** After reviewing the DEIR, I find it to be woefully inadequate and overly optimistic. The document underestimates the negative impacts that reopening the Idaho-Maryland Mine will have on our environment by not satisfactorily addressing the impacts that the mine will have on our air, water and soil quality—not to mention the mine's contribution to noise pollution.

Gold mining is a proud part of Grass Valley's history and heritage. However, one of the sad and enduring legacies of the local gold mining industry is environmental ruin. When mines operated for 24 hours a day, streams were polluted with waste-water runoff, forests were cleared for lumber, the air was blackened by the operation of industrial machines, and the deafening pounding of stamp mills could be heard for miles around.

**Ind 642-2** The DEIR has not convinced me that the Idaho-Maryland mine will not have a negative impact on our local environment.

Once Rise Gold Corp has extracted all the riches from the Idaho-Maryland Mine, they will pack up their carpetbags, head back to Canada, and leave our children and grandchildren with an environment in ruin. In this age of drought and wildfire, let's not add the consequences of mining to the list of environmental disasters that plague this region.

Thank you,
Patrick Johnson
Grass Valley resident

1

## INDIVIDUAL LETTER 642: PATRICK JOHNSON

### Response to Comment Ind 642-1

The commenter states that the DEIR is woefully inadequate but does not provide any specific evidence to support this claim, other than it does not satisfactorily address mine impacts to air, water, and soil quality, as well as noise. As discussed in Master Response 1, such general statements do not warrant specific responses under CEQA Guidelines. Please see the respective chapters of the DEIR for such concerns (4.3, 4.8, 4.7, 4.10).

### Response to Comment Ind 642-2

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Responses 1 through 3, and 16. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 643**

**I support re-opening the Idaho-Maryland Mine**

Dist 1

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

NO MINE! I DO NOT SUPPORT THIS

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 800 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Ind 643-1

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Email Address grijalva4000@yahoo.com

## INDIVIDUAL LETTER 643: PATTI GRIJALVA

### Response to Comment Ind 643-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 644**

I am writing in opposition to the reopening of the mine by Rise Gold and their mother company.

**Ind 644-1** Other than the obvious issues of excessive truck traffic laden with hazardous materials taken to be piled into mountains in the Brunswick area, and the need to widen Brunswick and E. Bennett streets to accommodate the traffic, with the added noise of diesel trucks and equipment pumping excessive exhaust pollution into the air near residential areas – there is the problem of water.

**Ind 644-2** Rise gold and affiliates will have to pump millions of gallons of water out of the shafts to clean in order to operate. This water, they contend, will be clean 'enough' to dispose of into Wolf creek where it will be used by home owners, businesses, farms and ranches for drinking, cooking, irrigation and bathing our babies. If this water is as safe as they suggest, then why is it not recycled for their own use as opposed to raping the needed water from our community. They want millions of gallons from us every day instead of recycling what they already have. We have been in a drought for many years. Commercial businesses in town and residents should be our priority over a corporation that boasts that they will be a boon to our community. That is a bare-face lie. As a commercial building owner on Mill St. I am very concerned over the longevity of our prosperous communities.

**Ind 644-3** The Idaho-Maryland mine closed in the mid 50's when 174 was still a dirt road with 49 a winding two-lane road. Population of Grass Valley was 2500 people with lake Olympia in Brunswick. Since then, the towns have grown up around it. It became a lumber mill for a great many years, with a mill also on E. Bennett. Brunswick basin grew into a commercial hub, Cedar Ridge enlarged along with Peardale, and then there is Whispering Pines adding to the commercial businesses. The former mine is now a small space locked inside a thriving community that has miles of shafts and tunnels beneath the surface that will certainly impact all with its fingers.

Perhaps 80 years of sucking us dry of Rise Gold and their affiliates enriching themselves at our expense is worth it? Roadway congested, vibrations from detonations, property values plummeting, wells drying up, businesses failing – reduction of our quality of life.

**Ind 644-4** In the 1800's, ghost towns have occurred when mines have dried up. Grass Valley and Nevada City have blossomed when the mine closed. Let's not turn us into a ghost town by reopening it.

Paul D Crovo

125 Mill St

13187 N Meadow View Dr

## INDIVIDUAL LETTER 644: PAUL CROVO

### Response to Comment Ind 644-1

The commenter's statement about the need to widen Brunswick Road and E. Bennet Road is not supported by the roadway segment analysis in the DEIR, which determined that widening is not required to accommodate project traffic (see Table 4.12-13 of the DEIR). Regarding transport of toxic waste, the commenter is referred to Master Response 8 – Mine Waste Characterization.

### Response to Comment Ind 644-2

Please see Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 644-3

The comment does not address the adequacy of the DEIR. Please see Master Response 1.

### Response to Comment Ind 644-4

The comment does not directly address the adequacy of the DEIR. For general concerns related to vibration, please see Chapter 4.10, Noise and Vibration; for general concerns regarding well impacts, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. Property value and quality of life concerns are outside the scope of CEQA – please see Master Responses 1 and 2.

**Individual Letter 645**

Subject: Definitions Correction - They Make a Difference to Idaho Maryland Mine Project EIR Draft

Dear Planning Dept. -

Please make the correction where noted in referenced draft EIR that the Nevada County Laura Rico Airport is not a SMALL Craft Airport! Perhaps that's a definition used at one time and in the out-of-date County general plan but not correct definition in the EIR ~~matter~~. draft.

**Ind 645-1**

The FAA has no reference to "Small Craft Airport" as stated in the mine's draft EIR. According to the FAA's airport definitions as easily found on their webpage, the Laura Rico Airport is defined as: General Aviation Airport: Basic. Please make note + correct within the draft.

Best Regards, Paul B Elias

**Ind 646-1**

Dear board of supervisors,
As a physician, I am opposed to anything that could pose a risk to the health and wellbeing of our community.
I realize that documents have been submitted that seem to suggest reopening the Idaho Maryland Mine would only be beneficial, this is simplistic reasoning motivated by the hope of profit.
Risking harm to our way of life and health by this huge industrial undertaking is not worth possible damage to our air and water quality or the tranquility we so enjoy.
Let future generations thank us for our good stewardship of our natural treasures instead of cursing us for being greedy.

Sincerely,

Paul G. McGrew
12481 Hillcrest Dr.
N.C., 95959

## INDIVIDUAL LETTER 646: PAUL MCGREW

### Response to Comment Ind 646-1

The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment specifically addresses health impacts to children. The commenter is referred to Master Response 18 – Air Quality Thresholds.

Regarding water quality concerns, please see Chapter 4.8, Hydrology and Water Quality. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 647**

Matt Kelley, Senior Planner
950 Maidu Ave, Suite 170
Nevada City, CA 95959

April 2, 2022

**Ind 647-1**

Table 2-1 Summary of Impacts and Mitigation Measures lists the concern:
4.3-4 Result in the inefficient or wasteful use of energy. This concern is addressed as mitigation measure -- none needed. How can this be?

Rise's own estimates of the amount of power and particularly electrical power is huge and undermines/conflicts with the State and County energy reduction plans. The ways that Rise suggests that energy can be conserved and not wasted is to mostly ride on the coattails of PG&E and other providers who are actively working to develop and use alternative sources such as solar, electrical, wind, and/or biomass. (section 4.3-4 pdf page 379) Rise's plan to not be *inefficient or wasteful* is to use massive amounts of electrical energy that is partly generated by these "green" sources.

Sadly, Rise projected use of electricity for a one-year construction period is 16,513,00 kWh (pdf 394). This wipes out the Nevada County effort that conserved 13,034,571 kWh in 10 years ending in 2019. The county plans to reduce energy demands won't be attained and instead because of Rise, usage will increase significantly.

**Ind 647-2**

Rise did find some very small ways to reduce the amount of energy, but it is less than significant compared to the amount they will use. The main strategy was to buy their way out with carbon offsets that doesn't deal with the huge increased need for electricity and the draw on the grid in this area.

Rise misses possible ways that align with the county energy plans. Looking at Table 4.3-22 Project Consistency with Nevada County Energy Action Plan Energy Reduction Measures; Goal 2; Renewable Energy – Expand the Utilization of Renewable Energy and Resilience Measures (4.3-89-90).

> The county goal Strategy 2.1: Prepare for the inclusion of renewable energy systems in new construction and large retrofit projects in-order-to meet California Zero Net Energy Goals by providing informational material when available.
> Project's role: Pertains to solar photovoltaic systems in all residential construction and large retrofit projects. County to implement the provision of informational materials. Not applicable to the project because the project consists of mining activity and industrial type development.

Why can't an industrial project that is constructing new buildings include renewable energy systems? Why does this type of construction with large buildings with large roof surfaces be used for to generate some solar power? What is missing in the DEIR is what ELSE Rise will do to

reduce its dependence on electricity. Rise isn't planning on installing solar panels on its steep sided hills, none are planned on the roof tops of the big buildings, parking won't be covered by roof top solar panels either (think Briar Patch).

The mining operations consume massive amounts of electrical energy. The data from the DEIR is briefly compared in the chart below.

For the purpose of comparison, the mWh unit (MegaWatt hours = 1000 kWh) used in the DEIR is converted to kWh (kilowatt hours)

| Phase | mWh units annually | kWh annually | Total kWh |
|---|---|---|---|
| Construction - 1 yr | 16,513 | 16,513,000 | 16,513,000 |
| Operations –79 yrs | 49,613 | 49,613,000 | 3,919,427,000 |
| | | Grand Total | 3,935,940,000 |

Source: page 4.3-88)

**Ind 647-3**

The County's Energy Action plan for unincorporated areas of the county (https://www.mynevadacounty.com/DocumentCenter/View/35183/Nevada-County-Energy-Action-Plan) from 2017 cited a combined usage of 344,045,975 kWh for residential, non-residential and combined county agencies. Rise would use more than 10 times as much electricity as the rest of the unincorporated county in one year. A letter to the Union dated July 2, 2021 compares the mine's energy use to adding 5,500 homes to the community. This huge demand conflicts with the EAP goal for 2035 of reducing the demand for electricity by 51% which is an energy savings of 202,936,611 kWh (pre-Rise additions).

**Table 4.3-23** is the Annual Estimated Green House Gas Emissions that PG&E supplied electricity generates given in Metric Tons (MT)

| Years | $CO_2$ | $CO_2e$ Gases equivalent to $CO_2$ |
|---|---|---|
| 2021-construction/dewatering | 1527.82 MT | 1542.97 MT |
| 2022-2032 | 4590.43 MT | 4635.82 MT |
| 2027-2032 | 4590.43 MT | 4635.82 MT |
| 2033-2102 | 4590.43 MT | 4635.82 MT |

.

This chart shows that indirectly the use of electricity isn't as "Green" as we'd like to think. It adds a significant amount of pollution / greenhouse gases into the atmosphere. It's not being generated at the mine but it is being produced for the mine. The mine DEIR doesn't include any mitigation that deal with the increase in pollution and its cumulative effect of GHGs from the electricity it will consume.

To review:

- The massive amounts of electrical energy required for mining operations is in conflict with the County's Energy Plan and energy reduction/conservation goal.
- The Mine's consumption will stress the capabilities of the electrical grid and cause large increases in pollution.
- The range of mitigations proposed are few and inadequate to address the reducing the use of "traditionally generated" electricity.

Respectfully,

Paul McMillan

Greenhorn Rd, Grass Valley

## INDIVIDUAL LETTER 647: PAUL MCMILLAN

### Response to Comment Ind 647-1

The commenter states that the project's energy consumption is wasteful and conflicts with State and/or County energy reduction plans. As stated on page 4.3-102 of the DEIR, implementation of the project in combination with other cumulative development would not result in the wasteful or inefficient use of energy. Please also see Response to Comment Agcy 8-17. Because the project would not conflict with a local plan to increase energy efficiency and reduce energy consumption, a less-than-significant impact would occur. The commenter is also referred to Master Response 25 – Nevada County Energy Action Plan.

### Response to Comment Ind 647-2

The commenter questions why solar energy was not proposed to mitigate energy consumption of the project and points to the Nevada County Energy Action Plan (EAP) reduction goals. Compliance of the project with EAP strategies has been analyzed in Table 4.3-22 in the DEIR and was determined to be consistent with the EAP. The commenter is also referred to Master Response 25 - Nevada County Energy Action Plan. Regarding a solar energy system, while solar panels are not currently proposed as part of the project, the roof space of the project buildings may be available in the future for installation of solar panels to reduce the project's reliance on the energy grid. However, any such solar power generation would be small in comparison to the requirements of the project. Notably, the GHG emissions presented in the DEIR are conservative, since California regulations will reduce GHG emissions overtime. For instance, Senate Bill 100 requires that zero carbon energy resources supply 100% of electric retail sales to customers by 2045. Neither this requirement, nor the progressive steps to achieve it (i.e., 44% of electricity by 2024, 52% by 2027, and 60% by 2030 be procured from renewable energy sources) were accounted for in the GHG analysis.

### Response to Comment Ind 647-3

This comment reiterates concerns regarding the project's energy consumption. The commenter is referred to Response to Comment Ind 647-2.

The project's air emissions and GHGs emissions are analyzed in Chapter 4.3 of the DEIR and are less than significant after mitigation. The commenter is also referred to Master Response 27 - Greenhouse Gas Thresholds.

As discussed on page 4.11-34 of the DEIR, the electrical grid system in the project area is well developed. A commercial sawmill that previously operated on the Brunswick Industrial Site was serviced by a dedicated 12kV PG&E power line. A high voltage power line also runs through the property west of the Brunswick shaft. Electricity for the project would be supplied by the existing 12kV PG&E line along Brunswick Road. The BRUNSWICK 1102 Circuit (Circuit), which would serve the project, has a rating of 13.26 MW. The project's total connected load is estimated at approximately 10 MW, with a net load of approximately 6 MW. As of the year 2021, the Circuit operates at 5.15 MW, or approximately 39 percent of the Circuit's maximum capacity. Based on PG&E's usage projections, the Circuit load is anticipated to drop to approximately 4.74 MW by the year 2025. Considering the project would generate an electric load of approximately 6 MW, and the Circuit currently provides 5.15 MW, the Circuit capacity would increase to 11.15 MW following implementation of the project. The increase in wattage associated with implementation of the project would remain within the Circuit's capacity of 13.26 MW and, thus, the Circuit would have available load capacity to accommodate the project.

**Individual Letter 648**

3-13-2022

**Attention: Nevada County Planning Department, Nevada County Planning Commission and Board of Supervisors**

Comments on the DEIR for the Proposal to Reopen the Idaho Maryland Mine

**Ind 648-1**

1. 4.10-1, 2, 3- From one section of the Noise and Vibration report (Pg 4-10-45) "It is conservatively concluded that the proposed project could result in a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or standards of other agencies, and the project's noise impacts could be significant." Seriously consider the setting and context as well. We are a rural community where noise levels are low in contrast to the constant background noise of traffic and urban activity in other cities and counties. Protecting and preserving the quality of our noise landscape is the right thing to do. The property is not currently zoned for heavy industrial mining operations. This is a General Plan designation made with community support and reflecting both community values, environmental integrity, and economic forethought.

**Ind 648-2**

2. The technical Reports reveal the energy requirements and the carbon footprint of the proposed Idaho Maryland Mine (IMM) enterprise are in conflict with the General Plan Energy Action Plan. The mine will require an energy increase equivalent to 12% of the current Nevada County energy load. In addition, it will require doubling the amount of energy currently used by the entire Nevada County commercial energy use. The document discounts the standing and relevancy of the Nevada County Energy Action Plan. Although implementation of the plan is in its infancy, the intent and goals are very clear. A project seeking an 80-year operating permit needs to fully address consistency with those goals and intent. At a minimum, a mitigation requiring an energy efficiency and carbon reduction plans revealing how Rise Gold intends to operate in the spirit of the Energy Action Plan.

**Ind 648-3**

3. The entire analysis of impacts to natural underground water systems lacks the data and analysis to accurately describe potential impacts to existing and future wells in the surrounding residential community. Changes in the natural underground water system resulting from massive dewatering need to be fully and accurately investigated. Projections need to be evaluated against industry know outcomes in similar mining operations to reveal the accuracy of these types of analysis. Similar gold mining enterprise in our county have dried and contaminated wells during the dewatering process. This is difficult to provide ongoing oversight without a clear long term funded plan for the 80-year permit. A plan that includes clearly defined oversight and periodic review and reporting. The plan should include methods, means, and clearly designated roles and responsibilities to monitor and mitigate conditions and damages to underground water sources for this part of the community. For instance, what are the first conclusive indicators of impacts to the natural underground water supply and what is

the action plan? Rise Gold needs to be required to provide a comprehensive plan and allow time for a peer review process to insure we understand the risks, indicators, and responses.

**Ind 648-4**

4. The DEIR fails to clearly outline strategy to mitigate dust and particulant pollution from the rock processing and transporting. Because of the risk associated with asbestos and other airborne hazards, manual wetting with water trucks and hoses is not good enough. A mitigation that describes an automated mechanical solution the trucks must go through and be washed and watered down before leaving the IMM or Centennial property is needed. In addition, for the rock processing, piling, and truck loading process, a system of overhead sprinklers or similar is needed to insure a constant level of quality throughout the enterprise. The DEIR must describe a mitigation plan that is more robust than providing on site water trucks and gravel pits for the trucks to drive through.

**Ind 648-5**

5. Policy related to view sheds, aesthetics, and community character in the General Plan are ignored. An example is the description of Brunswick Road as a minor arterial ignores the fact it is an entryway into the Brunswick basin and Nevada City. As an entryway it will continue to grow in importance and traffic volume. It represents for many guests to our community the first impression they will have and should not be dismissed because it does not have a scenic designation. We all know the cliché about how difficult it is to alter first impressions. A large part of our economy is derived from tourism, recreation activities, and the Arts. Protecting how we are perceived is critical to our long-term economic success. Over time the section of Highway 174 through Cedar Ridge into Grass Valley will see traffic levels flatten and Brunswick Road will become busier and busier. Caltrans investments and improvements to Highway 174 clearly show the importance of this route into our community and Brunswick Road should be recognized and protected from development that impacts its future success as an entryway and major arterial. This section of the traffic analysis and aesthetics impacts needs to be re-evaluated and reworked.

**Ind 648-6**

6. The DEIR analysis in each section is poorly organized and fails to describe or explain how proposed mitigation measures would reduce impacts to acceptable levels. The cumulative effect to our community of the negative impacts is poorly analyzed, dismissed, and ignored. Chapter 2, 2.5 Areas of Known Controversy includes 23 bullets to describe the breadth of the negative impacts the project carries with it. Mitigation Measures must be clear, feasible, and achievable. They must show how we can measure and determine the proposed mitigated outcome.

**Ind 648-7**

7. 3.0- "New underground workings would be below 500 feet from ground surface." What about existing workings that are less than 500 feet from the surface? Will these be properly filled and no longer used?

**Ind 648-8**

8. 4.1-1 "Have a substantial adverse effect on scenic vista" The analysis dismisses the height and massive rock infill that would be several stories high in the current IMM valley and rising above Brunswick Road. In addition to that are the multi-story buildings that require variances because they are more than double the acceptable height of buildings as defined in our General Plan and County regulation. How is this Less than Significant (LS) and how does Not Applicable answer to this Negative Impact? The next item in the table outlines a generic landscape plan that is proposed as a solution. This might be OK for a bank or a Wendy's, but it does not respond to the massive change to the viewshed or the extremely tall buildings.

**Ind 648-9**

9. 4.1-3 "Create a new source of substantial light and glare which would adversely affect day or night time views in the area." The DEIR designates this LS and mitigations as NA. Regardless of previous industrial activity at this location, decades have passed since their departure and the area is now predominantly residential. Introducing "substantial" new light and glare into the setting and dismissing the impact is unacceptable.

**Ind 648-10**

10. 4.3-1 Traffic controls on Highway 174 improvements resulted in 20-30 minutes waiting for the pilot vehicle. If you lived within the project area, one trip could add one hour to your travel time. There needs to be a specific traffic management plan that puts more on the contractor and impacts the traffic flow more efficiently for drivers. Scheduling construction delivery and future trucking to off hours is a good idea. What are the off hours and how is this enforced? The Construction Exhaust Minimization Plan needs to be revealed now as part of the DEIR or specific performance and enforcement standards brought forward. Elements of the plan should not be allowed to be ignored because its inconvenient, costly, or outside the critical path. The project must meet the Federal 8-hours ozone Standard and employ all feasible NOX mitigations to achieve satisfy NSAQMD thresholds. This needs to be spelled out in the EIR.

**Ind 648-11**

11. 4.3-2 The proposed Asbestos Dust Mitigation Plan should be detailed in the DEIR. This is a large part of the negative impacts the project will have on the neighborhood and the community. The generalized statements offered as mitigation measures are insufficient and potentially ineffective. Previous NSAQMD requirements for similar projects included paving in work areas and automated watering systems as opposed to water trucks and gravel drive through pits. The mitigation should include automated wheel washing technology for all vehicles operating on unpaved surfaces. A spray misting system may be required to subdue harmful dust from project operations. The EIR should describe and include as a mitigation available technology that removes harmful fibers from air exiting the mine. In addition, description of an asbestos monitoring program should be part of the EIR and subject to NSAQMD review.

**Ind 648-12**

12. I am concerned about adding significant flows to South Fork Wolf Creek. I was a Wolf Creek Alliance stream care volunteer and adding millions of gallons a day would increase erosion and downstream sedimentation. It would challenge wildlife populations that live in the stream zones. Determining the impacts are less than significant (LS) and mitigations are not needed (NA) is foolishness. Plans for special status species, wetland protections, erosion controls, culvert replacement and monitoring program needs to be spelled out in the EIR.

**Ind 648-13**

13. Given everything we know about Rise Gold's senior leadership and their history in British Columbia, what protections do we have that they will honor agreements and perform professionally. Does Nevada County government have the capacity to inspect, police, enforce, litigate, and control Rise Gold's performance? This maybe outside CEQA analysis, but it is relevant to the detail required in any mitigation or controlling regulation, variance, and oversight agreement.

**Ind 648-14**

14. Community character is also not specifically analyzed in the CEQA exercise. Yet, community character is at the heart of all the Sections. Nevada County, Grass Valley, Nevada City and Truckee have prospered over the last 40 years. Our down towns are strong and endured economic downturns, Amazon, covid, wildfires, and power outages. New on-line sales revenue sharing regulation is helping to offset the out of town purchasing and sales tax dollar exodus as folks shift spending to on-line. The strength of our economy, based on Economic Resource Council data, is rooted in technology, R&D, seniors, government, tourism, recreation, stewardship, and healthcare. We are perceived as a tourist and recreation destination. Do we want that perception to change to one of an industrial mining town? Mining is our past, not our future.

**Ind 648-15**

15. 4.3-4 "Result in the inefficient or wasteful use of energy" This is a negative impact and the DEIR finds it LS or less than significant and mitigations as NA (Not Applicable). We live in an era struggling to get our arms around climate change, wild fires, and drought. One element at the heart of this all-encompassing area of study is energy use and carbon footprint. How is it possible that a project that could double the commercial power use in Nevada County be

defined as less than significant? This is wrong and needs new analysis. The Nevada County Climate Action Plan calls for significant energy and carbon reductions. This project must participate in that process.

**Ind 648-16**

16. 4.3-5 "Conflict with State or local plans for renewable energy or energy efficiency." DEIR designates LS and NA. The Nevada County Energy Action Plan calls for energy and carbon reductions moving forward. The specific language in the Energy Action Plan may be weak and waffle at times it should be specific. However, the intent is there. The goals are there. The Rise Gold IMM project EIR must respect the intent of the local plan and State plans. The EIR must include an energy efficiency plan that shows reducing energy use over the length of the permit. The reductions should be frontloaded. One example of a real mitigation would be to require a portion of the property committed to a solar farm sized to support the project energy use. We require solar infrastructure on new homes, new enterprise must participate in the solution.

**Ind 648-17**

17. 4.3-7 Carbon Offsets- this family of mitigations should set the standard for what is expected. A mitigation must be CLEAR, FEASIBLE, AND ACHIEVABLE. If the County relies on a future plan or a future action, then the mitigation must identify clear performance standards.

**Ind 648-18**

18. 4.4-1 ADD- All landscape, habitat mitigations, transplanting, and seed propagation will include weekly monitoring by a qualified biologist to ensure success including the health and prosperity of the plant life. Restoration bonds should be implemented to fund this responsibility for the length of the mining enterprise.

**Ind 648-19**

19. 4.5-3 Retain a credentialed archeologist to be familiar with the history of the properties and be available to respond in concert with the Sheriff/ Coroner should human remains or Native American artifacts be unearthed. Artifacts would indicate human remains may be in the area.

20. The archeologist will establish contact with the Native American community before the project begins to better understand their wishes should an actionable event occur.

**Ind 648-20**

21. 4.11-7 NID has not agreed to fully commit an unlimited water supply to Rise Gold's IMM project and potential water service to homes with residential well failures. Rise Gold underestimates the potential for damage to existing and future residential well performance. The LS and NA designations are incorrect.

**Ind 648-21**

22. 4.12-4 Rise Gold must include pedestrian and bicycle lane improvements along the length of the Brunswick Road and Bennett Street property.

23. Alternative #1: The No build option is the correct answer. Develop according to the existing land use designation shown in the County General Plan with consideration for current contemporary planning philosophy that reflects planning ideas not consistent in an older Nevada County General Plan. For instance:

- Include pedestrian and bike corridors to connect with Grass Valley, Empire Mine, and Memorial Park.
- Minimize impacts on sensitive habitats and species.
- Require energy efficiency and carbon reduction plans. Require solar farming to reduce dependency on the power grid and energy consumption consistent with the County Energy Action Plan.
- Include open space for animal corridors, visual and scenic integrity.

**Ind 648-22**

The DEIR describes the No Project alterative in terms that maximize the development of the Brunswick property. This is not how it would go. This is an amazing important piece of property because of its location in this part of the County at an entryway to the Brunswick Basin. It is located near Empire Mine State Park and Grass Valley. It is flat. **There are many possible uses that would add synergy to the existing thriving local economy that fall within the existing General Plan use designation and are not hard rock mining.** I suggest current thinking of business parks might lean toward mixed use with housing and retail and seek to create a campus environment that is pedestrian friendly. Possible uses that are consistent with a Nevada County economy that has been growing in a sustainable positive direction for at least four decades are: Utilities, Manufacturing, Information, Science & technology, Real Estate, Professional, Arts, Entertainment, and Recreation. All of these would create more jobs, use less energy, have lower carbon footprints, have larger jobs and enterprise building multipliers, and generate more local wealth.

## INDIVIDUAL LETTER 648: PAUL SCHWARTZ

### Response to Comment Ind 648-1

As stated on page 4.10-45 of the DEIR, the implementation of Mitigation Measure 4.10-3 would reduce the potential significant noise impact to a less than significant level. The noise analysis of the DEIR considers ambient noise levels at receptor locations. Please see Chapter 4.10 of the DEIR.

As stated on page 4.9-16 of the DEIR, subsurface mining is allowed in all base districts subject to approval of a Use Permit. Surface access to subsurface mining, including vent and escape shafts, is allowed in the AG, FR, M1, M2, P, and PD base districts subject to approval of a Use Permit. Surface mining is allowed in the AG, FR, M1, M2, P, PD, and TPZ Districts and where the property is zoned ME, subject to approval of a Use Permit and Reclamation Plan.

### Response to Comment Ind 648-2

Please see Master Response 25 - Nevada County Energy Action Plan.

### Response to Comment Ind 648-3

Please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. Note that based on the groundwater model, which was peer reviewed by the County's independent experts, only 7 wells are expected to have a significant drawdown effect from the project. The groundwater impact analysis and related mitigation was peer reviewed by the County's independent experts, who provided input on the analysis and mitigation. Connection to NID water supply at the applicant's cost is provided for 30 parcels, although only 7 are expected to have a significant impact. With regard to unexpected impacts to wells beyond the 7 expected impacted wells, and the total of 30 parcels that are being provided access to NID water supply, as discussed in Chapter 4.8 of the DEIR, Mitigation Measures 4.8-2(a) and 4.8-2(b) require that monitoring wells be installed in the vicinity of the project and that additional baseline data be collected for 12 months prior to dewatering. Likewise, Mitigation Measure 4.8-2(b) requires that during dewatering, data from the monitoring wells is used to assess whether local groundwater wells would be impacted, which in the case of a significant impact would then trigger investigation and immediate replacement of water supply by the applicant at the applicant's cost.

As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells (water level and water quality) within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

### Response to Comment Ind 648-4

The commenter states that the DEIR underestimates the level of asbestos exposure that could be caused by the project and strategies to mitigate dust and asbestos emissions. However, the Health Risk Assessment is based on conservative assumptions that likely overestimate asbestos exposure. Please see Master Response 22 – Conservatism used for Asbestos Assumptions.

As stated on page 4.3-42 of the DEIR, use of the NSAQMD's cancer and noncancer thresholds to assess health risk significance for CEQA is consistent with AB 2588 risk assessment procedures. The threshold of significance for health risk is an increased cancer risk of >10 cases per million persons. The Health Risk Assessment prepared for the project concludes that the health risk to the most sensitive receptor will be below this threshold.

Nevertheless, the DEIR concludes that the project could result in a significant impact with respect to exposing receptors to substantial concentrations of asbestos and requires mitigation to reduce the impact to a less than significant level. Mitigation Measure 4.3-2 of the DEIR requires the submission and subsequent implementation of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring. Notably, compliance with the CARB ATCMs for naturally occurring asbestos, including development of an ADMP, is the standard approach within CEQA documents to address health concerns associated with exposure to asbestos from unpaved surfaces, construction, and grading operations and quarries where asbestos is found or likely to be found in order to ensure potential health risk impacts to the public would be minimized to a less than significant impact. Multiple other projects in the NSAQMD jurisdiction, as well as throughout the state, have relied upon compliance with these naturally occurring asbestos ATCMs in order to control any potential asbestos emissions to the extent possible. As described in Mitigation Measure 4.3-2 of the DEIR, the proposed project shall also comply with all applicable criteria in the CARB ATCMs for naturally occurring asbestos.

As shown in Table 3-9 of the DEIR, mobile tire washing plants are proposed to be used to wash truck tires of vehicles leaving non-paved areas where engineered fill would be placed. As shown in Figure 3-8 of the DEIR, all roads outside of the engineered fill piles are proposed to be paved. Therefore, vehicle tires will not require washing as they leave the Brunswick site onto public roads and would not leave visible track-out material on public roads. If necessary, the onsite paved roads could be cleaned to ensure employee and other vehicles do not track dust onto public roads. Mitigation Measure 4.3-2 provides several options based on Section e(4)(A)(2) Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations. The project proposes mobile tire washing plants to be used to wash truck tires of vehicles leaving non-paved areas where engineered fill would be placed and not rely on gravel pads or 50 feet of pavement to capture dust. Any sediment from tire washing would be captured onsite by the washing plant and disposed of onsite alongside the engineered fill being placed.

For clarification purposes, Mitigation Measure 4.3-2, on page 4.3-83, has been revised to add the word "or" in bullet point 3 to clarify that a gravel pad is not required if a wheel wash system is employed.

- *All visible track-out material (from vehicles leaving the work site) must be removed from all public roads at least once per day using wet sweeping or a HEPA-filter-equipped vacuum device. Sweeping or vacuuming on public roads shall be conducted so as to avoid peak AM and PM traffic hours.*
- *A gravel pad designed and maintained to effectively clean tires of exiting vehicles, or a wheel wash system, or a minimum of 50 feet of pavement must be placed between the construction area and any public road, and must be used by all exiting vehicles (including personal vehicles and delivery trucks) throughout the duration of the project.*

The above change is for clarification purposes and does not alter the efficacy of the mitigation measure, nor conclusions of the DEIR.

## Response to Comment Ind 648-5

As stated on page 4.13-15 of the DEIR, according to Table 4.1 of the Circulation Element of the Nevada County General Plan, Brunswick Road is considered a Minor Arterial.

As discussed on page 4.1-2 of the DEIR, according to the California Department of Transportation (Caltrans) Scenic Highway Program, State Route (SR) 20, 49, and 174 within Nevada County are eligible State Scenic Highways. Eligible state scenic highways, while recognized for aesthetic quality, are not officially designated as scenic highways. Only SR 49/SR 20 has views of the project sites. As SR 49 passes through Grass Valley, it is posted as both SR 49 and SR 20. At the north end of Nevada City, SR 49 turns west toward North San Juan, after which the north-south highway turns east and becomes SR 20. The entirety of SR 49 proceeds in a northbound/southbound direction. As the portion through Grass Valley is oriented north-south, it is therefore referred to throughout the DEIR's analysis as SR 49. The Brunswick Industrial Site is approximately two miles from SR 49 and the Centennial Industrial Site is approximately a 0.5-mile from SR 49.

Notwithstanding the above, as noted in Chapter 4.1, Aesthetics, the DEIR concludes that implementation of the proposed project would result in a substantial degradation to the visual character or quality of the Brunswick Industrial Site as viewed from Brunswick Road, and after implementation of mitigation, the impact would remain significant and unavoidable.

Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 648-6

The comment states that the DEIR is poorly organized and fails to describe how mitigation measures would reduce impacts to acceptable levels and that mitigation measures must be clear, feasible, and achievable. However, the commenter provides no specifics or evidence as to its assertions and is referred to Chapter 4 of the DEIR.

The DEIR analyzed the project's potential impacts with respect to baseline conditions, as defined in the DEIR, in addition to reviewing potentially significant cumulative impacts based on known or planned development in the region. CEQA Guidelines section 15130 requires an EIR to discuss cumulative impacts of a proposed project. Cumulative impacts are impacts created because of the combination of the proposed project with reasonably foreseeable future projects. DEIR section 5.3 summarizes the cumulative impacts analysis, and each resource analysis in each technical chapter of the DEIR includes an analysis of cumulative impacts specific to that resource.

The commenter states that Section 2.5 of the DEIR includes negative impacts of the project. As stated on page 2-8 of the DEIR, this list consists of areas of controversy that were identified in NOP comment letters and are otherwise known for the project area. Impacts of the project in all the listed subjects are analyzed in the DEIR. See Chapter 4 of the DEIR.

## Response to Comment Ind 648-7

Except for the construction of the Service Shaft, no blasting would take place closer than 500 feet to surface. Historic workings above this elevation may or may not be backfilled or used and are not required to be filled. Please see Master Response 29 - Near Surface Workings.

## Response to Comment Ind 648-8

As stated on page 4.1-14 of the DEIR, examples of typical scenic vistas include mountain ranges, ridgelines, or bodies of water as viewed from a highway, public space, or other area designated for the express purpose of viewing and sightseeing. In general, a project's impact to a scenic vista would occur if development of the project would substantially change or remove a scenic vista. The County General Plan does not identify any scenic vistas in the vicinity of the Centennial or Brunswick Industrial sites. Impacts to views of the project sites from SR 49, which is included within the County's Scenic Corridor Combining District (SC), are discussed under Impact 4.1-2. Thus, the proposed project would not have a substantial adverse effect on a scenic vista, and a less-than-significant impact would occur.

## Response to Comment Ind 648-9

The analysis in DEIR Section 4.1-3 does not consider the previous industrial activity at the site in the analysis. Rather, the determination of less than significant is based on substantial evidence provided in the form of a photometric plan for the Brunswick Industrial Site, inclusive of lighting types and projected lumen intensities across the site. As stated on page 4.1-24 of the DEIR, based on the photometric plan:

> […] the lighting intensities at the northern property line, near East Bennett Road, are at 0.0 foot-candles[9], and thus, light spillover is not projected to occur off-site. The nearest proposed pole-mounted LED, which is International Dark Sky Association compliant, would be located approximately 100 feet from East Bennett Road. Thus, the existing sensitive receptor along New Brunswick Court would not be impacted by light spillover from the proposed on-site lighting. Similar conclusions can be made for the remainder of the property boundaries, based on the Photometric Plan; no light spillover is projected to occur at the property boundaries.

As stated on page 4.1-29 of the DEIR, the proposed project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area, and a less-than-significant impact would occur. Please see Section 4.1-3 of the DEIR.

## Response to Comment Ind 648-10

The beginning of the comment related to Highway 174 is unclear. The project does not propose any traffic improvements on Highway 174.

Mitigation Measure 4.3-1(a) requires that temporary traffic control shall be provided during all phases of construction to improve traffic flow, as deemed appropriate by the local transportation agencies and/or the California Department of Transportation and construction activities shall be scheduled to direct traffic flow to off-peak hours as much as practicable. As shown in Table 4A of Appendix O of the DEIR, peak hours vary for various intersections but are 7:45AM to 8:45AM and 4:30PM to 5:30PM on Brunswick Road near the Brunswick Industrial Site (intersections 12-17).

Mitigation Measure 4.3-1(b) requires that prior to the initiation of construction, Rise Grass Valley Inc. or its designee shall submit a Construction Exhaust Emissions Minimization Plan to Nevada County or its designated representative for review and approval. The mitigation measure provides specific requirements as stated on pages 4.3-77 and 4.3-78 of the DEIR.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

Specific traffic management plans and the Construction Exhaust Emissions Minimization Plan are not required for the analysis of the DEIR, but will be required before the construction activities, as specified in Mitigation Measures 4.3-1(a) and 4.3-1(b). Engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.)

## Response to Comment Ind 648-11

The Asbestos Dust Mitigation Plan must be approved by the NSAQMD, is required pursuant to specific performance standards and regulatory requirements as set forth in Mitigation Measure 4.3-2, and is not required to be completed and approved for the analysis of the DEIR. Under California case law, compliance with a regulatory permit or other similar process may be identified as mitigation under CEQA if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards. (CCR Title 14 Section 15126.4.) Please see Response to Comment Ind 648-4.

## Response to Comment Ind 648-12

Based on substantial evidence in the DEIR, the proposed mine water discharge would not cause substantial erosion or sedimentation in South Fork Wolf Creek or significant impacts to sensitive aquatic species. Please see Chapter 4.8 of the DEIR, Master Response 36 - Flows in South Fork Wolf Creek, and Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 648-13

Please see Master Response 3 - Operator Responsibility.

## Response to Comment Ind 648-14

Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 648-15

Please see Master Response 25 - Nevada County Energy Action Plan, Master Response 27 - Greenhouse Gas Thresholds, Response to Comment Ind 648-16, and Response to Comment Agcy 8-17.

## Response to Comment Ind 648-16

Compliance of the project with EAP strategies has been analyzed in Table 4.3-22 in the DEIR and the project was determined to be consistent with the EAP. Please see also Master Response 25 - Nevada County Energy Action Plan. Regarding a solar energy system, while solar panels are not currently proposed as part of the project, the roof space of the project buildings may be available in the future for installation of solar panels to reduce the project's reliance on the energy grid. However, any such solar power generation would be small in comparison to the requirements of the project. Notably, the GHG emissions presented in the DEIR are conservative, since California regulations will reduce GHG emissions overtime. For instance, Senate Bill 100 requires that zero carbon energy resources supply 100% of electric retail sales to customers by 2045. Neither this requirement, nor the progressive steps to achieve it (i.e., 44% of electricity by 2024, 52% by 2027, and 60% by 2030 be procured from renewable energy sources) were accounted for in the GHG analysis, although these GHG reducing policies will ultimately reduce the project's carbon footprint.

## Response to Comment Ind 648-17

Mitigation Measure 4.3-7(b) provides extensive and detailed requirements and standards for carbon offsets. Please see page 4.3-96 of the DEIR and Master Response 28 - Greenhouse Gas Credits.

## Response to Comment Ind 648-18

The commenter requests that a mitigation measure be added to require all landscape, habitat mitigation, transplant, and seed propagation to include weekly monitoring by a qualified biologist and for restoring bonds to be imposed for the length of the mining enterprise. The commenter does not identify any deficiencies in the DEIR nor significant impacts that would require this mitigation. Numerous regulations and mitigation measures are already imposed on these project activities, as described in Chapter 4.4 of the DEIR, and the mitigation measure proposed by the commentor is not required for the project.

## Response to Comment Ind 648-19

Mitigation Measure 4.5-3 requires any person who, in the process of project activities, discovers any human remains within the project area, shall cease from all project activities within at least 200 feet of the discovery. In the event that human remains are encountered, the sheriff-coroner shall be notified immediately upon discovery. In the event that Native American human remains are encountered, the Native American Heritage Commission or the most likely descendants of the buried individual(s), who are qualified to represent Native American interests, shall be contacted. Specific treatment of Native American human remains shall occur consistent with State law.

## Response to Comment Ind 648-20

An unlimited supply of water from NID is not required for the project. Please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

## Response to Comment Ind 648-21

The commenter states that rise gold must include pedestrian and bicycle lane improvements along the length of Brunswick Road and Bennett Street property. These improvements and are not required for the project to mitigate any significant impact, and the impact from project-generated vehicle miles travelled is less than significant. Please see Section 4.12-5 of the DEIR.

## Response to Comment Ind 648-22

The commenter's preference for the No Project Alternative (Alternative #1) is noted for consideration by the County decisionmakers. Please also see Response to Comment Ind 388-6.

**Individual Letter 649**

3-13-2022

To: Matt Kelley, Senior Planner, Nevada County Planning Department

950 Maidu Avenue Suite 170, Nevada City CA 95959-7902

Idaho.MMEIR@co.nevada.ca.us

From: Paul S. Schwartz

13812 Meadow Drive, Grass Valley CA 95945

psschwartz21@gmail.com

**Attention: Nevada County Planning Department, Nevada County Planning Commission and Board of Supervisors**

Comments on the DEIR for the Proposal to Reopen the Idaho Maryland Mine

**Ind 649-1**

1. 4.10-1, 2, 3- From one section of the Noise and Vibration report (Pg 4-10-45) "It is conservatively concluded that the proposed project could result in a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or standards of other agencies, and the project's noise impacts could be significant." Seriously consider the setting and context as well. We are a rural community where noise levels are low in contrast to the constant background noise of traffic and urban activity in other cities and counties. Protecting and preserving the quality of our noise landscape is the right thing to do. The property is not currently zoned for heavy industrial mining operations. This is a General Plan designation made with community support and reflecting both community values, environmental integrity, and economic forethought.

**Ind 649-2**

2. The technical Reports reveal the energy requirements and the carbon footprint of the proposed Idaho Maryland Mine (IMM) enterprise are in conflict with the General Plan Energy Action Plan. The mine will require an energy increase equivalent to 12% of the current Nevada County energy load. In addition, it will require doubling the amount of energy currently used by the entire Nevada County commercial energy use. The document discounts the standing and relevancy of the Nevada County Energy Action Plan. Although implementation of the plan is in its infancy, the intent and goals are very clear. A project seeking an 80-year operating permit needs to fully address consistency with those goals and intent. At a minimum, a mitigation requiring an energy efficiency and carbon reduction plans revealing how Rise Gold intends to operate in the spirit of the Energy Action Plan.

**Ind 649-3**

3. The entire analysis of impacts to natural underground water systems lacks the data and analysis to accurately describe potential impacts to existing and future wells in the surrounding residential community. Changes in the natural underground water system resulting from massive dewatering need to be fully and accurately investigated. Projections need to be evaluated against industry know outcomes in similar mining operations to reveal the accuracy of these types of analysis. Similar gold mining enterprise in our county have dried and contaminated wells during the dewatering process. This is difficult to provide ongoing oversight without a clear long term funded plan for the 80-year permit. A plan that includes clearly defined oversight and periodic review and reporting. The plan should include methods, means, and clearly designated roles and responsibilities to monitor and mitigate conditions and damages to underground water sources for this part of the community. For instance, what are the first conclusive indicators of impacts to the natural underground water supply and what is

the action plan? Rise Gold needs to be required to provide a comprehensive plan and allow time for a peer review process to insure we understand the risks, indicators, and responses.

**Ind 649-4**

4. The DEIR fails to clearly outline strategy to mitigate dust and particulant pollution from the rock processing and transporting. Because of the risk associated with asbestos and other airborne hazards, manual wetting with water trucks and hoses is not good enough. A mitigation that describes an automated mechanical solution the trucks must go through and be washed and watered down before leaving the IMM or Centennial property is needed. In addition, for the rock processing, piling, and truck loading process, a system of overhead sprinklers or similar is needed to insure a constant level of quality throughout the enterprise. The DEIR must describe a mitigation plan that is more robust than providing on site water trucks and gravel pits for the trucks to drive through.

**Ind 649-5**

5. Policy related to view sheds, aesthetics, and community character in the General Plan are ignored. An example is the description of Brunswick Road as a minor arterial ignores the fact it is an entryway into the Brunswick basin and Nevada City. As an entryway it will continue to grow in importance and traffic volume. It represents for many guests to our community the first impression they will have and should not be dismissed because it does not have a scenic designation. We all know the cliché about how difficult it is to alter first impressions. A large part of our economy is derived from tourism, recreation activities, and the Arts. Protecting how we are perceived is critical to our long-term economic success. Over time the section of Highway 174 through Cedar Ridge into Grass Valley will see traffic levels flatten and Brunswick Road will become busier and busier. Caltrans investments and improvements to Highway 174 clearly show the importance of this route into our community and Brunswick Road should be recognized and protected from development that impacts its future success as an entryway and major arterial. This section of the traffic analysis and aesthetics impacts needs to be re-evaluated and reworked.

**Ind 649-6**

6. The DEIR analysis in each section is poorly organized and fails to describe or explain how proposed mitigation measures would reduce impacts to acceptable levels. The cumulative effect to our community of the negative impacts is poorly analyzed, dismissed, and ignored. Chapter 2, 2.5 Areas of Known Controversy includes 23 bullets to describe the breadth of the negative impacts the project carries with it. Mitigation Measures must be clear, feasible, and achievable. They must show how we can measure and determine the proposed mitigated outcome.

**Ind649-7**

7. 3.0- "New underground workings would be below 500 feet from ground surface." What about existing workings that are less than 500 feet from the surface? Will these be properly filled and no longer used?

**Ind 649-8**

8. 4.1-1 "Have a substantial adverse effect on scenic vista" The analysis dismisses the height and massive rock infill that would be several stories high in the current IMM valley and rising above Brunswick Road. In addition to that are the multi-story buildings that require variances because they are more than double the acceptable height of buildings as defined in our General Plan and County regulation. How is this Less than Significant (LS) and how does Not Applicable answer to this Negative Impact? The next item in the table outlines a generic landscape plan that is proposed as a solution. This might be OK for a bank or a Wendy's, but it does not respond to the massive change to the viewshed or the extremely tall buildings.

**Ind 649-9**

9. 4.1-3 "Create a new source of substantial light and glare which would adversely affect day or night time views in the area." The DEIR designates this LS and mitigations as NA. Regardless of previous industrial activity at this location, decades have passed since their departure and the area is now predominantly residential. Introducing "substantial" new light and glare into the setting and dismissing the impact is unacceptable.

**Ind 649-10**

10. 4.3-1 Traffic controls on Highway 174 improvements resulted in 20-30 minutes waiting for the pilot vehicle. If you lived within the project area, one trip could add one hour to your travel time. There needs to be a specific traffic management plan that puts more on the contractor and impacts the traffic flow more efficiently for drivers. Scheduling construction delivery and future trucking to off hours is a good idea. What are the off hours and how is this enforced? The Construction Exhaust Minimization Plan needs to be revealed now as part of the DEIR or specific performance and enforcement standards brought forward. Elements of the plan should not be allowed to be ignored because its inconvenient, costly, or outside the critical path. The project must meet the Federal 8-hours ozone Standard and employ all feasible NOX mitigations to achieve satisfy NSAQMD thresholds. This needs to be spelled out in the EIR.

**Ind 649-11**

11. 4.3-2 The proposed Asbestos Dust Mitigation Plan should be detailed in the DEIR. This is a large part of the negative impacts the project will have on the neighborhood and the community. The generalized statements offered as mitigation measures are insufficient and potentially ineffective. Previous NSAQMD requirements for similar projects included paving in work areas and automated watering systems as opposed to water trucks and gravel drive through pits. The mitigation should include automated wheel washing technology for all vehicles operating on unpaved surfaces. A spray misting system may be required to subdue harmful dust from project operations. The EIR should describe and include as a mitigation available technology that removes harmful fibers from air exiting the mine. In addition, description of an asbestos monitoring program should be part of the EIR and subject to NSAQMD review.

**Ind 649-12**

12. I am concerned about adding significant flows to South Fork Wolf Creek. I was a Wolf Creek Alliance stream care volunteer and adding millions of gallons a day would increase erosion and downstream sedimentation. It would challenge wildlife populations that live in the stream zones. Determining the impacts are less than significant (LS) and mitigations are not needed (NA) is foolishness. Plans for special status species, wetland protections, erosion controls, culvert replacement and monitoring program needs to be spelled out in the EIR.

**Ind 649-13**

13. Given everything we know about Rise Gold's senior leadership and their history in British Columbia, what protections do we have that they will honor agreements and perform professionally. Does Nevada County government have the capacity to inspect, police, enforce, litigate, and control Rise Gold's performance? This maybe outside CEQA analysis, but it is relevant to the detail required in any mitigation or controlling regulation, variance, and oversight agreement.

**Ind 649-14**

14. Community character is also not specifically analyzed in the CEQA exercise. Yet, community character is at the heart of all the Sections. Nevada County, Grass Valley, Nevada City and Truckee have prospered over the last 40 years. Our down towns are strong and endured economic downturns, Amazon, covid, wildfires, and power outages. New on-line sales revenue sharing regulation is helping to offset the out of town purchasing and sales tax dollar exodus as folks shift spending to on-line. The strength of our economy, based on Economic Resource Council data, is rooted in technology, R&D, seniors, government, tourism, recreation, stewardship, and healthcare. We are perceived as a tourist and recreation destination. Do we want that perception to change to one of an industrial mining town? Mining is our past, not our future.

**Ind 649-15**

15. 4.3-4 "Result in the inefficient or wasteful use of energy" This is a negative impact and the DEIR finds it LS or less than significant and mitigations as NA (Not Applicable). We live in an era struggling to get our arms around climate change, wild fires, and drought. One element at the heart of this all-encompassing area of study is energy use and carbon footprint. How is it possible that a project that could double the commercial power use in Nevada County be

defined as less than significant? This is wrong and needs new analysis. The Nevada County Climate Action Plan calls for significant energy and carbon reductions. This project must participate in that process.

**Ind 649-16**

16. 4.3-5 "Conflict with State or local plans for renewable energy or energy efficiency." DEIR designates LS and NA. The Nevada County Energy Action Plan calls for energy and carbon reductions moving forward. The specific language in the Energy Action Plan may be weak and waffle at times it should be specific. However, the intent is there. The goals are there. The Rise Gold IMM project EIR must respect the intent of the local plan and State plans. The EIR must include an energy efficiency plan that shows reducing energy use over the length of the permit. The reductions should be frontloaded. One example of a real mitigation would be to require a portion of the property committed to a solar farm sized to support the project energy use. We require solar infrastructure on new homes, new enterprise must participate in the solution.

**Ind 649-17**

17. 4.3-7 Carbon Offsets- this family of mitigations should set the standard for what is expected. A mitigation must be CLEAR, FEASIBLE, AND ACHIEVABLE. If the County relies on a future plan or a future action, then the mitigation must identify clear performance standards.

**Ind 649-18**

18. 4.4-1 ADD- All landscape, habitat mitigations, transplanting, and seed propagation will include weekly monitoring by a qualified biologist to ensure success including the health and prosperity of the plant life. Restoration bonds should be implemented to fund this responsibility for the length of the mining enterprise.

**Ind 649-19**

19. 4.5-3 Retain a credentialed archeologist to be familiar with the history of the properties and be available to respond in concert with the Sheriff/ Coroner should human remains or Native American artifacts be unearthed. Artifacts would indicate human remains may be in the area.

20. The archeologist will establish contact with the Native American community before the project begins to better understand their wishes should an actionable event occur.

**Ind 649-20**

21. 4.11-7 NID has not agreed to fully commit an unlimited water supply to Rise Gold's IMM project and potential water service to homes with residential well failures. Rise Gold underestimates the potential for damage to existing and future residential well performance. The LS and NA designations are incorrect.

**Ind 649-21**

22. 4.12-4 Rise Gold must include pedestrian and bicycle lane improvements along the length of the Brunswick Road and Bennett Street property.

**Ind 649-22**

23. Alternative #1: The No build option is the correct answer. Develop according to the existing land use designation shown in the County General Plan with consideration for current contemporary planning philosophy that reflects planning ideas not consistent in an older Nevada County General Plan. For instance:

- *Include pedestrian and bike corridors to connect with Grass Valley, Empire Mine, and* Memorial Park.
- Minimize impacts on sensitive habitats and species.
- Require energy efficiency and carbon reduction plans. Require solar farming to reduce dependency on the power grid and energy consumption consistent with the County Energy Action Plan.
- Include open space for animal corridors, visual and scenic integrity.

The DEIR describes the No Project alterative in terms that maximize the development of the Brunswick property. This is not how it would go. This is an amazing important piece of property because of its location in this part of the County at an entryway to the Brunswick Basin. It is located near Empire Mine State Park and Grass Valley. It is flat. **There are many possible uses that would add synergy to the existing thriving local economy that fall within the existing General Plan use designation and are not hard rock mining.** I suggest current thinking of business parks might lean toward mixed use with housing and retail and seek to create a campus environment that is pedestrian friendly. Possible uses that are consistent with a Nevada County economy that has been growing in a sustainable positive direction for at least four decades are: Utilities, Manufacturing, Information, Science & technology, Real Estate, Professional, Arts, Entertainment, and Recreation. All of these would create more jobs, use less energy, have lower carbon footprints, have larger jobs and enterprise building multipliers, and generate more local wealth.

## INDIVIDUAL LETTER 649: PAUL SCHWARTZ

This letter is a duplicate of Individual Letter 648. Please see the above responses to Individual Letter 648.

**Individual Letter 650**

**From:** Paul Snyder
**To:** bdofsupervisors
**Subject:** Vote NO on the Mine
**Date:** Friday, February 18, 2022 7:54:28 AM

Dist 1

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

I implore all the BOS's to vote no on the IM mine!!

**Ind 650-1** The past lawsuits and environmental damage left in the wake of Rise Gold in Canada has shown that they can not be trusted to take care of our town. They have repeatedly misrepresented their local support with fake biased "surveys" that also shows they can not be trusted.

**Ind 650-2** If you have read the survey's it's so obviously not credible. The drought and water issues are a huge unknown moving forward.

**Ind 650-3** We have many abundant resources for tourism that could be jeopardized with the mine. Have you been by the 5 Mile parking during prime biking season? The Pioneer trail , Hoot Trail have been a huge boon for our economy. The new Parliament trail being constructed, and the proposed Pines to Mines and Sugarloaf trails are the direction the county should be going in. I thank you for your support of these projects.

**Ind 650-4** Please use best judgement for what is really important to the counties residents and VOTE NO on the mine

Thank You,
Paul Snyder

**Ind 650-5** p.s. the recall is a complete joke and a waste of time. Thank your doing your best to keep us safe in uncertain times

## INDIVIDUAL LETTER 650: PAUL SNYDER

### Response to Comment Ind 650-1
Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 650-2
The comment expresses a general opinion that the "surveys" associated with the proposed project lack credibility, but does not provide specific examples that would allow for a detailed response. Please see Master Responses 15 and 16.

### Response to Comment Ind 650-3
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

### Response to Comment Ind 650-4
The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1.

### Response to Comment Ind 650-5
The comment does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Cc:** robertwheatley1099@gmail.com; Karin Huff Wheatley; Georgie; Art Derby; DEIRcomments@cea-nc.org; Kimmie
**Subject:** Comments on Idaho-Maryland Mine Project SCH# 2020070378 Draft Environmental Impact Report (DEIR)

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr. Kelly,

Our family has owned property on Wolf Creek in Nevada County for over **53** years. Four generations of us have enjoyed this beautiful, refreshing waterway. The thought of the Idaho Maryland mine reopening causes serious concern regarding the health of Wolf Creek.

**Ind 651-1**

The DEIR outlines a water treatment plan that would allow treated mine groundwater to be discharged into South Wolf Creek and thereby Wolf Creek. Mine owners hope to obtain a Limited Threat Discharge Permit from the State Regional Water Quality Control Board, page 3-18, with the treated water covered as Tier 3 discharge, page 4.8-28.

The project anticipates completion of the initial dewatering of the mine in approximately 6 months, pumping at a rate of 2,500 gpm, page 4.8.42. The treated water would be monitored and tested but the owner will only be required to submit quarterly monitoring reports to the State Regional Water Quality Control Board. This is too great a period of time, allowing potential pollutants to wreak havoc on the creek before any governing entity can stop the flows.

I request reporting of the water quality monitoring be done more frequently, such as monthly, to stop potential pollution more quickly.

**Ind 651-2**

I request that the monitoring be conducted by an independent party.

Lastly, on page 3-18, this statement is made: "The water discharged into South Fork Wolf Creek is expected to be at least as good or better quality than the water typically flowing through South Fork Wolf Creek." I would like to know the basis for this claim.

I ask that the DEIR be revised to address these concerns. Thank you.

**Ind 651-3**

Respectfully,

Paula Strang

10591 Salcido Lane
Grass Valley, CA 95949
pkstrang96@gmail.com

## INDIVIDUAL LETTER 651: PAULA STRANG

### Response to Comment Ind 651-1

The commenter states that water quality monitoring for discharges to South Fork Wolf Creek will occur on a quarterly basis. The commenter states this interval period is too long, and pollutants may be discharged to the creek in between reports. The commenter does not state why quarterly monitoring reports under the State's Limited Threat Discharge Permit is inadequate. Water monitoring is conducted under the requirements and oversight of the Central Valley Regional Water Quality Control Board. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 651-2

The commenter requests that the water monitoring be conducted by an independent party. The Central Valley Regional Water Quality Control Board would specify the location of the sampling, but reports would be submitted by the Project Applicant. (DEIR, p. 4.8-45.) Water monitoring is conducted under the requirements and oversight of the Central Valley Regional Water Quality Control Board. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 651-3

The commenter would like to know how the project's on-site water treatment system would treat water from the mine to be the same quality or better to the existing water in the South Fork Wolf Creek. As shown in Table 3-9 of Appendix K.2, water samples from South Fork Wolf Creek have elevated Iron and Manganese which are above water quality goals. Treated mine water would have lower levels of Iron and Manganese. The County's independent consultant, West Yost, peer reviewed the Water Treatment Plan Design Report and confirmed that the proposed method of treatment would be adequate to successfully treat mine water to comply with Regional Water Board effluent limitations. (DEIR, p. 4.8-41.) The commenter is also referred to Master Response 35 - Discharge to South Fork Wolf Creek.

**Individual Letter 652**

Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Ave. Suite 170
Nevada City, Ca. 95959

April 2, 2022

Dear Mr. Kelley,

This letter is in response to the notice of a Draft Environmental Impact Report (DEIR) for the Idaho-Maryland Mine Project and to express concerns of restarting 1950's industries in my neighborhood. I am a Grass Valley resident and have been for 26 years I am a dressage horse trainer. I live off Greenhorn Rd, within a mile of the Idaho-Maryland Brunswick site. My husband and I have examined much of the documentation in the DEIR. I have concerns.

**Ind 652-1**

Climate Change is having a dramatic effect on "average" rainfall. A lower average rainfall will have negative effects on any modeling/analysis results. Climate change is real and it will affect the analysis of expected impacts of mining operations. It must be considered.

However, because the full effect of Climate Change to Nevada County is not yet known and therefore could not have been considered in the DIER (properly)!

**Ind 652-2**

Chemicals and particulates will disperse somehow and could be harmful to us and live stock (horses)

**Ind 652-3**

I am concerned about noise pollution due to mining activity and increased truck traffic. (The DEIR indicates that the noise is acceptable according to County regulations. Acceptable to who?
Blasting rock under nearby properties will disrupt normal life functions not to mention the disruption of horse training exercises.

**Ind 652-4**

Grass Valley has not been a mining town for 70 years. Times have changed! We have developed new residential neighborhoods, new culture, and businesses. In addition, the climate has clearly changed and is changing to the point of no longer sensibly able to support the enormous water demand such a venture dictates. Do not allow this level of industrial operation to restart in Grass Valley especially in a residential neighborhood after all these years.

Sincerely,

Peggy Kelly (530) 274 8819
12748 The Hollow
Grass Valley

peggyrkelly@gmail.com

## INDIVIDUAL LETTER 652: PEGGY KELLY

### Response to Comment Ind 652-1

This comment is introductory in nature and states that climate change is impacting average rainfall. The comment also states that a lower average rainfall will negatively impact any modeling or analysis associated with the project and must be considered. Lastly, the commenter states that, because the full effect of climate change is unknown, the DEIR could not have considered that full effect.

The DEIR addresses climate change and its impacts to the variability of precipitation in the region. (DEIR, pp. 4.3-11–4.3-19.) The DEIR specifically discusses that long-term changes to precipitation may be no more than 10 to 15 percent of current totals. (DEIR, p. 4.3-16.) Please also see Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 652-2

The commenter states that chemical and particles will disperse somehow and could be harmful to people and livestock but provides no further details.

The DEIR discusses impacts to air quality in Chapter 4.3, hazards and hazardous materials in Chapter 4.7, and hydrology and water quality in Chapter 4.8. Please also see Master Response 18 regarding air quality thresholds, Master Response 19 regarding NSAQMD criteria pollutant thresholds during operations, and Master Response 35 regarding the discharge to South Fork Wolf Creek.

### Response to Comment Ind 652-3

The commenter is concerned about noise pollution from mining activity and increased truck traffic. The commenter indicates that the DEIR determined that noise produced by the project is acceptable to Nevada County regulations but then questions who would be accepting of the noise levels produced by the project. The commenter also states that blasting associated with the project would disrupt normal life functions and would disrupt horse training exercises.

The DEIR analyzes noise and vibration associated with the project in Chapter 4.10 and traffic impacts in Chapter 4.12. For noise and vibration, the DEIR found that the project would produce a substantial increase in ambient noise levels due to initial potable water pipeline construction activities along East Bennett Road, which are significant and unavoidable. (DEIR, p. 4.10-27.) However, the DEIR found that all other noise-related and vibration-related impacts would be mitigated to less than significant. (see generally DEIR, § 4.10.) The commenter provides no evidence that these conclusions are incorrect with regard to horse training exercises.

### Response to Comment Ind 652-4

This comment states that, because of the changing climate, it is not sensible to use water for the project. This comment presumably refers to the project's impacts to groundwater. The DEIR found that the implementation of mitigation measures, specifically a groundwater monitoring plan, well mitigation plan, and requirements to provide an alternative supply of domestic water would mitigate any impacts to groundwater supplies or groundwater recharge to less than significant. (DEIR, p. 4.8-54.)

The comments regarding the general opposition to the project are noted and the commenter is referred to Master Response 1 (Non EIR/Administrative Issues.)

**Individual Letter 653**

**Subject:** IMM/DEIR

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To Whom It May Concern:

The critical issue we face right now is a lack of groundwater!!! We have been in a drought period for several years now, with the past 2 being devastating to our environment. Unless you were on vacation in Hawaii for a month in late December and January, you could not have missed the devastation the snowmaggedon caused!

**Ind 653-1**

You would have to be blind to not see the hundreds of trees that snapped and fell. Why this year? Over the 32 years I have lived here, I have experienced many winters where 3 1/2 feet of snow fell in my yard with little if any damage to the surrounding trees. But this year, like everyone else, the Ponderosa snapped at about 30 feet and Live Oaks came crashing down because the groundwater has become depleted and the trees are sick!!! For years, I recorded about 66 inches of rain annually with much of it coming down in January, February, March and April but this year we have had so little last fall's leaves are still dry and not decomposing into mulch and soil.

We CANNOT afford environmentally to have the Idaho-Maryland Mine reopen! They will first drain the existing underground tunnels which are quite extensive. This will cause underground water throughout the area to be drawn toward the pull of the tunnel's water vacuum. That will mean our already depleted soils will become more depleted with many more trees dying and becoming fuel for the annually occurring wildfires!

Is opening the Idaho-Maryland Mine more important to the County than the health and well-being of our environment under these devastating climate circumstances? Quite frankly I am aghast that the County would even consider re-opening the mine right in the middle of our community with all of the other inherent environmental dangers like noise, mine waste, greenhouse gases, plus creating more toxins to clean up!

**Ind 653-2**

Please stop this madness and decline the DEIR going forward!

Sincerely,
*Penelope Curtis*

## INDIVIDUAL LETTER 653: PENELOPE CURTIS

### Response to Comment Ind 653-1

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Responses 1 (Non-EIR / Administrative Issues), 15 (Adequacy of Groundwater Monitoring Wells), 16 (Drought and Climate Change), and 33 (Groundwater Dependent Vegetation).

### Response to Comment Ind 653-2

Please see Master Responses 1, 8 (Mine Waste Characterization), 9 (Historical Mine Waste at Centennial Site), 16, and 27 (Greenhouse Gas Thresholds). The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 654**

Matt Kelley,
Senior planner
Nevada County Planning Department
950 Maidu Avenue
Suite 170
Nevada City, Ca.
95959-7902

cc: Heidi Hall, District 1 Supervisor: Ed Scofield, District 2 Supervisor: Dan Miller, District 3, Supervisor: Sue Hoek District 4 Supervisor: Hardy Bullock , District 5 Supervisor:

Dear Matt Kelley,
Senior planner

I am opposed to opening the Idaho Maryland Mine!

My family and I have lived in Nevada County for forty one years. During that time we have Enjoyed swimming in the river and hiking the many beautiful trails. I, like many other residents of Nevada County, feel very invested here.

**Ind 654-1**

We were drawn here by its natural beauty and the peacefulness of the environment. During our many years here, we have lamented the destruction of the environment,, in the past by Gold mining. We believed that the time of this destruction was in the past. Now that we know About the health hazards of gold mining, I am hoping that the Idaho Maryland Mine will NOT Be approved.

I am concerned about our air quality, the lowering of the water table in our wells, especially During this time of extreme drought, the safety of explosives during these extreme fire seasons, Wildlife and creek destruction, the noise and pollution from trucks making so many trips a day. We already have toxic air. Do we need to add more dust from the construction of this mine to The air we breathe. We have many elderly, retired people here and children who need the cleanest air possible. The construction of this mine will affect our health adversely. Our property values will decrease. There are, I believe, few factors that mitigate the risks our community will face should this mine be approved.

**Ind 654-2**

I would like to point out that the Grizzly Hill School STILL has contaminated water and needs to Use an expensive filtration system in order to have drinkable water. This was from the Siskon Mine in the 1990's.

**Ind 654-3**

Please vote No on opening the Idaho Maryland Mine. Thank you.

Respectfully,
Perissa Busick

Perissa Busick
P.O Box 742,
Nevada City, Ca
95959

## INDIVIDUAL LETTER 654: PERISSA BUSICK

### Response to Comment Ind 654-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 654-2

The comment does not directly address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project that do not enable a more specific response. For concerns related to air, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. For concerns related to well impacts and drought, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change. Regarding safety of explosives, please see Chapter 4.7, Hazards and Hazardous Materials. For noise concerns, please see Chapter 4.10, Noise and Vibration. Property value is a subject outside the scope of CEQA – please see Master Response 1.

### Response to Comment Ind 654-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Ind 655-1**

Do you ever hear the owls hooting in the morning ? Or watch the stars at night? Or just sit on your patio and listen to the quiet. I do
If the mine opens all that will be gone. Just the truck noise alone 24 hrs a day will be too much.
I moved to grass valley in the early 80s to get away from all the city lights and noise and be in nature.
The impact to the environment will be devastating!
Instead we should be focusing on recreation, boating biking, hiking, sports, and the Tourist trade.

Thanks for your time Pete Christakes

## INDIVIDUAL LETTER 655: PETE CHRISTAKES

### Response to Comment Ind 655-1

DEIR Impact 4.10-2 concluded all noise generated from engineered fill placement and compaction, and noise associated with haul truck operation (excepting potential jake brake use) and worker trips during this period, would remain below the applicable noise standards. Noise generated from hauling fill from the Brunswick Industrial Site to the Centennial Industrial Site could exceed local standards if jake brakes are used. Thus, Mitigation Measure 4.10-2 is included in the DEIR to reduce this impact to a less than significant level.

The commenter's opposition to the proposed project has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Ind 656-1**

Please remember that the mining industry has the worst environmental record of any industry, and that is saying a lot!

Within a half mile of my home are three abandoned mines that the extractors left for others to clean up. There are literally thousands within the state. No matter what they promised up front, they declare bankruptcy and walk away. Literally, they get the gold and somebody else gets the shaft. Let's not let it happen again.

The impact on water, traffic, housing, etc. also means major impacts right away.

**Ind 656-2**

Economic growth is not a challenge in our region. Maintaining a healthy environment, for both nature and humans while growing, is the challenge.

Please oppose any efforts to open large scale mining in our area.

Thank You,

Peter Arpin
15352 Stonehill Dr.

**Ind 657-1**

**Why would we want to do this?** I am skeptical of the happy talk about the jobs that will be created and the economic benefits to the community. At what cost? If you want to create jobs and bring money into the community, apply yourselves to getting high-speed, fiber-optic Internet to all households. This will bring an influx of highly-educated, well-paid professionals to our area, with no negative environmental impact. Why let our community suffer irreparable environmental damage so a few Canadians can make more money at our expense?

**Ind 657-2**

**Excerpts from an article in The Atlantic, "Is California on the Verge of a Second Gold Rush?"** https://apple.news/Aacn6zzlZRDiLtDnwN6WqYA

Rise Gold has pledged to mitigate the environmental impact of its new mining operation in part by employing a technique called "paste backfilling," which involves injecting a mixture of water, mine waste, and a binder (often cement) into mining tunnels. The practice helps provide structural support and reduce the amount of aboveground mine waste. There is some science to support the benefits of this approach, but it's only a partial solution and there are lingering uncertainties about its long-term impact.

**Ind 657-3**

Mining creates a lot of waste, including the rock that doesn't contain enough gold to extract (called "waste rock") and the slurry left over after gold has been extracted from ore (called "tailings"). Both waste rock and tailings can contain toxic substances that threaten to pollute groundwater and surface waters if not properly mitigated.

**Ind 657-4**

Grass Valley has been dealing with the fallout of Gold Rush–era mining for decades. Arsenic, which occurs naturally in the gold deposits of the Sierra Nevada foothills, remains an ongoing problem in the area. Old tailings can still leach heavy metals decades after mining operations have ceased. In Grass Valley, the Central Valley Regional

Water Quality Control Board documented high concentrations of arsenic in a pile of tailings nicknamed "the Red Dirt Pile." In 2020, high concentrations of lead, mercury, and arsenic were found in samples taken from a former mine-waste disposal area that now supports approximately four and a half acres of wetland habitat. That disposal area, known as the Centennial site, is owned by a subsidiary of Rise Gold called Rise Grass Valley.

**Ind 657-5**

The Centennial site was polluted enough to warrant consideration for listing as a federal Superfund site, but Rise Gold avoided federal regulation by agreeing to undertake its own cleanup.

**Ind 657-6**

Even when rock has little or no heavy metals, disposing of it can be a significant challenge. According to Rise Gold's website, the Idaho-Maryland mining operation historically had to remove a ton of rock for every half ounce of gold it recovered. "These mining companies come along and they want us to not notice that they're going to have a huge amount of mine-waste rock," says Elizabeth Martin, who recently retired as CEO of the Sierra Fund, a local conservation group based in nearby Nevada City. Rise Gold's draft environmental-impact report says the plan will result in approximately 182,500 tons of material produced per year that will need to be transported and then used as engineered fill. By comparison, a large dump truck can carry about 14 tons. Multiply that by more than 10,000, and the visual is "beyond most people's imagination," says Martin.

**Ind 657-7**

Paste backfilling is widely regarded as a more environmentally friendly way to dispose of mine waste. There is evidence that locking tailings up in cement decreases their permeability and stabilizes any heavy metals within them. There are still questions, though, about whether or not arsenic and heavy metals will stay put in the paste-backfill material over the long term. The leaching behavior of arsenic depends on a lot of different factors, including the binder used in the backfill and the chemical content of the tailings. The biggest unknown is what happens in the future, when the mine closes and the pumps shut down, which will let groundwater flow into the backfilled tunnels. Some studies have noted that even low levels of leaching could continue for years, potentially contaminating drinking water or nearby rivers and streams.

Heavy-metal leaching is high on the list of concerns in Grass Valley. Rise Gold promises that its operations will be clean, but even so, the company's hydrology report does note arsenic leaching from some test samples. The leaching tests, meant to simulate what might happen to a waste-rock pile when it rains, found that arsenic leached from samples of the mineral type serpentinite at concentrations 17 times greater than the water-quality standards.

**Ind 657-8**

Underground mining operations also intersect with the water table, which means the existing tunnels have to be dewatered, and the water that's pumped out of the tunnels has to be treated before it's released aboveground. "The water coming from these mines that they're dewatering is full of arsenic, manganese, iron, and other heavy metals," says the biologist Josie Crawford, the executive director of the Wolf Creek Community Alliance, another local group that opposes the mine. "It will be treated, but it needs to be treated forever."

**Ind 657-9**

Many conservationists and community opposition groups see gold mining as a battle between nature and greed, and question whether the pursuit of gold is really worth so much environmental destruction.

## INDIVIDUAL LETTER 657: PETER BREWER

### Response to Comment Ind 657-1
The commenter states that the economic benefits of the project are outweighed by its environmental impacts. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 657-2
The commenter is concerned about the use of cement past backfill (CPB) in the Idaho-Maryland Mine. Please see Response to Comment Ind 14-6.

### Response to Comment Ind 657-3
The commenter is concerned about the mining waste containing toxic substances. The commenter is referred to Master Response 8 - Mine Waste Characterization.

### Response to Comment Ind 657-4
The commenter states that historic mine tailings can leach arsenic into the environment. The commenter also states that the Centennial Industrial Site is highly contaminated. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA, and Master Response 9 - Historical Mine Waste at Centennial Site.

### Response to Comment Ind 657-5
The commenter states that the Centennial Industrial Site is polluted to the extent that it qualifies as a Superfund site. The commenter is referred to Master Response 9 - Historical Mine Waste at Centennial Site.

### Response to Comment Ind 657-6
The commenter implies that, based on the amount of waste rock to be removed from the Idaho-Maryland Mine, the number of trucks necessary to transport the waste rock is unimaginable. The comment does not identify a specific inadequacy with the DEIR and without additional detail, a specific response cannot be provided. Please see Master Response 1.

### Response to Comment Ind 657-7
The commenter is concerned about the potential for toxic substances to leach from the CPB. The commenter is referred to Master Response 8 - Mine Waste Characterization.

### Response to Comment Ind 657-8
The commenter is concerned that the treated was from the Idaho-Maryland Mine will adversely impact South Fork Wolf Creek. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek. As stated on page 4.8-51 of the DEIR, after mining is completed, and as underground mine workings fill with groundwater, water from the underground mine workings would begin to seep from the existing drains. The water that would seep from the underground workings is anticipated to have similar water quality to the water that currently discharges from the existing drains. Specifically, it may contain elevated levels of iron and manganese. Therefore, the condition after mining is completed would be similar to existing, or baseline, conditions, such that re-activation of the seeps would not represent a potentially significant impact under CEQA. Although part of the existing environmental setting, some of the seeps have elevated arsenic levels that could pose a threat to human health or the environment. However, despite these existing discharges from the drains, the reported concentrations of all metals and other constituents in the Wolf Creek samples are well below the NPDES water quality standards.

## Response to Comment Ind 657-9

The commenter states that some questions whether gold mining is worth the impacts to the environment. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 658**

**From:** peter fromm <moagi1951@gmail.com>
**Sent:** Sunday, April 3, 2022 1:05 PM
**To:** Idaho MMEIR
**Subject:** Idaho-Maryland Mine Draft EIR is Inadequate

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Mr. Matt Kelley

Senior Planner

Nevada County Planning Department

950 Maidu Ave, Ste 170

Nevada City, CA 95959

Dear Mr. Kelley:

The Draft Environmental Impact Report submitted by Rise Gold is inadequate for many reasons, but I will focus on only two: air and water.

**Ind 658-1**

Toxic Air Contaminants

Asbestos and crystalline silica are two substances which are hazardous when inhaled. They will become airborne when the material containing them is broken

1

or crushed, as will be the case during the mining operation. Table 4.3-3 shows the attainment status of Respirable Particulate Matter (PM10) as NONATTAINMENT.

**Ind 658-2**

In addition, the only monitoring station for this type of particulate matter is in Yuba City – 31 miles from the mining site. This is totally inadequate. We need better data. Also, how will the grading change once the mine is fully operable? It cannot get better, and I cannot afford to risk my health, and that of my family just so that a foreign company can turn a profit.

Water

According to recent studies, the current mega draught is the worst in 1200 years!!! It should be obvious, but during a draught, water levels in lakes, streams, reservoirs and aquifers goes down. In addition, the DEIR states that MILLIONS of gallons of water per day will be removed from the mine.

**Ind 658-3**

When that happens, more water will backfill whatever is pumped out. And the source of that backfill will be the aquifers which feed our local wells.

If our aquifers are threatened, each affected homeowner will need make other arrangements (i.e. NID). I checked with them to determine the cost and timeframe required to connect to their system. As it turns out, the cost is exorbitant. In my case, approximately $150,000. And after that, I will have the opportunity to pay for something which is currently essentially free.

So all the affected well owners are asked to subsidize this environmentally destructive operation.

Under section 4.8-2(b), the DEIR states: "If, based on the GMP, it is determined that mining operations are resulting in a significant impact to any well(s) (i.e., a 10

2

percent or greater reduction of the water column of any well), pursuant to Nevada County General Plan Policy 17.12, the project applicant shall be responsible for providing a comparable supply of water to such homes or businesses whose wells are significantly impacted, and if necessary, providing an ***immediate*** water supply until the source of the problem is determined and rectified."

