This is subject to many disputes I discuss at my #'s 3.D and F, 5, and 6. I note here, however, that there is no supporting discussion of the effect of such deep mining on the actual conditions that may be uncovered at those depths (eg, bigger fractures from blasting, underground rivers, or aquifers?). More importantly, because of drought and climate change, us locals and our governments or other organizations will have to start competing with the mine for groundwater at ever depths during the 80 plus years of this mining. See my #'s 3.D, F, and N, 5, and 6. Also, recall that the mine has been closed and flooded since 1956, and without access or reliable and sufficient records, how can the DEIR even guess about the stating state of the mine? and

(iii) Note that the DEIR admits (at 4.7-2) that: "The mine has been inactive since closure in 1956 and was inactive for several periods during the 1866 to 1956 production period. *** ...the project sites appear on several lists of hazardous materials sites complied pursuant to Government Code Section 65962.5." DEIR at 4.3-56 states: "Ore production through tunneling and long-hole blasting is anticipated to produce 1,000 tons per day (365,000 tons per year) of ore ..." with the 24/7/365 operations discussed elsewhere. See also the beginning of this long paragraph, regarding the 1000 vs 500-ton confusion. As discussed in my # 3.M, there are many flaws in the DEIR trying to predict the either the current or future conditions and issues based on such pre-1956 underground mining data, much less when (as now) the DEIR is seeking approval to mine new, expanded, and deeper areas into the unknown parts of the 2585-acres. What is safe and tolerable for us surface owners and users above the 2585-acre mine with that 24/7/365 blasting and mining beneath us is not a subject that the DEIR ever sufficiently addressed. See my #'s 4 and 14. That is not just noncompliance with CEQA (see my # 14), but it's also another provocation and failure to address the reasonable concerns of thousands of us

**Ind 254-13**

surface owners (see my # 3.N). We don't even yet know yet, who is living where above and around those 2585 acres of mine, because (as discussed above) the obscure aerial photos with dotted boundary lines on treetops do not identify meaningful surface landmarks, and no one has been given proper notice as a surface owner or user.

C. **Admitted (But Obscured) Use of Hazardous Chromium Without Warning Or Analysis. (See more detailed discussion in later subsections G and H below).**

**Ind 254-14**

Speaking of stigma complications that make our local problems and real estate value losses even worse, the disputed **DEIR admits in its dewatering discussion (at 4.8-42 to 51, especially at 46-49) that it intends to use "underground paste backfill" (ie, material glued with "cemented-paste backfill") that is (incorrectly) described as "environmentally benign" BUT WHICH IS "HEXAVALENT CHROMIUM" OR "Cr+6." See my discussion of more details and my DEIR rebuttals in the subsection below on hazardous substances.** See my #'s 3.G and H and 7. Also, notice that the scattered DEIR discussions of such mining plans often do not even mention, much less analyze, the hexavalent chromium threats or even mention the name, "hexavalent chromium," as if the DEIR parts were written by different mine advocates, ie, one who felt obligated by CEQA to confess the Cr+6 name without any hint of the toxic issues and notorious toxic data and history, and others who chose not to mention either that CR+6 name or the scandals. See, eg, DEIR at 4.3-58 entitled, "Earthwork and Material Handling," ignores this issue; DEIR at 4.3-61 entitled "Health Risk Assessment," **ignores their hexavalent chromium threat entirely and contains an insufficient discussion of the asbestos risks, as well as for the following (at 4.3-62): "Blasting and crushing would also result in emissions of heavy metal. TAC's including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium." But the DEIR relies upon the results of a study of what was found in the old, closed mine in 2020, not what will be now added in the new, expanded, and deeper area mining and not the hexavalent chromium now to be added as mine shoring cement pursuant to the DEIR. Again, in DEIR Mitigation Measure 4.11-7 at 4.11-36-37 they discuss water uses in "cemented paste backfills," including by admitting: "Water is needed to transport and bind the cemented paste backfill underground. ... Backfilling would consume approximately 20,000 gpd assuming a 15 percent water content by mass and 500 tons per pay of backfill placed," but nowhere in that #4.11 discussing hexavalent chromium ingredient or threat at all.** (Incidentally, as noted elsewhere above, sometimes the DEIR seems to talk about this as 1000 tons per day, instead of 500.)

**Ind 254-15**

**Some of the dangerous materials and chemicals admitted existing in the mine are summarized in the DEIR Mitigation Measure 4.8-1(a) at 4.8-52: "The NOI [to the Central Valley Regional Water Quality Control Board under the Limited Threat Discharge permit] shall include evaluation of potential constituents of concern, including ammonia, arsenic, hexavalent chromium, iron, manganese, pH, total suspended solids, TDS, and cis-1.2-DCE..." Also, eg, DEIR at 4.8-53+ (and where addressed in my #'s 3.C, G, H, and 7), the DEIR explains how Rise expects to use hexavalent chromium in its CPS plans to (in effect) glue or cement material in the mine as a continuous part of shoring up the old mine and its new, deeper, and expanded mining processes 24/7/365 for 80-years, if they can get away with that over resolute local resistance.**

38

**Ind 254-15**

**For those who never saw the movie "*Erin Brockovich*" read Wikipedia's (or other) accounts "Hinkley groundwater contamination," about how a utility allegedly misused that chemical by also dumping wastewater in spreading ponds in Hinkley, California, (now a toxic ghost town) and ultimately had to settle a class action with the local victims for $333 Million (back when that was serious money). The disputed DEIR alerts no one to this threat, apparently attempting without revealing the health issues to minimize any future concern by describing the exposures. Even a minimum Google search of "hexavalent chromium" will reveal even more serious health hazards than the movie. Indeed, the European Union is banning the chemical starting in 2024. See my #'s 3.G and H and 7. Even if government decisionmakers were mistakenly to accommodate Rise in ignoring all the science on the relevant EPA website, that mistake could never survive challenge by us locals and by any more serious, scientific analysis. In any event, the already "significant" stigmas from this mine will now become much worse for our local real estate values (and tourism)**, when people start talking about the mine area as the "next Hinkley."

Putting aside for the moment that toxic Cr+6 Hinkley problem and stigma, that whole dewatering mess is compounded by the DEIR again incorrectly assuming that the past reliably reveals the future. See my # 3.M. For example, the DEIR admits (at 4.8-51) that:

> "The water ... from the underground workings is anticipated to have similar quality to the water that currently discharges from the existing drains. ... Therefore, the condition after mining is completed would be like existing, or baseline, conditions, such that seeps ...would not represent a potentially significant impact under CEQA [where it just addresses the iron and manganese issues and tries ineffectively to further diminish the appearance of risk by describing how the new mining is going to be deeper]. *** Although the projects proposed water management and treatment, and adherence to permit requirements, would avoid significant impacts to water quality, **the impact is considered significant for the purposes of this analysis and mitigation, specifying requirements for regulatory compliance, is identified as necessary to reduce the impact to less than significant." [But only by ignoring the hexavalent chromium.]**

The DEIR cannot assume that the future will duplicate the past, even if there were compliance and a proper end to mining as the DEIR assumes (but many locals are skeptical for various reasons, including in my case what is discussed in my # 1 from my bankruptcy/cross border bankruptcy, insurance insolvency and other professional experience as to why there are more than 40,000 abandoned and dangerous mines in California according to the EPA website). **Besides the new normal of drought and climate change I discuss, only a fool or worse would assume that you can add Cr+6 and other things to the mining process and blast, dig, tunnel, remove rock, and mine 24/7/365 for 80 plus years and change nothing, especially when there is no adequate analysis of that unknown, new mining conditions underground. Indeed, who else but a wishful thinking miner or worse would imagine that the safety regulations and standards will still be as lax for the next 80 years as they are now? While there is little said about why anyone should rely on the DEIR to clean up the site as promised at the end of the mining process under the circumstances, the DEIR plan will clearly be leaving a flooded mine**

**Ind 254-15**

**full of hexavalent chromium and other unanalyzed, hazardous substances unleashed by that new, expanded and deeper mining, some of which (like CR+6) are not now reported to exist there, and others of which may be more dangerous and in larger qualities than before.**

**D. An Introduction To DEIR Admitted Water Data, While Also Concealing Massive Unaddressed Issues, Errors, And Omissions And Failing To Reveal The Underlying Assumptions And Artificial Limitations on Which the DEIR Bases Many Flawed Conclusion, Contentions, And Assumptions We Dispute.**

**Among the most serious DEIR deficiencies is the failure not only to identify and address the real water issues, but, contrary to CEQA as explained in my # 14, to scatter the often-conflicting water and related data in hard to reconcile ways in many different sections of the DEIR without reconciling links and often without common usage of terms or data for clarity. Any serious reader comes away from reading one DEIR water discussion by saying "yes, but what about what you said back there?"** Compare the location of various water related admissions that I quote and dispute in this Objection (eg, my #'s 3. A, B, D, E, F, and M, 5, 6, and 13). Government decisionmakers must begin to understand that, whether it is intentional or not, the mine advocates could not have made any understanding of the DEIR water issues any more difficult if they tried to do so as a tactic. See my # 14 and court precedents discussed there like, *Banning, Vineyards, and Concerned Citizens.* See also the related DEIR confusion over many places where toxic hexavalent chromium needed to be disclosed and addressed but was rarely named and never identified as a risk, in my #'s 3.C, G, H, and 7.

**Ind 254-16**

**Just consider this critical example, by studying pages 4.11-35 to 52 in the DEIR's "Public Services And Utilities" # 4.11 (where, in discussing NID water supply issues, they approach some realities more realistically, although deficiently), we discover more revelations than in the frustrating and intensely disputed 83 page discussion in "Hydrology And Water Quality" # 4.8 (where there again is no apparent attempt to reconcile that mine data with that NID discussion or even with other conflicting and disputed water discussions in many other DEIR sections mentioning water issues. See my # 14.) Among the interesting credibility challenges against the DEIR in this process is the following [slightly annotated by me in brackets to expose the DEIR's apparent "bait and switch" game] quote at 4.11-39 to 43 from a subsection of that "Public Services And Utilities" section called "Projected Water Supplies," where the DEIR admits some of my Objections in conflict with its other DEIR claims and goals where one would expect to read them. (Who knows what the DEIR's reconciled position may be, because they never sufficiently reconcile their admissions to their disputed claims we cite with any clarity about their purported factual basis, because most of the disputed DEIR positions seem to be sufficiently unsubstantiated except by underlying DEIR assumptions for its disputed projections either don't exist or are apparently buried in some unspecified places in the separate, lengthy reference materials the DEIR selected and lists by general and uninformative reference in supported support its disputed DEIR conclusions or assumptions.** See my # 14 and court precedents discussed there, like, *Banning, Vineyards, and Concerned Citizens.*

**By way of illustration, the DEIR approach too often is the equivalent of my saying (as I do) that hexavalent chromium is an intolerable threat to our community with a general reference to the EPA website and to the thousands of negative studies and reports available in a simple Google search. However, I am not the one with the burden of complying with CEQA: the DEIR proponents are. Consider the following water related data:**

**Projected Water Supplies.** Table 4.11-5 provides a summary of the District's projected supply entitlements [through 2040]. **[The relevance for this Objection in the following quotes lies in the unaddressed conflicts among NID's analysis of surface water supplies, since NID does not use groundwater, as discussed elsewhere. The DEIR's intensely disputed and, frankly, absurd, groundwater "recharge" and "balancing" assumptions ignore climate change and credible science in order elsewhere in the DEIR to predict the future from the average rainfall between 1967 and 2017, instead of the "new normal" used by responsible scientists, governments, and businesses to predict a chronically drier and drought harmed future.]**

**Ind 254-17**

Water Code section 10910(c)(4) requires that a WSA **[Water Supply Assessment, on which the DEIR mistakenly relies in cites throughout its disputed DEIR text regarding water and, therefore, misapplies the NID's different standards than CEQA and other relevant laws to this mine's imagined and disputed ability to recharge the ground water the mine depletes and sends somewhere else downriver.]** include a discussion with regard to "whether total projected water supplies, determined to be available by the city or county for the project, in addition to existing and planned water demand associated with the proposed project...." Accordingly, the WSA addresses these three hydrological conditions through the year 2040 ... in Table 4.11-6. [The DEIR then purports to "summarize" "projected availability" from the District's existing and planned future supplies THAT DO NOT INCLUDE GROUNDWATER OR ACCURATELY ADDRESS THE MINE'S LOCAL GROUNDWATER DEPLETION AND RECHARGE, but instead focus on] ... the District's projected water demands in normal, single dry and multiple dry years throughout buildout. **[As elsewhere, this compares "apples to oranges" since it is focused on the NID general service area demands from NID's surface water sources to rain recharging the massive groundwater depletion in one local area above and around the 2585-acre underground mine from 24/7/365 dewatering for 80 years, not the 20 years NID uses for different purposes.]** As shown, demand within NID's service area is expected to exceed the District's supplies from 2025 to 2040 during Single Dry Years and in the first and second years of a Multiple Dry Year period from 2025 to 2040. **[This is confusing since this DEIR paragraph at 4.11-39 begins with a "20-year projection" and shifts to the 15-year period "from 2025 to 2040." Throughout this Objection I make reference to the DEIR's lethal flaw of limiting its perspective to this 2040 or 20-year cut off, as if somehow the DEIR were entitled either to ignore the last 60 or 65 years of its 80-year mining binge or, worse, perhaps incorrectly and without any evidence to assume that the whole 80 year period matches the first disputed 15 or 20 year flawed and misleading projections (or that what follows 2040 will be the same as what preceded 2040). For convenience and simplicity, I often just say "20 years" to**

41

**avoid addressing this complexity and confusion every time. Since 20 years is better for the DEIR's disputed theory than 15 years, the DEIR advocates should not complain (but somehow, I expect they will anyway.]**

Factors contributing to inconsistency in NID's water supplies include legal limitations due to water rights and contracts limiting the quantity of water available to the District, environmental constraints, and reductions in availability due to climatic factors. The surface water supply to NID is subject to reductions during single and multiple dry years (seasonal and climatic shortages). ... **[These same kind of limitations apply with equal and often greater force to the existing and future competition for groundwater above and around the 2585-acre underground mine by locals like me, as demonstrated elsewhere in this and other Objections (see my #'s 3.E, F and M and 5), but the DEIR inconsistently ignores any discussion of our groundwater rights' disputes and mine limits, except for a distracting and disputed discussion of the 30 or so wells along East Bennett Road. Since the DEIR recognizes some of these factors here (with even a rare mention of "climate"), why not address these matters where readers would expect them? The answer to that may be that the mine advocates recognize that, once informed adequately of the DEIR's real water burdens, risks, and harms, DEIR or mine approval would trigger competition and legal and political disputes with us locals over groundwater (and, during expected shortages, NID surface water) as to which we have at least equal, if not superior, rights.]**

**Ind 254-17**

***

**Water Supply Sufficiency.** Pursuant to Water Code section 10910(c)(4) and based on the technical analyses describe in the WSA prepared for the proposed project, the total projected water supplies determined to be available for the proposed project during Normal water years during a **15-year projection** would meet the projected water demand associated with the proposed project. (emphasis added) **[Again, this incorrect general conclusion appears to be a "bait and switch" as above, since that WSA etc analysis is focused on NID general supplies from surface water; and not on the disputed recharge or "balancing" imagined in the DEIR to our local groundwater from mine depletion from dewatering 24/7/365 for 80 years during a time when the old "normal" of the DEIR (eg, average rainfall between 1967 and 2017) no longer exists in the "new normal" of climate change, unprecedented dryness and drought, and greater competition from us locals accessing their own groundwater rights with new or deeper wells from above and around the 2585-acre underground mine. While we also dispute the sufficiency of NID supplies to the mine for no net benefit to the community (eg, my # 4), as described elsewhere here, the above discussion and others in this Objection demonstrate the errors, omissions, and deficiencies in this DEIR.]** ... Therefore, [with the DEIR incorrectly referring to NID's "projected 2040 water demands" as to the 30 East Bennett Drive property connections, as if that were the only DEIR 2585-acre underground project impact, a claim contrary to many parts of the DEIR I address] NID would be able to serve the proposed project in addition to existing and

**Ind 254-18**

42

**Ind 254-18**

planned developments with some reliance on demand reductions in dry years by 2025. **[This erroneous and unsupportable conclusion is contrary to the DEIR itself, although it seems to admit that even the portion of the water use admitted here is admitted requiring "some reliance of demand reductions in dry years by 2025," which means that applying better information with a more scientific, fair, and appropriate analysis would reveal bigger shortages.]**

**Ind 254-19**

**[Besides what DEIR calls a Normal Year, Table 4.11-5 admits at 4.11-40:] "Potential Surplus (Deficit)" [for] "Single Dry Years" [of progressively increasing deficits from 2025 to 2040 in acre feet/year] [for] "Single Dry Years" [ranging from] [negative] 85,629"/"48%" "Percent Shortfall of Demand" to "-98,814"/"52%" "Percent Shortfall of Demand", [as well as more deficient years for Multiple Dry Years]. ... [DEIR quote continuing at 4.11-42]** Water demand within NID's service area is expected to exceed the District's supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year period. **[That ignores many realities of increased DEIR water use, because, instead of 30 wells along East Bennett Road, the reality will be hundreds of our locals' competing wells just in the areas above and around the 2585-acre mine as we locals combat climate change and drought as well as the mine's groundwater depletion, as I explain elsewhere. See, eg, my #' 3.E, F, and M and 5. If the DEIR advocates or NID imagine that they can stop that our competition with our new or deeper wells, a common response to chronic drought which has occurred already all over the state where water supplies are already insufficient, then they do not appreciate the political and legal ferocity of such locals defending their homes, their forests and environment, and their community way of life from the no net benefit mine's massive depletion and disposal downstream and other waste of our shared groundwater. See my # 3.N discussing how us thousands of local voters can reform the laws and change officials to accomplish our worthy defenses, even independent of other legal remedies. The indisputable reality is that few, if any, of us thousands of affected locals will be willing to sacrifice anything for the benefit of this undesirable mine. See my # 4.]** However, this project is not expected to exacerbate NID's water supply shortages during dry years and the project will supply water into the South Fork Wolf Creek and into the NID conveyance system, at volumes exceeding the project water demand for potable water from NID. **[Even if that were true, which we dispute, it means little to those of us living above and around the 2585-acre mine who are losing our groundwater to that mine dewatering waste for someone else downstream. Moreover, on the merits, why would NID allow its system to be polluted by mine water from Wolf Creek that, even if correctly treated without human error or storms (which treatment quality many would decline to trust to this DEIR for 24/7/365 quality for 80 years, when it comes to their families' health and the use and value of their homes), no one wants even to accept even the level of hexavalent chromium and other mine water toxins that some industry influenced bureaucrat standards official may consider tolerable.]**

43

*** This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID. **[However, the DEIR mine project can then be also expected to increase NID customer demand in years when their wells have deficient supplies, and none of that predictable defensive conduct is addressed in the DEIR or by NID, perhaps in the case of NID, because the managers do not expect the coming policy changes from us local voters to assure that they do not suffer from water wasters like this mine. See my # 3.N. The future will increasingly become what some politely call "competitive," but what (more accurately) is about us thousands of local voting residents insisting on our legal and political rights to our priority share of surface and ground water over less beneficial uses, especially no net benefit uses like the mine. See my #'s 3.N and 4.]**

*** (DEIR quote at 4.11-43) Thus, **a less-than-significant** impact would occur**. [That incorrect and disputed DEIR conclusion does not follow from the analysis that is rebutted above and elsewhere in this Objection and others. Please note, however, that the rest of the DEIR states that the economics of the mine (like the miner itself admits in its SEC Form 10K and 10Q) are so fragile that anything less than continuous 24/7/365 operations for 80 years creates significant operational and environmental problems. See, eg, my #'s 2 and 13. Such admitted water problems are inconsistent with those disputed claims, as addressed in my rebuttal to the DEIR's "Alternative's Analysis" discussion (at #6) I address near the end of this Objection at my # 13.]**

**Ind 254-19**

Part of the reason for the error, omission, deficiencies, and worse address in the prior long quoted and annotated paragraphs relates to compounded mistakes and worse in the disputed DEIR's preceding discussion (DEIR 4.11-7 at 4.11-35 to 38) entitled, "Project Water Demand," which distinguishes (unlike most of the DEIR) between "Potable Water Demand" and "Non-Potable Water Demand." That roughly correlates to surface water from NID versus groundwater. Those disputed DEIR discussions are summarized at Table 4.11-3 (at 4.11-38) stating "Total Groundwater Consumption for Non-Potable Water Use" of "84,000 gallons per day"/94.1 acre-feet per year" and "Total Water Use" of "107,600 gallons per day"/"120.5 acre-feet per year." However, scattered in discussions in DEIR 4.11-35 and 36 are also various other NID water uses at the mine project, such as: (i) "5700 gallons per day" for Brunswick Industrial site building uses, (ii) "17,900 gpd" for replacing groundwater from 30 wells on East Bennett Road, and (iii) "42,000 gpd" for dust suppression and compaction for five years at the Centennial Industrial Site (which is not really a separate CEQA project, as the disputed DEIR incorrectly claims). Instead of a comprehensive total use, the DEIR has scattered that water usage data by types of use, apparently hoping that critics cannot add [5700, plus 17,900, plus 42,000 equals 65.600 gallons per day]. Thus, the disputed DEIR states debatable aggregated service area numbers on that same page in Table 4.11-4, entitled, "Projected NID Service Total Water Demands with Project (ac-ft/yr)" of "Total Water Demand," progressing increasingly from 161,678 in 2020, to between 174,763 to 217,951 in 2040. But also note other mine water uses mentioned below in the next subsection, such as "Water Vapor in Ventilators" (40,000 gpd), "Cemented Paste Backfill" (with toxic hexavalent chromium, 20,000 gpd), "Gold Concentrate & Engineered Fill" (24,000 gpd) [another 84,000 gpd for those three], plus the 1,224,000 gpd or 850 gpm for dewatering the mine. **[By comparison, and as a reality check on**

**Ind 254-19**

**the resolute political and meritorious legal defense activities that this no net benefit mine related water competition and waste will inspire from us locals competing for our share of NID and ground water above and around the 2585-acre mine, consider this example. The most strict and painful governmental drought water restriction I have suffered since I moved to California in 1972 was a 50-gallons a person a day limit, and that happened in part because some of my local East Bay MUD water was reallocated to much drier Marin County. As political policy people, consider now how you would propose to deal with such a 50 gallon a day limit on human use, while this no benefit mine still uses some large part of its admitted 84,000 gallons per day use of our shared groundwater (plus more not included in that count), claiming an excuse that the DEIR miner cannot dewater the mine adequately to stop flooding, unless it takes more than its share of water from competing and higher local human priority uses. The same question applies as to the mines attempt to excuse excessive use of limited NID water during shortages in competition with local human uses. Because us voters and local property owners with competing rights will not tolerate suffering for this mine, that leaves you decisionmakers confronting the legal and political questions that the DEIR seemed afraid to address in a comprehensive and sufficient manner: what happens when the mine no longer has, or is allowed to use, the water it says that it needs for such mining operations?]**

**E. "Hiding the Ball" in the DEIR Is Not Compliance with CEQA And Other Applicable Law, And That Practice, Especially As To Water and Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousand At Risk of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DEIR Tries To Obscure By Distracting Attempts To Limit The CEQA "Project" And The Related Water Issues**

**Ind 254-20**

**I. Introductory Comments To Expose Some Consistent Flaws In the DEIR Analysis To Clarify My Disputes With the DEIR, Especially Where the DEIR's Errors, Omissions, And Deficiencies Create "Apples vs Oranges" Disputes.**

The DEIR pretends that it can comply with CEQA by treating this as if the only "project" were the Brunswick/Centennial Sites and 30 wells along East Bennett Road, when us thousands of local residents and voters like me who are living above or around the 2585-acre underground mine insist on knowing all about the risks, burdens, and harms to us from that mining underneath us. But see my # 14 and my supplemental CEQA brief. I do not know the DEIR authors' intentions (ie, I don't yet accuse them of intending to mislead the readers, although that is the result of the disputed DEIR.) As with hexavalent chromium and various other risks and issues (see my # 3.E), the DEIR could not have made the water problems more obscure and difficult to understand if that were their goal to minimize the problems and risks or confuse or distract the DEIR readers. Such DEIR inconsistencies and contradictions, even by themselves, violate CEQA's requirements for clarity and consistency. See my # 14. (If I were a law professor teaching an advanced environmental and land use class, I would give this DEIR a "D" grade or worse.)

45

In any event, if the following discussion of the many water-related DEIR deficiencies, errors, omissions, and understated risks seems disjointed, it's because that is how the disputed data is presented in the DEIR. In many cases I follow (and quote from) the DEIR's disjointed discussions come from different DEIR sections, because trying to present a coherent, integrated discussion from their gerrymandered scattered and incomplete commentaries would be both difficult (or impossible for an outsider like me), and I fear any attempt at clarity would be attacked as an incorrect translation. See my # 14 on the CEQA need for clarity and reality, missing in this DEIR. Therefore, I use the DEIR system and quotes with cites below to illustrate my points that are more conceptually addressed in my #'s 3.F and G, 5, and 6 in the context of my and other local concerns about water, especially for those of thousands of us living above or around the 2585-acres of the underground mine.