**Ind 658-4**

The DEIR does not include a definition of the word ***immediate***. I believe that their definition and mine do not agree. What happens if my well runs dry? When will someone come out to my house to investigate and remediate the situation? How long will that process take? How can anyone live without water? If this process takes more than a few days (or if the project applicant disputes their culpability in the loss of water), where are we then? Obviously, we will not be able to occupy (or sell) our home.

Due to the above, as well as all the other hazards and destruction outlined in the DEIR, I'm hopeful that the planning department and the Board of Supervisors will compel Rise Gold to revise this totally inadequate report.

**Ind 658-5**

Thanks for your consideration,

Peter Fromm

14006 Liquidambar Lane

Grass Valley, CA 95945

Moagi1951@gmail.com

## INDIVIDUAL LETTER 658: PETER FROMM

### Response to Comment Ind 658-1

The commenter states that the project will result in the release of toxic air contaminants, namely asbestos and crystalline silica, but does not state how the DEIR is inadequate. Chapter 4.3 of the DEIR analyzed asbestos and crystalline silica emissions from the project and found the associated impacts to be less than significant after mitigation. (DEIR, p. 4.3-82.) The commenter is referred to Master Response 21 - Conservatism of Silica Assumptions, and Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 658-2

The commenter states that the ambient air pollutant monitoring stations and data provided in the DEIR are not representative of the project site. The commenter does not suggest any stations that would have data more representative of the project site. Of note, the ambient data included in Table 2 in Appendix E.1 of the DEIR, and summarized in Table 4.3-4 of Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR, are provided as context for the existing local ambient air quality. Significance determinations, however, are based on comparison to the NSAQMD thresholds. As discussed on page 4.3-41 of the DEIR, the NSAQMD established thresholds of significance for CEQA purposes to achieve and maintain the National and California Ambient Air Quality Standards (AAQS). Because an AAQS is based on maximum pollutant levels in outdoor air that would not harm the public's health, and air district thresholds pertain to attainment of the AAQS, a project that complies with the thresholds established by a local air district, such as the NSAQMD, would not result in adverse effects to human health related to criteria pollutant emissions, which were developed based on compliance with the applicable AAQS. Regarding emissions quantification, the DEIR employed industry standard and vetted approaches and quantification equations, such as factors developed by the United States Environmental Protection Agency (EPA) in the AP-42 Compilation of Air Emissions Factors and by the California Air Resources Board (CARB) in the OFFROAD and EMFAC models. The assumptions and factors incorporated in the analysis are detailed in "Method of Analysis" section of Chapter 4.3 of the DEIR, starting on page 4.3-44.

### Response to Comment Ind 658-3

The commenter is concerned that the dewatering of the mine will have adverse impacts to groundwater supplies. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

### Response to Comment Ind 658-4

The commenter is states that the DEIR does not define the word "immediate" in the context of the Project Applicant providing water supply in the event that the dewatering of the mine impacts groundwater wells. The commenter is referred to Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 658-5

The commenter states that, due to the above, and the other "hazards and destruction" outlined in the DEIR, the commenter urges the County to revise the DEIR. The comment is noted for the decisionmakers.

**Individual Letter 659**

**Ind 661-1**

Hello,
As a resident of Nevada county for a decade and as an employee who works less than a mile from the site of the mine, I would like to express my dissent over the reopening of the mine. Reasons include environmental impacts related to noise, water, air, and ground pollution. I also feel that the increase in job creation does not outweigh the negative consequences our town will suffer if the mine reopens.

Warmest Regards,
Rachael Elam

## INDIVIDUAL LETTER 661: RACHAEL ELAM

### Response to Comment Ind 661-1

The comment does not directly address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project that do not enable a more specific response. For concerns related to air, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. For concerns related to well impacts, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. For noise concerns, please see Chapter 4.10, Noise and Vibration. Regarding ground pollution, please see Chapter 4.7, Hazards and Hazardous Materials and Master Response 8 – Mine Waste Characterization.

**Individual Letter 662**

**From:** Rachel
**To:** bdofsupervisors
**Subject:** I oppose the mine
**Date:** Sunday, January 30, 2022 9:17:04 AM

**Dist 1**

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hi Heidi,

**Ind 662-1** Thank you so much for checking on me and offering help during our 2 week power outage. I hope your new year is off to a great start.

I am writing to you as your constituent to express my opposition to Rise Gold reopening the mine.

**Ind 662-2** I am opposed to reopening based on water usage. At a time when there are signs on the sidewalks in downtown Nevada City about restricting water usage, I can't fathom why we would entertain a business that will waste and contaminate an astronomical amount of water in our community. To me, this detrimental impact outweighs all other factors.

The mine will use 1.2 million gallons a day every day after pumping 815 million gallons of water to begin mining. The mine will contaminate this water. The mine's usage of and contamination of water are facts. The mine's ability to clean the water after is irrelevant to my opposition.

**Ind 662-3** As a colleague wrote, "ongoing noise and possible loss of wells and lower property values, and those living along routes to be travelled by trucks hauling tailings at all hours, have to be considered first and foremost."

This article further cemented my opposition to Rise Gold reopening the mine. I thought it would be of interest:

**Ind 662-4** Is California on the Verge of a Second Gold Rush?
https://www.theatlantic.com/science/archive/2022/01/gold-mines-reopening-california/621403/

Sincerely, Rachel
Resident in district 1

## INDIVIDUAL LETTER 662: RACHEL

### Response to Comment Ind 662-1
The comment does not address the adequacy of the DEIR. Please see responses to more specific comments below.

### Response to Comment Ind 662-2
The commenter opposes the mine's use of water, which is noted for the record and forwarded to the decisionmakers. The commenter also states that the mine's contamination of water is a fact. The particular concern is unclear as the mine would pump existing groundwater from the underground workings of the mine and treat this water at an on-site water treatment plant, permitted by the State, prior to discharging the treated water into South Fork Wolf Creek. Please see Master Response 35 (Discharge to South Fork Wolf Creek) for further details.

### Response to Comment Ind 662-3
DEIR Impact 4.10-2 concluded all noise generated from engineered fill placement and compaction, and noise associated with haul truck operation (excepting potential jake brake use) and worker trips during this period, would remain below the applicable noise standards. Noise generated from hauling fill from the Brunswick Industrial Site to the Centennial Industrial Site could exceed local standards if jake brakes are used. Thus, Mitigation Measure 4.10-2 has been required to reduce this impact to a less than significant level. For concerns related to well impacts, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. Property value is outside the scope of CEQA – please see Master Responses 1 and 2.

### Response to Comment Ind 662-4
The comment does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 663**

**From:** Ralph
**To:** bdofsupervisors
**Subject:** Rise Reported County determinations on the Idaho-Maryland Mine
**Date:** Tuesday, February 22, 2022 10:25:57 AM
**Attachments:** RiseGoldLetterToWellOwners_Feb2022.pdf
ConcernsAboutRiseGoldMailers_Feb22.pdf

Dear Supervisors

**Ind 663-1** As you may be aware, Idaho-Maryland Mine owner Rise Gold Corp has sent out yet another mailer to Nevada County residents, this time claiming that "Nevada County has just completed the most thorough environmental study in its history," along with numerous unresolved claims about the project. The mailer includes a form for supporters to mail in to Rise Gold.

We want to bring your attention to another letter that was sent to well owners in the mine area. (Copy included)

**Ind 663-2** The letter states: "**The County has determined** that no domestic water wells will be drained by mine dewatering," that "**The County has determined**, using a safety factor of 100%, that several wells...could be impacted...to a maximum of 10 feet," and "**The County has determined** that there is no threat to water quality to domestic water wells from the Idaho-Maryland Mine Project."

We feel that it would serve the public interest for the County to issue a clarifying statement regarding the status of the Draft EIR and the status of determinations by the County.

**Ind 663-3** Thank you.
Sincerely,
Ralph

Rise Grass Valley Inc.
333 Crown Pt Circle, Ste 215
Grass Valley, CA 95945 USA

February 11th, 2022

[redacted]
Grass Valley, CA 95945

Mr. [redacted],

The Idaho-Maryland Mine Project proposes reopening the Idaho-Maryland underground mine with facilities constructed on the Brunswick Industrial site located south-west of the Brunswick Road and E. Bennett Road intersection. Nevada County has recently issued (January 4th, 2022) a Draft Environmental Impact Report (the "DEIR") for the Idaho-Maryland Mine Project. Rise has reviewed this document in detail over the last month and we are reaching out to you to provide further information on our project.

Rise Grass Valley Inc. (Rise) is the owner of the mineral rights, starting 200 feet and deeper beneath your surface property including all necessary and convenient rights to extract them, excepting the right of entry to the surface land. To access its mineral estate, Rise must first dewater the underground mine, and because your property is on a well, extensive research and modeling by certified, licensed hydrogeologists took place to assure us, the County and you how your well might be affected. While Rise does own the mineral rights deeper than 200 feet below the surface, Rise respects your surface property rights and is committed to being a good neighbor and community member. Out of an abundance of caution, Rise plans to provide you the option to connect to NID water at Rise's expense.

The hydrogeologic analysis was peer-reviewed by an independent California-licensed hydrogeologist. The County has determined that no domestic water wells will be drained by mine dewatering. The County has determined, using a safety factor of 100%, that several wells in the East Bennet Road area could be impacted by a reduction in the water column of wells ranging to a maximum of 10 feet. It should be noted that the water level in the existing mine workings is already approximately 100 feet below the depth of groundwater in your area, which illustrates that the mine is not hydrologically connected by significant fractures to the shallower groundwater well due to the impervious nature of the surrounding rock. Nevertheless, to ensure that you have 100% confidence in an uninterrupted access to water, Rise has committed to construct, at its own cost, an extension of the Nevada Irrigation District (NID) potable water system along E. Bennett Road which could service your property if you choose. This construction and connection would take place before any mine dewatering commences. Thus, you will have the option of either connecting to NID water, at Rise's cost, and/or continuing to use your domestic well. The County has determined that there is no threat to water quality to domestic water wells from the Idaho-Maryland Mine Project. Water does not flow upward from the mine

workings to feed your well, and as the water in the mine workings is removed, that would continue to be the case.

If you decide to utilize NID potable water, Rise will fund the connection to your property. The value per property owner, including capacity charges, is estimated at approximately $85,000. Rise would also pay for your ongoing water charges as long as you own your property. A high-quality water supply from NID would alleviate your ongoing treatment and monitoring of your current well. In addition, this water supply is reliable and not interrupted during our area's increasingly frequent power outages.

If requested by the landowner at the time of NID connection and service to their properties, Rise will pay to close property owners' wells using certified well drillers and under Nevada County regulations.

If the Nevada Board of Supervisors approves the project, we will proceed with the detailed design of the potable water line. We will consult with you about your preference in meter location and desire to connect to the NID potable water system.

The Idaho-Maryland Mine Project also has direct benefits to fire protection for your property. The extension of the water pipeline along E. Bennett Road will allow for installing of fire hydrants and allow firefighters to respond to fires in your area much more efficiently. Rise has also agreed to provide Ophir Hill Fire Protection District with a new fire engine and additional firefighters which will significantly enhance their ability to provide excellent service in your area.

Your property is over 1/2 of a mile away from the Brunswick site, and it would not be impacted by noise during operations. Rise will not route truck traffic along E. Bennett Road adjacent to your property. Technical analysis, performed by an expert PhD, shows that the anticipated vibrations from drilling and blasting underground are negligible, and in almost all situations, drilling and blasting will be unnoticeable and undetectable.

Rise recently engaged RCLCO Real Estate Consulting, a highly respected firm, on the potential effect of the Idaho-Maryland Mine Project on local real estate values in the local area. RCLCO found no negative impact on home prices based upon case studies or recently opened mines. However, due to demand created by employment, homes sold closer to a mine actually achieve higher pricing than those sold farther away. We believe the extension of NID water service will increase the value of your property, as will the economic impact of the 300+ high-paying jobs and approximately 300 indirect jobs that the project will create.

You can learn more about the Idaho-Maryland Mine Project at www.risegrassvalley.com and our company at www.risegoldcorp.com. If you are interested in more information, have any concerns, or wish to support our project please contact me and I would be pleased to arrange a

meeting in our Grass Valley office or at the Brunswick site. If you would like to meet in person or speak further about our project and the proposed NID water service, please contact me by phone or email as below.

Sincerely,

Ben Mossman
President, Rise Grass Valley, Inc.
CEO, Rise Gold Corp.

## INDIVIDUAL LETTER 663: RALPH SILBERSTEIN

### Response to Comment Ind 663-1

The commenter references a letter sent out by the applicant, which is included as an attachment. The applicant's dissemination of materials to the community is irrelevant to the County's independent and objective DEIR process. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 663-2

The commenter references language in the attachment regarding the lack of well impacts associated with the project. Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, which accurately presents the findings of the DEIR regarding well impacts.

### Response to Comment Ind 663-3

The DEIR and this Final EIR accurately present the County's findings with respect to the environmental review of the proposed project. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 664**

To: Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902
(530) 265-1423

From: Ray Bryars. 11574 Northview Drive, Nevada City, CA 95059
Email: raybryars@yahoo.com

Subject : Questions & Comments related to the Idaho-Maryland Mine Project DEIR

Date: 3/30/2022

Via email:Idaho.MMEIR@co.nevada.ca.us

Dear Matt

**Ind 664-1** I have reviewed section 4.7 - Hazards and Hazardous Materials section of the DEIR and was shocked at how they could possibly conclude that there are "No Significant issues". These are explosives materials and chemicals, they are addressing, how could there not be significant issues?

**Ind 664-2**

**Nearest Airports (page 4.7-10)**
Nevada County Airpark is only 4000 feet from the proposed Brunswick Industrial Site, with planes flying over on a regular basis.

It notes that the Nevada County Air Park is a "small aircraft airport" this is a disgraceful misleading statement that demeans the importance of the airport to protecting a number of communities. This airport is critical for the CALFIRE Grass Valley Air Attack Base. It is the permanent base for two Grumman S-2 Air Tankers that drop fire retardent, along with two Air Attack aircraft that coordinate the efforts of the Tankers. These planes protect a large portion of Nevada and adjacent counties during fire season. If anything were to happen to impede the ability of these and other firefighting planes to take off and land during critical firefighting periods, there could be horrendous impacts to our infrastructure and to the lives of many residents, businesses, employees and visitors. The airport is vital to the safety, vitality and future of Nevada County.
**Question**: Why would Rise Gold blatantly Lie about the value of the airport?
**Question**: How could the danger to this valuable asset ever be mitigated?
**Question**: Doesn't there need be special notification to pilots about the location of the mine and the possibility of emissions, explosions, plumes of air that might cause turbulence?
**Question**: When transportation of explosives is occurring within the flightpath, shouldn't all flights be stopped?
**Question**: Since the airport is crucial to the safety of our community during the fire season, shouldn't all transport of explosives be banned during fire season?

**Ind 664-3**

**Emergency Response and Evacuation (Page 4.7-10)**
This section discusses guidance for evacuation orders, warnings, etc.
**Question**: Will law enforcement be fully trained to respond to explosions?
**Question**: What if an explosion levels the buildings and cuts off any ability to contact law enforcement. How will the neighboring residents and businesses know what to do?
**Question**: Will all neighbors within a possibly impacted area be notified that they are living close to a site that is using dangerous explosives?
Question: Will the properties in the danger zones be provided with compensation for the danger that they will constantly be exposed to?
**Question**: Will the property owners in the danger zones be provided with compensation for the reduced value of their properties?
**Question**: Will property taxes be reduced for properties that are close to the Brunswick location where the explosives will be used?
**Question**: Will anyone proposing to purchase or sell a property within an area that could be impacted by explosions or hazardous materials be notified of the dangers?

**Ind 664-4**

On page 4.7-11 It mentions that the Greenhorn Road area would likely have several Zone Haven zones because it is a relatively large area.
**Question**: Are there any other areas in Nevada County that have or will have Zone Haven zones due to their proximity to the hazardous materials at the mine site?

**Ind 664-5**

**Section 4.7.3**
**Occupational Safety and Health Act (page 4.7-12)**
There is discussion about the training requirements.
**Question**: Can it be assured that all personnel will be adequately trained prior to any hazardous materials being brought to the site?

**Ind 664-6**

**Question**: Is the County able to ensure that the proper training takes place?
**Question**: Is the County adequately staffed to be able to monitor and enforce adherence to a Hazardous Materials safety program?
**Question**: Will the applicant be required to provide a detailed project timeline that included critical safety milestones, prior to any approval for the project to be started?
**Question**: Is the County Building Department able to verify that any buildings meet appropriate hazardous materials construction requirements?

**Ind 664-7**

**Question:** Who will pay for all the regulatory costs associated with transporting, handling and housing hazardous materials?
**Question**: Given the size of this project and the proposed 80 year operation. Will there be any costs to the County that taxpayers will need to cover?

**Ind 664-8**

**Question**: What steps will be taken to ensure that the Brunswick Mine site will not become a toxic waste site like the Centennial Site?

**Ind 664-9**

**Question**: Will a very large Security Bond be required to ensure that the applicant will not run off and or declare bankruptcy if there are problems? Please note there is a history of the applicant doing exactly this in Canada.
**Question**: If there is an explosion and hazardous materials are spread to surrounding neighborhoods, who will pay for the cleanup costs? Who will pay for inconvenience and housing for residents while the properties are cleaned up? Who would be liable if heaven forbid, someone is killed or injured?

**Ind 664-10**

**Nevada County General Plan (page 4.7-17)**
This section is misleading. It makes it appear that adding hazardous substances into the community fits into the General Plan. No it doesn't - The General Plan does not, nor should it, add more hazards to our community. This is very sleazy!
**Question:** If there is a hazardous waste cleanup situation caused by the mine in Nevada County, who pays for it?
**Question:** Why would the County approve any project that would present a hazardous waste cleanup risk?
**Question:** Given that any hazardous situation could result in road closures or flight cancellations. Who would pay for the cost to businesses and residents?

**Ind 664-11**

Policy HM-10.5.5 states that The County will actively promote clean-up or remediation of properties contaminated by mine waste or other hazardous materials .....
**Question:** If this is the case then why do we still have numerous BrownField sites in Nevada County?
**Question:** Since there are numerous BrownField sites related to mining, that have not been remediated, why are we even thinking about approving another potential disaster site? Let's make it a County Policy not to approve any mine until all Brownfield sites are remediated.

**Ind 664-12**

**Nevada County Environmental Health Department (NCEHD) (page 4.7-18)**
It discusses that the NCEHD is (amongst other things) responsible for implementing the hazardous materials storage, hazardous materials management plans and risk management plans.
**Question:** Is the Health Department staffed and trained to handle the huge risks of thousands of pounds of explosives being moved into and stored in our community?
**Question:** Does the Health Department have the budget to handle these additional responsibilities?

**Ind 664-13**

**Nevada County Emergency Operations Plan (EOP) (page 4.7-18)**
It refers to the EOP that delineates responsibilities of first responders (fire and Law) and other response support organizations. It discusses evacuation plans that would be needed as well as Standardized Emergency Management Systems (SEMS) and Comprehensive Preparedness Guidelines (CPG).
**Question:** How many other businesses require a reference to an EOP or SEMS or CPG?
**Question:** Does the community want or deserve to have a business that has to reference an EOP, an SEMS or a CPG? The Mine site could be used for many other businesses, organizations or activities that are of benefit to the community - Not one that brings the need for Emergency Operations Plans.

**Ind 664-14**

**Section 4.7.4 (note number appears out of sequence) Impacts and Mitigation Measures (page 4.7-19)**

**Standards of Significance (page 4.7-19)**
In accordance with CEGA Guidelines Appendix G, and impact is considered significant if the proposed project would:

Then there is a bullet item list of areas that are considered significant. each of the issues should be enough to deny the project. I will list only one:

- "This includes: For a project located within an airport land use plan or, where such a plan has not been adopted, within 2 miles of a public airport or or public use airport, would the project result in a safety, hazard or excessive noise for people residing or working in the project area."

**Question:** With the Nevada County Airport less than 2 miles from the Brunswick site. This is obviously a SIGNIFICANT issue that cannot be remediated. Shouldn't this alone require the DEIR to be updated or completely stop the project?
**Question:** After this list the DEIR says nothing to deny that all items are SIGNIFICANT, the paragraphs following the list totally ignore the list and make no effort to discuss mitigation. Shouldn't this require the applicant to completely revise the DEIR to address how to mitigate each issue?

**Section 4.7-1 (page 4.7-22)**
**Create a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials. Based on the analysis below, with implementation of mitigation, the impact related to the transpiration, storage and use of hazardous materials is considered less than significant.**

**Ind 664-15**

**Question:** This contradicts the conclusion on page 4.7-31 which states "it is conservatively concluded that the proposed project could result in a **significant** impact to the routing transport, storage and use of explosives. Why the discrepancy?
**Question**: Why doesn't this shut down the whole project?
**Question**: The transportation route is not spelled out. Shouldn't the property owners along the route be specifically notified and given the opportunity to voice their concerns?
**Question**: Why should the County approve a project that could impact the safety of the residents?

**Section 4.7-1 (page 4.7-22)**
**Explosives (page 4.7-23)**
In table 4.7-1 it lists a number of types of explosives some of which need to be transported and stored separately. It is obvious that the management of these explosives is a non-trivial task that will require highly qualified staff 24/7/365. It is extremely important since this is a highly technical, highly detailed duty that will require much oversight.

**Ind 664-16**

**Question:** To ensure safety in the community, shouldn't the details of this process and the staffing qualifications be spelled out for review, prior to any approvals by the Supervisors?
**Question**: Shouldn't the details of the training requirements for anyone handling explosives be spelled out?
**Question**: Shouldn't the details of the oversight of the explosives storage be spelled out?
**Question**: Why is there no reference to the "AMERICAN TABLE OF DISTANCES FOR STORAGE OF EXPLOSIVES AS APPROVED BY THE INSTITUTE OF MAKERS OF EXPLOSIVES AND REVISED JUNE 1991"? This should be used as the Bible for explosive storage and distances from Public Highways. Distances from Brunswick Road and East Bennet Street should be spelled out.
**Question**: Shouldn't the training of local emergency responders to a situation regarding hazardous materials be spelled out?
**Question**: Shouldn't staffing requirements of 24/7/365 for local fire departments, hospitals, etc be spelled out?

**Ind 664-17**

**Question**: The current Brunswick sites is not securely fenced. I have seen people casually breach the fencing a number of times. Will the fencing and perimeter security be spelled out in

detail and will the ability to maintain a high level of security 24/7/365 for 80 years be a requirement?
**Question**: Will the applicant's ability to fund and maintain a high level of security for 80 years, be determined prior to any thought of allowing this project to move forward?
**Question:** Will a very large bond be required along with annual compliance requirements that allow for complete closure of the site if there are any serious non-compliance issues?

**Explosive Storage**
On page 4.7-28 it specifies that "no mining is proposed closer than 500 feet to surface; thus explosives in transit would be at least this far from the surface." This is a ridiculous statement since the explosives have to be in transit from wherever they are manufactured to Grass Valley and then once at the mine site, they would be in transit to the 500 foot level.
**Question:** Why is Rise Gold making these obviously misleading statements? Explosives will be required for construction of a new axes shaft, reclamation of existing mine works and development of storage areas, etc. Doesn't the omission of details indicate that there is a SIGNIFICANT impact that can't be mitigated?

**Ind 664-18**

**Question**: Where will explosives and other hazardous materials be stored prior to transit to the 500 feet from the surface level?

On page 4.7-27 it specifies that no mining is proposed closer than 500 feet from the surface; thus explosives in transit would be at least this far from the surface. Again, a ridiculous statement. At this point it is not known what impediments will be found in the mineshaft. It has been decades since anyone has been into the mine, so there could be huge blockages that will require explosives to blast through.
**Question:** Why is Rise Gold giving misleading information? Can they guarantee that no explosives will ever be used above 500 feet below ground level?

****Proximity to roads**
The American Table of Distances for Storage of Explosives as approved by the institute of makers of explosives and revised June 1991. Spells out the distances explosive materials should be from public highways.
**Question**: Will this be adhered to and will there be extra precautions required due to the proximity of Brunswick Road and East Bennet to the areas where explosives will be stored?

**Ind 664-19**

Explosive Transport **(page 4.7-24)**
On page 4.2-24 it states that Hauling of explosives would occur using Brunswick Road to State Routes (SR) 20/49……
**Question**: Exactly what are the details of the routes that the explosives take on the way to the Mine? Will this be through business districts or residential areas? What security will there be? We have all been made aware of catastrophic explosions caused by the same explosives that Rise Gold intends to use. These explosions have caused the death of thousands of people and obliterated hundreds of homes.
**Question:** This route is extremely close to the Nevada County Airport? Will there be restrictions to flights during explosives transport?
**Question:** What will happen during fire season when planes need to rapidly access the airport to protect the community?
**Question:** Will Rise Gold be required to post a multi-million dollar bond in case something goes wrong?
If the answer is no. Why not?

**Ind 664-20**

**Question:** If there is an explosion, will trained resources be available to communicate with the community and evacuate residents as required? It is well know that along Sutton Way, close to Idaho-Maryland Road, there are senior care facilities that would require a massive evacuation response.
**Question:** Will trained personnel be available 24/7 to take care of these people in an emergency?

---

On page 4.7-23 It states that :" The handler or an employee authorized representative agent, or designee of the handler shall provide all state, city or county response personnel with access to the handler's facilities. In the case of the proposed project the contractors are required to notify the NCEHD (Nevada County Environmental Health Department) in the event of an accidental release of a hazardous material, who would then monitor the conditions and completion of remediation measures."

**Ind 664-21**

**Questions:** Where are the handler's facilities? Is this the mine? If there is an explosion or hazardous release on Brunswick Road or in the Glenbrook Basin, what steps would be taken to evacuate hundreds of people? Will the NCEHD be staffed to respond 24/7/365 for 80 years, if there were an emergency? What training does the NCEHD have for handling explosives? Will there be trained personnel available 24/7/365/80 to respond to incidents?
**Question**: Are there plans to train NCEHD personnel for explosive related incidents? When will training take place and at what intervals?

---

On page 4.7-26 there is reference to a maximum of 28,000 pounds of explosives would be stored underground at any given time. Prior to that statement it specifies that 0.93 tons of explosives would be used each day. Since there are 2000 pounds in a ton, that infers that the explosives would need to be replaced approximately every 15 days. This means that a truck carrying 28000 pounds of explosives would be taking the off ramp from Highway 20/49 at Brunswick Road and driving through very heavily used intersections on the way to the Brunswick site. This would occur throughout the year, which means possible transportation through wind, rain or snow conditions, not to mention the very high probability of traffic accidents over time. If there is another transit route, it should be spelled out.
**Question:** The two Intersections along Brunswick at Idaho Maryland Road and Loma Rica Drive are extremely close (less than 1/2 mile) to the Nevada County Airport. Should a valuable asset like the airport be subject to these explosion risks? There was a recent fatal accident close to Loma Rica Drive. What would happen if explosives were involved?

**Ind 664-22**

**Question**: Is the developer of the Loma Rica housing project aware of the possibility that explosives will possibly be be transported along Brunswick Road, past the development?
**Question**: Can it be confirmed that the developer will be required to disclose details of the hazards of the mine and transport of hazardous materials to potential property owners?
**Question:** Will the developer of the Loma Rica housing project be required to notify property owners of the probability that explosives will be used under their homes?
**Question:** Will all Realtors be required to notify all potential buyers of property above or within a mile of the mine be required to disclose that explosives will be transported close to their homes and potentially used under their homes?
**Question:** Does it make sense to be transporting huge amounts of explosives, causing a community like Grass Valley to be subject to the risks of the huge explosive damage that Ammonium Nitrate can cause? We see situations almost weekly where large communities have been evacuated due to the threat of explosions. Recently there was an uncontrolled fire in a North Carolina fertilizer plant. Is this a risk that our community deserves?

On Page 4.7-28 it states that "Blasting activities are proposed to take place twice daily with blasting between shifts at 7AM and 7PM ....."
**Question:** Will the property owners of the new Loma Rica Housing Development be made aware of these blasting activities? The explosions could be directly below hundreds of properties.
**Question:** Will current property owners on Sutton Way be notified of these blasting activities? There are people with fragile health conditions in some of the health facilities in this area. The blasting may impact their health.

**Conclusion (page 4.7-30)**
It states that: "compliance with applicable federal, State and local regulations would "minimize" the potential for the proposed project to result in a significant hazard to the public or the environment through the routine transport, use or disposal of hazardous materials."

Ind 664-23

**Question:** Why would the county knowingly subject its residents to ANY risk? We all know that humans make mistakes and accidents happen. If this project is approved it is almost a certainty that a disaster will happen. We have examples almost every week of explosions with the chemicals that are proposed for use at this site. Recently an Ammonium Nitrate plant in North Carolina burned out of control for a 3rd day, 6000 people were evacuated and it is projected to be one of the worst explosions in US history. Does Nevada County need to take a similar risk? I urge you to say NO.

Then on page 4.7-31 it states "It is conservatively concluded that the proposed project could result in a **significant** impact related to the routine transport, storage and use of explosives."
**Question:** Why should the community of Grass Valley subject its residents to these risks? It makes no sense, for any period of time, let alone the proposed 80 years?
**Question**: Why do previous sections conclude that "there is no significant risk" this is disgracefully misleading.

**Mitigation Measures (page 4.7-31)**

Ind 664-24

States that "The mine operator shall prepare a Risk Assessment when the underground mine is accessible..... The Risk Assessment shall be performed by a qualified professional .....The Risk Assessment shall demonstrate protection of the public from hazards of explosive storage and be provided too the Nevada County Planning Department before underground storage of explosives.
**Question:** Does the Planning Department have the staff and the expertise to address safety issues with explosives? If not who does?
**Question**: What is the timeframe for the Risk Assessment? Shouldn't this be part of the DEIR?

Ind 664-25

Page 4.7-31, 4.7-1(c) The mine operator ..... Proof of the agreement between ..... Shall be provided to the Nevada County Planning Department before transporting explosives to the site.

**Question:** Does the Planning Department have the staff and the expertise to address explosive transportation issues? If not who does?

Page 4.7-31, 4.7-1(d) Prior to the transport, storage, or use of hazardous materials or explosives at the site, the mine operator shall prepare a Hazardous Materials or explosives at the site, the mine operator shall prepare a Hazardous Materials Business Plan (HMBP). The County shall review and approve the HMBP prior to the use or storage of hazardous materials or explosives on-site.

**Ind 664-26**

**Question:** Is there anyone with the experience and expertise on County Staff who could do this? If not, what is required to hire and retain staff with the appropriate skills?
**Question**: Shouldn't the Hazardous Materials Business Plan be part of the DEIR?
**Question:** Who will pay for the costs associated with this?

**Cumulative Impacts And Mitigation Measures (page 4.7-39)**
**Section 4.7-5**
Page 4.7-39 it states:
"In general, hazardous materials and other public health and safety issues are site specific and project specific and would not be significantly affected by other developments within the project area."
**Question**: How is this possible when on page 4.7-31 it states "It is conservatively concluded that the proposed project could result in a **significant** impact related to the routine transport, storage and use of explosives." They are contradicting their own statements.
Also on page 4.7-39 it states:
"this EIR concludes that compliance with applicable federal and state regulations, such as MSHA, OSHA, and CCR, as set forth in Mitigation Measures 4.7-1 (a-d), would ensure that the explosive hazards associated with the ongoing operation of the proposed project should not combine with other cumulative projects to create significant related hazard impacts, and the cumulative impact would be **less than significant.**

**Ind 664-27**

**Question**: Shouldn't the compliance process be documented in detail to show all the interacting agencies and how they interface with the employees of the mining company? Details should show the costs to each organization and who is responsible for the costs. If any of these costs are carried by the County or any residents in the county, this should be clearly specified so that those responsible for allowing this project to move forward are made fully aware of who is really paying the bill.
**Question:** Is there an agency in County Government responsible for vetting the track record of anyone proposing to reopen a mine to ensure that reasonable attempts have been made to protect the residents from another Siskon Mine, Magenta Drain or Lava Cap Brownfields site problem?
**Question:** How can any of the statements in this DEIR be trusted until the applicant has been vetted?

## INDIVIDUAL LETTER 664: RAY BRYARS

### Response to Comment Ind 664-1

The commenter disagrees with the DEIR's findings that the impacts discussed in Chapter 4.7 pertaining to hazardous materials could be mitigated to less than significant. The commenter does not specifically state how the DEIR is inadequate. Section 4.7.4 of the DEIR describes the standards of significance and methodology used to analyze and determine the project's potential impacts related to hazards and hazardous materials. As discussed in Section 4.7-1 on pages 4.7-22 through 4.7-31 of the DEIR, with implementation of mitigation, the impact related to transportation, storage. and use of hazardous materials is considered less than significant. As discussed in this section of the DEIR, the transportation of explosives is heavily regulated and the transportation of explosives in the United States has an excellent safety record. Transportation, storage, and use of explosives used in furtherance of the project would be required to comply with applicable federal and State laws at all times. Compliance with such would help to ensure that a significant hazard to the public or the environment through the routine transport, use, or disposal of explosives would not occur. The commenter is also referred to Master Response 10 - Explosives, Reagents, and Brunswick Fill.

### Response to Comment Ind 664-2

The commenter states that the project will impede the operations of the nearby Nevada County Airport but does not provide specific reasons as to how the DEIR is inadequate in this regard. Page 4.7-10 of the DEIR discusses the Nevada County Air Park, a small aircraft airport, located less than one mile from the Brunswick Industrial site. The commenter is offended by the description of the airpark as a "small aircraft airport" but provides no information on how this description is related to the adequacy of the DEIR. Information on the Grass Valley Air Attack Base is provided on page 4.13-8 of the DEIR. Furthermore, the Nevada County Airport has a single runway that is aligned east to west. The runway is 4,350-feet long and 75 feet wide and designated as Runway 7-25. The Airport Reference Code (ARC) classification for the airport is ARC B-I (Small). This means the airport is used primarily by aircraft with approach speeds lower than 121 knots, wingspans less than 49 feet, and weighs less than 12,500 pounds. However, the airport is capable of accommodating larger and heavier aircraft at the pilot's discretion. The designated design aircraft is the twin-engine Cessna 421. (Nevada County Airport Land Use Compatibility Plan, p. 3-2 (https://www.nctc.ca.gov/documents/NCALUC/NCALUCP%20Final%209-21-11%20-%20Chapter%203%20-%20Background%20Data.pdf).)

The commenter asks how the danger to the airport can be mitigated and suggests special notifications on project activities, halting of flights during explosives transportation, and banning of explosives transportation during fire season. As stated on page 4.7-10 of the DEIR, according to the Nevada County General Plan EIR, land uses that could create hazards related to airport operations at the Nevada County Air Park include objects that exceed Federal Aviation Regulations Part 77 height standards, attract large concentrations of birds within approach/departure sectors, produce smoke, flash or reflect light, or generate electronic interference. As stated on page 4.7-36 of the DEIR, the project site is partially within Zones D and E of the Nevada County Airport Land Use Compatibility Plan (NCALUCP). For Zone D, airspace review is required for objects at elevations above 3,207 feet mean sea level (msl). The tallest point of the project site (the 165-foot-tall headframe building) would be at 2,912 feet msl. In addition, the project is not a noise-sensitive use, would not pose a hazard to flight, and would not exceed the density requirements; therefore, the project would comply with the requirements of the NCALUCP for Zones D and E. The project would not create smoke, moisture clouds, or

turbulence that would affect aircraft (see Response to Comment Grp 7-95). Implementation of Mitigation Measure 4.7-1 (a-d) would minimize risk, including to the Nevada County Airpark, from transport of explosives to a less than significant level.

## Response to Comment Ind 664-3

The commenter asks if law enforcement will be adequately trained to respond to explosions. The training of law enforcement and fire district personnel is the responsibility of those respective organizations. Law enforcement is trained to deal with a variety of mass casualty and critical incidents including bombs and explosions. In addition, the law enforcement mutual aid system is implemented if a critical incident overwhelms local knowledge or resources.

Mitigation Measure 4.7-1(d) requires that prior to the transport, storage, or use of hazardous materials or explosives at the site, the mine operator shall prepare a Hazardous Materials Business Plan (HMBP). The County shall review and approve the HMBP prior to the use or storage of hazardous materials or explosives on-site. The HMBP ensures that emergency response agencies, including fire and police, have access to current data including types of chemicals, quantities, maps of chemical locations, and evacuation assembly areas (see https://www.nevadacountyca.gov/2179/Hazardous-Material-Business-Plan).

The commenter asks what if an explosion levels a building and cuts off any ability for communication with law enforcement and suggests a notification and compensation program to neighbors within a possibly impacted blast area. With implementation of mitigation, the impact related to transportation, storage and use of hazardous materials is considered less than significant. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

Regarding the compensation program for reduced property values, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 664-4

The commenter asks whether any Zone Haven evacuation zones will be designated near hazardous materials at the project site. The mine site can be its own zone. This is achieved relatively easily and the remaining zones would have the same numbers they currently have.

## Response to Comment Ind 664-5

In accordance with MSHA regulations, section 48.5, each new miner shall receive no less than 40 hours of training as prescribed in this section before such miner is assigned to work duties. Such training shall be conducted in conditions which as closely as practicable duplicate actual underground conditions, and approximately 8 hours of training shall be given at the minesite. Training includes but is not limited to the recognition and avoidance of hazards present in the mine, particularly any hazards related to explosives where explosives are used or stored at the mine; and the health and safety aspects of the tasks to be assigned, including the safe work procedures of such tasks, the mandatory health and safety standards pertinent to such tasks, information about the physical and health hazards of chemicals in the miner's work area, the protective measures a miner can take against these hazards, and the contents of the mine's HazCom program. Records of employee training shall be made available to MSHA personnel during mine inspections.

## Response to Comment Ind 664-6

Please see Response to Comment Ind 664-5.

## Response to Comment Ind 664-7

The commenter asks about the regulatory costs of the project. This comment does not pertain to the adequacy of the DEIR. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 664-8

The commenter asks how the project will ensure the Brunswick Site will not require a remediation cleanup plan like the Centennial Industrial Site. This comment does not pertain to the adequacy of the DEIR. The commenter is referred to Master Response 8 - Mine Waste Characterization and Master Response 9 - Historical Mine Waste at Centennial Site.

## Response to Comment Ind 664-9

The commenter asks if there will be a security bond in place for the project. The commenter also asks who will pay the cleanup in the event of an explosion. These comments do not pertain to the adequacy of the DEIR. As stated on page 4.6-24 of the DEIR, to ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably determines are adequate to perform reclamation in accordance with the surface mining operation's approved Plan.

Minimum levels of financial responsibility for motor carriers transporting hazardous substances are provided in 49 CFR 387 (see https://www.ecfr.gov/current/title-49/subtitle-B/chapter-III/subchapter-B/part-387). The commenter is also referred to Table 4.7-2 of the DEIR, which details federal regulations for the transport of explosives. In regards to comments on the Project Applicant's reputation, the commenter is referred to Master Response 3 - Operator Responsibility.

## Response to Comment Ind 664-10

The commenter states that page 4.7-17 of the DEIR misleadingly finds that Nevada County's General Plan allows for explosives to enter the County. The DEIR is not misleading, it simply references the applicable provisions in the General Plan that govern the County's approach to hazard and disaster response preparedness.

The Project Applicant would be responsible for any hazardous waste cleanup caused by the project. Motor carriers transporting hazardous materials would be responsible for hazardous waste cleanup caused during transport. Minimum levels of financial responsibility for motor carriers transporting hazardous substances are provided in 49 CFR 387 (see https://www.ecfr.gov/current/title-49/subtitle-B/chapter-III/subchapter-B/part-387). The commenter is also referred to Table 4.7-2 of the DEIR, which details federal regulations for the transport of explosives.

The commenter states that the project presents a hazardous waste cleanup risk and that a hazardous situation could result in road closures or flight cancellation and suggests a compensation to affected business and residences. The comment does not pertain to the adequacy of the DEIR. As discussed in Section 4.7-1, on pages 4.7-22 through 4.7-31 of the DEIR, with implementation of mitigation, the impacts related to the highly regulated transportation,

storage and use of hazardous materials is considered less than significant. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." Regarding economic issues the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 664-11

The commenter suggests a modification of the Nevada County General Plan and remediation of all brown fields mining sites in Nevada County before approval of any mine. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 664-12

The commenter asks if Nevada County's Environmental Health Department will be adequately staffed and trained to enforce the project's Hazardous Materials Business Plan. This comment does not pertain to the adequacy of the DEIR. Regarding the Project Applicant's enforcement of mitigation measures and conditions of approval, a mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other local, state and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 664-13

The commenter references Nevada County's Emergency Operations Plan (EOP), the Standardized Emergency Management System (SEMS) and FEMA's Comprehensive Preparedness Guide (CPG) and whether other business are subject to these plans and guidelines. The documents referenced by the commenter are emergency operations plans to be used by the County for natural disasters and manmade emergency incidents. DEIR page 4.7-18 provides additional information on the Nevada County Emergency Operations Plan. The purpose of this section of the DEIR is to provide a summary of regulatory control pertaining to hazardous materials. A CEQA document for other projects would provide similar information. The comment does not address the adequacy of the DEIR and requires no further response.

## Response to Comment Ind 664-14

The commenter states that the project's vicinity to the Nevada County Airport is a significant impact and should be sufficient not to approve the project. As stated on page 4.7-36 of the DEIR, the project would not result in a safety hazard or excessive noise for people residing or working in the project area related to the Nevada County Air Park. Therefore, impacts related to airport safety hazards and noise would be less than significant. Please also see Response to Comment Ind 664-2.

## Response to Comment Ind 664-15

The commenter states that the DEIR's discussion of Impact 4.7-1 contradicts itself by stating the impact would be less than significant, but concludes the impact is significant. The DEIR does not contradict itself. As stated on page 4.7-31 of the DEIR, it is conservatively concluded that the proposed project could result in a significant impact related to the routine transport, storage, and use of explosives. Implementation of the mitigation measures 4.7-1(a) through 4.7-1(d) would minimize the risk from transport, underground storage, and use of explosives at the Brunswick Industrial Site, to a less-than-significant level.

The commenter also states that the DEIR fails to identify the transportation route for delivery of explosives and is concerned about the safety risks of transporting explosives through the community. As stated on page 4.7-24 of the DEIR, hauling of explosives would occur using Brunswick Road to State Routes (SR) 20/49. Explosives would be transported directly to the site by licensed explosive suppliers that possess the requisite permits, including a CHP hazardous materials transportation license and U.S. DOT hazardous materials permits. State Routes 20 and 49 are designated as explosive transport routes by the CHP. The DEIR analyzed the transport, storage, and use of explosives in DEIR Chapter 4.7 and found the impacts to be less than significant after mitigation.

## Response to Comment Ind 664-16

The commenter states that the DEIR should include a reference to the American Table of Distances for explosives and the DEIR should discuss the training and qualification of both project employees who handle explosives and emergency responders. Regarding the training of emergency responders, the commenter is referred to Response to Comment Ind 664-3. The commenter is also referred to Chapter 4.11 of the DEIR which discusses Public Services.

Regarding the project's use of explosives, explosives are not proposed to be stored on surface. Contrary to the commenter's assertion, page 4.7-27 of the DEIR specifically refers to the American Table of Distances. As stated on page 4.7-27 of the DEIR, it is likely that locations of underground magazines, determined through the risk assessment, would be located further by connecting tunnels and shafts from surface than the distances specified in the American Table of Distances (ATD). It is worth noting that no fatalities or serious injuries have ever occurred within the distances specified by the ATD in the extremely rare events where a detonation of an explosive magazine has occurred.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other local, state and federal agencies, those agencies will be responsible for their enforcement.

Regarding economic issues, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 664-17

The commenter is concerned about security issues at the Brunswick site. As stated on page 4.11-26 of the DEIR, in order to deter potential crime at the Brunswick Industrial Site, the property would be fenced and gated. A security officer would always be on-site to ensure controlled access to the mine. The commenter states that fencing and perimeter security details are required in the DEIR. However, engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.)

The commenter is also concerned about the bonding requirements for reclamation of the mine. As stated on page 4.6-24 of the DEIR, to ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably determines are adequate to perform reclamation in accordance with the surface mining operation's approved Plan.

## Response to Comment Ind 664-18

The commenter states that, despite the DEIR's assertion otherwise, mining would occur within 500 feet of the surface. The paragraph referred by the commenter on page 4.7-28 of the DEIR discusses transportation of explosives from underground magazines to underground working areas and states "Explosives required for loading drift rounds or longhole blasts would be transported directly from the underground magazine to the working area and therefore explosives quantities in transit underground would be a maximum of approximately 500 pounds at any given location. No mining is proposed closer than 500 feet to surface; thus, explosives in transport would be at least this distance from the surface."

As stated on page 4.7-26 of the DEIR, upon delivery to the project site, explosives and detonators would be immediately transported underground to designated storage facilities and placed in separate magazines pursuant to federal OSHA and MSHA regulations, including 29 CFR 1926.904, subdivision (b) and 30 CFR 57.6102, and California regulations, including Title 8 CCR 5251, subdivision (a). The materials would not be stored above ground.

The commenter speculates that the Brunswick shaft may be blocked within 500 feet from surface and will require explosives to blast through. However, the applicant has inspected the shaft to this depth with an underwater vehicle and no such obstruction is present in the Brunswick Shaft. (see https://www.risegoldcorp.com/uploads/content/feb20-risegoldbrunswicksurvey.pdf) Lastly, a condition of approval for the project will require that no blasting, except for the construction of the service shaft, will be conducted closer than 500 feet below ground surface.

## Response to Comment Ind 664-19

The commenter asks if the distances specified in the American Table of Distances will be adhered to given the proximity to the Brunswick and East Bennett areas. Explosives are not proposed to be stored on surface. As stated on page 4.7-27 of the DEIR, it is likely that locations of underground magazines, determined through the risk assessment, would be located further by connecting tunnels and shafts from surface than the distances specified in the American Table of Distances (ATD). It is worth noting that no fatalities or serious injuries have ever occurred within the distances specified by the ATD in the extremely rare events where a detonation of an explosive magazine has occurred.

## Response to Comment Ind 664-20

The commenter lists a number of concerns pertaining to the transport of explosives. As stated on page 4.7-24 of the DEIR, hauling of explosives would occur using Brunswick Road to State Routes (SR) 20/49. Explosives would be transported directly to the site by licensed explosive suppliers that possess the requisite permits, including a CHP hazardous materials transportation license and U.S. DOT hazardous materials permits. State Routes 20 and 49 are designated as explosive transport routes by the CHP.

With implementation of mitigation, the impact related to transportation, storage and use of hazardous materials is considered less than significant. The commenter speculates that an explosion may occur which would impact senior facilities and suggests various training programs and bonding. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

The commenter states that explosions have caused the death of thousands of people and obliterated hundreds of homes. However, as stated on page 4.7-25 of the DEIR, the transportation of explosives in the United States has an excellent safety record. A review of DOT incident reports for highway transportation of class 1.1B, 1.4B, 1.1D, and 1.5D materials shows 149 incidents over the past 30 years in the United States. The majority of these incidents were vehicle accidents resulting in no release or spillages. No fatalities were reported in any incidents and only 1 incident resulted in injuries.

Regarding comments on the airport and aircraft, the commenter is referred to Response to Comment Ind 664-2.

## Response to Comment Ind 664-21

The commenter raises questions regarding the handler's facilities in connection with explosives and the Nevada County Department of Environmental Health's role in handling explosives. In the context of the referenced paragraph on page 4.7-23 the "handler's facilities" are the Project Applicant's project sites.

In regard to explosions requiring evacuation of hundreds of people, the commenter is referred to Response to Comment Ind 664-20.

Nevada County Environmental Health Department employees would not handle explosives or be a first-responder to emergencies. As stated on page 4.7-23 of the DEIR, the NCEHD would monitor the conditions and completion of remediation measures. The commenter is referred to Response to Comment Ind 664-3 regarding training of emergency responders.

## Response to Comment Ind 664-22

The commenter raises a number of concerns regarding the transport of explosives through the community but does not comment on the adequacy of the DEIR. In regards to delivery schedule of explosives in relation to the analysis of explosives transport risk, the commenter is referred to Master Response 10 – Explosives, Reagents, and Brunswick Fill.

In regard to risk of explosions to the airport, the commenter is referred to Response to Comment Ind 664-2.

In regard to the Loma Rica housing development and property disclosures, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

With implementation of mitigation, the impact related to transportation, storage and use of hazardous materials is considered less than significant. Please see Response to Comment Ind 664-1.

The commenter asks whether property owners will be notified of blasting activities and states that blasting vibrations will affect the health of people with fragile health conditions. No such notification is necessary. As stated on page 4.10-58 of the DEIR, the project is not anticipated to result in the exposure of persons to or generation of excessive groundborne vibration levels. Nonetheless, out of an abundance of caution, in order to ensure that actual mining operations would generate vibration levels as expected, a Ground Vibration Monitoring Program is required. Without quantitative evidence and regular monitoring from the Ground Vibration Monitoring Program, a significant impact related to the generation of groundborne vibration could occur. Implementation of Mitigation Measure 4.10-4 would ensure the above potential impact is less than significant. Please also see Master Response 7 – Location of Future Mining.

## Response to Comment Ind 664-23

The commenter raises general concerns about the project's use of explosives. The commenter also states the DEIR contradicts itself by labeling an explosives-related risk as both significant and less than significant. As stated on page 4.7-31 of the DEIR, it is conservatively concluded that the project could result in a significant impact related to the routine transport, storage, and use of explosives. Implementation of the mitigation measures 4.7-1(a) through 4.7-1(d) would minimize the risk from transport, underground storage, and use of explosives at the Brunswick Industrial Site to a less-than-significant level.

The commenter states that almost every week explosions of chemicals that are proposed for use at the project occurs and cites a fire at an ammonium nitrate plant in North Carolina as evidence. However, the plant cited did not explode and a fertilizer plant is not proposed for the project. As stated on page 4.7-28 of the DEIR, the use of explosives in modern underground mines is made safe due to the many regulations and safety measures adopted in the United States. There have been only three incidents attributed to Explosives and Breaking Agents resulting in fatalities in the past 25 years (1995-2021) in all underground metal mines in the United States. Two of these incidents (2010 and 2011) were directly related to explosives and one of the incidents was related to CO poisoning from insufficient ventilation and was unrelated to explosives. None of the incidents presented a risk to the public from the use of explosives underground. As stated on page 4.7-25 of the DEIR, the transportation of explosives in the United States has an excellent safety record. A review of DOT incident reports for highway transportation of class 1.1B, 1.4B, 1.1D, and 1.5D materials shows 149 incidents over the past 30 years in the United States. The majority of these incidents were vehicle accidents resulting in no release or spillages. No fatalities were reported in any incidents and only 1 incident resulted in injuries.

The commenter believes the threshold of significance for hazards should be zero risk or a 100% certainty that residents are not exposed to any risk. However, CEQA does not require 100% certainty, as this could never be achieved. Rather, as stated by California Courts, "[t]he need for thorough discussion and analysis is not to be construed unreasonably… to serve as an easy way of defeating projects. Absolute perfection is not required." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376.)

## Response to Comment Ind 664-24

The commenter asks whether the Nevada County Planning Department has the expertise to address safety issues with explosives and states that the Risk Assessment should be in the DEIR. The U.S. Mines Health and Safety Administration (MSHA) is the regulator for underground mine safety, including the regulation of underground storage of explosives. As stated in Mitigation Measure 4.7-2(b), the Risk Assessment will be submitted to MSHA for their review. Regarding the inclusion of the Risk Assessment in the DEIR, explosives storage has been analyzed in the DEIR and an engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.)

## Response to Comment Ind 664-25

The commenter asks whether the Nevada County Planning Department has the expertise to review the agreement found in Mitigation Measure 4.7-1(c). The U.S. Department of Transportation regulates the transport of explosives through numerous regulations as described on pages 4.7-22 through 4.7-26 of the DEIR.

## Response to Comment Ind 664-26

The commenter asks whether the Nevada County Planning Department has the expertise to review the Hazardous Materials Business Plan and that the plan should be included in the DEIR.

Hazardous Materials Business Plans (HMBP) are routinely submitted for various project sites throughout the County under the requirement of CalEPA. (see https://www.nevadacountyca.gov/2179/Hazardous-Material-Business-Plan). The Project Applicant is responsible for preparing the HMBP. The HMBP shall be prepared prior to the transport of explosives and reviewed and approved by the County in accordance with Mitigation Measure 4.7-1(d).

## Response to Comment Ind 664-27

The commenter states that the DEIR's discussion of hazard-related impacts contradicts itself by labeling the same impact as both significant and less than significant. As stated on page 4.7-31 of the DEIR, it is conservatively concluded that the project could result in a significant impact related to the routine transport, storage, and use of explosives. Implementation of the mitigation measures 4.7-1(a) through 4.7-1(d) would minimize the risk from transport, underground storage, and use of explosives at the Brunswick Industrial Site to a less-than-significant level.

The commenter also requests that the DEIR includes a discussion on how the Project Applicant interacts with each applicable regulatory agency. CEQA does not require this level of detail. "The need for thorough discussion and analysis is not to be construed unreasonably… to serve as an easy way of defeating projects. Absolute perfection is not required." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 406.)

The commenter also questions the reputation of the Project Applicant. The commenter is referred to Master Response 3 - Operator Responsibility. Moreover, a mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other local, state and federal agencies, those agencies will be responsible for their enforcement.

**Individual Letter 665**

Ray Kinman
woodcarverguru@gmail.com, 530.277.5200

April 1, 2022

Matt Kelly, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

Dear Matt,

It's hard to know where to begin, since there are so many areas of concern with the Rise Gold Mine.

**Ind 665-1**

So I will begin with introducing myself. My name is Ray Kinman, and I live and work off of Greenhorn Road. I moved to this beautiful area 13 years ago because of the beautiful, serene nature of it. If the mine were to be approved, it would dramatically alter the nature of our community to such an extent that I would no longer find it tolerable to live here. This is how deeply I feel about this.

I have reviewed the DEIR report, and what strikes me is that it is so completely out of line with what suits our community, and it so under-states the huge and long-terms impacts that it would have on our community, as to border on the absurd.

Some of the **many** objections that I have to the mine are as follows:

**Ind 665-2**

1) **Surface and groundwater water impacts are inadequately addressed in the DEIR report.**
   a) Deir only has plans to address 39 wells, when there are potentially hundreds affected
   b) What impact would this have on the already extremely high forest fire hazard, and especially when we are in the midst of a multi-year drought?

**Ind 665-3**

2) **Visual impacts are unmitigated in the report**
   a) There would be what amounts to a skyscraper in our beautiful forest; engineered backfill off Brunswick that is 40+ feet tall; deforestation with minimal replanting of trees, and only along road corridors; the pristine nature of our dark nighttime sky would be gone.

**Ind 665-4**

3) **Traffic impacts would be huge, unmitigated, unavoidable**

**Ind 665-5**

4) **The mine runs counter to the need to reduce greenhouse gas emissions**
   a) As the residents of Nevada County strive to live in a more ecologically-conscious manner, the progress made would be obliterated by the additional greenhouse emissions by the mine.

**Ind 665-6**

5) **Explosives** would be brought to our community as they are transported, stored, and utilized on the mine site, bringing noise and the potential for accidents which could result in calamity.

**Ind 665-7**

6) **Air quality impact is inadequate in the report**
   a) We already score an F rating in terms of air quality, and mine emissions would only serve to worsen it.

**Ind 665-8**

7) **Clean-up of the Centennial site not included in the report**

Also – if it were to be approved, do we really want to open the door to other mining companies to come to our beautiful community and alter our lifestyles, scar our land, pollute our air, drain our water, fill the beautiful night sky with lights, fill the roads with traffic, and assault our ears with noise?

**Ind 665-9**

**I say most definitely NOT!**

Let's leave the charm of our community intact and our mining history quaintly in our past, where it belongs.

Sincerely,

Ray Kinman
12888 Lost Lake Road
Grass Valley, CA

## INDIVIDUAL LETTER 665: RAY KINMAN

### Response to Comment Ind 665-1

This comment is introductory in nature and the commenter is opposed the project. The commenter's opposition is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 665-2

The commenter states that the DEIR underestimates the number of groundwater wells the project would impact. The commenter also implies that the project's use of groundwater could exacerbate fire hazards. As stated on page 4.13-21 of the DEIR, it can be reasonably concluded that the dewatering of the mine would not affect the available moisture for vegetation in the project area because the depth to groundwater is already below the typical rooting depths in higher topographic areas, while adequate flows would occur in South Fork Wolf Creek and Wolf Creek to maintain groundwater levels in the lower topographic areas. The dewatering would not, therefore, increase fire risk due to reduced groundwater levels. The commenter is also referred to Master Response 33 – Groundwater Dependent Vegetation. Regarding groundwater, please also see Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Ind 665-3

The commenter states that the project would result in adverse impacts to aesthetics. The commenter also suggests the project would result in light pollution. The DEIR concludes that the project would substantially degrade the existing visual character or quality of public views of the project sites or the site surroundings and such impacts would be significant and unavoidable even after implementation of mitigation. (DEIR, p. 4.1-21–22.) Regarding light pollution, the DEIR concluded that the project would not create a new source of substantial light which would adversely affect day or nighttime views and that such impacts would be less than significant. (DEIR, p. 4.1-23.) Please see Chapter 4.1 of the DEIR regarding aesthetics impacts of the project.

### Response to Comment Ind 665-4

The commenter states that the project's traffic-related impacts would be "huge, unmitigated, [and] unavoidable" but does not provide additional detail. The DEIR found that all traffic-related impacts of the project would be less than significant after mitigation, with the exception of the impact to the intersections at Brunswick Road and State Route 174 (level of service impact) and Brunswick Road and Sutton Way (queueing impact), which would be significant and unavoidable even after implementation of mitigation. (DEIR, p. 4.12-56.)

### Response to Comment Ind 665-5

The commenter states that project would result in adverse impacts to air quality due to increased GHG emissions. The DEIR states that the project's GHG-related impacts would less than cumulative considerable. (DEIR, p. 4.3-92, 99.) Please also see Master Response 27 – Greenhouse Gas Thresholds.

## Response to Comment Ind 665-6

The commenter is concerned about the project's transport, use, and storage of explosives at the Idaho-Maryland Mine. Chapter 4.7 of the DEIR analyzed explosives and found the impacts to be less than significant after mitigation. Please also see Master Response 10 – Explosives, Reagents, and Brunswick Fill. Regarding noise from use of explosives, please refer to page 4.10-44 of the DEIR, where the DEIR concludes that blasting noise would be below the County's applicable thresholds.

## Response to Comment Ind 665-7

The commenter states that project would result in adverse impacts to air quality. The commenter is referred to Master Response 18 - Air Quality Thresholds.

## Response to Comment Ind 665-8

The commenter states that the DEIR should include the remediation of the Centennial Industrial Site. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 665-9

The commenter states that the project should not be approved. The commenter's opposition to the project is noted for decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

April 1, 2022

Matt Kelly, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

Dear Matt,

It's hard to know where to begin, since there are so many areas of concern with the Rise Gold Mine.

**Ind 666-1** So I will begin with introducing myself. My name is Ray Kinman, and I live and work off of Greenhorn Road. I moved to this beautiful area 13 years ago because of the beautiful, serene nature of it. If the mine were to be approved, it would dramatically alter the nature of our community to such an extent that I would no longer find it tolerable to live here. This is how deeply I feel about this.

I have reviewed the DEIR report, and what strikes me is that it is so completely out of line with what suits our community, and it so under-states the huge and long-terms impacts that it would have on our community, as to border on the absurd.

Some of the **many** objections that I have to the mine are as follows:

**Ind 666-2**
1) **Surface and groundwater water impacts are inadequately addressed in the DEIR report.**
   a) Deir only has plans to address 39 wells, when there are potentially hundreds affected
   b) What impact would this have on the already extremely high forest fire hazard, and especially when we are in the midst of a multi-year drought?

**Ind 666-3**
2) **Visual impacts are unmitigated in the report**
   a) There would be what amounts to a skyscraper in our beautiful forest; engineered backfill off Brunswick that is 40+ feet tall; deforestation with minimal replanting of trees, and only along road corridors; the pristine nature of our dark nighttime sky would be gone.

**Ind 666-4**
3) **Traffic impacts would be huge, unmitigated, unavoidable**

**Ind 666-5**
4) **The mine runs counter to the need to reduce greenhouse gas emissions**
   a) As the residents of Nevada County strive to live in a more ecologically-conscious manner, the progress made would be obliterated by the additional greenhouse emissions by the mine.

**Ind 666-6**

5) **Explosives** would be brought to our community as they are transported, stored, and utilized on the mine site, bringing noise and the potential for accidents which could result in calamity.

**Ind 666-7**

6) **Air quality impact is inadequate in the report**
   a) We already score an F rating in terms of air quality, and mine emissions would only serve to worsen it.

**Ind 666-8**

7) **Clean-up of the Centennial site not included in the report**

Also – if it were to be approved, do we really want to open the door to other mining companies to come to our beautiful community and alter our lifestyles, scar our land, pollute our air, drain our water, fill the beautiful night sky with lights, fill the roads with traffic, and assault our ears with noise?

**Ind 666-9**

**I say most definitely NOT!**

Let's leave the charm of our community intact and our mining history quaintly in our past, where it belongs.

Sincerely,

Ray Kinman

Ray Kinman
12888 Lost Lake Road
Grass Valley, CA

**Ind 666-10**

P.S. I am very concerned about the impact the mine would have on the value of our homes. Several of my neighbors have also decided they will move if the mine goes through. Who would want to buy + live here?

12888 Lost Lake Road, Grass Valley, California 95945

Subject: Idaho-Maryland Mine Project Draft EIR (SCH # 2020070378)

Dear Mr. Kelley,

**Ind 667-1**

Thank you for the opportunity to review and comment on the Draft Environmental Impact Report (Draft EIR) for the proposed Idaho-Maryland Mine Project (proposed project). The proposed project would reinitiate underground mining and gold mineralization processing for the Idaho-Maryland Mine over an 80-year permit period with gold mineralization processing and underground exploration and mining proposed to operate 24 hours a day, 7 days a week during full operations. The operations of the proposed would allow for unmitigable impacts on our community for 80 years resulting in significant and unavoidable environmental impacts as well as the damage the character and vitality of the community.

**Significant and Unavoidable Impacts**

The Draft EIR has determined that the following project impacts would remain significant and unavoidable, even after implementation of the feasible mitigation measures:

**Ind 667-2**

• Aesthetics

The Draft EIR determined that the proposed project would result in a significant impact related to substantially degrading the visual character or quality of the site and its surroundings. Even after mitigation, the impact would remain significant and unavoidable. The Draft EIR also determined that the project's incremental contribution to the significant cumulative impact related to substantial degradation of visual character or quality would be cumulatively considerable and significant and unavoidable.

• Noise.

1

The Draft EIR determined that during construction activities, the project could result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity (i.e., residents along East Bennett Road during construction of the potable water line). Even with implementation of mitigation, the impact would remain significant and unavoidable.

• Transportation and Circulation

The draft EIR determined that the proposed project would result in a significant impact at three study intersections under the EPAP Plus Project scenarios, one of which would be significant and unavoidable even after mitigation (Brunswick Road/SR 174). The Draft EIR also determined that the proposed project would have a cumulatively considerable incremental contribution to two intersections under both Cumulative Plus Project scenarios, one of which would be significant and unavoidable Draft EIR Idaho-Maryland Mine Project December 2021 Chapter 6 – Alternatives Analysis Page 6-8 even after mitigation (Brunswick Road/SR 174). In addition, the project's incremental traffic would cause a significant impact at one intersection queue during both Cumulative Plus Project scenarios (Brunswick Road/Sutton Way) Mitigation measures are identified and required for the aforementioned cumulative impacts, but it cannot be guaranteed that the measures would reduce the incremental impacts to a less than cumulatively considerable level.

**Preference of the No-Build Alternative**

Preference of the Environmentally Superior Alternative, which is Alternative 1: No Project (No-Build) Alternative. The No-Build ensure that the project area and the public would not result in project related impacts in the following CEQA Appendix G sections:

- Aesthetics
  - The proposed project would result in a significant impact related to substantially degrading the visual character or quality of the site and its surroundings. Even after mitigation, the impact would remain significant and unavoidable. The proposed project would result in tailings, the reduction of vegetative cover, the erection of industrial use buildings, mining equipment, engineered fill, and frequent trucks to transport materials. The No-Build would not impact the visual character or quality of the site and its surroundings.
- Air Quality
  - The proposed project would result in more truck traffic to the project area resulting in more air quality emissions, which may affect the health of the community even with the implementation of mitigation measures. The No-Build would not disturb naturally occurring asbestos as could possibly occur during underground mining.
- Biological Resources
  - The No-Build would not have the potential to impact special-status plants, foothill yellow-legged frog, western pond turtle, California red-legged frog, California black rail, coast horned lizard, special-status bats, and non-special status raptors and migratory birds. In addition, the Alternative would not result in any substantial adverse effects on riparian habitat and/or other sensitive natural communities and/or have a substantial adverse effect on federal or State protected aquatic resources.
- Cultural Resources
  - The No-Build would not substantial adverse effect would not occur to the underground mine workings, which were determined to be historically significant pursuant to the National Register of Historic Places (NRHP) and California Register of Historic Resources (CRHR). The No-Build would not impact any unknown cultural and tribal cultural resources should they be encountered during construction.
- Energy
  - The No-Build would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation. The No-Build would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

**Ind 667-3**

2

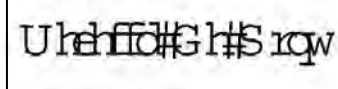
- Geology/Soils
  - The No-Build would not include underground mining and generation of engineered fill, grading or other ground-disturbing activities, substantial soil erosion would not occur. In addition, the near-surface geotechnical features identified for closure due to dewatering of the mine would not be adversely impacted, though they may currently pose some level of risk that would continue under the Alternative. Other geotechnical issues that could pose a significant effect under the proposed project, but would not pose an adverse effect under the Alternative, include potential seismic hazards at the Brunswick Industrial Site and slope stability associated with temporary steep cut slopes at the new service shaft collar. However, the proposed project would fix a few existing geotechnical issues that would remain under this Alternative, including the safety concern related to the presence of the South Idaho Shaft on the Centennial Industrial Site, and an unstable portion of the clay-lined pond dam on the Brunswick Industrial Site.
- Greenhouse Gas Emissions
  - The No-Build would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment or conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.
- Hazards & Hazardous Materials
  - The proposed project could result in a significant impact related to creating a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials, specifically, the transport and underground storage and use of explosives at the Brunswick Industrial Site. Compliance with applicable federal (MSHA, OSHA), State (CCR), and local regulations, and the additional mitigation measures in the Draft EIR, would reduce the significant hazard related to transport, underground storage and use of explosives to a less-than-significant level. Because the use of explosives would be eliminated under the No-Build, the significant impact would also be eliminated. The Draft EIR determined that the proposed project could result in a significant impact related to creating a significant hazard through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment related to the Brunswick Industrial Site, given the presence of elevated arsenic in the southeastern paved area, potential residual petroleum contamination in a few locations, and presence of groundwater monitoring wells of unknown status. The No-Build would result in fewer
  - impacts related to hazards and hazardous materials.
- Hydrology/Water Quality
  - The No-Build would not result in on-site construction disturbance or above-ground operations such that the following project-related significant impacts to water quality would not occur: Centennial Industrial Site: engineered fill pad construction; Brunswick Industrial Site: operations within industrial area, underground placement of Cement Paste Backfill, use of clay-lined pond for water treatment process purposes, engineered fill pad construction, and treated water discharge in South Fork Wolf Creek. In addition, the No-Build would not necessitate dewatering of the mine; thus, there would not be a substantial reduction in groundwater supplies resulting in effects to nearby wells, though the proposed project includes mitigation to offset impacts to wells (i.e., provision of potable water service). Further, due to the lack of on-site operations, the No-Build would not result in the substantial alteration of drainage patterns, and for the Centennial Industrial Site, risk release of pollutants in a flood hazard area.
- Noise
  - The No-Build would not result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity, nor a substantial permanent increase in ambient noise levels in the vicinity of the project due to haul truck traffic. In addition, the Draft EIR concludes that the combined operational noise sources at the Brunswick Industrial Site could result in a significant noise impact. With respect to vibration, the Draft EIR determined that while blasting is not projected to exceed applicable thresholds, a ground vibration monitoring program should be implemented to determine the actual levels of ground vibration at commencement of mining. These operational noise and vibration impacts would not occur under the No-Build.

3

- Tribal Cultural Resources
  - The No-Build would not impact any unknown cultural and tribal cultural resources should they be encountered during construction.
- Transportation
  - The No-Build would not generate construction traffic or operational vehicle traffic on local roadways and, thus, unlike the proposed project, the Alternative would not result in a significant construction traffic impact, nor would General Plan LOS policy conflicts occur under the EPAP Plus Project conditions to the intersections of Brunswick Road/Idaho Maryland Road, Brunswick Road/SR 174, and Idaho Maryland Road/Centennial Drive; and under the Cumulative Plus Project scenarios to the intersections of Brunswick Road/SR 174 and Sutton Way/Dorsey Drive. The proposed project would also result in a significant effect to the intersection queue during the Cumulative Plus Project scenarios (Brunswick Road/Sutton Way), which would not occur under this Alternative. Further, the Draft EIR determined that proposed project (Brunswick Industrial Site operations) would have an impact related to truck turn movements at the Millsite Road/E. Bennett Road project egress at the Brunswick Industrial Site; this effect would not occur under this Alternative. The Draft EIR determined that some of the above-noted impacts would be considered significant and unavoidable due to the uncertainty concerning certain mitigation measures. The subject impacts are the EPAP Plus Project and Cumulative Plus Project intersection impacts to Brunswick Road/SR 174 and the Cumulative Plus Project intersection queue at Brunswick Road/Sutton Way. These significant and unavoidable impacts would be eliminated under this Alternative.
- Wildfire
  - The No-Build would not result in a significant impact related to exacerbating wildfire hazards, as compared to the proposed project. For example, above-ground machinery would not be operated at both project sites. Therefore, potential vegetation fires associated with on-site equipment operations would be substantially reduced under the No-Build.

**Beyond the Scope of CEQA**

CEQA can be narrow in scope and does not address various issues such as social or economic issues.



The Draft EIR notes relevant caselaw on how impacts on private views are not studied under CEQA. Although this is true and accurate under CEQA, the property owners for those that would be impacted by the next 80 years of constant operation and construction would surely face a reduction in property value. Overall, the operations of the mine may act as a deterrent for the community and reduce the overall appeal of tourism as well as the demand for property within the area.

**Ind 667-4**

California droughts are affecting the entire state and the dewatering of our ground water supplies are going to exacerbate the issue. The area is highly prone to wildfire and the existence of the proposed project will exacerbate the wildfire risk within the project area which would affect the community at large. The permit period of 80 years is far too long, that is longer than most individuals may live and could have devastating effects on the community that would go unchecked for 80 years. The jobs the proposed project may bring into the area do not offset then potential impacts to the community and the environment. This is a quaint and appealing town, please do not decimate the positive aspects of this town for big business.

Thank you for the opportunity to review and comment on the Draft EIR. If you have any questions or would like clarification, please contact me here, beccaxdepont@yahoo.com

Sincerely,

Rebecca De Pont

## INDIVIDUAL LETTER 667: REBECCA DEPONT

### Response to Comment Ind 667-1

The comment does not directly address the adequacy of the DEIR. The commenter states that the DEIR identifies impacts that are considered significant and unavoidable.

The DEIR states that, before approving a project, the lead agency shall certify that the Final EIR has been completed in compliance with CEQA, and that the Final EIR has been presented to the decision-making body of the lead agency, which has reviewed and considered the EIR. (DEIR, p. 1-9.) The lead agency shall also certify that the Final EIR reflects the lead agency's independent judgment and analysis. (*Ibid.*) The findings prepared by the lead agency must be based on substantial evidence in the administrative record and must include an explanation that bridges the gap between evidence in the record and the conclusions required by CEQA. (*Ibid.*) If the decision-making body elects to proceed with a project that would have significant unavoidable impacts, then a Statement of Overriding Considerations explaining the decision to balance the benefits of the project against unavoidable environmental impacts must also be adopted. (*Ibid*.)

### Response to Comment Ind 667-2

The comment restates content from the DEIR and does not address its adequacy. No further response is required.

### Response to Comment Ind 667-3

The commenter indicates a preference for the No Project Alternative and does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 667-4

The comment expresses property value concerns, which are outside the scope of CEQA. Please see Master Responses 1 and 2. The commenter also expresses concerns regarding drought and wildfire. Please see Master Response 6 – Wildfire Impacts and Master Response 16 – Drought and Climate Change. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Ind 668-1**

Dear Honored Public Officials
I wish to make my voice heard in OPPOSING the opening of the Gold Rise Mine. The disastrous effects on so many levels that this project will bring to our community far outweigh any benefits. As a 30+ years member of this community, I implore you to keep our town clean and healthy and free from outside influences that come to take our resources and leave us to clean the mess. Your constituents are looking to you to protect our water, our air, our quality of life in this place we call home. I sincerely thank you for your time, Rebecca Vandegrift 16249 Thornberry Way Grass Valley,95949

## INDIVIDUAL LETTER 668: REBECCA VANDERGRIFT

### Response to Comment Ind 668-1

The comment does not address the adequacy of the DEIR, but expresses general concerns and opposition to the proposed project. Regarding general water concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding general air concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

Mr. Matt Kelley

Senior Planner

Nevada County Planning Department

950 Maidu Avenue, Suite 170

Nevada City, CA 95959-7902 (530) 265-1423

**Ind 669-1**

I am concerned about a deficiency in the DEIR regarding transportation of explosives to the Brunswick mine site. In chapter 4.11-24, Public Services and Utilities, the DEIR states that explosives will be transported by licensed explosives drivers under strict United States Department of Transportation rules via Brunswick Road from Highway 20/49. That route involves the very busy Sutton Way intersection, the Idaho-Maryland intersection, the Whispering Pines intersection, the Loma Rica Road intersection, and the Bennett road intersection. However, the DEIR does not state how often shipments would be arriving, what quantities would be involved, nor what times of day they would happen.

**Ind 669-2**

According to table 4.12-2 of the Transportation chapter, the following intersections have various levels of service. The Brunswick/Sutton intersection Level Of Service (LOS) varies from A to C depending on the time of day. Despite being signalized the intersection is multi-lane in all directions with right and left turn lanes involved, so complex traffic patterns lead to inevitable mishaps. The Brunswick/Idaho-Maryland Road intersection has a LOS that varies from A to F depending on direction. The Brunswick/Whispering Pines intersection has an eastbound left turn lane where drivers must contend with traffic speeding westbound up the hill. The Brunswick/Bennett Road four-way stop has LOS C at busy times of day.

Table 4.12-16 indicates that all sections from SR 49 to E. Bennett Road have peak hour LOS C or D when the survey was done, before the addition of the 50 to 100 mine trucks transporting tailings that will be using Brunswick from the mine site to Idaho-Maryland Road, or the 200 some employees of the mine. At 4.12-5 the DEIR notes that the Brunswick/Idaho-Maryland intersection saw illegal turn and through travel by vehicles, and page 16 notes that the same

1

intersection, plus those at Whispering Pines Lane and Bennett Street met the signal warrant, meaning that they may need a traffic light.

In regard to explosives deliveries, the trucks will be traveling through intersections that currently have LOS from C to F during peak hours. Vehicles traveling eastbound on Brunswick from the mine site will be building up speed down the steep grade from the Loma Rica Road traffic light. The speed limit there is 50 mph but heavy vehicles such as tailings trucks may struggle to limit their speeds while lighter vehicles, especially those of people leaving work at the Loma Rica Industrial Park will be speeding up. In addition, without a traffic signal at Idaho-Maryland Road, some vehicles will be turning left at the bottom of the hill without the aid of a signal.

It is easy to imagine the results of a heavy mine truck or even a passenger vehicle colliding with an explosives truck at any of the three signal-warranted intersections. As the Loma Rica Ranch housing development on the north side of Brunswick Road is built out there will be a large concentration of people and dwellings in the immediate vicinity with the possibility of large loss of life in the event of such a collision. Though the Brunswick/Sutton intersection has LOS from A to C, the complexity of the intersection and the traffic loads at busy times could lead to a disastrous accident.

It is imperative that the DEIR define the frequency, timing, and quantity of explosives being delivered and a specific regimen to assure the safety of county residents. It is also imperative that a traffic study immediately after the mine opening be specified and if there is any loss of service level or dangerous traffic patterns are detected that Rise Grass Valley be required to pay the full cost of installing signals at the warranted intersections so that residents don't have to pay for impacts they did not cause.

**From:** Renata Henry <renatahenry122@gmail.com>
**Sent:** Monday, April 4, 2022 3:21 PM
**To:** Idaho MMEIR
**Subject:** Public comment on mine reopening

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hello,

**Ind 670-1** I am a 31-year-old Grass Valley resident and educator, and I am writing regarding the proposed Idaho-Maryland mine.

I live 8 miles from the proposed mine site, and I am extremely concerned on how the reopening of the mine would impact my community and beautiful town. In particular, the pollution to the air and water in our community that would result from the mine operations. I don't believe that the DEIR adequately addresses these issues. For example, it cites that the mine operations would not have to adhere to the 100 foot buffer building zone currently in place on Wolf Creek. When I walk my dogs in this area, I still spot acid mine drainage from when the mine was open long ago. If we lower our protections currently in place for mine operations, how is the pollution going to get any better when we still haven't been able to clean up completely from the past?

**Ind 670-2** I also question the plan to measure air quality in the region of the mine. The DEIR doesn't seem to include the totality of air pollutants from mine operations. For example, the DEIR does not include the 4,000+ metric tons of greenhouse gases that would be emitted from cement alone per year as part of its greenhouse gas emission measurements. As someone who already struggles with health effects from fire season and poor air quality in Nevada County, I want to know that any new industrial activity that contributes particulate matter, exhaust and greenhouse gases to the air is being measured accurately and thoroughly.