Please remember as you government decisionmakers read, among the DEIR fatal flaws is the reality is that our much larger local community above and around the 2585-acre underground mine is at risk for water shortages and related problems that are not properly disclosed, addressed, or even covered by the other limited discussions in the DEIR, as illustrated both here and in my #'s 3.F and G, 5 and 6. See my # 14. **Among the many techniques about which a reader should be wary is that the DEIR often first states some disputed, unsubstantiated, or only partly relevant allegation, and then states a consequential (and disputed) "assumption" or "conclusion" as if somehow that impossibly "justified" such an erroneous and disputed "assumption" or "conclusion" into purported fact. (Decisionmaker officials should have a "key word" highlighted copy that includes a bolding of the words "assumption" and "conclusion" (and variants) for a revealing look at this DEIR problem.)**

**Ind 254-20**

These objectionable DEIR techniques and other errors, omissions, and deficiencies are especially common in places where the DEIR ignores the likely long-term impacts of climate change, such as much drier weather and much more chronic drought, and where the DEIR incorrectly assumes that the nonpredictive past somehow predicts the "new normal" future. See my #'s 3.M and 5. Indeed, my other # 15 asks **many hard questions dodged or unseen by the DEIR**, many relating to water issues, such as this one: **How can you government officials responsibly approve such 24/7/365 mining with such water risks and problems we identify (eg, here and in my #'s 3.A, B, D, E, F, and M and 5) for 80 years, when the DEIR only presents often inapplicable NID surface water data for 15 or 20 years (or until 2040), leaving us locals above and around the 2585-acre underground mine at extreme risk for longer term with increasing drought and other problems ignored and understated in the DEIR, even for that shorter period? Does the DEIR expect us to just surrender in ignorance to our fates for the last 60 or 65 years of the 80 years (or after 2040) of 24/7/365 mining, or without any credible science, rational bases, or evidence in the disputed DEIR? (Whatever the DEIR thinks, CEQA requires better as shown in my # 14.) Are we supposed to assume those last 65 or 60 years (or after 2040) will somehow be the same as the first 15 or 20 (or before 2040), despite all the credible science, facts, and experiences insist that our climate will continuously be getting drier and more drought harmed every year?**

**Ind 254-21**

**Also, consider the related question, that the DEIR ducks entirely, because nowhere did I find any mention of the indisputable and crucial fact that there are thousands of us living on and using the surface above that 2585-acre underground mine or around that mine, all with our own rights to compete for our groundwater by individually or collectively drilling our own**

**Ind 254-21**

**new wells when NID supplies become insufficient: How does the DEIR justify ignoring that data and risk about greater competition for our such water with the mine in the future? Does the DEIR dare to admit that they intend to oppose more wells by us residents and voters, so they can continue taking our groundwater for the mine, if that is their reason for the DEIR omitting such obvious realities? See my # 3.N. (By the way, if any government, in effect, allocates our groundwater to this mine with no net benefit to anyone (see my #4) by obstructing more or deeper local resident wells in the new climate change droughts, that will trigger not only extraordinary political conflicts we should all try to avoid (see my # 3.N), but also create causes of action for inverse condemnation, nuisance, and other claims (see my # 4).**

According to DEIR Mitigation Measure 4.11-7 at 4.11-36 and Table 4.11-3 regarding "Non-potable Water Demand," "only 10 percent" or **84,000 gpd** [notice these numbers do not match others in the DEIR] of such groundwater from continuous dewatering the mine will be used for mine operations characterized as "Underground Mining Service Water" (eg, for "dust suppression" [asbestos?] in the mine and reused so not counted somehow), "Water Vapor In Ventilation" (eg, added to air circulation in the mine: 40,000 gpd), "Cemented Paste Backfill" (water, **with hexavalent chromium only discussed elsewhere as I complain herein),** is used to "transport and bind the cemented paste backfill underground" mixed with "500 tons per day of backfill": 20,000 gpd), "Gold Concentrate and Engineered Fill" (24,000 gpd), and "Dust Control and Compaction" (controlling "fugitive dust with 42,000 gpd "during temporary fill placement"). This does not include the 2585-acre mine dewatering about which we have even greater concerns. DEIR at 4.11-37 states (note inconsistencies with other DEIR comments elsewhere): **"Once the initial dewatering is completed [a massive water disposition down river discussed elsewhere, perhaps to avoid scary repetition], approximately 1,224 million gpd (850 gpm) are estimated to be pumped [continuously as discussed elsewhere] to the surface and treated at the on-site WTP on an on-going basis to maintain the dewatered mine."**

**Ind 254-22**

This is separate from what is described there at 4.11-35-36 + 38 as "Potable Water Demand" from NID listed (and then summarized in Table 4.11-3 as 5700 gpd for Brunswick and 17,900 for East Bennett Residential (31 residences, although sometimes also described as 30 in the DEIR) uses, and add with other water demands in Table 4.11-4, as I also consider data showing the coming NID aggregate water shortage problems discussed later that the mine makes uses worse). But the Tables do not seem to count the Centennial site NID water uses admitted at 4.11-36 of "approximately 42,000 gpd" of water "for dust suppression and compaction over the five-year period of engineered fill placement. Compacting 8 hours a day and 5 days per week requires water service of up to 125 gallons per minute (gpm). ... Approximately 42,0000 gpd may be required for dust suppression and compaction over the six-year period of engineered fill placement." (Consider what happens to asbestos in the dust when it's not watered, but the DEIR cannot create its own potential crisis and then expect us to sacrifice to stop it, when the legally and politically appropriate response is to reject the DEIR.)

**Also consider this critical example, by studying pages 4.11-35 to 52 in the DEIR's "Public Services And Utilities" # 4.11 (where, in discussing NID water supply issues, they approach some realities more realistically, although deficiently), we discover more revelations than in the frustrating and intensely disputed 83 page discussion in "Hydrology And Water Quality" # 4.8 (where there again is no apparent attempt to reconcile that mine**

47

**Ind 254-22**

**data with that NID discussion or even with other conflicting and disputed water discussions in many other DEIR sections mentioning water issues.) Among the interesting credibility challenges against the DEIR in this process is the foregoing and some following [slightly annotated by me in brackets to expose the DEIR's apparent "bait and switch" game] quotes at 4.11-39 to 43 from a subsection of that "Public Services And Utilities" section called "Projected Water Supplies," where the DEIR admits some of my Objections in conflict with its other DEIR claims and goals.**

**II. General Overview of the Disputed DEIR's Errors, Omissions, And Deficiencies Regarding Water Demands, Supply, Depletion, "Recharge," "Balancing." And Related Concerns.**

**The unaddressed DEIR issue this raises, as discussed throughout this Objection, is the competition for insufficient supplies of both NID and local groundwater that will continually pit us competing local residents and desirable users versus suffering for this undesirable mine with no net benefit to our community (see my #4), depleting our shared, precious surface and underground water at a time of coming chronic dryness and droughts from climate change that is largely ignored by the DEIR, certainly after the first 15 or 20 years (or after 2040) of their proposed 80 years of water waste for the profit of foreign mine investors. Again, how at this time of diminishing water supplies can government approve a mine with no net benefit to our community (see my #4) for which the disputed DEIR claims they cannot project water shortages or proposed mitigation beyond 2040, when the DEIR is asking for permits etc for 80 years (and using mostly inapplicable NID surface water data before then and irrelevant and misleading average rain data between 1967 and 2017)?**

**Ind 254-23**

While the disputed DEIR states different things in different places, the most detailed forward-looking comments are in #4.11 at 4.11-37 et seq, citing to Table 4.11-4 containing what purports to be "NID's projected annual future water demand through 2040," including the "additional project-related demand of approximately 26.4 ac-ft/yr for Brunswick Industrial Site and East Bennett Road potable water line customers." [Government decision makers should not accept any such grossly over-simplified and cherrypicked DEIR summary from NID reports that contain much more complexity and cautions and need adaptions for differences between NID surface water and our groundwater issues.] However, this all ignores the direct or indirect addition of NID customers, when and if as feared by most locals above and around the 2585-acre underground mine (often ignored in this DEIR commentary) lose their well water because of the mine, and they call upon the mine to honor its mitigation obligation to replace their wells' water supplies (or, if not, under the victims' common view of the applicable law compensate them for buying their own replacement water or drilling deeper wells, either way adding to the water shortage.) Based on NID comments at the March 24 hearing and written follow-up, NID appears to understand part of the DEIR problems.

Among the many disputed statements in the DEIR that defy logic and science from the perspective of local impact is this at 4.11-37: "Notwithstanding the potable demand of 26.4 acre-feet per year associated with the project, the proposed project would be a net contributor of water to the NID water system [BUT DOWNRIVER SOMEWHERE ELSE] as a result of the

project's ongoing discharge of treated mine dewatering water to South Fork Wolf Creek (850 gpm or about 1371 ac-ft/yr) ..." **Besides the hexavalent chromium threat from mine water that is ignored in the DEIR (See my #'s 3.C, G and H and 7), that is one of the provocative, "bait and switch" comments that obscures the key threats and issues that the DEIR evades. What that DEIR quote admits is that (as us locals complain about and will resist) the mine (i) would drain our local ground water in the 2585-acre underground mine area and adjacent areas (owned by surface owners like me with a right to compete for that groundwater we own during the coming droughts and NID shortages), and (ii) would relocate our water somewhere else downriver. That imposition of a unique and particular loss on one victimized part of the community is the equivalent of what the leading California Supreme Court said created liability for claims of the victims downwind of the sewer plant imposed on them, as discussed at my #4. If local victims are to be made to suffer even for the common good (which this is not and cannot be here for this mine as a private, rather than public project), then we must be compensated, especially when the project is private for no net benefit to anyone except the foreign shareholders receiving the profits. See my #4. Also, there appears to be no way for the DEIR miner to afford funding any such obligations based upon its admitted financial condition described in my #2.**

**Ind 254-23**

**The disputed DEIR at 4.11-39 addresses "Projected Water Supplies" with reference to the Table 4.11-5 discussed Water Code section 109109(c)(4)'s 20-year projection requirement, as if that somehow excused them for any CEQA discussion of the foreseeable drought and water shortage horrors to come in the rest of the DEIR 80 years of mining. See my # 14. That DEIR omission adds gravity to the disputed contentions in the DEIR during that first 15 or 20 years (or until 2040) that are discussed throughout this Objection and in others. Without trying to summarize all of those many disputes here, they include the reality that, during at least some of the next 80-years of climate change dryness and drought, those many thousands of local residents (like me) in the area above and around the 2585-acre underground mine will compete with the mine, and if necessary with NID, for our respective shares of our groundwater when NID supplies are no longer satisfactory, a time that will certainly occur sooner on account of the mining operations and the massive dewatering that send our groundwater off somewhere else down the Wolf Creek.** While the disputed DEIR makes an insufficient and disputed attempt to discuss other NID water shortage variables, because the DEIR ignores climate change and drought realities that should be obvious to everyone, they must also consider the reality of government intervention, such as reallocating our water to even more drought harmed places. NID may doubt that for lack of a water transfer vehicle, but I saw reallocation happen with giant pipes when my East Bay MUD drought water transferred to Marin County in a massive pipe over the Richmond-San Rafael Bridge.

**Ind 254-24**

The climate change/drought realities are going to harm many other places worse than here, and when that gets sufficiently severe, our NID water may be reallocated to more desperate places, and our limited supplies will be much more restricted than now. (For example, in a prior drought cycle, I remember when I was living in the San Francisco Bay Area and my East Bay MUD water supply was cut to 50 gallons per person a day, so that our water could be shifted to Marin County, where their intentional policy of not addressing their water needs so as to create an excuse against more residential development created a water crisis from which government insisted our water had to save them.) **The legal and political point that**

**Ind 254-24**

**the DEIR is missing entirely is that there will be 80 years of competition over insufficient supplies of water, and few of us locals can imagine any rational reason for any resident to suffer for, or defer to, water use for this undesirable mine that adds no net benefit to any of us. See my # 4 and 3.N. By the way, notice that the disputed DEIR in that cited subsection does not address the admitted NID water supply deficiencies even in the next 20 years as admitted in Table 4.11-6, discussed herein, and which DEIR understates the problem and ignores various realities.**

**The disputed DEIR at 4.11-7 at 4.11-39-43 and Tables 4.11-5 and 6, purports to address "Water Supply Sufficiency" also cited to that Water Code section [not to CEQA or other applicable law and not for these kinds of disputes with a mine DEIR for the next 80 years] and is subject to the flaws and worse mentioned above. This discussion rebuts many errors and omissions in the DEIR on this insufficiently discussed topic before it incorrectly concluded at the end at 4.11-43: "Based on the above [which is disputed, unsubstantiated, and insufficient and ignores climate change realities by looking to unrevealing history], sufficient water supplies would be available to serve the proposed project, as well as existing and reasonably foreseeable development during normal, dry, and multiple dry years. Thus, a less-than-significant impact would occur." This absurd conclusion is contradicted by the DEIR's own admission at 4.11-39: "Therefore, NID would be able to serve the proposed project in addition to existing and future developments with some reliance on demand reductions in dry years by 2025." See the DEIR's disputed description of NID's position at 4.11-8 et seq. (although correctly noting at 4.11-9 that "NID does not utilize groundwater as an existing or planned source of water due to limited groundwater availability," inspiring one of the many hard questions the DEIR dodges or ignores (see my # 15), which is: if there were as much available groundwater as the DEIR claims (and we dispute), why is that water source ignored by NID? Stated another way, why shouldn't we trust NID's admitted decision not to tap such "limited groundwater availability," instead of the DEIR?** First, the disputed DEIR ignores the "new normal" of climate change's chronic drier weather and drought and greater competition from surface owners and users like me above and around the 2585-acre mine. Second, by refusing even to address the impact of 24/7/365 operations for the rest of the 80 years, the mine expects its surface owners above and around the mine and others to suffer an unknown fate of highly probable water shortages that government cannot responsibly permit to begin now. (Remember, as discussed throughout this Objection, such surface owners have our own individual legal rights as to our groundwater that the mine proposes to deplete, and so interfering with those thousands of surface owners' or users' rights can have legal and political consequences.) Third, Table 4.11-6 admits NID deficits for a single and multiple dry years, but that (and worse) may be all we can expect in the "new normal" future. The only DEIR "proof" is to the now nonpredictive past that ignores our new normal of climate change.

**Looking back in history to average rainfall between 1967 and 2017 (see below and DEIR at 4.8-2) to predict that next 20 or 80 years is worse than misleading; it's irresponsible. See my # 14.** Again, government decisionmakers, please note the different ways disputed DEIR water data is scattered, stated and, omitted (often inconsistently and confusingly) in various separate and unexpected places, as well as what many of us consider DEIR's many errors, omissions, and deficiencies. See my # 14. Also, again at 4.11-2 we have the dangerous "bait and switch" to which we objected earlier, plus again ignoring the **hexavalent chromium threat**,

Ind 254-24

chronic drought and dryness for climate change, government reallocation to more desperate places, etc., where DEIR states: "However, this project is not expected to exacerbate NID's water supply shortages during dry years and the project will supply water into South Fork Wolf Creek, and the NID water conveyance system, at volumes exceeding the project water demand for potable water from NID." Again, such disputed and unrealistic DEIR dewatering "solution" would strip surface owners and users above and around the 2585-acre underground mine of their personally owned groundwater for transfer downriver somewhere else in the Wolf Creek. The consequences of that transfer on our local community are ignored by the DEIR by not by us locals. See, eg, my #'s 3.D and F, 5, and 14.

**The disputed DEIR claims that it does not have to "speculate" about the future when it's about threats, problems, and risks of concern to us locals, but, when faced with admitted and other obvious problems like those we raise, the DEIR often assumes away the problems, risks, and burdens with its own speculations and assumptions. See my # 14. For example, at DEIR 4.11-42-43, the disputed DEIR speculates about NID planning in its "Plan For Water," about what will be left for NID's junior water rights, and about NID using DEIR treated mine water somewhere else in the NID system and ignoring the many problems, like hexavalent chromium and other toxic substances, that NID customers will find intolerable. The illusion is exposed in the DEIR "Conclusion" at 4.11- 51, where it incorrectly states: "Water supply exceeds existing and projected future demand, including the addition of the Idaho-Maryland project DURING NORMAL YEARS. Therefore, sufficient water supply is available to service existing and future reasonably foreseeable development DURING NORMAL YEARS." (Emphasis added) First, the second sentence does not follow in science or fact from the first sentence, even if one were to look realistically only at the next 15 or 20 years (or until 2040), as distinguished from what is reasonably foreseeable for the next 80 years of climate change impacts on the DEIR mine operations. Second, what they call a "normal year" is incorrectly based on history (see where the DEIR looks at the average rain from 1967 to 2017 and ignores the "new normal" of climate change and chronic dryness and drought.) Third, the dry and drought years are the "new normal," and there are admitted water shortages that will be worse than admitted by the DEIR (or estimated by NID), so that there will also be greater competition for groundwater and NID water not just with desirable newcomers who we would like to welcome to our community, but also with the thousands of us existing residents and voters living on the surface above and around the 2585-acres of the underground mine who have their own competing legal rights to such groundwater. See my #'s 4 and 14.**

**The disputed DEIR quotes and positions addressed in the previous paragraphs, especially at 4.11-42-43 and 51, have the same flaws as the disputed DEIR "Conclusion" admissions at 4.11-51 as follows, (but they seem inconsistent with them as well): "Water demand within NID's service area is expected to exceed the District's supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year period." Reality will likely be much worse, but even that will create problems more than what the DEIR addresses, especially if one excludes the speculation and errors and adds what the DEIR omits adequately to address.** For example, there is no satisfactory and sufficient basis for the DEIR's sheer speculation to conclude what so ignores such hard contrary issues **at DEIR 4.11-51 that: "This supply deficit can be addressed through NID's previously discussed Water Shortage**

51

**Ind 254-24**

**Contingency Plan, and as previously mentioned, the proposed project would be a net contributor of water the NID system" (which, as noted throughout this Objection, does nothing for those thousands of us living and using above and around the 2585-acre underground mine whose own groundwater would be exported downriver somewhere else with whatever hexavalent chromium, other toxins, and other problems it may contain).**

**Ind 254-25**

According to disputed DEIR at 3-15 et seq., there are water treatment complication problems, and those seem to be insufficiently addressed, especially since there are historical, dangerous examples of what happened elsewhere when extraordinary storms (the "new normal" of climate change) overwhelm the capacity of the mine water treatment facilities, or it just suffers from human error or negligence, which human history shows has overwhelmed even much more safety conscious and competent facilities than this DEIR mine proposes. I have yet to meet an informed local willing to trust their home, family's fate, and environment to this DEIR plan, even if the miner could somehow afford it (see my # 2). Consider, as a minor threat example (before we get to Three Mile Island, Chernobyl, etc) what happened so often with the City of Santa Rosa's repeated water treatment failures (before they eventually upgraded the facility), while delaying upgrades for years that they almost killed the Russian River. Why does anyone think the DEIR 30-acre foot clay lined settling pond and other facilities here will be sufficient? Remember also all the toxins (eg, arsenic and ammonia admitted at DEIR 3-17) and objectionable other concerns (eg, iron and manganese at DEIR 3-17) in such water. What about the hexavalent chromium from the cement paste on the mine shoring being dewatered and passed into the settling ponds? A more satisfactory DEIR would have explained the Hinkley, California story about how their hexavalent chromium from such ponds has left it a ghost town with large graveyards and a huge liability claim settlement by those most consider responsible. It's all on Google, Wikipedia, and the EPA website. See, eg, my #'s 3.C, G, and H and 7.

**Ind 254-26**

In another "bait and switch" problem with the disputed DEIR, mine efforts to reduce its air pollution, especially of dangerous materials, has adverse effects on our other local environmental concerns. For example, the disputed **DEIR admits (at 4.3-49) that they "assumed that about 11 million gallons [of water] would be required [ie, wasted] for construction dust suppression." (Thinks asbestos cover up.) Even worse, the DEIR states on that same page in discussion of the mine's "Surface Fugitive Dust Controls": "To account for dust control measures ... the assumption was made that that active work sites would be watered at least two times daily, resulting in an approximately 55 percent reduction of particulate matter." However, when chronic climate change drought and water controls limit NID and other water use, as is ignored in the DEIR, but nevertheless is inevitable as an inconvenient truth, that means either our precious water will be wasted for such mine "dust control" or our particulate air pollution (again think asbestos) will be 55% worse than projected from the mine, leaving the obvious solution to that dilemma of simply shutting the mine that never should have been reopened in the first place.**

**Ind 254-27**

**III. Misleading DEIR Mining Data That Incorrectly Assumes the Past Predicts the Future Without Sufficient DEIR Proof And Massive Omissions Relating To the "New Normal" Created by Chronic Drought And Dryness From Climate Change.**

Ind 254-27

According to the DEIR (that incorrectly focuses on groundwater as if the only issue was the small number of wells (30 or 31) by the surface site at the East Bennett Road area), there are two relevant "watershed areas": the Upper Wolf Creek Watershed and the South Fork Wolf Creek Watershed. DEIR at 4.8-2. **Among the worst deficiencies in the disputed DEIR is its lack of any adequate discussion of the detailed underground and groundwater conditions in and around the 2585-acre underground mind now and in the DEIR new mining future. While the DEIR ignores those issues, the thousands of people (like me) living above or around that 2585-acre underground mine share (or, when adequately informed, will share) the doubts and concerns addressed in this Objection and others. Even if those objections are mistakenly ignored, the disputed DEIR must still be rejected for not revealing the consequences when (as discussed above) those thousands of local residents and voters react to future NID climate change drought rationing and drought shortages by exercising and expanding our rights to compete with more and deeper wells for our own groundwater supplies from both the same underground fractured rock sources as the mine, plus from NID. While the DEIR depends on assumptions from obsolete history about an average water fall of 52.81 inches from 1967-2017 (admitting a minimum of only 18.48 in 1977), no responsible person I know is willing to bet their home and future that the next 80 years will be as wet as that irrelevant, pre-climate change history. See the discussion above and in my #'s 3.E and 5 about how the DEIR presents a flawed analysis with somewhat inapplicable NID data only until 2040, forcing everyone else to guess how much worse things will get for the balance of the 80 years of proposed DEIR mining.**

Climate change for us means much more chronic dryness and drought. For example, what is our real groundwater recharge rate at realistic future levels of rainfall/snowpack in the "new normal" future? What if that 1977 low point of 18.48 inches is the new average? **CEQA requires science and facts, and the DEIR cannot just assume the average from 1967-2017 has any relevance to predicting our drier, climate changed future. That means the disputed DEIR is worse than wrong about its water supply "assumptions" (as well as misunderstanding why the DEIR cannot just cherry-pick the NID surface water data for this different application and groundwater context.) In our future 80 years there will be increasingly less "recharge" and "balancing" of the groundwater and less availability from NID, especially compared to what is wasted in the mine dewatering or even in surface NID uses at the mine, as discussed herein.** Contrary to the disputed DEIR, the mine will seriously deplete both NID and underground water that our community needs for better and more important competing uses in times of progressive climate change increased drought and dryness that the DEIR fails to address satisfactorily, if at all.

For example, **the disputed DEIR Figure 4.8-8, entitled, "Simulated Drawdown of Groundwater Levels Under Current Conditions," and related commentary are regarded by many of us opponents as misleading, because what the DEIR cites as "current conditions" are irrelevant and nonpredictive of the "new normal" future of such dryness, drought, and climate change. See my #'s 3.M and 14. That water shortage is also certain to change for the worse, because of the effects of the blasting, digging, tunneling, dewatering, and mining work itself, changing the underground conditions in those 2585-acres in ways that the DEIR does not attempt to predict as it mines into unknown conditions in new, expanded, and deeper areas. (Note the DEIR also fails to predict the starting condition of the mine after being**

53

flooded and closed since 1956 with at best imperfect records.) What legitimate reasons would Rise have for asking for 80 years of 24/7/365 dewatering without seriously and properly addressing (especially after the misapplied NID data that cuts off at 2040) the future concerns of the locals (with whom the DEIR provokes perpetual water disputes)? Current climate science proves that such past is no guide at all to our future on these continuous water disputes. That is especially true when there are so many examples of groundwater depletion horrors already in the Central Valley, Bakersfield, and elsewhere, where those residents turned to new and deeper well to supplement inadequate surface supplies. See my # 3.M.

**Ind 254-27**

The DEIR also admits (at 4.3-59) that "Potable water use at the Brunswick Industrial site was estimated to be approximately 1.4 million gallons per year," not counting the 3952 gallons of potable water used daily for the septic system, plus an estimated 2.8 million gallons per year of the 26 (or 30 or 31) East Bennett Road area residences shifting from well water to NID. Again, the disputed DEIR water usage discussion only addresses the small number of wells around the Bennett surface site owned by Rise. More importantly, mine efforts to reduce its air pollution, especially of dangerous materials, has adverse effects on our other environmental concerns about water. For example, the DEIR admits (at 4.3-49 and ignores any such data where it should be located in # 4.8) that they "assumed that about 11 million gallons [of water] would be required [ie, wasted] for construction dust suppression." (Why can't the DEIR ever call the dust asbestos?) Even worse, the DEIR states on that same page in discussion of the mine's "Surface Fugitive Dust Controls": "To account for dust control measures ... the assumption was made that that active work sites would be watered at least two times daily, resulting in an approximately 55 percent reduction of particulate matter." However, when chronic climate change drought and water controls limit NID and other water use, as is ignored in DEIR but is obvious and inevitable as an inconvenient truth, that means either (i) precious water will be wasted for such mine "dust control," or (ii) our local particulate air pollution (and asbestos) will be 55% worse than projected from the mine. The obvious solution to such dilemmas is simply shutting the mine that never should have been reopened in the first place.

**Ind 254-28**

All that water waste from fugitive dust watering above was not disclosed where it should have been in the DEIR's "Hydrology And Water Quality" chapter water discussion at 4.8 that was already deficient (see my #'s 5 and 3.D, E, and F), but, by separately burying these water details instead in the air pollution section at 4.3, the DEIR creates confusion and conflict and makes the water use numbers unclear. See my # 14. How are these DEIR 4.3 water use numbers in the air discussion to compare those in DEIR 4.8 water section? Once again, the disputed DEIR seems to prefer data confusion to the clarity and reasoned factual debate required by CEQA. See my # 14 and my supplemental CEQA brief. For example, we still don't know how this water use relates to the depletion concerns we suffer not just from our groundwater, but also from our competing rights to NID water during shortages, as our community would blunder further into shortages on account of climate change droughts and dryer weather that the DEIR ignored and insufficiently addressed. Id.

As my Objection describes above and elsewhere, the even bigger water problems will relate to the increasing competition to be expected with those thousands of us living above and around the 2585-acres underground mine who are entitled to our owned shares of the

**Ind 254-29**

54

**same groundwater source.** For example, what happens when NID supplies in the coming chronic droughts are cut back (whether because NID doesn't have sufficient water or because its water has been reallocated elsewhere by government), and we all begin drilling our competing wells to survive for the next 80 years or until the mine stops wasting our water by dewatering and sending it downriver somewhere else? See my #'s 3.N and 14. Who will be the loser in that legal, political, and practical competition between us thousands of local residents trying to save ourselves, our trees and environment, and our community way of life, etc. versus the mine dewatering waste or twice daily watering dangerous mine dust for the profit of foreign investors? Our community and its residents cannot afford to lose in that perpetual competition, and, if that happens, it will be the fault of the government who was supposed to protect us from such calamities. Just saying "I told you so" to mine advocates and approval officials is an insufficient ending, and that mining should be not just legally incorrect, but politically impossible to sustain the way I count votes for any future local elections. **So, if it's inevitable that this mining will stop, sooner or later, sooner is better for everyone. In any event, CEQA and reason require responsible government to insist that the DEIR detail what happens next, when the mine stops after it were allowed to reopen. See my # 14 versus DEIR 4.3-103-104.**

**Ind 254-29**

**To address the scale of the water depletion problems to come, Rise admits (DEIR at 4.8-42) that to clear the mine of water will require pumping for 160 days to remove 385 million gallons of water.** Once so cleared, the dewatering process is stated (DEIR at 4.8) to pump away for treatment and downriver disposal in the Wolf Creek the amounts discussed above. While the DEIR makes a disputed attempt without sufficient evidence to claim there will be a "balance" between what is added from new seepage and what is continuously removed, that and other related claims are questioned or disputed above and elsewhere in this Objection (eg, my #'s 3.D, E, F, and M, 4, 5, and 14). Many **like me worry with good causes explained (eg, my #'s** 3.D, E, F, and M and 5**) about the risks that this 24/7/365 dewatering for 80 years is not only depleting the groundwater and drying out the surface owned or used by thousands of us local residents and public services above and around that larger 2585-acre underground mining boundary, but also in the surrounding areas. Nothing in the disputed DEIR adequately describes how far these adverse, water wasting consequences will spread over that long period. Also note near the end of this section my discussion about the DEIR's failure adequately to address what happens when the mining stops, including my rebuttals of the DEIR's "Non-CEQA Related Analysis" (at its 4.3-103-104).**

**Ind 254-30**

**IV. The DEIR's Distraction And Evasion of the Real Concerns With Groundwater Depletion And Its Consequences For Us Thousands Living Above And Around the 2585-Acre Underground Mine, Especially Because the DEIR Fails To Address The Underground Realities Of That Mine Closed And Flooded Since 1956 And Now Being Subjected To New, Expanded, And Deeper Mining Without Adequate DEIR Analysis.**

**The disputed DEIR (4.8-2 at 4.8-54) states that: "The project site [unclear as usual if they mean only the Brunswick site or the real 2585-acre mine, since the DEIR usually tries to**

55

**Ind 254-30**

**limit its discussion the smaller site, presumably to dodge the harder questions (see my #'s 14 and 15) and the concerns of the thousands of objecting surface owners and users above and around the underground mine] is not located within a groundwater basin that has been identified by DWR, and the nearest groundwater basin is located more than 15 miles to the west. ... Thus, the project could not impede sustainable groundwater management within a groundwater basin, because no such basin exists in the project vicinity. ... Groundwater is present within fractured bedrock throughout the region ... As a result [of deeper mining into unknown and unanalyzed conditions, which the DEIR contends, and many of us dispute as unproven, to be a good thing] dewatering of deeper tunnels and drifts would have less impact on groundwater levels in the fractured bedrock than would dewatering of shallower mine workings." As discussed elsewhere in this Objection (eg, at my #'s** 3.D, E, F, and M and 5) **and others, this (like the bogus attempt to limit this groundwater problem to the East Bennett Area 30 wells) seems to play disputed word games, and the DEIR data is often nonresponsive to the real issues and is especially unclear about what surface areas are impacted above and around 2585-acres underground mine. See my # 14. For example, Figure 4.8-11, like the rest of the DEIR, is useless to us locals trying to place our surface properties' locations in reference to that underground mining. The real DEIR question is NOT that more general question about "groundwater basins" versus water in "fractured bedrock" or "fractured bedrock aquifer." That is just filler and a distraction.**

Instead of such DEIR distractions and evasions, what every local who is OR WILL BE depending on underground water for ourselves and our forests and environment (already drying out and becoming a fire and fire smoke hazard) demands to know in the future 80-year crisis of chronic drought and climate change is this: **Will the new and expanded (even deeper) 24/7/365 mining and dewatering of the 2585-acres, plus the mine's planned uses of NID water, for the next 80 plus years adversely affect the sufficiency of water for our competing local surface uses in the area and especially on the surface for owners and users and homes in the forests above and around the mine and in the larger "impact zone" (eg, for groundwater depletion and subsidence) or "stigma zone" around that (ie, where we suffer real estate value losses because of the mining)? See, eg, my #'s** 3.D, E, F, and M, 4, 5, and 8. Note, for example all the massive groundwater depleting and NID misuses described in this section and others that **the DEIR even admits, such as, for example (at 4.3-59) that its potable water use at the Brunswick site will be "1.4 million gallons per year**," with more surface "dust suppression" watering also explained above.

**Ind 254-31**

Also, considering the massive amount of local groundwater so used on mining sites or that will be pumped up and sent downstream somewhere else in the Wolf Creek, how can we be reassured of adequate "recharge" or "balancing" of our depleted groundwater supply, looking forward to that 80-year future (and not back to the no longer relevant past rain and snow fall before climate change and chronic drought began)? See, eg, my #'s 3.D, E, F, and M and 5. As demonstrated even so far in this section and such others, with more errors, omissions, and problems revealed elsewhere in these and other objections, approval of the DEIR and mine would be intolerable to those who live and vote here just on account of our water competition, conflicts, and disputes alone, even without regard to our many other, also sufficient, concerns. Among the many reasons, I focus on the groundwater issues so vigorously here, is that us locals above and around the 2585-acre underground mine have personal legal

rights to groundwater that are more substantial, powerful, and legally defensible than other interests that are threatened in these CEQA disputes with the DEIR. See my # 14. That means that this may not just be the normal CEQA legal process with parallel chronic voting and other disputes until the mine stops. See my # 3.N. Nothing in the mine approval process can defeat our competing groundwater rights (assuming effective enforcement us locals will expect from our elected officials in the future), unless (which seems legally, economically, and politically impossible), some government exercised eminent domain rights and subjected itself to inverse condemnation claims. See, eg, my #4.

**Ind 254-31**

**Moreover, since that extreme DEIR mining will radically change the unknown and unanalyzed underground conditions in the 2585-acre mine below us in undisclosed ways that the DEIR never correctly or sufficiently addressed, how can we know how much worse that mining will make our future water shortages and other environmental problems for the next 80 plus years? See, eg, my #'s** 3.D, E, F, and M, 4, 5, and 14. **Such questions that the DEIR evades (or fails to address at all) lead to many other questions not addressed in the DEIR but noted in this and other such sections and other locals' objections, such as, what are adverse effects of such prolonged dewatering (which means moving water out of our local community groundwater supply somewhere else downriver) on such legal rights of the surface owners above the 2585-acres and adjacent neighbors (like me), such as when such removed water ceases to help provide the "subjacent support" and "lateral support" needed to avoid the "subsidence" that has proven so damaging to other places in our Central Valley, Bakersfield, and elsewhere where the ground surface dropped as much as six feet on account of groundwater pumping and removal? See my #'s 4 and 14.**

## V. DEIR Errors, Omissions, And Deficiencies In Addressing Imagined "Recharge" And "Balancing" of Our Depleted Groundwater Owned By Thousands Of Us Above And Around the 2585-Acre Underground Mine

This Objection and others explain why the DEIR's dodging or evading such critical groundwater questions is unacceptable, and why no DEIR can be legally approved without addressing them. See my # 14. In other words, **a disputed and inappropriate DEIR strategy of attempting to limit these groundwater concerns to 30 or so wells along East Bennett Road is an inappropriate distraction. See, eg, my discussion at #3.D, E, M, and N, 4, 5, and 8, of how everyone above or around the 2585-acre underground mine area (who can afford to do so), sooner or later, will be forced to drill deep wells and compete with the wasteful mine dewatering, no later in that future than when NID limits our NID water access, either because of shortages caused by drought or by government reallocations to even drier places. Also, note that the high cost and other issues of NID connections will cause many landowners to build with new wells. Distracting and tangent DEIR debates about "groundwater basins" cannot be allowed to deprive our community of essential water needed here in the next 80 years (not disposed of downstream somewhere else by dewatering a mine) on account of chronic drought and climate change never seriously addressed by the DEIR, as the proponents cling to their 1967-2017 average rainfall and other nonpredictive historical data they incorrectly claims enable them to pretend the past water situation will continue to recharge the depleted groundwater. Ask anyone in the Central Valley, Bakersfield, or elsewhere about**

**Ind 254-32**

**Ind 254-32**

**their recent experience with such bogus "recharge" assurances, as their local infrastructure breaks from subsidence caused by the surface dropping from over pumping of groundwater, but stand back, because they (like all water victims) may "explode" at the failure of their governments to stop water wasters like this mine (there not just pumping for agriculture, but sometimes for oil, gas, and fracking).**

The DEIR (at 4.8-58) also states: **"The predicted drawdowns shown in Figure 4.8-11 are those that would occur in addition to the existing drawdowns due to groundwater inflow to the mine under existing conditions, as previously discussed and shown in Figure 4.8-8. As shown in the figure the drawdowns of the water table are generally within the mineral rights boundary. This is due to the low-K rocks where the deep mining would occur." First, note that there is no satisfactory scientific or even informed discussion about what incorrect assumptions underlie those DEIR figures, and there is no CEQA compliance by DEIR (see my # 14) telling us where to hunt through their disputed pile of disputable exhibits for unspecified data. Eg,** Concerned Citizens of Costa Mesa, Inc v. 32nd Dist. Ag. Ass'n (1986), 42 Cal.3d 929. See also my # 3.M, and 14, where I illustrate other examples of obscuring data, insufficient data, strategic omissions, and other inappropriate tactics prohibited by CEQA cases like *Banning Ranch Conservancy v. City of Newport Beach* (2017), 2 Cal.5th 918, 940-41 ("**Banning**") and *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007), 40 Cal.4th 412, 442 ("**Vineyards**"), each insisting on "a good faith reasoned analysis," rather than scattered or buried data, and unexplained data in exhibits. See also my # 14. Here **neighbors (like me) cannot even figure out from the DEIR where we are on located by identifiable surface landmarks (eg, roads) above the 2585-acres in relation to that DEIR data. (Is that just a mistake, or is that a strategic intention in the DEIR? That is a question of good faith in CEQA challenges explained in my # 14.)**

**Second, there are predictable surface versus underground owner disputes against the DEIR mining removing and wasting all that groundwater (and its subjacent and lateral support) underneath us such surface owners and users both under the 2585-acres and anywhere else in the area where the mine would suck away and deplete our underground water into those 2585-acre pumps. (While there are hundreds of such existing wells, and many of us locals may not yet be tapping into that groundwater in which we have rights and claims [note: groundwater is not "minerals" to be mined], that day is coming on account of climate change and drought, not just here, but also (as is already occurring) in other, even more needy places where the government may reallocate NID water and force us to compete harder with the mine. See my #'s 3.D, F, M, and N, 4, 5, 8, and 14.)**

**Third, the disputed DEIR assumed "recharge" and "balance" without satisfactory proof, by reference to the past (eg, the average rain/snow between 1967 and 2017) that ignores both the coming chronic droughts, drier conditions, and climate change, as well as the impacts on water supplies by the proposed and still unevaluated new, deeper, and expanded mining activities into unknown conditions. See my #'s 3.D, F, and M and 5. Why would the DEIR fail to address such obvious matters? One answer is that they have no feasible mitigation to propose against these inconvenient truths. Apparently, they prefer omissions to confronting these realities. But as CEQA noncompliant and wrong as it is for the DEIR to assume the average rainfall between now and 1967-2017 will apply between now and 2040 (by misplaced and disputed use of NID data out of context), it is worse for the DEIR to**

58

**continue without any comparative other data to assume that does not change during the rest of the 80 years. See my #'s 3.M, 4, and 14.**

As just noted about dodging the real "recharge" and "balancing" issues, the disputed DEIR (at 4.8-58) states: **"Importantly, Itasca's groundwater modeling accounts for continual inflow into the underground mine workings (ie, maintenance dewatering) as well as recharge into the fractured bedrock system, such that the groundwater drawdown levels shown in Figure 4.8-11 generally reflect a new state of equilibrium after the initial dewatering of the mine. Further, the modeling shows that the new equilibrium is little affected by changes in the amount of the recharge." See my discussion of CEQA court cases above and in my # 14, rejecting such DEIR attempts to incorporate in such a disputed manner a small part of a separate "Itasca study," such as *Concerned Citizens of Costa Mesa, Banning, and Vineyards*. First, note this study and comment is focused on the East Bennett Road 30 well issue, which is a small part of, and different from, our concerns and locations regarding the larger 2585-acre plus impact and stigma areas often (as here) ignored in the DEIR. Second, as noted above and discussed throughout this Objection (eg, my # 3M and 5), this disputed and incorrect DEIR analysis is based on history that is now largely irrelevant and misleading in view of drought, climate change, and new, deeper, and expanded mining. Third, from the perspective of neighboring victims losing their own groundwater to this wasteful mining process, the "fractured bedrock system" may often be even more dangerous and harmful than depletion of a bigger groundwater basin, since there is no reason demonstrated in the DEIR for us to expect "recharge rates" in the coming dry and drought future from climate change to continue to match the Rise 2585-acre underground mine depletion rates. See my # 3.M.**

**Ind 254-32**

**The smaller and more complex the groundwater source area of the "fractured bedrock system" being emptied beneath us objectors, the worse such impacts on us may be. There is no satisfactory or sufficient DEIR study or discussion of these issues between those of us on the surface above or around the 2585-acre and the dangerous conditions that may now exist in that long closed (1956) and flooded mine and whatever mining they are doing into the unexplored rest of that underground area 24/7/365 for the next 80 years. While our local surface area above and around the 2585-acre mine is much bigger than the small East Bennett Road area addressed in the DEIR, it is small enough that such DEIR imagined recharge cannot reasonably be expected from other areas, thus concentrating our local risks and (when they understand the impacts, risks, and burdens) rousing the almost unanimous thousands of residents whose home use and value and personal fate is at risk to this undesirable mine based on this disputed DEIR.** See my #'s 3.N, 4, and 8, comparing the risks, impacts, and harms to our local community to whatever disputed and much lesser benefits may be claimed from this exploitive mine. However, as explained elsewhere (eg, my #'s 3.N and 8), the mine directly and immediately harms, impacts, and risks many more existing residents above and around that 2585-acre mine than the small number of jobs added, and the economic losses from mine harms, risks, and real estate value losses in the impact and stigma zones greatly exceed any imagined economic benefits from this no net benefit mine. See my #'s 4 and 3.N.

**As one example of the lethal mistake the DEIR makes in exclusively relying on the past to predict the future (see my # 3.M), consider what the DEIR says (at 4.8-62) about "Potential Future Exploration And Mining" based on its "Itaska Report model" also disputed above,**

59

**Ind 254-32**

**which provides largely irrelevant and misleading "simulations of [predicting that] the rate of groundwater inflow into the mine generally stabilize over the last 10 to 15 years of the 65 year model analysis."** But see my # 3.M, and 14 counters, where I dispute this kind of use of obscuring data, insufficient data, strategic omissions, and other inappropriate tactics prohibited by CEQA cases like *Banning Ranch Conservancy v. City of Newport Beach* (2017), 2 Cal.5th 918, 940-41 and *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007), 40 Cal.4th 412, 442, each insisting on "a good faith reasoned analysis," rather than referencing scattered or buried data, and unexplained data in exhibits. **How can such a model for a different situation based on the pre-climate change past be reliable or even useful in predicting future risks of groundwater depletion and recharge, when the DEIR ignores not only the unknown consequences of its new, expanded, and deeper 2585-acre underground mining, plus climate change caused drought and drier weather that does not recharge or balance as in the past?**

**Why is this Itaska study misleading? [Also note, as explained in my # 14 citing cases like *Concerned Citizens, Vineyards, and Banning*, us objectors are not required to analyze and object to the details of all the hundreds or thousands of pages of all such studies which are disputed, but often because they are just outdated and wrong, but also because they are often inapplicable or irrelevant (eg, relating to difference places, situations, or issues) and full of unanswered questions, unrepeated limitations and qualifications, and other reasons why it should be ignored in this context.] Consider that this dispute study is the basis for the DEIR incorrectly to conclude at (4.8-65 in "Groundwater Recharge"): "Thus, the project would not result in any appreciable new areas of compacted soils or impermeable surfaces that could substantially restrict or otherwise interfere with groundwater recharge." This seem to be another classic "bait and switch," and it's inconsistent with other DEIR data. Whether or not that disputed statement is true (which I doubt), it is not a substitute for the obvious factors preventing recharge and balancing that the DEIR chooses to ignore. See my # 14. This DEIR cherry picking of snippets of inapplicable or wrong data from such incorporated studies not detailed in the DEIR is not CEQA compliant, as such cases like *Concerned Citizens, Banning, and Vineyard* and my # 14 explain.**

One of the other DEIR problems with this kind of incorrect propaganda (ie, selecting some happy sounding things to say, while ignoring the more relevant science, issues, and "new normal" data after climate change that the DEIR ignores) is that in such a long report they leave hints of inconsistencies. (Again, this is another example of the flawed DEIR pretense that this mine CEQA analysis needs only to address that small Brunswick site owned by Rise and the 30 wells along East Bennett Drive and sometimes the so-called separate Centennial project.) **For example, in the discussion of the "Baseflow in South Fork Wolf Creek and Wolf Creek" the DEIR states (at 4.8-65) that: "Numerical modeling also indicates that dewatering could lower groundwater levels sufficiently to reduce the base flow in the South Fork Wolf Creek by as much as 0.1 cfs." The DEIR says not to worry about that, because the mine dewatering will end up moving our local groundwater downriver in the Wolf Creek for distant NID destinations that are irrelevant to our local recharge and groundwater needs. For the moment the issue is not the river flow, but this admission that, even ignoring the future effects of mining, drought, and climate change, Rise will be lowering the groundwater levels. That seems inconsistent with the DEIR's own analysis, which tries elsewhere to duck the**

60

**Ind 254-32**

central concern of many of us neighbors, that the surface relevant water level will be lowered in the future by such mining as the ground dries out and the water table drops, thus harming our surface improvements, forests, and environment, depriving us of our own water rights as surface owners and users or as neighbors sharing the same underground water sources (whatever you call them) and potentially killing our already climate stressed forests and creating more fire hazards over the next 80-years.

VI. DEIR Water Depletion Mitigation Ideas Ignore DEIR Errors, Omissions, And Deficiencies And Fail Even Under Their Own Disputed Terms

**Ind 254-33**

Even while ducking all the hard questions (see my # 15) and concerns of the surface owners and users above and around the 2585-acre underground mine and in the adjacent impact or stigma zones (like me), the disputed DEIR "Conclusion" and admission (at 4.8-66) is still: "WITHOUT IMPLEMENTATION OF A GROUNDWATER MONITORING PROGRAM AND WELL MITIGATION PLAN, THE PROJECT COULD RESULT IN A SIGNIFICANT IMPACT TO GROUNDWATER SUPPLIES." (Capitalization added). This understated conclusion is inconsistent with most of the DEIR commentary that precedes or follows it, as if they were written by different people having different opinions. Some might mistakenly celebrate even such a mild, if understated true conclusion among the many false and misleading DEIR statements disputed by me and others in our objections. However, this limited acknowledgment of an inconvenient truth serves as a distraction and "bait and switch," because it related only to the 30 wells along East Bennett Road, rather than the key areas above and around the 2585-acre underground mine that keeps being ignored by the DEIR, even though it is the major source of irreconcilable disputes for many of us objectors. Worse, the disputed DEIR then used the earlier disputed data leading to that conclusion to purport to justify a disputed and wholly deficient mitigation. No responsible government could accept such irrelevant groundwater mitigation monitors along East Bennett Road (or over the small surface areas owned by Rise) as any kind of adequate monitoring, much less mitigation, of the massive dewatering depletion of the shared groundwater owned by us above and around the 2585-acre mine. The unmitigated well threat is not going to be evaluated by those misplaced monitors. What is inevitable, if the mining is permitted, will be hundreds of existing and future wells going dry above and around that 2585-acre underground mine, as well as property owners wanting to drill new wells to use for their surface properties only to discover how much deeper they must drill to compete with the mine and how messed up their wells may be with the mine hazards, especially with the hexavalent chromium cement holding up that underground mine and, if *Hinkley/Erin Brockovich* is an example, adding new toxins to our shared water supply. See, eg, my #'s 3.C, G, and H and 7 (as to the Cr+6 issue) and to 3.F and M and 5.

The key, however, is that this CEQA analysis cannot be limited to the East Bennett Road 30 well properties, but is a general problem to be addressed for the entire area above and around the 2585-acre underground mine with hundreds more wells now and more to come. See my # 14. The mine is not just hurting existing wells, but all our groundwater rights in the area, including the rights of us surface owners and users and neighbors in the impact

61

Ind 254-33

and stigma zones to compete with new wells to develop their land or when the climate change and drought future that the DEIR ignores prevents (ie, government reallocation of scarce supplies to needier areas) or disables (eg, insufficient supplies) NID from supplying us with sufficient water for ourselves, our properties and trees, and our environments. See, eg, my #'s 3. D, M, and N, 5, and 8. Incidentally, those who are more focused on the small number of mining jobs than on the vastly greater number of us locals harmed by the mine above and around that 2585-acre underground area or in the larger groundwater impact zone or real estate value lost-stigma zone beyond that, should consider this reality about the disputed mine: More construction jobs will be lost by inability to develop those surface properties in such areas because of the impairment of real estate values from the mine. See my #4. And this cannot be good for tourism.

THAT DEIR ADMISSION IN THAT EARLIER CONCLUSION OF "SIGNIFICANT IMPACT" TO GROUNDWATER SUPPLIES AND OTHERS (ALTHOUGH UNDERSTATED AND NOT FOCUSED ON THE BIGGER ISSUES AND PROBLEMS) LED TO THE DEIR CONCLUSION (AT 4.8-66) AND MITIGATION MEASURES (EG, 4.8-2(A)) FOR QUARTERLY GROUNDWATER MONITORING UNDER THE PURVIEW OF THE NEVADA COUNTY ENVIRONMENTAL HEALTH DEPARTMENT, BUT IN THE WRONG AND INSUFFICIENT PLACES. (The biggest issue is not 30 wells along East Bennett Road, but obviously the thousands of people with groundwater rights above and around the 2585-acre underground mine where no monitoring is proposed.) First, with no offense to underfunded and understaffed regulators to whom many of our impacted community will be unwilling to delegate their fates in their effort to match such evasive efforts of the mine forces, us affected neighbors directly at risk each need personal access to all information to match our standing to deal with such disputes, risks, and problems as a matter of self-defense, since these risks and problems are much more serious, general, widespread, and in need of more attention than the DEIR admits and more than Rise's chosen Itasca Denver Inc planner has investigated or addressed. Also, this is our surface owned groundwater, not exclusive mine water. (The Rise mineral deed revealed in its SEC Form 10K [not in the DEIR] was not of water rights, but just for minerals below 200 feet, as discussed in my #2.) FOR EXAMPLE, WHAT IS THE DEIR PROPOSED (FRANKLY TOOTHLESS AND NID DISPUTED) CURE FOR MONITOR IDENTIFIED PROBLEMS (which monitors are in the wrong places to identify the bigger problems)? MERELY THAT RISE PROVIDE REPLACEMENT WATER TO EXISTING WELL OWNERS WHO LOSE MORE THAN 10% CAPACITY IN THEIR WATER COLUMN WHILE THEY ADDRESS THE PROBLEM IN A LEGALLY DEFICIENT MANNER THAT WILL SATISFY NO VICTIMS (NOR NID). First, AS SHOWN ABOVE IN MY #2 ANALYSIS OF RISE'S QUESTIONABLE FINANCIAL CONDITION, THIS MITIGATION "ASSURANCE" IS NOT RELIABLE, BECAUSE THE RISE SEC FILED 10K AND 10Q ADMIT RISE COULD NOT AFFORD WHAT THAT WILL COST IN THE FUTURE FOR OUR THOUSANDS OF AFFECTED SURFACE OWNERS AND USERS. REMEMBER, this is not just about a few existing wells along East Bennett Road, although that is the DEIR's disputed and incorrect contention. See the ultimate DEIR Conclusion at 4.8-83, stating: "[W]hile groundwater would be drawdown due to ongoing dewatering of the mine during the operational life of the project [ie, 24/7/365 for 80 plus years], the project includes installation of a new potable water line along East Bennett Road to supply potable water that would offset potential impacts to domestic wells from mine dewatering." What about the rest of us wanting to compete for our same groundwater in the

62

**Ind 254-33**

**future drought and climate change crises to come above the 2585 acre mine and in adjacent impacted areas? Or when property owners want to develop their land and cannot achieve or afford the NID connection, to the dismay of our local builders who could use that work? This is about a threat to every surface owner and user above and around the 2585 acre mine and others whose water level is impaired or whose trees die and must be removed as fire hazards, not to mention the loss of real estate values and other harms and stigmas. Even if Rise were to be willing and able to make and afford an unsecured promise to compensate all such victims, enforcing that promise would be expensive, time consuming, and, if history is a guide, will have a disappointing result for all such victims.** See My #'s 2, 3.N, and 8.

Further illustrating how the DEIR fails to predict the future, because it ignores both its own future mining effects and the irrefutable coming chronic droughts and drier weather and other climate change effects (see above and my # 3.M), the disputed DEIR, in effect, asks for future 24/7/365 mining "its way" for another 80-years based upon existing, outdated standards based on the irrelevant, insufficient, and misleading past data with insufficient mitigation that ignores the future climate change reality, as shown in disputed DEIR Mitigation Measures addressed above and 4.8-6 and 4.8-7. **Basically, 4.8-7 argues that, if the mine exhausts your groundwater, just use NID as mitigation (at 4.8-51-82). That ignores, among the huge connection cost (hint: even deep wells are cheaper) and many other things, the 80-year future when government will (for example, as East Bay MUD earlier did), insist that its customers had to live on 50 Gallons a day (in order to shift water to more desperate Marin County) limit from our NID water, so our local water can be transferred to drier and more desperate places. The DEIR also ignores our competing surface owner rights to groundwater owned beneath us for which we are entitled to compete against the 2585-acre mine uses. Ignoring the future and all those other concerns, the disputed DEIR incorrectly concludes (at 4.8-82): "While a small groundwater use would not be expected to combine with the project's groundwater effects because the increase would be small (due to the small size of the cumulative projects within the outlying areas) and the nature of the fractured bedrock aquifer system (eg, localized water-bearing fractures rather than one interconnected aquifer basin." Governments, please take note: this incorrectly says, in effect, don't worry because Rise does not expect any more growth in our area that would use competing water. Besides being wrong and again ignoring the future and the rights of us surface owners to use our own groundwater beneath us, the disputed DEIR is again ignoring the thousands of us already living on the surface above and around the 2585-acre underground mine. In effect, the DEIR is asking for its wasteful water use to crowd out both our local surface owner rights to access our own groundwater they are pumping and sending away downriver, plus competing future local surface growth, since everyone needs water.** See my #'s 3.N and 4. Beware, those who worry about local jobs, and governments, but who should be more concerned about inverse condemnation claims from landowners who cannot build, because they cannot access their own groundwater being taken by the mine. In effect, the disputed DEIR suggests stalling competing growth and competing water uses for existing local residents and users and existing local landowners, so that the DEIR mine can continuously dewater and send our groundwater downriver elsewhere 24/7/365 for 80 years (presumably to export mining profits to foreign investors as discussed in my # 2) without any net benefit to us locals and our community. See my # 4.

63

**F. One Illustrative Dispute Over Groundwater Depletion by the Mining.**

Before passing on to other topics, I will illustrate some of the many flaws in one of the few places where its DEIR advocate actually attempted (but failed) to address the future risks and harms that concern us. At DEIR 4.8-62, it states (with my comment annotations in brackets):

> It is also noted that public concerns have been expressed regarding a scenario in which mining operations encounter a fractured bedrock aquifer and drain out the water, thus, impacting groundwater supply wells. Fractures of geologic discontinuities decrease with depth due to the weight of overlying geologic materials. The mining would occur in the deeper geologic units where the fractures, if present, are closed or have smaller apertures, which would not transmit significant quantities of water. The scenarios addressed in the Itasca modeling cover a wide range of probable situations that may be encountered and the potential impacts to groundwater levels. **[We are entitled to disclosure in the DEIR itself, and CEQA does not require us to read the relate reference library of technical studies we suspect are cherrypicked by the DEIR for their disputed but friendly treatment of the mine risks and problems. See my # 14. In this case there is a dangerous inconsistency, where the DEIR admits massive groundwater pumping, use and disposition depleting our groundwater (without the absurdly assured, but illusory recharge) by reliance on average rain between 1967 and 2017 that ignores the "new normal" of climate change dryness and drought. Nevertheless, the disputed DEIR here tries to assume away the problems, insisting, in effect, don't worry, because somehow the water will stay in the deep bedrock; two inconsistent positions that both ignore the realities in this and other objections opposing the 24/7/365 dewatering for 80 years, without any proof in the actual conditions of the 2585-acre mine now and as it may change during the new mining, deeper and more expansively. The DEIR may want to gamble against the risk of groundwater depletion not being recharged through all that fractured bedrock, while the surface dries out from unprecedented climate change drought and dryness, but none of us living above or around that mining will consent to that risk or such impact to our homes, our forests and environment, and our community way of life, especially as that stigma depreciates the value of our properties.]**
>
> In other areas around the perimeter of the mine workings, the projected maximum drawdown in private wells is less than two feet. In all cases, based on the information available through the well completion reports, the maximum potential additional drawdown in the perimeter areas is less than 10 percent of the available water column in individual wells. The maximum drawdown is also substantially less than the normal seasonal fluctuation in the groundwater levels of 10 feet to 30 feet or more. **[This is bad enough for objection, although it is again another illustration of the DEIR bait and switch, because they are talking about the 30 well area along East Bennett Road by the small Brunswick site, but not our area above and around the 2585-acre underground mine where the unrevealed and unstudied situation has been hidden by**

**Ind 254-34**

64

**Ind 254-34**

**flood since 1956 and is now proposed to change by new, deeper, and expanded mining 24/7/365 for 80 years. Where is the DEIR data and science that make that risk reasonable for us?]**

Thus, in the perimeter areas and including a safety factor of 100 percent in calculations the project would not have any significant impact on groundwater supplies. **[citing the disputed study by EMKO Environmental Inc., in effect asking government, affected locals, and our community to risk everything on that disputed historical study and some selected sample of existing well data that ignores the coming new, deeper, and expanded mining into unknown conditions of the 2585-acre underground mine. No thanks. More importantly, because of the DEIR's general focus on avoiding opinions of the many objector properties located above or around the 2585-acre underground mine the DEIR generally ignores, as well as the broader impact and stigma zones owning or drawing from groundwater from the same source, that 100 percent calculation seems to be a 100% of a much smaller area around the Brunswick site, not the area where most of us objectors live and own the surface above the groundwater being depleted.]**

**Ind 254-35**

Before this becomes a battle of experts and, if the DEIR or mine is approved over our continuous local objections, in the rounds of competition and litigation and political disputes to follow (see my #'s 3.N, 4, 8, and 14, infra), consider the following additional example reasons why that DEIR commentary is worse than unreliable and nonresponsive:

I. The disputed DEIR commentary focuses (again) on the past (eg, rainfall average between 1967 and 2017), as if that pre-climate change weather were relevant, when it's not applicable to the "new normal" in the future on account not only on chronic drought and climate change dryness, but also on the impacts of the new mining itself changing things radically by 24/7/365 blasting, digging, tunneling, and other mining work for 80 plus years. Nothing in the DEIR reveals the geologic conditions at the greater depths or the new or expanded areas for mining. Therefore, the DEIR seems to rely on the risky assumption that the new normal will be comparable to the irrelevant old data altered by climate change. That dangerous risk should not be placed on us innocent neighbors and our community, but the DEIR burden of proof and persuasion must remain on this undesirable, no net benefit mine. See my #'s 4 and 14.