These are just a few of the areas in the DEIR that seem inadequate and incomplete to me, and I urge you to demand a new DIER that is done correctly.

Thank you for your time,

Renata Henry

1

## INDIVIDUAL LETTER 670: RENATA HENRY

### Response to Comment Ind 670-1

The commenter is concerned that the project would allow for development within the required 100-foot setback from the Riparian Area of a Perennial Watercourse. The commenter also states that acid mine drainage is still visible and is concerned that reopening the mine will lead to additional pollution. Mitigation Measure 4.4-3(b) requires the applicant to implement the Watercourse/Wetlands/Riparian Areas Management Plans prepared for the Centennial Industrial Site and Brunswick Area, as approved in their final form by Nevada County. Specifically, the applicant shall implement the mitigation measures and conditions identified in the Management Plans, which include measures designed to protect aquatic resources and the biological resources they support. Required measures for encroachment into non-disturbance buffers and restoration of area adjacent to impacted streams are included in the mitigation measure. (DEIR, p. 4.4-87–88.) Regarding the acid mine drainage, the commenter is referred to Master Response 8 - Mine Waste Characterization and Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 670-2

The commenter states that the DEIR fails to include approximately 4,000 metric tons of GHGs that would be emitted from cement each year. The commenter also states that emissions generated by the project would impact the air quality of the region. Regarding the emissions generated from cement, the commenter is referred to Master Response 26 - Life Cycle GHG emissions. Regarding the impacts to air quality, the commenter is referred to Master Response 18 - Air Quality Thresholds.

**Individual Letter 671**

**From:** Theresa Huck <theresahuck@gmail.com>
**Sent:** Monday, April 4, 2022 9:39 AM
**To:** Idaho MMEIR
**Subject:** Draft EIR Comment

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Planning Commission,

In response to the Draft EIR, I would like to says that in the entire process there is nothing that truly addresses human health. The Yellow Giant mine (Mossman's previous bankrupted venture) has not addressed the human health catastrophe he created there. There is a human health crisis trapped in the water in that mine.

**Ind 671-1**

Methylated mercury, arsenic, lead, chromium and more is trapped in the old mine tunnel. Those tailings have been lying there since the mine was closed. Our health system, here in Nevada County, does not currently have the bandwidth or knowledge to deal with what will come out of the dewatering.

The point of environmental review, such as this draft EIR is to look at all the ways this will affect us. This does not accurately address protections and handling of the tailing that are in the mine already and will be moved downstream by flushing. This DEIR is short sided and does not address this in a way that it needs to be.

Thank you for your time.

Resa

Resa Huck
(She, Her, Hers)

I understand that I am on Nisenan land that was never ceded and the original tribal families have yet to recover from the near genocide of their people.

1

## INDIVIDUAL LETTER 671: RESA HUCK

### Response to Comment Ind 671-1

The comment does not directly address the adequacy of the DEIR. Please see Master Response 3 – Operator Responsibility. Regarding the commenter's statement that methylated mercury, arsenic, lead, chromium, and more is trapped in the old mine tunnel, the water in the mine contains only iron and manganese above state water quality guidelines (as discussed in Section 3.4.1.1 of Appendix K.2). The proposed on-site water treatment plant has been designed to adequately treat iron and manganese to state standards. The water treatment plant will be permitted by the State prior to its approval and operation. For further detail, please see Mitigation Measure 4.8-1(a). Please also see Master Response 8 – Mine Waste Characterization.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Ind 672-1**

Hello, my name is Richard Charnley, owner of Empire Shoes in Grass Valley and resident of district three. I've lived in Nevada County for over thirty five years and I oppose the reopening of the I Idaho-Maryland mine. There are too many negatives associated with the reopening of the mine. Some of the negative impacts are: Pollution of the air and environment, the amount of our power that will be consumed, the amount of our water that will be used, the dumping of mine waste, and most importantly the pain and suffering due to noise levels, loss of wells, loss of property values and more that the residents living within a half mile or more from the mine will have to endure. As the county supervisors it's your job to do what's best for and protect the people of Nevada County...all the people. There are too many things that can go wrong with this mine, and we all know there will be many things that will go wrong. This is a bad deal. Too many negatives. You'll be making a deal with Rise Gold, a company with a record of failure and incompetence. What do you think is going to happen if you make a deal with a company that's incompetent?...you'll be like a bank loaning money to a company that defaulted on it's last loan. Don't put the people of Nevada County in that

**Ind 672-2**

position... And lastly, If you do approve this mine reopening, you know the residents that will be affected negatively by the mine, including myself are not going to be happy. If we have to endure loss of wells, noise from the mine and the lowering of our property values, we are not going to go down without a fight, you can expect legal repercussions. Think of the cost of that?... but let's not even go there. You were elected to do the right thing for Nevada County and to protect all the people living here, that's your job! Do your job and the right thing ....do not approve the reopening of the Idaho Maryland mine.

Sincerely, Richard Charnley

## INDIVIDUAL LETTER 672: RICHARD CHARNLEY

### Response to Comment Ind 672-1

The comment does not directly address the adequacy of the DEIR. For concerns regarding well impacts, please see Master Responses 14 and 15; for general concerns regarding pollution of the environment, please see Master Response 8 (Mine Waste Characterization) and 35 (Discharge to South Fork Wolf Creek); for concerns related air pollution, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy; for concerns related to energy use, please see Chapter 4.3 and Impact 4.11-6 (pg. 4.11-34) of Chapter 4.11; and for concerns related to noise, please see Chapter 4.10, Noise and Vibration. Property value is outside the scope of CEQA – please see Master Responses 1 and 2.

### Response to Comment Ind 672-2

Please see Response to Comment Ind 672-1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**To:** Idaho MMEIR
**Cc:** DEIRcomments@cea-nc.org
**Subject:** RISE Gold DEIR comments

Dear Members of the *Nevada County Planning Commission*:

Clearly, the proposed mitigations for the *RISE Gold Idaho-Maryland* mine application need to be carefully critiqued.

However, please also consider the precarious lack of ***organizational capacity*** of *RISE Gold* to successfully implement whatever proposed mitigations might finally be submitted.

In effect, *RISE Gold* is proposing an ***eighty year marriage*** with Nevada County, and, as with any suitor, promises mean little if they are not carried out.

Considering how little we could have predicted eighty years ago — (in 1942!) — about our circumstances today, our County would assume ***a level of risk far outweighing any potential benefits***.

**Ind 673-1**

If this suitor were to fail to follow through, and abandon our Nevada County family, we would suffer serious consequences for years to come.

Based on both its past performance and its current advocacy, *RISE Gold* has demonstrated a worrisome t***otal lack of credibility*** to fulfill its promises.

Please consider this letter an ardent request to recommend denial of this project application to the *Nevada County Board of Supervisors*.

Sincerely,

Richard L. Drace
1241230 Liquidambar Lane, Grass Valley

## INDIVIDUAL LETTER 673: RICHARD DRACE

### Response to Comment Ind 673-1

Please see Master Response 3 – Operator Responsibility. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 674**

**From:** Richard Johnston
**To:** Idaho MMEIR
**Subject:** Rise Mine
**Date:** Sunday, February 20, 2022 12:57:37 PM

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr. Kelly,

**Ind 674-1**

After my review of the DEIR, I fail to see what many others are concerned about. Sure, there will be some increased industrial traffic, power utilization and waste production. I believe the needed mitigations were provided by the company and that there is little to warrant stopping them from proceeding. In my mind, the threat of a community asking to stop a legitimate business for personal reasons should never be enough to stop the project from moving forward. Had there been definite health and safety issues arise in the DEIR, my tune would have changed tremendously. Being a father of four and a property owner in Nevada County, I do care about the environment and our surroundings just as much as the next person. This project doe not threaten our livelihoods like some are attempting to make it seem.

Please accept this as my vote to move the project forward and allow Rise to open the mine back up. I feel that it will open several unknown revenue streams within the county without any major negative impacts.

Thank you!
Richard Johnston

**Subject:** Questions regarding the Rise Gold hydrology data in the Draft EIR

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 675-1**

Does the draft EIR address the issue that the current Northern California water models used for predicting future water conditions are seriously out of date, due much in part by the rapid effect of climate change taking place?

One of the most important tools for predicting and managing water during periods of drought are the models developed by various state and federal agencies such as the National Weather Service's Office of Hydrologic Development, the Army Corps of Engineers and the California Department of Water Resources. Yet these models suffer from a simplistic view of drought and water, and they are in dire need of an update. In the Draft EIR it is stated that the predicted drop in feet of existing wells in the areas is within a permissible number of feet.

How was this drop in feet of existing surrounding wells calculated in the Rise Gold Draft EIR and what scrutinizing has been applied to the data?

And, importantly, was the fact that existing water models currently used by the State of California acknowledged to be out of date and unreliable?

Below, according to Dr. Schwartz, the lead scientist and station manager at the University of California, Berkeley, Central Sierra Lab:

> "Land surfaces, snow melt patterns and the climate have all changed since many climate models were developed, which means they're missing crucial pieces of today's water puzzle. What's prevented updates to the models for decades is shrinking funding for science and engineering.
>
> Models may not be able to reliably inform water managers how much rain and snow will run off the land into reservoirs, which can mean severe shortages in a worst-case scenario. Given the shrinking reservoir levels and meager snowpacks of recent years, discrepancies between the water expected and that which arrives could mean the difference between having water in the taps or entire towns running dry.

1

We are looking down the barrel of a loaded gun with our water resources in the West. The current water monitoring and modeling strategies aren't sufficient to support the increasing number of people that need water. These are problems that we'll inevitably face as climate change continues and water becomes more unpredictable.

It's time for policymakers who allocate funding to invest in updating our water models rather than maintaining the status quo and hoping for the best. Large-scale investment in the agencies that maintain and develop these models is paramount to preparing for the future of water in the West.

Better water models ultimately mean more accurate management of water, and that will lead to greater water security and availability for the millions of people who now depend on the changing water supply. It is an investment in our future and, further, an investment in our continued ability to inhabit the water-scarce regions in the West".

Respectfully,

Rick Range

22 year resident of Nevada County.

Subject: Comments on Draft EIR Submission

Adhering to the April 4th deadline:

These are our concerns that need to be thoroughly investigated in the final EIR:

1. Groundwater-affects of the mine's activities on the groundwater for residents in the area with wells

**Ind 676-1** The mine operation of dewatering huge amounts of water and other water use operations could significantly affect ground water levels leading to dry wells or less productive wells. If the affect of the dewatering cannot scientifically assure there will be no impact on the residential wells, the project should not go forward. Our existing wells are already stressed because of climate change and longer and hotter droughts, leaving aquifers that are unable to be sustained. The final EIR must take into account projected lower water tables due to drought and higher temperatures that are certain to increasingly occur because of climate change. And not to assume our current water conditions will extend in the future. There is little room for error considering the already adverse conditions that we will face without the mine. Another concern is the seismic affects of the dynamiting at the site.

**Ind 676-2** 2. How will the underground dynamiting affect the structure of the underground fissures and aquifers that deliver water to wells? How will it change given the complexities and interdependence of fissures in the course of underground water flow in surrounding areas? What provisions are there to mitigate a domino effect that may adversely ripple through them, considering possible the interlinking of these aquifers?

**Ind 676-3** 3. Air Quality

Nevada county is not in compliance with the state and local air quality standards. The county experiences bad air quality due to regular wildfires and being located at the edge of the inversion layer from the Sacramento Valley and the Bay

1

Area. Our residents suffer from respiratory illnesses and increased cancers from breathing unhealthy air. The additional emissions from increased traffic and on-site processing of materials will further deteriorate our already bad air quality. The final EIR must address how these emissions will be mitigated to comply with the Air Resources Board's and the Northern Sierra Air Quality Management District's air quality standards.

4. Greenhouse gases and climate change

**Ind 676-4** Any EIR must consider the effects of fossil fuels and other greenhouse gases. This is also linked to our county being designated an "extreme fire danger area". Our county could become unlivable if greenhouse gases are not mitigated. The county General Plan has zoned the property for medium density and residential business park. The General Plan is required to consider the affect of fossil fuels and other greenhouse gases in its planning. Zoning is part of that planning. The window to reduce greenhouse gases is closing behind us. Action must be taken now if we are to avoid its worst affects. The final EIR should address the rezoning as linked to the above issues.

5. Monitoring and oversight

**Ind 676-5** The final EIR should also include the monitoring, oversight, and penalties associated with the implementation of the project, both civil and criminal. How do we stop the mining company from either willfully breaking or claiming ignorance of the regulations to operate around these rules to their economic advantage?

It appears that Rise Gold has already ignored regulations in their test drilling operations.

6. Transportation and circulation

**Ind 676-6** Hwy. 174 is a major road that forms the corridor from Hwy. 80 into Grass Valley. Additional traffic congestion from the project will impede the flow of transportation into the Brunswick basin. This is downplayed in the DEIR.

7. Aesthetics

**Ind 676-7** As a major entry way into Grass Valley, the project would change the character of our rural Grass Valley-Nevada City area as a desirable place for tourists and residents to want to visit and live here.

Sincerely,
Rick and Dianne Range
17100 Sunset Mountain Place
Grass Valley

Sent from my Galaxy

## INDIVIDUAL LETTER 676: RICK AND DIANNE RANGE

### Response to Comment Ind 676-1

The commenter is concerned that the project will have adverse impacts on groundwater wells, leading to dry or less productive wells. The DEIR analyzed the project's impact to groundwater supplies and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is referred to Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

The commenter is concerned about the seismic effect of explosives used at the site but provides no specifics regarding this concern. The magnitude of the mine rock excavation and placement is far smaller than the magnitude of the mass of bedrock underlying the site. The magnitude of the energy released during mining excavations by rock removal and rock placement is much smaller than the magnitude of energy activation required to trigger the release of a local pre-Holocene fault. No analysis was performed nor is necessary, as there is no potential for inducement of seismic activity on these faults from the proposed mining activity. The commenter is referred to the NV5 Memo attached to the Final EIR as Appendix P. Blasting vibrations are analyzed in Chapter 4.10 of the DEIR.

### Response to Comment Ind 676-2

The commenter is concerned that the underground blasting will impact the hydrological connection to private groundwater wells. As discussed on pages 15-19 of Appendix M, numerous holes must be drilled and blasted sequentially into a void (the free face) in order to fracture rock and create mining excavations. Any blast damage to surround rocks, such as cracks, would be limited to a few feet surrounding the excavation. Therefore, blasting cannot "damage the aquifer" or cause draining of surface water and groundwater.

### Response to Comment Ind 676-3

The commenter states that Nevada County's air quality is already poor and that the project will exacerbate those conditions. The commenter states that the DEIR must demonstrate the project will comply with air quality standards. The DEIR demonstrates that the project will comply with applicable air quality standards with implementation of mitigation measures. (DEIR, 4.3-66.) The commenter is also referred to Master Response 18 - Air Quality Thresholds.

### Response to Comment Ind 676-4

The commenter states that the DEIR must analyze GHG emissions. The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds.

### Response to Comment Ind 676-5

The commenter states that the Final EIR should include a monitoring program for the project and the commenter also references the Project Applicant's prior mining project. A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The project mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 3 - Operator Responsibility.

### Response to Comment Ind 676-6

The commenter states that the DEIR understates the project's traffic-related impact to SR 174. However, the DEIR acknowledges that the project's impact to the intersection at SR 174 and

Brunswick Road would be significant and unavoidable. While the DEIR concludes that the proposed project would have a significant and unavoidable impact to the SR 174/Brunswick Road intersection, Mitigation Measure 4.12-1(b) of the DEIR requires the applicant to enter into a Traffic Mitigation Agreement with the County regarding the SR 174/Brunswick Road intersection. The Agreement shall require the applicant to pay the project's fair share contribution toward the improvements necessary to improve intersection operations to an acceptable level. The Agreement shall include the fair share calculations and total payment amount. Based on the Caltrans methodology to assess fair share, it is estimated that the fair share percentage is 14.9%. While the project is contributing toward addressing its contribution of traffic to the SR 174/Brunswick Road intersection, the remaining funding needed to improve the intersection (e.g., signalization) is not yet certain, nor secured. As a result, the DEIR conservatively concludes that the impact would remain significant and unavoidable.

## Response to Comment Ind 676-7

The commenter states that the project would change the visual character of the surrounding area. The DEIR has determined that the project would have a significant and unavoidable aesthetics impact even after implementation of mitigation. (DEIR, p. 4.1-14-15.)

### Response to Comment Ind 678-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 679**

To: Matt Kelley, Senior Planner, Members of the Planning Commission and Board of Supervisors.
**Re: Idaho Maryland Mine – Rise Gold, Grass Valley**
Fr: Ricki Heck, Homeowner, **13641 Greenhorn Road**, Within the mineral rights zone March 23, 2022

Dear Mr. Kelly -

I have lived on my property since the early 1980's, built my home, raised my children and now am enjoying retirement; all on the same property. I have lovingly tended to the gardens, landscape and hardscape over 40 years. This is my home and my treasure. I am writing to share my concerns about the adequacy of the EIR and highlight those areas where I believe the Draft EIR is simply inadequate.

Ind 679-1

**Water Quality Impacts to Neighborhoods.**

- ***My well and that of three of my immediate neighbors does not appear on the Applicants map of wells.*** The state database, Well Completion Report does not show my well, or that of 3 of my immediate neighbors. My well was drilled in 1981 by a private person who either did not know to report it or simply did not report. ***How many other wells may be unaccounted for?*** *This omission is a serious inadequacy of the DEIR.*

Ind 679-2

- Please require the Applicant to conduct a door to door, parcel by parcel inquiry to obtain an accurate count of the number of wells within the mineral rights area and within 1,000 feet of the mineral rights area. I believe a door-to-door survey may have been a condition of approval for the EmGold project, 20 years ago. This may be the only way to obtain an accurate count of the number of wells in the project area.

Ind 679-3

- Once an accurate count of wells is produced, I believe the Applicant should then conduct both potability and mineral/metal content testing, at the applicant's expense, of each well to establish a baseline. I believe the scope of potential water contamination may be far greater than is currently considered and can only be measured by an established baseline examination.

Ind 679-4

- Should wells beyond the scope of the project become compromised or contaminated, Rise would need to be required to extend NID system lines well beyond their current E. Bennet area to serve all households with compromised wells. I know the costs of connecting to NID is substantial, and would need to include actual hookups to each home paid for by Rise, and 80 years' worth of water payments to NID, including any costs in the raise in rates that are likely to occur over the term of the operations. Both the financial impacts and the environmental impacts should be evaluated in the event the number of wells exceeds the 30 as identified by the applicant.

Ind 679-5

- At what levels of contamination or change in water quality would be mandated for Rise to take action for private well owners, how will that be defined? Please include a definition of how "contamination" is measured

Ind 679-6

- I also note an omission in the DEIR that does not reveal levels of arsenic or mercury from their water sampling. Either this was an omitted test or left out of the discussion. Please require this information to be included in the document.

- Our well has produced sparkling clear, pure water since it was drilled, about 1981. That well is my only source of water. It has performed beautifully and reliably for my family and gardens for over 40 years.

**Noise.**

Ind 679-7

- One of the things I love most about living on my land is the quiet. I am extremely worried and concerned that the noise generated from the mining operations, said to be 24 hrs day / 7 days a week, would simply ruin the rural quality of my home and life and that of the other residents who live within the sphere of the project

Ind 679-8

- Please, please, should the project go forward, put reasonable restrictions on operating hours. In the EmGold process, I believe it was 7:00 am to 6:00 pm. No noise or trucks would be allowed outside of those hours.

Ind 679-9

- If the project is allowed to go forward without restrictions on operating hours, I simply could not live with the noise and traffic impacts. I would need to leave the neighborhood, my beloved home and gardens.

**Traffic and Fire Evacuation. The DEIR does not adequately address traffic and Fire Evacuation Routes.**

**Ind 679-10**
- The DEIR did not mention fire evacuation routes in the Traffic Impact Analysis Appendix, this is a serious oversight.

**Ind 679-11**
- The Greenhorn, E. Bennett, and Brunswick areas are known severe high fire areas and its residents have very few options for fire evacuation. Yet the DEIR says on page 594, "The Greenhorn Road area would likely have several evacuation zones because it is a relatively large area". This statement is ridiculous. I would suggest the Applicant work with the Fire Wise Communities of each area of potential impact to more accurately assess risks.

**Ind 679-12**
- The information in the DEIR with regard to evacuation routes was simply a cut and paste exercise of existing general plan, OES, and Cal Fire evacuation protocols. I did not see any efforts to discuss how the hundreds of employees and the vehicles and trucks would impact the community in the event of an evacuation.

**Ind 679-13**
- The assertion in section 4.7.4 and 4.13.1 of Table 2.1 states the impacts to the emergency response and emergency evacuation as being less than significant seems wrong. Upon what information is this conclusion based upon? It cannot be the Traffic Impact Analysis because that document does not address fire evacuations.

**Ind 679-14**
- Please require an in-depth analysis of specific impacts of the increased load due to the mining operations.

**Inverse Condemnation.** The DEIR should address ***local*** conditions within the real estate market.

**Ind 679-15**
- As a 30-year real estate professional, I strongly believe that if allowed to move forward, the homeowners within the sphere of the project may have their homes devalued and be unable to sell for fair market value, or more likely, be unable to sell at all. I believe the noise, water and traffic conditions alone would be a "taking", a cause for an inverse condemnation action.

**Ind 679-16**
- While I do understand that CEQA does not require an economic analysis, our local area would be severely impacted from a collapse of real estate values of the several hundred homes surrounding the project. I ask that a ***local*** analysis be made using ***local*** real estate professionals on the impacts to home values in the sphere of the project. The DEIR should address local conditions within the real estate market, and offer mitigations in the event such a "taking" occurs.

**Ind 679-17**
- This information will be valuable in assessing the applicant's claim of economic benefits against the loss of home value and the corresponding equity that is present in our community.

**Collapsing Tunnels. – The DEIR must address the issue of collapsing tunnels.**

**Ind 679-18**
- As a long-time real estate professional, I have personally witnessed a brand-new home, nearby the project in the Brunswick Pines area that fell into a previously unknown mine tunnel. It happened about 15-20 years ago.

**Ind 679-19**
- I would like to see a specific study on the probability of homes and lands being swallowed once the dewatering takes place. This is a *real* concern, and something that happens more often than is thought. Tunnel collapses can happen anywhere.

**Ind 679-20**
- I did not see a reference in the DEIR regarding collapsing tunnels or sink holes, or an offer of mitigation in the event of a collapse. This must be considered.

**Ind 679-21**
My concerns are many, with only a few stated here. While mining may have given Nevada County its beginnings; our lifestyle, economy and quality of life have changed since those days. There are homes and families that have invested in our community by building residential communities around this mine area. ***I urge you and the Board of Supervisors to demand the best for our community. Please require the Applicant to reevaluate the many inadequacies of the DEIR, do further research, re submit and recirculate the DRAFT. Please ask yourselves; "If my home was in this area, how would I feel, what assurances would I want and what protections do I deserve."***

Respectfully,

Ricki Heck

13641 Greenhorn Road

## INDIVIDUAL LETTER 679: RICKI HECK

### Response to Comment Ind 679-1

As discussed in Section 3.3.2 and shown on Sheet 12 of Appendix K.2 of the DEIR, over 1,200 Water Well Driller Reports (also known as Well Completion Reports) available from the California Department of Water Resources (DWR)'s online database for private domestic wells are located within approximately one to two miles of the project site. Many of these wells are geolocated by property location in the DWR database while some are only located by the US Public Land Survey System (PLSS) township, range, and section. In areas within the predicted 1-foot drawdown from the groundwater model, wells with only general PLSS locations in the DWR database were matched to properties and plotted. The well database was also augmented with well data from the previous applicant Emgold, which provides additional well information within the 1-foot drawdown isopleth that is not available in the DWR database. All available details about well construction and testing in the area of the 1-foot drawdown isopleth were reviewed and tabulated from the Well Completion Report or Emgold records and are provided and discussed in Section 3.3.2 of Appendix K.2. which are available for the majority of properties. The Well Mitigation Plan has been clarified to include measures to identify any wells not in the well database and gather individual well characteristics should an impact be predicted by the Groundwater Monitoring Plan. The revised Well Mitigation Plan is attached to the Final EIR as Appendix D. The commenter states that a complete inventory of domestic water wells within and beyond the mineral rights boundary is required for the analysis of the DEIR. However, wells outside the 1-ft drawdown were not specifically analyzed for impacts from mine dewatering because they would experience negligible drawdown and therefore would not be significantly impacted by mine dewatering. More effort in including these wells in the well database would not change the analysis nor conclusions of the DEIR, nor the necessary mitigation measures, and therefore is not required.

With respect to the commenter's property specifically, this property is located outside of the 1-ft isopleth as shown on Sheet 12 of Appendix K.2 of the DEIR and therefore is predicted to experience negligible drawdown (less than one foot) and impact from mine dewatering. Approximately five wells adjacent to the commenter's property are mapped on Sheet 12 based on the DWR database information. Nevertheless, the groundwater monitoring plan is implemented to ensure that any impact would be predicted and preemptively mitigated, if necessary. Please see Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 7 - Location of Future Mining Areas.

### Response to Comment Ind 679-2

Please see Response to Comment Ind 679-1.

### Response to Comment Ind 679-3

Baseline groundwater quality data is required to be collected 12 months before the commencement of mine dewatering and will be collected from groundwater monitoring wells which will be representative the groundwater quality in surrounding domestic water wells. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, for an updated description of the proposed monitoring approach, which now also includes a proposal by the applicant to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 679-4

The Well Mitigation Plan has been clarified to explain actions that would be taken for well mitigation, if required, in more detail. Please see the revised Well Mitigation Plan attached the Final EIR as Appendix D. Well mitigation outside of the E. Bennett area may not include the connection to NID potable water depending on the circumstances, as storage tanks and/or well deepening may be adequate solutions. Any mitigation required for wells impacted by the project would be done so at the cost of the applicant. Please also see Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 7 - Location of Future Mining Areas.

## Response to Comment Ind 679-5

Mitigation Measures are designed to ensure wells would not be contaminated by mining activities and baseline groundwater quality data will be collected and groundwater quality will be monitored throughout operations. Please see Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 679-6

Arsenic and mercury were analyzed in water samples. Please see Tables 3-6, 3-7, and 3-9 of Appendix K.2.

## Response to Comment Ind 679-7

Comment noted regarding the commenter's existing groundwater well. Noise from project activities has been analyzed in Chapter 4.10 of the DEIR and was determined to be less than significant after mitigation. Please see Chapter 4.10 of the DEIR. Furthermore, while the DEIR determined, based on best available data, that the project's operations would not result in noise levels that would exceed the County's thresholds, the DEIR conservatively concludes that the proposed project could result in a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, and the project's noise impacts could be significant. As a result, the DEIR includes Mitigation Measure 4.10-3, which requires implementation of a robust, ongoing noise monitoring program. The noise monitoring program shall evaluate noise levels at a minimum of five receptor locations surrounding the Brunswick Industrial Site. The noise monitoring system shall consist of the installation of permanent noise monitors at three to five locations on the Brunswick Industrial Site, and one site at the Centennial Industrial Site, to be determined by a third-party noise consultant under contract with the County, in coordination with the applicant. The permanent monitors shall be provided with a continual power source, and shall include internet connectivity technology, to enable electronic retrieval of noise monitoring data at any time by the County's third-party noise consultant. The County's third-party noise consultant is required to retrieve and evaluate mine-related operational noise levels within 30 days of commencement of mining, quarterly thereafter for the first five years, and then once per year thereafter for the life of the project. If noise levels are found to exceed the County's standards, then operation of the mine shall cease, until additional engineering controls can be implemented as needed.

Also see Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 679-8

Noise from project activities, including nighttime activities, has been analyzed in Chapter 4.10 of the DEIR and is less than significant after mitigation. The applicable CEQA threshold of significance for noise impacts is not "no noise". Please see Chapter 4.10 and Appendix L of the DEIR. Also see Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 679-9
Please see Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 679-10
Fire evacuation routes are discussed and analyzed in Chapter 4.13 of the DEIR. Please also see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 679-11
The Greenhorn Road area is currently broken into two evacuation zones. Please see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 679-12
Please see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 679-13
Fire evacuation routes are discussed and analyzed in Chapter 4.13 of the DEIR. The analysis is based on review of available data and correspondence with agency staff, including County OES and applicable fire agencies. Please refer to the footnotes in Chapter 4.13. Please also see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 679-14
Please see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 679-15
The comment does not address the adequacy of the DEIR but has been forwarded to the decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 679-16
The comment does not address the adequacy of the DEIR but has been forwarded to the decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 679-17
The comment does not address the adequacy of the DEIR but has been forwarded to the decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 679-18
As discussed on page 6 of Appendix H.6, the Old Brunswick mine features were described during the parcel map creation in a geotechnical report by Anderson (1986), who conducted test boring and delineated areas inappropriate for residential construction over the Old Brunswick mine features which were incorporated into the final map for Bet Acres.

As discussed on page 6 of Appendix H.6, the Old Brunswick Incline Shaft is located at 12305 Bet Road. The feature extends from the ground surface at an incline of approximately 45 to 50 degrees to the 1,250-level of the mine. A Non-engineered soil/rock backfill collapsed in 1998 at the existing residence location. The collapse was likely associated with a vertical excavation to the ground surface from the incline shaft. The collapsed portal was closed by engineered design and the foundation of the house was underpinned (Carlton Engineering, Structural Engineer Thomas Burkhart, S.E. 4378) in 2000 and 2001. Design and permitting documents are on file with Nevada County Building Department (Permit # 72094).

Near surface workings and subsidence are analyzed on pages 4.6-44 through 4.6-47 and Appendix H.6 of the DEIR. Please also see Master Response 29 - Near Surface Workings.

## Response to Comment Ind 679-19

The commenter states that a tunnel collapse can happen anywhere. However, a tunnel must actually be present and such a tunnel must be close to surface to cause subsidence. Please see Response to Comment Ind 679-18, DEIR pages 4.6-44 through 4.6-47, and Appendix H.6 of the DEIR. See also Master Response 29 - Near Surface Workings.

## Response to Comment Ind 679-20

Near surface workings and subsidence are analyzed on pages 4.6-44 through 4.6-47 of the DEIR and Appendix H.6 of the DEIR. Please also see Master Response 29 - Near Surface Workings.

## Response to Comment Ind 679-21

The commenter's opposition to the project is noted for decisionmakers. The County has determined that recirculation of the DEIR is not required as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met. Please also see Master Response 1 - Non-EIR/Administrative Issues.

Nevada City, CA 95959-7902
530-265-1423
Idaho.MMEIR@co.nevada.ca.us

Idaho.MMEIR@co.nevada.ca.us

Dear Mr Kelley,

My family and I live in downtown Grass Valley. We purchased out home in 2004 and since then have taken care of our 1870's Victorian and yard. We love our neighborhood and the proximity to downtown, library, stores and the Center for the Arts. It is a vibrant community of locals and tourists that keep these downtown business's going. I am very concerned about how the proposed Idaho-Maryland Mine Project by Rise Gold could impact our community. I've been reading the DIER and have some concerns about noise, traffic mineral processing and heaving equipment will impact on our community.

**Ind 680-1**

Noise and Vibration 4.10
Testing for Noise: Why are the noise testing areas limited to an area so close to the mine sites? The geography of Grass Valley is a VALLEY, noise travels far and wide. There should be noise test sites all over the county not just in close proximity to the mine sites. For example; Grass Valley at Mill St & Main St., Nevada Union High School, Union Hill School, Sierra Nevada Memorial Hospital and Sierra College.

**Ind 680-2**

Truck Traffic, Mineral Processing, Vibrations Levels of Heavy Earth Moving Equipment: Again I ask, why are the monitors and testing limited to areas only near the 2 mine sites? I request expansion of the monitoring to at least these suggested

sites: Grass Valley at Mill St & Main St., Nevada Union High School, Union Hill School, Sierra Nevada Memorial Hospital and Sierra College.

**Ind 680-3** I oppose allowing Rise Gold to re-open The Idaho-Maryland Mine. It will not benefit our community in the short or long run. How can we in good conscience allow a business in our county that uses more water than we currently use, while the state of California and Nevada County is in such a severe drought and we are being asked to ration our water? How can we allow a company to open a business that will increase energy use in this county by 25% when we are having increased power outages due to fires, over use during peak hours and weather? The DEIR does not discuss mitigating plans for bringing more water or power to Nevada County. I think the DIER should address this, such as building a

**Ind 680-4** renewable energy power plant to generate the additional power they need plus help meet the county's energy needs.

Sincerely,

Risa Roseman

## INDIVIDUAL LETTER 680: RISA ROSEMAN

### Response to Comment Ind 680-1

As discussed on page 4.10-4 of the DEIR, Bollard Acoustical Consultants conducted continuous noise level measurements at 11 locations in the project vicinity (see Figure 4.10-3 of the DEIR). The noise measurement locations were selected to be representative of ambient noise conditions at receptors nearest to both the Brunswick and Centennial Industrial Sites, at locations along East Bennett Road where the potable water system would be installed, and at receptors along the proposed haul routes. Any receptors further from these locations would be subject to lower noise levels, and thus, analysis of receptors located further away is not necessary.

The DEIR evaluates potential impacts associated with substantial increases in ambient noise levels relative to existing conditions under Impacts 4.10-1, 4.10-2, and 4.10-3. Where potential impacts are identified, the DEIR sets forth mitigation measures to reduce the severity level of the identified impacts to the extent feasible and discloses the level of impact that would occur subsequent to incorporation of mitigation. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project.

### Response to Comment Ind 680-2

Please see Response to Comment Ind 680-1.

### Response to Comment Ind 680-3

The comment does not directly address the adequacy of the DEIR. Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 680-4

The DEIR evaluates potential impacts associated with water supply in Chapter 4.8, Hydrology and Water Quality, and Chapter 4.11, Public Services and Utilities. The DEIR evaluates potential impacts associated with energy use in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. Please see the discussions and analyses contained therein. In addition, please see Master Responses 15 and 16.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 681**

Nevada County Board of Supervisors/ Nevada County Planning Commission

950 Maidu Avenue
Nevada City, CA 95959-8617

Dear Supervisors and Planning Commission, March 13, 2022

**Ind 681-1** I'm writing to you today because in reading the EIR, there is SO MUCH that has not been considered. How can they say there is 'minimal mitigation' needed when TON's of explosives are being trucked through our town every one to three weeks? Oh sure- the driver has to be a 'certified' explosive hauler.....that makes me feel so much better. If that truck is rear ended on the offramp it takes, it could blow up Grass Valley Charter School at Hwy 174 offramp, or Rite Aid drugstore at the Brunswick offramp, or maybe if we are lucky- it will be the Idaho Maryland offramp and only kill a few people in their cars and damage Hills Flat Lumber.

**Ind 681-2** I've been a resident of Grass Valley- living right in the downtown area- for about 16 years now. I am also a business owner and have a shop on Loma Rica Dr. close to the airport which will be effected by the noise and pollution from the mine.
I moved here because of the beauty & quiet, peaceful nature of living in a small town. I realize that there has been a history of mining in this area for some 170 years, however I was under the impression that those days were done and most of the jobs and income was from tourism, or high tech business's to our beautiful area. We should be very careful not to pollute our air and water, so people will still come up to our town to enjoy the vibrant town we have created. The EIR has not really addressed many concerns-

**Ind 681-3** 1) How will the downtown area be affected by noise from the 100 truck trips per day.
a) Noise travels across the valley that Wolf Creek carves out along Idaho Maryland road. Trucks dumping material 100 times a day up by Centenial Dr. will be heard by many residents and then there is the grading and compacting operation, which they say will be running 7 days a week from 6AM-10PM. Really!!!! Even construction sites aren't suppose to operate on Saturdays and Sundays.....and then starting at 6 AM on a weekend.....there goes sleeping in.....This is unheard of and should not be allowed! I don't see where the EIR addresses this.

**Ind 681-4** 2) How will all those machines/trucks affect our air quality.
a) We already suffer from bad ozone pollution coming up from the Sac. Valley Do we really want all that extra particulate matter put into our air too? Is the extra 100 trips a day really something we need to "mitigate" with carbon credits? The air is not going to be cleaned by those 'carbon credits'

3) How will they insure that the explosives they use will be safely transported through our town? As the EIR states; Explosives would be transported to the Brunswick Industrial Site a maximum of once a week to a minimum of once every three weeks.

They may be getting off Highway 49 at the main downtown exit and there-by passing right by Grass Valley Charter School (formerly Hennessy) at the bottom of the exit-or perhaps they will get off at Idaho Maryland Rd. In which case they will wind up a very narrow stretch of road on Idaho Maryland between Sutton and Brunswick. (A road I frequently bike up-Large trucks going up this road are very scary as there is NO shoulder.)

4) How will they insure that the vibrations from the explosives they use won't effect the sensitive business's in Whispering Pines business area. Again- the EIR is just speculative:

The U.S. Bureau of Mines (USBM) and Office of Surface Mining, Reclamation, and Enforcement (OSMRE) have both developed recommendations for ground vibration levels to prevent damage to residential structures. Dr. Konya of Precision Blasting Services recommended a threshold level of 0.4 in/s PPV for the IMM project. The threshold level is based on previous studies for which it was determined that less than approximately eight percent of people would complain about blasting activities if the peak particle velocity was below 0.4 in/s. The project-specific blasting report recommends this threshold be applied at the location of receptors on surface to minimize annoyance and complaints.

Ind 681-5

**Should we be content that only 8% of the population is upset/complaining about the vibrations from the blasting- what happens if it is 12% or 20%. What is the threshold of upset people considered acceptable?**

a) How can we be assured that we won't be woken up in the middle of the night by little "earthquakes" from their underground explosions? Oh sure they have their noise receptors along the haul routes, but not right across the valley in Downtown. We will never know what woke us up in the middle of the night-and those sensors won't do us any good at figuring it out either……

Ind 681-6

b) Will they compensate landowners if there is damage to property from the shaking?

c) What about sink-holes caused by underground mining activity?

Ind 681-7

a) The city of Grass Valley already had to deal with a major sinkhole on Freeman lane by Wolf Creek, cause by a drainage pipe that was damaged and not releasing water into the creek.

b) What sort of bond might they be required to put up to insure that they are solvent enough to pay for any damages that might incur.

Ind 681-8

5) And for the people living very near to the site- Their property values are going to suffer mighty bad from having a mine move in and potentially de-water their wells. I know that Rise Gold has proposed hooking them up to NID, but they have already invested in drilling and maintaining their own wells, and now to be told they might not have water anymore and must pay the Utility for it.....that is not part of the deal these

people should be going through now. Especially because people have already suffered through this pandemic.

6) Do the young people of Nevada County really want the job of an underground miner? Has anyone taken a survey and asked them? I would bet that the new high school graduates of Nevada Union High School will not be lining up to apply for these jobs- and they certainly won't be making $94,000/year as Rise Gold says the 'average salary' is.....They will be making $20-$25/hour, risking their lives, to enrich a Canadian Companies stockholders. No thanks- Not my kids.

**Ind 681-9**

Please say NO to this enormous gamble that the county will be taking if it approves this mine.

**Ind 681-10**

I appreciate your thoughtful consideration.

Sincerely,
Rob Katzenstein
245 N. Auburn St.
Grass Valley, Ca. 95945 530 218-7124 robkatsolar@gmail.com

## INDIVIDUAL LETTER 681: ROB KATZENSTEIN

### Response to Comment Ind 681-1

The commenter is concerned about the transport of explosives required by the project. As stated on page 4.7-25 of the DEIR, the transportation of explosives in the U.S. has an excellent safety record. A review of DOT incident reports for highway transportation of class 1.1B, 1.4B, 1.1D, and 1.5D materials shows 149 incidents over the past 30 years in the U.S. The majority of these incidents were vehicle accidents resulting in no release or spillages. No fatalities were reported in any incidents and only one incident resulted in injuries. The commenter's remarks regarding an accident that cause an explosion is speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

### Response to Comment Ind 681-2

The commenter provides an introduction and states we should be careful not to pollute air and water but does not identify how the DEIR is inadequate. Impacts to water are analyzed in Chapter 4.8 (Hydrology and Water Quality) of the DEIR. Impacts to air quality are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR.

### Response to Comment Ind 681-3

The commenter is concerned about the noise from trucks in downtown Grass Valley. The project does not propose any truck routes in downtown Grass Valley. (DEIR, Figure 3-13.) DEIR Chapter 4.10 (Noise and Vibration) analyzed noise impacts from trucks and found the impacts to be less than significant after mitigation. (DEIR, p. 4.10-31.)

### Response to Comment Ind 681-4

The commenter is concerned with the project's impacts to air quality and questions the efficacy of carbon offsets. The commenter also questions how the project will ensure safe transportation of explosives to the project site. The commenter does not identify any inadequacies with the DEIR. Air emissions from trucks and other machinery are analyzed in the DEIR, and all impacts related to air quality were determined to be less-than-significant after mitigation. The commenter is referred to Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and Appendix E.1 of the DEIR. The commenter is also referred to Master Response 18 - Air Quality Thresholds. Carbon offsets required under Mitigation Measure 4.3-7(b) would ensure that construction-related emissions would be reduced sufficiently to ensure that the project's incremental contribution of GHG emissions would be less than cumulatively considerable. A detailed discussion of explosives transportation and regulations is provided in Chapter 4.7 (Hazards and Hazardous Materials) of the DEIR.

### Response to Comment Ind 681-5

The commenter is concerned about the noise and vibration impacts from the use of explosives and states that the DEIR is speculative but does not provide any additional information. As stated on page 25 of Appendix M of the DEIR, the mining activities are located far from downtown Grass Valley are no ground vibration is expected. It is highly unlikely for anyone in downtown Grass Valley to perceive the ground vibration or for the ground vibration to cause any damage.

Blasting activities are intermittent. As discussed in Chapter 4.10 of the DEIR and the Technical Blasting Report prepared by Precision Blasting Services (Appendix M to the DEIR), a maximum of 0.23 inches per second vibration is modeled where a longhole blast could occur directly

beneath a receptor at 500 feet depth. Notwithstanding the rarity of this situation, such a blast might occur every three or four days between shift changes (7:00 AM and 7:00 PM) and would last for only seconds. At 500 feet depth and a horizontal offset of 1,400 feet, such a longhole blast would be undetectable by blasting seismograph (PPV <0.05 in/sec). Regular drift round blasting, occurring approximately twice daily over several seconds, are modeled to result in a maximum of 0.14 inches per second vibration at a depth of 500 feet directly beneath a receptor. At 500 feet depth and a horizontal offset of 900 feet, a drift round blast would be undetectable by blasting seismograph (PPV <0.05 in/sec). Historic mining was completed to approximately 1,600 feet depth and the majority of future mining would be below the historic mine. At this distance, regular drift round blasting and longhole blast would be undetectable by blasting seismograph (PPV <0.05 in/sec) at receptor locations directly above the blast location.

## Response to Comment Ind 681-6

The commenter asks if property owners will be compensated if there is damage from vibrations. As stated on page 4.10-54 of the DEIR, all groundborne vibrations calculated for blasting of both drift round and long-hole stopes, respectively, fall below the U.S. Bureau of Mines recommendations and the levels at which structural damage to buildings is possible. Regarding economic damages, the commenter is referred to Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 681-7

The commenter is concerned that the project will cause ground collapse or sinkholes. The commenter is referred to Master Response 29 - Near Surface Workings.

## Response to Comment Ind 681-8

The commenter states that the property values will be negatively impacted if groundwater wells are affected by the dewatering of the mine. Regarding the impacts to groundwater wells, the commenter is referred to Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells. Regarding economic impacts to property values, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 681-9

This comment is about the potential jobs generated by the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 681-10

The commenter opposes the project and urges the County not to approve it. The commenter's opposition to the project is noted for decision makers. See Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 682**

We DO NOT Support

**I support re-opening the Idaho-Maryland Mine**

RECEIVED
FEB 22 2022
NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Ind 682-1

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

## INDIVIDUAL LETTER 682: ROBERT AND FRANCESCA ERICKSON

### Response to Comment Ind 682-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 683**

**From:** Robert Gulbis
**To:** BOS Public Comment
**Subject:** no mine
**Date:** Tuesday, February 1, 2022 12:00:31 PM

Dist 4

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Greetings,

**Ind 683-1** As a long term resident of Nevada County, I would like to express my very clear opposition to reopening the Idaho Maryland mine. There are numerous reasons why I feel this way, and implore the BOS to reject any proposal to reopen this mine.

**Ind 683-2** Most obvious to me, is the draining and potential pollution of the groundwater. At this time of unprecedented wildfire danger, pumping millions of gallons of groundwater per day and flushing them down the river seems to be one of the worst ideas ever presented. If the forest has been suffering from drought, this will compound the danger many-fold.

**Ind 683-3** The other major concern I have deals with the track record of this firm and its CEO. They have had numerous violations regarding environmental stewardship. As a landlord, when doing due diligence about potential tenants, if I contact a former landlord who tells me the tenant trashed the property I disqualify the application. This CEO will try to sweet talk you about his/their intentions, do not be swayed as this is lip service & nothing more. This leads to another significant concern, which is that this is not a local company. These people will be taking the lion's share of any profits away from this region, permanently. Yes there will be some new jobs for as long as certain profit margins are met. But those jobs will pay a fraction of what is being siphoned out of the project. And then when the project ends they will turn tail and leave without ever looking back. The only evidence of their presence will be damage to the environment and prolonged legal entanglements trying to make the owners be held fully accountable. The defense team will be paid for by what was once Nevada County gold, while the prosecution will be underfunded due to the economic impact of the mine re-closing.

Please reject this proposal and take the option of re-opening the Idaho Maryland mine off the table. This is a choice of basic decency.

Sincerely,
Robert Gulbis

## INDIVIDUAL LETTER 683: ROBERT GULBIS

### Response to Comment Ind 683-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 683-2

The comment does not directly address the adequacy of the DEIR. Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, Master Response 16 – Drought and Climate Change, Master Response 33 – Groundwater Dependent Vegetation, and Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 683-3

The comment does not address the adequacy of the DEIR. Please see Master Response 3 – Operator Responsibility. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

Dist 4

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Greetings,

**Ind 684-1** As a long term resident of Nevada County, I would like to express my very clear opposition to reopening the Idaho Maryland mine. There are numerous reasons why I feel this way, and implore the BOS to reject any proposal to reopen this mine.

**Ind 684-2** Most obvious to me, is the draining and potential pollution of the groundwater. At this time of unprecedented wildfire danger, pumping millions of gallons of groundwater per day and flushing them down the river seems to be one of the worst ideas ever presented. If the forest has been suffering from drought, this will compound the danger many-fold.

**Ind 684-3** The other major concern I have deals with the track record of this firm and its CEO. They have had numerous violations regarding environmental stewardship. As a landlord, when doing due diligence about potential tenants, if I contact a former landlord who tells me the tenant trashed the property I disqualify the application. This CEO will try to sweet talk you about his/their intentions, do not be swayed as this is lip service & nothing more. This leads to another significant concern, which is that this is not a local company. These people will be taking the lion's share of any profits away from this region, permanently. Yes there will be some new jobs for as long as certain profit margins are met. But those jobs will pay a fraction of what is being siphoned out of the project. And then when the project ends they will turn tail and leave without ever looking back. The only evidence of their presence will be damage to the environment and prolonged legal entanglements trying to make the owners be held fully accountable. The defense team will be paid for by what was once Nevada County gold, while the prosecution will be underfunded due to the economic impact of the mine re-closing.

Please reject this proposal and take the option of re-opening the Idaho Maryland mine off the table. This is a choice of basic decency.

Sincerely,
Robert Gulbis

**Individual Letter 685**

To: Members of the Nevada County Planning Commission, Nevada County Board of Supervisors, and Nevada County Planning Department Staff
Attn: Matt Kelley, Senior Planner

Comments on the Draft Environmental Impact Report for the Idaho-Maryland Mine Project

4/3/22

To All Concerned:

The noise issues associated with the reopening and operation of the Idaho-Maryland mine are, by their nature, localized around the immediate surroundings of the Brunswick mine property, the Centennial disposal site and the trucking routes from the Brunswick to the Centennial site (and future, unnamed disposal sites).

**Ind 685-1**

The noise concerns listed in the DEIR are the preparation and construction noise at the Centennial site and at the Brunswick site, and the construction noise generated by installing a water main along East Bennet to insure four local well owners' continued water.

Noise is referenced with respect to 1) the source, and 2) the distance to 'The Nearest Receptor'. According to the County General Plan, Table 4.10-4 notes:

A) Compliance with the above standards shall be determined by measuring the noise level based on the mean average of not less than three (3) 20-minute measurements for any given time period Additional noise measurements may be necessary to ensure that the ambient noise level is adequately determined.

B) Where two different zoning districts abut, the standard applicable to the lower, or more restrictive, district plus 5 dBA shall apply.
C) The above standards shall be measured only on property containing a noise sensitive land use as defined in Policy 9.8 and may be measured anywhere on the property containing said land use. However, this measurement standard may be amended to provide for measurement at the boundary of a recorded noise easement or as determined in a recorded letter of agreement between all affected property owners and approved by the County.

Rise has chosen to measure the ambient sound levels of the 'Nearest Receptors', the neighboring parcels, at the property owner's dwellings, which are located at the greatest distance from the source of the sound. The true impact on those parcels of construction noise and ongoing operations, however, can only be determined by measuring at the property boundary.

According to the County General Plan, table 4.10.4, the decision to measure at this boundary is a County decision, so I ask the County to require Rise Gold to reassess the ambient and project noise levels on that basis.

**Ind 685-2**

Additionally, the ambient sound levels measured and used for this study date back to 2017/18. This is inaccurate data. The ongoing consequences of this project will not be known until after initial construction has finished and operation of the mine commences, easily 4 to 5 years in the future. I suggest that this analysis predicts only short-term sound level impacts, and does not adequately describe long term impacts to the local community, or to the larger community along the haul routes for mine waste.

**Ind 685-3** The study should look at projected future neighborhood growth and make a reasonable evaluation of additional noise in the context of the future ambient conditions in which the mine will be operating.

**Ind 685-4** The study describes in detail how the sound mitigation by terrain and ground cover will contribute to the mitigation of sound in the local neighborhood, and relies on these values for its conclusions, but does not address the time when the waste platform rises above the surrounding foliage and subjects the neighborhood to the direct, unobstructed noise of the fill and compact operation. PGS 762 - 769

**Ind 685-5** The study says: (pg. 764

"Assuming a bulldozer, grader, excavator, front-end loader and compactor were operating concurrently at the Brunswick and Centennial Industrial Sites during site preparation, the combined noise exposure from the effective noise center of those operations would be 85 dBA Leq and 85 dB Lmax at a distance of 50 feet from the operations. However, the earthmoving equipment would be at various locations on the project sites rather than grouped in a small portion of the sites. To provide a
conservative but reasonable assessment of project construction noise generation at the Brunswick and Centennial Industrial Sites, it was assumed that all of this equipment could be operating concurrently, but that the equipment would be spread
out over the sites during the site clearing/construction operations. As a result, average noise levels were predicted for the Brunswick and Centennial Industrial Sites preparation activities assuming the noise sources were distributed throughout the sites, whereas maximum noise levels were predicted based on the closest proximity of the equipment to the sensitive receptor locations."
This combined sound level would also be true of the later fill and compact operations at the Centennial and Brunswick sites.

This seems is a false assumption, since these machines work jointly to accomplish their task, and would sometimes be operating in close proximity.

Additionally, the suggestion that both the average and the maximum sound levels would be the same, 85 dBa. says that the noise would be ongoing and continuous. Acceptable daytime noise levels of 75dBa would still be like standing next to a busy freeway. This is a major change to a quiet neighborhood, even if it lies within County defined limits.

---

Page 786 of the DEIR describes a sound monitoring plan to evaluate the mitigation results of the operation. It says:

"If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed."

**Ind 685-6**

At this point, Rise will have sunk several million dollars into construction and development costs prior to starting operations. Are we to believe that they will just shut down until they can solve the problem, or will they continue to operate and pay fines levied as 'cost of doing business'? Safeguards should be put in place...

---

In fact, sound level calculations for the DEIR Table are based on values for construction noise from The FHWA Roadway Construction Noise Model (RCNM), and shown in Table 4.10-10. These values differ substantially from sound levels shown in the Noise Navigator Sound Level Database, published by the University of Michigan Department of Environmental Health Science. For example, where the RCNM shows Compactor and Front End Loader sound levels at 80dBa, the Noise

**Ind 685-7**

Navigator chart lists them as 92 and 93dBa. An Earth Scraper in Table 4.10-10 is listed at 85dBa. In the Noise Navigator chart, it is 107 to 111 dBa.

This calls into question the integrity of the analysis, since the actual machines to be used, the true sound levels of those machines, the real numbers of those machines in use at any given time, and their locations around the working locations at any given time are not actually known.

Other questions to consider –

There will be daytime noise levels resulting from haul trucks to and from the Brunswick site from 6:00AM to 10:00 PM, 7 days a week for 80 years. Do we want this in what is now a quiet, residential neighborhood? What happens to quiet, summer evenings on the back deck and sleeping in on Sunday morning? This is industrial city scheduling, not quiet countryside living.

The period of time from the Wright Bros flight to the moon landing was 66 years. A great deal changed during that time. This project is asking for an 80 year permit. Do we really want to lock Grass Valley and Nevada County into an unchanging heavy industrial existence for substantially longer than it took to get to the moon, while the world changes around us?

**Ind 685-8**

We live now in a quiet, rural neighborhood. Despite the DEIR's denials, there IS wildlife living on our property and the mine property. Deer wander the neighborhood freely. There is a resident owl who hoots softly in the evening. We have a neighborhood bear that visits from time to time. The operation of this mine will drive wildlife away, and that and the associated noise will totally change the character of the neighborhood - and much of Grass Valley - from a peaceful rural setting to a noisy, urban/industrial complex totally unlike it is today.

Regards,

Robert Hubbard
12966 Mink Court
Grass Valley, CA 95945

## INDIVIDUAL LETTER 685: ROBERT HUBBARD

### Response to Comment Ind 685-1

The comment is substantively the same as Comment Ind 617-5. The commenter is directed to Response to Comment Ind 617-5.

### Response to Comment Ind 685-2

The initial part of this comment is substantively the same as Comment Ind 617-4. The commenter is directed to Response to Comment Ind 617-4. With respect to the evaluation of long-term noise impacts, noise generated by the mining and processing components of the project would not change appreciably over time. Following completion of the engineered fill operations at both the Brunswick and Centennial sites, fill material would be hauled off site. Those future operations were evaluated in DEIR Impact 4.10-3 (Long-Term Off-Site Traffic). In addition, as future growth in the area unrelated to the project occurs, ambient traffic noise levels will increase incrementally while noise from the project would not. As a result, the project's contribution to the overall future ambient noise conditions would actually be lower compared to near-term ambient conditions.

In addition, out of an abundance of caution, Mitigation Measure 4.10-2 of the DEIR requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

Mitigation Measure 4.10-2 also requires quarterly noise monitoring by the County's third-party noise consultant during the first five years of project operation, and once per year thereafter for the life of the project.

### Response to Comment Ind 685-3

Commenter suggests that the DEIR needs to study future growth and increased future ambient noise conditions. Anticipated future ambient noise levels, including planned growth and the proposed project, are discussed in DEIR Impact 4.10-6. As future non-project related growth in the area occurs, traffic noise levels will increase incrementally as a result of that growth, while noise generated by the project would remain unchanged over time. As a result, the project's contribution to the overall future ambient noise conditions would be lower compared to near-term ambient conditions. In other words, as background noise increases due to future non-project neighborhood growth, that increase in noise will provide greater masking of project noise compared to existing ambient noise conditions.

## Response to Comment Ind 685-4

The ultimate elevations of the engineered fill areas were included in the three-dimensional noise modelling conducted for the environmental noise analysis. As a result, the condition referenced in this comment was accounted for in the DEIR impact assessment. The commenter is referred to page 6, last paragraph, of the project's Noise and Vibration Assessment (DEIR Appendix L). Additionally, the commenter is directed to Response to Comment Ind 617-6.

## Response to Comment Ind 685-5

This comment is substantively the same as Comment Ind 617-7. The commenter is directed to Response to Comment Ind 617-7.

## Response to Comment Ind 685-6

The project's requirement to comply with the County's adopted noise standards is neither arbitrary nor optional. Approval of the project by itself would not permit the project to generate noise levels in excess of those standards, regardless of how much investment the applicant has made in the project. Because the project does not yet exist, it is impossible to measure the noise generated by the equipment operating at the site prior to the project being approved. Rather, it is necessary to model the noise generation of the proposed project as accurately as feasible to evaluate impacts based on those modelling results. DEIR Mitigation Measure 4.10-3.2 requires implementation of a comprehensive noise monitoring program to ensure that the project's noise levels satisfy the County's noise standards once the project is operational and monitoring can be conducted. The requirements of the measure are summarized in Response to Comment Ind 685-2 above. Contrary to the assertions made by the commenter, the noise measurements will provide a safeguard for the residents, the County and the applicant in ensuring the project's noise generation will be maintained at acceptable levels. Additionally, commenter is directed to Response to Comment Ind 617-9.

## Response to Comment Ind 685-7

This comment is substantively the same as Comment Ind 617-8. The commenter is directed to Response to Comment Ind 617-8.

## Response to Comment Ind 685-8

Commenter is concerned with daytime noise levels, length of the permit, and impacts to wildlife and quality of life. Regarding quality of life, please see Master Response 1 - Non-EIR/Administrative Issues. Noise impacts associated with project traffic on both Brunswick Road and Whispering Pines Lane were evaluated in the DEIR and determined to be less than significant (see DEIR Table 4.10-16). Impacts to special-status wildlife species were also evaluated in the DEIR and found to be less than significant or less than significant with mitigation measures implemented (see DEIR Impact 4.4-2 and Impact 4.4-4). Existing sensitive receptors, including 30 surrounding residences, were chosen as the nearest potentially affected receptors to the project sites. (DEIR p. 4.10-4 and Figure 4.10-2.) Because this comment is editorial in nature, and does not address the adequacy of the EIR, no response is warranted.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

- Hello from the Jewels at 11948 E Bennett rd.

  I have a few concerts with the reopening of the mine.

**Ind 686-1**

If Mr Mossman and his organization want this to happen then put up all capital needed to address these issues.

The groundwater model has fundamental flaws in the initial start point and baseline data assumptions – all of which throw off the entire analysis.

fix the model so that it is correct.

- Dealing with mine waste – Asbestos will be a huge and expensive problem that requires far more comprehensive management than described in the report.

**Ind 686-2**

get an qualified estimate of the cost of this and then multiply it by 50 and put this money in escrow to deal with it

- Greenhouse gas emissions - The report excluded elements that would put the project over an arbitrary threshold limit, but recent climate change goals say the threshold should be "net zero".

**Ind 686-3**

it would be great to have zero emissions but we all know that will never happen

- Cleanup of the toxic, pre-superfund Centennial site that would be used to dump mine waste is not included in the DEIR but is required by the California Environmental Quality Act (CEQA).

**Ind 686-4**

before any new mine operations are to begin any and all toxic issues on any proposed sites WILL BE cleaned up. get a qualified estimate for this and multiply this by 100 and put it in escrow. having dealt with hazmat clean up in my time it always seams to fall back on the government when the money is short and the compny files Bankrupcy. Again no new work starts until all prework is complete

**Ind 686-5** - Missing construction time estimates throw off the entire analysis of noise, traffic, and air.

**Ind 686-6** - The DEIR incorrectly assesses nighttime noise and underestimates the noise of dumping mine waste near established residential neighborhoods.

1

all working needs to be done during regular business hours.

**Ind 686-7**

- Air traffic hazards and aesthetic impacts need to be studied further due the likelihood of a moisture cloud plume that could be created by warm, saturated air ventilation.

readdress this

**Ind 686-8**

- Blasting plans don't follow U.S. mining guidelines that restrict blasting during evening hours.

bring this into compliance

**Ind 686-9**

- The plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant.

address this

**Ind 686-10**

- Meteorological data used to assess the health risk of airborne pollutants doesn't fit Grass Valley's profile or accurately reflect local conditions.

needs further investigation

**Ind 686-11**

well water

We received a beautiful letter from RISE GOLD going on about how since my property will need to be shifted to NID water and that they have estimated the cost to be $85k i would like to know about line routing and the disruption on my property while this is under construction. Again just another number thrown out to make me feel good.

Also since i would be moved to NID will I be subject to water cutbacks due to dry years. Reason I ask this is we are building homes in the Brunswick Basin area and NID is selling our water to Roseville as I understand.

Roadways.. since there will be no tax benefit from the mining operations to the county will there be a roadway repair fund to cover the ongoing costs of upkeep? We will need this.

Let me be clear that the Jewels don't want the mine to reopen.

But if all conditions are met and Mr Mossman and company put up all the required funds and do all the front end work before starting any mining activity then I guess it may happen.

Robert and Victoria Jewel

2

## INDIVIDUAL LETTER 686: ROBERT JEWEL

### Response to Comment Ind 686-1

The commenter states that the groundwater model is flawed in the initial start point and baseline data but provides no specifics as to the flaws. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model.

### Response to Comment Ind 686-2

The commenter states that asbestos will be a huge and expensive problem that requires more management than described in the DEIR and the money for management should be put in escrow. However, the Health Risk Assessment is based on conservative assumptions that likely overestimate asbestos exposure. The commenter is referred to Master Response 22 – Conservatism used for Asbestos Assumptions.

As stated on page 4.3-42 of the DEIR, use of the NSAQMD's cancer and noncancer thresholds to assess health risk significance for CEQA is consistent with AB 2588 risk assessment procedures. The threshold of significance for health risk is an increased cancer risk of >10 cases per million persons. The Health Risk Assessment prepared for the project concludes that the health risk to the most sensitive receptor will be below this threshold.

Nevertheless, the DEIR concludes that the project could result in a significant impact with respect to exposing receptors to substantial concentrations of asbestos and requires mitigation to reduce the impact to a less than significant level. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring. Notably, compliance with the CARB ATCMs for naturally occurring asbestos, including development of an ADMP, is the standard approach within CEQA documents to address health concerns associated with exposure to asbestos from unpaved surfaces, construction and grading operations and quarries where asbestos is found or likely to be found in order to ensure potential health risk impacts to the public would be minimized to a less than significant impact. Multiple other projects in the NSAQMD jurisdiction, as well as throughout the state, have relied upon compliance with these naturally occurring asbestos ATCMs in order to control any potential asbestos emissions to the extent possible. As described in Mitigation Measure 4.3-2 of the EIR, the proposed project shall also comply with all applicable criteria in the CARB ATCMs for naturally occurring asbestos.

### Response to Comment Ind 686-3

The commenter states that the DEIR excluded elements that would put the project over a net zero threshold. The commenter is referred to Master Response 28 - Greenhouse Gas Credits.

### Response to Comment Ind 686-4

The commenter states that the remedial cleanup of the Centennial Industrial Site must be included in the DEIR. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 686-5

The commenter states that construction schedules missing from the DEIR skew the analysis for other impacts. The commenter is referred to Master Response 24 - Project Construction Schedule.

## Response to Comment Ind 686-6

The commenter states that the DEIR incorrectly assesses nighttime noise and underestimates noise of dumping mine waste near residential neighborhoods and that all work needs to be done during regular working hours. However, nighttime noise and dumping of mine waste is analyzed in the DEIR and is less than significant after mitigation. The commenter is referred to Chapter 4.10 of the DEIR and Responses to Comments Grp 21-130 and Grp 21-131.

## Response to Comment Ind 686-7

The commenter states that the DEIR must account for air traffic hazards and aesthetic impacts due to the likelihood of a moisture cloud plume. The commenter is referred to Response to Comment Grp 7-95.

## Response to Comment Ind 686-8

The commenter states that the DEIR inadequately demonstrates that the project's impacts to biological and aquatic resources are less than significant. The commenter is referred to Response to Comment Grp 21-144.

## Response to Comment Ind 686-9

The commenter states that the DEIR does not demonstrate the impact to biological and aquatic resources would be less than significant but provides no further details. The commenter is referred to Chapters 4.4 (Biological Resources) and 4.8 (Hydrology and Water Quality) of the DEIR. The commenter is also referred to Master Response 30 - Biological Study Technical Adequacy, Master Response 32 - Temperature of Mine Water Discharge, Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment Ind 686-10

The commenter states that DEIR uses meteorological data that does not reflect local conditions. The commenter is referred to Master Response 17 - Meteorological Data Used in HRA.

## Response to Comment Ind 686-11

The commenter states his family would like more information regarding the connection of homes to NID. The engineering details of line routing to individual properties will be determined during the engineering of the potable water line as required by Mitigation Measure 4.8-2(c). Engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.) Homes in the E. Bennett Road area which are connected to NID potable water under the project Well Mitigation Plan would be subject to any NID drought restrictions imposed on its customers.

Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the project driveway and Brunswick Road. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

Dear Supervisors,

Please do not approve the Rise Grass Valley Conditional Use Permit and Reclamation Plan for the Idaho Maryland Mine. I've lived here for 37 years, and I can't find one person who wants to see the mine reopened. I can't understand how the Supervisor's Board can even consider it.

**Ind 687-1**

Respectively,

### Response to Comment Ind 687-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 688**

**From:** Alice Root
**To:** Idaho MMEIR
**Subject:** Opposed to Risegold mine proposal
**Date:** Saturday, February 12, 2022 7:16:06 AM

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Attn Matt Kelley:

**Ind 688-1** I am a thirty plus year resident of Nevada County, living in Rough & Ready. Though we were in part drawn to Nevada County because of gold mining, we are opposed to this new mine proposal. We don't live near the proposed mining site, but think this is a terrible idea, at the wrong time and place. If it were proposed out in an unpopulated area, it might be somewhat viable, but to place this in the residential area of Grass Valley is horrific. The traffic and noise would be enough of a deterrent, but the

**Ind 688-2** environmental impacts beyond this do not make this a reasonable proposal. Also, this company is financially unstable, and out of the country. Please do not approve this proposal.

We vote in every election, and will vote and campaign against any supervisor that would

**Ind 688-3** approve this.

Sincerely,

Robert Root
Rough & Ready, CA

## INDIVIDUAL LETTER 688: ROBERT ROOT

### Response to Comment Ind 688-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 688-2

The comment does not directly address the adequacy of the DEIR. Please see Master Response 1. For general traffic concerns, please see Chapter 4.12, Transportation; for general noise concerns, please see Chapter 4.10, Noise and Vibration.

### Response to Comment Ind 688-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 through 3. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 689**

Mr. Matt Kelley
Senior Planner
Nevada County Planning Dept.
950 Maidu Ave. Suite 170
Nevada City, CA 95959-7902

April 3, 2022

Re: EIR Comment: Rise Gold Project

Please accept this comment on the IMM Draft EIR, Vol. 1, Ch. 4.10 (Noise) and insofar as it affects noise, Ch. 4.12 (Transportation).

I previously made a short general comment through the Mine Watch site, reserving my right to comment here.

**Ind 689-1**

The Draft EIR does **not adequately** serve as a CEQA (California Environmental Quality Act) informational and disclosure document. It appears to be drafted to reach a pre-ordained conclusion, which is that no significant impacts could exist from the Project. This conclusion is startling. It strains the imagination that such a Project could exist both adjacent to, and within, an urbanized area and not have at least some significant impacts.

A draft EIR is supposed to highlight significant impacts. That way, the final decision can be made to approve or disapprove in light of those impacts. When a draft EIR fails in this regard, it fails in its purpose to assist decision-making and becomes legally vulnerable to challenge. Challenges under CEQA frequently result in a court order to re-draft the Final EIR.

The draft EIR states that "audibility"--the very perception of sound--is to be categorically dismissed as a significant impact. So if Greater Grass Valley hears industrial and truck noise, the phenomenon cannot be significant, almost by definition. This conflicts with the common sense notion that <u>any noise</u> above quiet is very significant. A quiet neighborhood that experiences distant noise is going to be a less-than-quiet neighborhood, and less desirable.

Grass Valley's topography is such that distant sounds reverberate or echo and can be heard most places. For example, if one is atop Chester St., one can hear noise from the freeway, Main St., and even the Fairgrounds. Instead of asking what impact the Project will have on streets like Chester, the draft EIR is silent.

**Ind 689-2**

The draft EIR explains that the dBA scale is logarithmic, such that each level of noise can be multiple times greater than the previous level. Yet the graphic to

1

demonstrate this is represented as a thermometer in which the gradations move up from non-logarithmically from the 40 dBA of a quiet residential area to 70 (busy traffic) to 80 (busy street) to higher noise levels that are dangerous to hearing, such as chainsaws at 110 dBA.

Conveniently, the draft EIR finds that at selected monitoring sites, the dBA level will not be a significant increase in the otherwise prevailing sound. Between 7 a.m. and 10 p.m., Project operations will definitely be heard, but that would not be significant? Some 30 sensitive receptors are positioned around the Project site, but not much further away. The furthest out are 3 on Tinloy St. adjacent to the freeway, where noise is considerable and the Project's impact is perhaps less noticeable.

**Ind 689-3**

The monitoring sites in Table 4.10.2 are then reduced to only eleven. Given Grass Valley's topography and spread of residential areas, the monitoring should be much more extensive. Actual noise from large fully loaded trucks should be captured and recorded throughout the main residential areas of Grass Valley. I am convinced that most residents would find annoying and significant the roar of Project trucks in the morning from 7 – 10, and at night from 7-10. Those are the 6 hours during which I have perceived from sound from distant locations.

The Project is forecast to last 80 years. Noise generation lasting over an 80 year span is significant! Recall that in the past, Grass Valley heard stamp mills going 24-7. No one now wants to endure anything remotely like that. The effect on the local economy could be bad, discouraging tourism and depressing home sales.

**Ind 689-4**

The Project is not a good fit in its location. Grass Valley is already a very noisy town, but the Project should not be able to camouflage the Project's impact by saying that the Project's **increase** in noise is not significant.

My hope is that the County of Nevada will reject the draft EIR and insist on additional noise studies and analysis before approving a Final EIR. These studies should monitor sound from sites located all over the Grass Valley area, replicating what the actual Project noise will be, and how it will be perceived.

Thank you for receiving this comment.

Sincerely,

/s/
Robert Shulman

Property owner in Grass Valley, 227 June Dr.

## INDIVIDUAL LETTER 689: ROBERT SHULMAN

### Response to Comment Ind 689-1

Commenter disagrees with the conclusions of the DEIR and asserts that any noise is significant. The Project Applicant has proposed to incorporate project design elements to mitigate potential noise impacts by enclosing virtually all processing-related equipment and processes into insulated buildings, and through limitations on hours of operations of certain noise-generating activities which cannot practically be enclosed (i.e., engineering fill operations, transport of fill material to the Centennial Site, etc.). (DEIR pp. 4.10-38 and 4.10-24.) The analysis recognizes that substantial noise control measures will be required to be built into the project design to achieve this objective, and the applicant has committed to incorporate such noise control measures. (Id.) A comprehensive noise monitoring program will be required as a condition of project approval to ensure that the appropriate noise-control measures have been implemented to ensure satisfaction of the County's adopted noise standards. (DEIR 4.10-50.)

The commenter is correct that the purpose of the EIR is to disclose potential impacts of a project. However, as stated in DEIR Section 4.10.4 under “Standards of Significance,” CEQA guidelines Appendix G clearly states that, for a noise impact to be considered significant, the increase in noise resulting from the project must be substantial. A substantial increase in noise is defined in DEIR Section 4.10.4 under “Traffic Noise Increase Criteria.” As discussed on page 5 of the project’s Noise and Vibration Assessment (DEIR Appendix L), audibility is very subjective and can vary from person to person. Thus, audibility is not used as a significance criteria in evaluating noise impacts. In addition, a noise source can be audible without a substantial increase in ambient noise levels occurring. It is important to note that residents in the general project area, including the City of Grass Valley, are currently exposed to noise from existing trucks on the area roadway network, as well as noise from automobile traffic, all of which are audible. An extensive ambient noise survey was undertaken for the project’s noise impact assessment to establish baseline ambient conditions to ensure that any identified substantial noise level increases above those ambient conditions would be identified as significant and that appropriate noise mitigation measures would be developed.

The noise prediction model used to quantify the transmission of sound from the project area to the surrounding areas accounts for topography, atmospheric conditions, ground cover, shielding by intervening buildings, noise attenuation provided by building walls and ceilings, and vegetation (see pages 5-7 of DEIR Appendix L). Local topographic survey data was imported to develop a 3-dimensional model of not only the project site but the surrounding neighborhoods as well. (DEIR 4.10-23.) Reverberation (echo) can occur when sound impacts a reflective surface. However, vegetated ground with extensive tree cover, such as that present in the project vicinity, tends to be acoustically absorptive rather than reflective. (DEIR 4.10-24.) Where sounds can be heard over long distances, that phenomenon is frequently attributable to either a lack of intervening topography, vegetation, and ground cover between the source and receiver, or atmospheric conditions conducive to sound propagation. Such conditions are not anticipated to occur due to reflections or echoes at locations with soft ground, irregular topography, and extensive tree cover.

### Response to Comment Ind 689-2

Commenter believes the graphic representing the dBA scale is non-logarithmic, while the dBA scale is logarithmic. The graphic referenced in this comment (Figure 2 of project Noise and Vibration Study, DEIR Appendix L), depicts a linear range of sound pressure levels (in decibels), and typical noise sources associated with those noise levels. Although the graph is linear, the

pressures impacting the human eardrum required to generate the decibel levels shown are nonlinear. For example, a decibel level of 70 dB has 10 times more sound pressure energy impacting the eardrum than a decibel level of 60 dB; 100 times more sound pressure energy than a decibel level of 50 dB; and 1,000 times more sound pressure energy than a decibel level of 40 dB. For this reason, decibels cannot be added or subtracted, multiplied or divided without first converting the decibels into sound energy using exponential formulas. Once the arithmetic operations have been applied to the energy, the base-10 logarithm is taken to convert the energy back to decibels. For this reason, 50 dB + 50 dB = 53 dB, not 100 dB.

## Response to Comment Ind 689-3

The commenter believes any sound is significant, disagrees with the monitoring sites and believes sound is most significant from the hours of 7-10 am and pm. As noted in the Response to Comment Ind 689-2 of this letter, audibility is not the test of significance for a finding that a project would result in a noise impact. CEQA requires a “substantial” increase in ambient noise levels for a finding of significance, not merely an audible change. Ambient conditions at residences close to and far from the project area vary, as noted by the ambient noise survey results presented in Appendix L of the DEIR. Those ambient conditions were evaluated in the project's noise analysis to ensure that the CEQA criteria were appropriately applied.

The 12 noise monitoring locations identified on DEIR Figure 4.10-3 were specifically selected to be representative of baseline noise exposure of the nearest residences to both the Brunswick and Centennial project sites, and representative of sensitive receptors located along the project's proposed haul routes. Because sound decreases with distance, industry standard convention is to evaluate ambient conditions and potential noise impacts at the nearest sensitive receptors to a project's noise-generating areas. If impacts are not identified at the nearest receptors, it is reasonable and logical to conclude that impacts would not occur at substantially more distant receptor locations. Therefore, monitoring of ambient conditions at receptors located a considerable distance from the project site is typically not required. DEIR Figures 4.10-7 and 4.10-8 indicate that the project's noise generation is projected to be limited to areas in relatively close proximity to the Brunswick Site. Commenter states that “actual noise from large, fully loaded trucks” should be captured in the noise study. Heavy truck activity is common in the project area so the project would not be introducing heavy truck traffic noise into an area where such noise is currently absent. As indicated in Table 9 of the project noise study (DEIR Appendix L), off-site hauling would occur between the hours of 6 am and 10 pm. Given a projected average of 50 heavy truck round trips per day (100 individual passbys), the typical average number of hourly truck passbys on the local roadway network computes to approximately 6 per hour, or one truck passby every 10 minutes during typical operations. The noise generation of heavy trucks operating within the project area were modelled using the Federal Highway Administration Highway Traffic Noise Prediction Model, which is based on an extensive database of the noise generated by all vehicle categories, including heavy trucks. Those modelling results indicated that project-generated heavy truck traffic noise levels would not result in significant adverse noise impacts.

## Response to Comment Ind 689-4

This comment raises a concern with the length of the project permit, tourism and economic factors. Please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts. The timeline of the project does not affect the evaluation of the project's noise impacts or findings of significance for any identified impacts. This is because the County's noise standards state that the project cannot exceed the specific noise level limits during

any individual hour of any day, regardless of the week, month, or year during which the project is operational.

The ambient noise environment within the cities of Grass Valley and Nevada City varies, depending mainly on proximity to major roadways. At residences located near Highways 49 and 20, ambient noise levels are higher than at residences removed from busy roadways or other noise sources. For this reason, a focused ambient noise survey was conducted in proximity to the nearest residences to the project area to ensure that the impact evaluation properly accounted for baseline ambient conditions.

The portion of this comment pertaining to noise monitoring is similar to Comment 689-3 of this same letter. The commenter is referred to the response to that comment.

**Individual Letter 690**

**From:** Bob & Ann Thorpe <bathorpe@hughes.net>
**Sent:** Monday, April 4, 2022 4:51 PM
**To:** Idaho MMEIR
**Subject:** Idaho-Maryland Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 690-1** Please be advised that as eighteen year residents of Nevada County we most definitely oppose the reopening of the Idaho-Maryland Mine.