II. This is not just about 30 wells going dry on East Bennett Road, but also about drying out the land above and around the separate and environmentally and legally distinct 2585-acre mine and creating dangers to our forests and other environmental factors, thereby adding to our already increasing fire and fire smoke risks and trashing our property values. Moreover, as discussed elsewhere, chronic dryness and drought will inspire us locals to drill hundreds more and deeper wells to compete with the mine whenever NID water supplies are limited, whether by

65

**Ind 254-35**

shortages or governmental reallocations not imagined in the DEIR. Also, considering NID cost and connection issues, many landowners need wells to develop their properties. (Eventually, I also expect the many local people using NID "ditch water" will eventually have to switch to wells. And, as explained elsewhere, NID mitigation may not be possible when NID exhausts its own supply by drought and climate change or by government order to reallocate our NID water to more desperate places.)

III. The limited (and self-selected) DEIR 30 well sample from a noncomparable area of East Bennett Road to ours above and around the 2585-acre underground mine is both too small and too biased by the irrelevant past to be a guide (even with mitigation monitors) as to what to expect in the future, especially since the snowpacks are expected to diminish, and the competition for surface water will become increasingly more intense. Chronic drought and drier climate will be a progressively greater problem, especially when everyone with competing water rights wants to drill wells to save themselves from the scarce water future that water wasters like this mine wish to ignore by looking only to the now irrelevant and misleading past to predict our future, not only as to drought, dryness, and climate change, but even as to the effects of the new, deeper, and expanded mining; and

IV. The local impact areas include thousands of people living on Banner Mountain and other areas above and around the 2585-acre underground mine. Nowhere does the DEIR satisfactorily address the impacts and risks of dewatering and dumping the water downriver on those adjacent higher elevation places, some of which (eg, the Airport area) are admitted by the DEIR to be on the surface above the mine workings.

**G. The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?).**

**Ind 254-36**

In various places (eg, addressed at my # **3.C, G, and H and 7 [as to the Cr+6 issue] and to 3.F and M and 5)** the disputed DEIR talks about water quality issues in provocative ways with unjustified errors, omissions, and risks, especially relating to the ignored topic of **hexavalent chromium's toxic threats** addressed in various places in this Objection and others, since the toxic threat science is as compelling as the *Erin Brockovich* movie. (See the massive EPA website related data and why the European Union announced a Cr+6 ban starting in 2024.) Even if somehow our government delays the inevitable ban in the US (the irresponsible pattern of industry political resistance delaying regulatory reforms as seen earlier with asbestos, cigarettes, opioids, etc), the toxic stigma from this repetition of the *Erin Brockovich* horror movie will further harm our people, property, environment, and real estate values. **Some of the dangerous materials and chemicals admitted existing in the mine are summarized in the DEIR Mitigation Measure 4.8-1(a) at 4.8-52: "The NOI [to the Central Valley Regional Water Quality**

66

**Control Board under the Limited Threat Discharge permit] shall include evaluation of potential constituents of concern, including ammonia, arsenic, HEXAVALENT CHROMIUM, iron, manganese, pH, total suspended solids, TDS, and cis-1.2-DCE..." (capitalized and emphasis added.) Also, eg, DEIR at 4.8-53+ (and where addressed in my #'s 3.C, G, H, and 7), the DEIR explains how Rise expects to use hexavalent chromium in its CPS plans to (in effect) glue or cement material in the mine as a continuous part of shoring up the old mine and its new, deeper, and expanded mining processes 24/7/365 for 80-years, if they can get away with that over resolute local resistance.**

**Ind 254-36**

As addressed elsewhere in this Objection (eg, My # 3.C, G, and H, and 7), the risks are not only about incorrect, insufficient, or misleading data and assumptions by the DEIR and its advocates (eg, things like underestimating the dangers of hexavalent chromium that the EU is finally banning and, famously to bring that sigma to our community, what the groundwater polluter allegedly used previously to kill the town the town of Hinkley, CA in the *Erin Brockovich* movie and resulting in a huge class action settlement). **Key risks also include that the DEIR's new, expanded, and deeper mining 24/7/365 for 80 years may create worse or new exposures from that unanalyzed underground 2585-acre area that threaten our surface property, environment, health, and safety, but the DEIR offers no information on that topic at all, or even about the current starting point of this mine when it is dewatered for the first time since 1956. More importantly, permits for 80 plus years of mining using current (and many consider lax) toxic tolerance standards based on existing science or what part of science is motivating for bureaucrats subject to politics, lobbying and worse) will likely be not permitted in the future for good cause.** For example, the EU has announced a future ban on hexavalent chromium in 2024, and sooner or later it will be banned here too, just like asbestos, cigarettes, etc. **And, in any event (see my # 3.C, G, and H, and 7), do our governments really want the stigma of being called the "next Hinkley" and further depressing our real estate values and scaring away tourists and desirable residents (a term intended to exclude this mine and other harmful businesses)?**

**H. Some Technical Comments About Hexavalent Chromium, Since The Disputed DEIR Fails To Even Discuss the Existence of Controversy, Much Less The Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like Me) Who Fear Us Becoming Another "Hinkley" As Mourned By The *Erin Brockovich* Movie.**

**Ind 254-37**

The prior and later mentions the disputed DEIR's admitted plan for extensive use of **hexavalent chromium** [Cr+6] in its new mining in the 2585-acres underground mine beneath thousands of us, without any discussion of that obvious, toxic controversy that everyone knows from the *Erin Brockovich* horror/reality movie. The DEIR stated, but did not identify or explain satisfactorily, the risks, impacts, and harms from some areas underneath us to our surface owned and used by us residents and voters, who (like me) object to the mine and the disputed DEIR. Indeed, **there is no mention of toxic hexavalent chromium in the section 4.7 of the DEIR entitled, "Hazards And Hazardous Materials." That omission should be lethal to the DEIR, whether they were hoping no one would notice this fact buried in another section 4.8 of their lengthy DEIR, or because they imagine trying to argue this is just an airborne killer that can**

67

**Ind 254-37**

**somehow be contained underground (incidentally, one of the many doomed arguments the asbestos industry tried to use to evade accountability, and everyone knows how that comparable situation ended in decades of misery and economic losses for everyone involved.)** Our government decisionmakers need to consider the following realities, beginning with what little is revealed in the DEIR, then addressing the science (see the EPA website studies and reports and the EU ban and much more on Google or Wikipedia), and then addressing the stigma problems that make us neighboring real estate owners and surface users suffer even worse depression of values and marketability than we already face from mining burdens, risks, and impacts, even if this gold mine were perfect in every way (which it is not and no local or any rational real estate purchaser would trust such a DEIR on that issue).

**The DEIR admits (at 4.8-51) that:**

**"The water ... from the underground workings is anticipated to have similar quality to the water that currently discharges from the existing drains. ... Therefore, the condition after mining is completed would be like existing, or baseline, conditions, such that seeps ...would not represent a potentially significant impact under CEQA [where the DEIR just addresses the iron and manganese issues and tries to further diminish the appearance of risk by describing how the new mining is going to be deeper. In other words, the DEIR claims that none of us need to be concerned about hexavalent chromium, despite all the EPA studies, science, EU ban, *Erin Brockovich* stigmas, etc]."**

**Among the many differences between the water in the now flooded mine closed in 1956 versus the new, expanded, and deeper DEIR mine to come (besides the effects of their mining in other places than before and of climate change etc) is that the entire new mine work for the next 80 plus years will involve extensive, admitted use of hexavalent chromium cement paste in shoring. That makes the previously quoted DEIR statement both wrong and a reason to challenge the credibility of the entire disputed DEIR, assuming, as many will, that this was a knowing omission in the DEIR to duck a controversy that CEQA requires them to address. See my # 14. Specifically, the DEIR admits in its dewatering discussion (at 4.8-42 to 51, especially at 46-49) that miners intend to use "underground paste backfill" (ie, material glued with "CEMENTED-PASTE BACKFILL") THAT IS (INCORRECTLY) DESCRIBED AS "ENVIRONMENTALLY BENIGN" BUT WHICH IS 'HEXAVALENT CHROMIUM' OR "Cr+6."** (emphasis added)

**If one "Googles" "hexavalent chromium" or reads the negative studies and reports on the EPA website, he or she is overwhelmed with links that expose the serious health and safety threats, especially if one were to then follow the science links, such as the studies of the leading experts,** such as Wendy Wagner (University of Texas at the Austin School of Law, a specialist in and critic of EPA chemical regulation) or Steve Gold (Rutgers University environmental law professor). But since this Objection is addressed to government decisionmakers who may wish to know what the usually late and insufficient toxic regulators have to say (consider asbestos and cigarettes, both of which were eliminated by mass tort litigation jury awards causing bankruptcies of users based on science long before regulators acted), consider the mass of data that is readily available on the EPA website. (I share the

68

attitude of another relevant expert Kyla Bennett, who is often quoted for complaining, that too often among industry influenced regulators such "chemicals are assumed to be innocent until they're proven guilty." In my experience such regulators delay their final rulings way too long for the victims and good public policy.) In my case that attitude comes not from scientific expertise, but from my 50 years of bankruptcy, cross-border insolvency, and insurance insolvency experience in many of the mining, asbestos, and other environmental and mass tort failures of that period. See my #1. Regulatory inaction aside, and besides a mountain of critical studies and reports, I cannot imagine any prudent businessperson using hexavalent chromium like this DEIR, especially now that the European Union is banning it effective 2024. Using that notorious substance seems foolish and uneconomic considering the incurable stigma, even if CR+6 were legal and the DEIR advocates hired some partisan science person ready to support them against the mass of contrary evidence and experts, and even if they were technically correct [which I and others would dispute, as was the case with asbestos, cigarettes, opioids, and other hazardous substances, which those industries defended for a long time, despite mass tort and bankruptcy hits, before the long obvious truths finally overwhelmed the lobbyists and political money.]

**Ind 254-37**

**A basic EPA website search shows 29,369 studies and reports when you type in "hexavalent chromium." To save time, start with the EPA "TRI Program" by focusing on the "toxic release inventory" which begins: "hexavalent chromium compounds are human carcinogens, classified as weight-of-evidence Group A ... under the EPA Guidelines for Carcinogen Risk Assessment (EPA 1986a) ... all the hexavalent chromium compounds are assigned a "High" hazard rating for the proposed RQ adjustment." See also EPA's report "Evaluation of the Potential Carcinogenicity of Chromium And Hexavalent Chromium Compounds" on its website since issued 5/24/2002.**

**Even if the DEIR incorrectly argued that (despite everyone knowing the water pollution killer in Hinkley) this CR+6 threat was somehow not about water, but instead about air, so they could somehow incorrectly imagine hiding it "safely" underground, like their explosives for 24/7/365 blasting for 80 plus years (an argument many of us not only dispute, but also ridicule, since history and experience proves human error inevitable over 80 years), the DEIR is obligated (eg, by CEQA and other applicable law and basic principles of civil and tort law) to reveal the controversy and present their alleged excuses for cross-examination.** But assume for the sake of argument that the DEIR advocates were somehow correct and that oversight regulators and the government decision-makers mistakenly accepted those mining excuses, few others at risk will ever do so, especially those of us who have been taught by experience or wiser people that "it's better to be safe than sorry" about such things. **(Remember, the mass tort litigation results drove the asbestos, cigarette, opioids, and many other toxic industry defendants into bankruptcy long before their dangerous products were outlawed here.) However, what makes this situation especially compelling for rejection of the mine and its DEIR is that there will always be a stigma here because we already have a compelling and comparable case study that involves ground water pollution by hexavalent chromium. For those who never saw the movie *"Erin Brockovich,"* see the movie or read Wikipedia's (or other) accounts "Hinkley groundwater contamination," about how a notorious utility used that chemical, and then dumped the wastewater in spreading ponds in**

**Hinkley, California, (now a toxic ghost town), and ultimately had to settle a class action with the local victims for $333 Million (back when that was serious money).**

Government decision-makers here should consider this fact in deciding the fate of this disputed DEIR and mine, whether on this issue or about my even greater concern about water supplies or many other risks and problems addressed in this and other objections. It is not in the interest of our community needlessly to suffer for this undesirable and worse mine with no net benefit to our community (see my # 4) what would certainly follow such approval of such burdens, harms, risks, and threats to our homes, environment, and community above and around the 2585-acre underground mine. We locals have legal and political rights that are not eliminated by any such mine or DEIR approvals, **including our rights as surface owners above and around the 2585-acre underground mine.** See my #'s 3.N and 4. Thousands of locals at risk will be defending our homes and peace of mind against real problems, and (even if somehow decisionmakers were incorrectly to imagine the DEIR is sufficient and correct, despite my # 14 and other objections) an irrefutable stigma problem would still continue for our community that would trash our real estate values, meaning less new construction and money in the local economy and a negative reputation for tourists. See my # 4, demonstrating why there can be no net local or other benefit from this mine, even if it were feasible and affordable (see my # 2).

Ind 254-37

I. **A Brief Plea For Responsible Government, And For Environmental Security And Peace for Our Community.**

There is already too much civil division and discord in our lives for this DEIR mine to be allowed to cause more. That is especially true when, as here, the mine provides **no net benefit** to us locals and our community (see my # 4) and wants to impose risks, harms, and burdens on us locals on the surface with 24/7/365 mining under and around our suburban (not "rural" as they allege by only discussing the area around the small Brunswick site) community for 80 plus years in order to export profits to the mine's foreign investors. The negatives for thousands of us locals far outweigh the few jobs for some mine workers from somewhere, and those of harmed and at risk are far more numerous (and likely would become single issue local voters.) At the end, whatever else happens, we locals and our community would end up (best case) with a mine mess stigma (and likely much worse) and ultimately another abandoned mine with not just the existing risks, but with then a mine that is bigger, deeper, and full of hexavalent chromium, while our precious water supply and other things may be damaged and/or depleted forever. The downside risks and burdens for us locals are too bad to ignore or accept, and under applicable law we should not have to do so. See my # 14.

Ind 254-38

As demonstrated throughout this Objection, the disputed DEIR avoids dealing satisfactorily with even current science about the future, insisting by its disputed interpretation of CEQA that all government and the mine's potential victims need to know about the future can be deduced by the DEIR's chosen advocates studying the no longer predictive past. See my # 14. That makes the DEIR noncompliant with applicable law (see, eg, my #'s 4 and 14) and fatally deficient and flawed for its essential purposes. The proper questions that government should be asking (see my # 15) include these: Why impose under these circumstances all these many harms, burdens, and risks on our local residents and community, with materially adverse

**Ind 254-38**

opportunity costs and obstacles for competing and more beneficial land uses (eg, depleted water supplies, exhaustion of the cumulative margins for air and water quality, etc), for a mine that helps fewer workers (from somewhere?) than the thousands of voting locals at risk and harmed by the mining? Where is the proof of any net benefit to our local community, since all the controversy, conflict, and disputes would appear to be for the sole benefit (with exported profits) for Rise's foreign investors? See my #'s 3.N, 4, 8, and 15. One related public policy corollary of that question is: why should our community give away to such a DEIR mine with no net benefit to our local community (my # 4) the margins we need locally for better uses of our precious water supplies and quality, air quality, and standards for toxic and hazardous substances? In the future regulatory standards will become stricter, but existing resource exploiters and wasters (like this mine seeks to become) will crowd out better future uses for which no such margins remain available. Why would any responsible government tolerate that, especially when us local voters will never do so, since the only way to stop the threats that would harm us, our properties (and their value), our environment, and our community way of life, is to resist the mine until it stops?

J. **Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates.**

**Ind 254-39**

**As to air quality concerns insufficiently addressed in DEIR 4.3, even it admits (at 4.3-70 and see also 4.3-73): "Therefore, prior to mitigation, the project would result in potentially significant levels of ROG, NOx, and PM10 emissions and could conflict with or obstruct implementation of the Ozone Attainment Plan pursuant to Criterion 1." Also see the underestimated asbestos problem inadequately addressed at 4.3-80 and 82-84. [This is another topic on which I defer primarily to my incorporated objections of others with greater expertise on our common air quality impacts, harms, and risks.] What this disputed DEIR does not address in such quotes is that, when the air quality is overwhelmed by any insufficiently addressed factors, such as chronic wildfire smoke or droughts preventing the watering of "fugitive dust," which can last for long periods and come from many different places over great distances, what happens? See, K. Alexander, "California wildfire smoke may rise to practically unendurable levels in next decades," San Francisco Chronicle March 29, 2022, discussing a Princeton/NOAA study that predicts from climate change that particulate pollution from wildfires will increase by more than 50% by 2050 and triple that by the end of the century.**

**All these DEIR deficiencies, risks, and impacts raise more questions than they even attempt to answer. See also my # 15. Will the mine shut down, or will we suffer worse air while the mine continues to pollute 24/7/365 for 80 plus years as if it were the only polluter in the area? Having created such air problem in such environmentally stressed times, will the mine claim exemption from rules applicable to the rest of us on the theory that such self-created risks are too dangerous to stop the mining mitigations? Also, consider the effects of new, expanded, and deeper mining in new places may create new or greater than "assumed" from the past threats, none of which risks are addressed in the DEIR (ie, they are, here again as elsewhere throughout the DEIR, "assumed" away based on a largely irrelevant and nonrevealing past and lax regulatory standards that inevitably will become stricter in the**

**Ind 254-39**

**future). What have they withheld that CEQA and credibility require to be disclosed in the DEIR? See my # 14.**

**Mitigation of air quality problems addressed in disputed DEIR 4.3-6 at 4.3-91 + also admit some poorly described impacts that require mitigation. How will we be able to judge compliance locally with understated or ignored problems inadequately mitigated even in accordance with the deficient DEIR, not to mention compliance with applicable law and reality? See my #'s 10 and 14. Note how many at the March 24, 2022, DEIR hearing reminded the decisionmakers about how poorly Nevada County already ranks in air quality, and since our "F" grade cannot get any lower, they'll need to invent a new low grade for us after the mining starts. Speaking of the DEIR's absurd distractions from the real problems, what does the mine's "carbon offsets" elsewhere (see 4.3-96 plus) have do with making our local air quality and climate change problems less severe here locally where it matters to our health? (Long term promises like that cannot excuse current abuses of our environment.) See Table 4.3-23 and the inadequate Greenhouse Gas Emissions (GHG), admitting that (at 4.3-94):**

**Ind 254-40**

**"However, project construction would have the potential to generate GHG emissions that could have a significant impact on the environment or conflict with an applicable plan, policy, or regulation ... and the projects incremental contribution of GHG emissions would be cumulatively considerable." As explained by the California Supreme Court case about the sewer plant's benefit to those at a safe distance by harming those downwind, allowing those downwind locals disproportionately harmed to have inverse condemnation and nuisance claims (and other decisions) addressed in my # 4, there are legal and political consequences independent of CEQA and mining permits for harming locals for the benefit of others at a safe distance.**

**Also, the disputed DEIR "Asbestos Dust Mitigation Plan" is disputed, insufficient, and based upon past data that may change radically with new, expanded, and deeper mining and especially because it ignores the reality of what happens in the new normal chronic droughts and dry weather from the climate change. For example, the disputed DEIR totally ignores what happens when the mine cannot wet the toxic dust, as discussed in my water objections above. The answer is that locals may use that occasion for courts or government to force the mining to stop, whether by court injunctions, government actions, tighter regulations, or other legal remedies (see my #'s 3.N and 14). Also, the deficient DEIR mitigation plan ignores the predictable consequences of human error, and ordinary, sloppy behavior (which is hard for outsiders to monitor, although some will try and all will be ready to denounce when it is**

**Ind 254-41**

**discovered) in handling such asbestos and other toxins, like the hexavalent chromium threats they keep ignoring in the CEQA noncompliant DEIR.** Asbestos litigators are always looking for more defendants, and they often sue for less releases than are imagined by the DEIR here. Many such plaintiff lawyers will already be focused on the mine, because of the hexavalent chromium threat once the mining starts. (Note, that is not my kind of law practice, but those aggressive lawyers did manage to stop many bad industries, like asbestos, cigarettes, opioids, etc, long before the politically over-lobbied regulators were willing to act, so many of us won't mind what they do to this DEIR mine.) So, what does that all do to the mine's feasibility, which seem to drive all their profit driven planning for foreign investors? See my # 2. The DEIR's answer is its admitted mess described in its 4.3-103-04, but I believe that is an understatement of the adverse consequences, which is why the mine should never reopen.

72

Ind 254-42

As noted in DEIR 4.3-2 at 4.3-79, the disputed DEIR calculations (again based upon an erroneous "assumption" that the mine's emergency generators would only operate up to 100 hours per year) focus on misleading past data, not current reality. Besides underestimating climate change and the "new normal" of forest fire and weather shut offs, the DEIR fails to accurately describe PG&E's Public Safety Public Shut Off (PSPS) program to keep its often old and dangerous equipment from starting more fires with legally forbidden trees and vegetation PG&E will need at least a decade to clear, as admitted by PG&E in the official records discussed below, some of which are on the PG&E website. Based upon the "new normal" (eg, begin considering the real experience with the fires and with blackouts for weather, equipment problems and constant replacement work, and PSPS since 2019), that 100 hours assumption is both absurd and in conflict with all the relevant data readily available from on the following public records (ignored by the DEIR and the Rise SEC Form 10K explained in my #2): (i) in multiple CPUC hearings, orders, investigations, and reports on its website (all more recent and relevant than the largely superseded and heavily amended and supplemented old PG&E PSPS report to the CPUC cited in DEIR footnote 45 at 4.11-35), (ii) in PG&E's criminal probation proceedings before Judge Alsup in US v. PG&E Co., Case No. CR 14-0175 WHA pending in the Northern District of California, which often has the most useful data, (iii) in the docket of the PG&E Chapter 11 Case No. 19-30088 DM Pending in the Northern District of California Bankruptcy Court (San Francisco), and (iv) even on the PG&E website. As a bankruptcy lawyer intensely involved for affected clients regarding these issues in those three proceedings against PG&E and a local with my own natural gas generator apparently on the same local Brunswick PG&E electric facility distribution hub as the DEIR mine, I make an offer off proof that a more reasonable estimate of total generator use during the next decade alone on account of all such various PG&E issues will likely average at least 5 times the DEIR annual "assumption" about generator use from PG&E electricity cut off causes alone. Since our air quality is already a problem, it should matter that these backup generators (and more, they would need backups for these insufficient backups) will increase the problem. More importantly, that large of a DEIR mistaken "assumption" about generator use illustrates why the DEIR lacks credibility generally.

People (like me) who can afford generators have all invested in expensive systems (as recommended by PG&E itself) in anticipation of chronic and repeated blackouts from extreme weather events, fires, PG&E's PSPS program, PG&E's enhanced system improvement, repair and maintenance work, and even out of PSPS program emergency shutdowns, all planned and now beginning at a historically unprecedented pace, thanks to greater regulatory pressure and especially to Judge Alsup's probation condition orders. Moreover, because of such record and the admitted age and poor condition of much of the PG&E system here that needs to be replaced and upgraded, because of PG&E's need to catch up from decades of neglect of prohibited trees and vegetation next to its wires (estimated by PG&E to take a decade), as well as because of PG&E's recent plan to underground 10,000 miles of power and distribution lines, there will be massive and frequent disruptions in our local electric supply for years. All that means, for example, more generator use and that, as air quality issues become stricter, there will also be competition over who gets to run defensive generators in a zero-sum game. Will us locals be asked to cut back on our

73

generators so the mine can keep their generators at normal use to prevent mine problems they knowingly caused?

If applicable governments approve the disputed DEIR and attempt to interfere with our competing, self-defense resistance, that will provoke us opposition voters into more vigorous political and legal actions (see my # 3.N), especially as to the most provocative, implied DEIR idea that us local voters should suffer such chronic blackouts in our community by not using our generators, while the mine generators operate instead of ours. Consider how many of the thousands of us work from home and need our generators to remain functional. How can responsible government possibly allow this DEIR mine to create a new problem with no net benefit to our community (my # 4), and then claim priority for their generators to mitigate the problems they knowingly created over these objections? I cannot imagine any neighbors would consent to or tolerate losing any generator competition to the mine. Divisive things like that would create the political and law reform competition I discuss at my # 3.N, and as a good citizen I hope we never have to test the complex jurisdictional issues over who gets to deal with the law reforms to effectively mitigate and stop the mine harms.

**Ind 254-42**

Consider, for example, that the DEIR admits (at DEIR 6-14) that the mine is economically infeasible if it is cut back to a normal 12 hours a day for mining (instead of 24), which would be one of our new legislative priorities. When the DEIR advocates try to stop that kind of local law, they will then encounter local resistance insisting on at least priority of generation use for human needs over mine profits, just as we will be requiring priority for our human uses over mine uses of scarce water. Allowing the DEIR mining 24/7/365 is bad enough when our local electricity is working, but as soon as us resident voters are told the mine's air pollution and other environmental abuses get generator priority 24/7/365 for the air quality that inhibits us, the mine's end is near. Again, there is no one here who can be expected to tolerate suffering anything for this no net benefit mine we must continue to resist until it stops harming us. See, eg., my #'s 3.M and N and 4. Sooner or later this mining will stop for all the reasons it never should have started. I make this a formal offer of proof to any official decisionmaker interested in more data from the public record exposing more about these DEIR errors, omissions, and deficiencies.

K. Because the DEIR Fails To Comply With CEQA in Many Ways (see, eg, my # 14), The Strange DEIR "Non-CEQA Related Analysis" (#4.3-103+) Is A Revealing Admission About Some of What the DEIR Should Have Disclosed About What Happens When The Mine Starts And Then Stops, Whether From Lack of Funding Or Gold, From Our Local Legal Or Political Resistance And Law Reforms, Or Otherwise.

**Ind 254-43**

There are revealing admissions in the DEIR at 4.3-103-104, entitled "Non-CEQA Related Analysis," another unhelpful title for another topic again better positioned elsewhere, adding to its many ways the disputed DEIR obstructs anyone seeking clarity from its scattered disaggregated data of concern to potential local victims. See my #'s 3.E and 14. Nevertheless, "Non-CEQA Related Analysis" is an important admission about how vulnerable the mine is if it loses electric power, including from PG&E's "PSPS." See my analysis of the

74

electrical issues in the air-quality/generator dispute in my previous subsection 3.J (a topic on which I have extensive experience and knowledge. Decisionmakers should note that it doesn't matter what or why the electricity stops, because the main adverse effects on the mine are the same, whether the current stops for failure to pay the electric bill, for PSPS, PG&E system upgrades or repairs, or other actions or inactions by PG&E, from storm blackouts, or from other causes. The DEIR mitigation is generators, which are critical to the mine's functionality to avoid mine flooding and other consequences, and which add to the air quality and other issues addressed by this Objection. See, eg, 3.J and 10. I focus on this here at the end because this is the only place where the disputed DEIR even attempts (and fails) to discuss in any detail what happens when its mining stops after it starts. What that DEIR discussion reveals is some of what the fragile economics of Rise discussed in my # 2 above and elsewhere are environmentally critical, because if the mine somehow finds enough funding to start (since is financials at my # 2 do not now report sufficient funds to accomplish even the beginning DEIR work), the mine will likely find funding even more difficult to raise to cover the admitted losses caused by any such a stoppage. See, eg, my # 2 and 3.N.