The following are our concerns:

1) Toxic waste site pollution

**Ind 690-2** 2) Harmful chemicals leaching into the aquifer

**Ind 690-3** 3) Noise pollution both from the mining operation and trucks breaking down our roadways

**Ind 690-4** 4) Large scale mining in this day and age is not compatible to the quality of life in our community

**Ind 690-5** 5) Traffic congestion impact

**Ind 690-6** 6) Draining of nearby wells

**Ind 690-7** 7) The quality of life verses the exploitation of the environment does will not benefit this community

Concerned citizens,

Robert and Ann Thorpe

1

## INDIVIDUAL LETTER 690: ROBERT AND ANN THORPE

### Response to Comment Ind 690-1
The commenter's reference to "toxic waste site pollution" lacks specificity. It is unclear whether the commenter is referring to existing site conditions or potential effects of the project on the sites. Please see Master Responses 1, 2, and 8 through 11, as well as the discussions and analysis in Chapter 4.7, Hazards and Hazardous Materials, of the DEIR.

### Response to Comment Ind 690-2
The project will not result in harmful chemicals leaching into the aquifer and the commenter provides no evidence to this effect. Please see Master Responses 1, 8, and 35, as well as the discussions and analyses in Chapter 4.8, Hydrology and Water Quality, of the DEIR.

### Response to Comment Ind 690-3
Please see Master Response 1, as well as the discussions and analyses in Chapter 4.10, Noise and Vibration, of the DEIR.

### Response to Comment Ind 690-4
As discussed in Master Responses 1 and 2, quality of life concerns are outside the scope of CEQA.

### Response to Comment Ind 690-5
Please see Master Response 1, as well as the discussions and analyses in Chapter 4.12, Transportation, of the DEIR.

### Response to Comment Ind 690-6
Please see Master Responses 1 and 15.

### Response to Comment Ind 690-7
Please see Master Responses 1 and 2 – quality of life concerns are outside the scope of CEQA. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

10591 Salcido Lane

Grass Valley

CA 95949

916-412-5712 (Call/Text)

Dear Mr Kelly

Idaho-Maryland Mine Project SCH# 2020070378 Draft Environmental Impact Report

**Ind 691-1** I am writing as a family member married to Karin Wheatley, who co-owns, with her three sisters, the property at 10591 Salcido Lane to express my concern on aspects of this project. Our property relies on well water as the domestic water supply and the property borders Wolf Creek in which I and other family members including very young children play and bathe. I am therefore alarmed to read the paragraph at 4.8 -51 which states the presence of ***"elevated arsenic levels that could pose a threat to human health"***. I then read the mitigation plan at 4.8-52 Para 4.8 1 (a) and I am concerned at the following

the absence of any disaster recovery plan should the water purification process fail,

**Ind 691-2** the absence of a detailed description of the water purification process including redundancy and back-up process' in the event the primary system fails,

**Ind 691-3** no mention of a "cease operation" provision in the event that water samples exceed acceptable limits. Such provision to remain in effect until acceptable standards can be demonstrated to the City and accepted by the City.

I request that the draft environmental impact report be revised/reissued to satisfactorily address the above concerns, the failure of which I would consider sufficient grounds not to allow the project to proceed.

Yours faithfully,

Robert Wheatley

1

## INDIVIDUAL LETTER 691: ROBERT WHEATLEY

### Response to Comment Ind 691-1

The DEIR evaluates the potential for the proposed project to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality under Impact 4.8-1, which starts on page 4.8-41. Because the DEIR concludes that a potentially significant impact could occur, the DEIR requires Mitigation Measures 4.8-1(a) through 4.8-1(e), which would reduce potential impacts to a less-than-significant level. As provided by Mitigation Measure 4.8-1(a), the Project Applicant would be required to submit a Notice of Intent (NOI) to the Central Valley Regional Water Quality Control Board (RWQCB) for coverage under the Limited Threat Discharge permit (General Order R5-2016-0076; NPDES No. CAG995002), at least six months prior to construction of the water treatment system. The NOI would be required to include evaluation of potential constituents of concern, including arsenic and to demonstrate that the proposed water treatment plant (WTP) design would successfully treat mine water to meet the water quality standards and treatment goals identified in the Limited Threat Discharge order. Upon construction of the WTP, sampling would be provided to the RWQCB to demonstrate that the treated water meets the water quality standards and treatment goals specified in the Limited Threat Discharge order. Ongoing monitoring of treated water would occur at a location specified by the State prior to the point of discharge at South Fork Wolf Creek.

As stated on page 4.8-53 of the DEIR, consistent with NPDES Permit requirements, the WTP would have backup power source (i.e., generators) in the event of electric power failure or outage.

### Response to Comment Ind 691-2

Please see Response to Comment Ind 691-1. Please refer to Appendix K.4, Water Treatment Plant Design Report, for a detailed description of the proposed treatment process.

### Response to Comment Ind 691-3

Please see Responses to Comments Ind 691-1 and Ind 691-2. The water treatment plant and discharge of treated groundwater will be permitted by the State (CVRWQCB), who will have regulatory authority to stop mine operations if water quality samples exceed applicable limits.

**Individual Letter 692**

**From:** Robin DeMartini <rdemartini@protonmail.com>
**Sent:** Saturday, April 2, 2022 8:12 PM
**To:** Idaho MMEIR
**Cc:** DEIRcomments@cea-nc.org
**Subject:** NO to Rise Mine

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hello,

Thank you for this opportunity to express concerns re: The Rise Mine.

**Ind 692-1** COMMON SENSE...

Why would our beautiful community agree to a toxic, noisy, messy, and poisonous Mine "re-opening"?

Hasn't the Past proven anything (asbestos, arsenic, heavy metals soil contamination, air and noise pollution)?

The Mine would be allowed to burden our roads with trucks going to and fro 24/7, creating noise, vibrations (affects humans, animals and birds), pollution, toxic dust, traffic and road/asphalt deterioration.

**Ind 692-2** This would create a financial burden to repair said roads. Is Rise Mine going to pay for that, or Nevada County taxpayers?

**Ind 692-3** And why is it OK for a Corporation to go against any noise ordinance that we (ordinary citizens) follow (keeping our music down, not using machines, leaf blowers and construction tools between certain hours)?

**Ind 692-4** Why do big corporations get to bend all the rules while we take our old paint, oils, toxic materials, and recycling to specific recycle/removal businesses?

I am deeply concerned that this big corporation will allow their water to run off into the earth and nearby streams/creeks...

**Ind 692-5** Do they have a new invention that proves that their water purification system is clean enough for us to drink/consume as it leeches into our streams and rivers, where fish swim and wildlife drink from?

**Ind 692-6** What about the toxins in the Mine run-off traveling down through our farm lands, into our foods (we all took biology and know how plants depend on clean water, too, right)?

**Ind 692-7** I researched how much water the Mine will use to flush the old mines, really, DURING A DROUGHT?

**Ind 692-8** My biggest concern is that any burden this corporation creates - messy, broken up roads, pollution, noise, poisons, water contamination, threats to animals and birds, and citizen's wells - will end up being our problem to clean up for generations to come.

1

The ripple effect is staggering.

I do find it inspiring to see our community come together as concerned citizens, free thinkers, and intelligent researchers to see this issue be debated and put down. This Mine needs to be stopped. NO to the Rise Mine!

Thank you,
Robin DeMartini
12434 Silk Tassle Cir
Nevada City, CA

Sent from ProtonMail for iOS

## INDIVIDUAL LETTER 692: ROBIN DEMARTINI

### Response to Comment Ind 692-1

The commenter opposes the project but does not discuss the adequacy of the DEIR. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues. Responses to specific comments are provided below.

### Response to Comment Ind 692-2

The commenter states that the project will cause adverse traffic-related impacts such as damage to local roadways. The commenter states that the project will result in noise, vibration, and toxic dust but does not state how the DEIR is inadequate. Impacts from trucks are analyzed in Chapter 4.10 (Noise and Vibration), Chapter 4.12 (Transportation), Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy), and Chapter 4.4 (Biological Resources).

Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49 and E. Bennett Road between the project driveway and Brunswick Road. (DEIR, p. 4.12-91.)

### Response to Comment Ind 692-3

The commenter implies that the project would exceed local noise ordinances. The DEIR analyzed noise impacts in Chapter 4.10. With the exception of the installation of a potable water line along East Bennett Road, noise impacts would be less than significant after mitigation. (DEIR, p. 4.10-31.)

### Response to Comment Ind 692-4

The commenter implies that the Project Applicant will violate environmental standards governing the project but does not state how. A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other State and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 3 – Operator Responsibility.

### Response to Comment Ind 692-5

The commenter is concerned about stormwater runoff from the project sites and the quality of the water discharged to South Fork Wolf Creek. The DEIR analyzed hydrology and water quality impacts in Chapter 4.8 of the DEIR and found impacts to be less than significant after mitigation. The commenter is also referred to Master Response 8 – Mine Waste Characterization and Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 692-6

The commenter states that runoff from the site and/or discharges to South Fork Wolf Creek will contain contaminants. The DEIR analyzed hydrology and water quality impacts in Chapter 4.8 of the DEIR and found impacts to be less than significant after mitigation. The commenter is also referred to Master Response 8 – Mine Waste Characterization and Master Response 35 – Discharge to South Fork Wolf Creek.

## Response to Comment Ind 692-7

The commenter is concerned about the project's impacts to groundwater supplies during a drought. The DEIR analyzed hydrology and water quality impacts in Chapter 4.8 of the DEIR and found impacts to be less than significant after mitigation. The commenter is also referred to Master Response 16 - Drought and Climate Change.

## Response to Comment Ind 692-8

The commenter states that any adverse impacts from the project will be shouldered by the County after the project's completion. However, the commenter does not state how the DEIR is inadequate. The impacts that the commenter is concerned with (road damage, water pollution, wildlife, and groundwater) are discussed in the DEIR, the commenter is referred to Chapter 4.12, 4.3, 4.10, 4.8, 4.4 of the DEIR.

**Individual Letter 693**

**From:** Robin Ehlers <robinehlers@comcast.net>
**Sent:** Saturday, April 2, 2022 9:36 AM
**To:** Idaho MMEIR
**Subject:** No mine is worth the cost

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 693-1**

I am writing to voice my opposition again to the idea of a private company damaging use of land for financial gain. The water table below our land is a necessity to life of this entire community. The thought of a corporation utilizing this water at the risk to every other user of this water is absurd. The EIR is flawed and seems skewed to favor this endeavor. The model has fundamental flaws from inception corrupting the entire analysis. It is time for us as a community to protect and cherish our resources...air...water..dirt...and not contaminate it for the financial gain of a few. It is far beyond time to be the stewards of this earth that we are called to be.

Robin Ehlers

1

## INDIVIDUAL LETTER 693: ROBIN EHLERS

### Response to Comment Ind 693-1

The comment expresses a general opinion that the DEIR is flawed and skewed to favor the proposed project, but does not provide specific examples that would allow for a detailed response. Regarding dewatering concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. For general air quality concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy.

Re: Idaho-Maryland Mine Reopenning Project, DEIR Comment: Inadequate Mitigation of Wild Fire Danger

The greatest Rise Gold Mine negative impact affecting wildfire is the trucking and traffic that this heavy industrial complex would add to the evacuation of the populace in the event of a fire in the circulation area of the mine. This concern is included as one of the three impacts that are Significant after mitigations noted elsewhere in the DEIR.

**Ind 694-1** Statements found on DEIR pages 4.13-1, 4.15-15 that state 50-100 trucks per day, carrying 20 tons of rock per truck, will be driving on Brunswick Road, classified as a "Minor Arterial" road, 16 hrs. a day, 7 days a week. The DEIR is inadequate by not considering the extremely significant impact on fire evacuation of that area.

Plus "up to 18 additional truck trips could occur per day for various operations" for five years, also for 16 hours a day, seven days a week. This 118 trips per day of trucks does not include personnel in their own vehicles. As stated in this DEIR, this will constitute approximately 7.4 hauling truck round trips per hour on Brunswick Road. This is a significant amount of additional traffic coming into the basin and intersection of Brunswick Road and State Route 20/49. In an evacuation in that part of the County will have evacuees in their vehicles coming from all points east of Highway 20/49 if SR 174 is closed. This area was a serious bottle neck with the Bennett Fire in 2021.

**Ind 694-2** This will not "have a less than significant impact on emergency response plan or emergency evacuation plan", and yet no mitigation is required as stated on page 4.13-17. This must be changed to a "significant and unavoidable" impact on Transportation in spite of mitigations on the Brunswick and SR20/49 intersection. If no mitigation can be found, I believe that the Project must not be approved.

**Ind 694-3** The DEIR also proffers wild fire mitigations for the Brunswick site including clear cutting -- "vegetation reduction"-- on 18.5 acres of the 58 acres of forest. On the Centennial site, 6.5 acres of the 10 acres of forest will be cut down. The environmental impact of a 25-acre clear cut has to be mitigated.

1

**Ind 694-4** The report goes on to renumerate the fuel treatment projects far and wide in western Nevada County, which is of questionable relevancy especially since they are distant projects (some of which have been seeking funding for years).

**Ind 694-5** Why is there an inclusion in the description, in this section of the DEIR, to install a potable water line for residents along East Bennett Road as an example of roadside fuel reduction? There is already a Right of Way on the road to install such a pipeline so what fuel reduction will be done in digging up the road? This potable water line has been proposed to be installed by N.I.D. and paid for by Rise Gold since the wells along this road are anticipated to be negatively impacted. Why is putting a water line in being used as an example of "fuel reduction" to reduce wildfire hazard? This section needs reconsideration.

**Ind 694-6** Rise Gold's Fire Protection Plan needs to address the explosives that are being trucked in, that during a wildfire, if fire consumes the truck(s), and the explosives or the diesel tanks ignite.

**Ind 694-7** Why does the DEIR include a "fire flow system" as support of mitigation to "less than significant" impacts and then state, page 4.13-20 paragraph 3, that it is not known if the old fire flow infrastructure used by the lumber mill, even meets CFC requirements? Please review this for validity.

**Ind 694-8** The "comprehensive vegetation management plan" required by the County Fire Marshall's Office needs to be provided before the DEIR can be certified.

**Ind 694-9** The DEIR states that the CAL FIRE station on Ridge Road could reach a theoretical fire at the mine within the 5-minute response time goal. The DEIR acknowledges the response time is "depending on local traffic conditions". Once again, the unmitigable and significant impact of traffic at Brunswick Road and SR 20/49 makes this significant and unavoidable.

**Ind 694-10** There are several issues that I haven't covered in the comment, but these are sufficient to reject the DEIR. When it comes to wild fire danger, impacts that cannot be mitigated, but are significant and unavoidable render this project too dangerous to approve.

Sincerely,

Robin Hart

110 Berriman Loop

Grass Valley, CA 95949

530-271-7121 rhstarbird@gmail.com

## INDIVIDUAL LETTER 694: ROBIN HART

### Response to Comment Ind 694-1
The commenter states that the DEIR is inadequate because it fails to analyze project traffic during an emergency evacuation scenario. The commenter is referred to Master Response 5 - Evacuation Zones.

### Response to Comment Ind 694-2
The commenter states that the DEIR's finding that Impact 4.13-1 as "less than significant" is incorrect and must be changed to "significant and unavoidable." However, the commenter does not provide evidence as to why the DEIR is inadequate in this regard. The commenter is referred to Master Response 5 - Evacuation Zones.

### Response to Comment Ind 694-3
The commenter states that the removal of vegetation must be mitigated. The commenter does not state how the DEIR is inadequate. Impacts to vegetation communities are evaluated in detail in Chapter 4.4, Biological Resources, of the DEIR.

### Response to Comment Ind 694-4
The commenter states that the "Fuel Treatment Efforts" section of the wildfire chapter is irrelevant to the DEIR. The purpose of Section 4.13.2, including Fuel Treatment Efforts, of the DEIR is to describe the existing wildfire setting in the project region as stated on page 4.13-1 of the DEIR.

### Response to Comment Ind 694-5
The commenter asks why the installation of the potable water pipeline along East Bennett Road is included in the DEIR as an example of fuel treatment. The project does not propose to conduct fuel treatment along East Bennett Road. As stated on page 4.13-5 of the DEIR, with respect to planned but not yet funded fuel treatment projects in the immediate vicinity (i.e., grant application submitted but award not yet confirmed), the primary project is roadside vegetation management (to create defensible space) along East Bennett Road, where the potable water pipeline would be installed, as well as the portion of Brunswick Road along the frontage of the Brunswick Industrial Site. Similar roadside vegetation management is also proposed along Greenhorn Road, east of the Brunswick Industrial Site.

### Response to Comment Ind 694-6
The commenter states that the DEIR must address the possibility that a wildfire will ignite explosives being transported to the project site. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

### Response to Comment Ind 694-7
The commenter asks why the DEIR describes the installation of a fire flow system at the Brunswick Industrial Site and then states that it is unknown if the existing fire flow system meets California Fire Code requirements. The fire flow system is not constructed yet. As stated on page 4.13-20, two existing fire service lines extend into the Brunswick site. The installation of the fire flow system for the project would be required to meet California Fire Code (CFC) requirements.

## Response to Comment Ind 694-8

The commenter states that the comprehensive vegetation management plan described on DEIR page 4.13-20 must be provided to the County Fire Marshall before the DEIR can be certified. The commenter is incorrect. The vegetation management plan is not required to be submitted until improvement plans such as grading or building permit applications are submitted. Mitigation Measure 4.13-2 requires that in conjunction with submittal of Improvement Plans, the Project Applicant shall submit a comprehensive vegetation management plan, inclusive of the Centennial and Brunswick Industrial Sites, for the review and approval by the County Fire Marshall's Office. The applicant shall implement all provisions of the vegetation management plan during the project construction, operations, and reclamation activities. The mitigation measure has been formulated to include sufficient performance standards that must be met, in accordance with the requirements in CEQA Guidelines Section 15126.4(a)(1)(B).

## Response to Comment Ind 694-9

The commenter states that the DEIR is incorrect in stating that firefighters from the CalFire Station on Ridge Road could respond to a fire at the project site within five minutes because of traffic impacts at Brunswick Road and State Route 20/49. The project does not create significant and unavoidable traffic impacts at Brunswick Road and State Route 20/49. The commenter is referred to DEIR Chapter 4.12 (Transportation).

## Response to Comment Ind 694-10

The commenter states that the DEIR incorrectly assesses wildfire impacts as less than significant but does not provide any specific information or state how the DEIR is inadequate. Responses to specific comments are provided above. The commenter's opposition to the project is noted for the decisionmakers.

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 695-1**

Nevada County Planning staff,

I see that the EIR for Idaho Maryland Mine was just released. Please tell me that the public comment period will be extended by at least 30 days if not more.

Many residents and businesses do not have power or internet and will not for days or maybe even weeks to come. People and organizations are rightfully far more focused on recovery from this event and will lose several weeks if not a month of critical review time. The EIR release announcement is being buried by so many other priorities, that people do not have the cycles to review it properly at this point.

In fairness to all parties, an extension of the public review period is warranted.

Wishing you a safe, healthy, prosperous and sane 2022!

Robin Milam
Greenhorn/Lost Lake Road Community
530 263-1483

## INDIVIDUAL LETTER 695: ROBIN MILAM

### Response to Comment Ind 695-1

The public review period began on January 4, 2022 for a 60-day public review period, which was extended to April 4, 2022 for a total public review period of 91 days.

Dear Commission:

My name is Robin Resovich and I am a resident of Grass Valley.

**Ind 696-1** I am extremely concerned and disheartened to witness my community seriously considering going back in time to destructive mining practices. We should be moving forward economically and environmentally, not backwards. Our county has yet to fully recover from the ravages of our mining past.

Please do not allow this unenlightened project to move forward.

Thank you,

Robin Resovich

## INDIVIDUAL LETTER 696: ROBIN RESOVICH

### Response to Comment Ind 696-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition regarding the proposed project. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Ind 697-1**

Dear Sirs/Madams,

Allowing the opening of the proposed Idaho-Maryland mine would be an unthinkable travesty. Ours is not an industrial community. The damage to the water table, and the pollution from the huge number of trucks expected, would greatly decrease the quality of life for those living here.

Please do the right thing.

Ron Rosner DVM
15737 American Hill Road
Nevada City

## INDIVIDUAL LETTER 697: RON ROSNER

### Response to Comment Ind 697-1

The comment does not directly address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Responses 1 and 2. Regarding water table concerns, please see Master Response 15. Regarding truck exhaust concerns, the DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment specifically addresses health impacts to children. The commenter is referred to Master Response 18 – Air Quality Thresholds. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

I am against the opening of the mine for the following reasons:

**Ind 698-1** → Release of toxic chemicals in the aquaphere, air and surrandings environment.

**Ind 698-2** → Impact on the water while experiencing a drought

**Ind 698-3** → Lack of accountability in the impact of the same corporation in Canada

**Ind 698-4** → Lack of knowledge about REAL environmental impacts (wells level, and efficiency for example)

**Ind 698-5** → Against the noise pollution

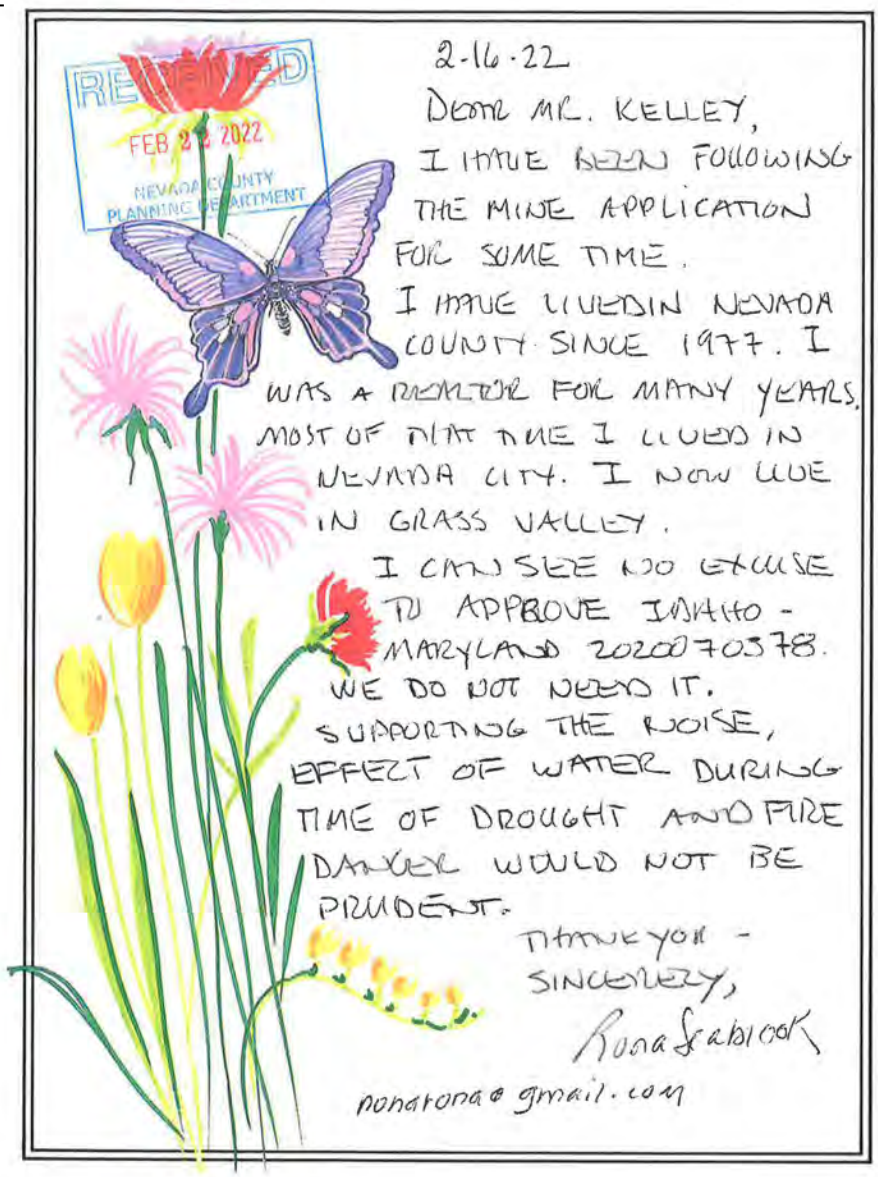
**Ind 698-6** → Against the industrial impact of the quality of life. (we chose to buy a house here for the sacred natural environment, not to be surrendered by industrial company)

## INDIVIDUAL LETTER 698: RON AND JULIE

### Response to Comment Ind 698-1
The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. The project will not result in release of harmful chemicals into the aquifer and the commenter provides no evidence to this effect. Please see Master Responses 1, 8, and 35, as well as the discussions and analyses in Chapter 4.8, Hydrology and Water Quality, of the DEIR.

### Response to Comment Ind 698-2
Please see Master Responses 15 and 16.

### Response to Comment Ind 698-3
Please see Master Response 3.



### Response to Comment Ind 698-4
The comment expresses a general opinion that the commenter has not been given the opportunity to learn about the "real environmental impacts," but does not provide specific examples that would allow for a detailed response. For well concerns, please see Master Response 15.

### Response to Comment Ind 698-5
For the general noise concerns, please see Chapter 4.10, Noise and Vibration.

### Response to Comment Ind 698-6
Quality of life concerns are outside the scope of CEQA. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 699**

**Ind 699-1**

## INDIVIDUAL LETTER 699: RONA SCABLOOK

### Response to Comment Ind 699-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1, 2, 6 (Wildfire Impacts), 15 (Adequacy of Groundwater Monitoring Wells), and 16 (Drought and Climate Change). The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

February 16, 2022

Open Letter to the Nevada County Board of Supervisors and Planning Commission

I have studied with much interest and concern about the application of Rise Gold to reopen the Idaho-Maryland mine. The potential environmental impacts are serious as are reported in the Draft Environmental Impact Report

In their application, Rise Gold is proposing extensive mining operations that could greatly alter the peaceful climate of Grass Valley, disrupt normal commerce, and re-create the very dangerous industry of underground mining.

When considering the viability of such a corporate development proposal it calls upon good business practices to ask for the credentials of the applicant, require proof of economic viability, a business history, and the resume of the representative leadership.

I have learned that Rise Gold is a speculative company. They have no business history. The present stockholders are gold investors throughout the U.S, Canada, off shore, and Wall Street. It is a company formed without capital needed for the project, but raised money through loans and stock sales to get the land, pay for EIR consultants and hire a public relations firm. Some commentators on gold driven companies say they mine stock value, and hope for gold. They are creating profits by manipulating value as they use government processes, and public relations. The permit if ever granted would multiply stock values. That permit could then be sold.

**Ind 701-2**

A glaring and shocking fact that I uncovered is that the Rise Gold's present CEO has previously been embroiled in a failed mine, financed in this same way, up in British Columbia. The corporation he managed, called Banks Island Gold Ltd, declared bankruptcy when the government ordered the mine closure. The mine's safety engineer became a whistle blower, sending photos of damage to government officials, bringing in helicopters and regulators. At that time there were 35 charges of failed compliance regarding environmental and safety standards. Court cases continue with fines and appeals of this CEO's role in the mine failure.

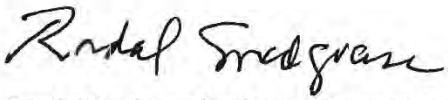
The mine is located on Banks Island, off shore from Prince Rupert, and is within territory of the Indian Gitxala Nation. They are outraged with the damage, possible destruction of traditional bird, fish and animal habitat, and the mess that must be cleaned up. The costs of remuneration are hundreds of thousands of dollars with the public and the government of British Columbia stuck with most of the cost. Banks Island Mine Ltd. did not post adequate bonds to cover such potential damages. A sad personal story is that the employees of Banks Island Mine Ltd. did not receive their severance benefits. Also there are pages after pages of unsecured creditors that were not paid.

Nevada County must look at the Rise Gold application with extreme caution. I read from newspaper accounts and Rise Gold's press releases that the application is costing a huge amount of money. There are hundreds of hours of county and related agencies staff time, and for the volunteers on the planning commission, and much angst, concern and interest of the general public.

**Ind 701-3**

It's very interesting that even Rise Gold itself cautions investors and states on its website:
*"No current mineral resources or mineral reserves have been defined... The Company has not completed a feasibility study to establish mineral reserves and therefore has not demonstrated economic viability for the Idaho Maryland Mine."*

**Ind 701-4**



And also, very concerning is this from the Securities and Exchange Commissions reports about Gold Rise's publicity:
*" such press releases that contain forward looking statements within the meaning of applicable securities laws... Words such as plan, expect, intend, believe, anticipate, and estimate that certain events or condition may or will occur, accordingly readers should not place undue reliance on forward-looking statements and information contained in this release."*

**Ind 701-5**

Rise Gold stated the estimated cost of the project would be $100 million dollars for full development. They have requested an 80-year permit, which is extreme, into the next century! That's four generations into the future.

To insure the viability of the applicant, the County should require Rise Gold to post performance and environmental safety bonds to continue being a permit applicant. I suggest 7% or $7million. We need to look at this with eyes wide open. Without such safety, we could end up like other towns, and rural areas that were left holding the bag by gold mines for failed promises and non-redeemable environmental damages. Good Insurance covering loss and liability is a common practice and should be required to help safeguard our county's economic, environmental and civic vitality.

**Individual Letter 703**

RONDAL SNODGRASS

CONSULTATIONS

March 30,2022

Matt Kelley
959 Maidu Avenue
Suite 170
Nevada City, CA
95959-7902

Dear Mr. Kelley,

**Ind 703-1** I will appreciate you sharing the following comments with the Nevada County Planning Commission concerning the DEIR for reopening of the Idaho Maryland Mine. Thank everyone in your department and the volunteer planning commission members for the public opinion meeting on March 24. All requests to speak were honored and accommodations for the overflow crowd were superb.

**Ind 703-2** Concern Number: 1
CEQA requires the presentation of alternatives to the permit for reopening. This is not adequately covered within the DEIR. Requests for re-zoning will impact the surrounding area and County plan. There are public funds available for purchasing this property for alternative uses. The alternative cost used in economic analysis can present impacts positive and negative for granting a permit or not granting a permit and the consequences of such decisions.

**Ind 703-3** Concern Number 2:
There are numerous environmental impacts listed in the DEIR and as required mitigations to eliminate or reduce to acceptable levels those impacts. How can the county monitor such mitigations and deal with the costs and repairs that would result from mitigation failures? How can mitigations investigate the future consolidated costs? A permit request for 80 years is inter-generational, lifetimes away, and must account for the uncertainties of climate, economic and societal changes ahead. Insurance and performance bonds must be posted out front.

**Ind 703-4** Concern Number 3:
CEQA calls for a cumulative impacts analysis for the County and the State of California. This is missing from the DEIR.

Thank you,

Rondal Snodgrass

Rondal Snodgrass

14582 Alderwood Way Nevada City, CA 95959 707-496-8729 ravenswatch@asis.com

## INDIVIDUAL LETTER 703: RONDAL SNODGRASS

### Response to Comment Ind 703-1
The comment is an introductory statement and does not address the adequacy of the DEIR.

### Response to Comment Ind 703-2
The DEIR evaluates alternatives to the proposed project in Chapter. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.)

### Response to Comment Ind 703-3
Please see Master Responses 1 through 3.

### Response to Comment Ind 703-4
An analysis of cumulative impacts associated with the proposed project is provided at the end of each technical chapter in the DEIR. In addition, please see the discussions under the Cumulative Setting heading in Chapter 5, Statutorily Required Sections, of the DEIR, which starts on page 5-3. The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

# 2. Responses to Comments *(CONTINUED)*

**Individual Letter 704**

February 20, 2022

Dear Nevada County Board of Supervisors,

**Ind 704-1** I OPPOSE the Idaho-Maryland Gold Mine being reopened by Rise Mining Company

As a registered voter in Nevada County and a homeowner in Cedar Ridge, I am deeply concerned aboul the proposed possibility of reopening the Idaho-Maryland Mine in my backyard and underneath my feet.

I have downloaded and reviewed the EIR report.

Here are the reasons why I oppose reopening the Idaho-Maryland Mine:

**Ind 704-2** MINE WASTE and WATER POLLUTION
Gold mining produces huge amounts of mining waste, some of which contain heavy metals and other toxic substances. Both waste rock and tailings threaten to pollute groundwater and surface water. Our community is still dealing with arsenic and the leaching of heavy metals from the Gold-Era days. And now, Rise, a Canadian company comes along and wants to produce even more mine waste for 80 years: 182,500 tons per year! More tailings that polluting big rig trucks will need to haul away with the potential for leaching more arsenic into our waterways for generations to come.

**Ind 704-3** INCREASE GREENHOUSE GAS EMISSIONS
Haul trucks, up to 100 round trips PER DAY will be needed to transport this mine waste, significantly increasing the amount of air pollution and greenhouse gas emissions into our community's air.

**Ind 704-4** TRAFFIC AND SAFETY
The increase of vehicles, specifically 20 ton haul trucks, up to 100 round trips per day on Brunswick Road and the Cedar Ridge Y (Brunswick Road and Highway 174) intersection will be significant and unavoidable! This is according to the EIR report. Are the supervisors aware that the Union Hill School District, with over 800 students and staff, are within the boundaries of these dangerous roads and intersections? The same intersection and roads that school buses and parents use to transport students to school five days a week, twice a day. The same roadways that the EIR report states will be significant and unavoidable even after implementation of feasible measures. Reopening the Mine will threaten the safety of our children, their parents, and the over 100 school staff members from the nearby Union Hill School.

Is the pursuit of gold really worth so much environmental destruction AND the real potential for significant and unavoidable auto accidents between 20 ton trucks and children in cars/buses?
I think not. Vote NO to Rise MIning Company.

**Ind 704-5** Sincerely,

Rose Capaccioli,
mailing address: P.O. Box 1812, Cedar Ridge, CA 95924
physical address: 11073 Cedar Ridge Dr., Grass Valley, CA 95945

## INDIVIDUAL LETTER 704: ROSE CAPACCIOLI

### Response to Comment Ind 704-1
The commenter does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1.

### Response to Comment Ind 704-2
Please see Master Response 8 – Mine Waste Characterization and Master Response 11 – Engineered Fill Utilized in Local and Regional Construction Markets.

### Response to Comment Ind 704-3
For general concerns regarding greenhouse gas emissions, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. Please also see Master Response 18 – Air Quality Thresholds, Master Response 19 – NSAQMD Criteria Pollutant Thresholds During Operations, Master Response 27 – Greenhouse Gas Thresholds, and Master Response 28 – Greenhouse Gas Credits.

### Response to Comment Ind 704-4
The DEIR states that no project truck traffic would occur on State Route 174, nor the intersection of SR 174/Brunswick Road (DEIR, Table 4.12-9.) This is because the designated haul routes for the project are north of the Sites (see Figure 3-13 of the DEIR), as described thusly on page 4.12-85 of the DEIR:

- To Centennial Industrial Site Haul Route
  - Brunswick Road northbound between E. Bennett Road and Whispering Pines Lane;
  - E. Bennett Road between Project Driveway and Brunswick Road (eastbound)
- To SR 49 Haul Route
  - Brunswick Road northbound between E. Bennett Road and Whispering Pines Lane;
  - Brunswick Road northbound between Whispering Pines Lane and SR 49;
  - E. Bennett Road between Project Driveway and Brunswick Road (eastbound)

The project's contribution of traffic to the SR 174/Brunswick Road intersection is solely related to employee commute trips.

### Response to Comment Ind 704-5
Please see the above responses to the commenter's concerns. The concerns are noted for the record and have been forwarded to the decisionmakers for their consideration.

**Individual Letter 705**

February 20, 2022

Dear Nevada County Board of Supervisors:

I OPPOSE the Idaho-Maryland Gold Mine being reopened by Rise Mining Company.

As a registered voter in Nevada County and a homeowner in Cedar Ridge, I am deeply concerned about the proposed possibility of reopening the Idaho-Maryland Mine in my backyard and underneath my feet.

I have downloaded and reviewed the EIR report.

Here are the reasons why I oppose reopening the Idaho-Maryland Mine:

MINE WASTE and WATER POLLUTION
Gold mining produces huge amounts of mining waste, some of which contain heavy metals and other toxic substances. Both waste rock and tailings threaten to pollute groundwater and surface water. Our community is still dealing with arsenic and the leaching of heavy metals from the Gold-Era days. And now, Rise, a Canadian company comes along and wants to produce even more mine waste for 80 years: 182,500 tons per year! More tailings that polluting big rig trucks will need to haul away with the potential for leaching more arsenic into our waterways for generations to come.

**Ind 705-1**

INCREASE GREENHOUSE GAS EMISSIONS
Haul trucks, up to 100 round trips PER DAY will be needed to transport this mine waste, significantly increasing the amount of air pollution and greenhouse gas emissions into our community's air.

TRAFFIC AND SAFETY
The increase of vehicles, specifically 20 ton haul trucks, up to 100 round trips per day on Brunswick Road and the Cedar Ridge Y (Brunswick Road and Highway 174) intersection will be significant and unavoidable! This is according to the EIR report. Are the supervisors aware that the Union Hill School District, with over 800 students and staff, are within the boundaries of these dangerous roads and intersections? The same intersection and roads that school buses and parents use to transport students to school five days a week, twice a day. The same roadways that the EIR report states will be significant and unavoidable even after implementation of feasible measures. Reopening the Mine will threaten the safety of our children, their parents, and the over 100 school staff members from the nearby Union Hill School.

Is the pursuit of gold really worth so much environmental destruction AND the real potential for significant and unavoidable auto accidents between 20 ton trucks and children in cars/buses?
I think not. Vote NO to Rise MIning Company.

Sincerely,

Rosemarie Capaccioli

## INDIVIDUAL LETTER 705: ROSEMARIE CAPACCIOLI

### Response to Comment Ind 705-1

Please refer to Responses to Comments Ind 704-1 through Ind 704-5.

**Individual Letter 706**

**From:** Ross Guenther <rossguenther@comcast.net>
**Sent:** Thursday, March 24, 2022 2:55 PM
**To:** Idaho MMEIR
**Cc:** Matt Kelley
**Subject:** Comments on the Idaho-Maryland Draft EIR

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Please include the following comments for the Idaho-Maryland Mine Draft EIR:

**REOPENING THE IDAHO-MARYLAND MINE WITH ZERO WASTE**

The gold at the Idaho-Maryland Mine may be just the icing on the cake. The primary value for the people of Nevada County is likely the much needed clean and sustainable aggregate and ceramic building products that might otherwise remain as waste dump rock and mill tailings.

**Ind 706-1**

Having worked and studied the Idaho-Maryland Mine over the past half century, I had documented most of the same geologic conclusions as Rise Gold in their present Draft Environmental Impact Report (DEIR). In the mid 1990s I received a final EIR, and related permits to dewater the New Brunswick shaft. Later, new management changed the location for the main shaft from the Brunswick to the Centennial site. Subsequently, my team and I ran successful Ceramext™ pilot test tile plants at the Idaho-Maryland Mine. We also ran successful tests for over 50 types of tailings including basalt fines with the Pacific Northwest National Laboratory, and tailings for several copper and gold mines.

The Idaho-Maryland Mine tailings advantageously have only very amounts of arsenic. The contaminates, if any, are rendered inert to leaching or other means by locking them within a stable glassy matrix within the Ceramext composition. My team has patented several composition and method patents for manufacturing ceramics.

Recently I was asked to write a case study by the Editor of "Tailings Management Handbook, A Life-Cycle Approach". The Handbook was published in February, 2022 by The Society for Mining, Metallurgy & Exploration. The case study was titled "Repurposing Tailings and Other Earth Material Waste into Ceramics". The study included a review of the success in manufacturing high quality tile at the Idaho-Maryland Mine. The Handbook dives into a wealth of information contributed by more than 100 world-renowned experts and was edited by Kimberly Fink Morrison, Senior Director, Global Tailings Management, of Newmont. It should be essential that consultants for the Nevada County Planning Commission consider the Handbook's findings.

**Ind 706-2**

Part of the SME Handbook discusses co-disposal of tailings, a relatively recent method of combining larger barren dump rock with much finer mine tailings. This method is proposed in the Rise Gold DEIR to contain mine wastes at the Centennial and Brunswick sites of the Idaho-Maryland Mine and has several potential disadvantages. These disadvantages include the difficult compaction required, complexity of mixing particle sizes, and being more difficult and expensive than other methods. Also mentioned is that the method could be a ground stability hazard in wet seasons in populated areas.

**Ind 706-3**

Extensive compaction tests were made by Ceramext of Idaho-Maryland historic tailings and of freshly crushed core samples of many mineral grain sizes (including some with larger fragments) with optimal wetness and extremely high pressures. This was for ceramic production prior to firing. In all cases the compacted material had very low strength and could not withstand even

1

small amounts of added water without becoming liquified. This could likely result in the tailings dangerously flowing down Wolf Creek into the city of Grass valley, gradually or all at once, for both the Brunswick and Centennial proposed tailings storage areas.

A better alternative would be to manufacture profitable high-quality low-cost floor and roofing tile, wall siding, counter-tops and many other green fireproof ceramic building products from the tailings. The larger waste development dump rock could be profitably sold as aggregate. If this profitable alternative of manufacturing ceramics is taken, the entire project could be done on the Brunswick industrial site without hauling tailings and development rock to the Centennial site.

**Ind 706-4**

In our area, as well as throughout the world, we are having problems with climate change, fires, and drought. Complicating this problem further are supply chain issues causing more delays, expenses and pollution from importing ceramics and other materials from China and other distant places. NID could economically conserve more water by using canal liners and piping made from tailings ceramics. PG&E presently needs thousands of miles of underground conduits (possibly partially made with tailings ceramics) to prevent wildfires and lower our energy costs.

In Nevada County we can have a clean and sustainable gold mine without waste dumps and excessive traffic, and produce high quality ceramics. So yes, you can have your cake and eat it too.

Ross Guenther is the General Manager of Ceramext, LLC and lives in Penn Valley, CA.

2

## INDIVIDUAL LETTER 706: ROSS GUENTHER

### Response to Comment Ind 706-1

The commenter proposes an alternative to the use of sand tailings as engineered fill by manufacturing tailings into ceramic products. This process was analyzed for a project proposed by a previous applicant in a Draft Environmental Impact report prepared by Environmental Science Associates for the City of Grass Valley in 2008 (ESA 2008)[1]. The 2008 DEIR contemplated a 600 ton per day ceramics plant (Phase I) with expansion of ceramic production to 1,200 tons per day (Phase II) (see Section 2.7 of ESA 2008). The Phase I production rate is similar to the amount of sand tailings proposed to be used for engineered fill by the current proposed Idaho-Maryland Mine Project. The project was found to have a significant and unavoidable air quality impact due to $NO_x$ emissions, primarily due to the manufacturing of ceramic products. Operational $NO_x$ emissions for Phase I were estimated at 643 pounds per day (see Table 4.2-6 of ESA 2008). The project was found to have a significant and unavoidable impact on global climate change due to $CO_2$ emissions, primarily due to the manufacturing of ceramic products (see Section 4.2.4 of ESA 2008). Construction and Operational $CO_2$ emissions for Phase I were estimated at more than 70,000 metric tons per year of $CO_2e$ (see Table 4.2-8 of ESA 2008). The commenter's proposed alternative would substantially increase the severity of impacts for the current proposed Idaho-Maryland Mine Project and create at least two new significant and unavoidable impacts. The commenter does not provide any information of how this alternative would lessen any impacts from the current proposed project. Further, the market for ceramic products made from material generated by the mine is speculative, and there is no evidence that such a market exists. An EIR need not evaluate an alternative that is considered speculative, theoretical, or unreasonable. Not every potentially feasible alternative need be considered; rather, the relevant test is whether a "*reasonable range*" of feasible alternatives is considered for that particular project (Guidelines §15126.6(a)). Given that the proposed alternative would create new significant impacts, has not been shown to reduce any significant impacts, and is speculative, the commenter's proposed alterative is not considered further.

### Response to Comment Ind 706-2

The commenter asserts that the project's proposed method of using waste rock and tailings for engineered fill has disadvantages due to compaction and mixing difficulties. NV5 provides recommendations for blending of rock and tailings on page 14 of appendix H.1 to the DEIR. As stated on this page, crushed blast rock with a maximum dimension of 6 inches may be blended into sand tailings to produce engineered fill material of up to 2 parts blast rock to 1 part sand tailings. A greater ratio may be feasible but would likely not be testable using nuclear methods and require a procedural test method. The engineered fill methods proposed in the DEIR are feasible based on the analysis done by NV5 in appendix H.1 to the DEIR.

The commenter states that the method of blending larger barren rock with much finer tailings would be a ground stability hazard in wet seasons in populated areas. The stability of engineered fill slopes, and response to precipitation and storms, is discussed on page 4.6-34 of the DEIR. The face of the fill should be easily maintainable at a slope of 1 to 3 (rise over run). The fill is going to be constructed over a period of years, and while most of the surface can be maintained in a finished, or semi-finished and stable vegetated condition, during the life of the project, there will likely be areas that will be open and subject to potential erosion should a larger than expected storm occur. An important design feature shown on the grading plans are the detention ponds

[1] ESA (Environmental Science Associates). (2008). *Draft Idaho-Maryland Mine Project Environmental Impact Report* San Francisco, California.

that are to be constructed immediately down-gradient of the fill areas. These ponds, while collecting sediments, also provide a second level of containment in the event that unanticipated erosion of an open surface occurs. Further, the design of the pond will allow any eroded material that has entered it to be recovered and reused beneficially. According to ECM's peer review of the DEIR and appendices, the design has been well thought out and is appropriate for the Site and project.

The commenter does not identify any inadequacies in the DEIR's analysis.

## Response to Comment Ind 706-3

The economic benefit of converting sand tailings to ceramics is a not a CEQA issue required to be analyzed in the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

The commenter states that even a small amount of water added to compacted engineered fill could lead to liquefaction and result in tailings dangerously flowing down Wolf Creek into the city of Grass Valley. However, as stated on page 4.6-11 of the DEIR, liquefaction occurs when saturated fine-grained sands and/or silts lose physical strength temporarily during earthquake induced shaking and behave as a liquid due to the loss of point-to-point grain contact and transfer of normal stress to the pore water. Liquefaction potential varies with water level, soil type, material gradation, relative density, and probable intensity and duration of ground shaking. As stated on page 4.6-41 of the DEIR, the Geotechnical Engineering Reports concluded that the overall potential for liquefaction at both the Centennial and Brunswick Industrial Sites is remote. ECM was retained by Raney (the County's EIR consultant) to perform an independent third-party peer review of the geotechnical documents prepared by NV5. ECM's peer review did not identify any deficiencies in NV5's reports. (see Page 4.6-29 of the DEIR)

Please also see Response to Comment Ind 706-1 regarding the commenter's proposed alternative.

## Response to Comment Ind 706-4

Please see Response to Comment Ind 706-1 regarding the commenter's proposed alternative.

**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**

This letter demonstrates the technical background and expertise to clearly state that the **IDAHO-MARYLAND MINE PROJECT:**

**Ind 707-1**
- Has the potential to start an economic, health and environmental chain-reaction that can desolate this thriving community.

**Ind 707-2**
- Has the potential to degrade/destroy private wells, leaving homes and farms inhabitable by the end of the day.
- Cannot predict the number of well failures that will result in generations of families losing home, small business and farm values without the having the resources to move or rectify the situation.

**Ind 707-3**
- Is equal to the daily water use of 16,000 citizens.

**Ind 707-4**
- Has a 30-acre-foot clay-lined settling pond for heavy metals that borders an earthquake fault line.

**Ind 707-5**
- Has, in addition to toxic and hazardous processes, severe soil issues with erosion, permeability and expansion.

**Ind 707-6**
- Is equal to an additional 3,450 cars on the road, every day.

**Ind 707-7**
- Will have a constant stream of massive dusty trucks that will destroy the structural integrity of the pavement.

**Ind 707-8**
- Does not provide funds for the perpetual maintenance of street lighting, traffic signals or pavement.

**Ind 707-9**
- Will not provide street or other improvements to the community, but only pays a "fair share" with no other funding provided.

**Ind 707-10**
- Will, every day, use a ton of explosives to set-off 257 detonations.

**Ind 707-11**
- Will require a Mass Evacuation Plan for the community.

**Ind 707-12**
- Will probably follow the historic record and be abandoned in five years.

**Ind 707-13**
- Will only benefit and profit Rise Grass Valley, a private company, while robbing the community of Grass Valley of public resources, integrity and reliability.

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

For over 40 years, I was employed as an engineering consultant. During my almost 20-year employment with a civil engineering firm, I found my niche. My area of expertise is not design. My expertise is in the areas of project analysis and evaluation, financing and implementation, and the maintenance of facilities in perpetuity. Incorporating in 1996, I headed a consulting firm for an additional 20 years. Following that time, for a 2-year transition period, I was employed as a principal consultant with an engineering firm, retiring in 2019.

During my career, all clients were various public agencies, counties, cities, municipal water districts, hospital districts, and fire protection districts. Representative is my work with a Southern California City with a rich history in the citrus and stockyard industries. The City evolved over the decades with a series of annexations that expanded the City by over 6,500 acres. These annexations allowed for residential, commercial and industrial development by providing major infrastructure for water, sewer, drainage, transportation corridors, and utilities. The intent was to aesthetically provide, in a sustainable manner, for anticipated growth crossing multiple drainage and water courses and transportation corridors. Public features such as fire stations, schools, parks, passive and active open space, golf courses, and fire buffer and fire protection zones were planned for and included.

**Ind 707-14**

Germane experience is further illustrated in the planned realignment and demilitarization of an US air force base. These actions included a 1,200-acre commercial/industrial development and a 236-acre healthcare campus requiring extensive demolition, the removal of hazardous materials, and the construction of major drainage and transportation facilities. These projects involved a variety of funding mechanisms for new construction, facility upgrades and conversion, as well as, for the perpetual maintenance of major flood control facilities, drainage areas, landscaping, street lighting, traffic signals, and streets.

My daughter, a teacher, and her husband, a therapist, own a home and work in Grass Valley. They have a young son and we look forward to more grandchildren in the future. When we can no longer manage the slice of paradise where we have lived for almost fifty years, my husband and I will join the family on their acreage in Grass Valley. Which is why I am involved, it's personal.

Listed at the end of this letter are my comments that correspond to Table 2-1, Summary of Impacts and Mitigation Measures, Chapter 2, of the EIR. Additional information referenced, in conjunction with this review of the EIR, includes the County's General Plan, population and employment data provided by the State of California's Employment Development Department, water use trends provided by the Legislative Analyst Office of the California Legislature's Nonpartisan Fiscal and Policy Advisor, Executive Reports issued by Division 5 of the State Water Resources Control Board and articles printed by the Union, the San Francisco Chronicle, CBS Sacramento, and the Atlantic.

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

In addition to the comments on Table 2-1, certain aspects of this controversy are discussed as follows:

1. In general, California State statute provides for and requires legislative bodies, in this case the County of Nevada, to establish a process for reviewing a property owner's proposed project. We are at the beginning of this process. Due to the significantly adverse social, economic and environmental ramifications of this project, it will be a lengthy certification process.

**Ind 707-15**

However lengthy, which I emphasize is due to the adverse nature of this project, and not the process itself, I am clear on proposing specific motions be taken by the County Planning Commission and the Board of Supervisors. Four Project Alternatives are presented for consideration in said Chapter 2. Following close of the Public Hearing on the Final EIR, the proposed motion to be taken by the Planning Commission would be to approve and recommend to the Board of Supervisor's adoption of Alterative 1, the No Project (No Build) Alternative. Following the Public Hearing to be held by the Board of Supervisors, I further advocate and recommend a motion by the Board giving final approval to Alternative 1, No Project.

2. During the course of 40 years, I have worked with many public agencies, property owners, corporations and other interested parties. Any difficulty can be surmounted if all members of the Project Team are honest about the risks involved and recognize the concerns of, and are responsive to, the community. I am disheartened by the cavalier attitude demonstrated by the property owner, Rise Grass Valley (RGV).

**Ind 707-16**

By soliciting certain groups and providing pre-printed support cards, RGV is actively working to rile-up and divide the citizenry. Grass Valley has a rich history and is multi-generational. The community protest against this project is spontaneous and crosses every economic, political, age, sex, race and divide you can find. Mr. Mossman, President of RGV, and RGV have shown a blatant disregard for the integrity of this community and is using the American flag to bully his way about town.

My kids know all their neighbors and felt joyous welcome when they moved here, pies included. With their neighbors, they have made it through scorching days, wildfires, heavy rains, heavy snows and weeks without water and electricity. Together. That is why we are investing in the community of Grass Valley, not to get rich and flash gold around.

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

3. In mentioning the American flag, I am wondering why the changes in the firm's structure and citizenship. In 2005, when RGV began purchasing aspects of this project, it was a company headquartered in Vancouver, British Columbia, Canada. RGV is now a local subsidiary and Mr. Mossman has changed his Canadian citizenship to American. He has indicated that he now lives and works in Grass Valley. There must be a reason to go to all this work and legal expense. Perhaps the reasons for these changes are for public relations, or taxes?

**Ind 707-17**

4. The EIR lists a projected workforce of 111 employees per shift, with a total of 312 employees. With two 12-hour shifts, a more reasonable estimate would be a total of 220 to 250 employees. The investment will be in machinery, not employees or improvements to the community. These are not secure jobs with unique potential or opportunity. A shut down or prolonged periods of inactivity are not unusual. The EIR clearly states, multiple times, there were many instances of inactivity during the 1866-1956 production periods. Due to the insurmountable difficulties and the negative impacts, shutdowns typically occur in the fifth year.

   In many statements, Mr. Mossman has misrepresented the economic and employment prospects of the project. Misrepresentation includes the number of employees, the number of local hires, and the outlandish claim that over 300 additional community jobs will be created. This is irresponsible misrepresentation. Further misrepresentation has been made in statements regarding expansion of the tax base and new public spending in the amount of $50 million.

**Ind 707-18**

5. Mr. Mossman has often stressed the amount of money RGV has spent on this project. Any cost incurred by RGV has been their decision made for the benefit of RGV and not the community of Grass Valley. The County of Nevada has incurred no obligation to RGV. Future improvements will be to the benefit of RGV or as a result of the significant hazardous impacts of this project. RGV has never had this type of responsibility before, this being the first mine in the company's portfolio. The firm's earnings reports indicate this venture is short of funding.

   Who goes into this type of project underfunded? IF RGV can't stand the heat, they should abandon a project they do not appear to comprehend. A firm going into the mining business should have the understanding of a capital intensive undertaking with many surprises and no guarantees. Mining is a business of starts and stops with unforeseeable delays and uncertain employment. The multiple risks this project brings to Grass Valley are unacceptable.

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

**Ind 707-19**

6. Long before RGV purchased the Centennial and Brunswick sites, it was recognized that historic mining activity had deposited or exposed natural occurrences of lead, arsenic, mercury and other metals at concentrations exceeding background soils metal concentrations and regulatory benchmark concentrations. In 2005, the Federal Environmental Protection Agency identified the Centennial Industrial Sire as a potential Super Fund Cleanup Site, and in 2018, confirmed that environmental remediation was necessary. Since purchasing the property in 2005, with full disclosure and an understanding of these hazards, RGV has been working with the California Department of Toxic Control (DTSC).

   Seventeen years later, no goals have been established, no cleanup activity has occurred, and no cleanup activity is scheduled to occur. Other than entering into a voluntary agreement twelve years ago with the DTSC, RGV has shown no intent or forward motion to commence action. RGV has not demonstrated, by any means, good faith efforts towards the environment of Grass Valley, preferring to play a shell game and stall for time.

**Ind 707-20**

7. Mr. Mossman has been quoted making comments such as, "Working in a mine now is like working in a residential community" and "There's no trade-off between the environment and jobs, we've designed it to have no impact on the environment".

   He also has the audacity to state that there isn't a problem with heavy metals where they are going to dig. How can Mr. Mossman make these statements when soils reports have indicated otherwise? It is well documented that there are health risks to the plants, animals, water, and humans at both the Centennial and Brunswick sites.

   There are already problems at the Brunswick site with more to come when the site is stripped of vegetation and the impact of prior mining activities is laid bare. As RGV digs around, at a depth of 5,000 feet within an underground area of 2,585 acres, we have no comprehension of the sink holes, landslides, flooding, and other issues that will be uncovered as we discover the impact of time and weather on the numerous uncharted abandoned mines that are known to exist.

   If an issue isn't recognized, it can't be solved or mitigated. Mr. Mossman prefers to deny and fails to recognize the significantly adverse social, economic and environmental ramifications of this project. Again, this firm has no experience in mining. RGV is not the firm to undertake mining activity, anywhere, let alone undertaking the dewatering that will need to occur 24/7 under this project.

Page 5

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

8. With growth, there are consequences, and oftentimes a reckoning. In an attempt to prevent recessions, bankruptcies, delinquencies, inflation, and project abandonment, new projects are justifiably under independent scrutiny. Stressing the word independent, studies on market trends, absorption rates, economic analysis, and appraisals can be invaluable to public agencies. Some projects just don't pan out, especially over the long term.

   Just because there is gold, doesn't mean we need to or should go get it. Gold has historically been a highly volatile commodity, subject to world market conditions and government policy. There is a reason they call it gold fever, it is a sickness. It is tempting to romanticize the past mining activities. With rampant disease, filth and malnutrition, the water was so degraded it was necessary to put your laundry on a boat to China.

9. Grass Valley is recognized by the County as a Community Region. While the population has remained constant, income levels in the area have steadily increased. Unemployment rates tend to be lower than the state and national averages, with the current unemployment rate being around 3.7%.

**Ind 707-21**

As the kids get back in the school room, Grass Valley has every reason to have a positive outlook for the future. There are labor shortages for skilled labor to shore up the energy grid, internet, and other infrastructure. Young professionals have found possibilities and moved here with their families. The baby boomer generation is retiring and many are taking early retirement, opening more employment opportunity in the community. For example, when I retired, three Project Managers assumed my workload.

This project romanticizes the past and is a distraction the community doesn't need. Enough of the community and county's resources have been given to this project. I have yet to find a policy statement, an initiative, a justification, a referendum, or community desire for this project at these locations.

In the Sierras, there is a neighborhood that has been plagued by wildfires and power outages. That neighborhood is using thermal energy to power homes during times of power outages. Air quality is still lousy but they can stay in their homes, keep the wells pumping and the food cool. Grass Valley is also inventive and has many resources, especially their neighbors. Upon the Board of Supervisor's approval of Alternative 1, No. Project, the County can direct resources towards other projects that provide truly sustainable services and benefits to the community.

Thank you for the consideration of my comments. Please contact me for any further discussion.

/S/ Roxanne E. Shepherd, 2370 Edgehill Road, Vista, CA 92084-4824, (760) 390-0679,
roxshepherd4@gmail.com

Page 6

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

**Roxanne Shepherd's Comments on**
**Table 2-1, Summary of Impacts and Mitigation Measures, Chapter 2, of the EIR**

The public is aware of the significant adverse social, economic and environmental ramifications of this project. Public comments have been documented in the EIR. The intent is to highlight statements within the EIR and offer additional viewpoints.

**Ind 707-22**

**Aesthetics (Section 4.1 etal)** – No Comments

**Agriculture and Forestry Resources (Section 4.2 etal)** – No Comments

**Air Quality and Greenhouse Gas Emissions (Section 4.3 etal)** - With the occurrence of daily dramatic climate events and over forty pages on air quality and greenhouse gas impacts, the EIR finds these impacts to be LS, Less than Significant and LCC, Less Than Cumulatively Considerable. Truck hauling and rock grinding activities will take place 24 hours a day, 7 days a week. If RGV doesn't meet goals or incurs production delays, it can be assumed they will apply for a Limited Threat Discharge Permit (further discussed under Section 4.8) .

The EIR projects 118 maximum daily round trips (2 trips) for haul trucks and suppliers. In terms of actual impact (structural stress and mechanics), these huge vehicles easily equate to 15 cars per truck. Accordingly, these trucks equate to 3,540 daily car trips. Each dusty truck trip removes water and oxygen from the air and replaces it with particulates and toxins having a significant and unavoidable impact.

**Ind 707-23**

Once this project starts, it can't halt production. If there is a power outage, at a minimum, two 7,500-gallon trucks will need to deliver diesel to the facility on a daily basis. The daily baseline energy consumption of this facility is equal to 15,000 gallons of diesel fuel. This use does not include energy for the transportation of trucks and other vehicles in and out of the facility.

If the Board of Supervisors votes to approve any aspect of this project (Alternatives 2, 3 or 4), the Board will also need to adopt a Statement of Overriding Considerations explaining the decision to balance the benefits of the project against the unavoidable adverse impacts.

**Biological Resources (Section 4.4 etal) –** The EIR states that the impacts to the biological resources due to this project are LS, Less than Significant and LCC, Less Than Cumulatively Considerable. In order to reach this conclusion there are Transplant Monitoring Programs, Pre-construction Survey and Avoidance and Minimization Measures, Watercourse/Wetlands/Riparian Management Plans, and Habitat Management Plans with Habitat Enhancement and Conservation Easements for each species (four programs).

**Ind 707-24**

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

These programs can entail growing endangered species from seed. Four programs will be prepared for the Pine Hill Flannelbush, the Foothill Yellow-Legged Frog, the Western Pond Turtle, the California Red-Legged Frog, the California Black Rail, the Coast Horned Lizard, Special-Status Bats, Non-Special Status Raptors and Migratory Birds, and any other plant and animal that will be disturbed by this project.

There appears to be no funding for these labor intensive plans. Unless these plans are fully funded and supported by community groups, they will fail. Lacking community involvement and sufficient fundin,g it can be anticipated that complaints will be made and they will be ignored to the point of distraction. Those that care will be ridiculed and nothing will get done. If these programs fail, the community's biological resources die. It has taken over 100 years to superficially recover from prior gold mining activity. There are still hazardous materials and discarded facilities in the County that can be considered ticking time bombs. There are no plans or actions proposed to rectify these issues.

**Ind 707-25**

**Cultural and Tribal Cultural Resources (Section 4.5 etal)** – No Comments

**Geology, Soils and Mineral Resources (Section 4.6 etal)** – The EIR has identified various loam soils types where construction is proposed to take place within the East Bennet Road ROW and the mining sites. These loam soils types, along with the sand and silt caused by prior mining activities, have been identified as having a severe high erosion potential. Samples indicate erosion is very likely to occur, with the hazard being a high, or a moderate to high, erosion potential. No areas have been identified as having a low potential for erosion.

A moderately slow rate of permeability (drainage) has been identified for these soils. Those areas containing clayey alluvial land have a moderately slow to a very slow rate of permeability. Expansive soils are characterized by their ability to undergo significant volume change due to a variation in moisture content. Expansive soils tests have established a moderate to high potential for expansive soils hazards that will affect the proposed improvements at all sites, especially the Brunswick site.

**Ind 707-26**

Physical closure is recommended for near surface features from prior mining activities that could become unstable, including three shafts, a drain and a tunnel. The site contains steep slopes gradients, 30% or greater, natural and manufactured, that allow for the leaching of toxic and hazardous materials.

This area lies within a Type C Fault Zone, with low seismicity, a low rate of occurrence and a moment magnitude of 6.5. The EIR assumes that since no historic seismic activity has been documented, there is no evidence the area is seismically active. However, the eastern shore of the 30-acre-foot clay-lined settling pond is adjacent and parallel to an unnamed north, northwest trending fault line. It is also noted that the fault line enters Wolf Creek which lies along and parallel to the south shore of the pond. This pond is to be used for water storage and surge capacity; and, for the settling and removal of total suspended solids, a significant portion being dissolved lead and manganese. The pond is scheduled to be cleaned-out every ten years.

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

All design and construction will be under the guidance of the County's Mitigation Measures and Best Management Practices of the Management Plans for Steep Slope and High Erosion Potential. From an engineering perspective, in theory, the proposed design and paste backfill construction could work. However, the EIR states that an entire project-area baseline has not been established and existing conditions may vary and be worse than the given estimates. The EIR also acknowledges that the proposed activities and disturbances set forth under the Measures and Practices may actuals result in further damage to the community and environment. However, with subsurface drainage control, trenching, compacting, reinforcing, evacuating, stabilizing, and placement activities, the EIR states the S, Significance impacts will be reduced to LS, Less than Significant.

Problems arise during implementation and construction when the unexpected occurs. The energy and the resources required to be expended to support this project will be without limits. At what point, at what cost, is this project abandoned? Historically, the sites are abandoned after a five-year period.

**Hazards and Hazardous Materials (Section 4.7 etal)** - It has been well documented that historic mining activity in Grass Valley and the surrounding areas has deposited or exposed natural occurrences of lead, arsenic, mercury and other metals at concentrations exceeding background soils metal concentrations and regulatory benchmark concentrations. Until cleaned-up, the 56.4-acre Centennial Site is closed and remains an active treat in the middle of the Grass Valley Community. In addition to the existence of these hazardous materials, the EIR indicates the 119-acre Brunswick site has been used as a dump site.

**Ind 707-27**

The EIR acknowledges that a full survey of the 119-acre site has not been done. With the historic storage and use of petroleum, PCPs, pesticide and hazardous products, undocumented soil fill, refrigerators, undocumented drums, undocumented drainage structures, former transformers, and above-ground storage tanks, mine shafts, standing water, and suspect pits that litter the site, an adequate survey would be delicate, labor intensive and prohibitively expensive. The EIR further states that the location, status and total number of monitoring wells within the site is not definitely known.

Due to the toxic nature of the proposed activities, and the explosives that will be stored on-site, an Emergency Response and Evacuation Plan will need to be structured to provide evacuation strategies for the County's response to emergencies that involve the mass evacuation of people and animals from an impacted area.

Under the EIR, the mine operator and the RGV employees will be monitoring and certifying that the S, Significance Impacts of this hazardous project will be reduced to LS, Less than Significant.

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

**Ind 707-28**

**Hydrology and Water Quality (Section 4.8 etal) –** Reference is made to Figure 4.8-4, Map of Domestic Supply Wells and Underground Mine Workings, of the EIR. An "as of" date is not given for the Map and new wells are daily being installed. There is a realistic six-month backlog of new well requests in the area. The reliance on wells illustrated on this Map is sufficient basis for the approval of Alternative 1, No Project.

If this project moves forward, it should be anticipated that RGV will apply for a Limited Threat Discharge Permit. This will allow **unlimited** amounts of discharge subject to **quarterly** monitoring at a specified site by the State Water Resources Control Board (SWRCB).

Grass Valley annually experiences 65 rainy days with an average rainfall of 55 inches. Leaching takes place when it rains. To be effective, reporting should be required after every rain and wind event. To know there are "adequate above- and below-drainage structures" is not the point. The point is that water will go through the treatment plant, through the 30-acre foot waste settling pond, and into Wolf Creek.

Any proposed action in the EIR that simply monitors the impact is not true mitigation. As with all public agencies, Division 5, SWRCB has casework overload further aggravated by COVID. For the period of July 1 to December 31, 2021, 57 facilities (42%) of the 151 target facilities were inspected. The number of non-target facilities was not listed in the SWRCB Executive Report. Years can go by without a State or Federal inspection while discharges of over 250,000 gallons per day, are allowed. Although presented otherwise, the proposed actions set forth in the EIR do not adequately reduce the significant and unavoidable impacts of this project.

The hydraulics and hydrology of this project are very complicated. As water levels fluctuate on a project of this size, the actual stress on the existing infrastructures will not be known until breakage occurs. The ramifications of massive well failures would be devastating. Rural irrigation districts are not typically designed to meet high demand and can be plagued by maintenance issues that affect water reliability, insurance rates, and the financial ability to move beyond merely placing band-aids on the system. Should this occur, funding and liability is not addressed in the EIR.

Private wells are the backbone of this community. If well failure occurs, a home becomes inhabitable within hours. This project has the potential to start an economic, health and environmental chain-reaction that can desolate this thriving community. The EIR states that this project is located in two watershed areas and will substantially degrade surface and ground water quality; impede sustainable ground water management of the water basins; extensively alter existing drainage patterns resulting in erosion, flooding; impede and redirect flood flows; and, pollute. It is astonishing these facts are not considered in the EIR to be significant and unavoidable. When digging thousands of feet below the ground water level, the pumps removing the water cannot stop. Water will be constantly sucked out of the ground (dewatering) and poisoned before discharge in Wolf Creek.

Page 10

However, the EIR finds that, because there are management and monitoring plans, all of these impacts are reduced to LS, Less Than Significant.

It is noted that water usage is discussed under Section 4.11, Public Service and Utilities.

**Ind 707-29**

**Land Use and Population and Housing (Section 4.9 etal)** – An EIR can set a project's trajectory. This EIR inadequately protects the environment and its citizenry. In order to avoid setting any precedent for this project's forward motion, is recommend that the Board of Supervisors deny approval of the EIR. Over time, these impacts are compounded and expand into new long-term negative impacts. Due to a lack of adequate REM sleep, what is a noise problem can becomes a concentration and behavior issue at home, school or work..

**Ind 707-30**

**Noise and Vibration (Section 4.10 etal)** – Every day, for 80 years, this project can use a ton of explosives to set off 257 detonations. Approximately 500 tons of barren rock and 1,000 tons of mineral rock will be ground every day, for 80 years. As previously stated, every day, this project will equate to an additional 3,540 cars on the road.

The EIR acknowledges that the current noise level in the Grass Valley Community is already S, Significant. The EIR finds that the noise impact of this project will be SU, Significant and Unavoidable.

**Ind 707-31**

**Public Services and Utilities (Section 4.11 etal)** - Fire protection and emergency services, police for the security of hazardous and explosive materials, water supply, wastewater, solid waste, electricity and gas, are all community resources that will be used to support a project that benefits a private company. These facilities have been paid for and maintained by the citizens of the community. However, The EIR considers the impact of this project on public service and utilities to be N/A, Not Applicable.

The EIR states that water usage per day for this project will be 5,700 gallons per day (gpd) of potable water for sinks, toilets and showers; 42,000 gpd of non-potable water for dust suppression and compaction; 84,000 gpd of groundwater during operations; and, once dewatering is complete, 1.2 million gpd will be pumped to the surface for treatment, totaling 1.4 million gpd of water use. The typical person in this area consumes for inside and outside water purposes, an annual average of 85 gpd. In water alone, this project will consume an amount that would serve almost 16,000 people every day.

**Ind 707-32**

**Transportation (Section 4.12 etal)** – Under all scenarios, the proposed project would increase traffic through intersections already identified by CALTRANS as already operating under unacceptable conditions. As proposed, conditions only worsen along the 24 identified streets and intersections. The project will fund what is termed a "fair share contribution" to bring transportation operations to an acceptable level. The determination of fair share contribution is not based on benefit, but rather the percentage of access upon a route. For example, a project may be required to fund 8% of a specific traffic signal.

Matt Kelley, Senior Planner
**NEVADA COUNTY PLANNING DEPARTMENT**
**IDAHO-MARYLAND MINE PROJECT**
**ENVIRONMENTAL IMPACT REPORT (EIR) EVALUATION**
February 16, 2022

The EIR states that because the remaining funds of the improvements are unknown, in terms of timing and contributing parties, the successful implementation of the improvements is uncertain. The result of the fair share contribution will be that inadequate funds are collected and no improvements will be made to the transportation system.

**Ind 707-33** The construction and maintenance of pavement, lighting and signalization along transportation corridors is extortionately expensive. The coordination of traffic signals is highly technical, expensive and the results are seldom worth the cost and headache.

**Ind 707-34** The daily impact of this project will be equal to 3,450 cars driving by. The EIR infers that once a vehicle trip is counted, it exists and should not be counted as an increase the following year. Yet the impact of these heavy trucks on the pavement occurs with every trip, regardless of the number of years. The cumulative impact on pavement, lighting and signalization caused by this project will be immeasurable. When it is hot and a truck comes to a stop, the pavement is folded underneath, like a fault line. The pavement thins and then builds up in layers. Big-box warehouses, with high truck traffic, are causing pavement buildup in certain older areas, like Grass Valley, that is affecting drainage and the structural life and integrity of the pavement. When you add the steep slopes, the dust, the wind, ice, and rain, these trucks are going to literally rip up and degrade the streets. After the first year, this impact will not only exist, it will compound. For an EIR to judge that an impact does not exist because it was already there after the first year of production is ludicrous.

The EIR states that the negative impacts related to transportation, **even if all the improvements actually are constructed,** the majority of the impacts remain SU, Significant and Unavoidable.

**Ind 707-35** **Wildfire (Section 4.13 etal.)** – The EIR finds that this project, with abatement programs and fire extinguishers, poses an LS, Less Than Significant threat to wildfires. With the razing and explosive nature of fires experienced in Redding and Paradise, Grass Valley is already on alert year round. There is no justification for the risk this project poses to Grass Valley. If the facility can't shut down, should a fire occur, who has the priority of the water first? Due to its hazardous nature, water from the mine can't be used for fire abatement.

The EIR finds this project has an LS, a Less Than Significant impact on the threat of wildfire to the community of Grass Valley.

"There is no long a fire season; there is a world-wide fire year". This comment was made by an Orange County firefighter battling urban wildfires in February, 2022.

## INDIVIDUAL LETTER 707: ROXANNE SHEPHERD

### Response to Comment Ind 707-1
The commenter states that project will lead to a chain-reaction of economic, health, and environmental impacts that will desolate the community. Regarding economic impacts, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 707-2
The commenter states the project will degrade or destroy private wells and that the DEIR underestimates the number of potentially impacted wells. The commenter is referred to Chapter 4.8 of the DEIR which found that impacts to groundwater supplies would be less than significant. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 707-3
The commenter states that the project's water use is excessive. The commenter is referred to Chapter 4.8 and the Water Supply Assessment in Appendix N of the DEIR.

### Response to Comment Ind 707-4
The commenter is concerned that the clay-lined settling pond allegedly rests on an earthquake fault. The DEIR states that over 150 years of observation has produced no records of movement in Grass Valley area mines. (DEIR, p. 4.6-31.) As discussed in Chapter 4.6-1 of the DEIR, based upon substantial evidence in the record, the project includes a request to amend the Final Map for Bet Acres recorded in February 1987 in Book 7 of Subdivision Maps at Page 75 to remove the "200' Building Setback From Fault", as shown on Sheet 4 of Final Map #85.

In addition, a management plan was prepared pursuant to Nevada County LUDC Section L-II 4.3.8 to address potential seismic hazards associated with the previously identified inferred fault alignment. It is NV5's professional opinion that the subject fault, identified on the property in Map 85-7, does not qualify as a seismically active area as defined by Nevada County LUDC Section L-II 4.3.8.B, and the proposed project development within the designated building setback fault zone is generally feasible from a geotechnical engineering standpoint. (DEIR, p. 4.6-31.)

While the analysis shows that an active fault (activity within 11,000 years) likely does not exist, out of an abundance of caution, the County has concluded that a significant impact could occur without mitigation. Mitigation Measure 4.6-1 requires that prior to approval of Improvement Plans, the design recommendations from the Brunswick Industrial Site Geotechnical Report (November 18, 2019) shall be incorporated into the Plans to the satisfaction of the Nevada County Building Department.

### Response to Comment Ind 707-5
The commenter states that the project has severe "soil issues with erosion, permeability, and expansion", but provides no additional information on which to formulate a response. The commenter is referred to Chapters 4.6 and 4.8 of the DEIR.

### Response to Comment Ind 707-6
The commenter states that the project will result in an additional 3,450 cars on the road per day but provides no evidence to substantiate this claim. The commenter is referred to the traffic impact analysis in Chapter 4.12 of the DEIR.

## Response to Comment Ind 707-7

The commenter states that the project's use of haul trucks will destroy the pavement. The DEIR analyzes impacts to pavement in Chapter 4.12. Specifically, the DEIR requires the Project Applicant to enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impacts to pavement. (DEIR, Mitigation Measure 4.12-6(b).)

## Response to Comment Ind 707-8

The commenter states that the project would not provide funds for the perpetual maintenance of street lighting, traffic signals, or pavement. As discussed in Response to Comment Ind 707-7, the DEIR requires the Project Applicant to enter into agreements with Nevada County or Grass Valley to provide the project's fair share funding for applicable improvements. (DEIR, 4.12-67, 91.)

## Response to Comment Ind 707-9

The commenter states that the project will not provide street or other improvements to community. The commenter is referred to Responses to Comments Ind 707-7 and Ind 707-8. Additionally, various required traffic improvement fees and fair share payments for intersection improvements are discussed in Chapter 4.12 of the DEIR.

## Response to Comment Ind 707-10

The commenter states that the project would require 257 detonation per day. The DEIR analyzed the project's use of explosives and found the impact to be less than significant after implementation of Mitigation Measures 4.7-1(a-d). (DEIR, 4.7-22.)

## Response to Comment Ind 707-11

The commenter states the DEIR requires a mass evacuation plan. The project does not require a mass evacuation plan for the community. The commenter is referred to Chapter 4.7 of the DEIR, which discusses Nevada County's emergency response and evacuation procedures. (DEIR, 4.7-10.)

## Response to Comment Ind 707-12

The commenter states the project will likely be abandoned in five years. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 707-13

The commenter states that the project will only benefit the Project Applicant. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 707-14

This comment is introductory in nature and does not discuss the adequacy of the DEIR. The comment is noted.

## Response to Comment Ind 707-15

The commenter is opposed to the project and prefers that the County selects the "No Build" Alternative to the project. The commenter's opposition to the project is noted. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 707-16

This comment discusses the Project Applicant, it does not discuss the adequacy of the DEIR. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 707-17

The commenter states the Project Applicant misrepresents the employment benefits derived from the project. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 707-18

This comment discusses the Project Applicant, it does not discuss the adequacy of the DEIR. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 707-19

This comment discusses the Project Applicant and prior projects at the Brunswick and Centennial Industrial Site. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 4 - Cleanup Project is a Separate Project Under CEQA, and Master Response 9 - Historical Mine Waste at Centennial Site.

## Response to Comment Ind 707-20

The commenter states that the Project Applicant understates the environmental and economic impacts of the project and makes references to heavy metals at the project site and associated impacts to plants, animals, water, and humans but provides no additional detail on which to formulate a response. Regarding economic impacts, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts. The commenter is also referred to Master Response 3 - Operator Responsibility.

Regarding the risk heavy metals pose to plants animals, water and humans, the commenter is referred to Chapters 4.3 and 4.8 of the DEIR, Master Response 20 - Conservatism of Metals Assumptions, and Master Response 8 - Mine Waste Characterization.

Regarding the risk of “sinkholes” and landslides, please see Chapter 4.6 of the DEIR. The commenter is also referred to Master Response 29 - Near Surface Workings.

## Response to Comment Ind 707-21

This comment discusses social and economic impacts of the project and does not discuss the adequacy of the DEIR. The commenter is refereed to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 707-22

The commenter offers no comments on Chapters 4.1 and 4.2 of the DEIR. The comment is noted.

## Response to Comment Ind 707-23

The commenter references several components of the project regarding impacts to air quality but does not comment on the adequacy of the DEIR. A limited threat discharge permit is required before mine dewatering commences. The commenter is referred Master Response 35 - Discharge to South Fork Wolf Creek. The DEIR analyzes air emissions in Chapter 4.3 of the DEIR. The project’s significant and unavoidable impacts are summarized in Chapter 5.6 of the DEIR.

## Response to Comment Ind 707-24

The commenter states that mitigation measures in Chapter 4.4 of the DEIR will fail unless they are fully funded and supported by community groups and that complaints will be ignored. A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 3 - Operator Responsibility.

The commenter says that there are hazardous materials and discarded facilities in the County and no plans or actions are proposed to rectify these issues. The DEIR analyzes the proposed project impacts and does not analyze other sites or projects.

## Response to Comment Ind 707-25

The commenter does not have comments regarding Chapter 4.5 of the DEIR. The comment is noted.

## Response to Comment Ind 707-26

The commenter states that the type of soil present at the Brunswick site poses stability hazards for the project. The DEIR's Chapter 4.6 analyzes the geotechnical aspects of the project and found related impacts to be less than significant after mitigation. In regard to leaching of toxic and hazardous materials from the slopes, the commenter is referred to Master Response 8 - Mine Waste Characterization. Regarding the fault adjacent to the water treatment pond, the commenter is referred to Response to Comment Ind 707-4. Regarding economic impacts, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 707-27

The commenter states that both project sites contain historical contamination but does not identify any inadequacies with the DEIR. The commenter also states that the project requires an evacuation plan due to the storage of explosives. Regarding the Centennial site cleanup, the commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA, and Master Response 9 - Historical Mine Waste at Centennial Site.

As stated on page 4.7-35 of the DEIR, implementation of the proposed project could create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment, specifically related to elevated arsenic levels in the existing mixed soil and rock fill beneath the southeastern paved area of the Brunswick Site, should the area be disturbed as part of the proposed project, potentially encountering contaminated soils, the potential presence of petroleum contaminated soils, and the presence of monitoring wells. As a result, impacts would be considered significant. Implementation of the mitigation measures 4.7-2(a) through 4.7-2(c) would reduce the above potential impact to a less-than-significant level. The commenter is also referred to Master Response 10 - Explosives, Reagents, and Brunswick Fill.

An Emergency Response and Evacuation Plan for mass evacuation specifically related to project activities is not required. The commenter is referred to Chapters 4.7 and 4.13 of the DEIR.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

## Response to Comment Ind 707-28

Regarding impacts of the project to domestic water wells and groundwater quality, the commenter is referred to Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

The limited threat discharge permit is required before mine dewatering commences. Water is treated before discharge and is placed first into the water treatment pond and then into the water treatment plant and is discharged to South Fork Wolf Creek. The project would have a less than significant impact to water quality in surface waters or South Fork Wolf Creek. The commenter is referred Chapter 4.8 of the DEIR and Master Response 35 - Discharge to South Fork Wolf Creek.

Regarding impeding or redirecting flood flows, erosion, and flooding, the commenter is referred to Chapter 4.8 of the DEIR. The DEIR includes mitigation measures to mitigate the project's impacts to all of the aforementioned topics.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

Regarding economic impacts, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 707-29

The commenter states the DEIR is inadequate without any additional detail. The commenter's unsubstantiated opinion is noted for the decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues. The commenter states that the project will have adverse noise impacts causing sleep disturbances. The commenter is referred to Response to Comment Grp 21-130.

## Response to Comment Ind 707-30

The commenter is concerned about the impacts of blasting associated with the project but does not provide additional detail. Blasting vibrations have been analyzed in Chapter 4.10 of the DEIR and are less than significant after mitigation. The commenter reiterates the concern with traffic-related impacts. Traffic impacts are analyzed in Chapter 4.12 of the DEIR. The commenter states the DEIR acknowledges noise impacts from the project are significant and unavoidable. The construction noise from the installation of the potable water pipeline in East Bennett Road is considered Significant and unavoidable (DEIR, p. 4.10-30.) All other construction noise and noise during operations would be less than significant after mitigation. The commenter is referred to Chapter 4.10 of the DEIR.

## Response to Comment Ind 707-31

The commenter states the project will require an increase in emergency services. Impacts to public services and utilities are analyzed in Chapter 4.11 of the DEIR. The DEIR found that impacts to public services and utilities would be less than significant. (DEIR, p. 4.11-21, 26, 28, 29, 30, and 31.) The DEIR also found that sufficient water supplies are available for the project. (DEIR, 4.11-35.) The commenter is also referred to Chapter 4.8 of the DEIR and the Water Supply Assessment in Appendix N of the DEIR.

## Response to Comment Ind 707-32

The commenter states that the project will result in adverse traffic-related impacts and that the fair share contributions of the Project Applicant will be inadequate. As stated on page 4.12-98 and

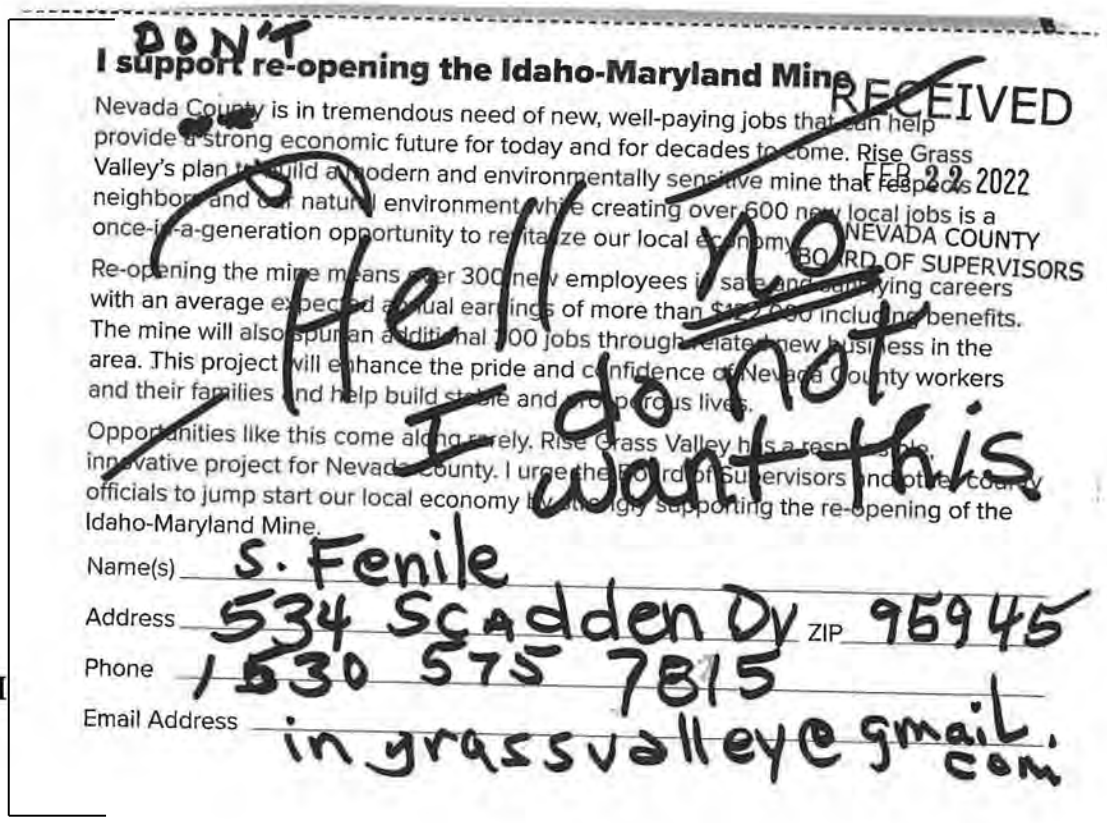
4.12-103 of the DEIR, NCTC removed the SR 174/Brunswick Road intersection from their RTMF program in their 2016 Nexus Study, while Caltrans has the intersection identified as a planned, but unfunded improvement in their SR 174 TCR. Mitigation Measure 4.12-1(b) requires the Project Applicant to enter into a traffic mitigation agreement with Caltrans and provide the project's fair share contribution toward the improvements needed to improve intersection operations to an acceptable level. Because the remaining funds for the intersection improvements are unknown, in terms of timing and contributing parties, the successful implementation of the intersection improvements is uncertain. Therefore, the project's incremental impact to the SR 174/Brunswick Road intersection is considered significant and unavoidable in the DEIR. (DEIR, p. 4.12-93.)

## Response to Comment Ind 707-33

This comment does not pertain to the adequacy of the DEIR. The comment is noted.

## Response to Comment Ind 707-34

The commenter states that the impact of the project is equal to 3,450 cars driving by but provides no calculations or information as to the relevancy of this statement. The commenter states that traffic impacts are immeasurable. However, traffic impacts are analyzed in Chapter 4.12 of the DEIR and are based on numerous measurements such as traffic counts and traffic modeling. Various impacts from project traffic to certain intersections are less than significant, less than significant after mitigation, or in the case of SR 174 / Brunswick Road and Brunswick Road/Sutton Way, significant and unavoidable. The commenter is referred to Chapter 4.12 of the DEIR.



Impacts to pavement are discussed on pages 4.12-85 through 4.12-86 of the DEIR. Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between project driveway and Brunswick Road.

## Response to Comment Ind 707-35

The commenter states that water from the mine cannot be used for fire abatement. However, the project treats mine water (see Master Response 35 - Discharge to South Fork Wolf Creek) and has several connections to NID fire service water (DEIR, p. 4.13-20.)

As stated on page 4.13-22 of the DEIR, the Centennial and Brunswick Industrial Sites have limited steeply-sloping topography that is known to exacerbate wildfire risk and spread. Prevailing wind conditions within the surrounding area are from the North-East and South-West directions, both of which have forest lands. The incorporation of defensible space around proposed structures at the Brunswick Industrial Site, as well as designing buildings in conformance with Chapter 7A of the CBC, would help to slow the spread of wildfire moving through the area. In addition, proposed improvements at both Sites would reduce the vegetation fuel load in the area. Nevertheless, vegetation would remain on both Sites and would need to be managed on an ongoing basis. In addition, use of hydrocarbon-powered heavy-equipment on-site could exacerbate wildfire risk. Without implementation of a vegetation management plan, the proposed project could have a significant impact related to exacerbating wildfire risks, and thereby exposing project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire. Implementation Mitigation Measure 4.13-2, requiring a comprehensive vegetation management plan, would reduce this impact to less than significant.

**Individual Letter 708**

DON'T

**I support re-opening the Idaho-Maryland Mine**

RECEIVED
FEB 22 2022
NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $[illegible],000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Hell no
I don't want this.

**Ind 709-1** I am writing about the impact the Idaho-Maryland Mine would have on us (the neighbors) that live in the area. I live 1.5 miles from the mine site and 2 miles from the dumping site on Centennial Drive. We are on a well and have no access to any other water. We cannot get NID. If the mine dewatering contaminates or dries up our well, what would we do? The spokesman for Rise Gold said "our water might taste funky and be cloudy but would still be acceptable". Acceptable to who?

**Ind 709-2** My family moved here forty years ago to be near relatives and the beauty of Nevada County. My ancestors were Cornish miners here in Grass Valley. I value our heritage but re-opening the mine and the environmental impact it will have on our community is a huge mistake and one that will permanently damage our beautiful county. People live here and visit here for the peaceful beauty. How does a mine with its toxic mine waste, air pollution and noise pollution fit into the lifestyle of Nevada County. Not to mention the blasting underground in an area that has earthquakes or the dumping of minewater into our creeks.

**Ind 709-3** We also have to look at the history of Mr. Mossman and his gold mining operation in British Columbia. He ran leaving massive environmental damage and law suits. Do we really think he would not do the same in our county if things got difficult.

Thank you,

Sandra Bacon

## INDIVIDUAL LETTER 709: SANDRA BACON

### Response to Comment Ind 709-1

For the commenter's well impact concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 709-2

The comment does not address the adequacy of the DEIR, but rather expresses general concerns about the proposed project. Please see Master Response 1. For toxic mine waste concerns, please see Master Response 8 – Mine Waste Characterization; for the generally noted air pollution concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy; for generally expressed noise and blasting concerns, please see Chapter 4.10, Noise and Vibration; and for dumping of mine water into creek, please see Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 709-3

Please see Master Response 3 – Operator Responsibility.

**Individual Letter 710**

Matt Kelley

Nevada City, CA 95959-8617

February 20, 2022

Re: Idaho-Maryland Mine Project Draft EIR, SCH # 2020070378

Mr. Kelley,

I am responding with a few of my concerns regarding the DEIR for the Idaho-Maryland Mine Project and its potential impacts on the residents of Nevada County.

**Ind 710-1**

#1: The current zoning of the land appears to be Light Industrial, M1 which is defined as "For the production, repairing, distribution, and warehousing of goods and equipment, along with support businesses and services. Uses should provide for buffering from adjacent land uses to minimize incompatibility and should have convenient, controlled access to arterial or major collector roads without passing through residential areas.
The zoning indicates that "Any other intensive industrial use not allowed in the BP or M1 Districts" are Not Permitted.

The access between the Idaho-Maryland and Centennial sites is along rural, residential zoned properties, contrary to the Light Industrial zoning. Mining, with the subsequent blasting, rock crushing, and hauling certainly seem to be an 'intensive industrial" use, which is not permitted for the sites.

These two items should be included within the list of impacts which can not be mitigated.

**Ind 710-2**

#2: The abandoned mine tunnels have created paths for water flow for decades that residents in the watershed of the mining property have come to rely upon. If the tunnels had not been created, or they had been continuously dewatered since their inception, water which now serves other properties potentially miles away from the tunnels would have failed to obtain water reliant upon this water. The owner of the mineral rights owns the minerals, but do they have the right to divert this water for non-beneficial uses (dumping into a creek) when an unknown number of properties rely on this water source?

**Ind 710-3**

The DEIR addresses that "Under existing conditions, the effect of this drawdown is limited to the East Bennet Road area." (Page 4.8-54, second paragraph). This seems a grossly oversimplified conclusion that does not account for the distance that underground water can travel. Page 3-15, fourth paragraph, indicates that static levels of groundwater is 260' below ground surface. That static level is taken at an elevation of ~2700'. This needs clarification as to how drawdown at this elevation, with such a low static level of ground water, could not affect properties below 2700' elevation that may be served by that same groundwater.

#3: Blasting underground can disrupt and forever change the fractures that homeowners downstream rely on to transport the underground water to their wells. Information within the DEIR that addresses the potential alteration of existing rock fractures that transport underground water does not seem to be sufficient or the potential impact to houses and communities reliant upon these groundwater sources.

**Ind 710-4**

Page 4.8-48 indicates that 'new mining activity would all occur at depths that are comparable to or much deeper than the historic mine workings." Thus, any blasting will be occurring below existing fractures which deliver water to residents well below the location of the mine. Again referring to the DEIR indications that static water is at 260', that is an area of rock formation and fractures that could be as much as 1000' in depth that could be impacted by blasting. The potential footprint of properties within the zone can't be estimated if there is not an accurate map of the underground aquafers and watercourses. The DEIR needs to include the potential impact to properties well beyond the mineral rights boundaries.

The DEIR needs to exponentially expand its scope of impact to wells within the region not just within the mineral rights.

**Ind 710-5**

#4: California is already experiencing insufficient energy production and availability compared to demand during heavy use periods. Pacific Gas and Electric Company has announced plans to move their residential customers to time of use rate schedules to encourage less energy usage during the hottest part of the day. The DEIR is lacking in any options for including renewable energy within the scope of the project to reduce the impact of the significant energy proposed to be used by the project.

A project alternative utilizing renewable energy sources should be included within the DEIR.

**Ind 710-6**

#5: The DEIR is working off assumptions regarding the Centennial Site and eventual cleanup of the site. Even if the site is cleaned up and the Department of Toxic Substance Control (DTSC) issues a No Further Action letter, there are still ongoing requirements for sites where the toxic substance is not removed from the site to a remote disposal location. Since that process is still moving forward with California DTSC the stipulations, land use covenants and Operations and Maintenance Agreements are unknown at this time. Per page 1-7, second to last paragraph "...even if the Centennial Clean-Up Project is not completed within the term of the mining permit,...in which case, material from the Idaho-Maryland Mine Project would not be placed on the Centennial Site.".

Since many of the figures and calculations are based upon the use of the Centennial Site, this DEIR needs to either be postponed until the actual available level of use of the Centennial Site is known or the use of the site should be excluded as part of the project. Either the Centennial site is part of the project, which should then incorporate the cleanup as part of the project, or the Centennial site is not within the scope of the project and all calculations on GHG emissions and other assumptions regarding availability of the Centennial Site need to be removed from the DEIR.

**Ind 710-7**

#6: Regarding the Water Treatment Plant and pond, the DEIR needs to have additional information on how the level of the pond will be regulated to prevent emergency overflows into South Fork Wolf Creek, if there are alternatives to dumping the water into South Fork Wolf Creek, and whether the levels of water introduction into South Fork Wolf Creek will have an adverse effect on downstream properties during storm events.

Per page 3-15 the clay-lined pond will have a capacity of approximately 40 acre feet (40 af). Per page 3.17 the pond will have an approximately 30 af working capacity. If the mine is to be dewatered at 2,500 af in a 6 month period (page 3-15), that is equivalent to 13.66 af per day. At 13.66 af per day that only provides a capacity of 2.15 days for the pond. This brings up concerns which should be addressed within the DEIR regarding:
a) What is the settling rate is for the water and how fast is the water treated and released?
b) What happens of the Water Treatment Plant is shut down for any length of time? Will the pond overfill and flow into South Fork Wolf Creek or is there an emergency shut-off that halts mine dewatering to protect the creek?
c) Will the Water Treatment Plant be staffed by a licensed Treatment Plant Operator 24/7 to address any emergencies and monitor the systems?
d) If backwash material is to be placed into the same pond, this will further reduce the capacity of the pond, shortening the period of time that water can be pumped into the pond.

**Ind 710-8**

The numbers used to discuss dewatering are inconsistent. At one point, the DEIR indicates 2,500 acre-feet of water will be removed over a 6 month period. At another the DEIR indicates that 5.6 cubic-foot-seconds (cfs) will be removed. That is a difference of 433 af of water. During the extreme drought conditions California is currently experiencing, clear water impact information is even more important.

**Ind 710-9**

The DEIR needs to have a more precise and consistent reference to the water amounts to be removed from the mine both before and during operation should be provided, using a consistent unit of measure, or provide a table showing acre-feet, cubic foot/second, and gallons per minute per day for each type of event to clarify water usage.

**Ind 710-10**

The DEIR should also address treated water discharges into the creek during abnormal rain events. While the DEIR addressed surface run-off analysis, with treated water discharges being estimated from 1.9 cfs to as high as 5.6 cfs, which are NOT part of the surface runoff analysis, there needs to be additional research and alternatives to treated water discharges into the creek during storm events.

**Ind 710-11**

The DEIR did not discuss opportunities for beneficial use of the water from dewatering the mine. There should be a discussion on opportunities to re-introduce the treated water back into the ground, either through storage or tapping into an underground aquifer.

**Ind 710-12**

The DEIR should discuss the possibility of another event such as what occurred at the Siskon Mine in North San Juan. What would be the ramifications of hitting an underground 'river', how would the overflow of water be mitigated? Are there tools available to help prevent such an event from occurring at this site? North San Juan has a significantly lower population than the Grass Valley area where the Idaho-Maryland Mine is located. The footprint of dewatering a major underground 'river' could impact properties for miles.

**Ind 710-13**

#7: Within the Summary of Impacts and Mitigation Measures:

I would request that the determination of LCC (less than cumulatively considerable) be reviewed for Impact 4.2-6. Nevada County already has numerous days where the pollution from the valley impacts our area, raising the AQI numbers to unhealthy levels. How can the increase of the levels of GHG being estimated by this size and longevity of this project not be a significant impact with needed mitigations?

**Ind 710-14**

The determination of 4.3-9 (Results in the inefficient or wasteful use of energy or conflict with a State or local plan for renewable energy or energy efficiency) as being Less than Significant is not consistent with the findings within the DEIR. The project is a huge net energy user during a period when State and local governments are requiring more renewable energy usage and less consumption. The project destroys Nevada County's energy use goals and that should be addressed to bring the project within the County and State goals.

**Ind 710-15**

I also object to the findings of 4.7-5 and 4.8-6 as less than significant. All these findings need to be reviewed and more fully discussed as to their impact over a span of 80 years.

**Ind 710-15**

Why are the mitigations for construction only? This project has an 80-year expected life-span. Mitigations need to be ongoing for all aspects of the project and should include the potential to replace equipment run on petroleum products with alternatives that will lessen the 80-year cumulative impact on the environment and the community.

**Ind 710-16**

Thank you for the opportunity to comment on this DEIR. I am by no means an expect on review of such documents, but this draft appears to have numerous areas that have not been addressed at all or the focus has been on meeting the letter of the law as opposed to the actual environmental impact upon the community, as evidenced by the number of project comments that have been deemed less than significant and not worthy of further discussion. I trust that more expert eyes then mine will point out many more of these deficiencies so that Nevada County can have a complete EIR, with adequate discussion that is representative of the valid concerns of the region and its citizens.

Sandra Hewston
19919 Casa Loma Drive
Grass Valley, CA 95945

## INDIVIDUAL LETTER 710: SANDRA HEWSTON

### Response to Comment Ind 710-1

The commenter states that the current zoning of the project site does not allow for mining. As discussed on page 4.9-16 of the DEIR, Subsurface mining is allowed in all base districts subject to approval of a Use Permit. Surface access to subsurface mining, including vent and escape shafts, is allowed in the AG, FR, M1, M2, P, and PD base districts subject to approval of a Use Permit. Surface mining is allowed in the AG, FR, M1, M2, P, PD, and TPZ Districts and where the property is zoned ME, subject to approval of a Use Permit and Reclamation Plan.

### Response to Comment Ind 710-2

The commenter states that residents situated in the watershed depend on the groundwater in the Idaho-Maryland Mine to supply private wells. Water present in the underground mine workings does not supply domestic water wells. Rather the regional groundwater flow supplies domestic water wells. Impacts to domestic water wells from mine dewatering has been analyzed in the DEIR. The DEIR found that the project's impacts to groundwater supplies from the dewatering of the mine would be less than significant. (DEIR, p. 4.8-54.) The commenter is referred to Chapter 4.8, Appendices K.2 and K.3 of the DEIR.

### Response to Comment Ind 710-3

The commenter states that the DEIR underestimates the number of private wells potentially impacted by the dewatering of the mine. As stated on page 4.8-19 of the DEIR, the static water level in the New Brunswick shaft and underground mine workings is approximate 2,497 feet msl to 2,502 feet msl. Regarding impacts to domestic water wells, the commenter is referred to Chapter 4.8, Appendices K.2 and K.3 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 710-4

The commenter states that the DEIR underestimates the scope of the impacts to groundwater supplies and must be expanded beyond the mineral rights boundaries. As discussed on pages 15-19 of Appendix M, numerous holes must be drilled and blasted sequentially into a void (the free face) in order to fracture rock and create mining excavations. Any blast damage to surrounding rocks, such as cracks, would be limited to a few feet surrounding the excavation. Therefore, blasting cannot "damage the aquifer" or cause draining of surface water and groundwater.

In regard to the hydrogeology model and area of potential impact to domestic water wells, the commenter is referred to Chapter 4.8, Appendices K.2 and K.3 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 710-5

The commenter questions why solar energy was not proposed to mitigate energy consumption of the project. The commenter also states that a project alternative that utilizes solar should be included in the DEIR. Regarding a solar energy system, while solar panels are not currently proposed as part of the project, the roof space of the project buildings may be available in the future for installation of solar panels to reduce the project's reliance on the energy grid. However, any such solar power generation would be small in comparison to the requirements of the project. Notably, the GHG emissions presented in the DEIR are conservative, since California regulations will reduce GHG emissions overtime. For instance, Senate Bill 100 requires that zero carbon

energy resources supply 100% of electric retail sales to customers by 2045. Neither this requirement, nor the progressive steps to achieve it (i.e., 44% of electricity by 2024, 52% by 2027, and 60% by 2030 be procured from renewable energy sources) were accounted for in the GHG analysis. (DEIR, Appx. E.1.)

## Response to Comment Ind 710-6

The commenter states that the cleanup of the Centennial Industrial Site should be included in the DEIR. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA and Response to Comment Grp 21-122.

## Response to Comment Ind 710-7

The commenter asks how the level in the pond will be regulated to prevent emergency overflow into South Fork Wolf Creek and what happens if the water treatment plant shuts down for any length of time, and whether the pond would overflow and flow into South Fork Wolf Creek under this circumstance. The water treatment plant is designed for a maximum treatment rate of 2,500 gallons per minute and all equipment would be in place to increase treatment to this capacity at any time it was necessary. (DEIR, p. 4.8-42.) Pumps in the underground mine pump to the water treatment pond and can be turned on and off as necessary by mine employees. Supervisors on the surface can communicate with underground and surface workers though radio communications to provide necessary instructions. The water treatment pond provides water storage capacity so that the mine pumping and water treatment are not required to be identical but would average the same rates over a day or several days. As discussed in Section 4.5 of Appendix K.2, at the maximum mine dewatering rate of 2,500 gpm, the pond has the capacity to hold the volume of water that would be dewatered during two days of pumping. At the maintenance dewatering rate of 850 gpm, the pond has the capacity to hold the volume of water that would be pumped over more than six days. (DEIR, p. 4.8-74.) This capacity allows time for any necessary maintenance or repairs to the water treatment plant without curtailment of underground dewatering. As discussed in Section 5.4 of Appendix K.4, the removal of sludge from the water treatment pond can be achieved with slurry pumps. Therefore, the periodic removal of settled solids would not require the curtailment of mine dewatering. In addition, the underground mine has a substantial capacity if it were ever necessary to curtail water pumping for an extended period of time. An estimate of the volume of existing mine workings is provided in Section 3.3.3.2 of Appendix K.2, with the lower levels (2300 – 3280 level) having a volume of 84-acre ft and the entire mine having a total volume of 1,183 acre-ft. At an average inflow rate of 850 gpm (3.75-acre ft per day) it would take approximately 22 days for the lower levels of the mine to flood and approximately 314 days for the entre mine to flood. The site drainage plan for the Brunswick site routes the majority of precipitation run-off from the site to the storm water detention basin, not the water treatment pond, as shown in Drawing H-4 of Appendix K.5. Section 4.5 of Appendix K.2 discusses the 6.4-acre catchment area where precipitation would inflow into the water treatment pond and confirms that the designed freeboard volume is more than adequate to retain the runoff from an extreme storm event. As discussed above, the pond would not overflow due to maintenance or precipitation events of at least a 100-year storm. (DEIR, p. 4.8-74.)

The commenter asks what the settling rate is for the water. As discussed above, at the maximum mine dewatering rate of 2,500 gpm, the pond has the capacity to hold the volume of water that would be dewatered during two days of pumping. (DEIR, 4.8-74.) At the maintenance dewatering rate of 850 gpm, the pond has the capacity to hold the volume of water that would be pumped over more than six days. (*Ibid.*) The water treatment plant also incorporates media filtration. As stated on page 5-3 of Appendix K.4, during initial NBS shaft dewatering, the total suspended solids (TSS) in the underground water are expected to be low, and data presented by EMKO from

their sampling events shows suspended solids below laboratory detection limits (<5 mg/L) in the water currently flooding the shaft (EMKO 2020, Table 3-6). During active mining, the amount of TSS in the water is expected to increase and will be heavily influenced by the effectiveness of the underground settling sumps. Assuming that water discharged from the mine has suspended solids of 100 mg/L, which are subsequently reduced by settlement in the pond to the 20 mg/L treatment goal (EMKO 2020 Table 4-10), and an average flow rate of 850 gallons per minute, the mine would produce approximately 37 tons per year of silt-born sludge. The requirements of treated water discharge include requirements for total suspended solids and ensure that total suspended solids of water released to South Fork Wolf Creek meets water quality goals. Please see Master Response 35 - Discharge to South Fork Wolf Creek.

The commenter asks how quickly the water will be treated and released. Appendix K.4 of the DEIR describes the design and operation of the water treatment system. The treatment plant would be sized to treat the maximum pumping rate from the mine of 2500 gpm (3,600,000 gallons per day). The initial dewatering of the mine requires the pumping of the water volume currently in the flooded mine as well as groundwater inflow into the mine. If this maximum pumping rate is not achieved during initial dewatering due to operational concerns, the duration of time to complete initial dewatering would be extended. The pumping rates during initial dewatering would be determined by company management and supervisors in accordance with relevant permit requirements and operational concerns. The discharge from the mine into South Fork Wolf Creek will be governed by the Central Valley Regional Water Quality Control Board, who will have enforcement authority over discharges from the mine. Please see Master Response 35 - Discharge to South Fork Wolf Creek, and Master Response 32 - Temperature of Mine Water Discharge.

The commenter asks if the water treatment plant will be staffed by a licensed water treatment plant operator 24/7. The water treatment plant is not a public water system or potable water treatment facility and therefore does not require licenced operators. However, water treatment plant operators will be trained to operate the water treatment plant and the plant will be staffed 24 hours per day, 7 days per week. Numerous trades people such as electricians and millwrights are available at the site to assist with mechanical repairs and maintenance.

The commenter asks if backwash material would be placed into the same pond. As stated on page 4-2 of Appendix K.4, a mechanical solids separation process, such as centrifugation, or belt or drum filters, will be installed onshore in order to segregate the solids from the pyrolusite media backwash stream that will be returned to the clay-lined pond. In this manner, the pond will remain unaffected by the solids generated by backwash events.

## Response to Comment Ind 710-8

The commenter states that DEIR is inconsistent with regard to the volume of water to be pumped from the mine. The commenter states this information is necessary during a drought. Flow quantities in the DEIR are rounded and 2,500 gallons per minute is equivalent to 5.57 cubic feet per second, which is rounded to 5.6 cubic feet per second. (DEIR, p. 4.8-54.) The commenter is referred to Master Response 16 - Drought and Climate Change.

## Response to Comment Ind 710-9

The commenter states that more precise and consistent references to flow rates are needed in the DEIR. Water flows are estimates and the level of precision requested by the commenter is not required for the analysis of the DEIR. Please see Response to Comment Ind 710-8.

## Response to Comment Ind 710-10

The commenter states that the DEIR must discuss discharges to South Fork Wolf Creek during abnormal rain events. The DEIR discusses treated water discharge into South Fork Wolf Creek during normal and abnormal precipitation events. As stated on page 4.8-70 of the DEIR, at the Brunswick Industrial Site, a detention basin would be constructed at the downstream toe of the engineered fill placement slopes, above South Fork Wolf Creek (see Figure 4.8-15). The detention basin for the Brunswick Industrial Site is sized to detain storm flows to compensate for the quantity of treated mine water discharged to South Fork Wolf Creek, in addition to compensating for increased runoff from potential future industrial development of the site. Peak storm flows at both the Centennial and Brunswick Industrial Sites would be reduced to levels less than existing conditions peak storm flows due to the detention basins that would be constructed below the engineered fill areas.

## Response to Comment Ind 710-11

The commenter states that the DEIR is lacking a discussion of beneficial uses of treated water from the mine. As stated on page 2 of Appendix N, the mine water flow would have a positive effect on water supply. NID could adjust its flows upstream to use the extra water available downstream if it desired to. The commenter suggests that the water could be re-introduced back into the ground. Some water may recharge into the ground as its flows in South Fork Wolf Creek and then Wolf Creek. However, the recharge of most or all of the mine water discharge back into the low permeability fractured rock would be difficult if not impossible and require many injection wells throughout the mine area and the associated infrastructure such as wells and pipelines. The benefit of such an endeavour is not apparent and is not required for the project to reduce significant impacts to a less than significant level.

## Response to Comment Ind 710-12

The commenter states that the DEIR must include discussion of a possible underground river to avoid the impacts that occurred at the Siskon Mine. No “underground rivers” are present in the mine area and proposed mining is in rock unlike the San Juan Ridge mine, which was a near surface underground gravel mining operation. The commenter is referred to Chapter 4.8, Appendices K.2 and K.3 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 710-13

The commenter requests that the determination of less than cumulative considerable for Impact 4.2-6 is further analyzed given the poor air quality of the region. The commenter is referred to Master Response 18 - Air Quality Thresholds, and Master Response 27 - Greenhouse Gas Thresholds.

## Response to Comment Ind 710-14

Compliance of the project with Energy Action Plan strategies has been analyzed in Table 4.3-22 in the DEIR and was determined to be consistent with the EAP. The commenter is also referred to Master Response 25 - Nevada County Energy Action Plan. Regarding a solar energy system, while solar panels are not currently proposed as part of the project, the roof space of the project buildings may be available in the future for installation of solar panels to reduce the project’s reliance on the energy grid. However, any such solar power generation would be small in comparison to the requirements of the project. Notably, the GHG emissions presented in the DEIR are conservative, since California regulations will reduce GHG emissions overtime. For instance, Senate Bill 100 requires that zero carbon energy resources supply 100% of electric retail sales to customers by 2045. Neither this requirement, nor the progressive steps to achieve it (i.e., 44% of

electricity by 2024, 52% by 2027, and 60% by 2030 be procured from renewable energy sources) were accounted for in the GHG analysis. Please also see Response to Comment Agcy 8-17.

## Response to Comment Ind 710-15

The commenter objects to the findings of 4.7-5 and 4.8-6 in the DEIR but provides no specific reason or evidence for this objection. The comment noted.

## Response to Comment Ind 710-16

Please see Master Response 18 – Air Quality Thresholds, and Master Response 19 – NSAQMD Criteria Pollutant Thresholds During Operations.

## Response to Comment Ind 710-17

The commenter concludes that the DEIR is generally inadequate. The comment is noted for the decisionmakers.

**Individual Letter 711**

**From:** Sara Brownw
**To:** Idaho MMEIR
**Subject:** Idaho-Maryland Mine Project
**Date:** Monday, February 7, 2022 7:31:29 AM

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Dear Mr Kelley,

**Ind 711-1**

I am very worried about the effects of the mine on the stability of the lands through and under which the project will encompass. I can clearly visualize worrisome disruptions in underground water resources affecting property owners, watersheds, and ecosystems that are dependent on what is established now. I don't think it's wise to wreak havoc on our community for the financial gain of a mega corporation. We are just recovering from the environmental tragedy of the gold mining era, and now having to learn to cope with the threat of wildfire: why would we choose to add to the stressors of this community?

Please consider the effects of such an industrial project on the environment and its inhabitants: plants and animals, humans included.

Thank you,

**Sara Cooper Brownwood**

## INDIVIDUAL LETTER 711: SARA BROWNWOOD

### Response to Comment Ind 711-1

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1. For concerns related to underground water resources and ecosystems, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, Master Response 32 – Temperature of Mine Water Discharge, Master Response 35 – Discharge to South Fork Wolf Creek, and Master Response 36 – Flows in South Fork Wolf Creek.

NEVADA COUNTY
BOARD OF SUPERVISORS

# THE IDAHO-MARYLAND MINE: A PROUD HISTORY

The Idaho-Maryland Mine was one of the most productive and best-known gold mines in the United States, producing approximately 2.4 million ounces between 1866 and 1955. The mine closed in 1956 as the fixed price of gold at $35 per oz made the mining of American gold unprofitable.

Rise Grass Valley will reinitiate mining and will do so with a focus on green-friendly practices and minimizing the impacts to neighbors. The project will use modern, clean, state-of-the-art mining equipment and proven techniques to produce "green gold." The result is a project that has no significant impacts to water, air quality, and the natural environment or from noise or vibrations during operations.

When in full operation, Rise Grass Valley's Idaho-Maryland Mine project will create hundreds of good-paying jobs and realize broad economic benefits for Nevada County.

**Please fill out and send back to us your support for the Idaho-Maryland Mine**

Ind 712-1

## I support re-opening the Idaho-Maryland Mine

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

## INDIVIDUAL LETTER 712: SARAH LAZARD

### Response to Comment Ind 712-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1.

**Individual Letter 713**

**From:** Sarah Bliss <sarahblisss@gmail.com>
**Sent:** Monday, April 4, 2022 4:34 PM
**To:** Idaho MMEIR
**Subject:** Stop the Idaho Maryland Mine

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To Whom It May Concern:

**Ind 713-1** I am writing to share that I strongly oppose Rise Gold's unnecessary reopening of the Idaho Maryland Mine. I moved from the Bay Area in 2020 and now live near downtown Grass Valley. One of the things I love most about living in Grass Valley is how peaceful and clean it is.

**Ind 713-2** When I imagine our beautiful little town being taken over by the mine, it breaks my heart. This mine would operate 24/7 for up to eighty years and has the potential to bring so much pollution, toxicity, and sickness to our community. The constant dust, carbon emissions from mine owned trucks, and inevitable toxic spills will literally make our residents ill. Nevada County already has a high rate of deaths due to chronic lung disease and having the mine here would only make it worse.

**Ind 713-3** Our power grid is already so strained and the Idaho Maryland mine would call for massive amounts of energy usage. Why should we prioritize corporate greed over our own citizens? I know my ability to work from home has been impacted several times by loss of power. Knowing that the mine would be taking more energy from our grid for profit is upsetting to say the least.

**Ind 713-4** The CEO of Rise Gold has been proven to have a negative track record in Canada, where tribal waters were polluted and left for someone else to clean up. Why would we give such an irresponsibly run company a chance to cause harm to our beloved community?

Finally, we all know water is a scarce and precious resource. Rise Gold would be pumping out millions of gallons per day for decades. Our local flora and fauna (not to mention private residents with wells) deserve more reverence and respect.

**Ind 713-5** I am strongly opposed to the Idaho Maryland Mine and know that allowing Rise Gold to have a place in our town would be a grave mistake. Please don't allow harm to come to our community in this way. Thank you for your time and consideration.

Best,
Sarah Snyder & Family

## INDIVIDUAL LETTER 713: SARAH SNYDER

### Response to Comment Ind 713-1
The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1.

### Response to Comment Ind 713-2
The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1. For concerns related to dust and airborne chemicals, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy; for concerns related to exhaust, please see the health risk assessment (DEIR Appendix E.1), the results of which are incorporated into Chapter 4.3; and for concerns related to spills, please see Chapter 4.7, Hazards and Hazardous Materials.

### Response to Comment Ind 713-3
The comment does not address the adequacy of the DEIR. Please refer to Chapter 4.11, Public Services and Utilities, for additional information regarding the project's impact on electricity supplies. As discussed on page 4.11-34 of the DEIR, the electrical grid system in the project area is well developed. A commercial sawmill that previously operated on the Brunswick Industrial Site was serviced by a dedicated 12kV PG&E power line. A high voltage power line also runs through the property west of the Brunswick shaft. Electricity for the project would be supplied by the existing 12kV PG&E line along Brunswick Road. The BRUNSWICK 1102 Circuit (Circuit), which would serve the project, has a rating of 13.26 MW. The project's total connected load is estimated at approximately 10 MW, with a net load of approximately 6 MW. As of the year 2021, the Circuit operates at 5.15 MW, or approximately 39 percent of the Circuit's maximum capacity. Based on PG&E's usage projections, the Circuit load is anticipated to drop to approximately 4.74 MW by the year 2025. Considering the project would generate an electric load of approximately 6 MW, and the Circuit currently provides 5.15 MW, the Circuit capacity would increase to 11.15 MW following implementation of the project. The increase in wattage associated with implementation of the project would remain within the Circuit's capacity of 13.26 MW and, thus, the Circuit would have available load capacity to accommodate the project

### Response to Comment Ind 713-4
Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 713-5
For concerns related to groundwater use and effects on local flora and fauna, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 33 – Groundwater Dependent Vegetation. The commenter's concerns and opposition to the proposed project are noted for the record and have been forwarded to the decisionmakers for their consideration.

**Individual Letter 714**

**From:** Sasha Soukup <astralweekend.shop@gmail.com>
**Sent:** Monday, April 4, 2022 9:59 AM
**To:** Idaho MMEIR
**Subject:** Comments re: DEIR on proposed mine

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hi there!

**Ind 714-1** I am a 16 year Grass Valley resident, business owner, local musician, and social media activist, and I am writing regarding the DEIR on the proposed Idaho-Maryland Mine.

I live two miles from the mine site (at Brunswick) and I am extremely concerned in particular about the heightened noise levels, the change of traffic volume, and the long term air quality impact that could result from the mine operations. I don't believe that the DEIR adequately addresses these issue- for example, it cites that the noise resulting from the mine is in the "acceptable" decibel level, when in fact the decibels cited as acceptable are several times the level of a garbage truck collecting trash. This is absolutely not acceptable, and I question how this threshold was established.

I also question the plan to measure air quality in the region of the mine- the DEIR doesn't seem to include the totality of air pollutants from mine operations. As someone with asthma who already struggles during fire season with the poor air quality in Nevada County, I want to know that any new industrial activity that contributes particulate matter and exhaust to the air is being measured accurately and thoroughly.

**Ind 714-2** These are just a few of the areas in the DEIR that seem inaccurate and incomplete to me, and I urge you to demand a new DEIR that is done correctly.

Thanks for your time,

Sasha Soukup

## INDIVIDUAL LETTER 714: SASHA SOUKUP

### Response to Comment Ind 714-1

Air pollution is addressed in Chapter 4.3 of the DEIR, and Noise is addressed in Chapter 4.10. Based on the project-specific noise analysis, which was independently reviewed by the County's third-party noise consultant, none of the individual activities associated with long-term operations of the proposed project would generate noise in excess of the applicable noise standards. Furthermore, combined project noise impacts are not anticipated for the proposed project. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 of the DEIR requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

Regarding changes in traffic volumes, please refer to Chapter 4.12, Transportation.

### Response to Comment Ind 714-2

The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment specifically addresses health impacts to children. The health risk assessment (HRA) provides the health risk at the maximally exposed individual resident (MEIR) and has determined the health impact at the MEIR is less than significant. Prevailing wind speed and direction were accounted for in the HRA to determine where and how far emissions from the project would travel. (Appendix E.1 of the DEIR.) As stated on page 27 of the HRA (Appendix E.1 of the DEIR), the MEIR would be the nearest existing residence to the north of the Brunswick Industrial Site. Emissions would be dispersed as distance increases from the emission source. Since the HRA presents the health risk levels at the maximally exposed individual, all other receptors in the vicinity of the project would have less exposure and consequently less potential health risk than the MEIR. Several commenters identified not being able to see the risk of the HRA visually. Isopleth figures were developed in response to these comments, which show where the project's emissions would travel. Please see Dudek Memo – Isopleths attached to the Final EIR as Appendix K.

The commenter otherwise suggests that the DEIR contains inaccuracies and is incomplete but provides no specific examples. Thus, a specific response is not possible.

To: Matt Kelley, Sr. Planner

Nevada County Planning Dept.

950 Maidu Ave. Suite 170

Nevada City, CA 95959-7902

**Ind 715-1** As a member of the Ironhorse Townhome Association, we agree with the Board of Directors' opposition to the proposed IMM project and the impacts identified in their response to the DEIR.

**Ind 715-2** In California, water is so scarce. There can be no justification for risking the supply or quality of well and groundwater. Increasing the consumption of NID water to replace lost or tainted well water is not a mitigation of Impact 4.8-2, it is a negative impact in itself.

**Ind 715-3** According to the DEIR Executive Summary, the "No Project/No Build" alternative is environmentally superior.

**Ind 715-4** RISE suggests they're doing the community a favor in the short term by creating jobs and in the long run by preparing more land for industry. But does the EIR fully investigate the socio-economic impacts (Policy 17.10)? This isn't the first time a town or county has been tempted to try to raise revenue by adding jobs and businesses. Before allowing IMM to proceed, consider the lesson learned throughout the rest of the state that adding more jobs results in higher prices and more competition for housing (i.e. less available housing).

The IMM project is not a good use of our environmental or social and physical resources.

Sincerely,
Scot and Patty Marsters
136 Ironhorse Place
Grass Valley, CA

## INDIVIDUAL LETTER 715: SCOT AND PATTY MARTSERS

### Response to Comment Ind 715-1
The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1.

### Response to Comment Ind 715-2
Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 715-3
The commenter does not address the adequacy of the DEIR, but rather restates its finding that the No Project (No Build) Alternative would be the environmentally superior alternative.

### Response to Comment Ind 715-4
The comment pertains to economic and social issues - please see Master Responses 1 and 2.

**Ind 716-1**

I am totally opposed to opening up the mine which my father worked at in the 1950s.

There EIR is totally biased and corrupt. Why the County is relying on the developer for information is totally corrupt. They are only giving you info that benefits their cause.

We don't want pollution!

This penny stock foreign corporation is just out to scam folks for profit.

Their motto is screw Nevada County and run back to Canada with the profits.

Turn down the Rise scam.

Scott Peterson
95945

## INDIVIDUAL LETTER 716: SCOTT PETERSON

### Response to Comment Ind 716-1

The commenter suggests that the DEIR is biased but does not provide any evidence to support this spurious claim. The CEQA Guidelines allow a Project Applicant to prepare a DEIR as long as the lead agency, in this case Nevada County, independently reviews the DEIR. (14 CCR 10584(d)(3); (e).) Not only did the County independently peer review the information provided by the applicant, but the County hired Raney Planning and Management to prepare the DEIR. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 717**

**From:** Sean Johnson <seanspuppet@gmail.com>
**Sent:** Sunday, April 3, 2022 8:04 PM
**To:** Idaho MMEIR; DEIRcomments@cea-nc.org
**Subject:** No Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Board of Supervisors,

My name is Sean Johnson, I'm a of Grass Valley and I'm writing to express my opposition to the reopening of the Idaho Maryland Mine.

**Ind 717-1** I've reviewed the Draft Environmental Impact Report and I feel it is woefully inadequate. I have three main issues that I'd like you to address. First, the Canadian company attempting to reopen the mine has boasted that the mine will bring 600 jobs to the area. The DEIR states that the mine will have no impact on traffic, I'd like to know exactly how you can add this many jobs to the region and have no impact on traffic. Second, as a resident that relies on well water, I feel the

**Ind 717-2** DEIR doesn't fully address how the mine will not have a negative impact on local wells or local water quality. Please let me know how draining the water from the mine and dumping water into local streams and rivers won't have a negative impact on wells and our local environment. Finally, as someone that moved to this area to enjoy the peace and quiet I'm concerned about noise pollution. The DEIR doesn't fully explain how five years of construction and a fully operational mine will have no impact on noise pollution. Please provide more details on how mine construction

**Ind 717-3** and operation won't have an impact on noise in the area.

I look forward to receiving your response.

Sincerely,
Sean Johnson

## INDIVIDUAL LETTER 717: SEAN JOHNSON

### Response to Comment Ind 717-1

Traffic is evaluated in Chapter 4.12, Transportation, of the DEIR. As noted therein, the DEIR does not claim that the proposed project would have no impact on traffic; rather, impacts to certain intersections were concluded to be significant. Nevada County, as the lead agency, will consider such impacts when determining whether to approve the project.

### Response to Comment Ind 717-2

Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 717-3

Noise is addressed in Chapter 4.10. The DEIR does not claim that 5 years of construction will have no noise impacts. Rather, the DEIR finds that construction noise from installation of the potable water pipeline along East Bennett Road would have a temporary significant and unavoidable noise impact to nearby residents, even after implementation of mitigation.

Based on the project-specific noise analysis, which was independently reviewed by the County's third-party noise consultant, none of the individual activities associated with long-term operations of the proposed project would generate noise in excess of the applicable noise standards. Furthermore, combined project noise impacts are not anticipated for the proposed project. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 of the DEIR requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

**Individual Letter 718**

**From:** Shannon Ross <shannon.ross22@gmail.com>
**Sent:** Monday, April 4, 2022 9:29 AM
**To:** Idaho MMEIR; deircomments@cea-nc.org
**Subject:** Draft EIR - Inadequate

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Attention Nevada County Supervisors & Planning Commission:

**Ind 718-1** The Draft EIR is completely inadequate. Having been a court reporter for 35 years and listening to many hearings on environmental issues, it is from my experience that the only this this Draft EIR will lead to is a lawsuit against the county.

**Ind 718-2** First off, the process did not include discussions or information from local tribes. It is beyond belief that the leaders of this county would tear down this town with contaminated air, destroy wildlife corridors and habitat, and basically turn a wonderful tourist destination into a town that has the look and feel of a burned out old Appalachian mining town.

**Ind 718-3** This is not 1920. As a community we all have worked to create a beautiful historical town where people love to live and enjoy the outdoors.

**Ind 718-4** The Draft EIR does not devote enough thought or research into Air Quality and what 24-hour Noise will do to our health. It does not consider native people. You have to pretend global climate change is NOT A THING to understand how they put the studies together.

**Ind 718-5** It is not possible that a snake will change it's stripes, and to allow a foreign company to come into the beautiful foothills of California with this crappy Draft EIR and believe that they will be good for their word is the most insane thing this county can do. You will destroy our homes and our city.

**Ind 718-6** The Draft EIR does not address water adequately. To say that only 30 wells will be affected, is ludicrous. You don't have to be a scientist to understand this is just false.

**Ind 718-7** There are so many flaws in the Draft EIR, you must do a new one that takes into account: the health of the citizens of this county, the water, the air, and native peoples and lots more science on the destruction of our wild birds and animals that will all be destroyed if you allow this mining company in here to do some ancient form of gold mining and take us back to the 1850s.

1

You people disgust me that you would ruin our town like this.

Thank you for your time,

## INDIVIDUAL LETTER 718: SHANNON ROSS

### Response to Comment Ind 7

The commenter states that the DEIR is complete inadequate but provides no evidence to support this spurious claim. Please see Master Response 1. See the below responses to more specific comments.

### Response to Comment Ind 718-2

Please see Chapter 4.5, Cultural and Tribal Cultural Resources, and, specifically, the following excerpt from page 4.5-21 of the DEIR:

> […] InContext contacted the NAHC on September 10, 2019 to request a search of the Sacred Lands File for tribal cultural resources within or near the project area. The results of the Sacred Lands File search were negative, which indicates that known cultural resources do not exist on the project site.[2] In addition, InContext contacted each of the following Native American tribes with the potential to have knowledge of cultural resources in the project area:
>
> - Colfax-Todds Valley Consolidated Tribe;
> - Tsi Akim Maidu;
> - United Auburn Indian Community of the Auburn Rancheria (UAIC); and
> - Nevada City Rancheria Nisenan Tribe.
>
> In an effort to gather data regarding cultural resources of importance to these entities that could be affected by the project, the above parties were contacted via regular mail, email, and telephone between September 16, 2019 and December 16, 2020. Reponses were not received from any of the above tribes.
>
> On November 25, 2019, Nevada County sent project notification letters with offers to consult pursuant to AB 52 to the Tsi Akim Maidu Tribal Council, Shingle Springs Band of Miwok Indians, Nevada City Rancheria Nisenan Tribe, and UAIC. The Tsi Akim Maidu Tribal Council, Shingle Springs Band of Miwok Indians, and Nevada City Rancheria Nisenan Tribe did not respond within the 30-day consultation period. The UAIC responded on December 18, 2019, and requested consultation and copies of the Cultural Impact Report, technical reports, requests for and results of records searches, and Geographic Information System (GIS) Shapefiles. The County provided such information. In addition, the UAIC noted that they are not aware of any Native American archaeological sites in or near the project site.

As presented above, consistent with CEQA Guidelines and Assembly Bill 52, as part of the DEIR process, local tribes were notified and invited to consult on the proposed project, and such information was presented in the DEIR.

### Response to Comment Ind 718-3

For the commenter's general air pollution concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. Regarding impacts to wildlife corridors and habitat, Impact 4.4-4 included in Chapter 4.4, Biological Resources, of the DEIR assessed whether the

[2] InContext. *Historic Properties Inventory and Finding of Effect for the Idaho-Maryland Mine Project, Nevada County, California*. December 2020.

proposed project would interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites. Known migratory deer ranges outlined in the Nevada County General Plan were reviewed as part of the DEIR for deer migration corridors, critical range, and critical fawning areas. According to the Migratory Deer Ranges Nevada County General Plan map, the Centennial Industrial Site and Brunswick Area are located in an area of potential Deer Winter Range. However, field surveys conducted for the proposed project did not record any observations of deer. In addition, the DEIR noted that the Centennial Industrial Site and Brunswick Area do not contain any known major deer migration corridors, known deer holding areas, nor critical deer fawning areas. Based on the analysis included in the DEIR, the proposed project was determined to have a less-than-significant impact related to interfering substantially with the movement of any wildlife.

Please refer to Chapter 4.4, Biological Resources, for general concerns related to habitat impacts.

## Response to Comment Ind 718-4

The commenter states that the DEIR does not devote enough thought or research into air quality, but provides no evidence or examples to support this assertion. Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, provides a very detailed analysis of the proposed project's potential air quality impacts. Chapter 4.3 is supported by the technical air quality analysis included as Appendix E.1 to the DEIR. Appendix E.1 also includes the results of a detailed health risk assessment performed in accordance with State guidance. Please see also Master Responses 18 – Air Quality Thresholds, and Master Response 19 – NSAQMD Criteria Pollutant Thresholds During Operations.

For the concern related to 24-hour noise operations, please see Response to Comment Grp 21-130.

Global climate change is addressed in detail in Chapter 4.3 of the DEIR. Please also see Master Response 27 – Greenhouse Gas Thresholds and Master Response 28 – Greenhouse Gas Credits.

## Response to Comment Ind 718-5

Please see Master Response 1 and Master Response 3.

## Response to Comment Ind 718-6

Please see Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 718-7

Please see the above responses to comments.

**Individual Letter 719**

RECEIVED
MAR 30 2022
NEVADA COUNTY
PLANNING DEPARTMENT

March 27, 2022

TO:
Matt Kelley - Senior Planner / Project Manager
AND:
Nevada County Planning Commission
RE:
No Mine in Nevada County
Draft Environmental Impact

I vehemently OPPOSE the reopening of the Idaho-Maryland Mine! I moved to Nevada County in 2001 from Sacramento. We wanted a life living in the trees and a like-minded group of people to embrace the small town, healthy, happy, simpler lifestyle of Grass Valley and Nevada City!

**Ind 719-1** The mine and reopening it cannot possibly serve our people of this county. It only serves the money hungry, out of country Rise Mine investors who want to take the gold and run leaving us to deal with all the toxic waste - AIR POLUTION, ENERGY USAGE, CLIMATE CHANGE, DRAINS OUR WATER and PUTS GROUND WATER AT RISKS - TRAFFIC, DUMPING MINE WASTE and NOISE.

(over)

Please
please
please

NO
IDAHO
MARYLAND
MINE

Thank you!

The Reverend Sharon Delgado
11328 Red Dog Road
Nevada City, CA 95959

Dear Nevada County Supervisors:

As we residents of Nevada County experience climate change for ourselves and struggle to adapt to extreme drought, heat waves, water shortages, periodic power outages and threat of forest fires, we also must contend with Rise Gold's attempts to persuade the public and local officials that reopening the Idaho-Maryland Mine would do us good. Yet regardless of its flawed and deceptive public outreach and its completely inadequate DEIR, the mine would negatively affect the community in many ways, including in our ability to adapt to and mitigate the impacts of climate change.

**Ind 720-1**

In June, our region got a taste of a record-shattering heat wave that farther north led to many deaths. We are in a historic "severe to exceptional drought," resulting in depleted reservoirs and mandatory water restrictions. Fire insurance rates are skyrocketing and policies are being canceled as fire season extends to almost year-round and as wildfires become ever more ferocious, burning more acres. Even as we pack our go-bags and create fire safe spaces around our homes, we know that catastrophic forest fires could come at any time.

Reopening the mine would only make these climate-related impacts worse.

Nevada County has had the foresight to respond proactively by adopting the Nevada County Energy Action Plan, which was developed by the Sierra Business Council with support from PG&E in collaboration with Nevada County and community members. The energy use of the mine would eliminate and more than cancel out gains attained through the Nevada County Energy Action Plan.

The plan, based on scientific climate forecasts in the context of our region, states: "From record temperatures to proliferating wildfires and changing precipitation patterns, climate change poses an immediate and escalating threat to the region's environment, economic strength and public health."

**Ind 720-2**

The plan is intended to "guide local government decisions that will help achieve greater efficiency, reduce costs and demonstrate the county's commitment to energy independence and community resilience," and to "inspire residents, businesses and other public agencies in Nevada County to participate in community efforts and maximize energy efficiency, renewable energy, and water efficiency."

This plan should guide analysis and decision-making about the mine as it relates to climate. It points to goals, strategies and ways to implement policies that will enable us as a community to adapt to projected climatic changes and mitigate harm by lowering greenhouse gas emissions. But reopening the mine would take us in the opposite direction.

Adapting to climate change means developing resiliency so that we human beings, our fellow creatures and coming generations can survive and thrive as much as possible.

This means carefully preserving our region's air, land, and water. The mine would further pollute our air, replace life-sustaining ecosystems with mine waste, and perhaps deplete our precious groundwater, putting wells at risk and sending millions of gallons of treated wastewater daily down Wolf Creek.

**Ind 720-3**

Adaptation means generating sustainable forms of livelihood, housing, education, business, agriculture, and more — locally-based as much as possible — and moving away from fossil fuels to justly sourced renewable power. Many community members, local businesses and local nonprofits are working to attain just such a vision. Rise Gold's project as described in the DEIR does not align with these goals.

**Ind 720-4**

Because it is a global problem, we must also do our part to mitigate the harm of climate change by reducing our regional carbon footprint. The Nevada County Energy Action Plan calls for gradually reducing annual residential electric use by 12 percent. Rise Gold's projected electrical use would cancel out this goal by annually using electricity equivalent to 5,000 new homes and could strain our already overburdened power grid.

**Ind 720-5**

Even more significant would be the massive carbon emissions caused by diesel-powered heavy equipment used for: constant construction during the first year and half; ongoing continuous excavating, underground blasting, drilling, rock crushing, loading, hauling, unloading, spreading, and compacting to create engineered fill up to seven stories tall; continuous mine dewatering by pumping, treating and sending millions of gallons of wastewater down Wolf Creek; increased new diesel truck traffic (up to 100 round trips a day, seven days a week, 16 hours a day). This would result in significant increases of greenhouse emissions rather than decreases as outlined in the county's Energy Action Plan.

**Ind 720-6**

What makes sense for Nevada County in light of these impacts on the climate system? In the words of the California Air Resources Board 2017 Climate Change Scoping Plan: "Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development." Given this goal and the tremendous impact on local emissions, the EIR must establish a net zero threshold for new GHG emissions from the project and declare that it has significant and unavoidable impacts.

The county has taken a proactive approach with its plan to foster resiliency and mitigate the harmful effects of climate change. Let's not turn back now.

Sharon Delgado

## INDIVIDUAL LETTER 720: SHARON DELGADO

### Response to Comment Ind 720-1

The commenter states the DEIR is inadequate. Responses to specific comments are provided below. The commenter states that approval of the project would exacerbate climate change. As stated on page 4.3-92 of the DEIR, with implementation of mitigation, the project's incremental contribution to global GHG emissions and climate change is less than cumulatively considerable. The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds.

### Response to Comment Ind 720-2

The commenter states that the project's energy usage would interfere with the County's Energy Action Plan. The commenter also states that the project would exacerbate climate change. Although the County's Energy Action Plan is not a Qualified GHG Emissions Reduction Plan under CEQA, the DEIR nevertheless states that the project is consistent with the Energy Action Plan. (DEIR, p. 4.3-88.) The commenter is also referred to Master Response 25 - Nevada County Energy Action Plan. Regarding climate change, with the implementation of mitigation, the project's incremental contribution to global GHG emissions and climate change is less than cumulatively considerable. (DEIR, p. 4.3-92.) The commenter is also referred to Master Response 27 - Greenhouse Gas Thresholds and Master Response 25 - Nevada County Energy Action Plan. The commenter also states that the project would pollute our "air, land, and water" but provides no additional detail. Air emissions from the project are analyzed in Chapter 4.3 of the DEIR, biological impacts are analyzed in Chapter 4.4 of the DEIR, and groundwater impacts are analyzed in Chapter 4.8 of the DEIR.

### Response to Comment Ind 720-3

The commenter states that many in the community are focused on moving towards energy produced by renewable sources and questions why solar energy was not proposed to mitigate energy consumption of the project, pointing to the Nevada County Energy Action Plan reduction goals. Compliance of the project with Energy Action Plan strategies has been analyzed in Table 4.3-22 in the DEIR and was determined to be consistent with the Energy Action Plan. The commenter is also referred to Master Response 25 - Nevada County Energy Action Plan. Regarding a solar energy system, while solar panels are not currently proposed as part of the project, the roof space of the project buildings may be available in the future for installation of solar panels to reduce the project's reliance on the energy grid. However, any such solar power generation would be small in comparison to the requirements of the project. Notably, the GHG emissions presented in the DEIR are conservative, since California regulations will reduce GHG emissions over time. For instance, Senate Bill 100 requires that zero carbon energy resources supply 100% of electric retail sales to customers by 2045. Neither this requirement, nor the progressive steps to achieve it (i.e., 44% of electricity by 2024, 52% by 2027, and 60% by 2030 be procured from renewable energy sources) were accounted for in the GHG analysis.

### Response to Comment Ind 720-4

The commenter references the Energy Action Plan and states that the County should strive to reduce electric use and the project would eliminate progress towards that goal. The commenter is referred to Master Response 25 - Nevada County Energy Action Plan.

### Response to Comment Ind 720-5

The commenter states that a number of the project's components would increase GHG emissions and contribute to climate change. As stated on page 4.3-92 of the DEIR, with implementation of mitigation, the project's incremental contribution to global GHG emissions and climate change is

less than cumulatively considerable. The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds and Master Response 25 - Nevada County Energy Action Plan.

## Response to Comment Ind 720-6

The commenter states that a goal of any new development or project is to result in no net additional increase in GHG emissions. A net zero threshold is not required for the project. The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds.

February 2, 2022

To our Board of Supervisors, I hope you all read our wonderful local newspaper The Union. The letter written in todays " other voices" section hit the nail right on the head. Mr. Tony Lauria stated the facts that all of us who lived here then and now remember about the not so glorious days when the mines were close to shutting down. I was 10 years old and walking to school at Hennessey and had to cross Wolfe creek where it flowed gray and scary. I felt if I ever fell in it would dissolve me. Please read Mr. Lauria's article and use your common sense.

Sharon Lynch Seck, R.N. (retired(

## INDIVIDUAL LETTER 721: SHARON SECK

### Response to Comment Ind 721-1

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1.

March 21, 2022

Matt Kelley, Senior Planner
Nevada County Planning Dept.
950 Maidu Ave., Suite 170
Nevada City, CA 95959-7902

Re: Idaho-Maryland Mine Project

Dear Mr. Kelley,

I have lived in Grass Valley since 1973 when I was in my 20s. I moved here from Sacramento to enjoy the beauty of the area and the small town atmosphere. It was peaceful here. A wonderful place to raise children.

**Ind 722-1** As I learned more about the history of the area, the realities of the mining industry made a deep impression on me. I could see the destruction wrought by the hydraulic mining that was eventually outlawed. I toured the Empire Mine site and was amazed at the extensive honeycomb of tunnels beneath the ground. I learned that the stamp mills ran day and night to process the ore removed from the mines. I couldn't imagine how anyone could endure that constant noise and pounding. I learned of the contamination of water and earth from heavy metals that were a byproduct of the mines. We are still dealing with cleaning up that contamination.

**Ind 722-2** While the new mining project may have differences from past practices, it's still an industrial mining project. Its reality will involve blasting, loading truck after truck with the material being removed from the ground, and transporting that material over our local roads in truck after truck rumbling through our community. The mining company contends that the noise, dust, wear and tear on the roads, and inconvenience to residents won't be that bad. Sounds pretty bad to me.

**Ind 722-3** They promise that they won't deplete or contaminate the aquifer that supplies water to people's wells, or that if they do, they'll do something to make up for it. Sounds iffy to me. The amount of water they will be using daily for their project is astounding, especially while we are suffering through historic drought conditions.

**Ind 722-4** The picture they paint of how they will mitigate the impact to our community is too rosy for me to believe. The potential loss to the beauty and peace of our community is too great. The proposed benefit seems to be only for the mining company. The number of jobs they propose to create seems like a very small positive measured against a huge negative. The details of this project that I have read about in The Union seem like a nightmare scenario for my beloved Grass Valley.

We are not a mining community anymore. This mining project will not make people want to move to Grass Valley to work, raise a family, retire, or even vacation. It will make them ask how anyone could live in a place like that? And those of us who already live here will suffer the consequences brought on by this project. The mining company may downplay the negative impact, but I'm not buying it.

We are a community of art, theater, music, schools, families, retirees, technology and invention, clean industry, recreation, tourism.

Please don't send us back to the ugliness of our mining history. Let it remain in the past. Please reject this project.

Sincerely,

Sharon C Wagner

Grass Valley, CA 95945
530-272-1082

## INDIVIDUAL LETTER 722: SHARON WAGNER

### Response to Comment Ind 722-1

The comment does not address the adequacy of the DEIR, but rather provides information on historical mining in the area and its effects. No response is required.

### Response to Comment Ind 722-2

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Regarding haul truck noise, DEIR Impact 4.10-2 concluded all noise generated from engineered fill placement and compaction, and noise associated with haul truck operation (excepting potential jake brake use) and worker trips during this period, would remain below the applicable noise standards. Noise generated from hauling fill from the Brunswick Industrial Site to the Centennial Industrial Site could exceed local standards if jake brakes are used. Thus, Mitigation Measure 4.10-2 is included in the DEIR to reduce this impact to a less than significant level.

Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the Project Driveway and Brunswick Road. (DEIR, p. 4.12-91.)

Pursuant to Mitigation Measure 4.3-2 and the minimum requirements of the Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations, the project must ensure that visible dust does not cross the boundary of the property and that the project is in compliance with the approved Asbestos Dust Mitigation Plan and would be required to take whatever necessary measures to ensure compliance.

### Response to Comment Ind 722-3

Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change, as well as the analysis in Chapter 4.8, Hydrology and Water Quality.

### Response to Comment Ind 722-4

The comment does not address the adequacy of the DEIR. Social and economic concerns expressed by the commenter are outside the scope of CEQA, but have been noted for the record and forwarded to decision-makers for their consideration. Please see Master Responses 1 and 2.

RECEIVED
MAR 24 2022
NEVADA COUNTY
PLANNING DEPARTMENT

**Ind 724-1**

Like the vast majority of this community, I am vehemently opposed to this project. This community is still dealing with the mining history of these lands. We just tested our well (dug only in 2017) and it has TEN times the federal limit of ARSENIC. I spoke with a water remediation specialist and she said that is actually low for our area. She said she very frequently sees wells testing for THIRTY times the federal limit of arsenic. We are experiencing some of the worst droughts (every year) in history and we cannot risk one of our most precious resources for the continuation of LIFE with this unecessary, non-beneficial and reckless project. **Ind 724-2** As we all know, one of the most important aspects of our local economy is TOURISM. It provides more economic benefit to our economy in a single year than this project could accomplish in its entire duration. And WHY do people flock here to visit from near and far? **Ind 724-3** It's because of the pristine nature, the peace and quiet that is a hallmark of our community. All of that would be destroyed by this project. The pristine nature ~~is also~~ and quality of life is also why people even want to live here, despite wildfire risk. This project would rob of us of the reasons we live here and endure, PLUS would put us at even greater wildfire risk by disturbing the very precarious balance of our ecosystem. **Ind 724-4** WHY are we still talking about this?! We are all against it! Enough.

## INDIVIDUAL LETTER 724: SHEERLIE RYNGLER

### Response to Comment Ind 724-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1. Regarding well concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 724-2

Please see Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 724-3

Please see Master Responses 1 and 2 regarding quality of life and other social/economic concerns.

### Response to Comment Ind 724-4

The comment does not address the adequacy of the DEIR, and has been noted for the record. In addition, please see Master Response 33 – Groundwater Dependent Vegetation.

Phone: 530-265-1423
Email: Idaho.MMEIR@nevada.ca.us

February 23, 2022

Dear Nevada County Board of Supervisors:

**Ind 727-1** I am OPPOSED the Idaho-Maryland Gold Mine being reopened by Rise Mining Company.

As a registered voter in Nevada County and a homeowner, I am deeply concerned about the proposed possibility of reopening the Idaho-Maryland Mine. I have downloaded and reviewed the EIR report.

Here are the reasons why I oppose reopening the Idaho-Maryland Mine:

**Ind 727-2**

MINE WASTE and WATER POLLUTION
Gold mining produces huge amounts of mining waste, some of which contain heavy metals and other toxic substances. Both waste rock and tailings threaten to pollute groundwater and surface water. Our community is still dealing with arsenic and the leaching of heavy metals from the Gold-Era days. And now, Rise, a Canadian company comes along and wants to produce even more mine waste for 80 more years: 182,500 tons per year! More tailings that polluting big rig diesel trucks will need to haul away with the potential for leaching more arsenic into our waterways for generations to come. I also find it interesting that the Canadian Company is choosing to open a mine in the US (California) instead of Canada. I know that Canadian

**Ind 727-3**

INCREASE GREENHOUSE GAS EMISSIONS
Diesel haul trucks, up to 100 round trips PER DAY will be needed to transport this mine waste, significantly increasing the amount of air pollution and greenhouse gas emissions into our community's air.

**Ind 727-4**

TRAFFIC AND SAFETY
The increase of vehicles, specifically 20-ton haul trucks, up to 100 round trips per day on the Cedar Ridge Y (Brunswick Road and Highway 174) intersection will be significant and unavoidable! This is according to the EIR report. Are the supervisors aware that the Union Hill Elementary School District, with over 800 students and staff, are within the boundaries of these dangerous roads and intersections? The same intersection and roads that school buses and parents use to transport students to school five days a week, twice a day. The same roadways that the EIR report states will have significant and unavoidable harm even after implementation of feasible measures. Reopening the Mine will threaten the safety of our children, their parents, and the over 100 school staff members from the nearby Union Hill School.

I am in attaching a copy of information I researched regarding the effects of mines on the environment, our communities and the world.

Is the pursuit of gold really worth so much environmental destruction AND the real potential for significant and unavoidable auto accidents between 20-ton trucks and children in cars/buses?
I think not. Please vote NO to Rise Mining Company.

Sincerely,

Sheri Hoss, 118 Margretta Ct. Grass Valley, CA 95945

**BLOG ENTRY**
5 February 2019, 1.26pm EST https://miningwatch.ca/blog/2019/2/5/behind-glitter-gold-facts

# Behind the Glitter: The Gold Facts

**THE GOLD FACTS**

1. Gold mining has some of the largest human and environmental impacts of all types of metal mining.
2. More than 1 in 4 metal mines in the world (and in Canada) is a gold mine.
3. Top gold producing regions include China, Australia, Russia, USA, Canada, Latin America, South Africa.
4. In Canada, gold surpassed all other types of metals mined and exported in value over the last 10 years.
5. 50-60% of gold mined is for jewellery, 30-40% for banks & investments, 10% for industry and technology.
6. China, India, USA & Europe dominate the $350 billion jewelry market.
7. Some of the largest jewellery retailers in North America include Signet Jewelers, Tiffany, Walmart, Costco.
8. In North America and many parts of the world, mining is the largest source of contaminated solid waste into the environment.
9. Industrial-scale gold mining generates over 20 tons of contaminated wastes for each new gold ring made.
10. Industrial mining also uses large quantities of sodium cyanide – a substance very toxic to living organisms.
11. Artisanal small-scale gold mining is still the largest source of mercury pollution on earth, ahead of coal burning (!!!) – but there are mercury free alternatives.
12. As more accessible and higher-grade gold deposits are mined out, gold mining is expanding into more socially and ecologically sensitive areas, affecting local communities and Indigenous peoples' livelihoods.
13. About 40% of gold mining corporations are headquartered in Canada, 20% in Australia, 15% in the USA and Europe, and operate across the planet (eg: 45% of companies in Latin America are Canadian).

**Ind 727-5**

14. Increased mechanisation and automation mean that gold mining represents only about 15,000 direct jobs in Canada, but millions globally – mostly artisanal and small-scale miners.
15. While the mining sector accounts for about 20% of all Canadian exports, it represents only 3% of Canada's GDP – and gold mining a fraction of this.

## INDIVIDUAL LETTER 727: SHERI HOSS

### Response to Comment Ind 727-1
This comment is introductory in nature. The commenter's opposition to the project is noted for the decision makers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 727-2
The commenter states that the project will produce mining waste that will pollute groundwater and mine water. The commenter is referred to Master Response 8 - Mine Waste Characterization and Master Response 35 - Discharge to South Fork Wolf Creek. The commenter also states that the mining waste will need to be hauled by polluting diesel trucks. Chapter 4.3 of the DEIR analyzes air quality, including associated with haul trucks, and found the project's impacts to be less than significant after mitigation. (DEIR, Impacts 4.3-1 and -2.)

### Response to Comment Ind 727-3
The commenter states that diesel haul trucks needed for the transport of mine waste will significantly increase air pollution and GHG emissions. Chapter 4.3 of the DEIR analyzes air quality, including associated with haul trucks, and found the project's impacts to be less than significant after mitigation. (DEIR, Impacts 4.3-1 and -2.)

### Response to Comment Ind 727-4
The commenter mistakenly states that the trucks used for hauling engineered fill to the Centennial Industrial Site will impact the Brunswick Road/State Route 174 intersection. Truck traffic from the project would not use the Brunswick Road/State Route 174 intersection. The commenter is referred to Figure 3-13 of the DEIR. Traffic impacts are analyzed in Chapter 4.12 of the DEIR.

### Response to Comment Ind 727-5
The commenter refers to a blog post which discusses the gold industry in general. This comment does not pertain to the adequacy of the DEIR. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

SLEEP

**Ind 728-1**

Studies have proven, without a doubt, that sleep is as necessary to optimal health as is pure food and water. Poor sleep, or lack of sleep, detrimentally affects a persons health. It also adversely affects cognition, heart rhythms and the immune system.

As a Grass Valley resident, and a native California retiree, I live on a busy road that has school buses, garbage trucks, semi's and regular traffic. It is not my first choice to live here, but I am lucky to live here as my retirement income does not allow for market rate rent. I live in a senior community, tax deferred, and my rent is somewhat controlled and reasonable. It is not an option to move.

Studies have also proven that noise, exhaust and dust particles contribute to Dementia and Alzheimers. I am 30' from the road. Lucky for me, the traffic quiets down after 9 p.m. and starts again at 6 a.m.. The weekends actually are quiet enough, at times, to hear the birds and resident Red tail Hawk that reside in the forest of East Bennett Street.

Which brings me to the plans of Rise Gold to run their dump trucks 24/7 on various residential roads, and Hwy. 49, which disects our city of Grass Valley where hundreds of residents will be captive to the noise, exhaust and dust particles spewed from Rise Gold's dump trucks.

Lastly, the study that proves our brains need silence to regenerate, as the brain is still active during sleep, leaves no doubt that the health impacts of Rise Gold's plans to run dump trucks 24/7 will be detrimental to hundreds of Grass Valley, and surrounding areas, physical and mental health.

Therefore, the conclusion to Rise Gold reopening the mine is a resounding NO MINE!

Sincerely,

Sheryl Luxon
sherylllux@gmail.com

## INDIVIDUAL LETTER 728: SHERYL LUXON

### Response to Comment Ind 728-1

The commenter states that the noise impacts from truck traffic will interrupt the sleep schedule of the nearby residents. The commenter also states that exhaust and dust particles contribute to dementia and Alzheimer's disease. Regarding the sleep disturbances, the commenter is referred to Response to Comment Grp 21-130. Regarding the project's impacts to air quality, the DEIR found that all impacts will be less than significant after mitigation. (DEIR, Impacts 4.3-1 and -2.) The commenter's general opposition to the project is noted for the decision makers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 729**

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

January 18, 2022

Dear Commissioners:
Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned resident of Grass Valley, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter.

**Ind 729-1**

I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent and misleading in their insensitivity to the environmental concerns we citizens have. Even though I have not gone over the EIR thoroughly yet, so far it seems they fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses:

**Ind 729-2**

- Air Quality – we already have a compromised air quality due to the pollution from the Sacramento Valley and fires. Any more and I will leave!
- Traffic – 100 large, heavy trucks moving rock etc. every day from the site down through the busy shopping area on Brunswick to Hwy 49 and all the way to Sacramento and beyond is inconceivable and intolerable for these reasons:

**Ind 729-3**

  - Traffic snarls potentially
  - Damage to road surfaces
  - Noise all along the route
  - Fossil fuel emissions adding to greenhouse gases
  -

**Ind 729-4**

- Water usage – more when we already have a shortage from drought is unacceptable.

**Ind 729-5**

- River pollution is possible from the water used in mining.

It is up to YOU as the Planning Commission to protect the citizens and keep this very special Foothills habitat beautiful and healthy. YOU are responsible for protecting our environment. Besides, there seems to be very little economic value from the project to local people.

**Ind 729-6**

I trust you will value my input and the comments from thousands of other residents, and see through the Rise Mine claims geared at profit to the truth of the hazards this mine might bring.