**Ind 254-43**

While stopping the mine is our continuous defensive goal, and we cannot imagine any adverse consequences of stopping the mine to be worse than its continuing operation, CEQA still requires the DEIR to disclose those consequences of stopping; an irony since the DEIR's only attempt to do so is labeled a "Non-CEQA Related Analysis." See my # 14. Consider what the disputed DEIR admits (at 4.3-103-04) about all the things that happen when the mining stops for lack of electricity. Those same problems will also occur for anything else that stops the mining, whether its lack of sufficient groundwater, court injunctions (eg, stopping the use of hexavalent chromium or groundwater waste), lack of operating funds by Rise (see my # 2, which is already a currently existing problem), incompatible legal requirements (like a mere 12 hour day work limit we locals advocate, which the DEIR admits at 6-14 can stop the mine operations), and other events, including its own human errors (eg, water treatment wrongs, the explosives, etc.) or surprises they encounter in their blasting, tunneling, or other mining work into old or new, expanded and deeper areas of the 2585-acre underground mine (eg, what if they unleash more toxins than their water treatment plan can correct and the dewatering stops?), etc.

For example, as to the data errors that I mentioned in 3.J that illustrate a pattern of disclosure credibility problems, those disputed DEIR statements about PG&E's PSPS ignoring many other electricity blackouts and generator use problems, are insufficient, inaccurate, and outdated. See my # 3.J. For instance, the DEIR admits in that part 103-104 many health, safety, mitigation failure, economic problems, and other hazards that will occur, if the mine dewatering is even briefly impaired by any blackouts. Since the DEIR is itself creating problems and risks that will require extensive use of its generators in competition with our many other generators in and continually being added to the local area, the disputed DEIR cannot claim priority generation rights in that competition with us locals for knowingly creating its own crisis needs, and those legal and political disputes will be extreme, since most of the community above and around the mine will never willing sacrifice anything for the benefit of this no net benefit mine and its foreign profit takers. See my #'s 3.N and 4. People here cannot imagine failing to resist shutting off our generators and suffering without electricity needed for our homes (where many work), while the nearby mine generators

pollute our air while they also drain away our groundwater through their hexavalent chromium mine walls, etc.

See my discussion in my # 3.J above of the DEIR's dangerously deficient "Asbestos Dust Mitigation Plan," which, for examples, depends on water that may not be available 24/7/365 for 80 years. Likewise, the DEIR's odor analysis at 4.3-85 plus is also based on unrevealing history unrelated to the new, expanded, and deeper mining, which may unearth bigger new threats, because the DEIR has no idea what they will encounter in their blind pursuit of gold. The same discredited "assumptions" that somehow the past must reveal the future, which ignore the new mining activities in unstudied parts of the underground mine flooded since 1956, as well as such climate and other changes. The DEIR/Rise business plan seems to be based on a variant of the old predator theory that "it's better to ask for forgiveness, than for permission." The DEIR version of that theory seems to be that their path to mining is easiest to achieve if they ask for permission by a DEIR that contains errors, omissions, and deficiencies, and then ask for forgiveness when the much worse realities are exposed on the theory that stopping the mine would be too harmful to everyone, such as by the adverse stopping consequences the DEIR admits at 4.3-103-04 in a section quaintly and inaccurately labelled "Non-CEQA Related Analysis." My point here is that there will be no forgiveness to reward or allow this miner to have another chance to harm us. See, eg, my #'s 3.N, 4, and 14.

**Ind 254-44**

Mitigation of air quality problems addressed in DEIR 4.3-6 at 4.3-91 plus (discussed in my # 3.J) also admits some poorly described problems that require mitigation. How will we be able to judge compliance with understated or ignored problems inadequately mitigated even in accordance with the DEIR, not to mention compliance with applicable law and reality. What does the mine's "carbon offsets" elsewhere (see 4.3-96 plus) have do with making our local air quality and climate change problems less severe here where it matters? See Table 4.3-23 and the inadequate Greenhouse Gas Emissions (GHG), admitting that (at 4.3-94): "However, project construction would have the potential to generate GHG emissions that could have a significant impact on the environment or conflict with an applicable plan, policy, or regulation ... and the projects incremental contribution of GHG emissions would be cumulatively considerable." But see my #'s 3.M and N and 4.

In summary, I note the DEIR footnote 48 at 4.3-104, which may be the DEIR's attempted excuse for it massive omission and consistent refusal to deal with the "new normal" future and climate changes, as well as to resist any discussion beyond assuming the past will reveal the future, even though that is absurd in time of climate change, chronic drought and drier weather, water shortages, air quality deterioration, increasing regulatory standards and other changes. See, eg, my #'s 3.E, M, 4, and 14. For example, consider the fact that the disputed DEIR too often incorrectly assumes and pretends that the 2585-acre underground mine conditions into new, expanded, and deeper areas are the same as when the mine closed in 1956. That presumed, disputed, and refuted DEIR excuse is their meritless claim that, for purposes of CEQA Guidelines 14 CCR 15145, that the DEIR can ignore "a particular impact [that] is too speculative for evaluation." But see my # 14 and my coming legal rebuttal supplement. That disputed "speculation" excuse applies to none of the criticisms and concerns raised in this Objection and other key objections. To accept that absurd DEIR logic would mean that, for a 24/7/365 -- 80 plus year project in an unknown

**Ind 254-45**

**Ind 254-45**

**condition since it closed and flooded since 1956 can reopen to expand blindly into new and deeper areas of the 2585-acre underground mine without anyone being able to complain because such complaints are "speculative". No. What is speculative is the DEIR mining into such unknown conditions and assuming that whatever conditions existed before 1956 can be relied upon as to whatever else they do in that 2585-acre mine for the next 80 years. No responsible government can give such a miner a "blank check" to indulge itself like that beneath us in our suburban community, especially since Rise does not have the funding or unencumbered assets to pay for the harm it causes. See my #'s 2 and 14 and my coming legal rebuttal supplement.**

**The DEIR cannot do whatever it wants, just because that distant future is too "speculative." See my # 3.M and 14. Nonsense. And, in any event, what is "speculative" is what the DEIR chose to evade and not investigate or address, but which is addressed by science and observable facts the DEIR just finds inconvenient or worse to their goal. See CEQA and my # 14 and supplemental briefing. But here's the thing that matters most in all these debates in this Objection and others: the burden of proof and persuasion must be on the disputed DEIR, and it cannot say they wish to proceed and ignore obvious risks and problems because they wish incorrectly to consider them "too speculative." This situation is worse a criminal defendant demanding some special relief, while taking the Fifth Amendment and refusing to address a mountain of damning evidence and suspicious circumstances as "too speculative." Why? Because such a criminal defendant has a right not to speak, but no mine has a right under these circumstances to reopen like this after being closed since 1956, especially without adequate disclosure (see, eg, my #'s 3.E and 14) and convincing everyone who matters that all the obvious risks and problems are not just solvable but will be solved (something this DEIR cannot do, even if it tried. See my # 2). What is "too speculative" here are the disputed assumptions, arguments, and so-called facts on which the disputed DEIR purports to justify the mine reopening.**

**L. Consider The What The DEIR Is Not Disclosing (eg, my # 3.E and M and 14) And The Questions That The DEIR Is Not Answering, Because Those Of Us Impacted Or At Risk Will Assume the Nondisclosures And Answers Require Continuous Resistance To the Mine (See my #'s 3.N, 4, and 14).**

**Ind 254-46**

Considering such admitted DEIR facts quoted in this long rebuttal alone, my many stated questions about DEIR errors, omissions, and deficiencies must be answered before any such DEIR could be worthy of consideration. See, eg, my # 3.E and M and 14, as well as my # 15, asking more hard questions evaded or ignored in the DEIR. Such questions are especially serious because the DEIR never sufficiently addressed the consequences of its future 24/7/365 mining for 80 years, except by reference to the irrelevant and misleading past data that cannot accurately predict our relevant future. See my # 3.M. No one tells us in the disputed DEIR what will be unleashed by its new and expanded and deeper mining in the 2585 underground mine beneath or near thousands of us locals, since the DEIR just assumes (incorrectly placing the risk of the unknown on that massive underground mine's neighbors) the same future situation as in the past BEFORE 1956 when the mine last operated, although no one even knows the true

77

Ind 254-46

starting condition of the mine closed and flooded in 1956 or what will be unleashed by the new, expanded, and deeper mining under the new normal of our changing climate the DEIR ignores. See my # 3.M. Responsible governments also must consider what happens in the future when industry lobbyists lose their applicable influence sufficiently for impaired safety regulations finally to catch up with science and reality. See my #'s 3.N and 14. What happens then, when mine advocates cannot dodge such risks and problems they created with the toxic and hazardous substances (eg, arsenic, asbestos, and hexavalent chromium, for example). See my #'s 3.K, L and N, 4 and 14, as well as for toxics #'s 3.C, E, G, H, J, M, and N, 4, 6, 7, and 10.

Even if one were willing to overlook the impacts and risks identified by the best science that prevails outside of the industry influences, there remain the human risk factors when dealing with such dangerous substances and supposed mitigations. What happens if negligence or economic poverty cause neglect at the mine fails to maintain the promised safety and mitigation protections for us locals? Considering the admitted realities in my # 2, how can we rely on this DEIR for consistent compliance for such 24/7/365 operations for 80-years? For example, as discussed above, consider the problems of the mine continuously using hexavalent chromium for its underground paste backfill (think concrete like mining shoring with that toxic substance, as all those millions of gallons of underground mine water are pumped up and, after DEIR deficiently described treatment (if it happens as promised) flows away in the Wolf Creek somewhere downriver. Think also about all that mine again flooded water sitting for eternity against that massive underground structure made of toxic hexavalent chromium in our community. (And again, watch the *Erin Brockovich* movie, read my #'s 3.C, G, H, and 7, and consider what you would tell a buyer of your house above this 2585-acre underground mine.) Why doesn't the DEIR adequately address those issues now before the dispute processes change and such evasions become much more challenging for the mine? See my #'s 3.E, J, L, and M. For us locals, this is like someone constructing a building with asbestos in the days before it was finally banned, but when everyone could already see that ban coming because of the massive obvious health problems and related litigation that had already begun to bankrupt many in the industry (without satisfying most of the victims). That is the kind of history that should concern responsible government and require strict compliance with applicable law (see my # 14 and my supplemental CEQA brief) to avoid the continuous legal and political conflicts and practical property surface versus underground miner competitions that are inevitable until the mining stops (see my #'s 3.N and 4).

**M. Among the Biggest DEIR Disputes Is About Timing of Facts When Making This Decision About An 80 Year Plus Future Impact, Risk, And Burden, When We Know That The Past Is A Faulty And Largely Irrelevant Guide To Predicting The "New Normal," Which the Disputed DEIR Fails To Do So Either (i) By Its Almost Exclusive Focus On That Unhelpful Past Data, Or (ii) Its Limitation To (At Most) Occasional And Deficient Looks At The Fantasy The DEIR Imagines In The Next 20 years (Or Until 2040).**

The DEIR Cannot Assume (As It Does) That Such Earlier Conditions Will Apply Equally To 2040 Or To The Next Unanalyzed 60 Years Of 24/7/365 Mining Of The 2585-Acre Underground Mine

78

Below And Near Thousands Of Us Suburban Residents. The DEIR advocates have refused to engage in any meaningful effort to predict rationally with credible evidence the extent of future burdens, harms, and risks. Instead, with one limited and incorrect use of NID data until 2040, the DEIR's exclusive focus is on backward looking data, such a long-term, historical averages (eg, average rain between 1967—2017) that science and most people who are not mining advocates generally regard as irrelevant, misleading, and worse in the new normal of climate change and with respect to mining data. See the other incorporated objections with more specific data from more credible sources (my # 1). The question is not the history (eg, average rainfall between 1967 and 2017) before climate change; it is about the "new normal" that is here now and getting progressively more damaging from extraordinary and unprecedented dryness, drought, fire, fire smoke, storms, etc. Few responsible, credible, and science-based analysts now believe, for example, that we can waste precious potable groundwater or surface water here on no net benefit to the community mining. See my # 4. The question for the responsible government decisionmakers (and, if the decisionmakers get it wrong like the DEIR, the courts and/or our political voting power, as described in my # 3.N) is this: if it was your home, community, and environment at risk, would you decide today, based on all the credible facts, science, and information available today, to approve this project? Also, if you had to sell your property above or around the 2585-acre underground mine, what could you tell your buyer about all this?

**Ind 254-46**

Those thousands of us directly affected locals (who far outnumber the small number of new job mine workers from who knows where) decline to consent to being burdened, harmed, and at risk of many other adverse impacts by this 24/7/365 mining for 80 years for all the reasons stated in this and other objections. Why? Among other things, we object, because it is wrong and worse to assume, as the disputed DEIR seems to insist our government decisionmakers do, that such future "new normal" periods will be the same as what the DEIR says about the water, air, toxins, and even mining data from the past, before the **mine closed in 1956** (DEIR at 4.7-2) and flooded with water to obscure any changes over that time.

Consider the key groundwater "recharge" or "balancing" examples from my #'s 3.A, B, E, and M and 5, where the DEIR falsely assumes that the mine can "dewater," draining vast amounts of our shared groundwater 24/7/365 for 80 years based on another erroneous assumption that our future rainfall will match the average between 1967—2017. See my water rebuttal details at my #'s 3.D, E, F, and 5. For example, **consider the following water related disputed DEIR data [and some of my bracketed counters] that not only incorrectly and confusing jumbles the NID data with groundwater data and the NID's Water Code provisions for its surface water with the mine's CEQA groundwater requirement, but even worse assumes the old past determines our future by ignoring the new normal of climate change for the DEIR mine's groundwater depletion (with some emphasis added in some quotes by capitals):**

**Ind 254-47**

> **Projected Water Supplies.** Table 4.11-5 provides a summary of the District's projected supply entitlements [through 2040]. **[The relevance for this Objection in the following quotes lies in the unaddressed conflicts among NID's analysis of surface water supplies, since NID does not use groundwater, as discussed elsewhere. The DEIR's intensely disputed and, frankly, absurd, groundwater "recharge" and "balancing"**

79

**Ind 254-47**

**assumptions ignore climate change and credible science in order elsewhere in the DEIR to predict the future from the average rainfall between 1967 and 2017, instead of the "new normal" used by responsible scientists, governments, and businesses to predict a chronically drier and drought harmed future.]**

Water Code section 10910(c)(4) requires that a WSA **[Water Supply Assessment, on which the DEIR mistakenly relies in cites throughout its disputed DEIR text regarding water and, therefore, misapplies the NID's different surface water supply standards, rather than CEQA and other relevant laws to this mine's imagined and disputed ability to recharge our local ground water the 2585-acre mine depletes and sends somewhere else downriver.]** include a discussion with regard to "whether total projected water supplies, determined to be available by the city or county for the project, in addition to existing and planned water demand associated with the proposed project...." Accordingly, the WSA addresses these three hydrological conditions through the year 2040 ... in Table 4.11-6. [The DEIR then purports to "summarize" "projected availability" from the District's existing and planned future supplies THAT DO NOT INCLUDE GROUNDWATER OR ACCURATELY ADDRESS THE MINE'S LOCAL GROUNDWATER DEPLETION AND RECHARGE, but instead focus on] ... the District's projected water demands in normal, single dry and multiple dry years throughout buildout. **As elsewhere, this compares "apples to oranges" since it is focused on the NID general service area demands from NID's surface water sources to rain recharging the massive groundwater depletion in one local area above and around the 2585-acre underground mine from 24/7/365 dewatering for 80 years, not the 20 years (or until 2040) NID uses for different purposes.]** As shown, demand within NID's service area is expected to exceed the District's supplies from 2025 to 2040 during Single Dry Years and in the first and second years of a Multiple Dry Year period from 2025 to 2040. **[This is confusing since this DEIR paragraph at 4.11-39 begins with a "20-year projection" and shifts to the 15-year period "from 2025 to 2040." Throughout this Objection I make reference to the DEIR's lethal flaw of limiting its perspective to this 2040 or 20-year cut off, as if somehow the DEIR were entitled either to ignore the last 60 or 65 years of its 80-year mining binge or, worse, perhaps incorrectly and without any evidence to assume that the whole 80 year period matches the first disputed 15 or 20 year flawed and misleading projections (or that what follows 2040 will be the same as what preceded 2040). For convenience and simplicity, I often just say "20 years" to avoid addressing this complexity and confusion every time. Since 20 years is better for the DEIR's disputed theory than 15 years, the DEIR advocates should not complain (but somehow, I expect they will anyway.]**

Factors contributing to inconsistency in NID's water supplies include legal limitations due to water rights and contracts limiting the quantity of water available to the District, environmental constraints, and reductions in availability due to climatic factors. The surface water supply to NID is subject to reductions during single and multiple dry years (seasonal and climatic shortages). ... **[These same kind of limitations apply with equal and often greater force to the existing and future competition for groundwater above**

80

**Ind 254-47**

**and around the 2585-acre underground mine by locals like me, as demonstrated elsewhere in this and other Objections (see my #'s 3.E, F and M and 5), but the DEIR inconsistently ignores any discussion of our groundwater rights' disputes and mine limits, except for a distracting and disputed discussion of the 30 or so wells along East Bennett Road. Since the DEIR recognizes some of these factors here (with even a rare mention of "climate"), why not address these matters where readers would expect them? The answer to that may be that the mine advocates recognize that, once informed adequately of the DEIR's real water burdens, risks, and harms, DEIR or mine approval would trigger competition and legal and political disputes with us locals over groundwater (and, during expected shortages, NID surface water) as to which we have at least equal, if not superior, rights.]**

***

**Ind 254-48**

**Water Supply Sufficiency.** Pursuant to Water Code section 10910(c)(4) and based on the technical analyses describe in the WSA prepared for the proposed project, the total projected water supplies determined to be available for the proposed project during Normal water years during a **15-year projection** would meet the projected water demand associated with the proposed project. (emphasis added) **[Again, this incorrect general conclusion appears to be a "bait and switch" as above, since that WSA etc analysis is focused on NID general supplies from surface water; and not on the disputed recharge or "balancing" imagined in the DEIR to our local groundwater from mine depletion from dewatering 24/7/365 for 80 years during a time when the old "normal" of the DEIR (eg, average rainfall between 1967 and 2017) no longer exists in the "new normal" of climate change, unprecedented dryness and drought, and greater competition from us locals accessing their own groundwater rights with new or deeper wells from above and around the 2585-acre underground mine. While we also dispute the sufficiency of NID supplies to the mine for no net benefit to the community (eg, my # 4), as described elsewhere here, the above discussion and others in this Objection demonstrate the errors, omissions, and deficiencies in this DEIR.] ...** Therefore, [with the DEIR incorrectly referring to NID's "projected 2040 water demands" as to the 30 East Bennett Drive property connections, as if that were the only DEIR 2585-acre underground project impact, a claim contrary to many parts of the DEIR I address] NID would be able to serve the proposed project in addition to existing and planned developments with some reliance on demand reductions in dry years by 2025. **[This erroneous and unsupportable conclusion is contrary to the DEIR itself, although it seems to admit that even the portion of the water use admitted here is admitted requiring "some reliance of demand reductions in dry years by 2025," which means that applying better information with a more scientific, fair, and appropriate analysis would reveal bigger shortages.]**

**[Besides what DEIR calls a Normal Year, Table 4.11-5 actually admits at 4.11-40:] "Potential Surplus (Deficit)" [for] "Single Dry Years" [of progressively increasing deficits from 2025 to 2040 in acre feet/year] [for] "Single Dry Years" [ranging from]**

81

**Ind 254-48**

**[negative] 85,629"/"48%" "Percent Shortfall of Demand" to "-98,814"/"52%" "Percent Shortfall of Demand", [as well as more deficient years for Multiple Dry Years]. ... [DEIR quote continuing at 4.11-42]** Water demand within NID's service area is expected to exceed the District's supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year period. **[That ignores many realities of increased DEIR water use, because, instead of 30 wells along East Bennett Road, the reality will be hundreds of our locals' competing wells just in the areas above and around the 2585-acre mine as we locals combat climate change and drought as well as the mine's groundwater depletion, as I explain elsewhere. See, eg, my #' 3.E, F, and M and 5. If the DEIR advocates or NID imagine that they can stop that our competition with our new or deeper wells, a common response to chronic drought which has occurred already all over the state where water supplies are already insufficient, then they do not appreciate the political and legal ferocity of such locals defending their homes, their forests and environment, and their community way of life from the no net benefit mine's massive depletion and disposal downstream and other waste of our shared groundwater. See my # 3.N discussing how us thousands of local voters can reform the laws and change officials to accomplish our worthy defenses, even independent of other legal remedies. The indisputable reality is that few, if any, of us thousands of affected locals will be willing to sacrifice anything for the benefit of this undesirable mine. See my # 4.]** However, this project is not expected to exacerbate NID's water supply shortages during dry years and the project will supply water into the South Fork Wolf Creek and into the NID conveyance system, at volumes exceeding the project water demand for potable water from NID. **[Even if that were true, which we dispute, it means little to those of us living above and around the 2585-acre mine who are losing our groundwater to that mine dewatering waste for someone else downstream. Moreover, on the merits, why would NID allow its system to be polluted by mine water from Wolf Creek that, even if correctly treated without human error or storms (which treatment quality many would decline to trust to this DEIR for 24/7/365 quality for 80 years, when it comes to their families' health and the use and value of their homes), no one wants even to accept even the level of hexavalent chromium and other mine water toxins that some industry influenced bureaucrat standards official may consider tolerable.]**

**Ind 254-49**

*** This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID. **[However, the DEIR mine project can then be also expected to increase NID customer demand in years when their wells have deficient supplies, and none of that predictable defensive conduct is addressed in the DEIR or by NID, perhaps in the case of NID, because the managers do not expect the coming policy changes from us local voters to assure that they do not suffer from water wasters like this mine. See my # 3.N. The future will increasingly become what some politely call "competitive," but what (more accurately) is about us thousands of local voting residents insisting on our legal and**

82

**Ind 254-49**

**political rights to our priority share of surface and ground water over less beneficial uses, especially no net benefit uses like the mine. See my #'s 3.N and 4.]**
*** (DEIR quote at 4.11-43) Thus, **a less-than-significant** impact would occur. **[That incorrect and disputed DEIR conclusion does not follow from the analysis that is rebutted above and elsewhere in this Objection and others.]**

**What is the net to remember from that analysis, which I admit is confusing because it's matching the DEIR's "bait and switch" and "apples vs oranges" tactics confusion? The lesson here is that the disputed DEIR wants us incorrectly to join them in the illusion that we can safely assume the past average wet years from 1967 to 2017 will be repeated from now through 2040 (or sometimes they say the next 20 years), despite the DEIR ignoring our climate change drier and drought future. Worse, the DEIR then next assumes that same rainfall "recharge" of our groundwater will continue for the rest of the 80 years of mining with no proof or analysis or legal excuse at all; just apparently a disputed and meritless theory that the future after 2040 is too "speculative" to consider, so, therefore, they are somehow allowed to act as if they were a public water district following the Water Code reporting rules for timing, instead of what the mine is: a no net benefit private, exploitive, speculator business operating for the benefit of largely foreign investors. The DEIR cannot transfer to us locals the risk of any such unknowns, whether about groundwater, surface water, toxins, air quality, or any other factors that make this mine a risk menace, especially since we have our own competing contrary surface ownership rights above and around the mine to protect in competition with whatever the mine does with any shared resources like water or air, not to mention the right to prevent tortious harms to our health by water or air pollution.**

**Also consider the illusion is exposed in the DEIR "Conclusion" at 4.11- 51, where it incorrectly states: "Water supply exceeds existing and projected future demand, including the addition of the Idaho-Maryland project, during normal years. Therefore, sufficient water supply is available to service existing and future reasonably foreseeable development during normal years." First, the second sentence does not follow in science or fact from the first sentence, even if one were to look realistically only at the next 15 or 20 years (or until 2040), as distinguished from what is reasonably foreseeable for the next 80 years of DEIR mine operations. Second, what they call a "normal year" is incorrectly based on history (see where the DEIR looks at the average rain from 1967 to 2017 and ignores the "new normal" of climate change and chronic dryness and drought.) Third, the dry and drought years are the "new normal," and there are admitted water shortages that will be worse than admitted by the DEIR, as sort of admitted in the next paragraph where the DEIR partly contradicts itself, although the DEIR still ignores the fact that there will also be competition for groundwater (eg, from new and deeper wells) and for NID water, not just with desirable newcomers who we would like to welcome to our community instead of this no net benefit mine (see my # 4), but also the thousands of us existing residents and voters living on the surface above and around the 2585-acres of the underground mine who have their own competing legal rights to such groundwater and NID water. The DEIR ignores the reality of future water shortages and competition, but reality will expose that obvious error. Then what? See my Objections**

**versus the DEIR's only admitted but insufficient statement of what happens when the mining stops at its 4.3-103-04.**

**The disputed DEIR quotes and positions addressed in the previous paragraphs, especially at 4.11-42-43 and 51, have the same flaws as the disputed DEIR "Conclusion" admissions at 4.11-51 as follows, (but they seem inconsistent with them as well): "Water demand within NID's service area is expected to exceed the District's supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year period." Reality will likely be much worse, but even that admitted shortage will create problems more than what the DEIR addresses, especially if one excludes the speculation and errors and adds what the DEIR omits adequately to address.** For example, there is no satisfactory and sufficient basis for the DEIR's sheer speculation to conclude what so ignores that hard contrary issues **at DEIR 4.11-51 that: "This supply deficit can be addressed through NID's previously discussed Water Shortage Contingency Plan, and as previously mentioned, the proposed project would be a net contributor of water the NID system" (which, as noted, does nothing for those thousands of us living and using above and around the 2585-acre underground mine whose water would be exported down river somewhere else with whatever hexavalent chromium, other toxins, and other problems it may contain). See, eg, my # 3.N when the mine starts to compete with us locals during water shortage, and we counter compete in a context where no one has any interest in sharing with this no benefit mine that remains a threat to everything we love about our community and everything we have invested in our homes the mine is devaluing.**

**Ind 254-49**

Science and rational, informed people would make the reasonable and rational decisions today, based upon the much worse "new normal" reality that has begun and will only get worse over that 80-year period. Our future in this relevant local area is going to be painfully drier or worse weather, with frequent and chronic droughts from climate change, together with all manner of horrible side-effects like wildfire smoke that will cumulatively exhaust the outdated safety standards on which the DEIR insists we rely for the next 80 plus years. See My #'s 3.D, E, F, and 5, discussing adverse DEIR admissions and incorrect or misleading discussions and revealing omissions by the DEIR on these water and timing issues. Worse, as I address in my # 14 and my supplemental brief, the disputed DEIR fails to comply with CEQA and other applicable law by generally only looking backward to a nonpredictive past, and at most when the DEIR occasionally feels compelled to do so looking only at the next 20-years (or until 2040) of the 80 years they ask to mine, deplete our groundwater, and otherwise impact, risk, and distress our environment 24/7/365 to the detriment of our community, our devalued homes, and our health and welfare.