Sincerely,

Shirley Freriks 144 Sierra Blanca Ct, Grass Valley 95945…530-446-6446 sfreriks@mcn.org

Cc: Director of Planning Brian Foss, Senior Planner Matt Kelley, Principal Planner Tyler Barrington

## INDIVIDUAL LETTER 729: SHIRLEY FRERIKS

### Response to Comment Ind 729-1
The commenter does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1.

### Response to Comment Ind 729-2
For the generally noted air quality concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy.

### Response to Comment Ind 729-3
Regarding haul truck noise, DEIR Impact 4.10-2 concluded all noise generated from engineered fill placement and compaction, and noise associated with haul truck operation (excepting potential jake brake use) and worker trips during this period, would remain below the applicable noise standards. Noise generated from hauling fill from the Brunswick Industrial Site to the Centennial Industrial Site could exceed local standards if jake brakes are used. Thus, Mitigation Measure 4.10-2 is included in the DEIR to reduce this impact to a less than significant level.

Regarding damage to road surfaces, Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the Project Driveway and Brunswick Road. (DEIR, p. 4.12-91.)

The analysis of greenhouse gas emissions in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, includes mobile sources. Please refer to Chapter 4.3 for the detailed evaluation.

### Response to Comment Ind 729-4
Please see Master Response 16 – Drought and Climate Change, and Chapter 4.8, Hydrology and Water Quality, for additional information related to drought conditions and water usage, respectively.

### Response to Comment Ind 729-5
Please see Master Response 35 – Discharge to South Fork Wolf Creek and Chapter 4.8, Hydrology and Water Quality, for additional information related to water pollution.

### Response to Comment Ind 729-6
The comment does not address the adequacy of the DEIR. The comment has been noted for the record and forwarded to decision-makers for their consideration.

**Subject: Received the Draft Enviroment Impact Report**

# Received the Draft Enviroment Impact Report

**Ind 730-1** About this report that came out. How is a normal,person supposed to understand this report. Of course not. but I have a nephew that works in the gold mine industry. He has worked all over the world in administration. I had him take a look. He can't understand why anyone would think it is a good idea to open a gold,mine in the middle of a small town. He read all the reports. He did say California has some of the strictest regulations. Did not believe California would allow this.

My first question is why we would agree to this site as light industrial to be changed for one person who once to open a gold mine that has been closed for 50 years in the middle of our town.

**Ind 730-2** I am wondering why anyone would consider allowing this person to open anything here when they still have a court case pending in Canada. They left a lot of damage from their gold mine they were running until they were ordered to

close it down. What they did to the people there they filed bankruptcy and came here to raise a lot of problems. I also would like to know if their company is located in Nevada but they are here. If this is true why is their company not registered in California. Has to be a reason. I would like to know what it is.

**Ind 730-3** I live about a block from this mine. I have lung cancer. I have spoke to my doctor about this problem. He said all the crap that this mine would put out will be very bad for me. The trucks throwing out all the diesel fumes would be bad for everyone but it could be deadly for me so I want this on record.

**Ind 730-4** The constant noise from this mine would , I am sure, destroy my peace and quite that I am entitled to. I will not even be able to sit out on my deck which is the enjoyment I am entitled to.

**Ind 730-5** I have to travel Brunswick every day for doctors, grocery stores, meds. Will I have to sit behind one of these diesel trucks breathing their crap when I need to go someplace.

**Ind 730-6** They talk about these high paying jobs. What jobs. I have heard nothing about what jobs these are and what are they are being paid. For instance a Truck Driver - $15.00 hour. Working deep in a hole - $20.00 hour. I don't know what jobs they are talking about but I have seen nothing that says what the jobs are or what they would be paid. They should have to list these jobs as they keep saying these jobs will pay $100,000 a year. What Jobs.

**Ind 730-7** This company has already violated rules in the beginning and the County did nothing.

**Ind 730-8** What about our water. Does the powers that be not listen to the news. Our water situation is not very good. We are being ask to conserve water because we are in a drought that is the worst we have had many, many years. Now you want to allow this mine that no one wants to drain our wells, hook people up to NID who ask for conservation. What about all the wells that NID WILL NOT BE ABLE TO REACH when all these other wells go dry. Are you going to guarantee that these people will not lose their water.

**Ind 730-9** How many on the board of supervisors will be living near this site. I don't think any of you will or would. There is so much that can be said about this project that is wrong but I will close with this. I read about "Rise Gold Valley which seeks to open the Mine has stated the project benefits far out weigh the impacts". Really someone thinks that having lung cancer and the crap that the mine would put into my lungs is just to bad for me. Really. thanks but no thanks.

Sincerely
Shirley Williams

## INDIVIDUAL LETTER 730: SHIRLEY WILLIAMS

### Response to Comment Ind 730-1
The comment does not address the adequacy of the DEIR, but rather expresses opposition and general concerns related to the proposed project. Please see Master Response 1.

### Response to Comment Ind 730-2
Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 730-3
The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment (HRA) provides the health risk at the maximally exposed individual resident (MEIR) and has determined the health impact at the MEIR is less than significant. Prevailing wind speed and direction were accounted for in the HRA to determine where and how far emissions from the project would travel. (Appendix E.1 of the EIR.) As stated on page 27 of the HRA (Appendix E1 of the DEIR), the MEIR would be the nearest existing residence to the north of the Brunswick Industrial Site. Emissions would be dispersed as distance increases from the emission source. Since the HRA presents the health risk levels at the maximally exposed individual, all other receptors in the vicinity of the project would have less exposure and consequently less potential health risk than the MEIR. Several commenters identified not being able to see the risk of the HRA visually. Isopleth figures were developed in response to these comments, which show where the project's emissions would travel. Please see Dudek Memo – Isopleths attached to the Final EIR as Appendix K.

### Response to Comment Ind 730-4
Noise is addressed in Chapter 4.10. Based on the project-specific noise analysis, which was independently reviewed by the County's third-party noise consultant, none of the individual activities associated with long-term operations of the proposed project would generate noise in excess of the applicable noise standards. Furthermore, combined project noise impacts are not anticipated for the proposed project. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 of the DEIR requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

## Response to Comment Ind 730-5

Please see Response to Comment Ind 730-3.

## Response to Comment Ind 730-6

The comment does not address the adequacy of the DEIR. Jobs and other social topics are outside the scope of CEQA – please see Master Responses 1 and 2.

## Response to Comment Ind 730-7

The comment does not address the adequacy of the DEIR and lacks specificity. Please see Master Response 3 – Operator Responsibility.

## Response to Comment Ind 730-8

Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 730-9

The comment does not address the adequacy of the DEIR. The comments concerns and opposition to the proposed project have been noted for the record and forwarded to the decision-makers for their consideration.

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170

Nevada City, CA 95959-7902
(530) 265-1423

My name is Stefanie Martinez, and I am a resident of the Grandview Terrace neighborhood. I live at 10910 Drift Alley, Grass Valley and have been a homeowner here since 2011. I have grown up in the Grass Valley community since age 7, completing all of my schooling and college here, contributing to the local workforce, and deciding to purchase my home at the age of 25 further committing my ties to this community. I have always felt incredibly fortunate to call this place my home and have chosen to build my life here as I place a very high value on the natural beauty and peaceful quality of life that has been remarkably gifted to this area. Not only is Grass Valley considered a unique and beautiful paradise for its residents, it is also what continues to draw its tourists and visitors, which has a significant contribution to our local economy. Furthermore, I feel just as significant in importance is the local wildlife habitat and natural ecosystems in which we share our environment with.

**Ind 733-1**

I'm writing all of this with the point to establish my major concern with the reopening of the Idaho Maryland Mine by Rise Gold and its potential harmful impacts and toxic destructive inevitability in my hometown. It is a historically dangerous and hazardous operation and highly pollutant process. I understand that some of these concerns have been under evaluation and proposed to be mitigated within the DEIR. I strongly feel that the DEIR is incomplete and inadequate by far in order to sanction the extraordinary negative impact of this destructive business on this community. Please do not allow this to happen. I feel an extraordinary amount of helplessness as I understand this decision falls within the hands of a few. I live within a -too close for comfort- proximity to the mine site and I have enormous concerns for how this is going to affect me, my family, friends and neighbors health and quality of life. I think that it would be a huge mistake to allow for this operation to exist right within the proximity of so many residents. There are numerous concerns that I have with the many aspects of the potential impacts.

- Pollution of Water

**Ind 733-2**

Water IS gold. It is our most valuable resource. We need to preserve and protect it. What is essentially purposefully contaminated water being treated and released back into the environment simply spells out "bad idea". Room for accidents and error should not be ignored and dismissed. I am very uncomfortable with the track record of Ben Mossman's former mining business venture on Banks Island in Canada, where accidends did happen and contamination was found in the aftermath, left behind undealt with. I do not want to see this happen in my community, in our water streams. Wolf Creek is a life source to many ecosystems and animals throughout our county, parts of which run through properties where children play. Not to mention the numerous wells of which are located within the surrounding area supplying water for people and their properties. I do not want to see a repeat of the devastating and irreversible effects

1

of the North San Juan Siskon Mine. Of course these types of occurrences are never intended, but this industry has proven time and time again that disaster lurks heavily, and with nearly impossible irreversibility.

**Ind 733-3**

-Air pollution
The proximity of which mine dust and toxic particulates will be disrupted and expelled into the atmosphere near my own residence is highly concerning and leaves me feeling anxious about what effect it could have on my health and everyone around me who will be living and breathing this air EVERY day of my life.

**Ind 733-4**

-Noise Pollution
I have concerns for the amount and level of noise that will be produced by the equipment and operation of the mine. As mentioned before, one of the highly desirable qualities of this area is its quiet, small town, peaceful environment. I am afraid that the intrusion of this industry will depreciate this value significantly.

These are just a few of my main concerns regarding the reopening of the Idaho Maryland mine. Please, please do not allow this in our community. The DEIR does not mitigate enough concerns of so many experts and of our community members. This dirty industry has no place in our future.

Thank you for your time,
Stefanie Martinez

## INDIVIDUAL LETTER 733: STEFANIE MARTINEZ

### Response to Comment Ind 733-1

The commenter expresses concern that the DEIR is incomplete, but does not provide specific examples that would allow for a detailed response. Quality of life concerns are outside the scope of CEQA – please see Master Response 1. The commenter's concerns are not for the record and have been forwarded to the decisionmakers for their consideration. Please also see the below responses to more specific comments.

### Response to Comment Ind 733-2

Regarding water pollution concerns, please see Master Response 35 – Discharge to South Fork Wolf Creek; regarding well concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells; and regarding applicant concerns, please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 733-3

Please see Chapter 3, Air Quality, Greenhouse Gas Emissions, and Energy, for additional information related to air pollution. The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment (HRA) provides the health risk at the maximally exposed individual resident (MEIR) and has determined the health impact at the MEIR is less than significant.

### Response to Comment Ind 733-4

Please see Chapter 4.10, Noise and Vibration, for additional information related to noise impacts. Based on the project-specific noise analysis, which was independently reviewed by the County's third-party noise consultant, none of the individual activities associated with long-term operations of the proposed project would generate noise in excess of the applicable noise standards. Furthermore, combined project noise impacts are not anticipated for the proposed project. Nonetheless, because the project would include multiple processes which generate noise, and because compliance with the Nevada County Noise Standards is required, Mitigation Measure 4.10-2 of the DEIR requires ongoing implementation of a comprehensive noise monitoring program using noise monitors around the Brunswick and Centennial Industrial Sites. The monitoring program will be independently verified by a third-party consultant under direct contract with Nevada County. Within 30 days of installation and operation of mine-related equipment at the Brunswick Industrial Site, the County's third-party noise consultant shall retrieve and evaluate noise monitoring data to evaluate whether mine-related operational noise levels are in compliance with County noise standards at the pre-determined Receptor locations. The results shall be submitted to the Nevada County Planning Department within one week from evaluation of the noise data. If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc. After implementation of any recommended measures, follow-up noise level data evaluation shall be conducted to demonstrate that the resultant operational noise levels comply with the County noise level standards at nearby sensitive receptors.

The commenter's opposition to the proposed project is noted for the record and has been forwarded to the decision-makers.

**Individual Letter 734**

**From:** Stephanie Almanzar <steph.almanzar@gmail.com>
**Sent:** Monday, April 4, 2022 12:30 PM
**To:** Idaho MMEIR
**Subject:** Comment against the reopening of the Idaho-Maryland mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To whom it may concern,

My name is Stephanie Almanzar and I live in Grass Valley, CA District 1. I am writing to comment on the Rise Gold's application to reopen the Idaho-Maryland mine.

I moved to this area in 2020 because I wanted to be close to all the beautiful nature this area provides. As an entrepreneur working in the online space it was an easy yes to make the decision to move here with my partner from San Francisco.

One of the things that stood out to me was the community here. I could tell that the people that live here love this area deeply and show their care by keeping this area beautiful and clean. One place I noticed this was at the Yuba river. Noticing how locals clean up trash left by those who may not have the amount of reverence and respect for this area as the people who live here do. I have found this area deeply nourishing to my soul and would hate to see something so destructive as the mine start to decrease the quality of life in this precious area.

**Ind 734-1**

I believe that the county needs to take a look at the bigger picture surrounding the potential for reopening the mine. Looking at the impact it will not only have in the immediate future for the quality of life for those already living here but also the for the future generations to come. Quality of life is the most important thing for people to have the energy and resources to create and give back to the community. Reopening a mine owned by people who have no respect or reverence for the land here is not the answer to increase the quality of life for those of us who actually live in the area, those of us who love living here and respect this land as sacred.

Bringing in traffic, noise, and destruction would not only deter people from coming to visit and boost the economy it would drive those of us who love living here away. They say that this mine would boost the economy but I believe that instead it would deplete the lands natural resources and drive people away from this area. And so I urge you to do a legitimate and sound economic analysis in the DEIR before making any final decisions.

I also believe that it is important to look at Rise Gold as a company. Where do their interests lie? Do they actually care about those of us who live here and the impact this will have on us? Are they reputable? Have they successfully opened a mine and received profit? With only minimal research it is apparent that Rise Gold is all talk, shiny marketing, and empty promises. They are a 14 year old company and have never opened a mine or received profit. The CEO is known to have failed in their last venture. Leaving polluted tribal waters and rid themselves of responsibility, leaving Canadians with the price to pay for their failures. Is this really the type of company that will serve this community? I think not. I believe there is more in depth scrutiny necessary to make a sound decision on this issue. And I believe that if there is sound research done that who ever is reading this will find that opening this mine would be the biggest mistake this county can make for its people and this scared land we live on.

**Ind 734-2**

1

Thank you for receiving me.

With sincerity and hope,

Stephanie Almanzar

## INDIVIDUAL LETTER 734: STEPHANIE ALMANZAR

### Response to Comment Ind 734-1

Quality of life and economic concerns are outside the scope of CEQA - please see Master Responses 1 and 2. Dear Mr. Matt Kelley:

I am writing today as a concerned citizen of Nevada County. I am a home owner and I live in Rough and Ready. I've been in this area for 22 years. I am adamantly opposed to the reopening of the Idaho-Maryland mine. We don't need this in our community. Why do we want to destroy our water supply or the beauty of this place any more with mining?! The amount of jobs this reopened mine promises will NOT off-set the environmental damage.

**Ind 735-1**

It is simply **not** worth it to vote yes on reopening the mine. Please add my letter of opposition.

Thank you.

Sincerely,
Stephanie Steyer
13672 Quail Alley
Rough and Ready, CA 95975

## INDIVIDUAL LETTER 735: STEPHANIE STEYER

### Response to Comment Ind 735-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project, which has been noted for the record. Please see Master Response 1. Regarding water supply concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

**Individual Letter 736**

March 25, 2022

Stephen J. Baker
13975 Wings of Morning Drive
Nevada City, California 95959

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, California 95959-7902

Dear Mr. Kelley:

I am commenting on the risks on private domestic water wells created by the proposed Rise Gold mining project.

**Ind 736-1**

As a resident of Nevada County, I live on upper Banner Mountain and have used a groundwater well for 26 years. My background is unique to the issue of private domestic wells. I am a California Registered Geologist and Certified Hydrogeologist, have been doing hydrogeology for 42 years, completed a 10-year groundwater study in Nevada and Placer Counties that looked at domestic well vulnerabilities in fractured rock environments and submitted the draft environmental impact report (DEIR) comments on behalf of the Banner Mountain Home Owners Association when this mine was proposed to be reopened by Emperor Gold in 2009.

Based on what I have read in the draft environmental impact report (DEIR), I am concerned for our community. Dewatering the mine and its impacts on domestic wells are currently undefinable, unpredictable, the fundamental dataset is biased and monitoring data is not long enough in duration and too low a resolution to provide useful information.

First, I will explain what is wrong or missing from the DEIR and then I will explain what is needed.

Rise Gold relies on four datasets to generate an opinion on private domestic well vulnerability. The first dataset was generated by Emperor Gold. Emperor Gold's groundwater monitoring data ranged from 1995-2001 & 2003-2007. This well monitoring dataset is too sparse; 1) not long enough time period of monitoring (this is an 80-year project) and 2) data time intervals are once a month.

**Ind 736-2**

The second dataset consists of precipitation data and water levels in Rise Gold mine shafts. Rise Gold comments that water levels in mine shafts are unaffected by seasonality therefore wells are safe. They compared daily precipitation with fifteen water level readings in a sixteen-year period. This is the same issue as just mentioned. It is not possible to see trends because you miss the aquifer responses as a result of the low-resolution dataset. This dataset is also too short in duration. Conditions also change when going from steady state to transient. It is noted that our community has had more severe droughts since 2007 which may have created a more pronounced impact on groundwater this is not reflected in available data. We will likely be experiencing much more extreme droughts in the future.

**Ind 736-3**

The third dataset was generated from a computer numeric groundwater model. This is the wrong tool for answering the question of dewatering impacts in a fractured rock system. Numerical computer models are great tools that provide very useful projections in porous aquifers and other aspects of this project. But this area is a fractured rock aquifer and fractures are not mappable. Groundwater flow paths are not predictable with specificity. The model generalizes predictions on domestic well impacts. It's the details that matter. We need much more detail.

Lastly, Rise Gold is following a conclusion that the United States Geological Survey (USGS) made in 1984 regarding groundwater in fractured rock areas of California. USGS stated that well yields decrease with depth. The statistics that were quoted in the Rise Gold report were:

- 70% of the wells that are 215 feet in depth or less yield greater than five gpm and
- 75% of the wells that are deeper than 215 feet yield less than five gpm.

These datasets support Rise Gold's conclusion that mine dewatering is not going to impact wells. Wells are less productive as you drill deeper.

**Ind 736-4**

This conclusion is incorrect because the bias has not been recognized and adjusted in the data. Let me explain. The motivation of property owners is to drill until you find enough water for their property. Sometimes this is less than 215 feet of drilling and sometimes it is deeper. If you find water at a shallow depth, you stop drilling, even though deeper groundwater may also be available. Rise Gold's estimate of existing deep water are too low. Greater than 25% of the deep wells yield greater than five gpm and that doesn't include properties that have not drilled a well. Discrete flow pathways do exist at depth and can be quite robust to a well owner. There are more areas of deep groundwater than estimated by Rise Gold. The numbers are wrong.

OMISSION OF IMPORTANT DATA

The number of new wells has increased since the 1984 USGS report and the Emperor Gold hydrologic reports. Ask any local driller and County Staff. There is more reliance on wells today than ever before. Risk to losing groundwater supplies are also greater today because of the increase in drought intensity and length and population increases. The deepening of wells and new replacement wells have also increased during the last fifteen years. Again, ask local drillers and your County Staff.

My 10-year groundwater study in Nevada and Placer counties concluded that domestic wells are vulnerable to losing their supply however wells are uniquely different from one another. Specific well vulnerability characteristics are only recognized by monitoring the specific well.

**Ind 736-5**

The bottom line is data used by Rise Gold is outdated and biased. Domestic wells are already vulnerable and mine dewatering increases that vulnerability. A much stronger and more realistic analysis is needed.

Now I will explain what is needed. There are two main questions:

1. Does groundwater flow into the dewatered zones of the mine within an eighty-year period of time?
2. If so, what flow path is groundwater travelling to reach the mine workings, if at all?

The first question is answered by age dating the mine shaft water at several discrete depths. You may consider using sulfur hexafluoride (SF6) or chlorofluorocarbons (CFC). If groundwater takes less than 80 years to percolate to the mine workings under today's nonpumping conditions, then, the wells and mine are vulnerable to drought and dewatering of the mine. It becomes possible that mine dewatering would divert some of the groundwater away from domestic wells. We just don't know which wells and which groundwater flow paths are being used by domestic wells. I have age dated groundwater in the granites and metavolcanics found on the San Juan Ridge. Groundwater was estimated to be fourteen years to forty-six years old. I would expect similar age water at Rise Gold's mine.

**Ind 736-6**

In order to identify which well is impacted, we need to monitor specific wells at high resolution. This needs to start now. Background data is critical. Establishing background water behavior requires several years of monitoring. This is an essential monitoring criterium. Without adequate background data, evaluation of mine impacts on wells will become a hundred percent arbitrary decisions that is not relevant to the real problem. YOU NEED TO GENERATE ADEQUATE BASELINE DATA NOW.

**Ind 736-7**

I have only addressed water availability but I will say one thing about water quality. Dewatering is going to change groundwater flow paths and that can impact water quality. Different groundwater flow pathways sometimes encounter diff. rocks/chemical conditions. The system is dynamic. Groundwater monitoring must include both water level measurements and water quality analyses. Establishing background conditions is fundamental to building a strong and pragmatic well protection and contingency program.

**CONTINGENCIES**

Ultimately, contingencies will need to be comprehensive, well-funded and logistically sound. Don't waste money on the fifteen nested groundwater monitor well locations recommended in the DEIR. Focus on monitoring existing wells as your monitoring points.

**Ind 736-8**

Bringing NID into potential impacted neighborhoods early is the right thing to do, but, in many cases, you will not know who will be impacted until the last minute and that won't provide enough time to expand Nevada Irrigation District (NID) infrastructure into the entire impacted area. This is a problem. I am not sure how it can be answered.

My suggestion regarding the groundwater monitoring needs is to create a strategic, tiered groundwater monitoring plan to identify problems before they become critical. This is very different from the monitoring proposed by Rise Gold.

Construction of water pipes into each area that is predicted to have water impacts before the impact creates dysfunction. The zone of dewatering influence will not become known until dewatering occurs. The radius of influence will become more unpredictable because of seasonal precipitation changes and the expansion of mine working as related to unexpected encounters with secondary porosities of rock formations through time. Significant funding will be needed to anticipate responses to the expanding radius of domestic wells adversely impacted by mine dewatering. This will likely be costly.

**Ind 736-9**

Unfortunately, a couple conditions cannot be mitigated. **Rise Gold will handicap our community's ability to respond to future droughts.** Domestic well owner's response to drought is to deepen their wells or drill a new one. After Rise Gold dewaters the deeper well production zones, property owners will be drilling into a dewatered area. Eighty years is a long time to dewater an aquifer. This will impact our great grandkids.

As we stand now, our communities are not prepared to lose their groundwater supply especially if Rise Gold adds to the vulnerabilities of domestic well users.

**Ind 736-10**

**The second handicap is the loss of the domestic well owner's water right to their groundwater resource.** The dewatered mine water is public water that property owners can use. There is a caveat. The use must be reasonable and for use on their property. Mine dewatering will be occurring for eighty years, not five, and during that time, Rise Gold will remove water from properties other than their own. It is not reasonable or of value to domestic well owner properties. If water is transported to an unknown location down-gradient, the beneficial uses of that water need to somehow be returned to the domestic well owners. This large diversion of groundwater out of the subbasin will eventually be viewed as an overdraft of the subbasin. Aquifer characterization would be recognized as over drafted if the demand for water exceeds the volume of water that fills the aquifer each year.

If the overdraft in the subbasin is not corrected, the domestic well owner's very strong Overlying Groundwater Right could be lost by prescription. Imagine, water is there, the quality is perfect but the domestic well owner no longer has a right to use the groundwater.

This becomes possible because Rise Gold is pursuing 80 years for pumping, water rights in CA are going to change significantly (they already are) and predictions that drought will worsen and will create more

adversarial water conflicts in Nevada County communities. Officially recognized over drafted basins could develop. Prescription will become a reality in our communities if we are not careful. This is bad for the property owner and bad for the county.

Our wells are already vulnerable. We don't want to be handicapped. We need to be better prepared.

The monitoring and contingencies, as stated in the draft environmental impact report are not effective enough to safeguard our communities.

Respectfully submitted,

## INDIVIDUAL LETTER 736: STEPHEN BAKER

### Response to Comment Ind 736-1

The commenter asserts that the data used by the DEIR groundwater analysis is too sparse and does not cover a long enough period. The groundwater monitoring data referred to in this comment are plotted on hydrographs in Appendix B of the *Groundwater Hydrology and Analysis Report*, which is Appendix K.2 of the DEIR. For all but a few wells, the data show consistent cycles without any long-term increasing or decreasing trends throughout the almost 10-year period over which data were obtained, as discussed on DEIR page 4.8-12. It would not be reasonable to expect data collection over an 80-year period prior to this project. Review of Figure 3-4 of Appendix K.2 of the DEIR indicates that during this 10-year period, the annual water-year rainfall varied from 85.98 inches in 1995 to 30.73 inches in 2001. These values are within the 98$^{th}$ percentile and the 6$^{th}$ percentile, respectively, of the rainfall variation shown for the period from 1967 to 2018 on Figure 3-4 of Appendix K.2. Therefore, the monitoring occurred across a timeframe during which there were substantial variations in the rainfall amounts from year to year.

Monitoring of individual private wells at a greater frequency than that recorded for the monitoring from 1995 to 2001 and 2003 to 2007 may show short periods during which the water level was lower than the minimum recorded value in some wells, but that would be due to pumping of the well itself and not an indication of the actual water level within the fractured bedrock. More frequent monitoring in the past would not alter the understanding of the historic baseline of the groundwater elevations in the region.

Furthermore, the DEIR concludes, on page 4.8-66, that the potential impacts to groundwater supplies in private wells would be significant. Additional data from existing private wells would not alter that conclusion or the need for mitigation. The groundwater analysis and underlying data were reviewed by the County's water supply experts, who concurred that the analysis was accurate and that the impacts would be less than significant after implementation of mitigation. As such, the groundwater analysis constitutes substantial evidence to support the DEIR's conclusions.

### Response to Comment Ind 736-2

The commenter asserts that the data used in the DEIR when comparing precipitation data and water levels in the mine shafts is inadequate because of too short of duration and too few readings, to conclude that wells are "safe." This comment mischaracterizes the evaluation presented in the DEIR, which does not conclude that wells are "safe." As noted in the Response to Comment Ind 736-1, above, the DEIR concludes, on page 4.8-66, that the potential impacts to groundwater supplies in private wells would be significant prior to mitigation. Additional data from existing private wells would not alter that conclusion or the need for mitigation.

It should also be noted that the water level data from the New Brunswick Shaft, as presented on Figure 4.8-5 of the DEIR, varies by less than seven feet, with the exception of one potentially anomalous result. Even considering that potentially anomalous result, the water level in the shaft varies by only 11 feet, in comparison with seasonal variations in the private domestic wells of 10 to 50 feet per year, even though measurements were made during a range of wet years and dry years.

As noted in Appendix K.2 of the DEIR, the water within the shaft and existing underground mine workings are not static. Water from the mine workings is constantly discharging to Wolf Creek. However, the rate at which the water discharges is limited by the rate at which the water can enter the workings through the fractures that have been encountered. The water level in the New

Brunswick shaft is 25 feet to 265 feet below the static water level in the wells in the East Bennett area, indicating that the water can flow out of the drains faster than it can enter the mine. The flow of water into the shafts and through the underground mine workings has also resulted in an existing drawdown cone around the shafts. These dynamic conditions provide an indication of the degree of interconnection between subsurface fractures and the mine workings, and the rate at which water can enter the mine, which is limited. As discussed above, the available data provides adequate resolution to understand the groundwater dynamics and to predict likely impacts based on dewatering. Further, the groundwater analysis and underlying data were reviewed by the County's water supply experts, who concurred that the analysis was accurate and that the impacts would be less than significant after implementation of mitigation. As such, the groundwater analysis constitutes substantial evidence to support the DEIR's conclusions.

## Response to Comment Ind 736-3

The commenter asserts that the computer groundwater model is the wrong tool to analyze dewatering impacts in a fractured bedrock system. Please see Response to Comment Ind 232-1. Computer groundwater flow models that are based on the assumption of porous media are widespread in use in fractured bedrock analyses, and are appropriate in the context of the large area analyzed for the project. The upper alluvium and fractured shallow bedrock behave as a porous media on the scale that Itasca modeled for the project. An assumption of a porous media is appropriate given the scale and the objectives of the model. As discussed in the NRC (1996), a document referenced by Dr. Schneiderman in comment 232-1, and presented below:

> The level of detail required in the conceptual model depends on the purpose for which the model is being developed—for example, whether it will be used to predict fluid flow or solute transport. Experience suggests that, for average volumetric flow behavior, predictions can be made with a relatively coarse conceptual model provided data are available to calibrate the simulation model. Thus, a continuum approximation may be used to predict well yields with sufficient accuracy, even if a fracture network is poorly connected.

The continuum approximation mentioned in this paragraph is a porous media approximation. The application of a continuum (porous media) approximation is applicable to mining projects in that it is used generally to estimate flows from the mine and drawdowns in water levels due to dewatering, a situation similar to predicting well yields as discussed by the NRC (1996). The approach followed by Itasca is appropriate and is supported by the literature and common practice in the hydrogeology field.

## Response to Comment Ind 736-4

The commenter asserts that the DEIR is wrong in concluding that there is less groundwater present at deeper depths below surface, and the DEIR is mistaken to rely on a USGS conclusion from 1984 on that issue. The DEIR does not rely solely on the 1984 USGS study (Page et al.) regarding well yields related to depth. Substantial evidence from California Department of Water Resources Well Completion Reports was also considered to evaluate how water production changes with depth from wells within the fractured bedrock. That additional evidence considered in the DEIR is illustrated on Figures 3-8, 3-9, and 3-10 in Appendix K.2 of the DEIR. The commenter is unclear on what depth range is implied when referring to "deep wells," however, as noted in Appendix K.2 (at page 33), below a depth of 450 feet, the maximum pumping rate was only four gallons per minute (gpm).

## Response to Comment Ind 736-5

The commenter asserts that domestic wells are vulnerable to losing their water supply, and that the data used by the EIR is outdated and biased. As noted in the Response to Comment 1 of this

letter, the DEIR concludes, on page 4.8-66, that the potential impacts to groundwater supplies in private wells would be significant without mitigation. However, the DEIR concluded that the impact would be less than significant after implementation of mitigation. The groundwater analysis and underlying data were reviewed by the County's water supply experts, who concurred that the analysis was accurate and that the impacts would be less than significant after implementation of mitigation. As such, the groundwater analysis constitutes substantial evidence to support the DEIR's conclusions.

## Response to Comment Ind 736-6

The commenter states that the County should age-date the mine shaft water at several discrete depths to determine if water percolates into the mine in less than 80 years and should monitor specific wells at high resolution to generate baseline data before dewatering. Isotopic age dating of the water at various depths within the existing mine is described on page 65 of Appendix K.2 of the DEIR. The data indicate that the water at all depths sampled is less than five to 10 years old. This finding is consistent with the dynamic (i.e., not static) flow of water through the mine workings, as discussed in the Response to Comment Ind 736-2. Since the water under existing conditions takes only a few years to flow through the mine workings, and the existing water levels in the mine are below the static groundwater level in the surrounding fractured bedrock, then if there was a direct connection between the mine workings and any existing private well, it would already be reflected in the current observations.

The DEIR has concluded that additional monitoring is necessary as part of a mitigation program (Mitigation Measure 4.8-2(a)). Performance standards that identify when a well is impacted have also been identified in the DEIR (Mitigation Measure 4.8-2(b) on DEIR page 4.8-68).

The groundwater monitoring plan (Itasca 2021) provides a rationale for installing specifically designed groundwater monitoring wells versus using existing domestic wells.

The Itasca groundwater monitoring plan provides the following rationale:

> Assessment of impacts of water-level changes in domestic wells is difficult to perform when examining each domestic well on an individual basis because of operational and depth considerations for each well. In order to understand water-level fluctuations within the well, one must know how the well is completed and screened. The fluctuations of the water levels for each domestic well are controlled by the pumping rate, and it is not easy to obtain accurate pumping rates for a domestic well over time. Measuring well yields from domestic wells as an indicator of potential impacts from mining is not recommended because well yields or specific capacities of the well will not indicate impacts due to mining. Specific capacity is defined as the pumping rate (e.g., gallons per minute) divided by the drawdown, which is usually measured in feet. Specific capacities of wells can be influenced by many factors, such as mineral encrustation of the well screen, a malfunctioning pump, or biofouling of the well screen due to bacterial growth within the screen or well. These influences cannot be attributed to Rise's operations. The primary impact on a domestic well that may be attributed to the mining operations by Rise would be a decline of the water level in the well that is sufficient enough to reduce its use to provide an adequate water supply.

Nevertheless, in response to public comments, and as discussed in Master Response 15 – Adequacy of Groundwater Monitoring Wells, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master

Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

Groundwater monitoring will be initiated at least 12 months before the commencement of dewatering. This will allow sufficient time to assess background conditions.

## Response to Comment Ind 736-7

Monitoring of water quality from the mine, which would reveal if there were any changes due to encountering different rock types or geochemical conditions, as stated in the comment, is included as part of Mitigation Measure 4.8-1(a) on DEIR page 4.8-52. Additionally, monitoring of groundwater quality through the monitoring wells is also required by the groundwater monitoring plan.

Mitigation Measure 4.8-2(a) on page 4.8-68 of the DEIR is hereby amended to clarify that the groundwater monitoring plan includes monitoring requirements for water quality, as follows:

> *4.8-2(a)* *The Project Applicant shall implement the Groundwater Monitoring Plan (GMP) prepared by Itasca Denver, Inc. (February 2021), as approved by the County. Implementation of the GMP shall be initiated prior to the dewatering of the mine and on an ongoing basis. Pursuant to the GMP, a network of monitoring wells shall be installed to the satisfaction of the Nevada County Environmental Health Department. Prior to construction of any monitoring wells within the County or City right-of-way, the applicant shall obtain an encroachment permit from the Public Works Department of the respective agency. Groundwater-level and groundwater quality information shall be obtained from the project groundwater monitoring wells and collected on a quarterly basis, and submitted in report form to the Nevada County Environmental Health Department, and used to generate the following information:*
>
> *1) Water-level and groundwater quality monitoring data for a minimum of 12 months before commencement of dewatering of the mine.*
>
> *[…]*

The above change has been made in response to the comment for clarification purposes and does not alter the conclusions of the DEIR. It is also noted that the Domestic Well Monitoring Plan proposed by the applicant (see Master Response 15 – Adequacy of Groundwater Monitoring Wells) similarly requires evaluation of water quality data from domestic wells within the projected 1-foot drawdown contour.

## Response to Comment Ind 736-8

The commenter asserts that the monitoring program should use existing wells rather than new monitoring wells. The commenter recommends "tiered" groundwater monitoring to identify problems before they become critical. Additionally, the commenter states that the radius of drawdown will not be known until dewatering occurs. Mitigation Measures 4.8-2(a), -2(b), and -2(c) address monitoring, performance standards, and corrective measures to address impacts to individual wells. While the commenter disagrees with the conclusions of the DEIR, the groundwater analysis and underlying data were reviewed by the County's water supply experts, who concurred that the analysis was adequate and that the impacts would be less than significant after implementation of mitigation. As such, the groundwater analysis constitutes substantial evidence to support the DEIR's conclusions. In addition, as previously noted, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the

predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 736-9

The commenter states that the mine will cause well owners to lose their water supply for 80 years and will handicap the community's ability to respond to future droughts. The existing baseline data evaluated in the DEIR do not provide substantial evidence that drought conditions (i.e., several successive years of below normal precipitation) have an appreciable effect on the groundwater elevation in the areas surrounding the project. With only a few exceptions, the monitored wells show consistent patterns and cycles that do not vary depending on the amount of rainfall. For the few wells that do not follow such patterns, the variations, or trends do not correlate with wet and dry periods. While drought conditions and the potential effects on groundwater supply are of concern throughout the state of California, the existing data do not indicate that drought conditions have had any substantial effect on the groundwater within the fractured bedrock in the project area. Please see Responses to Comments Ind 736-1 to Ind 736-8.

The proposed project would diversify water supplies available to the community and increase drought resiliency (see Master Response 16 - Drought and Climate Change). No groundwater level measurements have been completed since 2007 which creates some uncertainty to the predicted impact to percentage of water column in domestic wells. Uncertainty in predicted impacts is addressed through the various sensitivity scenarios discussed in Appendix K.3, the application of a 100% factor of safety (see page 4.8-58 of the DEIR), and the proposed connection of all 30 properties, including properties where no significant impact is predicted, in the E. Bennett area to NID potable water (see page 4.8-66 of the DEIR). Nevertheless, the analysis in Chapter 4.8 of DEIR has determined that the project could result in a significant impact to groundwater supplies without implementation of a groundwater monitoring program and well mitigation plan. Mitigation Measure 4.8-2(a) requires that a minimum of 12 months of water-level monitoring data is collected before commencement of dewatering. Impacts to domestic water wells will be measured against those current baseline measurements and not historic water levels. Mitigation Measure 4.8-2(b) requires well mitigation if, based the groundwater monitoring plan, a 10 percent reduction in the water column of a well is determined. Therefore, the determination of impact would be based on current water level data and any impacts to domestic wells would be mitigated through the proposed mitigation measures. In addition, as previously noted, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

The focus of proposed mining is at depth greater than 500 feet below surface, and typically greater than 1,000 feet below surface (see Figure 5-1 of Appendix K.3), which is a much greater depth than an economically feasible water supply well due to the decrease in well yield with depth in a fractured bedrock system. The decrease in fractures and hydraulic conductivity with depth is well documented. As stated on page 4.8-8 of the DEIR, the U.S. Geological Survey (Page et al., 1984) conducted a study covering a 148-square mile area of southwestern Nevada County, including the segment of the Wolf Creek watershed from Grass Valley to the Bear River. The underlying bedrock consisted of similar rock types to those encountered at the project site, including hard, dense metavolcanic and igneous rocks of pre-Tertiary age. The study results found that the degree of fracturing in the bedrock, and thus the well yield, decreases with depth, with most of the available groundwater occurring above a depth of 215 feet below the ground surface (bgs). At depths shallower than 215 feet bgs, 70 percent of the wells evaluated produced more than five

gallons per minute (gpm). However, at depths deeper than 215 feet bgs, 75 percent of the wells produced five gpm or less. As stated on page 4.8-16 of the DEIR, EMKO reviewed 38 well completion reports within a 1- to 2-mile vicinity of the project site, which contained information regarding the total drawdown that occurred and the pumping rate achieved during initial testing of the wells immediately after they were drilled. A clear correlation exists between pumping rate and depth. The maximum pumping rate achieved was 125 gpm in a well with a total depth of 123 feet bgs. In contrast, at depths of 200 feet or deeper, the maximum reported pumping rate is 50 gpm. Below a depth of 300 feet, the maximum pumping rate reported was 10 gpm, and below a depth of 450 feet, the maximum pumping rate reported was only four gpm. Similarly, Todd Engineers (2007) developed a relationship between the hydraulic conductivity and depth based on information from approximately 300 driller reports. Todd Engineers (2007) found that the hydraulic conductivity of the fractured bedrock penetrated by the domestic supply wells in their study area varied significantly with depth, with greater values at shallower depths where more fractures are prevalent, and with much lower values at deeper depths, where fractures may be either less common or have smaller aperture (open) widths.

## Response to Comment Ind 736-10

The California Department of Water Resources defines alluvial groundwater basins, and by extension, subbasins. There are currently no defined groundwater basins or subbasins in the project area within Nevada County. The commenter has not provided any data or other substantial evidence to support the statements or arguments in this comment for the County to evaluate further. Thus, the concerns raised are speculative and not related to a specific action or set of actions. The existing data does not provide an indication that would lead to a conclusion in the DEIR that the project would deplete or “overdraft” the groundwater throughout the region. The commenter’s argument that the dewatering of the mine could lead to the surface owner’s loss of a legal right to groundwater beneath their property is not supported by any legal citation and is speculative.

However, the DEIR does conclude that the project could have a significant impact on individual wells and provides mitigation measures that require monitoring, define performance standards, and prescribe corrective actions to address such impacts (see Mitigation Measures 4.8-2(a), -2(b), and -2(c) on pages 4.8-67 and -68).

## I support re-opening the Idaho-Maryland Mine

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

## EIR gold mine

**Sterling Honea** <sterlinghonea@gmail.com> Wed, Feb 9, 2022 at 6:29 PM
Draft To: Idaho.MMEIR@co.nevada.ca.us

RECEIVED
FEB 18 2022
NEVADA COUNTY
BOARD OF SUPERVISORS

**Dist 3**

Mr. Matt Kelley, Senior Planner
Nevada County Planning Department.
950 Maidu Avenue.
Nevada City, California 95959.
Idaho.MMEIR@co.nevada.ca.us

Dear Mr. Kelley,

The following reflects my comments as a resident of the City of Grass Valley with respect to Draft EIR number SCH 20200 -70378, commonly referred to as the Idaho Maryland Mine project (hereafter project).

INTRODUCTION

**Ind 738-1** The purpose of a draft EIR is to alert the general public and elected officials to environmental changes before they reach an ecological point of no return. In essence, it is an "alarm bell" to demonstrate to apprehensive citizenry that the lead agency has in fact analyzed and considered all ecological implications of the report. If CEQA is scrupulously followed the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public will be duly informed and can respond accordingly to action to which it disagrees. According to the most cited California Supreme Court in this area held that: "The EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal. 3rd 376, 392, 405).

I believe the report does make an attempt to identify significant environmental effects, and some unavoidable significant environmental effects, but it has not adequately addressed a number of issues that should be identified separately in order for the project to proceed further.

DEFICIENCIES IN EIR PROJECT REPORT

**Ind 738-2** The project readily admits that it will need financing for it to proceed to completion. However, there is no discussion whatsoever of how this financing will be obtained. Rise Gold Grass Valley appears to be a shell company with no significant financial assets for a project of this magnitude. The report does not indicate otherwise.

The report does not indicate the applicant has any financial backing for a project like this to proceed. There are no identified partners or other companies that will be forming any type of joint venture. Such a discussion and an analysis is extremely important in the event that the project has to be shut down for economic or other reasons like it did in 1956, and the public is not left holding the bag and put in the federal Super Fund endless line for eventual remediation.

**Ind 738-3** There's no discussion in the project report as to what the minimum price of gold would have to be for the mining project to remain profitable, if it was opened again. Without such critical information and the history of the applicant operating a project on the scale of this one, this would be critical information necessary for the public to know.

**Ind 738-4** There is no discussion if the applicant has ever successfully operated a project like this adjacent to a residential and commercial community such as Grass Valley. The project in section 4.7 acknowledges that this undeveloped project is next to low density, residential developments and commercial uses.

**Ind 738-5** One of the most critical omissions of the project report is an analysis and discussion of insurance that would be required, and if the applicant is able to even acquire such insurance for a high risk rock mining operation.

**Ind 738-6** No discussion is offered concerning necessary indemnification agreements with the County of Nevada or City of Grass Valley which is in the affected area. There is possible massive environmental disruption this project could cause, including endless class action lawsuits against the county. If the county approved the project, who would be responsible for payment of all the attorney fees, court costs, and expert witnesses to defend the county's position? If the applicant

abandoned the project for any reason, how is the county protected against necessary expenditures for all foreseeable consequences or remediation costs?

**Ind 738-7**

The project proposes a high risk operation which is covered by the strict liability legal standard. There is no analysis or discussion of what type of liability insurance the applicant could obtain. Accordingly, it would be difficult to even get an excess and surplus lines policy as there are few companies that would offer such a policy, such as Munich Re or Lloyd's Group. There is no discussion there is even a preliminary commitment by any adequately capitalized reinsurance company that would be willing to issue a policy that would cover the potential liability this report clearly shows is possible and foreseeable. Even if a policy could be obtained, the retention would be enormous, and as noted above, there is no financial information in the report that would indicate the applicant would qualify for the type of policy and reinsurance needed.

**Ind 738-8**

Another area that would require insurance would be the issue of earth movement. A standard homeowner's policy or commercial policy does not cover damage to property or structures as a result of earth movement. What happens if due to blasting operations, scheduled for twice daily, or dewatering, the buildings nearby suffer damage as a result of earth movement? Who is going to be responsible for obtaining the necessary earth movement endorsement insurance to give peace of mind to nearby residents in case there is damage? Or does the applicant propose to establish a claim bond fund for any claims that may arise whether or not it can be definitively proven if the applicant caused or partially caused earth movement that damaged nearby property?

**Ind 738-9**

Another example is that only a portion of the project proposes to give some nearby residents access to potable water. What type of insurance would be made available to other residents who may be adversely affected by their well operations either by contamination, volume, or quality? Does Rise Gold propose to issue policies to protect such property owners by way of a loss payee endorsement? It is common knowledge that a first party claim or lawsuit has a much greater chance of being resolved in favor of the resident who has a legitimate loss or claim, than a third-party lawsuit in which the claimant must prove actual and proximate causation for any damages for recovery.

**Ind 738-10**

Noticeably absent from analysis is the EIR assertion that there have only been three incidents of fatalities involved in underground mines in the past 25 years, one of which involved "CO poisoning." No discussion was made as to whether or not such mines were in close proximity to residential and commercial infrastructure such as this project. The fact that accidents do occur is even more compelling that a more comprehensive analysis of insurance must be included in a supplemental EIR report.

**Ind 738-11**

It is important to note that the project encompasses approximately 2,585 acres in the area. There's no indication if existing tunnels will be used or if new ones will be drilled, not to mention the discussion of explosion mitigation factors. There is no table or map that I can find that identifies the specific geographic location of the 73 miles of existing tunnels, or map of the 2,585 acres of mineral rights. (sec. 4.7) Nor is there a discussion of specific reclamation procedures and how long it would take to dewater these tunnels and the effect upon neighboring properties in terms of soil compaction and water quality.

**Ind 738-12**

One of the most significant deficiencies in this project report is the economic consequences to nearby businesses and residences. There is no analysis of property values possibly going down because of potential environmental effects, especially noise and traffic congestion. The only economic analysis done was that it would add 300 jobs to the tax base. An analysis and discussion needs to be done with regard to the economic consequences of property values that would counterbalance the positive contribution to the tax base. What type of buyer would want to be nearby? 118 round trips per day truck hauls by any standard, would contribute to traffic congestion, air pollution, and noise pollution that the report acknowledges is unavoidable and not capable of acceptable mitigation. Compounding an already unavoidable consequence of the project, is a lack of discussion as to how far these trucks will travel per day and what areas would be affected other than the ones nearby. No remediation of the noise was even addressed (except prohibiting trucks with Jake Brakes), such as the use of EV trucks that will become widely available in 2024.

**Ind 738-13**

CONCLUSION

The glaring and significant report omissions affecting the environment need to be addressed by ordering a supplemental report with public comment allowed thereafter within 45 days. If a request to intervene by the City of Grass Valley is filed, it should be permitted to participate as a necessary party due to their city residents being within the phase of influence for this project.

Respectfully submitted,

Sterling Honea

City Attorney of Grass Valley

## INDIVIDUAL LETTER 738: STERLING HONEA (1)

### Response to Comment Ind 738-1
The commenter states that the DEIR, as a general matter, is inadequate. Responses to specific comments are provided below.

### Response to Comment Ind 738-2
The commenter states that the Project Applicant has not demonstrated adequate financing for the project. However, this matter does not fall within the scope of CEQA review. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

The project requires an approved Reclamation Plan. To ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably determines are adequate to perform reclamation in accordance with the surface mining operation's approved Plan. (DEIR, p. 4.6-24; Appendix C.)

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other State and federal agencies, those agencies will be responsible for their enforcement.

### Response to Comment Ind 738-3
The commenter states that the DEIR omits any discussion of the price of gold needed to ensure the project is profitable. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 738-4
The commenter states that the DEIR does not discuss whether the Project Applicant has successfully implemented a similar project in the past. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 738-5
The commenter states that the DEIR omits any analysis and discussion of any insurance that would be required. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts, as well as Response to Comment Ind 738-2.

### Response to Comment Ind 738-6
The commenter states that the DEIR omits any analysis and discussion of any indemnification agreements that would be required by the County. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts, as well as Response to Comment Ind 738-2.

## Response to Comment Ind 738-7

The commenter states that the DEIR omits any discussion of any potentially available insurance policies for the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts, as well as Response to Comment Ind 738-2.

## Response to Comment Ind 738-8

The commenter questions how the project will obtain insurance in the event that underground blasting causes damage to structures on the surface. Although the Project Applicant's insurance for the project is not a CEQA matter, all groundborne vibrations calculated for blasting of both drift round and longhole stopes, respectively, fall below the U.S. Bureau of Mines recommendations and the levels at which structural damage to buildings is possible. (DEIR, p. 4.10-54.) Mitigation Measure 4.10-4 requires a Ground Vibration Monitoring Program to ensure the impact from blasting vibrations is less than significant.

As stated on page 4.6-47 of the DEIR, near-surface mine features require closure prior to initial mine dewatering to ensure that collapse does not occur. Mitigation Measure 4.6-3(c) requires the closure of these features prior to mine dewatering. The commenter is also referred to Master Response 29 - Near Surface Workings.

## Response to Comment Ind 738-9

The commenter is concerned about what insurance would be available for residents that lose access to groundwater as a result of the project. The commenter is referred to Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 738-10

The commenter states that a supplemental EIR is required because there have been three mining-related accidents involving explosives and breaking agents in the Country in the past 25 years, and the DEIR does not state whether these accidents occurred in residential or commercial areas. As demonstrated by the DEIR, mining-related accidents involving explosives or breaking agents are extremely rare. (DEIR, p. 4.7-28.) California courts have consistently held that "an EIR is not required to engage in speculation in order to analyze a worst-case scenario." (see *Napa Citizens for Honest Government v. Napa County Bd. Of Supervisors* (2001) 91 Cal.App.4th 342.)

## Response to Comment Ind 738-11

The commenter states that certain project details are not discussed in the DEIR. Proposed underground mining is described on pages 3-18 and 3-19 of the DEIR. The dewatering, including an estimate of time to dewater the mine, is provided on page 3-15 of the DEIR and page 30 of Appendix K.2 of the DEIR. A map showing the mineral rights area is shown on Figure 3-2 of the DEIR. Maps showing the location of existing underground tunnels are provided in Appendix K.2 and K.3 of the DEIR. Impacts from the use of explosives are analyzed in Chapters 4.10 and 4.7 of the DEIR. The Reclamation Plan is provided as Appendix C of the DEIR. Impacts from mine dewatering, including impacts to water quality, are addressed in Chapter 4.8 of the DEIR. Mine dewatering would not affect "soil compaction" of neighboring properties and it is unclear what the commenter is referring to. The commenter is referred to Chapter 4.6 of the DEIR.

## Response to Comment Ind 738-12

The commenter states that the DEIR lacks any discussion of economic impacts from the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts. The commenter also references a number of impacts

that could impact economic values in the area such as traffic and emissions. Traffic impacts are analyzed in Chapter 4.12 of the DEIR. Air quality, including emissions from trucks, is analyzed in Chapter 4.3 of the DEIR. Noise from trucks is less than significant after mitigation. The commenter is referred to Chapter 4.10 of the DEIR.

## Response to Comment Ind 738-13

The commenter states that the DEIR is inadequate and opposes the project. The commenter's opposition to the project is noted for the decisionmakers.

## EIR gold mine

**Sterling Honea** <sterlinghonea@gmail.com>
Draft To: Idaho.MMEIR@co.nevada.ca.us

Wed, Feb 9, 2022 at 6:29 PM

FEB 10 2022
NEVADA COUNTY
PLANNING DEPARTMENT

Mr. Matt Kelley, Senior Planner
Nevada County Planning Department.
950 Maidu Avenue.
Nevada City, California 95959.
Idaho.MMEIR@co.nevada.ca.us

Dear Mr. Kelley,

The following reflects my comments as a resident of the City of Grass Valley with respect to Draft EIR number SCH 20200 -70378, commonly referred to as the Idaho Maryland Mine project (hereafter project).

INTRODUCTION

The purpose of a draft EIR is to alert the general public and elected officials to environmental changes before they reach an ecological point of no return. In essence, it is an "alarm bell" to demonstrate to apprehensive citizenry that the lead agency has in fact analyzed and considered all ecological implications of the report. If CEQA is scrupulously followed the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public will be duly informed and can respond accordingly to action to which it disagrees. According to the most cited California Supreme Court in this area held that: "The EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal. 3rd 376, 392, 405).

I believe the report does make an attempt to identify significant environmental effects, and some unavoidable significant environmental effects, but it has not adequately addressed a number of issues that should be identified separately in order for the project to proceed further.

DEFICIENCIES IN EIR PROJECT REPORT

**Ind 739-1**

The project readily admits that it will need financing for it to proceed to completion. However, there is no discussion whatsoever of how this financing will be obtained. Rise Gold Grass Valley appears to be a shell company with no significant financial assets for a project of this magnitude. The report does not indicate otherwise.

The report does not indicate the applicant has any financial backing for a project like this to proceed. There are no identified partners or other companies that will be forming any type of joint venture. Such a discussion and an analysis is extremely important in the event that the project has to be shut down for economic or other reasons like it did in 1956, and the public is not left holding the bag and put in the federal Super Fund endless line for eventual remediation.

There's no discussion in the project report as to what the minimum price of gold would have to be for the mining project to remain profitable, if it was opened again. Without such critical information and the history of the applicant operating a project on the scale of this one, this would be critical information necessary for the public to know.

There is no discussion if the applicant has ever successfully operated a project like this adjacent to a residential and commercial community such as Grass Valley. The project in section 4.7 acknowledges that this undeveloped project is next to low density, residential developments and commercial uses.

One of the most critical omissions of the project report is an analysis and discussion of insurance that would be required, and if the applicant is able to even acquire such insurance for a high risk rock mining operation.

No discussion is offered concerning necessary indemnification agreements with the County of Nevada or City of Grass Valley which is in the affected area. There is possible massive environmental disruption this project could cause, including endless class action lawsuits against the county. If the county approved the project, who would be responsible for payment of all the attorney fees, court costs, and expert witnesses to defend the county's position? If the applicant

abandoned the project for any reason, how is the county protected against necessary expenditures for all foreseeable consequences or remediation costs?

The project proposes a high risk operation which is covered by the strict liability legal standard. There is no analysis or discussion of what type of liability insurance the applicant could obtain. Accordingly, it would be difficult to even get an excess and surplus lines policy as there are few companies that would offer such a policy, such as Munich Re or Lloyd's Group. There is no discussion there is even a preliminary commitment by any adequately capitalized reinsurance company that would be willing to issue a policy that would cover the potential liability this report clearly shows is possible and foreseeable. Even if a policy could be obtained, the retention would be enormous, and as noted above, there is no financial information in the report that would indicate the applicant would qualify for the type of policy and reinsurance needed.

Another area that would require insurance would be the issue of earth movement. A standard homeowner's policy or commercial policy does not cover damage to property or structures as a result of earth movement. What happens if due to blasting operations, scheduled for twice daily, or dewatering, the buildings nearby suffer damage as a result of earth movement? Who is going to be responsible for obtaining the necessary earth movement endorsement insurance to give peace of mind to nearby residents in case there is damage? Or does the applicant propose to establish a claim bond fund for any claims that may arise whether or not it can be definitively proven if the applicant caused or partially caused earth movement that damaged nearby property?

Another example is that only a portion of the project proposes to give some nearby residents access to potable water. What type of insurance would be made available to other residents who may be adversely affected by their well operations either by contamination, volume, or quality? Does Rise Gold propose to issue policies to protect such property owners by way of a loss payee endorsement? It is common knowledge that a first party claim or lawsuit has a much greater chance of being resolved in favor of the resident who has a legitimate loss or claim, than a third-party lawsuit in which the claimant must prove actual and proximate causation for any damages for recovery.

Noticeably absent from analysis is the EIR assertion that there have only been three incidents of fatalities involved in underground mines in the past 25 years, one of which involved "CO poisoning." No discussion was made as to whether or not such mines were in close proximity to residential and commercial infrastructure such as this project. The fact that accidents do occur is even more compelling that a more comprehensive analysis of insurance must be included in a supplemental EIR report.

It is important to note that the project encompasses approximately 2,585 acres in the area. There's no indication if existing tunnels will be used or if new ones will be drilled, not to mention the discussion of explosion mitigation factors. There is no table or map that I can find that identifies the specific geographic location of the 73 miles of existing tunnels, or map of the 2,585 acres of mineral rights. (sec. 4.7) Nor is there a discussion of specific reclamation procedures and how long it would take to dewater these tunnels and the effect upon neighboring properties in terms of soil compaction and water quality.

One of the most significant deficiencies in this project report is the economic consequences to nearby businesses and residences. There is no analysis of property values possibly going down because of potential environmental effects, especially noise and traffic congestion. The only economic analysis done was that it would add 300 jobs to the tax base. ### Response to Comment Ind 740-1

This letter is a duplicate copy of Individual Letter 738. Please see comments and responses in Individual Letter 738.

**Individual Letter 741**

**From:** Sterling Honea <sterlinghonea@gmail.com>
**Sent:** Wednesday, February 9, 2022 6:34 PM
**To:** Idaho MMEIR
**Subject:** EIR gold mine

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Mr. Matt Kelley, Senior Planner
Nevada County Planning Department.
950 Maidu Avenue.
Nevada City, California 95959.
Idaho.MMEIR@co.nevada.ca.us

Dear Mr. Kelley,

The following reflects my comments as a resident of the City of Grass Valley with respect to Draft EIR number SCH 20200 -70378, commonly referred to as the Idaho Maryland Mine project (hereafter project).

INTRODUCTION

The purpose of a draft EIR is to alert the general public and elected officials to environmental changes before they reach an ecological point of no return. In essence, it is an "alarm bell" to demonstrate to apprehensive citizenry that the lead agency has in fact analyzed and considered all ecological implications of the report. If CEQA is scrupulously followed the public will know the basis on which its responsible officials either approve or reject environmentally significant action, and the public will be duly informed and can respond accordingly to action to which it disagrees. According to the most cited California Supreme Court in this area held that: "The EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project." (Laurel Heights Improvement Assn. v. Regents of University of California (1988) 47 Cal. 3rd 376, 392, 405).

**Ind 741-1**

I believe the report does make an attempt to identify significant environmental effects, and some unavoidable significant environmental effects, but it has not adequately addressed a number of issues that should be identified separately in order for the project to proceed further.

DEFICIENCIES IN EIR PROJECT REPORT

The project readily admits that it will need financing for it to proceed to completion. However, there is no discussion whatsoever of how this financing will be obtained. Rise Gold Grass Valley appears to be a shell company with no significant financial assets for a project of this magnitude. The report does not indicate otherwise.

The report does not indicate the applicant has any financial backing for a project like this to proceed. There are no identified partners or other companies that will be forming any type of joint venture. Such a discussion and an analysis is extremely important in the event that the project has to be shut down for economic or other reasons like it did in 1956, and the public is not left holding the bag and put in the federal Super Fund endless line for eventual remediation.

There's no discussion in the project report as to what the minimum price of gold would have to be for the mining project to remain profitable, if it was opened again. Without such critical information and the history of the applicant operating a project on the scale of this one, this would be critical information necessary for the public to know.

There is no discussion if the applicant has ever successfully operated a project like this adjacent to a residential and commercial community such as Grass Valley. The project in section 4.7 acknowledges that this undeveloped project is next to low density, residential developments and commercial uses.

One of the most critical omissions of the project report is an analysis and discussion of insurance that would be required, and if the applicant is able to even acquire such insurance for a high risk rock mining operation.

No discussion is offered concerning necessary indemnification agreements with the County of Nevada or City of Grass Valley which is in the affected area. There is possible massive environmental disruption this project could cause, including endless class action lawsuits against the county. If the county approved the project, who would be responsible for payment of all the attorney fees, court costs, and expert witnesses to defend the county's position? If the applicant abandoned the project for any reason, how is the county protected against necessary expenditures for all foreseeable consequences or remediation costs?

The project proposes a high risk operation which is covered by the strict liability legal standard. There is no analysis or discussion of what type of liability insurance the applicant could obtain. Accordingly, it would be difficult to even get an excess and surplus lines policy as there are few companies that would offer such a policy, such as Munich Re or Lloyd's Group. There is no discussion there is even a preliminary commitment by any adequately capitalized reinsurance company that would be willing to issue a policy that would cover the potential liability this report clearly shows is possible and foreseeable. Even if a policy could be obtained, the retention would be enormous, and as noted above, there is no financial information in the report that would indicate the applicant would qualify for the type of policy and reinsurance needed.

Another area that would require insurance would be the issue of earth movement. A standard homeowner's policy or commercial policy does not cover damage to property or structures as a result of earth movement. What happens if due to blasting operations, scheduled for twice daily, or dewatering, the buildings nearby suffer damage as a result of earth movement? Who is going to be responsible for obtaining the necessary earth movement endorsement insurance to give peace of mind to nearby residents in case there is damage? Or does the applicant propose to establish a claim bond fund for any claims that may arise whether or not it can be definitively proven if the applicant caused or partially caused earth movement that damaged nearby property?

Another example is that only a portion of the project proposes to give some nearby residents access to potable water. What type of insurance would be made available to other residents who may be adversely affected by their well operations either by contamination, volume, or quality? Does Rise Gold propose to issue policies to protect such property owners by way of a loss payee endorsement? It is common knowledge that a first party claim or lawsuit has a much greater chance of being resolved in favor of the resident who has a legitimate loss or claim, than a third-party lawsuit in which the claimant must prove actual and proximate causation for any damages for recovery.

Noticeably absent from analysis is the EIR assertion that there have only been three incidents of fatalities involved in underground mines in the past 25 years, one of which involved "CO poisoning." No discussion was made as to whether or not such mines were in close proximity to residential and commercial infrastructure such as this project. The fact that accidents do occur is even more compelling that a more comprehensive analysis of insurance must be included in a supplemental EIR report.

It is important to note that the project encompasses approximately 2,585 acres in the area. There's no indication if existing tunnels will be used or if new ones will be drilled, not to mention the discussion of explosion mitigation factors. There is no table or map that I can find that identifies the specific geographic location of the 73 miles of existing tunnels, or map of the 2,585 acres of mineral rights. (sec. 4.7) Nor is there a discussion of specific reclamation procedures and how long it would take to dewater these tunnels and the effect upon neighboring properties in terms of soil compaction and water quality.

2

One of the most significant deficiencies in this project report is the economic consequences to nearby businesses and residences. There is no analysis of property values possibly going down because of potential environmental effects, especially noise and traffic congestion. The only economic analysis done was that it would add 300 jobs to the tax base. An analysis and discussion needs to be done with regard to the economic consequences of property values that would counterbalance the positive contribution to the tax base. What type of buyer would want to be nearby? 118 round trips per day truck hauls by any standard, would contribute to traffic congestion, air pollution, and noise pollution that the report acknowledges is unavoidable and not capable of acceptable mitigation. Compounding an already unavoidable consequence of the project, is a lack of discussion as to how far these trucks will travel per day and what areas would be affected other than the ones nearby. No remediation of the noise was even addressed (except prohibiting trucks with Jake Brakes), such as the use of EV trucks that will become widely available in 2024.

CONCLUSION

The glaring and significant report omissions affecting the environment need to be addressed by ordering a supplemental report with public comment allowed thereafter within 45 days. If a request to intervene by the City of Grass Valley is filed, it should be permitted to participate as a necessary party due to their city residents being within the phase of influence for this project.

Respectfully submitted,

Sterling Honea

### Response to Comment Ind 741-1

This letter is a duplicate copy of Individual Letter 738. Please see comments and responses in Individual Letter 738.

**Individual Letter 742**

Steve and Carolyn Battaini
14027 Liquidambar Ln.
Grass Valley, CA 95945

April 2, 2022

Board of Supervisors
County of Nevada County
950 Maidu Ave,
Nevada City, CA. 95959

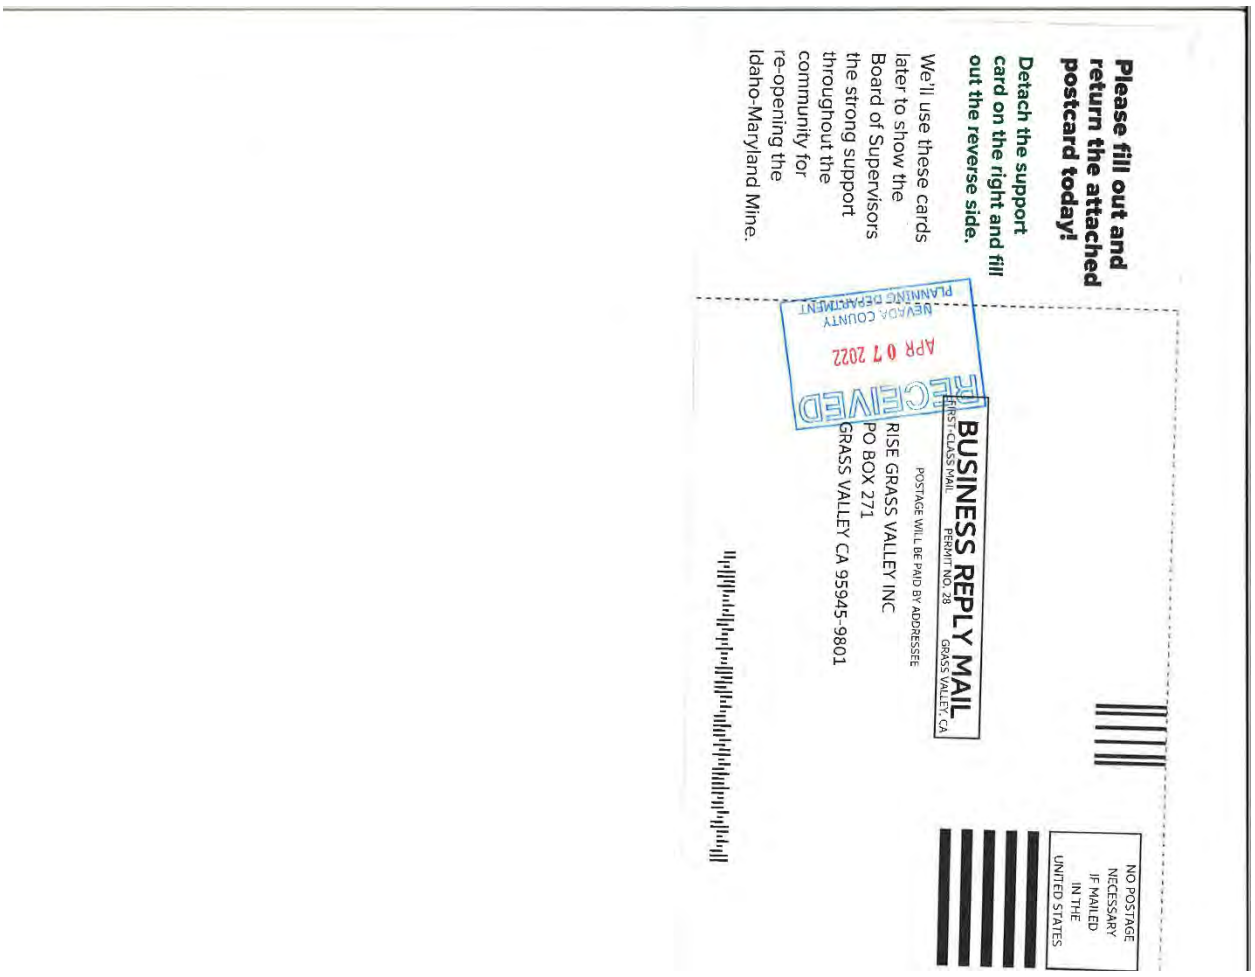
Dear Sirs,

We oppose the Idaho Maryland Mine because it's a short-sighted, profit driven project with long-term consequences for this community, for local flora and fauna, the air, the water, and our quality of life. We also know well the harmful impacts of mining.

Water is the new gold. It's the lifeblood of every living creature. This project will pump it out of our county, into the watershed with the potential of heavy metal pollution to all downstream users.

**Ind 742-1** We are living in a time of climate crisis and ecological emergencies. The idea itself is absurd, let alone the consequences it will have many generations into the future.

This unconscious greed for gold requires no regard to the unforgiving impacts it leaves in the wake of the destructive operations to get it out of the ground, literally, under our homes. In a nutshell, mining devastates communities, water and the environment, and should never be considered an option where people live nearby or downstream.



Please consider the horrible consequences of this ill advised project to the area, California, United States and the world.

Thank you for your consideration.

Sincerely,

Carolyn Battaini

Carolyn & Steve Battaini

**Please fill out and return the attached postcard today!**

**Detach the support card on the right and fill out the reverse side.**

We'll use these cards later to show the Board of Supervisors the strong support throughout the community for re-opening the Idaho-Maryland Mine.

**I support re-opening the Idaho-Maryland Mine.**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

To the planning committee,

As a Nevada city resident I attended the open forum two weeks ago. The level of detail that was glossed over in the report is of great concern. There seems to be highly optimistic appraisals of how limited the pollution – air, water, noise etc. - will be with the mine reopening.

**Ind 743-1** Our priorities should lie with reducing pollution and moving to a carbon neutral city. Allowing the mine to reopen is detrimental, damaging and dangerous for our community.

I urge the committee to reject any proposals to redevelop the
Idaho Maryland Mine.

Yours sincerely

RE: Businesses OPPOSE Rise Gold's proposal to re-open the Idaho-Maryland Mine

Dear Supervisors:

The undersigned businesses respectfully request that you oppose Rise Gold's proposal to re-open the Idaho-Maryland Mine.

**Ind 744-1** Mining is our past, not our future. During the past 50 years, Nevada County has worked diligently to attract people and investments that contribute to and renew its economic vitality through promising and sustainable enterprises which align with the aspirations of its residents. That is what continues to make this County an attractive place to live, to make a living, and to start new business ventures.

**Ind 744-2** Reopening the mine risks a transformation from a community that is a scenic and cultural destination to an industrial town that tolerates excess noise, dust, and truck traffic. It would entail supporting a business that puts precious water resources at risk, generates significant greenhouse gases, and consumes so much energy that it would completely erase the county's plan to reduce the effects of climate change. The mine could become a deterrent for many seeking to build new business opportunities in Western Nevada County, resulting in reduced community investment and property values. We welcome the County's call for an independent economic study of the impacts of the proposed mine and expect that it will include a non-mine alternative.

Rise Gold's promises to inject money into the local economy may sound attractive, but Nevada County can do better by continuing to invest in existing industries as well as new enterprises that address current priorities in the Sierra like watershed and forest management. The Economic Policy Institute Brief cited by Rise Gold actually shows that other industries can produce far better job numbers than mining, including eight industries Nevada County already has today. An economic study commissioned by the City of Grass Valley during Emgold's attempt to reopen the Idaho-Maryland Mine in 2008 concluded that Nevada County would be better off economically if it pursued other opportunities than mining.

An industrial gold mine would not be a constructive addition to our community. The social and economic benefits are far from clear. The environmental impacts are sobering.

**Ind 744-3** We urge you to protect our health, economy, and quality of life. Please deny Rise Gold's application to reopen the Idaho-Maryland Mine.

Thank you for your time and consideration.

Sincerely,

2/2/22

## INDIVIDUAL LETTER 744: STEVE HARTSHORN

### Response to Comment Ind 744-1

The comment does not directly address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Please see Master Response 1. Regarding the generally noted dust concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. In addition, pursuant to Mitigation Measure 4.3-2, the project must ensure that visible dust does not cross the boundary of the property and that the project is in compliance with the approved Asbestos Dust Mitigation Plan and would be required to take whatever necessary measures to ensure compliance.

Regarding noise concerns, please see Chapter 4.10, Noise and Vibration, as well as Response to Comment Ind 733-4; regarding truck traffic concerns, please see Chapter 4.12, Transportation; regarding concerns related to energy consumption, please see Chapter 4.3 and Master Response 25 – Nevada County Energy Action Plan; regarding greenhouse gases, please see Chapter 4.3 and Master Response 27 – Greenhouse Gas Thresholds and Master Response 28 – Greenhouse Gas Credits; and regarding water resources concerns, please see Chapter 4.8 and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 744-2

The comment does not address the adequacy of the DEIR. Economic impact considerations are outside the scope of CEQA - please see Master Response 2.

### Response to Comment Ind 744-3

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and forwarded to the decision-makers for their consideration.

**Individual Letter 745**

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Dear Mr. Kelley

I wish to offer my comments and recommendations on an aspect of the Idaho-Maryland mine project not covered in the Draft EIR. While the DEIR includes Chapter 4.8, Hydrology and Water Quality, the issue of water *quantity* is not addressed either here or elsewhere in the DEIR, as far as I could determine. The subject of water quantity is apropos to the discussion of groundwater in Chapter 4.8, beginning on Page 8 (and perhaps elsewhere as well).

The DEIR fails to adequately address the potential adverse affects of *climate change* on groundwater hydrology. Numerous analyses by federal and state agencies and academic institutions have documented the well established trend of increasing drought in California and the U. S. Southwest. Numerous reports from these sources are warning that our region may be entering a period of drought the likes of which have not been experienced in 1,200 years. Of course, with drought – as we have all witnessed – comes lack of precipitation, precipitation that is necessary to recharge groundwater tables.

**Ind 746-1**

The DEIR cites well water level monitoring data from the periods 1995 – 2001 and 2003 – 2007 (Page 4.8-11). It states that groundwater levels in the 79 wells from which they have records exhibit " . . . seasonal fluctuations . . . between wet and dry times of the year but remain relatively consistent from year to year within each individual well," citing above normal, normal, and below normal water years during the data periods (Page 4.8-12). The DEIR concludes that "**Based on the lack of changes in the individual well hydrographs between wet and dry climatic cycles, the amount of recharge appears to be consistent from year to year and is not affected substantially by drought or wet cycles**" (Page 4.8.-12).

I submit that the limited number of years from which well water level data were obtained were not sufficient to describe the occurrence of climate "cycles." The "below normal rainfall" of 2007 actually was followed by two more drought years (2008 and 2009), and since 2009 we've experienced extended drought periods of five years (2012 – 2016) and now going on another five years (2018 – 2022). Or, to put it more starkly, with the exception of 2017, it can be considered that we are in, essentially, an 11 year "drought cycle."

I believe that the data presented in the DEIR are not adequate to conclude, as the project applicants have done, that groundwater recharge, as it may affect local wells, "is not affected *substantially* by drought" [my emphasis]. At the very

1

minimum the County should require the project applicants to update their well water "quantity" data to include the years since 2009. Further, I believe it is possible that the project sampling area may not be representative of groundwater quantity trends in the region, which may over time affect recharge in the project area. Therefore, I request that the County require the project applicants to include an examination of well water level and groundwater recharge trends over a wider area than that encompassed in the DEIR.

Thank you for your consideration of my comments and recommendations.

Sincerely,

Steve Nicola

**Re: Draft Environmental Impact Report (DEIR) on the Idaho-Maryland Mine Project**

Dear Mr. Kelley,

Thank you for the opportunity to comment on the DEIR for the Idaho-Maryland Mine Project.

**Ind 748-1**

I am concerned that the DEIR does not use the proper baseline to analyze the impacts of the project on the environment. During the 80-year proposed permit period for the project, the Grass Valley/Nevada County region will experience increased flooding, increased wildfire, and increased temperatures, but the DEIR analyzes the projects impacts as if the project will be operating under existing conditions. The direct, indirect, and cumulative impacts of the project in a changed climate will differ from the impacts of the same project under existing conditions. For the DEIR to satisfy its obligations to inform, the DEIR must analyze the impacts of the project in the environment in which it will be operating. Specifically, but not limited to, the analysis of stormwater drainage and air quality are inadequate because the analysis is based on existing conditions rather than on the conditions which are expected during the next 80 years.

**Stormwater Drainage**

**Ind 748-2**

My main concern about the DEIR is its inadequate analysis of the stormwater drainage system. The drainage system is sized for a single, standalone 100-year/24-hour storm event. An event of smaller magnitude than what is predicted to occur. Expert scientists predict stormwater runoff during the 80-year life of the project will exceed the DEIR's 100-year/24-hour event based on climate change modeling for the Sierra Nevada. For instance, reports indicate floods comparable to the Great Flood of 1861-1862 are three times more likely to happen in the next 80 years.[1] During the 1861-1862 flood Nevada City

[1] Swain et al; Speaking about the probability of a deluge the size of the 1861-1862 storm event: "Our results suggest that such an event is more likely than not to occur at least once between 2018 and 2060, and that multiple occurrences are plausible by 2100 on a business-as-usual emissions trajectory. Therefore, recognizing that risks associated with hydroclimatic extremes may rise more rapidly than the gradual projected shift in regional mean precipitation might otherwise suggest will be a critical step in ensuring resilience amid a warming climate."

"Anthropogenic forcing is found to yield large twenty-first-century increases in the frequency of wet extremes, including a more than threefold increase in sub-seasonal events comparable to California's 'Great Flood of 1862'. Smaller but statistically robust increases in dry extremes are also apparent. As a consequence, a 25% to 100% increase in extreme dry-to-wet precipitation events is projected, despite only modest changes in mean

reported snowfall equivalent to 115 inches of rain. At Red Dog the 24-hour maximum rainfall during the 30-day storm was reported at 11 inches. [2] The "double whammy" effect of an Atmospheric River falling on accumulated snow dramatically increases surface runoff.[3]

The proposed drainage system is undersized. The maximum capacity of the proposed drainage system is calculated to contain a 100-year/24-hour storm event which will generate 9.64 inches of rain. (Preliminary Drainage Report p.7) The Preliminary Report does not consider what will happen if that 24-hour event occurs during a month-long event where flooding is exacerbated by warm rains that melt an existing snowpack as occurred during the Great Flood of 1861-1862 and which is predicted to occur again before 2060.

When the region next experiences a flood comparable to the 1861-1862 event, I am concerned that the drainage system proposed for the project will be overwhelmed and could cause a release of hazardous materials into the watershed.

I strongly encourage the County to reevaluate the proposed drainage system assuming storm conditions comparable to the Great Flood of 1861-1862 as the design storm event, not just on the basis of the maximum amount on a single day, but on the basis of a series of precipitation events that occur over a period of weeks; reevaluate how to mitigate the impacts of the project operating in an environment likely to see storm events such as the Great Flood of 1861-1862 and recirculate the DEIR.

Below are my detailed comments on the DEIR:

**The DEIR does not use correct baseline conditions to analyze the impacts of storm water runoff**

**Ind 748-3**

In section 1.3 the DEIR justifies using two environmental baselines to analyze the impacts of the proposed project. For evaluation purposes the DEIR proposes to use either existing conditions or post-remediation conditions depending on the resource topic being evaluated. For Aesthetics, Agriculture and Forestry Resource, Biological Resources, Hazards and Hazardous Materials and Wildfire, the DEIR uses an adjusted environmental baseline for the Centennial Industrial Site purported to reflect the "reasonably anticipated conditions of the site following remediation activities." For all other resource topics existing conditions are the environmental baseline.

The use of these two baselines is inadequate because they do not inform the public and decision makers about the environmental conditions *during* the 80-year life of the project. They only consider the initial conditions at the onset of the project and do not consider climate change and the expectation of

---

precipitation. Such hydrological cycle intensification would seriously challenge California's existing water storage, conveyance and flood control infrastructure."

Huang et al; "The disproportionately large increases in runoff during the most extreme [Atmospheric Rivers] could raise significant challenges for water resource management and flood control. Nearly all rivers draining [Sierra Nevada] watersheds are impounded by reservoirs. During future extreme AR events, the managed or even total storage capacity of those reservoirs could be exceeded by river water volumes that would be unprecedented."

[2] Null, Jan and Hulbert, Joelle (2007, January/February). California Washed Away The Great Flood of 1862. Weatherwise, p.29.
[3] Huang et.al p.7.

more severe storm events. During this period, experts predict the quantity of runoff due to storms will increase as documented in the attached reports. In fact, the DEIR also expects stream flows and flooding to increase during this period (DEIR p. 4.3-16) but does not quantitatively address the impacts. The increase in large pulses of runoff later in the century may cause increased hazards which should be analyzed in the DEIR.

The California Natural Resources Agency advises lead agencies to consider not just existing hazards, but the potential for increasing severity of hazards over time because due to climate change, increased flooding may worsen a proposed project's direct, indirect, or cumulative environmental impacts in the future.[4] According to the decision in *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th439:

> "Consideration of future conditions in determining whether a project's impacts may be significant is consistent with CEQA's rules regarding baseline. "[N]othing in CEQA law precludes an agency... from considering both types of baseline—existing and future conditions—in its primary analysis of the project's significant adverse effects." (*Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal. 4th 439, 454.) "The key... is the EIR's role as an information document." (Id. at 453.)"

For the DEIR to serve its purpose as an information document, I urge the County to use a baseline that considers the storm and flood conditions that will occur during the entire 80-year permit period, update the DEIR accordingly and recirculate the DEIR.

**Ind 748-4**

**Regarding Section 4.8-3: Substantially alter the existing drainage pattern...in a manner which would...create or contribute to runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?**

In the conclusion of Section 4.8-3 the DEIR claims that peer analysis by West Yost concurs with the drainage analysis by EMKO. However, the EMKO numerical model is only based on the 100-year/24-hour storm event and does not consider the impact of the larger storm events expected with climate change. West Yost concurs the analysis is adequate based on the assumptions made for the model but recommends a reassessment of those assumptions. Significantly, but not acknowledged in the DEIR, West Yost concludes its peer review report by stating, "Rise should evaluate whether the time frame evaluated in the numerical model adequately addresses the proposed 80-year duration of permitted activities."[5]

Please require the design storm event of the DEIR be updated to reflect the environmental conditions which will exist during the 80-year duration of the project; re-analyze the impacts of the project in the relevant environment and recirculate the DEIR.

[4] California Natural Resources Agency, "Final Statement of Reasons for Regulatory Action Amendments to the State CEQA Guidelines" p.39

[5] West Yost Peer Review of Groundwater Hydrology and Water Quality Analysis and Groundwater Model Reports for the Idaho-Maryland Mine Project p.19

**Regarding Mitigation Measure 4.8-3**

Section 4.8-3 concludes the project's stormwater facilities design will avoid significant impacts associated with the potential to result in or contribute to runoff water exceeding storm drain system capacity. The impact, however, is nevertheless considered significant in the DEIR because The Preliminary Drainage Report does not meet the requirements for regulatory compliance to reduce the impact to less than significant. Specifically, the DEIR presents a confusing set of steps for assuring that drainage is adequate for the magnitude of storm drainage events. As a mitigation measure, the DEIR proposes generation of a Final Drainage Report which will "demonstrate that the on-site storm drain systems are sized such that site runoff (in addition to treated mine discharge for the Brunswick Industrial Site) under the post-development condition will not exceed pre-development levels in the downstream channel(s) during the design storm events."

Does this mean Rise will generate a Final Drainage Report which will simply confirm the conclusions of the Preliminary Drainage Report, or will the Final Drainage Report meet regulatory compliance requirements and independently propose the necessary parameters of the drainage system? If the Final Drainage Report is generated to simply confirm the conclusions of the Preliminary Drainage Report, I don't understand how that is a sincere effort to mitigate potential significant impacts.

**Ind 748-5**

The mitigation measure should ensure not only that storm flows post-development do not exceed the storm flows of pre-development levels; but also, that the project does not release pollutants into the watershed while dewatering the mine during storm events like those of the 1861-1862 Great Flood. If the Final Drainage Report proposes a drainage system with different parameters than the Preliminary Drainage Report, that system must be subject to environmental review. Allowing approval of the EIR before complete analysis is concluded deprives the public and decision makers from reviewing the potentially significant impacts of the whole project.

The mitigation measure does not set out clear performance standards as required by CEQA for what the future mitigation must achieve. Significantly, the mitigation measure proposes to use the "design storm event" as a basis for its calculations. The DEIR does not define "design storm event." Assuming it is the 100-year/24-hour event, as discussed above, it is inadequate.

Why defer this mitigation measure until after project approval? What is the design storm event? If the Final Drainage Report does not concur with the Preliminary Drainage Report what will be the result? Beyond generation of a report, it is unclear what enforceable measures mitigation measure 4.8-3 contains. A deferred report is not a sufficient mitigation measure.

I urge you to require the Final Drainage Report be prepared for environmental review as a part of the DEIR using the Great Flood of 1861-1862 as the design storm event; update the DEIR accordingly and then recirculate the DEIR.

**Impacts of a Storm Event like the Great Flood of 1861-1862**

**Ind 748-6**

Attached documents describe the large storm events California may experience during the 80-year life of the project. My main concern is how the project's proposed drainage system will perform during these events.

The stormwater drain system of the Idaho-Maryland Mine is tasked with managing and treating mine water discharge in addition to the volume of water that falls during storm events. The DEIR explains ground water must be continuously pumped out of the underground mine:

"•Ground water continually flows into the underground mine. If the water is not pumped out, the water would very quickly flood the lowest tunnels. Flooding would destroy electrical equipment that was left in place and cause increased work and material waste when the workings would be again dewatered.
• The ventilation system must be continuously on in order to provide airflow through the underground workings. Continuous operation of the ventilation system is necessary to provide a safe environment underground.
• The compressed air system for the underground mine is important for emergency situations where the ventilation system could fail or a fire occur underground and therefore must be kept operational.
• Electric locomotives need to remain functional at all times to move persons and equipment from working headings to the shafts.
• Underground lighting at certain key locations is necessary for safety.
• The hoists must be available for use to move personnel and equipment from the underground to surface. If the hoists did not function the workers would be trapped underground.
• The processing plant recirculates water and ground minerals through the processing systems. The slurry of water and ground minerals must be constantly agitated so that the solids do not settle. If the recirculation machines are turned off during operations, the sand would settle in all of the tanks and pipes which is very costly and time consuming to remediate.
• *The water treatment system must remain functional so that water can be treated and discharged." (emphasis added)* (DEIR page 4.3-103)

Given the urgency of keeping the tunnels dewatered, what size pumps does Rise propose to use? Will Rise size their pumps to manage a 100-year/24-hour event like the storm water drainage system? Or will Rise protect its investment with pumps capable of conveying the groundwater that might infiltrate the mine during the large storms predicted to occur in the next 80 years? Will the water treatment and stormwater drainage system be able to manage an 1861-1862 event? If not, will the project release pollutants into the watershed? If Rise uses pumps sized for a 100-year event which fail to dewater the mine during a larger storm event, will the water treatment system fail; will the mine become inoperable; will the project release pollutants into the watershed? If a large storm event overwhelms the drainage system, where will the water being pumped out of the mine go? What will be the impacts to downstream users and infrastructure, biological, agricultural, water quality and forestry resources? If electrical power is unavailable during a large storm event, will air quality be impacted by the use of gas pumps? The answers to these questions must be presented to the public and decision makers during environmental review.

**Air Quality**

**Ind 748-7**

The DEIR analyzes the impacts on air quality of the project as if existing conditions are constant over the next 80 years. We know this will not be the case. A recent study, "Increasing co-occurrence of

fine particulate matter and ground-level ozone extremes in the western United States" by Kalashnikov, et al, (attached) details the hazards to the environment and human health of the co-occurrence of fine particulate matter and ground-level ozone. It details the climatological and meteorological conditions which are causing increased chances of elevated concentrations of both air pollutants to occur simultaneously from July through September. The proposed project will contribute considerable amounts of these pollutants to the environment against the background described not the background assumed in the DEIR. The DEIR analysis does not consider how the project's discharges will add to the concentration of fine particles and ozone existing because of meteorological changes and wildfires that will occur in the next 80 years. The DEIR's conclusion that the project will not contribute to significant impacts or significant cumulative impacts to air quality, therefore, are suspect.

In an updated DEIR I strongly urge you to reevaluate the environmental impacts to air quality of the Idaho-Maryland Mine project taking into consideration the air quality the region will experience over the next 80 years due to the co-occurrence of high temperatures and wildfires as the baseline.

**Conclusion**

**Ind 748-8**

For the DEIR to serve its purpose to inform, I request you reevaluate the environmental impacts of the Idaho-Maryland Mine project using the conditions that will occur during the 80-year permit period as a baseline for analysis.

Thank you for your consideration,

Stevee Duber
Former Sierra County Planner and former CEO of the High Sierra Rural Alliance

## INDIVIDUAL LETTER 748: STEVEE DUBER

### Response to Comment Ind 748-1

The commenter asserts that the baseline used for the DEIR is incorrect because it does not account for climate change and changing conditions that will occur during the 80-year project operation. With regard to climate change, there is no consensus on how climate change will affect groundwater recharge and numerous other areas of concern, so analysis based on varying climate change predictions would be speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As analysis of climate change scenarios, when there is no consensus on how climate change will affect the project site, would be speculation, this analysis is not required by CEQA. Further, the DEIR already analyzes varying climate conditions such as large storm events and multiple drought year scenarios, so the analysis already is responsive to the commenter's concerns. Finally, while the commenter states that use of existing conditions as the baseline is incorrect, CEQA Guidelines Section 15125 states that existing conditions "will normally constitute the baseline physical conditions by which a Lead Agency determines whether an impact is significant."

### Response to Comment Ind 748-2

The commenter asserts that the storm events analyzed by the DEIR in order to size the storm water basin and drainage infrastructure are too small, and the DEIR should instead look at the great flood of 1861-1862. As stated in Appendix K.5 of the DEIR, the drainage calculations and detention basins are specifically designed to respond to the drainage requirements of the County of Nevada. The Nevada County drainage requirements indicate that new storm drain systems and channels shall be designed to convey the 10- and 100-year, 24-hour storm events. Furthermore, the California Surface Mining and Reclamation Act (SMARA) states that erosion control methods shall be designed for the 20-year, 1-hour storm and shall control erosion and sedimentation during operations as well as after reclamation is complete (see CCR Title 14, Section 3706). The 2-, 10-, 25-, and 100-year, 24-hour storm events were analyzed in this report, which more than satisfies the Nevada County requirements. Since the 100-year, 24-hour event is greater than the SMARA required 20-year, 1-hour event, the 100-year, 24-hour results will provide a greater factor of safety in the drainage design. Analysis of larger storm events would be speculation and is not required by CEQA. (CEQA Guidelines Sec. 15384.)

The engineered fill and mine water would not be classified as hazardous waste as discussed in the DEIR (see 22 CCR section 66261.3 for the definition of hazardous waste).

### Response to Comment Ind 748-3

Please see Response to Comment Ind 748-1 with regard to the commenter's assertion that the baseline should include climate change effects. Regarding the different baselines used in the DEIR, the County uses an adjusted baseline for the Centennial Site in certain resource sections, because the Centennial Site will need to be cleaned up under a separate DTSC project prior to any project activity taking place on that site. If the DTSC clean up project is not completed, the project will not affect the Centennial Site. As such, analysis of the project's impacts based on existing conditions would be misleading to the public and decision makers for certain resource sections, as the project would only impact the Centennial Site after the DTSC cleanup project is implemented. Please see Chapter 1.3 of the DEIR for a full explanation of the different baseline approaches used for the project. As stated in the DEIR, "An agency may, where appropriate,

adjust its existing conditions baseline to account for a major change in environmental conditions that is expected to occur before project implementation." (DEIR, p. 1-4.) Further, CEQA Guidelines Section 15125(a)(1) states that, "…where necessary to provide the most accurate picture practically possible of the project's impacts, a lead agency may define existing conditions by referencing historic conditions, or conditions expected when the project becomes operational, or both, that are supported with substantial evidence."

## Response to Comment Ind 748-4

The commenter cites a comment from the County's independent expert, West Yost, for the argument that the DEIR should analyze larger storm events. However, the quote from West Yost referred to by the commenter references the numerical model used for the prediction of groundwater drawdown and not the drainage analysis**.** As such, this comment from West Yost was taken out of context and does not relate to stormwater flow.

The drainage calculations and detention basins are specifically designed to respond to the drainage requirements of the County of Nevada. Please see Response to Comment Ind 748-2.

## Response to Comment Ind 748-5

The Final Drainage Report will take into account the engineering details of the proposed drainage improvements which will be included in the application for grading and building permits. Therefore, the Final Drainage Report is a refinement of the Preliminary Drainage Report included in the DEIR. The approval of a Final Drainage Report is an administrative action not required to be analyzed under CEQA. The Preliminary Drainage Report is provided to allow the County to analyze the project's impacts, but a final engineered drainage report is not required to be included in an EIR under CEQA. California case law provides that engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.) The DEIR clearly defines the 100-year storm event as the requirement for Nevada County hydrology and hydraulics standards (see page 4.8-82 of the DEIR). The Final Drainage Report will meet the Nevada County hydrology and hydraulics standards, and as stated in Mitigation Measure 4.8-3, the project water discharge under post-development conditions must not exceed pre-development conditions; therefore, the mitigation measure provides clear performance standards and is not deferred mitigation.

## Response to Comment Ind 748-6

The commenter speculates that a large storm could flood the mine causing the pumps to not keep up with the infiltrating water, resulting in water quality impacts and impacts to biology, agriculture, infrastructure and forestry. Likewise, the commenter asks whether there would be air quality impacts from gas pumps used to dewater the mine if there is a power outage during a storm event.

As an initial point, the commenter's claim that the mine could suddenly flood due to a storm event is not accurate, as the mine shafts are designed such that they would not be subject to flooding, and the infiltration of groundwater through bedrock into the underground mine works is an extremely slow process, not one that is impacted by heavy rainfall events. A 100-year storm would have limited effect on the underground mine because the openings to surface would be limited to the Brunswick and Service shafts, which would be graded to prevent surface run-off from entering the shafts. Further, there is no history of the mine ever being flooded by large storm events; rather, the mine only flooded when the pumps were turned off for long periods of time. As such, the commenter's statements are speculation and do not require analysis in the DEIR. (see CEQA Guidelines Section 15384.) Contrary to the commenter's statement, the storm water detention pond and associated facilities are not tasked with managing and treating mine water discharge. Mine water is placed in the water treatment pond and not in the storm water detention pond.

The pumps will be sized as necessary for dewatering and ongoing maintenance of water levels in the mine. The majority of other historic shafts connected to the mine are currently or proposed to be closed before mine watering, which limits water inflow from the surface into the underground mine workings.

The site drainage plan for the Brunswick Site routes the majority of precipitation run-off from the site to the storm water detention basin, as shown in Drawing H-4 of Appendix K.5. Section 4.5 of Appendix K.2 discusses the 6.4-acre catchment area where precipitation would inflow into the water treatment pond and confirms that the designed freeboard volume is more than adequate to retain the runoff from a 100-year storm event. An emergency overflow spillway prevents water from overflowing the water treatment pond berm and mitigates the risk of catastrophic overflow or failure of the pond walls caused by rapid erosion. The detention pond outlet structure also has an emergency overflow at the top of the open culvert to prevent the pond from overflowing (see page 12 of Appendix K.5). Any emergency spill during a storm larger than a 100-year storm would be primarily precipitation and therefore any release of pollutants (iron and manganese in mine water) would be heavily diluted and inconsequential in relation to the enormous water flows and runoff during such an event. The project includes backup power generators capable of powering the entire mine operation in the event of a power disruption. No gas pumps are proposed for the project.

## Response to Comment Ind 748-7

The commenter asserts that the existing baseline conditions included in the DEIR should have considered meteorological changes and wildfires that may occur in the next 80 years. The State CEQA Guidelines Section 15125 provides the following guidance for establishing the baseline:

> An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant.

The baseline is not based on potential changes to the environment (such as meteorological changes and wildfires) that may or may not occur over the life of a project. These potential changes are speculative, and the CEQA Guidelines state that if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145). Please see Response to Comment Ind 748-1.

## Response to Comment Ind 748-8

This comment summarizes the commenter's prior comments and questions. Please see Responses to Comments Ind 748-1 to Ind 748-7.

**Individual Letter 749**

**From:** Steven Millard <s.millard95945@gmail.com>
**Sent:** Saturday, April 2, 2022 6:04 PM
**To:** Idaho MMEIR
**Subject:** I. M. Mine Reopening issues

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 749-1** Of course the water issues are at the top of the priority list, loss of well water & pollution are high on the agenda as well as air pollutants in the form of particulates like asbestos & silica dust floating in the air lodging in the lungs making people sick & die anywhere around the noisy mining operation.

**Ind 749-2** I believe that the affect on traffic on Brunswick road is not properly addressed as traffic has grown on this road & moves up the hill at a good clip & they are claiming minimal impact when in fact trucks hauling mine rock will be turning on either Whispering pines with a growing business park & anticipated heavier traffic on a roadway that is already well worn & in need of replacement also there are times in winter months when Brunswick rd is impassable due to snow & ice & the chance of a runaway truck sliding out of control down Brunswick is frankly a horrifying thought.
The trucks will either be turning in front of on coming traffic at Whispering pines or Idaho Maryland which after Sutton is yet another well worn road already in need of replacement all of the way to the roundabout.
At the bottom of the Brunswick hill Idaho Maryland road is a winding narrow road running dangerously close to wolf creek before the stop at Sutton way with many semi trucks going in the opposite direction along with residential traffic commuters & hospital traffic adding to the likelihood that there will be collisions along that route.

**Ind 749-3** I have recently seen a map showing the existing mine footprint & it comes within feet of my property along Burma road putting my well in jeopardy as well & along Rattlesnake road as far as highland blvd.
When I spoke with M-gold who sold the rights to Rise gold they told me that I was out of the area of where they would have to be concerned about well issues & I now know that was a lie & I don't like being lied to about matters of this magnitude so I am understandably skeptical to say the least & I am firmly in opposition to the reopening proposal!
It's just not a good fit for this retirement community.
Thank you. Steven Millard 13055 BlueJay Hill Road GrassValley ca 95945

## INDIVIDUAL LETTER 749: STEVEN MILLARD

### Response to Comment Ind 749-1

The commenter is concerned with impacts to private wells and air pollution but does not state specifically how the DEIR is inadequate. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

Regarding air pollution, air emissions, including silica and asbestos, are analyzed in the DEIR and are less than significant after mitigation. The commenter is referred to Chapter 4.3 of the DEIR, Master Response 21 - Conservatism of Silica Assumptions, and Master Response 22 - Conservatism of Asbestos Assumptions. The DEIR analyzes noise impacts in Chapter 4.10.

### Response to Comment Ind 749-2

The commenter states that the DEIR is inadequate regarding traffic-related impacts on Brunswick Road. Traffic impacts, including cumulative impacts, have been analyzed in Chapter 4.12 of the DEIR. As stated on page 4.12-89 of the DEIR, TJKM's peer review also notes the presence of "ICY" signs on Brunswick Road, north of the Brunswick Industrial Site, also implies difficult traffic conditions during periods of inclement weather. Loaded trucks on the downhill section of Brunswick Road, approaching the Loma Rica Drive signals during poor weather, should be addressed. As mentioned above, this portion of Brunswick Road is already regularly used by heavy-duty haul trucks. An approximate length of just over 900 feet exists from the crest of the hill on Brunswick Road to its down grade intersection with Loma Rica Drive. As is currently the case, it is incumbent upon individual truck drivers to drive with caution during periods of inclement weather.

### Response to Comment Ind 749-3

The commenter is concerned about impacts to the private well on the commenter's property. The commenter is referred to Master Response 13 - Historic Hydrogeologic Assessments, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

The commenter is opposed to the project and states it is not a good fit for the community. The commenter's opposition to the project is noted for decision makers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

# THE IDAHO-MARYLAND MINE: A PROUD HISTORY

The Idaho-Maryland Mine was one of the most productive and best-known gold mines in the United States, producing approximately 2.4 million ounces between 1866 and 1956. The mine closed in 1956 as the fixed price of gold at $35 per oz made the mining of American gold unprofitable.

NO MINE

Rise Grass Valley will reinitiate mining and will do so with a focus on green-friendly practices and minimizing the impacts to neighbors. The project will use modern, clean, state-of-the-art mining equipment and proven techniques to produce "green gold." The result is a project that has no significant impacts to water, air quality, and the natural environment or from noise or vibrations during operations.

When in full operation, Rise Grass Valley's Idaho-Maryland Mine project will create hundreds of good-paying jobs and realize broad economic benefits for Nevada County.

Ind 750-1

**Please fill out and send back to us your support for the Idaho-Maryland Mine**

## I support re-opening the Idaho-Maryland Mine

X OPPOSE

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Hello,

**Ind 751-1** Allowing the mine to reopen and rebuild is a terrible idea. The potential to disturb or pollute groundwater for such a large population of people is too high considering the continuing drought and unknown future impacts of climate change.

**Ind 751-2** Traffic would be impacted, noise levels would be too high from constant trucks, and our roads would be torn up and filthy.

**Ind 751-3** This company does not have a good record of managing the environmental impact of it's mining productions -- mining, in general, should no longer be allowed in an area that is as populated as Grass Valley due to the health and environmental impacts. It went bankrupt running a project much smaller in scope! I have no faith in their ability to manage this project in a way that is not detrimental to Nevada County.

Please do not allow this to move forward!

Summer Scanlan

To Matt Kelley, Senior Planner,

In The Union December 24, 2020, there was a full-page Christmas letter ad by Rise Grass Valley's Ben Mossman. He assures readers his goldmine won't have any ill effect on Grass Valley. He used old time photos of miners to conjure nostalgia for the old days. He invited readers to send him a letter, providing his email. So while, I am against the plan to re-start the old Idaho Maryland Mine, since he listed his email address and invited our letters, I decided to send Mr. Mossman an email.

My letter's focus was to suggest another way to develop that property, something other than a goldmine. The alternative idea would be more beneficial to the community. What if he took all the money he would use to re-start the goldmine and think of something that would be beneficial to the community? A marketplace, a park, a clean energy park, a staging location for CalFire, so many good options.

**Ind 754-1**

It's now two years since I was invited to write my email to Rise Grass Valley. Since then I've received two 11x14 glossy full-color promotional pamphlets mailed to my house touting the greatness of re-opening of the Idaho-Maryland Mine. His approach now is to show clean streams of water with a man washing his face in it, a young blond woman outfitted as a smiling miner - really? While he asked for my email two years ago, apparently, he didn't want to hear from me and didn't think it might offend me to send me these promotional materials.

As a resident of Grass Valley, I feel like I've been terrorized for two years, never knowing for sure if this mining might be accepted and start wreaking havoc in our beautiful town. Since I live nearby, I would be able to hear the rock grinding and explosions, I would have to drive with the mining truck traffic, my well water may be affected with the suction of water by Rise Grass Valley, my property value will decrease. Recently I had a rock hit and crack my windshield from a truck driving by my car on 174. More trucks on 174 would be disastrous for so many reasons.

What if he took all the money he would use on drills, trucks, explosives and gasoline and instead enhance the beauty of the area with — how about a Mossman Park? It could be a beautiful tribute to the old mine but with an Earth friendly park that teaches about local flora and fauna while honoring the area's mining history, how about a farmers market, a playground? Does Ben Mossman own this property? Will he ever change his mind? How do we get out of this mess?

Ben Mossman and Rise Grass Valley do not respond to the community, I can attest to that. Their PR company schemes to deceive us into thinking the community supports this. God forbid a problem arises with the gold mine — and any sort of issue could develop from explosions alone — we can't expect this company to care as much as we do about our land, to have any motivation to correct problems. This will be in our hands, and the hands of the supervisors to correct, for 80 years, what a mess this will be.

Please stop Rise Grass Valley from gold mining here. In fact, please stop all future gold mining proposals here, what a waste of time this has been for the community to deal with this possible destruction when we could be spending time doing positive things.

Sincerely,

Susan Brandt Blachley

13784 Crawford Lane

Grass Valley, CA 95945

## INDIVIDUAL LETTER 754: SUSAN BRANDT

### Response to Comment Ind 754-1

Regarding the commenter's suggestion of various alternatives, it is noted that the DEIR evaluates alternatives to the proposed project in Chapter 6. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers.

Regarding operational noise concerns, please see Response to Comment Ind 733-4. Regarding well water concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. Property value concerns are outside the scope of CEQA – please see Master Responses 1 and 2.

SR 174 is not a proposed truck haul route for the project. Please see Response to Comment Ind 704-4.

Regarding the generally noted explosion concerns, please see Chapter 4.7, Hazards and Hazardous Materials.

The commenter's opposition to the proposed project has been noted for the record, and forwarded to the decision-makers for their consideration.

**Ind 755-1**

Ray Bryars' article today sums up what we've all been concerned about the opening of the Idaho Maryland mine but have not investigated. I object to the mine reopening, but have the usual non-information about noise, traffic, etc. impacts. Mr Bryars has researched the histories of significant mine explosions around the world so he has real insight into one huge reason why we should deny this project.

RE: Rise Gold Mine

March 15, 2020
339 Clay St.
Nevada City Ca 95959

Planning:

**Ind 756-1**

Rise Gold is supposedly doing everything right in the reopening of the Idaho Maryland mine.

They've checked all the boxes but that doesn't mean that their property is the best use of the land. Yes, they own it and it is zoned properly, but let's assume they've thought of another use for the mine site: perhaps a nuclear reactor or a military storage facility with bombs and artillery. Nuclear waste would certainly be a good place for a defunct mine. Rise Gold could still do all the mitigation and provide jobs, but where is the use permit? That's what an EIR is supposed to cover.

Please say no to this project.

Sincerely
Susan Graf

## INDIVIDUAL LETTER 756: SUSAN GRAF (2)

### Response to Comment Ind 756-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. The commenter's opposition to the proposed project has been noted for the record, and forwarded to the decision-makers for their consideration.

**Individual Letter 757**

**From:** Susan Jaffe
**To:** Idaho.MMEIR@co.nevada.ca.us
**Subject:** comments about proposed mine
**Date:** Sunday, April 3, 2022 3:14:32 PM

**Ind 757-1** I live less then a mile from the proposed Idaho Maryland mine. My husband and I and all our neighbors are totally against the opening of this mine. With all we have been throught these last 2 years, covid, threat of fires and smoke, adding mine worries is unthinkable. There is the issue of noise, traffic near our home will be constant. Air pollution, dust and truck hauling unacceptable with issues of climate change that threaten our area, as well as pollution coming up the hill from Sacramento. Possibility of losing our wells is devastating. Reduction of property values, which we are told is already happening because of threat. The area proposed is residential and totallly inappropriate for a mine and will affect wildlife and peace and tranquillity. I could go on and on. We hope the council listens and hears what so many of us feel so passionate about. No mine please. Not now or ever. Thank you for your attention. Susan Jaffe and George Marks, 13974 Glenn Pines Rd, Grass Valley, Ca 95945

## INDIVIDUAL LETTER 757: SUSAN JAFFE

### Response to Comment Ind 757-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition and concerns related to the proposed project. Please see Master Response 1. Regarding noise concerns, please see Chapter 4.10, Noise and Vibration, as well as Response to Comment Ind 733-4; regarding traffic concerns, please see Chapter 4.12, Transportation, which determined that all project-related traffic impacts could be fully mitigated except impacts at SR 174/ Brunswick Road (level of service impact) and Brunswick Road/Sutton Way (queuing impact in cumulative scenario); regarding the generally noted dust concerns, please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. In addition, pursuant to Mitigation Measure 4.3-2, the project must ensure that visible dust does not cross the boundary of the property and that the project is in compliance with the approved Asbestos Dust Mitigation Plan and would be required to take whatever necessary measures to ensure compliance.

Regarding climate change, please see Master Response 16 – Drought and Climate Change.

Regarding well impact concerns, please see Chapter 4.8 and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

Property value concerns are outside the scope of CEQA – please see Master Responses 1 and 2.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 758-1**

My name is Susan Kemp, and I own a home at 122 Stanford Ct. Grass Valley, CA 95945.

First off, I want to thank you for giving our community many opportunities for input regarding such an important issue as Rise Gold. My major concerns and worries about the environmental report are as follows. First, is the noise I believe will be associated with a mining operation. Due to the increased freeway noise in the Cypress Hills area, I am disheartened by the possibility that the constant roar of mining trucks will exacerbate an already existing and growing noise problem. In addition, what about wear and tear upon our roads? Second, our water is a resource more valuable than gold, when one considers an enduring drought that has plagued our community as well as the entire West Coast. Pumping vast amounts of water into our creeks must certainly affect our aquifers. It's not enough for Rise Gold to tell the most affected that their problems will be mitigated. How will such a huge drainage of a much needed resource affect a much larger area? Third, what about the air quality? We already get enough smog and pollutants from the valley. It worries me to think that even the tiniest amount of asbestos, for instance, could linger in the air and affect our community's health. And this mining operation is to last 80 years? Fourth, I believe the aesthetics of the area will be hampered immeasurably. I don't want to live where I see swaths of trees cut down to make way for enormous piles of tailings. I don't want to see glaring mine lights that hide the stars. I want to see clear streams, catch glimpses of wildlife- - yes, even the willow flycatcher. I want to breathe in clean air and experience quiet. So do many, many others. Let's not trade the "gold" we have now for a mining operation that is fraught with so many environmental negatives. Thank you.

1

## INDIVIDUAL LETTER 758: SUSAN KEMP

### Response to Comment Ind 758-1

The comment does not address the adequacy of the DEIR, but rather expresses general concerns regarding the proposed project. Regarding haul truck noise, DEIR Impact 4.10-2 concluded all noise generated from engineered fill placement and compaction, and noise associated with haul truck operation (excepting potential jake brake use) and worker trips during this period, would remain below the applicable noise standards. Noise generated from hauling fill from the Brunswick Industrial Site to the Centennial Industrial Site could exceed local standards if jake brakes are used. Thus, Mitigation Measure 4.10-2 is included in the DEIR to reduce this impact to a less than significant level.

Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the Project Driveway and Brunswick Road. (DEIR, p. 4.12-91.)

Regarding water and drought concerns, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells and Master Response 16 – Drought and Climate Change.

Regarding discharge of treated groundwater, please see Master Response 35 – Discharge to South Fork Wolf Creek.

Regarding asbestos concerns, please see Response to Comment Ind 686-2.

Regarding aesthetics concerns, the DEIR already concludes that the project would substantially degrade the existing visual character or quality of public views of the project sites or the site surroundings (page 4.1-22). Implementation of Mitigation Measure 4.1-2 would reduce the significant impact by requiring more dense plantings along the project frontages to screen project structures to the maximum extent feasible. However, given the proposed heights of the structures and the permanent alteration of the views, the impact would remain significant and unavoidable. In addition, as stated on page 4.1-29, long-term changes in visual character associated with the project in combination with cumulative development, is cumulatively considerable and significant and unavoidable.

The commenter's opposition to the proposed project has been noted for the record, and forwarded to the decision-makers for their consideration.

**Individual Letter 759**

## IDAHO-MARYLAND MINE PROJECT
## DRAFT EIR COMMENT FORM

To document the author of comments received, please provide the following information. Thank you.

Name: Susan Merrill

Address: 115 Union Jack #47, GV, 95945

Organization (if applicable): UUCM Social Justice Task Force

Please provide us with your written comments on the Idaho-Maryland Mine Draft EIR by **5:00 PM, April 4, 2022**. Comments may be placed in the comment box located in the back of the Board of Supervisors Chambers during the Special Public Meeting of the Nevada County Planning Commission. Written comments may also be submitted (email or hardcopy) to the address below:

PLANNING DEPARTMENT

**Ind 759-1**

Almost 50 items that say will have significant impact. ~~that~~ Rise says it will submit the mitigation reports at "a later date." These should not be in the DEIR.

## INDIVIDUAL LETTER 759: SUSAN MERRILL

### Response to Comment Ind 759-1

All project-related impacts could be reduced to a less than significant level through implementation of mitigation with a few noted exceptions. As noted in Chapter 5 of the DEIR, the proposed project would result in significant and unavoidable impacts related to aesthetics (substantial degradation of the existing visual character or quality of the site and its surroundings), and transportation (intersections of SR 174/Brunswick Road and Brunswick Road/Sutton Way). The DEIR provides substantial evidence that all other impacts would either be less than significant or less than significant with implementation of the mitigation measures incorporated into the DEIR. These mitigation measures will be made enforceable by state law through adoption of the mitigation monitoring and reporting program, included as Chapter 4 of this Final EIR.

The commenter's reference to an applicant statement that mitigation reports will be submitted at a later date is unclear. The comment has been noted for the record and forwarded to the decision-makers for their consideration.

**Individual Letter 760**

absolutely do NOT

## I support re-opening the Idaho-Maryland Mine

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

EIR "solutions/mitigations" are completely inadequate

## INDIVIDUAL LETTER 760: SUSAN REYNOLDS

### Response to Comment Ind 760-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. The commenter's opposition to the proposed project has been noted for the record, and forwarded to the decision-makers for their consideration.

**Individual Letter 761**

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Av. Ste. 170
Nevada City CA 95959

Susan Turney
Edward Sherman
15385 Nancy Wy
Grass Valley CA 95949

We are not in favor of re-opening the Idaho-Maryland Mine for the following reasons:

Rise Gold issued a press release on 2/8/22, available to read on NASDAQ. com based upon the result of their recent postcard survey sent to "selected" Nevada County residents, " showing strong support" for re-opening the mine. The press release is full of forward-looking statements such as" expect, plan, project, believe." The results of re-opening the mine may materially differ from these statements, and Rise Gold is under no obligation to update these anticipatory statements.

**Ind 761-1** It appears Rise Gold is attempting to attract investors to buy stock in their golden jackpot fantasy during the current inflationary period. Gold trading and gold futures, being market driven, offer no long term stability to the projected 80 year operation of the mine. The mine operation is, in fact, the extraction of non-renewable resources, using vast quantities of non-renewable resources, and then shipping the extracted resources out of Nevada County. This produces nothing of inherent value for Nevada County residents at a significant, unavoidable cost to local residents.

The EIR presents hypothetical impacts based upon best-case scenarios in current environmental conditions, without regard to drought, or other climate change factors.

**Ind 761-2** For example, the projected use of 11 million gallons of water to be supplied by NID, solely for " dust control" during the preparation phase. This is more water than the population of Grass Valley would use, based upon average household water use, for one year.

Has NID factored this projected demand into their current planning?

**Ind 761-3** When operational, the projected electrical demand of the mine would be 500,000 Mwh per year. This translates to using the same amount of electricity required to power 50,000 households for one year. Again , the mine would consume more resources than the city of Grass Valley.

Nevada County has unmet goals for its Ozone Management Plan. Re-opening the mine will

**Ind 761-4** further degrade local air quality by increasing greenhouse gas emissions.

For example, from the projected " 100 round-trips from 6 a.m. to 10 p.m. every day" hauling waste rock by diesel powered trucks. Add impacts to air quality from blasting, rock crushing and pumping to further degradation.

The categories in the EIR that list significant unavoidable negative impacts, even with

**Ind 761-5** mitigation, are: noise, traffic, road damage, and the visual character of the area.

The best-case scenarios list probable decibel levels for all above-ground mining activities as just under the threshold where sleep is interrupted.

**Ind 761-6** In addition to altering the visual character of the area, there will be negative impacts to sensitive species of plants, Sierra frogs and bird life on the site.

**Ind 761-7** In view of the many negative impacts to Grass Valley and Nevada County, should the mine be

re-opened, the positive impacts are defined as: 162 new job positions for " trainees" at undefined wages. There is a projected need for approximately 50 qualified equipment operators at undefined wages. The balance of employees will be recruited from outside of Nevada County; those with expertise in the technical aspects of gold mining operations, at undisclosed wages. The report concludes, "there will be no significant inducement to local growth." The mine will not produce a job bonanza for local residents.

There are already 212 unfilled job openings in Nevada County.

The negative impacts and the no-impact conclusions in the EIR far outweigh the projected positive economic impacts for residents of Nevada County.

**Ind 761-8**

Sincerely,

Susan Turney

Edward Sherman

## INDIVIDUAL LETTER 761: SUSAN TURNEY

### Response to Comment Ind 761-1
The commenter states that the project will not improve the surrounding community. The commenter's opposition of the project is noted for decisionmakers. See Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 761-2
The commenter states that the DEIR does not adequately analyze the amount of water to be used by the project during the drought and questions if NID has factored in this water usage. The commenter is referred to Master Response 16 - Drought and Climate Change, Chapter 4.11, and Appendix N of the DEIR.

### Response to Comment Ind 761-3
The commenter states that the project would use 500,000 MWh per year. However, as stated on page 4.3-88 of the DEIR, the project is anticipated to result in increased electricity consumption of 16,513 MWh during the year of construction and 49,613 MWh annually during operations.

### Response to Comment Ind 761-4
The commenter states that the project's GHG-related emissions will impede the County's ozone management plan. Ozone is not related to GHG emissions. As stated on page 4.3-2 of the DEIR, ozone is a reactive gas consisting of three oxygen atoms. In the troposphere, ozone is a product of the photochemical process involving the sun's energy, and is a secondary pollutant formed as a result of a complex chemical reaction between reactive organic gases (ROG) and oxides of nitrogen ($NO_X$) emissions in the presence of sunlight. As such, unlike other pollutants, ozone is not released directly into the atmosphere from any sources.

As stated on page 4.3-91 of the DEIR, global climate change is, by nature, a cumulative impact. Emissions of GHG contribute incrementally to adverse environmental effects associated with global climate change (e.g., sea level rise, impacts to water supply and water quality, public health impacts, impacts to ecosystems, impacts to agriculture, and other environmental impacts). Because climate change is a global phenomenon, a single project could not generate enough GHG emissions to contribute noticeably to climate change.

Air emissions from all project activities have been analyzed in the DEIR. The commenter is referred to Chapter 4.3 of the DEIR.

### Response to Comment Ind 761-5
The commenter states that the DEIR discusses impacts that are significant and unavoidable. The commenter also states that noise-related impacts will occur just below the threshold for sleep interruption. Significant and unavoidable impacts are presented in Section 5.6 of the DEIR.

Project noise is not just under the threshold where sleep is interrupted. The commenter is referred to Response to Comment Grp 21-130.

### Response to Comment Ind 761-6
The commenter states that the project will result in biological impacts. Impacts to plants, frogs, and birds are less than significant after mitigation. The commenter is referred to Chapter 4.4 of the DEIR, Master Response 31 - Rare Plants, Master Response 37 - Birds and Raptors, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

## Response to Comment Ind 761-7

The comment states that the DEIR overstates the employment benefits of the project. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 761-8

The commenter states that the employment benefits of the project are outweighed by the environmental impacts. The commenter's opposition of the project is noted for decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

**Ind 763-1**

Recently a "test" was done at the proposed mine site. I live near Scotia Pines, on Carpenter Street, in a historic Victorian. My house shook, tea cups rattled and the animals (a dog and a cat) jumped and hid.

Although my home is old, and has new foundations built to current codes, I dearly love my home. I cannot believe I would have to live with this shaking and booming noise if this mine reopens!

I was born and grew up in Grass Valley during the time of the stamp mills. We still deal with the toxics left by those days. Enough I say!

Susanna Wilson

## INDIVIDUAL LETTER 763: SUSANNA WILSON

### Response to Comment Ind 763-1

The comment does not directly address the adequacy of the DEIR, but rather expresses general concern regarding alleged on-site testing which is not part of the proposed project. Please see Master Response 1. The comment has been noted for the record and forwarded to the decision-makers for their consideration. For concerns related to noise and vibration, please refer to Chapter 4.10, Noise and Vibration.

**Individual Letter 764**

**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley plans to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Developing the mine will create over 300 new employee-owned safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous communities.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to play a part of local economy by strongly supporting the re-opening of the Idaho-Maryland Mine!

Re: Comments on Idaho-Maryland Mine Project Draft EIR

Dear Mr. Kelley and Planning Department,

Thank you for your work on this complex issue.

We are writing as:

~ 14 yr. residents of Nevada County;

~ long-term supporters/volunteers of Wolf Creek Community Alliance, (former WCCA volunteer Restoration Coordinator);

~ long-term supporters/volunteers of South Yuba River Citizens League, (former SYRCL volunteer Clean-Up Site Coordinator);

~ long-term supporters/volunteers of Redbud Chapter of California Native Plant Society, CNPS;

~ past Chair of the Maidu Interpretive Center Foundation, Roseville, CA; and

~ as a resident with asthma.

**Ind 765-1**

After reading the Draft EIR, we strongly urge the Nevada County Planning Department to reject the Idaho-Maryland Mine Project (IMMP) for the multiple reasons listed below as comments on the Draft EIR, and for these overarching general comments below.

Four General reasons for denying Idaho-Maryland Mine Project:

**Ind 765-2**

1. After over 170 years, Nevada County is still cleaning up, mitigating for, and living with the environmental disasters from previous mining operations. Regardless of the best plans and best

practices for mining projects, unforeseen problems create environmental disasters for future generations.

2. Rather than waiting to receive proposals to resurrect similar previous disastrous mining projects, we strongly urge the NC Planning Dept. to actively seek out forward-looking projects that would be beneficial to our community such as solar power manufacturing/generation or biofuels processing/generation, etc.

**Ind 765-3**

3. Regardless of written plans and intentions, the Draft EIR begs the questions: How much will these plans insure that workers try to avoid damage in the moment during work? How much damage will they actually avoid in the moment during work? And how much success will there be with mitigation for damage done?

**Ind 765-4**

4. Lastly, we respectfully suggest that in Table 2-1, "Level of Significance" related to mitigation, there should be a category of "SA, Significant AND Avoidable", by rejecting the project.

Specific Comments on Draft EIR for rejection of Idaho-Maryland Mine Project:

**Ind 765-5**

Pg. 53-54 2.2 Summary Description of Proposed Project, Management Plans:

We object that all 5 sub points require County approval for the IMMP to disregard/ignore well thought out and reasonable requirements of 100' setbacks, steep slopes, and grading to keep Wolf Creek safe and sound.

Pg. 55 2.4 Summary of Project Alternatives, Alternative 1: No Project (No Build) Alternative:

**Ind 765-6**

It is incumbent upon the NC Planning Dept. to evaluate other site project options to create a sustainable, environmentally sound, and community appropriate project. The EIR requires the NC Planning Dept. to identify environmentally superior alternatives "...from among the range of reasonable alternatives that are evaluated." This Draft EIR's major flaw is that it does not evaluate any other reasonable alternatives to the IMMP, such as solar manufacturing/generation, or biofuel processing/generation, etc.

**Ind 7656-7**

Pg. 58-59 2.5 Areas of Known Controversy

All 23 items on this list are supporting reasons for rejecting the Idaho-Maryland Mine Project.

Pg. 60-158 Table 2-1 Summary Impacts and Mitigation Measures

**Ind 765-8**

4.1-2, Items #5-8

Existing native vegetation cannot be "repaired or replaced" adequately due to variety of plants, size of plantings, timing of planting, and irrigation needs. Level of Significance After Mitigation should be "SA, Significant and Avoidable".

**Ind 765-9**

4.3, 1-7

Totally inadequate mitigations. Air Quality, Greenhouse Gasses, and Energy usage should be monitored and reported daily; how will these be enforced? "...efforts to comply" equals non-

compliance. ..."sensitive receptors" means people! "... visible dust": what about invisible particles, which are most likely more damaging?

4.3-4-9

**Ind 765-10** In this era of climate crisis, this cannot be "LS, Less Than Significant", or "LCC, Less Than Cumulatively Considerable"; LS and LCC designations basically say that IMMP does not need to comply with requirements which have been created for the health of all. Mitigation Measures refer only to construction, but neglect operation after construction. Even with carbon offsets verified, there will be more GHG locally.

4.4-1(a)

**Ind 765-11** In all sections of Mitigation Measures for vegetation, California Native Plant Society, Redbud Chapter should be included in monitoring. It is a valuable local resource with abundant local knowledge of local native plants.

4.4-1(b)

**Ind 765-12** IMMP should not be in protected Riparian Zone in the first place. Mitigation Measures should include not only bulbs, but root balls. 80% down to 50% survival is not successful.

4.4-2 (a-g)

**Ind 765-13** All of these animals are the reasons for not approving a variance to the 100' setback from the Riparian Zone.

4.4-3

Inability to truly mitigate loss of riparian habitat is one more reason for not approving a variance to the 100' setback.

4.4-3(b) Implement Post-Construction Erosion Control

**Ind 765-14** "...erosion control mixture" should be all native plants.

4.4-3(c)

**Ind 765-15** ... "Section 404 permit... for fill" is an egregious mitigation. Wetlands cannot be successfully mitigated, restored, or created and paying an "in lieu fee" or buying credits does not protect local wetlands on site, which are part of the approximately 2% of wetlands left in California.

4.4-3(d)

**Ind 765-16** ..."initiating ground disturbing activities within the non-disturbance buffers"... is an oxymoron; no Section 1600 Streambed Alteration Agreement should be approved based on this contradiction.

4.4-4

**Ind 765-17** IMMP does substantially interfere with movement of native wildlife species by virtue of its existence.

| | |
|---|---|
| **Ind 765-18** | 4.4-6<br>Level of Significance After Mitigation should be "CC, Cumulatively Considerable". |
| **Ind 765-19** | 4.5-2<br>Mitigation Measures: Both a qualified archeologist trained in local culture and also a representative of our local Nevada City Nisenan Rancheria should be on site during construction and mining activities, (not just after a bulldozer operator or mining worker, who are not trained to recognize archeological artifacts, uncovers artifacts, which may or may not cause a work stoppage); add consultation with the California Native American Heritage Commission. |
| **Ind 765-20** | 4.6-2<br>Mitigation Measures: ..."substantial erosion"... should be "S, Significant" and "CC, Cumulatively Considerable", since even with Mitigation Measures, IMMP will be affecting Wolf Creek negatively. |
| **Ind 765-21** | 4.7-1 and 2<br>Even with Mitigation Measures and despite Best Management Practices, there are still significant dangers of hazardous materials to the public; designation should be "SA, Significant and Avoidable". |
| **Ind 765-22** | 4.7-4 and 5<br>Yes IMMP would impact emergency response and emergency evacuation plans due to excessive truck use of roadways; should be designated "S, Significant" and "CC, Cumulatively Considerable". |
| **Ind 765-23** | 4.8-1<br>Designation should be "SA, Significant and Avoidable" or at a minimum, "S, Significant" and "CC, Cumulatively Considerable" because of ..."potential constituents of concern, including ammonia, arsenic, hexavalent chromium, iron manganese, pH, total suspended solids, TDS, and cis-1, 2-DCE". Monitoring reports (and NOI) should be daily or weekly, not quarterly, and should go to Nevada County, Wolf Creek Community Alliance (WCCA), and South Yuba River Citizens League (SYRCL) in addition to RWQCB. |
| **Ind 765-24** | 4.8-5<br>"Grading and land disturbance within the limits of the SFHA (100-year floodplain) of Wolf Creek shall be avoided." "Areas within 100 feet of the 100-year floodplain, which are disturbed due to construction activity..." These statements are contradictory, and the second one shows a disregard for the importance of the 100' setback regulations. |
| **Ind 765-25** | 4.8-7<br>These impacts are very "S, Significant" and "CC Cumulatively Considerable" to Wolf Creek, not "LS" as stated. |

| | |
|---|---|
| **Ind 765-26** | 4.10-2, 2 (a) and 3, 2 (bi and bii)<br>Designation should be "S, Significant" and "CC, Cumulatively Considerable". Noise monitoring evaluation should be weekly for the duration of the IMMP; 30 days is too long between monitoring evaluations when listening to loud noises. Receptor locations should be at a minimum of 5 locations, not 3-5 as stated in that section; and should be at specifically pinpointed locations, not in "surrounding" area as stated. |
| **Ind 765-27** | 4.11-7<br>Designation should be "S, Significant" and "CC, Cumulatively Considerable" since sufficient water supplies cannot be guaranteed in the severe, extreme drought we are experiencing. |
| **Ind 765-28** | 4.12-1 (b)<br>..."the fair share percentage is 14.9%." for Traffic Mitigation Agreement. This is not a fair share for work strictly necessitated because of the IMMP. |
| **Ind 765-29** | 4.12-5<br>Designation should be "S, Significant"; "CC, Cumulatively Considerable"; or "SA, Significant and Avoidable". |
| **Ind 765-30** | 4.12-6 (a) dot #13<br>Add requirements to continuously monitor wild fires within 10 mi. proximity and immediately stop all truck work on roadways to allow for public emergency evacuation on public roadways. |
| **Ind 765-31** | 4.12-10<br>"the fair share is 8.5 percent." Again, this is not a fair share for work strictly necessitated because of the IMMP. |
| **Ind 765-32** | 4.13-1<br>Designation should be "S, Significant", and "CC, Cumulatively Considerable" or "SA, Significant and Avoidable" because the increased truck traffic substantially impairs emergency evacuation. |
| **Ind 765-33** | 4.13-2 (last dot)<br>..."in accordance with the State Board of Forestry and Fire Protection's, "General Guidelines for Creating Defensible Space, February 8, 2006". These guidelines are 16 yrs. out of date; use current Nevada County guidelines for defensible space. |

Again, thank you for your work on this complex issue.

Sincerely,

Suzanne Ferroggiaro

Rob Ferroggiaro

## INDIVIDUAL LETTER 765: SUZANNE AND ROB FERROGGIARO

### Response to Comment Ind 765-1
This is an introductory comment. Please see Master Response 1 - Non-EIR/Administrative Issues. Comment noted.

### Response to Comment Ind 765-2
The commenter's opposition to the project is noted for the decisionmakers. Please see Master Response 1, Non-EIR/Administrative Issues.

### Response to Comment Ind 765-3
The commenter speculates as to whether, and to what extent, workers will try to avoid damage while doing work. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." This comment is speculative and does not require a specific response. Nevertheless, it is noted that a mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

### Response to Comment Ind 765-4
The comment is unclear. Table 2-1 already has an "SU" category for significant and unavoidable.

### Response to Comment Ind 765-5
DEIR Section 2.2 is a list of all entitlements and approvals sought by the applicant and required in order to construct and operate the project as proposed. The commenter's concerns have been forwarded to the decisionmakers. Please see Master Response 1.

### Response to Comment Ind 765-6
DEIR section 6 considered project alternatives. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers. Solar manufacturing/generation and biofuel processing/generation would not achieve many of the project objectives and would also not be feasible as those businesses required specialized expertise not held by the applicant. Further, the commenter's description of these proposed alternatives is undefined, so it is unclear whether these proposals would avoid any significant impacts of the project or would create new significant impacts. As these proposed alternative uses do not achieve many project objectives, would not be feasible due to the need for specialized expertise, and are not formulated specifically enough that they could be shown to reduce any significant project impact, no further consideration is required.

## Response to Comment Ind 765-7

This list is a summary of issues identified during the scoping process and helped guide which issues to analyze in the DEIR.

## Response to Comment Ind 765-8

The commenter's concerns are noted. Mitigation Measure 4.1-2 requires the applicant to submit a Landscape Plan concurrent with improvement plan review and outlines the required information for inclusion in that landscape plan.

## Response to Comment Ind 765-9

The comment is somewhat unclear and the request for daily air quality monitoring is not supported by the DEIR analysis. The commenter provides no substantial evidence as to why daily air quality monitoring would be needed. Nevertheless, it is noted that Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring.

## Response to Comment Ind 765-10

DEIR Impacts 4.3-7 and 4.3-8 analyzed the project's contribution of greenhouse gases and recommended Mitigation Measures 4.3-7(a & b) to reduce the construction GHG emissions impact to a less than significant level. Operational GHG emissions are below the threshold and are therefore considered less than significant. As shown in this impact analysis, specifically Table 4.3-23, the entire life of the project was analyzed and not just construction. Please see Master Response 27 – Greenhouse Gas Thresholds.

## Response to Comment Ind 765-11

As is standard practice, there are federal and state agencies that have the requisite expertise to monitor the successful implementation of biological mitigation measures concerning protected species.

## Response to Comment Ind 765-12

Mitigation Measure 4.4-1(b) requires the preparation of a habitat management plan if special status plant species are identified during preconstruction surveys. The requirements listed in Mitigation Measure 4.4-1(b) are the minimum requirements for the habitat management plan and, during County review and approval, can be modified or changed to be more protective if necessary.

## Response to Comment Ind 765-13

Mitigation Measures 4.4-2(a-g) outline the specific measures for protection of special status species that may be identified onsite.

## Response to Comment Ind 765-14

Mitigation Measure 4.4-3(b) requires the preparation of a Watercourse/Wetlands/Riparian Areas management plan. The requirements listed in Mitigation Measure 4.4-3(b) are the minimum requirements for the habitat management plan and, during County review and approval, can be modified or changed. Native plants will be used for erosion control, when appropriate.

## Response to Comment Ind 765-15

Mitigation Measure 4.4-3(c) provides for a variety of methods to mitigate the potential impact that will require consent and approval of the United States Army Corps of Engineers and/or California Department of Fish & Wildlife.

## Response to Comment Ind 765-16

The authority to approve a Section 1600 Streambed Alteration Agreement is vested with the California Department of Fish & Wildlife. It is important to clarify that the County Land Use Development Code allows encroachments within non-disturbance buffers so long as an adequate Watercourse, Wetlands, and Riparian Areas Management Plan is prepared, approved by the County, and implemented by the Applicant, subject to County oversight. Said Management Plans have been prepared for the project (see DEIR Appendix F.5 and Appendix F.8).

## Response to Comment Ind 765-17

The CEQA guidelines require analysis of substantial interference to "the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." Migration is defined as the seasonal movement of animals from one habitat to another. Various animal, bird, and fish species are not automatically considered migratory just because they move from one location to another. Migration serves a purpose for the species such as winter/summer habitat for foraging or breeding. It is acknowledged and analyzed in the DEIR impact analysis (see section 4.4.4) that species exist within the project site that are common to the area. Potential impacts to these species were analyzed and mitigation measures have been provided where it was determined impacts to species could occur as a result of project activities, including the implementation of preconstruction surveys and agency permitting requirements. The only migratory species corridors acknowledged by the County General Plan are deer migration corridors. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded that it would be less than significant.

## Response to Comment Ind 765-18

The commenter does not provide any additional information and evidence to support a change in the significance determination.

## Response to Comment Ind 765-19

As noted in DEIR section 4.5.4, and Appendix G, the Historic Properties Inventory and Finding of Effect included a cultural records search, literature review, consultation with the Nevada County Landmark Commission, consultation with the NAHC, and a field survey. The DEIR identifies the potential cultural resources onsite and includes mitigation measures to reduce the potential impact (see Mitigation Measures 4.5-1(a & b)). Given the sites' history of significant surface disturbance it is unlikely cultural resources are still intact. In the event unidentified resources are discovered, Mitigation Measures 4.5-2 and 4.5-3 require the appropriate coordination and consultation consistent with the California Environmental Quality Act, Secretary of the Interior, and County Code.

The County attempted to consult with interested tribal groups and none responded to the request for consultation within the statutory consultation timeframes (e.g., see responses to Group Letter 14).

## Response to Comment Ind 765-20

The commenter does not provide any additional information and evidence to support a change in the significance determination.

Please see Master Response 36 - Flows in South Fork Wolf Creek, and Master Response 35, Discharge to South Fork Wolf Creek.

## Response to Comment Ind 765-21

DEIR Chapter 4.7, Hazards and Hazardous Materials, and Chapter 4.8, Hydrology and Water Quality, analyzed impacts related to hazardous materials and found all potential impacts to be less than significant after implementation of mitigation. The commenter does not provide any additional information and evidence to support a change in the significance determination.

## Response to Comment Ind 765-22

The commenter does not provide any additional information and evidence to support a change in the significance determination. Please see Master Response 5 – Evacuation Zones.

## Response to Comment Ind 765-23

The commenter does not provide any additional information and evidence to support a change in the significance determination. Please see Master Response 35 – Discharge to South Fork Wolf Creek. Water quality monitoring requirements are dictated by the Regional Water Quality Control Board who will have the authority to enforce water quality standards.

## Response to Comment Ind 765-24

Mitigation Measure 4.8-5 requires the implementation of the Floodplain management plan. Requirements listed in Mitigation Measure 4.8-5 are to ensure that when working within 100 feet of the SFHA (100-year floodplain) that grading within the limits of the SFHA (100-year floodplain) shall be avoided. The 100-foot buffer from the SFHA floodplain is a different area than the 100-foot floodplain area and therefore the mitigation measure is not contradictory.

## Response to Comment Ind 765-25

The commenter does not provide any additional information and evidence to support a change in the significance determination.

## Response to Comment Ind 765-26

Noise monitoring required by Mitigation Measure 4.10-3 is continuous and reported to the County on a regular basis for review. The initial 30-day report is after the start of operations to ensure the noise predictions in the DEIR were accurate, and if County noise standards are exceeded, operations must cease until additional engineering controls to reduce noise levels can be implemented. After this initial analysis, analysis of the permanent continuous noise monitoring is required to be submitted to the County quarterly. The monitoring timing was independently reviewed by a third-party technical noise expert, under contract with Raney, who has experience conducting noise monitoring at active mine sites.

## Response to Comment Ind 765-27

The commenter does not provide any additional information and evidence to support a change in the significance determination. Regarding drought concerns, please see Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 765-28

The fair share percentage is based on the project's traffic volume it adds to the existing traffic levels. Requiring the applicant to pay 100% of traffic fees for only contributing a minor amount of traffic would be unconstitutional.

## Response to Comment Ind 765-29

The commenter does not provide any additional information and evidence to support a change in the significance determination.

## Response to Comment Ind 765-30

Mitigation Measure 4.12-6 requires the preparation of a traffic control plan for the construction phase of the project. The requirements listed in Mitigation Measure 4.12-6 are the minimum requirements for the traffic control plan and, during County review and approval, can be modified or changed by County Public Works. Please see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 765-31

The fair share percentage is based on the project's traffic volume it adds to the existing traffic levels. Requiring the applicant to pay 100% of traffic fees for only contributing a minor amount of traffic would be unfair.

## Response to Comment Ind 765-32

The commenter does not provide any additional information and evidence to support a change in the significance determination. Please see Master Response 5 - Evacuation Zones.

## Response to Comment Ind 765-33

DEIR section 4.13 analyzed the project's potential to increase wildfire risk. DEIR section 4.13.3 specifically identifies various State and County regulations including County General Plan policies, emergency operations plan, local hazard mitigation plan, and the County community wildfire protection plan. Consistency with these requirements and plans was analyzed in DEIR impact 4.13-1 and considered less than significant. Please see Master Response 6 - Wildfire Impacts.

**Individual Letter 766**

April 3, 2022

To Whom It May Concern:

I have been a resident of Nevada City since 2009 and immediately fell in love with its river, forest, flora and fauna. I am now a mother and a teacher who respects and honors the Nisenan people. Enough devastation has been carried out on their lands which they stewarded for thousands of years and continue to steward. As stewards of this land we must be conscientious as to how we treat our water, air, wildlife. This mine, no matter how well its presented, will devastate and dry wells, and release contaminants into the environment. I am opposed to this mine full stop. Below are some points from the Community Environmental Advocates Foundation which I echo:

**Ind 766-1**

**Ind 766-2**

"Dewatering the mine is a key concern. "Groundwater modeling in fractured rock systems is considered unreliable even when everything is done right," said Silberstein. According to experts, Rise Gold's model has fundamental flaws in the initial start point of the model and baseline data assumptions – all of which throw off the entire analysis. The result is a DEIR that concludes that groundwater levels would drop a maximum of 10 feet and no more than 30 local wells would be a risk. Experts, however, recognize the extremely high degree of uncertainty involved. Comments submitted to the County by the community and the Nevada Irrigation District (NID) include requests to expand the potential area of impact, provide a comprehensive groundwater monitoring program, and post a $14 million bond.

**Ind 766-3**

Dealing with mine waste is another major concern. "Looking at the rock core sample analysis, it is abundantly clear that asbestos will be a gnarly problem that will require comprehensive management. Mining operations don't get to just haul and dump rock like the days of old," said Silberstein. "Air and water quality regulations will significantly restrict throughput and the costs will be exorbitant." Experts found the plans to mitigate fugitive dust to be inadequate. They also found no credible evidence that the mine tailings could be effectively sold to 3rd parties for fill or offsite construction.

**Ind 766-4**

Climate change has increased forest fires and parched lands, resulting in the newest Federal and State greenhouse gas reduction goals. The DEIR used a threshold of 10,000 metric tons per year for greenhouse gas emissions but failed to include some elements that puts the project over that limit and makes it a significant impact. In the long run however, the limit defined in the DEIR is likely to be found irrelevant. Recent changes mean the County's threshold must be established at "net zero".

**Ind 766-5**

Following is a quick list of additional gaps in the draft:

- Cleanup of the toxic, pre-superfund Centennial site that would be used to dump mine waste is not included in the DEIR but is required by the California Environmental Quality Act (CEQA).

**Ind 766-6**

- Missing construction time estimates throw off the entire analysis of noise, traffic, and air.

**Ind 766-7**

- The DEIR incorrectly assesses nighttime noise and underestimates the noise of dumping mine waste near established residential neighborhoods.

**Ind 766-8**

- Air traffic hazards and aesthetic impacts need to be studied further due the likelihood of a massive fog plume that could be created by warm, saturated air ventilation.

**Ind 766-9**

- Blasting plans don't follow U.S. mining guidelines that restrict blasting during evening hours.

**Ind 766-10**

- The plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant.

- Meteorological data used to assess the health risk of airborne pollutants doesn't fit Grass Valley's profile or accurately reflect local conditions."

**Ind 766-11**

Please, please, preserve our human community and our animal and plant communities and DO NOT allow this mine to move forward.

Thank you,

Suzanne Hall

## INDIVIDUAL LETTER 766: SUZANNE HALL

### Response to Comment Ind 766-1
The commenter is opposed to the project for cultural and environmental impact reasons. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 766-2
The commenter states that the DEIR's analysis regarding the dewatering of the mine is flawed due to inaccurate baseline assumptions and the commenter requests that the DEIR expand its potential area of impact, implement a groundwater monitoring program and post a $14 million bond. The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 766-3
The commenter is concerned with asbestos-related impacts and states there is no evidence that mine tailings could be sold to third parties for offsite construction. The commenter is referred to Chapter 4.3 of the DEIR, Master Response 23 - Adequacy of Asbestos Sampling, Master Response 22 - Conservatism of Asbestos Assumptions, Master Response 8 - Mine Waste Characterization, and Master Response 11 - Engineered Fill Utilized in Local and Regional Construction Markets.

### Response to Comment Ind 766-4
The commenter states that the GHG threshold for air quality impacts must be net zero. The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds.

### Response to Comment Ind 766-5
The commenter states that CEQA requires that the cleanup of the Centennial Industrial Site be included in the DEIR. The commenter is refereed to Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 766-6
The commenter states that the DEIR omits construction time estimates which skew the analysis of impacts. The commenter is referred to Master Response 24 - Project Construction Schedule.

### Response to Comment Ind 766-7
The commenter states that the DEIR incorrectly assesses nighttime noise and underestimates noise of dumping mine waste near residential neighborhoods and that all work needs to be done during regular working hours. However, nighttime noise and dumping of mine waste is analyzed in the DEIR and is less than significant after mitigation. (DEIR, p. 4.10-31.) Please see Responses to Comments Grp 21-130 and Grp 21-131.

### Response to Comment Ind 766-8
The commenter states that the DEIR must account for air traffic hazards and aesthetic impacts resulting from a potential fog plume. The commenter is referred to Response to Comment Grp 7-95.

### Response to Comment Ind 766-9
The commenter states that the DEIR does not adhere to federal mining guidelines for blasting during evening hours. The commenter is referred to Response to Comment Grp 21-144.

## Response to Comment Ind 766-10

The commenter states that the DEIR does not demonstrate the impacts to biological and aquatic resources would be less than significant but provides no further details. The commenter is referred to Chapters 4.4 and 4.8 of the DEIR.

## Response to Comment Ind 766-11

The commenter states that meteorological data used in the health risk assessment does not reflect local conditions. The commenter is referred to Master Response 17 - Meteorological Data Used in HRA. The commenter's opposition to the project is noted for decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 767**

March 30, 2022

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA. 95959-7902

RE: Review of the Draft EIR for the Proposed Idaho-Maryland Mine

Dear Matt Kelley,

Thank you for the opportunity to comment on the Draft EIR for the proposed Idaho Maryland Mine project, State Clearinghouse Number 2020070378. My comment are included below.

**Ind 767-1** Overall the document is difficult to read and cumbersome as well as incomplete in its review of many issues on the proposed project as well as discussion on the Reclamation Plan and documents. The Reclamation Plan is a project under CEQA and the impacts must be analyzed in a CEQA document. Including brief discussions on the Reclamation Plan in different sections of the DEIR does not constitute full CEQA review of the project.

The following section is a discussion on Land Use includes comments on the County's processing of the project's rezoning proposal, which should be discussed in the analysis of this project. My comments on the rest of the DEIR follow this section.

***Land Use***

**Volume 1 - page I-1 of the Nevada County General Plan:**

**Ind 767-2** The County, in response to key issues affecting the County's quality of life, has established four central themes which articulate the vision for the development of the County:

1. Fostering a rural quality of life;
2. Sustaining a quality environment;
3. Development of a strong diversified, sustainable local economy; and
4. Planned land use patterns will determine the level of public services appropriate to the character, economy and environment of each region.

**Section L-II 1.1 Authority and Purpose Nevada County Zoning Ordinance**

The zoning ordinance is adopted in order to achieve the following objectives:

A. To serve as the primary tool to implement and ensure consistency with the goals, objectives, and policies of the Nevada County General Plan based upon the following central themes:
1. Fostering a rural quality of life.
2. Sustaining a quality environment.

1 of 5

3. Development of a strong diversified, sustainable local economy.
4. Planned land use patterns to determine the level of public services appropriate to the character, economy, and environment of each region.

Both the General Plan and Zoning Ordinance have as key issues for consistency for development within the County the "Fostering of a rural quality of life, sustaining a quality environment, development of a strong diversified, sustainable local economy, and planned land use patterns to determine the level of public services appropriate to the character, economy, and environment of each region, A project requiring a rezoning to mining uses partially located within the Rural Region of the County (inconsistent with the General Plan) adjacent to residential uses, does not provide the consistency with General plan or Zoning Ordinance envisioned by the creators of the documents. Beyond showing which General Plan policies the proposed project is attuned to the Draft EIR should provide the Policies that the project is not in compliance with.

The County's Zoning Ordinance, Section L-II 1.4, Rules of Interpretation for the rezoning of the SP portion of the project requires findings 1 through 4, see section below, for the removal of the SP Zoning District and the application of the ME zoning, which is required for mining uses. The Rules of Interpretation, as shown below, allow for the Planning Director to determine an allowable use, if the Director finds the use will, among other findings, share characteristics common with those listed in the district and not be of greater intensity of density, generate greater impact on public facilities and services, or generate more environmental impact than the uses listed n the district.

**Ind 767-3**

The Rezoning from M1-SP site performance standards applied to Ordinance 1853, adopted in January 18, 1994 by the Nevada County Board of Supervisors, to the M1-ME zoning district allows for a major intensification of uses and environmental impacts, not consistent with the zoning district, or the rules of interpretation of the Zoning Ordinance.

Ordinance 1853 is specific as to uses allowed within the district, listing uses, noise, air pollution( "1. The use of any materials subject to becoming airborne shall only be permitted if it is demonstrated that no significant air pollution will result. 2. Refuse burning shall be permitted. 3. Any odors which interfere with the comfort of the adjacent residential uses and/or workers on site shall be prohibited).", hazardous materials, circulation, lighting, landscaping requirements, etc. The SP application to the M1 zoning clearly acknowledged that the adjacent residential uses were to be protected from heavy industrial use.

*Section L-II 1.4, Rules of Interpretation*

*D. Zoning District Land Use Interpretation. If a proposed use of land is not listed in Article 2 (Zoning Districts), the Planning Director may determine the use to be allowable if the Director finds the use will:*

1. *Be consistent with the goals, objectives, and policies of the Nevada County General Plan; and*
2. *Meet the purpose and intent of the zoning district that is applied to the site; and*
3. *Share characteristics common with those listed in the district and not be of greater intensity or density, generate greater impact on public facilities and services, or generate more environmental impact than the uses listed in the district; and*
4. *Be treated in the same manner as the listed use including determining where it is allowed, what permits are required, and what standards affect its establishment.*

Further the Zoning Ordinance requires that:

*Determinations that specific unlisted uses are equivalent to listed uses will be recorded by the Planning Department, and will be incorporated into the ordinance when amendments to the ordinance are next considered.*

And allows for a public hearing:

*The Planning Director may forward questions concerning equivalent uses directly to the Planning Commission for determination at a public hearing.*

And an **Appeal** process available to the public:
*Section L-II 1.4, E. Appeal. Any determination or interpretation by the Planning Director may be appealed to the Board of Supervisors consistent with Article 5 of this Chapter.*

This information needs to be discussed and included in the Land Use section of a revised Draft EIR available for public comment.

**Transportation**

The application package for the proposed reopening of the mine submitted to Nevada County suggested that the additional 69 years of mine waste would be sold off site for local projects. The Draft EIR proposes that the mine "engineered fill" be distributed throughout various local counties after the first 11 years in which the Brunswick and Centennial sites will be filled, and the fill must be transported somewhere else.

**Ind 767-4**

Page 9, II.3.a. Heavy Truck Vehicle Miles Traveled, KDAnderson, Traffic Impact analysis, states:
*Heavy trucks can be included in VMT analysis for convenience, but are not the subject of the new CEQA requirement. In this case, inclusion of heavy trucks would not be convenient and rather would make the EIR's traffic analysis confusing.*

The Draft EIR must be revised to include impacts from heavy trucks and include impacts to Hwy 49, including noise from "Jake breaks." Inconvenience is not a CEQA related reason to omit necessary traffic analysis. Please include this analysis in a Revised Draft EIR.

3 of 5

DEIR page 21:
*Trucks would transport barren rock from the Brunswick Industrial Site to the Centennial Industrial Site or Brunswick Industrial Site engineered fill areas. Transport of barren rock to the Centennial Industrial Site would occur 16 hours per day, seven days per week. An approximately 44-acre area of the 56-acre Centennial Industrial Site would be filled using engineered fill from the Brunswick Industrial Site over approximately five years. Engineered fill would be hauled to either the Centennial site or to off-site construction sites and mining concentrate would be shipped off- site via State Route (SR) 49.*

The project needs to include full estimated analysis beyond the first 11 years. Traffic impacts to the County and Hwy 49, Hwy 174, and Hwy 20 need to be included in the analysis. Guessing that 69 years of "engineered fill" will be able to be sold off site to other projects leaves the CEQA analysis incomplete.This needs to be further analyzed in a revised Draft EIR.

**Hydrology and Hydraulic Calculations, Nevada City Engineering, Vol IX, AppendixK-5**

Pages 4-9. Calculations and runoff coefficients used for the analysis make no sense here. The "engineered fill" a both sites must be compacted to Urban Use Standards pursuant to SMARA.

**Ind 767-5**

The coefficients in a standard Rational Method of calculating runoff requires 0.9 be used for roofing and pavement, gravel pavement 0.85 (which may be the valid value for the engineered fill piles), side slopes, earth (prior to revegetation) 0.60, side slopes turf 0.30, etc. Coefficients used in the evaluation of post project runoff do not account for roofing, compacted engineered fill, roadways, etc.

It is impossible for the proposed Post-project to have less runoff than the Pre-project. These calculations are part of the Reclamation Plan as well as the proposed operational plan. This information needs to be recalculated and included in the text and mapping of the DEIR, in a revised Draft EIR for public review for both the Pre-project and the Post project estimates for the proposed Drainage Plans.

**Ind 767-6**

***Detention Study, Nevada City Engineering:*** *On-site fills are proposed to be constructed at a slope ratio of 3:1. Under this scenario, due to the relatively mild gradient, mid slope benches will not be required. Where slope banks are great enough in height to require mid-slope interceptor ditches, "J" Ditches as indicated on the detail included on Page 14 of this study will be provided. These will eliminate any likelihood of erosion occurring on the slope faces. Additionally, the 3:1 slopes have a softer, more natural look which will make the proposed ultimate development of the engineered fill areas into industrial parks more aesthetically pleasing than benched slopes. These flatter slopes will also enhance the viability of landscaping and vegetative efforts on those slopes.*

Please provide calculations and verification that slopes are stable. Additionally the DEIR states that vegetative grasses will not need irrigation and they

4 of 5

will need irrigation. This information would be included in a Revised Draft EIR, Reclamation plan, and water estimates.

**Improvement Plan proposed as Mitigation**

Page 2-86 of the DEIR Impact 4.8-3 states *"As part of the Improvement Plan submittal process, the applicant call submit a Final Drainage Report to the County Planning Department for review and approval. The Final Drainage Report may require more detail than that provided in the preliminary report, and will be reviewed in concert with the Improvement Plans to confirm conformity. The report shall address the Centennial and Brunswick Industrial Sites, prepared by a Registered Civil Engineer, and shall, at a minimum include: narrative describing existing conditions, the effects of the proposed improvements, all appropriate calculations, watershed maps, changes in flows and patterns, and proposed on- and off-site improvements to accommodate flows from this project, including treated mine water and mine water discharge and stormwater runoff. The Final Drainage Report shall demonstrate the on-site storm drain systems are sized such that site runoff (in addition to treated mine discharge for the Brunswick Industrial Site) under the post development will not exceed predevelopment levels in the downstream channel(s) during design storm events.*

**Ind 767-7**

The requirement that the applicant adopt mitigation measures recommended in a future study is in direct conflict with the guidelines implementing CEQA. CEQA's mandates that significant environmental impacts and feasible mitigation measures be meaningfully analyzed prior to project approval. This information should be completed now and included in a Revised Draft EIR.

**Ind 767-8**

Further, PRC 2773(a), and (b)(4) require that "The Reclamation Plan shall establish site specific sediment and erosion control criteria for monitoring compliance with the reclamation plan." It is unclear as to when the County intends to complete the CEQA review of the Reclamation Plan, but this information should be included as part of the Reclamation Plan for public review.

**Ind 767-9**

First and foremost CEQA requires a public friendly environmental document. It appears that much has been done to make the review of this document difficult for the public to review and understand. This document is overly lengthy and confusing for the reader. Please edit and resubmit as a revised Draft EIR.

Sincerely,

Suzanne Smith
PO Box 2176
Nevada City, CA 95959

## INDIVIDUAL LETTER 767: SUZANNE SMITH

### Response to Comment Ind 767-1

The commenter states that the DEIR does not fully analyze the reclamation plan, but does not explain its assertion that the DEIR's analysis of the reclamation plan is inadequate. This is an introductory comment and does not provide a comment on an environmental issue associated with the project. Please see Master Response 1.

### Response to Comment Ind 767-2

Comment noted. Please see Master Response 1 - Non-EIR/ Administrative Issues regarding quality of life concerns. DEIR Chapter 4.9, Land Use and Population and Housing, addresses potential project conflicts with applicable County General Plan land use goals and policies and zoning code requirements, and concludes that the project would be generally consistent with County policies.

### Response to Comment Ind 767-3

Please see Master Response 1 - Non-EIR/ Administrative Issues regarding quality of life concerns. DEIR section 4.9.2 identified the applicability of Nevada County Ordinance No. 1853 creating the SP zoning district and that the Brunswick Industrial Site was designated M1-SP (see Table 4.9-2 and Figure 4.9-2). As discussed in the DEIR Project Description, section 3.8, the applicant has requested a rezone to the parcels located at the Brunswick Industrial Site from M1-SP to Light Industrial with Mineral Extraction Combining District (M1-ME). As a result, the DEIR does not analyze the project's consistency with the SP zoning district and sufficient detail was provided to inform reviewers of the site's existing zoning and requested amendment.