Incidentally, while its slightly tangent please notice where I elsewhere call the DEIR out for incorrectly considering the depletion of our local groundwater "balanced" because the mine supposedly treats our groundwater and sends it on down the Wolf Creek somewhere else in NID territory. That is worse than absurd. Wherever else that relocated groundwater of ours goes from our surface home groundwater source does nothing to recharge or balance our groundwater. Taking our groundwater (remember we locals on the surface above and around the 2585 acre mine have our own groundwater property rights we could use to drill wells to use that groundwater before it goes to the mine for removal somewhere else, as discussed in my # 3.N and elsewhere) to another NID destination is irrelevant to the harm caused to us here

84

**Ind 254-49**

locally. This is the same kind of disproportionate wrong that the California Supreme Court called a nuisance and inverse condemnation in my # 4 discussion, except in that sewer plant case those downwind locals driven from their homes by smells were sacrificing for the common good of a public benefit project, whereas this private mining gamble has no net benefit to anyone in our community, even those at a safe distance away from the mine. See my #'s 4, 8 and 3.N.

**N. Political Dynamics, Law Reforms To Protect the Community, And Consequences From Starting The Mining Before We Stop It And More Risks, Impacts, And Harms Occur, Even Some Admitted By The DEIR, Although, As Usual, In An Obscure Place at 4.3-103-04 Called The "Non-CEQA Related Analysis."**

**Ind 254-50**

**This opposition to the mine is not a normal political dispute over ideology, political partisans, or other divisions that sadly disrupt our lives these days. This is about saving our property values, our water, forests, and environment, our health and safety, and our community way of life from a serious menace that has not even attempted in this disputed DEIR to engage us in a rational and appropriate discussion of our vast differences about the burdens, risks, and harms of the mine impacting us locals on the surface above and around the 2585-acre mine too often ignored in the disputed DEIR. (For example, a casual reader of the DEIR would think the only dry well issue is 30 wells along East Bennett Road, instead of the hundreds of other impacted wells now [and more coming] on the ignored surface above and around the 2585-acre underground mine depleting our groundwater.) That means we locals will have to organize and exercise not only our legal, but also our political rights to defend us from this menace and any copycat mining this mine may inspire, if the aggressive, exploitive "entrepreneurs" see that this County is willing to be exploited by such no net benefit mines. See my # 4.** In the brief minutes allowed at the March 24, 2022, DEIR hearing more than 100 locals complained of such things, and I expect many will follow up with written objections, most of which seemed meritorious and all of which reflected the high, personal level about their reasons of concerns inspiring the many oppositions I expect and describe here. When I receive that transcript and those other objections, I request permission to supplement this Objection.

**Ind 254-51**

**This is not the forum to explain what all that means for the future or to debate the many defensive reforms and legal and political counters and other competitions that are desirable, except for one clarifying alert to our governmental decisionmakers. The mine advocates seek to distract us with a legal debate and disputes over CEQA technicalities (in which we will engage as discussed in my #'s 4 and 14 and my supplemental CEQA brief), but another defensive front involves law reform. The DEIR is so fragile that it admits at 6-14 (as I quote above) that the mine would likely not be economically feasible if it only operated continuously 12 hours a day, instead of insisting on the special and undeserved 24/7/365 operations for 80-years that our governments generally do not even allow our existing desirable businesses to operate. That means government cannot and should not allow the mining to start, since it will soon stop for many reasons, even just reality and lack of funding as described in my #2, but including because of local or state law reforms, such as stopping**

**Ind 254-51**

mining at 12 hours a day in such suburban areas. I say that not as a threat, but as a means of reducing the adverse consequences for us locals of starting and stopping this mine (see the previous subsection on that topic and even what parts the DEIR admits at 6-14.)

FOR THE RECORD, NOTHING IN THIS OBJECTION SHOULD BE INTERPRETED AS A THREAT THAT I OR ANYONE ELSE WILL SUE RISE OR ANYONE ELSE, SINCE IT IS PREMATURE TO MAKE THAT KIND OF COMPLEX DECISION AND ANY SUCH PREMATURE LEGAL ACTION WOULD NOT BE "RIPE" YET AS A JUSTICIABLE CAUSE OF ACTION. A DISCUSSION REACTING TO SOMEONE'S THREATENED FUTURE CONDUCT BY IDENTIFYING OBJECTIONS AVAILABLE FUTURE REACTION OPTIONS IS NOT A THREAT TO EXERCISE THOSE OPTIONS. FOR EXAMPLE, THIS IS ONLY A DRAFT ENVIRONMENTAL IMPACT REPORT THAT MUST GO THROUGH A COMPLEX PROCESS BEFORE THE MINING STARTS, AND MANY IMPROVEMENTS AND REFORMS ARE POSSIBLE THAT MAY REDUCE THE NEED FOR SUCH LOCAL SELF-DEFENSE FROM SUCH FORESEEABLE DEIR/MINING BURDENS, RISKS, AND HARMS. THE REASONS FOR THIS OBJECTION COUNTER DISCUSSIONS OF POSSIBLE REACTIONS AND DISPUTE REMEDIES INCLUDE TO EXPLAIN WHY, IF IT PROCEEDS, THE DEIR NEEDS TO BE REDONE TO CORRECT

**Ind 254-52**

ERRORS, OMISSIONS, AND OTHER DEFICIENCIES. The reasons for the urgent or strong commentary about local reactions now is that history of such conflicts shows what could follow involving legal, political, and competitive self-defense possibilities that have commonly occurred in such situations, which discussions reflects a desire to assure that the DEIR advocates and decisionmakers (i) take our local concerns seriously, (ii) improve the next version of the DEIR, if any, and (iii) address more comprehensively and appropriately the local issues and concerns in this and other objections, including all those appropriate concerns voiced at the March 24, 2022, County hearing. What we want is peace and the status quo. What this Objection also does, as lawyers do, is to correct the DEIR on some of its many disputed express and implied legal assertions and illustrate the need for technical reforms in the DEIR and mining by reporting about the litigation, political, and competitive options from other such unrelated mining and environmental approval disputes with some similar circumstances. In other words, the goal of this Objection is to reduce in advance the issues in dispute here for our common good, rather than just to combat problems in appropriate ways after the mining begins and the burdens, risks, and harms become actual instead of theoretical.

Consider, for example, that continuous 12 vs 24-hour operational dispute that the DEIR mine says (at 6-14) it cannot economically survive. See my #2, which exposes the real problem is not the 12 hours as much as the weak financial condition of Rise admitted in its current SEC Forms 10K and 10Q and shown by its own accountant's "going concern"

**Ind 254-53**

qualifications on its (at best) unimpressive financial statements. The same political and policy reasons we do not allow other businesses to operate 24/7/365 apply with even more force and reasons to this no net benefit mine. See my # 4. If the existing laws and court injunctions do not save us local from those burdens, risks, and harms from such 24/7/365 operations for 80-years, then we (directly or through right-thinking elected officials) may limit all such undesirable, large scale mining close to such significant inhabited communities to the same hours we restrict desirable businesses. Consider that many disruptive activities are limited in operations for the protection of locals; eg, road repairs are done at night to avoid traffic problems during the day. Consider that the stresses on our environment from mining can be

moderated by reducing hours of operations; eg, groundwater recharge can happen better from 12 hours than 24 hours of depletion. There are scores of such law reforms possible, and I expect that they will become very popular with us locals. So also, might be laws requiring sufficient, high rated liability insurance coverage, surety bonds, and other protections for mine victims, especially for reclamation at the end of the mining. [As a bankruptcy and insurance insolvency lawyer who once liquidated the nation's leading insurance/surety company issuing mining and other surety bonds, I doubt that a company with the financial condition and circumstances I describe in my #2 and Rise admits in its 10K and 10Q could obtain sufficient reputable coverage, if any at all, at any economically rational price. That should give government decisionmakers pause, because by approving the DEIR they would be assigning to this resisting community risks that any sophisticated and qualified insurer would reject on the merits. Note: with insurance/surety exposures on needs quality California admitted insurers because there are many offshore insurance frauds selling bogus policies through surplus lines brokers. (For just one of many examples, unless it's changed since then, consider my State Bar pro bono project years ago, when most of the local LA businesses were defrauded by a no asset Turks & Caicos insurance company, which was unregulated and had purchased its insurance license for a nominal fee and was unable to pay any fire and other policyholder claims after the Rodney King riots.)

**Ind 254-53**

Consider who wants to vote against defensive initiatives imposing safer practices and operating rules on undesirable mines like this seeking the right to blast, dig, dewater, and otherwise create noise, vibrations, toxic safety hazards, water depletion and waste, and other disturbances, risks, and harms all day and night beneath or near thousands of people already living above or around that underground mining. The surface residents and voters should not have to limit their response to what rights they may win in court in such competition with the underground miners, since the law allows voters to improve the laws regulate such activities in scores of additional ways, either directly or through reform minded officials they elect.

While the mine (like others before it) may attempt to argue that somehow such new regulations and laws reducing its profits are "eminent domain" "takings" or otherwise barred by its constitutional rights, that meritless theory has long been rejected by the US Supreme Court and others, both on that legal and because us surface owners also have our own competing property rights that merit protection from the competing underground rights. Consider the leading such Supreme Court decision of *Keystone Bituminous Coal Ass'n v. DeBeneditis*, 480 U.S. 470 (1987), where the Court upheld against a coal miner challenge the Bituminous Subsidence And Land Preservation Act (the Subsidence Act as it's called in Pennsylvania and many places where it has been replicated), where mining was limited to prevent "subsidence" (the loss of surface lateral and subjacent support and loss of groundwater or depletion of surface water, which are legal rights we surface residents already have here, but it helps to have more laws to detail specific applications and thereby avoiding the need for expensive defense litigation). That Supreme Court decision defined the "subsidence" concerns (also equally at issue for this DEIR project, especially because of the massive and objectionable groundwater depletion and [even what's so far revealed of] the DEIR's new, deeper, and expanded DEIR blasting, tunneling, rock removal, and other mining activities) as follows (at 474-5):

87

Coal mine subsidence is the lowering of the strata overlying a coal mine, including the land surface, caused by extraction of underground coal. This lowering of the strata can have devastating effects. It often causes substantial damage to foundations, walls, and other structural members, and the integrity of houses and buildings. Subsidence frequently causes sinkholes or troughs in land which make the land difficult or impossible to develop. Its effect on farming has been well documented—many subsided areas cannot be plowed or properly prepared. **Subsidence can also cause the loss of groundwater and surface ponds.** In short, it presents the type of environmental concern that has been the focus of so much federal, state, and local regulation in recent decades. (Emphasis added). [That conclusion about groundwater has a fn 2 which states:]

Fn2. "Whenever [subsidence effects] extend, damage can occur to buildings, roads, pipelines, cables, streams, water impoundments, wells, and aquifers. Buildings can be cracked or titled; roads can be lowered or cracked, **streams, water impoundments, and aquifers can all be drained into the underground excavations**. Oil and gas wells can be severed, causing contents to migrate into underground mines into aquifers, and even into residential basements. Sewage lines, gas lines, and water lines can all be severed, as can telephone and electric cables. ... (emphasis added).

**Ind 254-53**

While that subsidence law generally required 50% of the coal to remain for support in strategic places, it did many other things to protect the surface and limit the mining, explaining that the government was entitled to so act "to protect the public interest in health, the environment, and the fiscal integrity of the area," such as by "exercising its police powers to abate activity akin to a public nuisance," although the court made clear that the police power was broader than nuisances. (At 488) Of special note, the Court (at 493-94) noted that this challenge was to the enactment of the law before it was enforced, and that meant that it was premature to complain about how the law might be abused, when the facts of that surface and underground mining competition of rights were not yet established. Citing its own precedent in Hodel v. Virginia Surface Mining & Reclamation Ass'n Inc, 452 U.S, 264 (1981), the Court explained:

"[The] court ignored this Court's oft-repeated admonition that the constitutionality of statutes ought not be decided except in an actual factual setting that makes such a decision necessary. [citations omitted] Adherence to this rule is particularly important in cases raising allegations of an unconstitutional taking of private property. *** (at 497): [W]here an owner possesses a full 'bundle' of property rights, the destruction of one 'strand' is not a taking because the aggregate must be viewed in its entirety. [The Court then followed that discussion how valid zoning laws always affect without any "taking" property uses with things like setbacks, lot size vs building size, etc.]

While the "taking" legal issues could be debated by lawyers at length, this is not the place for that, and, unlike in that Supreme Court case where surface owner had signed waivers in favor of the underground mining, the reverse is clear here, as demonstrated by my discussion

88

of the deed limitations and absence of surface waivers, as admitted by Rise in its SEC Form 10K. I do note, however, that the California Courts have upheld such surface owner protection laws against underground mineral rights or other uses, such as in California Civil Code section 848(a)(2), upholding such surface owner protections challenged by oil and gas miners. *Vaquero Energy, Inc. v, County of Kern* (2019), 42 Cal. App. 5th 312 (including among protections some delegations of power to surface owners, depending on Tiers classified by the extent of current mining domination vs competing uses dominating the area and many other interesting ideas, involving notice requires, 120-day delays of mining etc.). The point here is that there are many things our local government can and should do by enhanced legislation (or, if need be, by initiatives) independent of any CEQA or other screening or permitting as to this mine, to further protect us residents and voters above and around the 2585-acre underground mine from the kinds of concerns expressed in this and other objections. While the mine could attempt to challenge such new protections for our community, they then expose themselves to a whole different type of litigation than the usual CEQA fights. In those kinds of disputes, the surface owners have many practical and legal advantages, while the miners are exposed to having to defend what seems to me to be indefensible mining positions under the circumstances and to answer all the hard questions (eg, my #'s 14 and 15) and expose all the data missing from or evaded in the DEIR. As my # 14 explains, many of us have a different interpretation of CEQA and other laws to apply in this situation.

**Ind 254-53**

As noted in the financial discussion in the prior section 2 of this Objection, a question arises for such legislation and initiatives about controlling who is actually doing the mining versus to whom the mining permissions are granted. For example, if Rise were granted the mining opportunities it seeks in the DEIR, and, then still lacking the funding to mine itself, leased the mine to an unsuitable miner tenant for a share of the profits and other compensation, we could suffer more unhappy surprises from the new miner tenant. Indeed, one tactic used by this others in this mining industry for reducing government scrutiny and regulation generally is when a mine owner so leases the mine to another even more unsuitable and safe operator-tenant for a share of the profits and other compensation, and then the tenant does the bad things we worry about, and then the landlord claims (under older and under these distinguishing circumstances disputed case law, as to which there are important exceptions) that the landlord miner is not liable for the often then bankrupt tenant's wrongs, as in cases like *Butte Copper & Zinc Co. v. Poaque*, 164 F.2d 201 (9th Cir. 1947). See my # 4 and 14. Legislation or initiatives that could improve our surface owner and user defenses against such abuses, if any such things were attempted here. (Again, I have no idea what this particular miner intends to do, but responsible government mistakenly allowing such 24/7/365 mining needs to ask the appropriate questions and protect us surface owners and users above and around the 2585-acre mine from any such possible risks.)

**Ind 254-54**

**4. There Is No Net Benefit To Justify Approving This Mine Or It's DEIR, Especially When One Gives Appropriate Weight To The Objections Of The Burdened And Harmed Locals At Risk Of Worse.**

89

**A. A General Discussion of Some of the Many Negatives Decreasing Any Imagined Benefits From the Mine, Applying Some Legal And Political Self-Defense Rights And Counters Expected From Those Of Us At Risk Living Above Or Around the 2585-Acre Underground Mine.**

**There can be no net local benefit from this mine to Nevada Country, even if the DEIR were correct, which it is not. As Rise admits in its SEC form 10K and 10Q and as explained in my # 2, it is speculative to even imagine what part of the DEIR plan Rise even has funding sufficient to accomplish that it considers benefits. That "no net benefit" analysis is especially true if one focuses on the thousands of us who live on the surface above and around the 2585-acre underground mine, who are generally ignored by the DEIR, in its erroneous pitch to consider this CEQA "project" generally as if it were only the small Brunswick Industrial Site and 30 or so well properties along the East Bennett Road (and, although the DEIR incorrectly describes it as a separate CEQA project, the Centennial Industrial Site). That is all one CEQ project that cannot be separated with CEQA discussions limited to just one part. As this Objection demonstrates, the greatest weight must be given to us locals above and around the 2585-acre underground mine, who could suffer many of the greatest negative impacts.** Any

**Ind 254-54**

DEIR decisionmakers who may like distant mines that are too far away to cause them personal burdens or risks, should especially consider the contrary leading precedent against uncompensated disproportionate impacts: ***Varjabedian v. Madera*** (1977), 20 Cal.3d 285 (relying on the Fifth Amendment holding in *Richards v. Washington Terminal Co.* (1914), 233 U.S. 546, and noting that our California Constitution offers us even broader protection than the US Constitution), involving for our discussion purposes here both successful nuisance and inverse condemnation claims (among other claims) of local homeowners against the City of Madera's approved sewer treatment plant. **That court upheld the jury's damages award that was not just for the stink nuisance harms suffered by the downwind locals, but also for the loss of real estate value measured** (at 291) by "the difference between the present fair market value of the property as the same would have been without the construction of the sewage treatment plant... and the present fair market value after said plant was constructed and put into operation." The court rejected all the usual defense arguments that a mine owner might be expected to attempt. **As the Court stated (at 298): "If a plaintiff can establish that his property has suffered a 'direct and peculiar and substantial burden as a result of the recurring odors produced by a sewage facility -- that he has, as in *Richards*, been singled out to suffer the detrimental environmental effects of the enterprise—then the policy favoring the distribution of the resulting loss of market value is strong ... and the likelihood that compensation will impede necessary public construction is slight. ... and a burden unfairly and unconstitutionally imposed on the individual landowner." See my #'s 3, 8, and 14.**

**Ind 254-55**

Some our local concerns should also be of broad concern to others in the County who may imagine they are too distant to be harmed by this mine. For example, the groundwater dumped into the Wolf Creek from the mine's wasteful dewatering goes somewhere else downstream, where those citizens should share our worry about hexavalent chromium (see my #'s 3.C, G, and H, and 7). While the depletion of our groundwater in ways that add to our mine related miseries (see my #'s 3.D, E, F, and M, and 5) may seem local under the disputed DEIR analysis of our fractured rock aquifer system, the drying out of our surface and its forests by

**Ind 254-55**

such wasteful local groundwater mine depletion and mine NID uses (without the illusory "recharge" incorrectly assumed in the DEIR) harms everyone in this "new normal," zero sum game of climate change and chronic drought and dryness impacts. Because there is not enough water for everyone in the future, we're all in competition for an insufficient supply. See my # 3.N. Also, because the consequent fires and smoke and other air quality threats are not locally contained, even those with sufficient water will end up sharing those adverse consequences of this mining. See m #'s 3.J and 10. Those and other problems addressed in this Objection and others need to be placed on the negative side of the balance sheet to compare against the minor alleged benefits of the mine debated at the end of this section.

I cannot imagine us locals (once adequately informed of the realities and the errors, omissions, and deficiencies of the disputed DEIR) accepting the mine, especially when presently less informed people discover "the hard way" the burdens, risks, and problems which the DEIR was required to disclose and failed to do so satisfactorily. See my #'s 14 and 15. Thus, we hope the County and others (with whom we do not wish conflict) do not choose the wrong side of this foreign mine operator against their existing citizens and voters resisting until all appropriate practical, legal and political options have been exhausted to defend their homes, our water, safety, and other environmental factors, and our community. See my # 3.N. It should be easy for our governments to avoid conflicts with their voting citizens on this mine because this mine is unlike most other such conflicts in the case law. Often the challenged CEQA projects involved **public improvement** projects needed by the broader community that hurt smaller impacted groups of citizens, like roads, sewer plants, or other public improvements. Here, this private exploitive mine has no such material net public benefit. From its readily available information quoted or explained in my #2, Rise seems to be just a private, mostly foreign, speculative business seeking to impose itself on our local community for the profit of mostly foreign investors with little comparative net benefit to anyone in Nevada County, beside some mine workers from unknown places, whose small numbers are dwarfed by the thousands of us voting and tax paying neighbors and others living in the community impact and stigma zones, like mine above and around the 2585-acre mine. Be clear, this is not just citizens worried about local burdens, harms, and risks that someone can resolve by some DEIR policy debate. There is little doubt that our real estate values (like local tax revenue and tourism) will suffer, even from the stigma of the mine, because, even if we somehow were all wrong about all the mine related problems (which we're not), no one wants to pay these kinds of real estate prices to acquire such burdens, risks, and harms. See the transcript (when available) of the March 22, 2022, County hearing and those objectors' follow up written comments. Clearly, no government blessing of the DEIR or mine approval will convince anyone at risk in such impact zones above or around the 2585-acre mine (or any buyer or mortgage lender/appraiser) to accept such risks for no benefit to their community. So, sadly, approval of the DEIR and mine would divide our County in one additional way, and I hope that is not our fate. For our county, our state, and our country to succeed and prosper, we need to be able to come together again, despite our differences. However, to do that we need wise, effective, and responsible government that must be responsive to its citizens, or us voters will improve our representation and our applicable laws. See mt # 3.N. Approval of the DEIR and mine would just drive us further apart, and for what? Certainly not for the trivial and often illusory benefits promised by the mine DEIR

that the miner apparently cannot afford (see my #2) and that are also discounted at the end of this discussion.

I mention the ***Varjabedian v. Madera*** nuisance claim, not just because such claims (if and when presented) would further affect the economics of the mine and other issues, if and when any victims were to collect the nuisance evidence and consider the time to be right for accountability. **My primary reason for focusing on this *Varjabedian* case is the court's discussion of why disproportionate harm suffered by some locals cannot be justified by the benefits to others more distant who can escape that harm**. Those cases (and many others) may create problems for the County in situations like this one, if it were to impose a nuisance (among other things) on such particular victims, like the downwind ***Varjabedian*** homeowners, as a "taking" under the Fifth Amendment and under the California Constitution, potentially creating claims against both the private nuisance maker and the approving governmental authority. See, eg, *Uniwill v. City of Los Angeles (2004)*, 124 Cal. App. 4th 537 (a private party, here a private utility, and an approving governmental authority can be jointly liable in inverse condemnation for depriving a victim of property rights). As that ***Varjabedian*** Court stated (at 298): "If a plaintiff can establish that his property has suffered a 'direct and peculiar and substantial burden' as a result of the recurring odors produced by a sewage facility -- that he has, as in *Richards,* been singled out to suffer the detrimental environmental effects of the enterprise—then the policy favoring the distribution of the resulting loss of market value is strong ... and the likelihood that compensation will impede necessary public construction is slight. ... and a burden unfairly and unconstitutionally imposed on the individual landowner." This policy to avoid disproportionate local harms should be especially powerful here, where the mine is not a public improvement for the common good, but rather a private exploitive business of no net benefit to the public.

**Ind 254-55**

More importantly, we are not just talking about intangible issues like smells (although noise, traffic, air quality margins, and other intangibles may also arise in disputes, especially since this no net benefit mine is to be granted 24/7/365 operating approval that few of our more beneficial local businesses enjoy as far as I know, without any justification in the disputed DEIR for such continuous operation except the arbitrary profit margin desired by Rise and its foreign owners) or on account of Rise's admittedly weak financial condition discussed in my # 2. Here the conflict includes our groundwater depletion and hexavalent chromium pollution of commonly owned groundwater, as well as potential interference with the legal property rights of surface owners above and around the 2585 acre mine (eg, for subjacent and lateral support, etc.) With our water table dropping in the climate change future of dryness and drought, the last thing we need to risk trees dying and becoming bigger fire hazards is that 24/7/365 dewatering for 80 plus years and admitted 1.4 million gallons a year NID depletion uses at the mine, plus more addressed in my #'s 3.D, E, F, and M and 5. Stated another way, all of us locals impacted by the mine are being asked to sacrifice some of our water, health, property rights and value and other things mentioned and all grossly understated in the DEIR, but for what? So far, the only credible answer seems to be for a speculative and dangerous private project to export profits to private investors across the border enjoying their exploitation of us locals, while we suffer those disclosed problems, plus far greater undisclosed burdens, risks, and harms only revealed as cited errors, omissions, and deficiencies in the disputed DEIR.

**Ind 254-56**

92

In considering the scope and nature of any mine approval and its terms and conditions, the government decisionmakers should consider both the nuisance and inverse condemnation court decisions as flip sides of the same coin. (Note: As explained in US Supreme Court cases in my # 14 and elsewhere, when a government creates or approves a nuisance by a **public** project [like that sewer plant] it is exposing itself to inverse condemnation liability. When a private company does anything that would be such an inverse condemnation if done by a government, then the private company should have equivalent nuisance liability with similar consequences and considerations. That is why I discuss both public and private nuisance and inverse condemnation cases together, for illustration of the common principle they both have that no one can use their property to damage or harm other properties in actionable ways without consequences.) The damages and "taking" (eg, eminent domain or inverse condemnation) consequences in "taking"/inverse condemnation cases can be similar when a nuisance is imposed on local victims. For example, consider *County of San Diego v. Bressi* (1986), 184 Cal. App.3d 112, where an aviation easement was imposed on homes at the end of a runway with approval authorized for hugely abusive (although unlikely) uses (such as not only jumbo jets, but also "any other contrivance yet to be invented for flight in space.") See also *Coachella Valley Water District v. Western Allied Properties, Inc* (1987), 190 Cal.App. 3d 969 (where the court ordered a retrial where the trial court mistakenly limited the "before condition" valuation damage expert's evidence about the value before impacts of the flood control alternatives if they varied from the government's desired plan, holding the jury was entitled to consider the value of the plaintiff victim's property without being limited to the defendant's idea of solutions or consequences of doing things the defendant's way.) The *Bressi* court rejected the defense that the government should only have to pay for the less burdensome current uses (ie, only small private planes versus jumbo jets and rocket ships in the permits), holding that "just compensation" to the homeowner is measured (like nuisance damages) based on what the owner has lost, rather than by what the taker has gained. And stated (at 123) that: The jury ... must "once and for all fix the damages, present and prospective, that will accrue reasonably from the construction of the improvement and in this connection **(the jury) must consider the most injurious use of the property reasonably possible. ...In determining the most injurious use of the property reasonably possible, the jury must consider the entire range of uses permitted under the resolution of necessity." (ie, in that case making a small airport into a hub for first jumbo jets and then spaceships.)** (Emphasis added) Thus, if a dangerous or risky mine were allowed such great powers for massive abuse 24/7/365 for 80 years, any liability would be calculated on that worst case basis. That means current nuisances, trespasses, and other torts that have modest current impact can become a huge liability because that current harm can be multiplied for 80 years' impacts.

**Ind 254-56**

Therefore, to the extent that us locals suffer damages, the county is better off with the narrowest approval imaginable, not the worst (or something vague that the DEIR could exploit with loopholes for which there is then maximum possible exposure with the 80-year multiple.) The government authorities should also consider making any approval not include hexavalent chromium, not allowing 24/7/365 operations (eg, versus the normal 12 hours) for 80 plus years (but at most the limited period for which they have reliable data, which could never exceed 2040 as the outside date for which the disputed DEIR offers even deficient data on limited topics, especially not extending any period allowed based on some assurance of achieving some

**Ind 254-57**

93

**Ind 254-57**

arbitrary profit margin), not allowing such unlimited depletion of our groundwater based on a disputed and preposterous recharge fantasy ignoring climate change dryness and drought, and not allowing other burdens, risks, and harms to us locals and our property rights. That means any approval which is granted (and I urge that none be granted) must be conditioned on such credible protections for the locals from all such burdens, risks, and harms, especially where the disputed DEIR lacks reliable data and just assume the future will be the same as the past. Otherwise, someone may have to pay us not just for current suffering, but also for the risk for future, "worst case" suffering for 24/7/365 for 80-years, as noted above, even if the mine has no funds or ability to operate that long.

**Ind 254-58**

Besides such damages for nuisance and other claims, victim locals in such disputes can also entitled to recover (eg, restitution) costs of mitigating the victims' damages for any nuisance and inverse condemnation. Eg, *Ahlers v. County of L.A.* (1965), 62 Cal.2d 250 (when road construction causes landslides, the threatened property owners are entitled, among other things, to recover the cost of minimizing their damages in good faith, as by installing 25 shear pin caissons to try and hold back the landslide); *Sheffet v. County of L.A.* (1970), 3 Cal. App.3d 720,741-42 (water diversion damages from subdivision and road entitle victim to mitigate his or her damages in good faith and recover the cost of protecting his or her property). While it is premature to address the mitigations cost recoveries from many defensive strategies local victims could elect to protect their properties from the many burdens, risks, and harms that anyone may suffer from a mine like this, one hypothetical example could be that the locals individually or collectively sink their own competing wells into their owned groundwater beneath their properties above and around the underground mine, hoping to save their surface share) of groundwater otherwise lost by plans to dewater, treat, and flush such groundwater downriver in some disputed but depleting amounts. See my #'s 3.D, E, F, M, and 5.

As discussed elsewhere, one likely such hypothetical scenario where such defensive victim mitigation of damages could occur is where (i) there is a local water shortage from the chronic droughts and dryness from the climate change that the disputed mining plan and environmental impact report entirely ignores without any satisfactory discussion (see also, for comparison, my # 3.M, explaining how the DEIR erroneously predicts the future to be the same as the nonpredictive past), and (ii) the local water company has insufficient water for such locals, because it is short, whether by its own shortage problems or because of government reallocations to more desperate places. In such cases, such locals could compete for their own groundwater in accordance with applicable law, as is their right (and as new construction on neighboring land would do), even when they are surface owners above the underground mine that is wasting precious groundwater on less important dewatering and other mining uses. Nothing in the DEIR addresses such potential competition or any of those risks, problems, and conflicts during the next 80 years, dismissing such ideas as "too speculative," but what is even more "speculative" and unsubstantiated is the disputed DEIR just assuming (without any satisfactory evidence) that there will be no local resistance from such surface owners to the depletion of their ground water 24/7/365 for 80 years without the already resisting locals exercising their defensive rights, including to compete for their own groundwater before it's all gone. It would be inappropriate for the governmental authorities addressing the mine approvals to do anything to prejudice our groundwater or NID competition or other rights by any disputed DEIR or mine approvals, especially because we locals contemplate law reforms

94

**Ind 254-58**

going in the opposite direction of prioritizing our human uses over such private mining exploitation. See my # 3.N.

Other issues may also arise in such nuisance and inverse condemnation etc cases, some of which are analogous to the risk of "subsidence" from this mine for those above and around it entitled to subjacent and lateral support, groundwater, and other rights. E.g., *Smith v. County of L.A.* (1986), 214 Cal. App. 3d 266 (county road repairs created landslide conditions destroying homes triggering nuisance, inverse condemnation, and other claims, including both damages for diminution in the value of real property, but also damages for annoyance, inconvenience, and discomfort, as well as mental distress as a part of the loss of enjoyment.) See also my # 14 or my supplemental brief, citing the Supreme Court and California cases allowing voters to protect surface owners from underground mining abuses. **For example, consider again the leading such Supreme Court decision of *Keystone Bituminous Coal Ass'n v. DeBeneditis*, 480 U.S. 470 (1987), where the Court upheld against a coal miner challenge the Bituminous Subsidence And Land Preservation Act (the Subsidence Act as it's called in Pennsylvania and many places where it has been replicated), where mining was limited to prevent "subsidence" (the loss of surface lateral and subjacent support and loss of groundwater or depletion of surface water, which are legal rights we surface residents already have here, but it helps to have more laws to detail specific applications and thereby avoiding the need for expensive defense litigation). That Supreme Court decision defined the "subsidence" concerns (also equally at issue for this DEIR project, especially because of the massive and objectionable groundwater depletion and [even what's so far revealed of] the DEIR's new, deeper, and expanded DEIR blasting, tunneling, rock removal, and other mining activities) as follows (at 474-5):**

**Ind 254-59**

> Coal mine subsidence is the lowering of the strata overlying a coal mine, including the land surface, caused by extraction of underground coal. This lowering of the strata can have devastating effects. It often causes substantial damage to foundations, walls, and other structural members, and the integrity of houses and buildings. Subsidence frequently causes sinkholes or troughs in land which make the land difficult or impossible to develop. Its effect on farming has been well documented—many subsided areas cannot be plowed or properly prepared. **Subsidence can also cause the loss of groundwater and surface ponds.** In short, it presents the type of environmental concern that has been the focus of so much federal, state, and local regulation in recent decades. (Emphasis added). [That conclusion about groundwater has a fn 2 which states:]
>
> Fn2. "Whenever [subsidence effects] extend, damage can occur to buildings, roads, pipelines, cables, streams, water impoundments, wells, and aquifers. Buildings can be cracked or titled; roads can be lowered or cracked, **streams, water impoundments, and aquifers can all be drained into the underground excavations.** Oil and gas wells can be severed, causing contents to migrate into underground mines into aquifers, and even into residential basements. Sewage lines, gas lines, and water lines can all be severed, as can telephone and electric cables. ... (emphasis added).

95

**Ind 254-59**

While that subsidence law generally required 50% of the coal to remain for support in strategic places, it did many other things to protect the surface and limit the mining, explaining that the government was entitled to so act "to protect the public interest in health, the environment, and the fiscal integrity of the area," such as by "exercising its police powers to abate activity akin to a public nuisance," although the court made clear that the police power was broader than nuisances. (At 488) Of special note, the Court (at 493-94) noted that this challenge was to the enactment of the law before it was enforced, and that meant that it was premature to complain about how the law might be abused, when the facts of that surface and underground mining competition of rights were not yet established. Citing its own precedent in Hodel v. Virginia Surface Mining & Reclamation Ass'n Inc, 452 U.S, 264 (1981), the Court explained:

> "[The] court ignored this Court's oft-repeated admonition that the constitutionality of statutes ought not be decided except in an actual factual setting that makes such a decision necessary. [citations omitted] Adherence to this rule is particularly important in cases raising allegations of an unconstitutional taking of private property. *** (at 497): [W]here an owner possesses a full 'bundle' of property rights, the destruction of one 'strand' is not a taking because the aggregate must be viewed in its entirety. [The Court then followed that discussion how valid zoning laws always affect without any "taking" property uses with things like setbacks, lot size vs building size, etc.]

Please note that there is nothing in the disputed DEIR to explain why we surface residents above or around the mine need not worry about our legal right to mining contrary to our legal rights to "subjacent and lateral support and protection" from "subsidence" from either defective repair of the old 2585 mine that has been closed and flooded since 1956 and would now be blasted, tunneled, rock removed, and otherwise mined 24/7/365 for 80 years. How can we judge our risks when there are no clear standards and timely and effective monitors to protect us? History shows most often it takes a crisis damage event to trigger effective inspections, and at that point the damage is done, and all that would be left would be to pursue legal remedies against the miner, typically with an insufficient financial condition (see my #2) based and managed in a foreign place (eg, here Canada) whose only reported real asset is the mine everyone wants to close that just revealed such a problem. Remember the old Broadway musical that they made into a Clint Eastwood movie called "Paint Your Wagon" about Nevada City gold mining? It ends with the whole town collapsing into the miners' underground diggings. I hope that is not prophecy, but it illustrates one more topic in the disputed DEIR where there is no reliable or sufficient information. As to why that matters, besides our peace of mind and safety, consider question: what is your real estate broker going to tell a buyer about when you try to sell your house above or around the 2585 acre underground mine here? I do not think the answer will be, "don't worry, the DEIR reassures us all."

**Ind 254-60**

Contrary to the disputed DEIR and other propaganda from the mine, even their own admissions cited in this Objection and others are sufficient to defeat the DEIR (see, eg, my #'s 2, 13, and 14). For example, consider that **this Objection and other challenge the disputed DEIR protective or safety assurances or mitigations, and, even apart from the merits, none are sufficient, credible, or feasible, when and if Rise cannot afford them, as shown by Rise's admissions (and its own accountant's "going concern qualification" to its audited financials)**

96

**Ind 254-60**

**in Rise's SEC Forms current 10K and 10Q filings. See, eg, my #2 and 13.** That means us locals are even more likely to suffer even worse from the menace of a noncompliant and worse 2585-acre mine underground mine underneath them, blasting, mining, dewatering our groundwater, exposing us to hexavalent chromium toxic cement shoring, and otherwise burdening, risking, and harming us and our environment. What this Objection also demonstrates to those distant from the objectionable mine burdens, risks, and harms of concern to us locals, is why government decisionmakers should factor into their analysis continuing local resistance may expand if and as needed with appropriate self-defense legal and political counters and other competition if government were mistakenly to approve the disputed DEIR and the mine. See my # 3.N. We cannot afford to suffer the mine to continue imposing such burdens, risks, and harms to our real estate values, our homes, our water, air, safety, and environment, and even our community way of life. When distant decisionmakers consider that reality, then CEQA asks (and the DEIR has no sufficient answer, although its partial answer in its "Non-CEQA Related Analysis" at 4.3-103—104 is bad enough): what happens if the mine starts and then, as seems inevitable, stops well short of its 80-year run? That answer is that we would all be worse off than if the mine had never started, but less in misery than if the mining continued. Since the manufacturing/business site Alternative avoids all this conflict, I urge the decisionmakers to disregard the meritless dismissal of that normal business site DEIR Alternative at DEIR # 6 rejected by the mine advocates for no satisfactory reason. (The DEIR preferred fallback Alternative in #6 [the idea of just dropping the Centennial Industrial Site] won't work, because in reality it's not a separate project, but an integrated part of the one mine project, and cutting it out would mean a total rewrite of the whole DEIR to conform to that reality and comply with CEQA. More importantly, that DEIR preferred Alternative does not resolve any of my Objections, since most are focused on the 2585-acre underground mining, although I am not excusing the Centennial asbestos, pollution, noise, traffic, and other objections which are also sufficient to reject the DEIR. See my #14 and my supplemental brief.)

**B. Some Other Ways To Illustrate And Calculate Examples Of The Many Risks, Burdens, And Detriments That Reduce Any Alleged Mine Benefits**

**Ind 254-61**

**Please consult the many places in this Objection where I list and explain major concerns like using hexavalent chromium to shore up the mine, the burdens, risks, and harms depressing local real estate valuations as confirming proof of other mining impacts like subsidence and safety, water supply and quality problems and our local defensive water competition issues in the worsening climate change dryness and drought, air quality problems, excessive traffic, noise, and vibration problems, surface owner/user competition and legal and political conflicts with the underground mining, future vs past DEIR analysis errors, and scores of other locals' objections, unknowns not disclosed. Even limited to three minutes each at the hearing, it took all day on March 24, 2022, for more than 100 objectors to identify their scores of common and unique concerns.** (I expect many will follow up with many more written objections, most of which seemed meritorious.) There are also many other burdens, problems, and risks the community could suffer, including those identified by other local objectors and some even admitted (but understated or incorrectly dismissed as trivial) by the disputed DEIR like constant big truck traffic (ie, 50 to 100 a day) harm to roads and other

97

stresses on local infrastructure from the kind of 24/7/365 for 80 plus years of intense operations of a type government generally does not tolerate by even more beneficial local businesses.

**Please also study the admitted financial reasons why even the deficient DEIR protections and mitigations do not appear credible or feasible, because the Rise SEC 10K and 10Q filings show a current inability of this miner to accomplish even what is insufficient things are assumed or planned in the disputed DEIR. See my # 2. In any event, whenever the mining stops for any reason, whether at 80 years, or if overwhelmed or underfunded, or just retreating when the mine is exhausted, or otherwise, as noted above, the disputed DEIR does not adequately address what happens when and if the mine stops without completing the assumed final remediation and cleanup. See DEIR's only and deficient such discussion at 4.3-103-04, which I analyze elsewhere. There are sad reasons why major such "bad ending" problems exist in the more than 40,000 California abandoned mines on the EPA website, and no "net benefit" can be calculated in favor of a mine as to which there is no credible assurance of funding everything promised or assumed "from start to finish" even in the deficient DEIR, much less what more would be required by the time the usual legal and political disputes are completed. State another way, it is less speculative for us to assume such a bad ending for such a disputed DEIR mine, than it is for the DEIR to speculate that somehow it can find the money needed to accomplish even what the DEIR planned, much less the other things that will be required if the mine continuous its continuously disputed process.**

**Ind 254-61**

The **"opportunity costs"** of such a profit exporting, exploitive mining business (such as what CEQA and the disputed DEIR call "cumulative impacts") include crowding out more desirable local businesses and residential opportunities to improve our community. That opportunity cost adds to the other risks, burdens, and harms on our exploited existing community, our existing resisting residents, and discouraging new additions and tourists. For example, because there will be progressively stricter regulatory standards limiting what community air pollution or water pollution or depletion, or other environmental stresses are tolerated here (see also my # 3.N), this "no net benefit" DEIR mine will prevent many new businesses or residents from coming to add even their small parts to our cumulative, community environmental tolerance limits. **Incidentally, those who are more focused on the small number of mining jobs than on the vastly greater number of us locals harmed by the mine above and around that 2585-acre underground area or the larger groundwater impact zone or real estate value lost-stigma zone beyond that, should consider this reality about the disputed DEIR mine: More construction jobs will be lost by inability to develop those residential and commercial properties in such areas, because of the impairment of real estate values from the mine and the reasons why such stigmas exist on the merits.**

**Ind 254-62**

As another community-mine conflict issue, consider what happens when government tells our people that they can no longer use their wood stoves or burn their leaves and fire defense cuttings, because the DEIR mine has exhausted the margin of that local bad air tolerance capacity? Stated another way, because there will be many increasingly strict limits on the aggregate or cumulative impositions on our local environment, there should be some way of allocating that limited environmental tolerance capacity favoring/prioritizing local residents and the new additions we need for new human additions, tourists, and better businesses (and

**Ind 254-63**

98

subordinating such no net benefit mining as the first thing to be shut down.) See my # 3.N. Otherwise, this no net benefit mine could crowd out the rest of those more desirable uses for its own uses, and our whole community will suffer for it, until, as discussed in my # 3.N, the courts or our local law reform political efforts correct the situation with wiser such priorities and limit the mine's burdens, risks, and harms.

**Ind 254-63**

These DEIR mine problems could become an even greater threat if this mine is allowed to set such a negative precedent for such negative uses in our community. If this DEIR were approved our area would become a magnet for every other undesirable, polluter/exploiter looking for some target opportunity. Then the argument of more mines and other undesirable businesses will become that this is no longer an idyllic community, but rather just another expendable industrial area to be exploited. Want a case study to prove that? Look at what happened down in the Bay Area to Richmond after Chevron and Benicia after Valero. Stated more harshly, once one such exploitive and environmentally harmful and risky business is allowed, others will come knocking and arguing, not that they are desirable, but rather that the area has changed for the worse, and, since they are not as bad as this DEIR mine, they can jump our new "low bar" for approval.

**C. Why Imagined Mine Benefits Are Less Than Alleged In the Disputed DEIR Or Illusory.**

**Ind 254-64**

While the DEIR mine might provide some small number of mining jobs for people from who knows where, if it finds the funds somewhere to actually reopen and operate (see my #2), the cost per additional worker is massive compared to what those jobs cost our community, as discussed above. Remember that those number of workers (and all the other locals imagined receiving alleged benefits from the mine) are trivial compared to the massive number of existing local residents and voters in this suburban (not rural as the DEIR claims) community, all whose real estate values have already suffered, not to mention the other coming burdens, risks, and harms described in this and other objections. In making that cost/benefit comparison one needs to recall that the disputed DEIR generally treats this "project" as if it's just the small Brunswick and (despite their meritless effort to separate it) the Centennial) sites, plus 30 well properties along East Bennett Road, instead of the reality, which is that PLUS the whole 2585-acre underground mine, above which thousands of us residents and voters live on the surface above and around that underground mining and in the broader groundwater impact zones or even broader still real estate stigma zones all around them, who will suffer daily and continuously resist for 24/7/365 for 80 plus years or until the mining stops again (as has since the mine closed in 1956.)

For the county officials making decisions from a safe distance and who might be tempted to address this as an abstract policy question or mistakenly give the disputed DEIR the undeserved benefit of some doubt, please consider this and other objections, especially what I said in my prior sections above and my analogy to what the California Supreme Court said in its ***Varjabedian v. Madera*** decision about the local sewer plant's disproportional harms to the locals downwind. Even if this mining project were for the public benefit (like a sewer plant), which it is not, and were not just for the private benefit of its foreign owners' profits (see my # 2), there are legal (as well as political) limits on what majority of the safe and distant imagined

beneficiaries of a local project can impose on the harmed local's unlucky to live nearby. As here, where the problems could affect us such locals 24/7/365 for 80 plus years, these continuous harms, burdens, and risks are not the kind of theoretical or ideological impositions that can be or will be forgiven or forgotten, since mining approval means those detriments described above, such as losing value in our homes, environmental quality, and the quiet enjoyment of our properties and community.

Conflicts, like those chronic and enduring legal and political disputes and competitions that would be unleashed by any disputed DEIR and mine approval, are not just divisive, but they are also distracting and expensive for our local and county governments and the rest of us (and bad for tourism and real estate values; who wants to be described as the "next Hinkley" to suffer from hexavalent chromium in our water?) This is not the time for that kind of endless battling to be triggered by approving a DEIR mine with no net benefits and all these demonstrated, and even some admitted, adverse consequences and insufficient or illusory mitigations. Because until the mine threat stops us local victims of the mine must be expected continuously and indefinitely to exercise our competing legal and political rights to resist the DEIR mine risks and harms and to protect our property, environment, and community way of life above and around the 2585-acre mine (and in the groundwater depletion impact and other stigma areas around that, where real estate values will also be depressed), approval of the DEIR mine by government starts intense legal and political conflicts and competitions at a time when our community and country need no more conflicts and division. See my # 3.N.

**Ind 254-64**

One of many problems any approving government will have is that once our real estate values are depressed, our environment and quality of life is harmed and at risk of worse, and our groundwater and NID water is being wasted on this mine during the perpetual climate change dryness and drought, how do our governments manage such intractable continuing conflicts thereafter? Getting caught in such legal and political crossfires and competitions is going to be bad for government, as well as the rest of us. No one should want our government budgets diverted to the legal costs associated with the endless legal and political conflicts and competitions this DEIR would trigger and continue. Once approved the DEIR mine has been given rights by our government, the miner can be expected to defend them, although not as vigorously as us locals defend our homes, environment, and community (see my # 3.N). Such competitions and conflicts will force governments to take sides, which then becomes the single dominate issue in every election until the mining stops. Consider us locals did not come (or stay) here for the mining, nor has anyone else for generations. We can for the quality of life, environment, and community that we love, and now this foreign miner, who will never be part of our community, wants to deprive us locals of what we already have.

At the local level that means more than just massive, "single-issue voting" by thousands of us anti-mine locals, since, for example, I cannot imagine ever voting again for or supporting any mine supporting politician of any party. But, as discussed in section 3.N above, local mine opponents will have a legislative agenda for law reform for regulating the mining and related threats, risks, and problems until the mining stops. Remember, for those of us at risk of these harms, approval of the mine would mean stripping away important things away from us that we now enjoy. That is especially intolerable when there is no corresponding "net benefit" to anyone locally or even in the County to justify us even considering making such any such sacrifice. If this DEIR mining happens, there will be endless "I told you so" situations to haunt

**Ind 254-64**

any pro-mine politicians, some of whom many of us could otherwise favor for other issues, but not as long as the mining exists.

Once the mine has started and while the courts and other forums are deciding what to do about that in the context of various different kinds of legal and political disputes and competitions beyond CEQA that are predictable from time to time, there will be an intense focus will become on monitoring and enforcing compliance with applicable laws and regulations. All of us local objectors will be exercising our public records and other monitoring rights and systematically collecting data and evidence on noncompliance events or conditions and other "I told you so" situations. That is where the interim conflicts with government officials become most likely. It would be unusual (at best) if this mine's operations went as smoothly as imagined in this disputed DEIR. In my experience none of the more 40,000 California abandoned mines on the EPA list probably adequately warned the applicable governments or public in advance of the risks and problems that stopped the mines typically after causing much local misery, often on the despicable theory of predators that it's better to ask forgiveness than permission. Therefore, when there are compliance problems, the key question becomes: does government enforcement accommodate such situations as they would for a beneficial local business, or does government enforcement use its power to progressively enforce such laws and regulations to minimize the burdens, harms, and risks to us locals for DEIR mining that should never have been approved in the first place? That is the choice every politician and every voter must make for the next 80 plus years, while us locals are suffering under 24/7/365 burdens, risks, and harms addressed in this and other objections. If that is too

**Ind 254-65**

expensive and counterproductive for our local government, then don't approve the DEIR or the mine. In any case, we'll want officials who are interested in money saving collaborations with us locals consistent with our stated concerns to rigorously enforce all applicable laws and permit conditions without any waivers, plea bargains, or other excuses.

If this sounds too abstract, consider one example. One legal and political battle will be over access to information about the mine's compliance and operations. Us citizens who are at risk of harm will be seeking various ways to monitor the mine and to collect, assess, and defensively use information and evidence, especially when such data contradicts the DEIR or proves the truth of what objectors like me are expressing. What us local voters will want is the election and appointment of officials who will aggressively monitor and enforce compliance and investigate citizen complaints and problems. (Note, as explained elsewhere, putting up monitors along East Bennett Road or the surface borders of the Brunswick or Centennial sites is almost meaningless to the real burdens, risks, and harms that concern those of us living above or around the 2585-acre underground mine, which is where the real monitoring is needed, although, if I were NID, I would be testing all the purportedly treated mine water released downriver into the Wolf Creek for fear not only of human errors, or storms or other conditions that defeat adequate treatment, but because of what toxins may still be in that water which many will no longer want to use, even if, at present, some industry sympathetic regulator imagines that the toxic level is tolerable. (Standards often change too late, based on harms done to prove the errors in existing lax standards, as one may note by study of the hexavalent chromium threat the disputed DEIR wants to inject into this mine cement paste shoring for the 2585-acre underground mine after the Erin Brockovich reality horror movie inspired the

**Ind 254-65**

thousands of studies now posted on the EPA website or available in a simple Google search or explained in the European Union ban coming in 2024.)

5. **Even the Disputed DEIR's Own "Hydrology And Water Quality" Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H, as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, "Drawdown," "Recharge," And Other Water Problems Much More Wide-Spread And Serious Than the 30 East Bennett Road Dry Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future "New Normal" Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste For 24/7/365 For 80-Years, Etc.**

   A. **An Introductory Overview Illustrating Some of the Many Water Related Objections To the DEIR That Evade the Real Burdens, Risks, And Harms In Our "New Normal" By Pretending the Past Is A Reliable Guide To the Future (See my # 3.M).**

**Ind 254-66**

If this dispute DEIR and mine approval process advances to the next dispute stages, experts will battle over many, complex technical surface and ground water issues. Such disputes often will not involve "apples to apples debates," because the disputed DEIR attempts to limit the debate to its almost exclusive analysis of the past and an artificially small part of the CEQA "project" that largely ignores us living on the surface above and around the 2585-acre underground mine, while us potential victim neighbors and locals and our community are focused on the "new normal" we face in the future and our competition with the mine for groundwater and NID water as supplies diminish. (I said almost because the disputed DEIR misuses some NID surface water/weather data until 2040, as discussed in my # 3.M, but asserting beyond that the either nothing changes thereafter or CEQA excuses the DEIR from speculating on what would happen as the mine continues to deplete our groundwater thereafter for the rest of the 80-years; in effect, transferring the risk of what they call the unknown to us local residents who have our own rights to that depleted groundwater.) As explained in many places in this Objection, the largely irrelevant, unreliable, and even misleading past on which the disputed DEIR relies (eg, average rainfall between 1967 and 2017 that cannot predict our groundwater recharge rate or "balancing") is no longer a reliable guide to a future that science and our experiences assure us will be different and much worse as we confront and react to chronic and massive drought, wildfires, climate change, and other calamities almost entirely ignored by the DEIR. Hint: any government decisionmakers should have someone highlight all the places where the disputed DEIR conditions critical predictions, assumptions, and conclusions (which we objectors refute) with words like "under existing conditions." The reality is that the future is certain to change in ways that make such qualifications and the entire DEIR useless or worse in assessing the coming burdens, risks, and harms to thousands of us locals and our community impacted by the 2585-acre underground

mine. Among the many reasons for that are also such changes that will occur from the new, expanded, and deeper 24/7/365 mining itself into unknown (or unrevealed) underground conditions, as well as from drought, climate change, and other future problems almost entirely ignored by the disputed DEIR and its advocates.

As noted in more detail in the next subsection below, the errors, omissions, and deficiencies of the disputed DEIR regarding NID and groundwater are compounded by the fact that they are scattered throughout many sections of the DEIR, frequently providing inconsistent or contrary data, and obscuring inconvenient truths that the DEIR should, but refuses to, address in a comprehensive and integrated discussion of the many disputes and issues. See my # 14 and my supplemental CEQA rebuttal brief. If this section (or my illustrative statement of DEIR facts and contentions for rebuttal in my objections above) seem to contain repetitive data from some other parts of this Objection, I apologize, but I blame the disputed DEIR's scattered approach to which I was compelled to respond in two ways: once in the various places where the DEIR chose to bury important water data in places outside the labeled water discussion in DEIR # 4.8 (where people expect it all to be revealed), and, secondly, here where I can provide some clarity by a more comprehensive or detailed discussion of water issues (or at least some helpful cross-references lacking in the DEIR) that the DEIR chooses to separate and obscure.

**Ind 254-66**

What this Objection attempts to do is to remind the applicable governments that, if one were to mistakenly believe the disputed DEIR or its advocates (which many of us affected locals do not believe for reasons explained in our objections), the DEIR incorrectly claims this water supply depletion and waste issue is merely about drying up 30 or so wells along East Bennett Road. Wrong and worse. First, by ignoring the chronic droughts and adverse climate change effects, the disputed DEIR ignores the predictable responses when the rest of us start competing with the mine both (i) for NID water in shortages, and (ii) for our groundwater under our owned surface properties, including those of us owning and using the surface above and around the 2585-acres being mined underneath us. While the mine disposes of precious water as dewatering mine waste to be treated and discarded somewhere else downriver in the Wolf Creek, the rest of us need that water for our own use, as well as our forests, plants, and environment that are already drying out and increasing our fire and fire smoke risks. When NID is no longer able to supply our local needs, locals here will certainly do what everyone else in the State is doing in areas where there is suddenly insufficient water from their water company: they drill competing wells to survive on the groundwater they already own. What is a small number of dry wells today will become a huge number of competing wells for thousands of us in the future, especially if the State or other governments do what happened last time when we had two-hundred-year droughts in a row: limit water deliveries to locals (eg, 50 gallons a person) so that our water can be shipped to even more desperate places, even when they don't deserve it (eg, think desert golf courses and grass yards, subsidized cotton farms, and profitable almond farms), because they caused much of their own shortages by tolerating waste like this mine. (Note: I lived in Orinda at that time when our East Bay MUD water was limited to 50 gallons a person a day, because much of our water was piped to Marin County instead, which had sabotaged by neglect their own water supply to obstruct real estate development, and people began to drill self-defense wells.) While this will be a challenge for any government, this disputed DEIR mine dewatering and "wastewater" disposal somewhere else down Wolf Creek will make our community conflict problems much worse (see my # 3.N), especially when one

considers the hexavalent chromium threat and other water quality concerns (see my # 3.C, G, and H and 7).