### Response to Comment Ind 767-4

The commenter asserts that transportation of engineered fill to supply local and regional markets was not analyzed in the DEIR; however, this activity and its associated impacts were analyzed in the DEIR. As described in Chapter 3.0 of the DEIR, the project proposes placement of engineered fill at both the Centennial and Brunswick Industrial Sites over the course of 11 years. After completion of engineered fill placement at the project site, engineered fill would be transported offsite and supplied to construction aggregates market. As described in DEIR Project Description section 3.7, a maximum of 2,000 tons per a day of engineered fill could be transported offsite. This would result in an average of 50 round trip truck trips, or a maximum of 100 round-trip truck trips, per a day of engineered fill. Hauling of engineered fill (barren rock and sand tailings) would shift entirely to be utilized in local and regional construction markets.

This aspect of the project was analyzed in numerous portions of the DEIR including traffic, air quality, greenhouse gases, and noise. As discussed in DEIR Chapter 4.12, Traffic (subsection 4.12.4), engineered fill assumptions consistent with the volume outlined above was analyzed as project trip generation (see Table 4.12-7). The DEIR analyzed project trip generation contributions to both existing plus approved project conditions and year 2035 cumulative conditions. Analysis included 24 intersections, including intersections along State Route 174, State Route 49, and within the City of Grass Valley.

Regarding truck traffic noise and the use of jake brakes, DEIR Chapter 4.10, Noise and Vibration, analyzed the trucks trips potential impact to increase noise levels along the haul route. As determined in DEIR Impact 4.10-2, haul truck vehicle noise would not substantially increase noise levels at the nearest residences along the haul route (see Table 4.10-15) except:

> *"However, it should be noted that the results presented above do not account for the use of jake brakes. In the event that jake brakes are used by project haul trucks operating between the Brunswick and Centennial Industrial Sites, the potential exists that a substantial increase in ambient noise levels could result from the project at the sensitive receptors located along that haul route." (Draft EIR page 4.10-35)*

As a result, the DEIR provided Mitigation Measure 4.10-2 which requires:

> *4.10-2 Haul truck operators shall be required to operate their trucks in such a manner so as to not require the use of jake brakes along the project haul routes. The Project Applicant shall post signage at the exits of both the Centennial Industrial Site and Brunswick Industrial Site informing drivers that the use of jake brakes is not permitted. Additionally, drivers directly employed by the Project Applicant, as well as any contract drivers, shall be required to abstain from use of jake brakes as a company policy. Proof of sign postage (e.g., photographic documentation) and a copy of the company policy language shall be provided to the Nevada County Planning Department prior to commencement of hauling. In the event that jake brake usage associated with project-related heavy truck traffic is observed, the Project Applicant shall implement additional measures to educate drivers regarding the safe operation of their vehicles without the use of jake brakes or take disciplinary action, if required, to the satisfaction of the Nevada County Planning Department. In addition, haul trucks shall be fitted with broad-band "growler" type back-up warning devices rather than the conventional "beeper" devices.*

As demonstrated above, engineered fill truck trip generation and the use of jake brakes was analyzed in the DEIR.

## Response to Comment Ind 767-5

The Surface Mine and Reclamation Act section 3704(a), Performance Standards for Backfilling, Regrading, Slope Stability, and Recontouring, states:

> Where backfilling is proposed for urban uses (e.g., roads, building sites, or other improvements sensitive to settlement), the fill material shall be compacted in accordance with the Uniform Building Code, published by the International Conference of Building Officials and as adopted by the lead agency, the local grading ordinance, or other methods approved by the lead agency as appropriate for the approved end use.

As stated in Appendix K.5, hydrologic calculations were developed utilizing the unit hydrograph method. The coefficients for Rational Method supplied by the commenter are not applicable to the analysis of the post-project drainage in the project area because the rational method was not used. As stated in Appendix K.5, the hydrologic calculations and detention studies for both sites anticipate runoff at full development. Therefore, when mining operations are completed, all potential increases in runoff due to increases in impervious surfaces (pavement and buildings) will already be accounted for.

The rational method is only used to confirm the sizing of two culverts for the project as shown in bullets 6 and 7 on pages 7 and 8 of Appendix K.5. A Coefficient of Runoff for use in the Rational Formula (C) is calculated in order to determine the required size of Drainage culverts for subarea A-2 and B-3. In accordance with the Nevada County Land Use and Development Code Sec L-XVIII 5.1 (B), the runoff coefficient shall be determined using Standard Drawing D-15. Subarea A-2 is the off-site area of unimproved forested land and industrial land that drains towards an existing culvert that directs water onto the Centennial site (see figure H-2 of Appendix K.5). Subarea B-3 is the off-site area of sparse residential development and forest that drains towards

the existing 48-inch culvert on Brunswick Road (see figure H-4 of Appendix K.5). The calculation sums factors in accordance with the table for estimating "C" in Rational Formula for unimproved areas presented in Standard Drawing D-15. Appropriate and conservative C factors were used to confirm the sizing of these two culverts.

https://www.nevadacountyca.gov/DocumentCenter/View/6277/Nevada-County-Standard-Road-Drawings-PDF?bidId=

The commenter states that it is impossible for post-project conditions to have less runoff than pre-project conditions. However, as discussed in the DEIR, the project uses storm water detention basins to reduce peak flow in streams during storms below pre-project levels. The design and calculations for the storm water detention ponds are shown in the DEIR.

## Response to Comment Ind 767-6

The commenter asserts that the DEIR needs to provide calculations that prove the fill slopes will be stable; however, calculations on fill slope stability are provide in Appendix H.1. The fill slope design of 3:1 (30%) is significantly shallower than the maximum of 2:1 (horizontal : vertical) recommended by NV5 in the Geotechnical Report (see Section 5.1.9 of Appendix H.1).

The commenter also asserts that the vegetative grasses proposed for the project site will require irrigation, which should be analyzed in a revised DEIR. As discussed in Section 5.8.1 of the Reclamation Plan (Appendix C of the DEIR), the hydroseed mix proposed is consistent with erosion control seed mixes used by Caltrans and County Public Works in the surrounding area. Irrigation will be used as necessary to support revegetation. If irrigation is required, revegetation will be shown to be self-sustaining for two-years prior to release of the financial assurance cost estimate.

As stated on page 9 of the water supply assessment (Appendix N), because the WSA is assessing the impacts at buildout of the proposed project, the water demand during construction (including any irrigation to support revegetation) is not included in buildout water demands.

## Response to Comment Ind 767-7

A Preliminary Drainage Analysis (PDA) (Nevada City Engineering, 2019) was prepared and included as DEIR Appendix K.5. As described in DEIR section 4.8.4, the PDA was peer reviewed by the County and potential impacts were analyzed in Impact 4.8-3. As stated in the conclusion to Impact 4.8-3:

> "The drainage analyses discussed above conclude that the project would not significantly alter the drainage patterns of the sites in a manner which would result in substantial erosion or siltation on- or off-site, nor substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site, nor create or contribute to runoff water which would exceed the capacity of existing stormwater drainage systems, nor impede or redirect flood flows." (DEIR page 4.8-75)

Despite this conclusion, the DEIR conservatively concluded a potential significant impact due to "regulatory compliance"; specifically, the County requires a final drainage analysis be approved by County Public Works prior to development. The DEIR provides sufficient information to inform a reader on the potential environmental issue and associated impact and provide a meaningful opportunity to comment.

## Response to Comment Ind 767-8

As provided in DEIR section 3.8, Requested Discretionary Actions, the Reclamation Plan will be considered for approval in conjunction with the Use Permit for the project.

The Reclamation Plan, included as Appendix C to the DEIR, addresses the requirements of PRC 2773(a) in sections 5.3, 5.5, 5.8, and 5.10. In addition, Appendix G of the Reclamation Plan includes the Nevada City Engineering Preliminary Drainage Analysis providing stormwater flows and capture calculations for the reclaimed condition of the site.

As discussed in the sections outlined above, and Appendix G, the project and Reclamation Plan includes the use of culverts, drainage swales, detention basins, revegetation, and other means to control onsite erosion. Section 5.8.4 of Appendix C describes revegetation success criteria and Section 5.8.5 describes monitoring and maintenance of revegetated areas. Grading, drainage and erosions control are discussed in Section 5.5.

## Response to Comment Ind 767-9

The commenter asserts that the DEIR is overly long and confusing. The DEIR is the length necessary to address the environmental impacts associated with the project, and those raised by the public. This comment does not address an environmental issue associated with the project, but has been forwarded to the decisionmakers for their consideration.

Matt:
Here are my questions concerning the mine:
Why did the TCSC stop the retesting of the Idaho Mary toxic investigation when Rise Gold arrived?
How specifically are they going to manage the Arsenic and Asbestos once it is airborne and in the water?
How are they going to manage the Fog Plume and green house affects?
Who is going to make them accountable for the noise levels that were grossly understated in the EIR?
Thank you
Suzi Kerston

**Subject:** March 24, 2022 Special Planning Commission Meeting

Good Morning Suzi:

Thank you, I have received your voicemail message. The Special Meeting of the Nevada County Planning Commission is scheduled to take place from inside the Board of Supervisors Chambers with the meeting being open to in-person attendance. All verbal public and agency comments on the adequacy of the Draft EIR will need to be made in-person at the meeting. The meeting will be broadcast live on Nevada County Media Channel 17 in Western Nevada County and on Suddenlink Channel 78 in Eastern Nevada County. The meeting can also be viewed live through the web at: http://nevco.granicus.com/ViewPublisher.php?view_id=19. Below is a link to the Planning Commission Agenda along with a link to the Notice of Availability.

March 24, 2022 – Special Meeting of the Nevada County Planning Commission Agenda

## INDIVIDUAL LETTER 768: SUZI KERSTON

### Response to Comment Ind 768-1

The commenter's reference to TCSC is unclear. Arsenic and asbestos are addressed in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. For the commenter's fog plume reference, please see Response to Comment Grp 7-95. Greenhouse gas effects are addressed in Chapter 4.3; please also see Master Response 27 – Greenhouse Gas Thresholds and Master Response 28 – Greenhouse Gas Credits.

Matt Kelley
Senior Planner, Nevada County Planning Department
950 Maidu Avenue Suite 170
Nevada City, CA 95959-7902
April 4, 2022

Subject: Comments on Rise Gold Idaho Maryland Mine DEIR

Dear Mr. Kelley:

I am writing to express my dismay over the inadequate and flawed draft environmental impact report prepared for the Rise Gold Idaho-Maryland Mine project.

I attended the special planning commission meeting on March 24, 2022 and was very impressed with the depth of analysis and civic community engagement on display that day. While I have little to add to the record over and above the analysis and comments prepared by the public and agencies, I would like to add my concerns over several specific issues:

Empire Mine State Historic Park is set aside for the public to enjoy and appreciate, and learn from. The park has experienced ongoing issues inherited from legacy mining impacts, and even with the relatively deep pockets of the state, and the commitment to improving environmental conditions, those negative impacts associated with water, toxic chemicals (arsenic, mercury), subsidence and collapse remain today, long after the active mining pursuits have been curtailed. The proposed project would have significant and unavoidable impacts to the park, from underground plumbing effects, to noise and aesthetics. Groundwater and surface water are inextricably linked, and the subsurface complex geology of fractures and faults render the transport paths of fluids in unpredictable ways.

**Ind 769-1**

The very thought of an active industrial mine surrounded by quiet parks, and residential areas is an abhorrent one. The zoning of the two sites should prohibit even the prospect of the project as untenable.

The county's general plan and zoning should be relied upon to be consistent and any thoughts to change to mining extraction would devalue the surrounding properties significantly.

The huge engineered fills would tower above the surrounding terrain. The visual impact would be astonishing, and the unconsolidated materials would be subject to erosion and movement, eventually impacting Wolf Creek.

Since the Centennial site has yet to be cleaned up under a separate DTSC project, future use and additional negative impacts to this location are yet to be resolved.

**Ind 769-2**

**Ind 769-3**

Unfortunately our community has experienced multiple cycles of gold mine re-activation proposals, and failed enterprises due to inadequate planning, execution and management.
Our community is steeped in gold mining history and legacy impacts we continue to struggle with. While the mining activities soften with time and through the lens of nostalgia, modern techniques are at odds with an economy based on tourism and environmental quality.
I strongly recommend that the Planning Commission make the determination that the proposed project is a non-starter, and save our community the additional time and expense to carry forward additional oppositions to a project virtually no one wants, save for the gold-fevered investors and the Rise Gold principals.
So, no to the re-zone request, no to the use permit, and no to any variance requests. With these noes in hand, hopefully the project can be abandoned, for all time.
Sincerely,
Syd Brown

Nevada City, CA 95959
sydneylloydbrown@gmail.com

## INDIVIDUAL LETTER 769: SYD BROWN (1)

### Response to Comment Ind 769-1

The commenter expresses concerns regarding the project's adverse effects on Empire Mine State Park, which are addressed in the responses to Agency Letter 1. Agency Letter 1 is authored by the California Department of Parks and Recreation. For concerns related to engineered fill piles, please see Master Response 8 – Mine Waste Characterization.

### Response to Comment Ind 769-2

Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 769-3

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project. Please see Master Response 1. The commenter's opposition to the proposed project has been noted for the record and forwarded to the decision-makers for their consideration.

**Individual Letter 770**

**From:** Syd Brown <sydneylloydbrown@gmail.com>
**Sent:** Tuesday, February 1, 2022 4:05 PM
**To:** Idaho MMEIR
**Subject:** Requesting extension of comment period for Idaho Maryland Mine DEIR

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 770-1**

I request that Nevada County extend the comment period for the Idaho Maryland DEIR. The 60 day comment period is insufficient to review and analyze the complex aspects of this project. Please provide the necessary time to enable thoughtful and accurate evaluations of the potential impacts associated with the proposed project. With the power and internet outages from the storm still wreaking havoc in the county, and the limitations to in-person library access, extending the comment period seems to be only reasonable.
Thank you.
(Ms.) Syd Brown

**Ind 771-1**

I vehemently OPPOSE the reopening of the Idaho-Maryland Mine.

My family moved to Nevada County from Southern California 20+ years ago to enjoy a cleaner, quieter life. We own a home, eat, shop, recreate, and plan to retire here. The Mine is detrimental to our quality of life and will cause many of your constituents to leave the County.

Bad idea, Sups!

Thank you for your time.

## INDIVIDUAL LETTER 771: SYLVIA OTTON

### Response to Comment Ind 771-1

The commenter's opposition to the proposed project has been noted for the record and forwarded to the decision-makers for their consideration. Quality of life concerns are outside the scope of CEQA. Please see Master Response 1.

### Response to Comment Ind 772-1

The commenter's opposition to the proposed project has been noted for the record and forwarded to the decision-makers for their consideration. Please see Master Response 1.

**Individual Letter 773**

Matt Kelley,
Senior Planner
Nevada County Planning Department
950 Maidu Avenue
Nevada City, CA 94959-8617

Mr. Kelley:

Please add my name and company to the ranks of supporters of re-opening the Idaho-Maryland mine – an essential project for the future of Nevada County and our local businesses.

I have worked with the team at Rise Grass Valley, and I have confidence in their plan to bring a vibrant new business to our community. The time that they were here, it boosted my business and numerous others. Rise Gold predicts creating 312 new jobs in our county in an era where working families are suffering more and more from low wages and high unemployment.

**Ind 773-1**

Rise Gold is offering ON AVERAGE $94,000 in wages for these positions – almost $50,000 more annually that the current average wage in the county. This doesn't even count the much more significant potential of 4.7 indirect jobs created for every one job Rise creates directly. My business and scores of others will be lifted by this project, allowing us to have greater security and offer a brighter future to our own employees Passing up this opportunity to build a state-of-the-art clean mining operation right here in Grass Valley would be a foolish mistake.

I urge the Board of Supervisors and Planning Commission to avoid the baseless and desperate attacks from extreme anti-business voices in our community and approve this project so that Nevada County can build for a more prosperous future.

Sincerely,

Tammy McCrary, Owner
Foster and Son Hose and Fittings
780 Whispering Pines Lane
Grass Valley, CA 95945

## INDIVIDUAL LETTER 773: TAMMY MCCRARY

### Response to Comment Ind 774-1

The comment does not address the adequacy of the DEIR, but rather expresses general opposition to the proposed project, which has been noted for the record and forwarded to the decision-makers for their consideration. Please see Master Response 1.

Regarding the commenter's generally noted concerns about project effects on wildlife, please see Chapter 4.4, Biological Resources.

**Individual Letter 775**

April 4, 2022

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

email:idaho.MMEIR@co.nevada.ca.us

To the Nevada County Board of Supervisors,

I write as a concerned 35-year resident of Nevada County, a retired University of California history professor (Ph.D. UCLA in U.S. History, 1987), and active member of Nevada County Historical Society.[1] My most recent book is The Nevada City Nisenan (2022). My father resided Atria Grass Valley at 150 Sutton Way until his death in 2016. The impacted area and its various businesses and roads are very familiar to me.

**Ind 775-1**

Having read the **entire** EIR, **I strongly oppose reopening the Idaho-Maryland Mine.** The draft EIR is misleading in its manipulative selectivity and its omissions, creating a false impression of the relative harmlessness of the mine's dire impacts. Far more scientific research is necessary to protect the environment: the mitigations proposed are far from adequate. I respectfully offer my two part analysis of why approval is a grave mistake for this county:

**Part I: Environmental/Quantitative:** Of 83 identified impacts, 30 were deemed "significant and only 3 found "unavoidable." I find the analyses of those mine opponents with scientific expertise in the community, such as the CEA, persuasive: that baseline studies on air and water are not current, groundwater models faulty, and mitigations insufficient. That County residents should be subject to **any** increase in traffic, **any** deterioration in air or water quality, or **any** dangers from potential accidents is **unacceptable**. My questions and comments are directed at my primary concerns.

**Ind 775-2**

**I. Insufficient research on wind patterns:** No where in this EIR is a scientific analysis of wind patterns in the impacted area. Such in-depth study is necessary given the mortal danger of windblown pollutants like asbestos dust. Rise Gold acknowledges this hazard and offers to mitigate by drawing on NID water to tamp down the dust. **Addressing one problem by creating another (a huge draw on water in a mega-drought) is not a viable solution**: it is a double environmental hit on our air and water. Given the grave severity of air-borne pollutants, Rise Gold should be required to do much more investigation and explication and mitigation than they currently offer. There are, as I understand it, two sources of airborne contaminants: dried mud from the dewatered mine [2] and asbestos-laden mine-rock brought to the surface in stupendous volumes. I should like to know more about the process of monitoring and containing such pollutants. Finally, as a known pattern of climate warming

**Ind 775-3**

[1] tanisthorne.com The book includes a chapter on mining by Hank Meals.
[2] "The water coming from these mines [after dewatering] that they're dewatering is full of arsenic, manganese, iron, and other heavy metals," says the biologist Josie Crawford, the executive director of the Wolf Creek Community Alliance, another local group that opposes the mine. "It will be treated, but it needs to be treated forever." Quoted in the Atlantic, Jan. 30, 2022.

we currently experiencing (such as the winter storm of December 2021) is increasingly erratic and intense weather events,[3] worst-case scenerios for wind events should be anticipated, not the best case scenerios anticipated in the EIR. The erection of wind barriers around the areas where mine rock at industrial sites, addresses only one small phase where such fibers could escape into the air. Rise Gold should be required to more than a "half-baked" analysis. The mitigations offered are inadequate.

**Ind 775-4**

**II.** How often will the mine rock be tested for dangerous contaminants before piled up at the industrial sites or loaded on trucks? How will asbestos-laden rock be segregated from other waste rock? How will contaminated rock be treated? Who will do the monitoriing and who will pay? Then, there is the rather serious issue, which the MEIR does not address of long-term leakage and wind-borne contamination in the "recuperated zones" of so-called "engineered" mine rock **The mitigation proposed** (as above) **which creates yet another "significant and unavoidable" aesthetic impact** —and more frighteningly a legacy of poison for our descendants—**is unacceptable**: viz. mine rock disposal creating 165-foot tall towers. (Likewise, the "solution" to disposal of mine rock exported by trucks, creates at least two "unmitagatable" impacts.)

**Ind 775-5**

**III.** Insufficient research on contaminants entering the South Fork watershed. Given the danger not only to County residents and biotic environment, but potentially millions more lifeforms living downstream to the Delta and beyond, there needs to be more pre-testing, monitoring by 3rd parties and more precautionary measures in place in the event of storm events (627) Once water from the dewatered mine be brought to the surface, County residents have a right to know what contaminants are in the water, and how treated, and what the chemical analysis is prior to being released into the South Fork. New testing should be done to test water quality now. Again, worst-case scenerios should be anticipated—an extreme flood event—to prevent overflow of contaminated, untreated water from the catchment ponds into the river. The mitigations, while offering some protections against flood events (628) are inadequate (699). Rise Gold should be required to pay the Wolf Creek Alliance or other independent 3rd party for regular monitoring.

**Ind 775-6**

**IV.** Unprecedented historic drought conditions have altered conditions, requiring recalibration of the water use projections deemed "insignificant. 42,000 gpd for dust suppression for 6 years may we more than NID can spare. Already, according to Section 11.5, the demand expected to exceed supply in dry years. (840) The mitigation proposed is that additional water could be supplied from the Bear River drainage has no realistic basis. California has mandated water conservation and water is over-allocated everywhere—in other words there are far more stakeholders promised water than there is water.[4] A more accurate hydrologic model is needed to address concerns about groundwater impacts for all well owners in the impacted area, whose concerns have been slighted. EmGold acknowledged the potential threat to well-owners was more serious and widespread. Rise Gold has underestimated the threat to well owners.

---

[3] "How Bad Is the Western Drought? Worst in 12 Centuries, Study Finds."Fueled by climate change, the drought that started in 2000 is now the driest two decades since 800 A.D." By Henry Fountain, *NY Times,* Feb. 14, 2022 https://www.nytimes.com/2022/02/14/climate/western-drought-megadrought.html

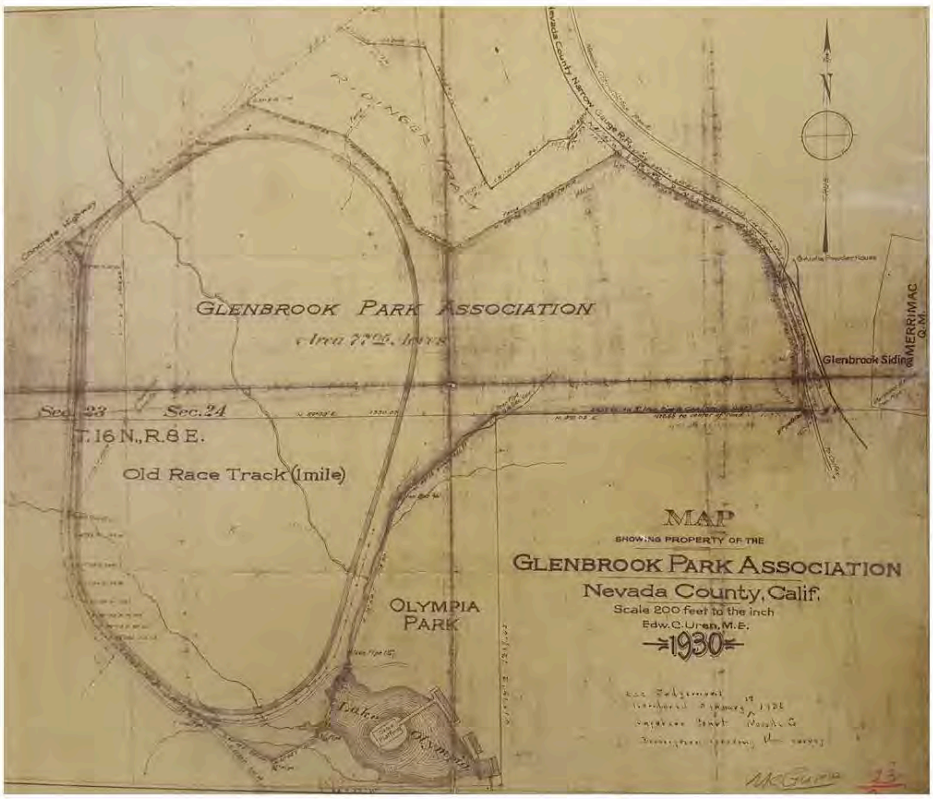
[4] "In California, rights to water exceed the supply," by George Skelton, *LA Times Capitol Journal:,* April 12, 2015 https://www.latimes.com/local/politics/la-me-cap-drought-water-20150413-column.html

**Ind 775-7**

**V. Greenhouse Gas emissions underestimated.** Rise Gold acknowledges mining operations will be emitting a huge amount - 9000 metric tons per year – but this does account the additional 4000 related to cement manufacturing, that would be well over the 10,000 metric ton significance threshold.

**Ind 775-8**

**VI. Skewing of Data: O**mitted from the report is 1) a complete scientific analysis of the clean-up of the Centennial Industrial Site (CIS), construed as a "separate," but actually an integral part of the mine-reopening project;; and 2) In the Transportation section (pp.: 903-906) the VMTs from heavy trucks, is excluded, as it was not strictly "required". (This is a loophole big enough to drive 118 heavily laden trucks—236 roundtrips—through a day for 80 years.) This leads to underestimates in the negative biological, traffic and noise impacts. Regarding the Centennial Industrial Site (CIS) there is great inconsistency and confusion generated by referring to the clean up there as "Voluntary" (587), thus underplaying the seriousness of the pollution there as one of the nation's top Superfund sites. The EIR repeatedly says this is the company's primary place for dumping mine rock (e.g. 4.3-50, 4.3-11, 4.3-55, 4.3-19) and bases various scientific analyses and calculations upon this "anticipated" chronology (104, 175, 767) when in fact Rise Gold has delayed beginning the clean-up at CIS. These two elements need to be included to get a truly accurate assessment of environmental impacts.



**Ind 775-9**

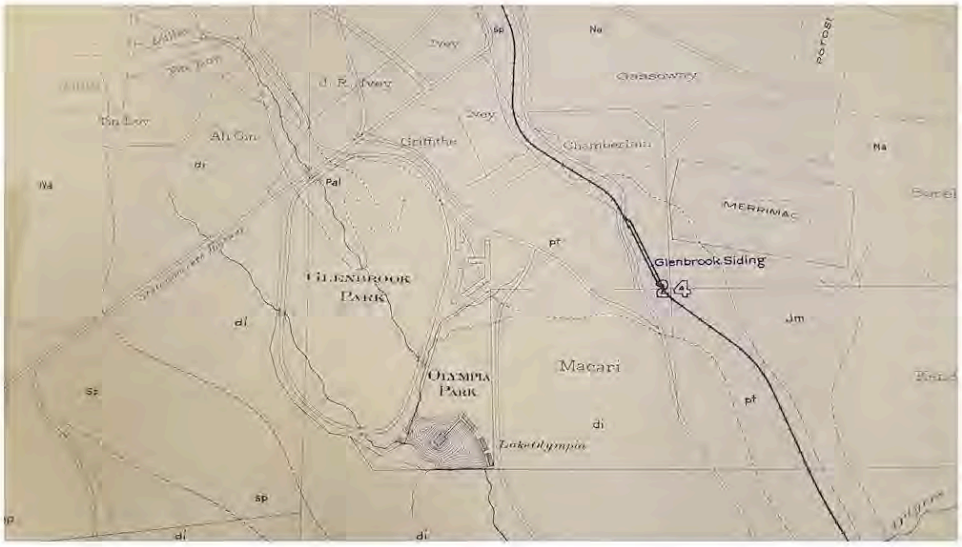
**Part 2: A historical-cultural perspective.** From a historical-cultural perspective, the draft EIR and the project documents are seriously deficient, specifically in Section 4.5 of the report (Cultural and Tribal Resources). On page 1028 [Section 6.3], the report claims that quantitative and in some cases qualitative evidence has been consulted for each impact, but this is a gross distortion: Rise Gold and its consultants wants to make the entire problem quantitative (and presumably fixable) while ignoring the qualitative effects on the region.

**Omission: County History, Culture, and Native Americans: The Impacted Area as a Major County Transportation Hub:** These are are significant omissions: 1) Two and possibly three Nisenan settlements were in the impact area: Yol si an, Dam im luk, and Si po ny, the last had a large roundhouse and graveyard.[5] These sites were recorded in 1928 by anthropologist Hugh Littlejohn from information acquired from Nevada City and Colfax Indian consultants. Bedrock

[5] Hugh W. Littlejohn field notes on Southern Maidu (Nisenan), 1928, p. 39. Online Archive of California; see also Shelley Covert's recent slide presentation for the Bear Yuba Land Trust.

mortars are located at the corner of Plaza and Sutton within the impact area. 2) There is no

mention of Lake Olympia or the Glenbrook Racetrack, both located in the Glenbrook Basin.



Map 1 (above, dated 1930) and Map 2 (below, dated 1924)[6] show the location of the race track and Lake Olympia (the last in the vicinity of the cinema at the junction of Plaza and Sutton). The Glenbrook Basin was registered as an important county landmark[7] in 1993, NEV 93-01.

Marker No. 59 is on Sutton Way, south of Brunswick Rd, next to bus shelter in the Glenbrook Plaza parking lot. The Idaho-Maryland mine's buildings were about a mile to the south.

This is the Landmarks Commission description of this historic site:

[6] Both maps are in the Searls Library.
[7] landmark defined as a loadstar, guide, beacon in German

5 of 12

"Early In the 1850's Glenbrook Basin first became known as the site of county fairs, horse racing and other special events. When Olympia Park, located at the south end of the basin, opened in 1901, Glenbrook Basin became the recreational center of Nevada County and much of Northern California, and remained so for over fifty years. People would come to the basin by horse and buggy or later the automobile, but those wishing for a little more excitement would often use the Nevada County Traction Company's trolley, or the Nevada County Narrow Gauge Railroad. The large grandstands of the three-quarter-mile racetrack stood near the junction of present Brunswick Road and Sutton Way. Trotting, pacing, and running horse races were held at the track, and motor car races began in 1913. The racetrack was one of the first electrically lighted racetracks in the state. A dam was constructed just northeast of the existing electrical substation to form Lake Olympia. The lake soon became one of the Basin's main attractions. Located in the center of Lake Olympia was an island with a pavilion which had a coil-spring-mounted dance floor that swayed with the rhythm of the dancers' feet. There was swimming, boating and fishing in Lake Olympia, and during some winters there was ice skating. There were boats and bathing suits for rent, and the park contained a bathhouse, a roller skating rink, and a bar. Many a romance blossomed on the lake during an evening boat ride under the stars. Families rented cabins and picnicked in the shade of the large pine trees along the shores of Lake Olympia. Olympia Park was the site of high school commencements, football and baseball games, and special events such as fat ladies' races and freckled-face children contests. The annual miners' picnics were held at the park with mucking and drilling contests, tug-of-wars and Cornish wrestling, as refreshments of various kinds flowed freely. Olympia Park fell into disrepair in the 1950s and ceased operation in 1958. **Glenbrook Basin,** once the recreational center for Nevada County, has **developed into one of the county's main centers of commerce** in supplying various types of

shopping, restaurants, services and recreation for the residents and visitors of Nevada County."[8]

Much abundant documentation exists for the cultural and historical importance of Glenbrook Basin as a recreational zone from 1850s to 1950s (See appendix 1).

**A poorly planned hub:** Subsequent to the closure of the Idaha-Maryland mine after World War I, Basin also ceased to be a recreational center. The basin was rezoned to promote light industry and commerce to promote economic growth. The 49/20 freeway came through in the 1960s when funds for highway improvement came through, bisecting the basin north/south as Brunswick Road had done a century before west/east. Lamentably, the automobile brought an end to the County's exceptionally-efficient and integrated mass transit system. As early as 1971, the poor planning of the area was acknowledged as "development gone awry." In fact, there had been no master plan, and one bad decisions one after another was made. The Basin was a hodgepodge of architectural styles, fast food joints, already facing traffic congestion. The water courses were paved over and the hillsides carved up. Names of streets and shopping malls retain the history of this past era, and there are some physical reminders as well, for example, some of the original tourist cabins along the Nevada City Highway, As one descends from Main Street to Sutton on Dorsey, the exhilerating, sweeping road curve follows the hoof-print of the defunct racetrack. Because of its **centrality in the County,** it nonetheless emerged as "Nevada County's most vital commercial area"[9] by the early 1990s.

Reopening the Idaho-Maryland will add yet another layer of damage to an already over-crowded badly planned road system, burdening it with bad air and heavy truck traffic. At the very least, as a mitigation Rise Gold should be required to pay for redesigning the bridge spanning the freeway and onramps to the freeway along Brunswick Road to create separate lanes for heavy truck use.

**Ind 775-10**

**Evidence and lack of evidence of Indian occupation and its mediation:** The EIR correctly observes that mining destroyed the cultural landscape of what existed prior to the gold rush. There are no registered archaeological sites in the Glenbrook Basin; indeed, there would not be as neither the United Auburn people, nor the Taylorsville Tsi Akim, nor the Nevada City Rancheria has jurisdiction in this area. The Rancheria has no legal standing as it is not federally-recognized and therefore had no voice in demanding or monitoring any archaeological project mandated under CEQA. The fact that there may be village sites, one with a graveyard, advises an abundance of caution. The EIR states (p. 6-26) that "the implementation of the proposed project could result in a **significant but mitigatable impact to unknown** archaeological resources and Tribal Cultural Resources." This is because disturbance of Central Hill Nisenan archaeological sites during construction is possible. The mitigation for such an eventuality is to follow established procedures by bringing in an archaeologist as consultant (4.5-2 and 4.6 ff; pp. 524-527). **This mitigation is inadequate.** How can one mitigate an unknown? The Native American Heritage Commission's Sacred Lands file preserves the record of only a tiny percentage of the places sacred to Native Californians. Heavy machinery used in construction and mining would obliterate any traces of artifacts or bones. **A mitigation by Rise Gold should**

[8] Excerpted from: David Comstock and Bernard Zimmerman. "Exploring Nevada County." Apple Books. "https://nevadacountylandmarks.files.wordpress.com/2017/05/glenbrook-basin.pdf

[9] *The Union* Nov. 29, 1991, p. 1.

**include a full archaeological exploration and accompanying CRM (Cultural Resource Management Report with Native monitors). There should be sample testing at several places, especially in construction areas, prior to the project beginning. At the very least, , the area which has known bedrock mortars in the vicinity of Lake Olympia should be thoroughly investigated by professional archaeologists.** This would serve the double-purpose of discovering possible remains from the Lake Olympia recreational site: foundations for buildings, etc.

Geo-physical and hydrological evidence suggest conditions were highly favorable for Indian village site(s) in the Glenbrook Basin. This is flat valley (first used by settlers for dairying) fed by numerous springs and creeks entering the basin from both the west and the east hillsides, thus creating meadows where a diversity of wildlife flourished, ideal for Nisenan seasonal and semi-permanent camp sites.[10] The first mention of the Glenbrook Basin in the historical early 1850s was wrestling and racing events, consistent with popular entertainments drawing miners and Indians as participants, such as those documented at Storm's Ranch in present-day Chicago Park and Bouvyer's Ranch on Deer Creek in 1850s. A racetrack at that site dates back to the mid-1850s. A marsh in the southeastern corner of the basin is where bedrock mortars have been identified.

**Analysis: Rattling the Bones of Our Elders/Omitting County Culture and History as Irrelevant.** Since there are few if any no-above ground physical remains, the point seems moot.[11] However, 1) Glenbrook Basin is a very significant place in Nevada County history, arguably the site of Nevada County's most glorious era from the 1880s to WWII when public transportation was king and environmentally-friendly: the electric tram and the narow gauge railroad linked Colfax, Nevada City, and Grass Valley. 2) More to the point: the Glenbrook Basin has always been a central place dating far back into pre-histoy. Historically, it is a hub of transportation, a major artery for Nevada County. The draft EIR report's failure to acknowledge our history and current needs—the importance of the basin for travel and trade, for residential occupation, and for housing our elderly— demonstrates an insensitive and callous indifference —or deliberate obfuscation —that is highly objectionable, and should not be allowed to pass withou comment. These omissions are deserving to note:

**Ind 775-11**

- No mention is made of the nursing homes and assisted living areas concentrated along Dorsey/Sutton: Atria, Spring Hill Manor, the Golden Empire, some of whom still drive to or walk or drive wheelchairs on newly installed sidewalks to Brunswick Basin shops. A demographic analysis of the impact area should have been included the dense concentration of the elderly here. The 2570 acre area in the Glenbrook Basin whose 73 miles of underground tunnels will be worked is an area where some of the most vulnerable County residents are concentrated: the homeless, and poorer, older, and ailing persons. A rise in ambient noise and light, seismic vibrations from explosions, construction and truck traffic, 16 hours a day, is inhumane.

**Ind 775-12**

[10] Geohub aAs defined by archaeologist Hank Meals, A meeting and living place based upon favorable topography where trails converge, connecting watersheds and ridges and offering access to territories of many groups," (Hank Meals). Places of abundant resources, adjacent to springs and/or wetlands favorable for trade, ceremonial events, and social transactions. See glossary, *Nevada City Nisenan.*

[11] but all that remained of I-M was a silo and a lot of mining pollution at CIP, yet it was on the Register of Historical Places.

- The tangible impacts to those above the tunnel area has been consistently underestimated.
- What the report fails to mention is that the reopened mine will do so much damage to a prosperous, stable, and high-functioning with light industry, businesses, and homes. Rural residents depend on the varied services here, e.g. banks, Verizon, well service, pharmacies, etc..
- Anyone that travels on Brunswick Road from the freeway to 174 knows how dangerous it already is and that it is far worse in bad weather. Imagine how intimidating it will be for the elders of our community to have to brave 14-ton trucks, some with explosives, when they venture out to shop or buy other supplies. Traffic accidents are inevitable.

Ind 775-13

Privileging the mining history in Section 4.5 of the report creates an illusion of continuity and disguises the profoundly aberrant nature of the proposal to reopening the I-M gold mine. We are in a post-industrial historic period. We are still remediating the damage to Native people and to the environment from the last epoch of mining. What is obvious to county residents is blithely swept aside in the report: the impact zone **at an intersection of 49/20 and the Brunswick Road to 174 to Colfax** is **a transformation hub** This is a "**central**" place on our landscape. Anyone who lives here knows the area is already congested and poorly planned, that Brunswick Road is dangerous, especially so in winter, and air quality already marginal and downright unhealthy during the fire season. A decline in property values is inevitable, especially for homes on Bennett Street and over the tunneling area. Property owners in this impact area were told by realtors as required by law that they were buying where underground mining rights were still active, but in a zone which banned heavy industry.. The residents of this area are the "new Indians" as history repeats itself. Homeowners, renters, and business owners—promised one thing—can continue to work and live in the mining area, but only at the cost of the destruction of their tranquility and the poisoning of lifeforms and/or total destruction of habit. No point in expecting or demanding compensation for losses; this is a one-way deal.

**Conclusion: "Wherefore the future?"** Rise Gold plays a double game, saying on the one hand, quality of life issues are "intangible," unmeasurable, and therefore unscientific and at same time the report claims brazenly that qualitative evidence has been incorporated for each impact. This is an untrue statement.[12] What we see here is a very slick strategy to "control the narrative" and thereby exclude information from the report that does not support their project about the how mining would ruin the peace,and quiet of rural life in this County.

Ind 775-14

1. **A Sustainable Future or Years of Seige?** What sureties/guarantees, permits, inspections could offset real as well as potential negative impacts and risks? The draft EIR attempts to apply all manner of technical fixes in service of corporate profit. This is one where we march forward into the past by attempting to reimpose an archaic industrial past on a post-industrial present. Nevada County is better than that. Over the last half-century, governmental laws and policies direct us towards better environmental practices: stewardship, conservation, checking the worst mistakes of the past, and implementation of technologies that reduce waste. We have mandates
    - to reduce automobile usage and greenhouse gas emissions

[12] 1 On page 1028 [Section 6.3], the report states that quantitative and in some cases qualitative evidence has been consulted for each impact.

- to encourage bicycle use (872, 976) and pedestrian traffic
- to reduce our electricity consumption and water consumption
- to improve the health of our forests
- to improve aesthetics by imposing building codes
- to clean up polluted areas and cease poisoning our rivers and creeks.

Approval of the Rise Gold's mining operations would require a number of code changes, one allowing unsightly, post-apocalyptic, 7-story high piles of mine rock, another returning Glenbrook Basin to an industrial rezoning. While engaging in stone-walling denial that degradation of the environment is "significant," the report shows degradation on multiple fronts. To rezone the Basin now, would be a betrayal to homeowners and just cause for litigation.[13] Approving the mine is going in the wrong direction. Nevada County Board of Supervisors should be leading us to a better future, not a worse one. We have a beautiful landscape, a growing population, and booming tourist industry. Why not show some character and vision, and put the mass back into transit, and make Nevada County a pioneer in implementing environmentally-friendly technologies? It was quite alarming to hear at the public hearing last Thursday at the Rood Center that Rise Gold 's use of electric power would gobble up most of the hard-won gains of electricity conservation. Consumers should not be asked to conserve so that foreign investors can profit. Economic benefits to County residents are chimerical; this propaganda should be exposed for what it is. Far more jobs and County property taxes will be created by projects that are approved or are reasonably foreseeable in the next five years (4.12-35, 4.12-43; pp. 886. 899)

**Ind 775-15**

Rise Gold, as many have pointed out, is not a reliable partner, and Ben Mossman is not credible. Canadian mining companies have a notorious record of making false promises and leaving environmental messes off-shore and within California itself in recent years,.[14] The Canadian Sonora Mining Company, for example, skipped town and left the taxpayers of California with a $30 million dollar clean up at the Jamestown Mine. Rise Gold has shown a willingness to make mitigations in Nevada County, but only when it is pressed to do so. In the course of this review process, some critics have suggested Rise Gold be required to put up sizable amounts of money to cover costs to individual well-owners or to the County. water issues/mining/region5 success stories/ia More numerous and regular and frequent site inspections or monitoring by objective, third parties could be required. I see these as ineffectual. **Could there ever be enough monitoring to ensure pollutants weren't entering the air or water.? How could we be exempt from freak accidents or meteorological events like windstorms or floods?** Realistically, as Robert Hubbard of the CEA and others have pointed out, once the mine is up and in operation and

[13] Tony Lauria, *Union*, March 7, 2022, A4; cf. https://www.waterboards.ca.gov/rwqcb5/
[14] For example, Canadian Mining in Latin America: Exploitation, Inconsistency, and Neglect June 11, 2014 COHABy Malavika Krishnan athttps://www.coha.org/canadian-mining-in-latin-america-exploitation-inconsistency-and-neglect/#:~:text=Canadian%20firms%20such%20as%20Barrick,the%20development%20stage%20%5B3%5D.

making profits for its non-resident investors, Rise Gold would simply pay penalties rather than cease operations and correct the violations. Worst comes to worse, tax payers are left with clean-up costs as they were at Jamestown mine. Personally, I would like to see test runs, as well as more scientific study. 14-ton trucks should run up and down Whispering Pines and Brunswick 16-hours a day to see if anyone notices increased noise or traffic congestion. As a sign of trustfulness and commitment to the well-being of our community, Rise Gold should first clean up the Centennial Industrial Site to community members satisfaction; then and only then will we consider reopening the Idaho-Maryland mine.

**The real core of the problem, however, is this**: **Rise Gold has put us on the defensive in our own land. Our safety depend on regular monitoring, honesty, and proper enforcement.** Hundreds and hundreds of hours by private citizens, environmental groups, and county government employees have already been expended to protect the status quo. (I have put in more than 200 hours working on this existential threat.), If approved, thousands more hours will be required to minimize the environmental degradation to come and to avert potentially catastrophic destruction. Why should we allow Rise Gold to put us in this unpleasant and unending role? A vastly expanded government bureaucracy would be necessary to serve as a watchdog over mining operations of this scale (the largest operating gold mine in the nation?!) and to enforce penalties. To paraphrase political analyst P.J. O'Rourke: Government can't be tasked to do everything and expect it to be well done.[15]

Do we really want to enlarge our rural county government to serve as a counter-balance to Big Business? Is it really a good use of our resources to have our bureaucracy expand to do such things as send a wildlife biologist (4.34-36) out to rescue a single western pond turtle? Far better not to endanger it and its/her/his fellows in the first place. The County would have to engage lawyers to force Rise Gold to pay for this alleged violation of its contractual agreements, and this would go on and on and on. With the enlargement of our chronically-underfunded County bureaucracy to counter a wealthy business enterprise comes the increased opportunities for bribery and corruption. The County government may be seduced by the prospect of income for the County government: jobs-creation and power expansion from huge permitting fees. Taking a lesson from history, the Bureau of Indian Affairs (or Office of Indian Affairs) was originally created within the Department of the Interior with good intentions: to protect, serve, and uplift the Native people. As time passed, the Bureau's size and budget grew until 50 % of its budget was expended to pay the salaries of non-white employees, and an unfortunately large number of government employees engaged in graft and skimming, exploiting the very people they were supposed to serve. If approved, whose interests will the County of Nevada be serving over the course of the next 80 years: the mine owners, or the people who are its first responsibility: County residents?

CEQA was intended to protect the environment against environmental polluters. Rise Gold has misused a process designed to protect human beings, by turning the EIR into a document that dismisses our quality of life as "insignificant" as well as our culture and our history. The correct take-away from this report is: **"the project's incremental contributions to the significant cumulative impact is cumulatively considerable." (4.0-3)**

---

## Appendix: Glenbrook Basin (aka Brunswick Basin)[16]

In the mid-1880s, county boosters advocated for the creation of a county fair, and Glenbrook was chosen because of its central location by a 6-1 vote. (*Nevada County Daily Transcript*, April 4, 1885).People could walk there from both Grass Valley and Nevada City. it was a prime candidate because of its existing racetrack, a staple of county fairs at that time. The goal was to create one of the best race tracks and fairgrounds in the western United States; it was"the biggest racetrack in California" according to Vince Seck . The opening was attended by Leland Stanford and California Governor George Stoneman, General Francis Amasa Walker (president of MIT) and Stephen Gage of the Central Pacific Rail Road. 500 persons attended the ball. A dedicatory speech was delivered at the Nevada Theatre by Aaron Sargent. In 1887, the race track became world-class electrification, likely having the distinction of being the first illuminated sporting event at night on Sept. 8, 1887. In 1889, a brook feeding the marsh was damned to create the 2-acre, artificial Lake Olympia (near Plaza Road and Sutton Way).

In the early 1900s, Lake Olympia and Glenbrook Race Track were at the first peak of their popularity. In August 1901, the Nevada County Traction Company, the electric rail line linking Grass Valley and Nevada City, was completed and the first electric car from Grass Valley arrived at Glenbrook. The Traction Company had 4 streetcars running between Pine and Broad Streets in Nevada City and Boston Ravine in Grass Valley (departing hourly from NC) and , passing through Glenbrook Basin near where Olympia Way meets Brunswick Road today. The fare was 15 cents each way. The Traction Co had a successful 25 year electric streetcar line. Coaches were 32 feet long holding 32 passengers inside and 12 outside. On big events, cars left at 15 minute intervals. The opening of the was electric road was dedicated with concerts, reception, parades, dances, the ringing of bells, and mine excursions;

Also in 1901, Lake Olympia had been developed as 15 acre park with a dance floor and pavilion on an artificial island, swimming, canoeing, high diving, summer tourist cabins, confectionery, bar, and bath houses. Teddy Roosevelt visited in 1903. Lake Olympia was reputedly the "most popular spot in Nevada County", a "social and recreational center of Grass Valley and Nevada City. "It was a little piece of paradise, like a 'fun world' today," said local historian Ron Sturgell. "Lake Olympia will always live on in our memories."

In the first half of the 20th century, Glenbrook basin remained the premier location for recreation in Nevada County; its dance hall was the most popular in the county, thanks to the excellent mass transit system in place. It was cheaply and easily accessed by county residents. Residents (miners, ranchers, orchardists) could and did travel from Chicago Park on the narrow gauge railroad to recreate, picnic, tennis, swim, listen to live music and dance many nights a week. Race cars replaced horses at the racetrack, attracting large crowds and competitors from across the western U.S. In the 1920s and 1930s, Big Bands regularly made appearances at Lake Olympia. Lionel Hampton and other big-band musicians provided entertainment on weekends. "There was always good music there," said Helen Williams. Williams grandfather helped build

[16] Brunswick Road bisecting the Glenbrook Racetrack carried traffic to the Brunswick Mine;

the spring floor. "the floor would really bounce," she said. Soldiers stationed at Beal Air Force Base came to dance at Lake Olympia, a popular place for rest and recuperation during World War II.

Thanks to its productive gold mines and low unemployment, Nevada County enjoyed prosperity and entertainment at the Glenbrook Basin while others in the nation struggled. Nevada County residents swam and danced at Lake Olympia. Adjacent to the Idaho-Maryland mine, Glenbrook's racetrack and Lake Olympia were the two symbiotic sides of the Nevada County life: the economic and the social. Each was served by the remarkably efficient and environmentally-friend infrastructure of electric street cars and railways.

***Sources:***

The major secondary sources on Glenbrook Park are Juanita Kennedy Brown, *A Tale of Two Cities and a Train* (1987) and David Allan Comstock, *Greenbacks and Copperheads, 1859-1869* (1995). Most of the information is drawn from Union newspaper articles; see for example, a 3 part series Nov. 28, 29, 30, 1991. Some clippings are preserved in the Landmark Commission file on Glenbrook Basin, Searls Library (NCHS). Dozens of photographs of the the racetrack and Lake Olympia are preserved there as well; others are found in the Dorsey Collection, Bancroft Library, Berkeley, California. Vince Seck, whose family were the last owners of Lake Olympia has a good collection of photos and newspaper clippings.

## INDIVIDUAL LETTER 775: TANIS THORNE (1)

### Response to Comment Ind 775-1
This is an introductory comment and does not provide a specific comment on an environmental issue associated with the project. Please see Master Response 1 - Non-EIR and Administrative Issues.

### Response to Comment Ind 775-2
This is an introductory comment and broadly outlines the commenter's disagreement with conclusions identified in the DEIR. The commenter does not provide specific reasons why the environmental analysis was deficient but rather states disagreement with its overall conclusion. Please see Master Response 1 - Non-EIR and Administrative Issues.

### Response to Comment Ind 775-3
The commenter asserts there is insufficient research on wind patterns in the DEIR. The dispersion model in the Health Risk Assessment used the most appropriate available data (including wind) for the HRA. Please see Master Response 17 - Meteorological Data Used in HRA**.**

The commenter describes a huge drawdown on water in a mega drought and asserts that using water to control dust is problematic due to the drought. The impacts from groundwater drawdown from mine dewatering have been analyzed in the DEIR and are less than significant after mitigation. Water use for dust suppression was also examined in the DEIR, and impacts related to that use were considered less than significant. (DEIR p. 4.11-36; Appendix N.) As stated on page 4.8-12 of the DEIR, based on the lack of changes in the individual well hydrographs between wet and dry climatic cycles, the amount of recharge appears to be consistent from year to year and is not affected substantially by drought or wet cycles. The commenter describes a grave severity of air-borne pollutants. The health impact of constituents in dust particles produced by various project activities has been analyzed in the DEIR and is less than significant after mitigation measures. The Health Risk Assessment is based on conservative assumptions. Please see Master Response 22 – Conservatism of Asbestos Assumptions. Nevertheless, the EIR concludes that the project could result in a significant impact with respect to exposing receptors to substantial concentrations of asbestos and requires mitigation to reduce the impact to a less than significant level. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. The minimum requirements of the ADMP are provided in the DEIR. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. With regard to health impacts of metals in dust from the mine, these impacts were analyzed in a Health Risk Assessment using conservative assumptions, which reached the conclusion that acute and chronic health impacts would be less than significant under NSAQMD standards. (see Master Response 20 – Conservatism of Metals Assumptions).

### Response to Comment Ind 775-4
The commenter asks how often mine rock will be tested for dangerous contaminants, specifically asbestos. As described in DEIR section 4.3.4 (page 4.3-61) and Appendix E.2, Asbestos Serpentine and Ultramafic Rock (ASUR) Plan, two methods of asbestos testing are required. PLM testing is required to comply with the Asbestos ATCM. TEM testing is done to verify that mine planning is effectively minimizing the potential for public exposure to airborne asbestos from the project. The amount of sampling for asbestos, segregation and management of materials is

described in Appendix E.2 of the DEIR. Air monitoring will be performed and paid for by the applicant in accordance with the approved Asbestos Dust Mitigation Plan (ADMP). Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring. The ASUR Plan will be an enforceable condition of approval, and components of the plan will become part of the approved ADMP at the NSAQMD's discretion.

The commenter states the DEIR does not address long-term leakage/wind-borne contamination from engineered fill piles. As stated in the DEIR and reclamation plan (Appendix C of the DEIR), fill slopes and the final pad will be revegetated which would minimize long-term wind erosion on the engineered fill piles. As described in Chapter 3 of the DEIR, the engineered fill placement creates large flat areas suitable for potential future industrial buildings and not 165 tall "towers" as described by the commenter. Nevertheless, the DEIR has concluded the project would have a significant and unavoidable aesthetics impact, in part due to the visibility of the engineered fill piles.

## Response to Comment Ind 775-5

The commenter states that more pre-testing and monitoring by 3rd parties for the mine water discharge to protect downstream lifeforms and requests more information on contaminants in water, water treatment, and chemical analysis prior to discharge to South Fork Wolf Creek. The mine water that will be discharged to South Fork Wolf Creek will be treated prior to discharge to ensure that it meets water quality standards set by the Central Valley Regional Water Quality Control Board; therefore, the project has a less than significant impact to water quality in the creek after mitigation. Please see Master Response 35 - Discharge to South Fork Wolf Creek.

The commenter states that more precautionary measures are required in the event of storm events and extreme flood events to prevent overflow of untreated mine water to South Fork Wolf Creek. A Preliminary Drainage Analysis (PDA) (Nevada City Engineering, 2019) was prepared and included as DEIR Appendix K.5. As described in DEIR section 4.8.4, the PDA was peer reviewed by the County and potential impacts were analyzed in Impact 4.8-3. As stated in the conclusion to Impact 4.8-3:

> "The drainage analyses discussed above conclude that the project would not significantly alter the drainage patterns of the sites in a manner which would result in substantial erosion or siltation on- or off-site, nor substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site, nor create or contribute to runoff water which would exceed the capacity of existing stormwater drainage systems, nor impede or redirect flood flows." (DEIR page 4.8-75)

As stated in Appendix K.5 of the DEIR, the drainage calculations and detention basins are specifically designed to respond to the drainage requirements of the County of Nevada. The Nevada County drainage requirements indicate that new storm drain systems and channels shall be designed to convey the 10- and 100-year, 24-hour storm event. Section 4.5 of Appendix K.2 discusses the 6.4-acre catchment area where precipitation would inflow into the water treatment pond and confirms that the designed freeboard volume is more than adequate to retain the runoff from a 100-year storm event.

The commenter states that regular monitoring of mine water discharge should be done by 3rd parties such as Wolf Creek Alliance and paid for by the applicant. The Central Valley Regional

Water Quality Control Board is the regulatory agency responsible for the regulations pertaining to the mine water discharge and the applicant would conduct monitoring in accordance with the approved Notice of Applicability. The Central Valley Regional Water Quality Control Board would also have enforcement authority over the mine operator for any violations. Please see Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment Ind 775-6

The commenter asserts that there is insufficient water supply for the project due to drought conditions. The County EIR consultant prepared a water supply assessment (WSA) for the proposed project (see Appendix N) which was analyzed in DEIR Chapter 4.11. The WSA evaluated the adequacy of NID's total projected water supplies, including existing water supplies and future planned water supplies, to meet the existing and projected future water demands, including those future water demands associated with the proposed project, under all hydrologic conditions (Normal Years, Single Dry Years, and Multiple Dry Years) (see DEIR page 4.11-8). The WSA concluded that NID has sufficient water supply to meet the project's demand. DEIR Impact 4.11-7 analyzed whether sufficient water supply exists to serve the project for the foreseeable future and under the previously mentioned conditions. This impact analysis concluded sufficient water supplies would be available to serve the proposed project, as well as existing and reasonably foreseeable future development during normal, dry, and multiple dry years. As a result, this was considered a less than significant impact. In addition, the Nevada Irrigation District has approved the project's water supply assessment and is an expert agency in water supply.

NID has also established contingency measures during drought years. Regarding NID's Water Shortage Contingency Plan, as described in NID's 2020 UWMP (Chapter 6 Drought Plan) and the WSA (Section 6.2 Additional Planned Future Potable Water Supplies), there are numerous management and operational efforts available to NID to address potential supply shortfalls during drought periods. Demand reductions, carryover storage strategies, system operational strategies, supplemental supplies, increased storage, and others are all options available to NID in the event of a water shortage condition. NID will evaluate each specific shortage condition and select the appropriate response action(s) for implementation. If supplies become extremely critical requiring implementation of Stage 6 of NID's Water Shortage Contingency Plan, drinking water supplies to NID's treated water and municipal water customers may be reduced to health and safety use of water only, but would not be cut off.

NID is also in the early stages of a long-term visioning and planning effort to better understand potential future conditions and needs in response to climate change, and identify management and operational practices to meet those needs. The process, Plan for Water, will identify optional water management practices as triggering points in supply, demand, regulatory, legal, and other events are reached. These practices may include supply projects, demand management efforts, policy changes, and others. As the Plan for Water process is developing mitigation measures for drought resiliency, NID will continue to implement its current drought and water shortage contingency efforts as described in NID's 2020 UWMP.

Water used for dust suppression at the Centennial site may be purchased from NID and the project would be subject to the same water restrictions as any other NID customer.

Contrary to the commenter's assertion that the EmGold analysis reached a significantly different conclusion, previous hydrogeologic assessments conducted for Emgold proposals, have come to a similar conclusion as the current analysis despite the use of simplistic analytic solutions. Please see Master Response 13 – Historic Hydrogeologic Assessments.

## Response to Comment Ind 775-7

The commenter suggests that GHGs associated with the manufacture of cement should have been included in the DEIR. This comment pertains to a "lifecycle" analysis, which is not required under CEQA. Please see Master Response 26 – Life Cycle GHG emissions.

## Response to Comment Ind 775-8

The commenter states the Centennial Industrial Site Clean-Up project should be included in the analysis of the Idaho-Maryland Mine project. Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA. The commenter states that Rise has delayed the cleanup of the Centennial site; however, this is not accurate. Rise is working with DTSC to enter into a voluntary cleanup agreement and is still awaiting DTSC approval to enter into that agreement and begin cleanup. No steps have been taken by Rise to delay cleanup; rather Rise has taken affirmative steps to initiate cleanup at its own expense, of a site that has historic pollution issues not caused by Rise.

The commenter also makes an assertion that because Vehicle Miles Travelled (VMT) was not used to assess potential project impacts, the DEIR underestimated potential impacts, including biology, traffic and noise. The commenter correctly states heavy truck trips used to transport fill to the Centennial site and surrounding construction market were excluded from the VMT analysis. As explained in detail in DEIR section 4.12.4, subsection Project Vehicle Miles Traveled Analysis (see pages 4.12-52 – 55), the VMT legislation, Office of Planning and Research (OPR) guidance, and CEQA guidelines section 16064.4 was based on reduction of greenhouse gases caused by automobiles and light trucks. Nothing in the legislation, OPR guidance documents, CEQA Guidelines, or County traffic analysis guidelines requires heavy vehicle truck trips be included in the VMT analysis. Rather, OPR guidance documents suggest that heavy trucks should not be included in VMT analysis for CEQA purposes. Contrary to the commenter's assertion, heavy truck traffic was included in the noise analysis. The commenter does not explain its comment that heavy trucks would result in biological impacts.

## Response to Comment Ind 775-9

The commenter provides additional historical information regarding the region near the project site called Glenbrook Basin. Glenbrook Basin is outside the project footprint and would not be subject to project related surface disturbance and impacts. As noted by the commenter, this area is already heavily developed and is now "one of the County's main centers of commerce."

## Response to Comment Ind 775-10

The commenter summarizes DEIR Cultural Resources Impact 4.5-2 and disagrees with the conclusion and mitigation measure identified. As explained in this section, a site-specific cultural resources survey was conducted by a qualified archeologist meeting the Secretary of the Interior's Professional Qualification Standards. This included outreach to the Native American Heritage Commission, surrounding Native American tribes and historical entities, and the Nevada County Landmark Commission (see DEIR pages 4.5-19 – 21). The analysis, conclusion, and mitigation measure in Impact 4.5-2 was based on this extensive site-specific analysis and broad outreach and reflects the judgment of professional experts in the field and the best available information.

## Response to Comment Ind 775-11

Please see Response to Comment 775-9 above regarding Glenbrook Basin.

## Response to Comment Ind 775-12

Please see Response to Comment 775-9 above regarding Glenbrook Basin.

The commenter also raises general concerns regarding potential ambient noise increases, light, vibrations, and truck traffic within the Glenbrook Basin. The commenter does not provide any specific comments regarding deficiency of the analysis, disagreement with conclusions, or additional potential mitigation measures.

Potential ambient noise increases from proposed project activities and traffic was analyzed in DEIR Chapter 4.10, Impacts 4.10-2 and 4.10-3. The impacts were found potentially significant and mitigation measures were identified, including prohibiting the use of Jake brakes and development and implementation of an ongoing noise monitoring program. These noise impacts were considered less than significant after mitigation.

Aesthetics impacts, including potential for additional light and glare, were analyzed in DEIR Chapter 4.1, Impacts 4.1-3 and 4.1-5. These impacts were considered less than significant.

Ground-borne vibration impacts from underground mining activities were addressed in DEIR Chapter 4.10, Impact 4.10-4. The impact was found potentially significant and the DEIR identified a mitigation measure requiring the preparation and ongoing implementation of a Ground-Borne Vibration Monitoring Program. This impact was less than significant after mitigation.

Transportation impacts are evaluated in Chapter 4.12 of the DEIR. Haul routes are established for the project's heavy trucks, the majority of which do not need to be travelled to access shopping opportunities.

## Response to Comment Ind 775-13

Please see Response to Comment Ind 775-9 above regarding Glenbrook Basin. Transportation impacts are addressed in Chapter 4.12 of the DEIR. It is noted that the DEIR includes the following mitigation measure, addressing truck traffic on Brunswick Road:

> *4.12-6(e)* *Prior to commencement of operations, the Project Applicant shall obtain an encroachment permit from Nevada County and install: 1) W51 "Slow Trucks" road sign along Brunswick Road, about 500 feet north of the E. Bennett Road intersection; 2) A second sign shall be installed at the applicant's expense just south of the crest of the grade, warning truck drivers of the transition in grade and presence of the downgrade Loma Rica Drive intersection.*

Regarding property value concerns, please see Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 775-14

Please see Master Response 1 - Non-EIR and Administrative Issues, and Response to Comment Agcy 8-17 regarding evidence that the project would not result in wasteful or inefficient use of energy.

## Response to Comment Ind 775-15

This is a conclusory comment and does not provide a comment on an environmental issue associated with the project. Please see Master Response 1 - Non-EIR and Administrative Issues, regarding project opposition and support, and see Master Response 3 - Operator Responsibility.

RECEIVED
APR 04 2022
NEVADA COUNTY
PLANNING DEPARTMENT

To the Nevada County Board of Supervisors,

I write as a concerned 35-year resident of Nevada County, a retired University of California history professor (Ph.D. UCLA in U.S. History, 1987), and active member of the Nevada County Historical Society.[1] My most recent book is The Nevada City Nisenan (2022). My father resided Atria Grass Valley at 150 Sutton Way until his death in 2016. The impacted area and its various businesses and roads are very familiar to me.

**Ind 776-2**

Having read the **entire** EIR, **I strongly oppose reopening the Idaho-Maryland Mine.** The draft EIR is misleading in its manipulative selectivity and its omissions, creating a false impression of the relative harmlessness of the mine's dire impacts. Far more scientific research is necessary to protect the environment: the mitigations proposed are far from adequate. I respectfully offer my two part analysis of why approval is a grave mistake for this county:

**Ind 776-3**

**Part I: Environmental/Quantitative:** Of 83 identified impacts, 30 were deemed "significant" and only 3 found "unavoidable." I find the analyses of those mine opponents with scientific expertise in the community, such as the CEA, persuasive: that baseline studies on air and water are not current, groundwater models faulty, and mitigations insufficient. That County residents should be subject to **any** increase in traffic, **any** deterioration in air or water quality, or **any** dangers from potential accidents is **unacceptable**. My questions and comments are directed at my primary concerns.

**Ind 776-4**

I. **Insufficient research on wind patterns:** No where in this EIR is a scientific analysis of wind patterns in the impacted area. Such in-depth study is necessary given the mortal danger of windblown pollutants like asbestos dust. Rise Gold acknowledges this hazard and offers to mitigate by drawing on NID water to tamp down the dust. **Addressing one problem by creating another (a huge draw on water in a mega-drought) is not a viable solution**: it is a double environmental hit on our air and water. Given the grave severity of air-borne pollutants, Rise Gold should be required to do much more investigation and explication and mitigation than they currently offer. There are, as I understand it, two sources of airborne conta-

[1] tanisthorne.com The book includes a chapter on mining by Hank Meals.

minants: dried mud from the dewatered mine [2] and asbestos-laden mine-rock brought to the surface in stupendous volumes. I should like to know more about the process of monitoring and containing such pollutants. Finally, as a known pattern of climate warming we currently experiencing (such as the winter storm of December 2021) is increasingly erratic and intense weather events,[3] worst-case scenerios for wind events should be anticipated, not the best case scenerios anticipated in the EIR. The erection of wind barriers around the areas where mine rock at industrial sites, addresses only one small phase where such fibers could escape into the air. Rise Gold should be required to more than a "half-baked" analysis. The mitigations offered are inadequate.

**Ind 776-5**

II. How often will the mine rock be tested for dangerous contaminants before piled up at the industrial sites or loaded on trucks? How will asbestos-laden rock be segregated from other waste rock? How will contaminated rock be treated? Who will do the monitoriing and who will pay? Then, there is the rather serious issue, which the MEIR does not address of long-term leakage and wind-borne contamination in the "recuperated zones" of so-called "engineered" mine rock **The mitigation proposed** (as above) **which creates yet another "significant and unavoidable" aesthetic impact** —and more frighteningly a legacy of poison for our descendants—**is unacceptable**: viz. mine rock disposal creating 165-foot tall towers. (Likewise, the "solution" to disposal of mine rock exported by trucks, creates at least two "unmitagatable" impacts.)

**Ind 776-6**

III. Insufficient research on contaminants entering the South Fork Wolf Creek watershed. Given the danger not only to County residents and biotic environment, but potentially millions more lifeforms living downstream to the Delta and beyond, there needs to be more pre-testing, monitoring by 3rd parties and more precautionary measures in place in the event of storm events (627) Once water from the dewatered mine be brought to the surface, County residents have a right to know what contaminants are in the water, and how treated, and what the chemical analysis is prior to being released into the South Fork. New testing should be done to test water quality now. Again, worst-case scenerios should be anticipated—an extreme flood event—to prevent overflow of contaminated, untreated water from the catchment ponds into the river. The mitigations, while offering some protections against flood events (628) are inadequate (699). Rise Gold should be required to pay the Wolf Creek Alliance or other independent 3rd party for regular monitoring.

**Ind 776-7**

IV. Unprecedented historic drought conditions have altered conditions, requiring recalibration of the water use projections deemed "insignificant. 42,000 gpd for dust suppression for 6 years may we more than NID can spare. Already, according to Section 11.5, the demand expected

---

[2] "The water coming from these mines [after dewatering] that they're dewatering is full of arsenic, manganese, iron, and other heavy metals," says the biologist Josie Crawford, the executive director of the Wolf Creek Community Alliance, another local group that opposes the mine. "It will be treated, but it needs to be treated forever." Quoted in the Atlantic, Jan. 30, 2022.

[3] "How Bad Is the Western Drought? Worst in 12 Centuries, Study Finds."Fueled by climate change, the drought that started in 2000 is now the driest two decades since 800 A.D." By Henry Fountain, *NY Times*, Feb. 14, 2022 https://www.nytimes.com/2022/02/14/climate/western-drought-megadrought.html

to exceed supply in dry years. (840) The mitigation proposed is that additional water could be supplied from the Bear River drainage has no realistic basis. California has mandated water conservation and water is over-allocated everywhere—in other words there are far more stakeholders promised water than there is water.[4] A more accurate hydrologic model is needed to address concerns about groundwater impacts for all well owners in the impacted area, whose concerns have been slighted. EmGold acknowledged the potential threat to well-owners was more serious and widespread. Rise Gold has underestimated the threat to well owners.

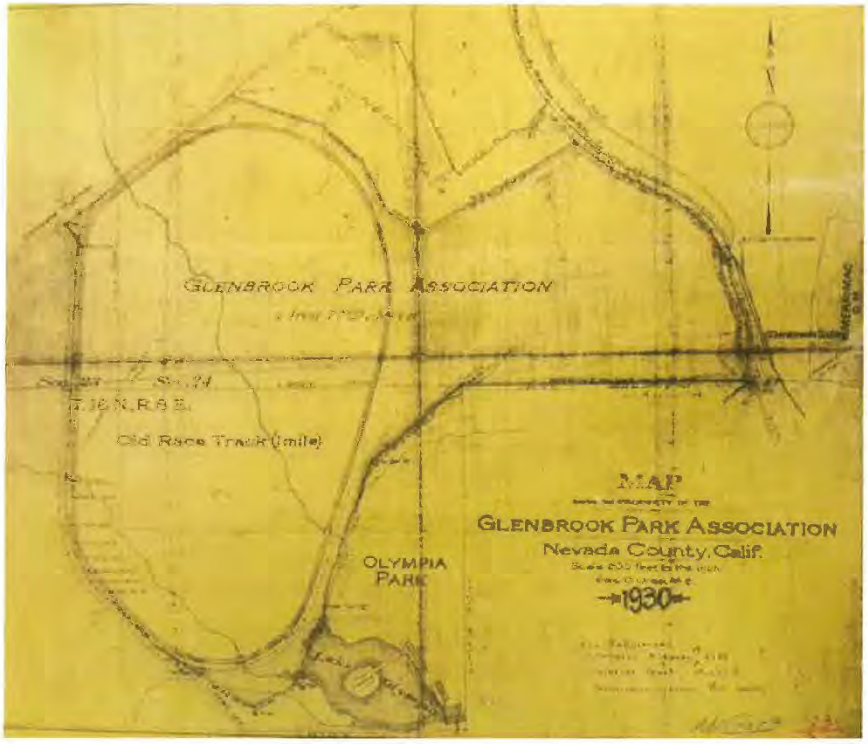
**Ind 776-8**

V. **Greenhouse Gas emissions underestimated.** Rise Gold acknowledges mining operations will be emitting a huge amount - 9000 metric tons per year – but this does account the additional 4000 metric tons per year related to cement manufacturing, that would be well over the 10,000 metric ton per year significance threshold.

**Ind 776-9**

VI. **Skewing of Data: Omitted** from the report is 1) a complete scientific analysis of the clean-up of the Centennial Industrial Site (CIS), construed as a "separate," but actually an integral part of the mine-reopening project;; and 2) In the Transportation section (pp.: 903-906) the VMTs from heavy trucks, is excluded, as it was not strictly "required". (This is a loophole big enough to drive 118 heavily laden trucks—236 roundtrips—through a day for 80 years.) This leads to underestimates in the negative biological, traffic and noise impacts. Regarding the Centennial Industrial Site (CIS) there is great inconsistency and confusion generated by referring to the clean up there as "Voluntary" (587), thus underplaying the seriousness of the pollution there as one of the nation's top Superfund sites. The EIR repeatedly says this is the company's primary place for dumping mine rock (e.g. 4.3-50, 4.3-11, 4.3-55, 4.3-19) and bases various scientific analyses and calculations upon this "anticipated" chronology (104, 175, 767) when in fact Rise Gold has delayed beginning the clean-up at CIS. These two elements need to be included to get a truly accurate assessment of environmental impacts.

**Ind 776-10**



**Part 2: A historical-cultural perspective.** From a historical-cultural perspective, the draft EIR and the project documents are seriously deficient, specifically in Section 4.5 of the report (Cultural and Tribal Resources). On page 1028 [Section 6.3], the report claims that quantitative and in some cases qualitative evidence has been consulted for each impact, but this is a gross distortion: Rise Gold and its consultants wants to make the entire problem quantitative (and presumably fixable) while ignoring the qualitative effects on the region.

**Omission: County History, Culture, and Native Americans: The Impacted Area as a Major County Transportation Hub:** These are significant omissions: 1) Two and possibly three Nisenan settlements were in the impact area: Yol si an, Dam im luk, and Si po ny, the last had a large

[4] "In California, rights to water exceed the supply," by George Skelton, *LA Times Capitol Journal*:, April 12, 2015 https://www.latimes.com/local/politics/la-me-cap-drought-water-20150413-column.html

corrected typos and grammar, 4/5 4 of 13

roundhouse and graveyard.[5] These sites were recorded in 1928 by anthropologist Hugh Littlejohn from information acquired from Nevada City and Colfax Indian consultants. Bedrock mortars are located at the corner of Plaza and Sutton within the impact area.(2) There is no mention of Lake Olympia or the Glenbrook Racetrack, both located in the Glenbrook Basin.

Map 1 (above, dated 1930) and Map 2 (below, dated 1924)[6] show the location of the race track and Lake Olympia (the last in the vicinity of the cinema at the junction of Plaza and Sutton). The Glenbrook Basin was registered as an important county landmark[7] in 1993, NEV 93-01.

corrected typos and grammar, 4/5 5 of 13

Marker No. 59 is on Sutton Way, south of Brunswick Rd, next to bus shelter in the Glenbrook Plaza parking lot. The Idaho-Maryland mine's buildings were about a mile to the south.

This is the Landmarks Commission description of this historic site:

> "Early In the 1850's Glenbrook Basin first became known as the site of county fairs, horse racing and other special events. When Olympia Park, located at the south end of the basin, opened in 1901, Glenbrook Basin became the recreational center of Nevada County and much of Northern California, and remained so for over fifty years. People would come to the basin by horse and buggy or later the automobile, but those wishing for a little more excitement would often use the Nevada County Traction Company's trolley, or the Nevada County Narrow Gauge Railroad. The large grandstands of the three-quarter-mile racetrack stood near the junction of present Brunswick Road and Sutton Way. Trotting, pacing, and running horse races were held at the track, and motor car races began in 1913. The race-track was one of the first electrically lighted racetracks in the state. A dam was constructed just northeast of the existing electrical substation to form Lake Olympia. The lake soon became one of the Basin's main attractions. Located in the center of Lake Olympia was an island with a pavilion which had a coil-spring-mounted dance floor that swayed with the rhythm of the dancers' feet. There was swimming, boating and fishing in Lake Olympia, and during some winters there was ice skating. There were boats and bathing suits for rent, and the park contained a bathhouse, a roller skating rink, and a bar. Many a romance blossomed on the lake during an evening boat ride under the stars. Families rented cabins and picnicked in the shade of the large pine trees along the shores of Lake Olympia.

Olympia Park was the site of high school commencements, football and baseball games, and special events such as fat ladies' races and freckled-face children contests. The annual miners' picnics were held at the park with mucking and drilling contests, tug-of-wars and Cornish wrestling, as refreshments of various kinds flowed freely. Olympia Park fell into disrepair in the 1950s and ceased operation in 1958. **Glenbrook Basin,** once the recreational center for Nevada County, has **developed into one of the county's main centers of commerce** in supplying various types of shopping, restaurants, services and recreation for the residents and visitors of Nevada County."[8]

Much abundant documentation exists for the cultural and historical importance of Glenbrook Basin as a recreational zone from 1850s to 1950s (See appendix 1).

**A poorly planned hub:** Subsequent to the closure of the Idaho-Maryland mine after World War I, the basin also ceased to be a recreational center. The basin was rezoned to promote light industry and commerce to promote economic growth. The 49/20 freeway came through in the 1960s when funds for highway improvement came through, bisecting the basin north/south as Brunswick Road had done a century before west/east. Lamentably, the automobile brought an end to the County's exceptionally-efficient and integrated mass transit system. As early as 1971, the poor planning of the area was acknowledged as "development gone awry." In fact, there had been no master plan, and one bad decision after another was made. The Basin was a hodgepodge of architectural styles, fast food joints, already facing traffic congestion. The water courses were paved over and the hillsides carved up. Names of streets and shopping malls retain the history of this past era, and there are some physical reminders as well, for example, some of the original tourist cabins along the Nevada City Highway, As one descends from the freeway to Sutton on Dorsey, the exhilerating, sweeping road curve follows the hoof-print of the defunct racetrack. Because of its **centrality in the County,** it nonetheless emerged as "Nevada County's most vital commercial area"[9] by the early 1990s.

Reopening the Idaho-Maryland will add yet another layer of damage to an already overcrowded badly planned road system, burdening it with bad air and heavy truck traffic. At the very least, as a mitigation Rise Gold should be required to pay for redesigning the bridge spanning the freeway and onramps to the freeway along Brunswick Road to create separate lanes for heavy truck use.

**Ind 776-11**

**Evidence and lack of evidence of Indian occupation and its mediation:** The EIR correctly observes that mining destroyed the cultural landscape of what existed prior to the gold rush. There are no registered archaeological sites in the Glenbrook Basin; indeed, there would not be as neither the United Auburn people, nor the Taylorsville Tsi Akim, nor the Nevada City Rancheria has jurisdiction in this area. The Rancheria has no legal standing as it is not federally-