Second, the "existing conditions" and past data (irrelevant or misleading rain average between 1967 and 2017) on which the disputed DEIR relies are certain to change because of the new, expanded, and deeper mining itself. Who knows what lurks in the 2585-acre mine depths unaddressed in the DEIR or assumed without satisfactory analysis of the impacts and risks for us locals? You don't need to be an expert to fear that the proposed 24/7/365 blasting, tunneling, digging, rock removal, processing, and the rest itself will change the "existing conditions" qualifications so common in this DEIR, especially when the whole mine is to be shored up with hexavalent chromium cement. Even more absurdly, this disputed DEIR also begins this mining of that 2585-acre underground mine with no idea of its "existing conditions" since it closed and flooded in 1956. The governments will need to share information from both the insufficient DEIR monitoring and the additional monitoring imposed by locals legal or political defense activities, because it's too late and limited protection for local victims when the future realities become apparent by discovery that our fears were correct when some predictable disaster strikes. That is when government and the courts will have to struggle at a more intense level over the competing rights of us surface locals and our community versus the mine which has no net benefit to us locals or our community that outweighs its burdens, risks, and harms.

**Ind 254-66**

This section demonstrates some basic related flaws in the disputed DEIR with illustrations that expose some of the DEIR's more obvious strategic errors, omissions, and deficiencies. My purpose is to provide some background examples proving the merit of the hard water questions that the applicable governments must ask (See my #'s 3.D, E, F, and M, 14, and 15.), as well as to illustrate how the disputed DEIR continuously misdirects and evades the critical realities without addressing even the obvious questions of concern to the neighbors and local community. This goes far beyond 30 dry wells along East Bennett Road and focuses on the areas above and around the 2585-acre underground mine, such as those addressed in my such cited Objection sections to include our concerns about lowering the water table and harming the forests and environment here that are already suffering from drought, insects, and other climate change problems. Such abuse of our surface by water depletion, drainage away to distant places down Wolf Creek, and waste will worsen the other environmental conditions the disputed DEIR understates, ignores, or deficiently addresses. For example, by drying out the surface by lowering the water table with such water depletion and waste, the DEIR is increasing our fire and fire smoke risks, which in turn makes our air quality and health more at risk. We live in an interactive "environmental system" where harm to one central part like water sufficiency and quality threatens significant adverse effects on the other parts like air quality (eg, fire smoke) or water quality (see my # 3.C, D, E, F, G, H, J, and M, 6, 7, and 10.)

Consider the entire underground area of the 2585-acre mine that is largely neglected by the DEIR (but not by the affected community), where the DEIR's **admitted facts inefficiently** describe 2585-acres of planned underground blasting, drilling, tunneling, rock removal, Cr+6 cement shoring, and other activities 24/7/365 for 80 years (see, eg, my #'s 3. A, B, C, D, E, F G, H, and M, and 6, 7, 8, 9, and 12.) with 72.8 miles of underground tunnels (7.5—8.5 feet wide) so far, without any satisfactory limitations on how such threats could expand and worsen by the new, deeper, and expanded mining into unknown parts of that area. By analogy, imagine a

**Ind 254-67**

104

**Ind 254-67**

bucket with holes (ie, the water drains and pump system) once full of water needed to remain full of our jointly owned groundwater level needed both to sustain surface wells and our home forest and other life and essential environmental conditions on the surface and to even avoid subsidence and maintain the legally required "subjacent support" and "lateral support" (see my # 4 and 14) of those of us living on the surface above the 3585-acre underground mine, all of which is generally ignored and evaded in the disputed DEIR. (When I say forests, I am not referring to what the DEIR incorrectly describes as a rural situation, but rather the fact that, for example, thousands of affected residents of Banner Mountain like me live in homes surrounded by big trees. For example, as is typical for the whole area, in the fenced acre around my suburban house I have 48 trees over 50 feet tall [many heirloom ancients], with more in my other two acres.) See also my discussions of the subsidence and other impacts on surface and near surface infrastructure and improvements, when the subjacent or lateral support is impaired by such drainage, including such legal issues ignored by the disputed DEIR, because, among other things, DEIR ignores the massive problem by attempting to limit the debate to such 30 dry wells along East Bennett Road. What the disputed DEIR proposes to do is to drain water from that local area "bucket" continuously 24/7/365 for 80 years on the unproven and disputed idea that somehow sufficient "recharge" water (eg, imagined average rainfall from 1967 to 2017) will replace all that drained **and wasted** water as fast as it is transferred elsewhere downriver by the Wolf Creek, maintaining the illusion of theoretical "balance" that the disputed DEIR incorrectly attempts to assume (not promise or prove) in DEIR # 4.8 and other places where the DEIR has scattered that data.

Notice that the disputed DEIR attempts to justify this massive depletion, drainage, transfer, and waste by looking back into the DEIR's disputed version of the irrelevant **past** and its selected and disputed historical studies, while ignoring the unprecedented, "new normal" reality of coming **future** drought and climate change problems. The reason that the "bucket" metaphor is apt is that groundwater is does not readily or timely rebalance itself (like the ocean does) when there is such drainage, because, as even the DEIR admits, there are unknown underground conditions that generally limit the local area groundwater replenishing itself from distant sources when the local water (the bucket) seeps into the mine to be drained, pumped away, and wasted in the Wolf Creek. That is why the disputed DEIR mentions (but does not helpfully apply) concepts, such as "transmissivity" and "hydraulic conductivity," which complicate and obstruct "balancing" of the underground water levels by drawing from more distant places. The point for now is that the future here (as has already been proven in the Central Valley, Bakersfield, and elsewhere) is not "recharge" or "balance," but chronic depletion 24/7/365 for 80 plus years that creates many environmental problems on our surface above and around the 2585-acre underground mine, as well as "subsidence" threats to surface infrastructure and improvements deprived of subjacent support.

What the disputed DEIR proposes will create local burdens, problems, and risks that are not considered or satisfactorily addressed in the DEIR, such as what lessons can be learned (and must be applied in any final EIR) from other places in California where groundwater depletion not only worsens the impacts of chronic drought and climate change, but by reducing subjacent and lateral support causes subsidence that drops the surface level by many feet, harming or threatening surface (or near surface) homes, infrastructure, and improvements. While the soil and aquifer conditions are different from here in such Bakersfield and Central Valley areas, the

105

scientific principles are the same. See admissions at DEIR #4.8-16, where it notes that "hydraulic conductivity" related to the "permeability of the overall aquifer zone" is usually addressed for "porous media, such as sand and gravel type aquifers": "but they are also applied to fractured bedrock aquifers when there is a sufficient degree of fracturing and interconnections between fractures." That means water depletion and subsidence can also occur throughout this fractured rock aquifer area, and, since the DEIR has no adequate study of the actual underground condition that now exist or that its new, expanded, and deeper mining will create, there is nothing in the DEIR to ease our concerns. Think of it this way, if again you put a hole in the bottom side of the bucket (aquifer), that will empty the whole bucket, not just the original 2585-acre mined area water. Everyone depending on that fractured rock aquifer water suffers as the whole area water level drops (absent illusory recharge assumptions from average rain between 1967 and 2017). Considering the depth at which this mining (ie, the

**Ind 254-67**

24/7/365 blasting, digging, tunneling, rock removal, pumping, and dewatering process) occurs, the burdens, risks, and harms could be massive over such 80 years, far beyond both the mine owned surface boundaries (which are the only things that the disputed DEIR even purports to address besides the 30 East Bennett Road wells) and above and around the 2585-acre underground mine and even beyond that, since it is unknown what new groundwater problems the old mine repair or the new, expanded, and deeper mining will create.

No one should take seriously as a CEQA compliant "good faith" attempt to analyze these issues a disputed DEIR, whose essential erroneous premise is that the future risks and problems for the next 80 years can be judged from past history like average rain between 1967-2017, since any rational and reasonably well informed person can see that we now face unprecedented underground and NID water risks and problems that make such backward looking analysis irrelevant, materially misleading, and dangerous. For example, if one Googles even casually about groundwater depletion from pumping or about related "subsidence" (or more technically removal of "subjacent support") one will find many government and scientific reports and studies about these calamities, such as addressed in California's Sustainable Groundwater Management Act, largely ignored by the disputed DEIR (a complex debate I leave to the other objectors more expert on the science), which may eventually "grow teeth" and greater relevance against such water abuses here long before the 80 years expire. While these problems are currently most obvious where they are devastating the Central Valley, Bakersfield, etc, the disputed DEIR is bringing those problems right here to Grass Valley, and that horror reality show is the history that is more relevant than the climate change ignoring DEIR's focus on the "good old days" of environmental abuses by the mining industry.

If the disputed DEIR imagines some reason why this mine area will be different, the burden of proof and persuasion should be on the DEIR to prove that to us locals with clear and convincing evidence. So far, all we have is evasion or ignoring of these key issues without

**Ind 254-68**

anything convincing at all. For example, because the disputed DEIR seeks to export our groundwater away from us and our aquifer for 80 plus years to places downstream in the Wolf Creek, where does the water come from that the DEIR imagines to replace/recharge what they have taken away from us and (from the perspective of those of us concerned about water as an essential local public resource, and because we surface property owners own that groundwater below our homes) wasted? (ie, where does the replacement/recharge water come from for this imagined "balancing" of our own underground water pumped out of our local area and aquifer

106

**Ind 254-68**

to some other place where it does us no good here?) As should be irrefutable and as illustrated by the diminished state of the aquifers in other with excessive pumping in the Central Valley, Bakersfield, and elsewhere, there is no balancing; just increasing depletion and subsidence at an increasing deficit as climate change and drought dry out our land. While such other competitive pumping at least is for local human benefits and growing crops etc, as demonstrated in the case of this mine (my # 4), there is no such net benefit here for such DEIR depletion and waste of our precious water for mine profits to export to its foreign investors. Government planners should ask how many important and locally beneficial projects will be rejected in the future 80 years, because of insufficient water on account of this disputed DEIR waste to dewater their mine. See, eg, my #'s 4, 8, and 14.

**Ind 254-69**

The point for now is that there is a large local area (where I live) at huge risk above and around this massive 2585-acre underground mine, and my whole fractured rock aquifer (ie, the whole "bucket") even before the new mining expands and deepens further (see my # 3.A, D, F, and M, discussing DEIR admissions, errors, deficiencies, and omissions), and none of the key concerns of those of us potential victims are satisfactorily addressed in the disputed DEIR or elsewhere (eg, in the Rise mining data in its 10K discussed in my #2.) Worse, since the DEIR has not alerted us neighbors in the impact, risk, and stigma zones of those direct threats to our 200 deep feet surface rights that include groundwater at all depths (eg, nothing in the DEIR adequately identifies where the surface addresses are above the 2585-acre underground mine, which the disputed DEIR incorrectly ignores generally as if it were not part of this "project"). See, eg, my # 4 and 3.N, discussing how surface owners and users above and around the underground mine will suffer from loss of real estate value and marketability, as well as environmental burdens, risks, and problems. Why is that basic surface versus 2585-acre underground mine information not shared in this DEIR process? Is it because the disputed DEIR hopes to obtain its approvals and permits before the mine's local surface neighbors fully appreciate such threats to their individual homes and environment, not just generally to their community?

**Ind 254-70**

The applicable governments should also consider the problem of "subsidence" from the blasting and removal of the underground rock depriving us surface owners and users (eg, utilities, roads, public improvements, etc.) of the essential subjacent support they depend upon and have legal rights to expect and protect. See my above legal discussion and my # 4 and 5, 6, 8, 12, and 14. Such problems will not only harm our community, but also our local taxes that should be spent on better things will be applied to fixing problems created by the disputed DEIR for the benefit of exporting profits to generally foreign investors. See my # 3.N, 2, and 4. While water does not provide the same subjacent support as the rock did, it is clearly better than nothing, which is what seems to be happening here when both the rock and the water are removed from supporting the surface. See my # 3.A. The reason that it is so important to stop this mine before it starts operating is that most of us victims' more effective legal remedies are delayed until we suffer damages and are then triggered by the impact of such harms on us. When such concerning harms and risks occur, all that is left will for us victims will be the typically disappointing litigation recoveries for harms done and court and/or governmental orders to stop mining and causing further harms. Unfortunately, as I have demonstrated from bankruptcy and cross-border insolvency cases (see my #1), the usual result illustrated in a long set of precedents in unrelated prior industry scandals is that the local miner exports its profits

107

**Ind 254-70**

to the foreign investor beneficiaries and then, when the mine is now longer profitable, it is commonly abandoned or dumped into a bankruptcy (and sometimes cross-border bankruptcy), resulting almost always in disappointing recoveries for the local victims. There are sad reasons why there are more than 40,000 abandoned mines in this State on the EPA list that no one is cleaning up and that continue to be a blight on their local communities. If this disputed DEIR is to be an exception to this horrible tradition, why is the DEIR not making that case that it is the exceptional "good actor" in a scandal prone industry, as opposed to the DEIR dodging the key issues as if it were hoping the locals at risk would not notice until it was too late or hoping our elected representatives would not care enough to protect us locals from such disputed DEIRs and mining burdens, risks, and harms to which our community is now alerting those officials?

**B. Admitted DEIR Water Data Conceals Massive Unaddressed Issues, Errors, And Omissions, And the DEIR Fails To Reveal The Underlying Assumptions And Artificial Limitations On Which the DEIR Bases Many Flawed Conclusions, Contentions, And Assumptions We Locals Dispute.**

**Ind 254-71**

Among the most serious DEIR deficiencies is the failure not only to identify and address the real groundwater and NID water issues, but to spread out the often-conflicting scattered water and related data in unclear, confusing, and hard to reconcile ways in many different sections of the DEIR without links or cross-references, and often without common usage of terms or data to make understanding easy. See my # 14 and my supplemental CEQA brief citing cases forbidding that kind of DEIR game. Any serious reader comes away from reading one DEIR water discussion by saying not only "yes, but what about" certain errors and omission, but also "how does that match what you said in that other section" somewhere in the 1500 plus page DIER maze? Compare the location of various water related admissions that I quote and dispute in this Objection, and government decisionmakers will begin to understand that, whether it is intentional or not, the mine advocates could not have made any understanding of the disputed DEIR water issues any more difficult if they tried to do so as a tactic. Just consider this one critical example, by studying pages 4.11-35 to 52 in the DEIR's "Public Services And Utilities" # 4.11 (where, in discussing NID water supply issues they approach some realities more realistically than elsewhere, although deficiently, the DEIR is more revealing than in the frustrating and intensely disputed 83 page discussion in "Hydrology And Water Quality" # 4.8 (where there is no sufficient attempt to reconcile that mine data with that NID discussion or even other conflicting and disputed water discussions scattered in many other DEIR sections.) Among the interesting credibility challenges in this process is the following [slightly annotated to expose the disputed DEIR bait and switch game] quote at 4.11-39 to 43 from a subsection of that "Public Services And Utilities" section called "Projected Water Supplies" wherein the DEIR admits some limits (who knows what exactly, because most of the underlying disputed DEIR assumptions underlying its disputed projections are apparently buried in the lengthy reference materials the DEIR selected to support its disputed DEIR conclusions or assumptions):

> Projected Water Supplies. Table 4.11-5 provides a summary of the District's projected supply entitlements [through 2040]. [The relevance for this Objection in the following quotes lies in the unaddressed conflicts between NID's analysis of surface water

108

**Ind 254-71**

supplies, since NID does not use groundwater, as discussed elsewhere, and the DEIR's intensely disputed and, frankly, absurd, groundwater "recharge" assumptions which ignore climate change and credible science in order elsewhere in the DEIR incorrectly to predict the future from the average rainfall between 1967 and 2017 instead of the "new normal" used by responsible scientists, governments, and businesses to predict a chronically drier and drought harmed future.]

Water Code section 10910(c)(4) requires that a WSA [Water Supply Assessment, on which the DEIR mistakenly relies in cites throughout its disputed texts regarding water, and, therefore, which misapplies the NID's different standards than CEQA and other relevant laws to this mine's imagined and disputed ability to recharge the ground water it depletes and sends somewhere else downriver in Wolf Creek.] include a discussion with regard to "whether total projected water supplies, determined to be available by the city or county for the project, in addition to existing and planned water demand associated with the proposed project...." Accordingly, the WSA addresses these three hydrological conditions through the year 2040 ... in Table 4.11-6. [The disputed DEIR then purports to "summarize" "projected availability" from the District's existing and planned future supplies THAT DO NOT INCLUDE GROUNDWATER OR ACCURATELY ADDRESS THE MINE'S LOCAL GROUNDWATER DEPLETION AND RECHARGE, but instead focus on] ... the District's projected water demands in normal, single dry and multiple dry years throughout buildout. [As elsewhere this DEIR compares "apples to oranges," since it is focused on the NID general service area demands from NID's surface water sources as distinct from rain recharging the massive groundwater depletion in one local area in and around the 2585-acre underground mine from 24/7/365 dewatering for 80 years, not the 20 years/2040 limit NID uses for different purposes under a different law than CEQA applying to water districts.] As shown, demand within NID's service area is expected to exceed the District's supplies from 2025 to 2040 during Single Dry Years and in the first and second years of a Multiple Dry Year period from 2025 to 2040. [This is confusing since this DEIR paragraph at 4.11-39 begins with a "20-year projection" and shifts to the 15-year period "from 2025 to 2040." Throughout this Objection I make reference to the lethal DEIR flaw of it limiting its perspective to this 2040 or 20-year cut off, as if somehow it is entitled either to ignore the last 60 or 65 years of its 80-year mining binge and/or, perhaps, to assume that the DEIR can assume the whole 80 year period matches the first disputed 15 or 20 year flawed and misleading projections ending in 2040. For convenience and simplicity, I often just say "20 years" to avoid addressing this complexity and confusion every time it occurs. Since 20 years is better for the DEIR's disputed theory than 15 years, the DEIR advocates should not complain (but somehow, I expect they may anyway.]

Factors contributing to inconsistency in NID's water supplies include legal limitations due to water rights and contracts limiting the quantity of water available to the District, environmental constraints, and reductions in availability due to climatic factors. The surface water supply to NID is subject to reductions during single and multiple dry years (seasonal and climatic shortages). ... [These same kinds of limitations apply with equal

**Ind 254-71**

and often greater force to the existing and future competition for groundwater around the 2585-acre underground mine by locals like me, as demonstrated elsewhere in this and other Objections, but the DEIR inconsistently ignores any discussion of groundwater rights disputes and limits, except for a distracting and disputed discussion of the 30 or so wells along East Bennett Road. Since the DEIR recognizes these factors here (with even a rare mention of the bare word "climate"), why not address the matters where it matters most, as the DEIR or mine approval would trigger competition and legal and political disputes with us locals over groundwater as to which we have at least equal, if not superior, rights.]

***

Water Supply Sufficiency. Pursuant to Water Code section 10910(c)(4) and based on the technical analyses describe in the WSA prepared for the proposed project, the total projected water supplies determined to be available for the proposed project during Normal water years during a 15-year projection would meet the projected water demand associated with the proposed project. (emphasis added) [Again, this incorrect general conclusion appears to be a bait and switch as above, since that WSA etc analysis is focused on NID general supplies from surface water; and not on recharge to our local groundwater from mine depletion from dewatering 24/7/365 for 80 years during a time when the old "normal" of the disputed DEIR no longer exists because of climate change, unprecedented dryness and drought, and greater competition from locals accessing their own groundwater rights from above and around the 2585-acre underground mine. While we also dispute the sufficiency of NID supplies to the mine for no net benefit to the community, as described elsewhere here, the above discussion and others in this Objection demonstrate the errors, omissions, and deficiencies in this DEIR.] ... Therefore, [with the DEIR incorrectly referring to NID's "projected 2040 water demands" as to the 30 East Bennett Drive property connections, as if that were the only project impact, a claim contrary to many parts of the DEIR my Objection addresses] NID would be able to serve the proposed project in addition to existing and planned developments with some reliance on demand reductions in dry years by 2025. [This erroneous conclusion is contrary to the DEIR itself, although it seems to admit that even the portion of the water use admitted here is admitted requiring "some reliance of demand reductions in dry years by 2025," which means that applying better information with a fair and appropriate analysis would create even bigger shortages.]

[Besides what DEIR calls a Normal Year, Table 4.11-5 actually admits at 4.11-40:] "Potential Surplus (Deficit)" [for] "Single Dry Years" [of progressively increasing deficits from 2025 to 2040 in acre feet/year] [for] "Single Dry Years" [ranging from] [negative] 85,629"/"48%" "Percent Shortfall of Demand" to "-98,814"/"52%" "Percent Shortfall of Demand", [as well as more deficient years for Multiple Dry Years]. ... [continuing at 4.11-42] Water demand within NID's service area is expected to exceed the District's supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year

110

**Ind 254-71**

period. [That ignores many realities of expected increased water use, because, instead of 30 wells, the reality will be hundreds of competing wells just in the areas above and around the 2585-acre mine, as locals combat climate change and drought as well as the mine's groundwater depletion, as I explain elsewhere. If the DEIR advocates or NID imagine that they can stop that competition, which has occurred already all over the state and is continuing where water supplies are already tight, then they do not appreciate the political and legal ferocity of such locals defending their homes, their forests and environment, and their community way of life from the no net benefit mine's massive depletion and disposal downstream and other waste of our shared groundwater. See my #'s 3.N and 4. The indisputable reality is that few, if any, of us thousands of affected locals will be willing to sacrifice anything for the benefit of this undesirable mine.] However, this project is not expected to exacerbate NID's water supply shortages during dry years and the project will supply water into the South Fork Wolf Creek and into the NID conveyance system, at volumes exceeding the project water demand for potable water from NID. [Even if that were true, it means little to those of us living above and around the 2585-acre mine, who are losing our groundwater to the mine dewatering waste. Moreover, on the merits, why would NID allow its system to be polluted by mine water that, even if correctly treated (which would delegate trust to this miner for 24/7/365 quality for 80 years, which seems unlikely when it comes to the downstream user's families' health), no one wants even to accept even the level of hexavalent chromium and other mine water toxins that some industry influenced bureaucrat standards official may still consider tolerable, despite the EU ban, a mountain of negative evidence on the EPA website, and the *Erin Brockovich* stigma.]

*** This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID. [However, the mine can then be expected to increase NID customer demand in years when their wells have deficient supplies, and none of that predictable defensive conduct is addressed in the DEIR or by NID, perhaps in the case of NID because the managers do not expect the coming policy changes coming from the local voters to assure that they do not suffer from water wasters like this mine. See my # 3.N. The future will become what some politely call "competitive," but what more accurately is about thousands of local voting residents insisting on their legal and political rights to their priority share of surface and ground water over less beneficial uses, especially no net benefit uses like the mine.] *** (at 4.11-43) Thus, a less-than-significant impact would occur. [That incorrect and disputed conclusion does not follow from the preceding analysis that is rebutted above and elsewhere in this Objection and others. Please note, however, that the rest of the disputed DEIR states that the economics of the mine (like the miner itself admits in its SEC Form 10K and 10Q) are so fragile that anything less than continuous 24/7/365 operations for 80 years creates significant operational and environmental problems. DEIR at 6-14. Such admitted water problems are inconsistent with those disputed DEIR claims, as addressed in my rebuttal to the DEIR's "Alternative's Analysis" discussion I address near the end of this Objection at my # 13.]

Part of the reason for the errors, omissions, deficiencies, and worse addressed in the prior paragraphs relate to compounded mistakes and worse in the DEIR's preceding discussion (DEIR 4.11-7 at 4.11-35 to 38) entitled, "Project Water Demand," which distinguishes (unlike most of the DEIR) between "Potable Water Demand" and "Non-Potable Water Demand," which roughly correlates to surface water from NID versus groundwater from the underground mine. Those disputed DEIR discussions are summarized at Table 4.11-3 (at 4.11-38) stating "Total Groundwater Consumption for Non-Potable Water Use" of "84,000 gallons per day"/94.1 acre-feet per year" and "Total Water Use" of "107,600 gallons per day"/"120.5 acre-feet per year." However, scattered in discussions on 4.11-35 and 36 are various NID water uses at the mine, such as: (i) "5700 gallons per day" for Brunswick Industrial site building uses, (ii) "17,900 gpd" for replacing groundwater from 30 wells on East Bennett Road, and (iii) "42,000 gpd" for dust suppression and compaction for five years at the Centennial Industrial Site (which is not really a separate CEQA project as the disputed DEIR claims). Instead of a total, the DEIR scattered that data by use, apparently hoping that critics cannot add [5700, plus 17,900, plus 42,000 equals 65,600 gallons per day], the disputed DEIR states aggregated service area numbers on that same page in Table 4.11-4, entitled, "Projected NID Service Total Water Demands with Project (ac-ft/yr)" of "Total Water Demand" progressing increasingly from 161,678 in 2020, to between 174,763 to 217,951 in 2040. [By comparison, and as a reality check on the resolute political and meritorious legal defense activities that this no net benefit mine related water competition and waste will inspire from us locals competing for our share of NID and ground water above and around the 2585-acre mine, the most strict and painful governmental drought water restriction I have suffered since I moved to California was 50 gallons a person a day, and that happened in part because some of my local East Bay MUD water was reallocated to much drier Marin County. As political policy people, consider now how you decisionmakers would propose to deal with such a 50 gallon a day limit on human use, while this no benefit mine still uses some large part of its admitted 84,000 gallons per day use of our shared groundwater, claiming an excuse that it cannot dewater the mine adequately to stop flooding, unless it takes more than its share of water away from competing and higher human priority uses. The same question applies as to the mines attempt to excuse excessive use of NID water. Because us voters and local property owners with competing rights will not tolerate that (see my #'s 3.N and 4), that leaves you decisionmakers confronting the questions that the DEIR seemed afraid to address in a comprehensive and sufficient manner: what happens when the mine is no longer has or is allowed to use the water it says that it needs for such mining operations? See DEIR # 4.3-103-104 and my rebuttals to that inadequate DEIR response.]

Ind 254-71

**C. Nondisclosures, Errors, And Disputes Regarding Future Risks And Problems From New, Expanded, And Deeper Underground Mining Operations in the 2585-Acre Mine Beneath Our Local Surface Objectors.**

Ind 254-72

The disputed DEIR (eg, at 4.8) speaks to irrelevant data from the past about this long-closed mine and fails to address not only the "new normal" of drought and climate change. However, it also ignores the burdens, risks, and harms to be expected from the renewed mining operations. What is the point of data about the 72 miles of existing tunnels in the 2585-acres of

**Ind 254-72**

underground mine (where the surface above and around it is owned and used by us objecting locals, without satisfactory DEIR analysis), when the DEIR plan is to change everything underground by 24/7/365 blasting, digging, dewatering, removal of rock, and other mining work in new, expanded, and deeper areas for the next 80-years? The DEIR assumes incorrectly that there will be a "balancing" by "recharged" water from above or elsewhere in the relevant local water sources replacing what is wasted by dewatering the mine and disposed of downstream in the Wolf Creek. But how is that possible without addressing the future mining changes, as well as the future drought and climate changes? See my discussions at 3.A, D, E, F, 5 and 6. Ironically, much of disputed DEIR # 4.8 addresses how they can more efficiently dewater the mine, which actually increases the risk of harm to the rest of us co-owners of that shared groundwater, who see our groundwater as an essential resource to be conserved, rather than a burden to be discarded somewhere else downriver as inconvenient to profitable underground mining. Note that all the discussion of groundwater movement is about its passage through rock fractures. When the disputed DEIR mining continually blasts, tunnels, digs away, and removes the deep mine rock, that must affect those rock fractures and resulting water flows, but nothing in the DEIR adequately analyzes that fate because, among other things, the DEIR has not analyzed the 2585-acre underground mine where they are repairing the old mine closed and flooded since 1956 and the new, deeper, and expanded areas for new mining. Consider the following DEIR comment (at 4.8-19), especially in the context of that 24/7/365 blasting, tunneling, digging, rock removal, and other mining activities for 80 years:

> ...the shafts act as "wells" that constantly draw groundwater from the surrounding shallow bedrock (ie, above a depth of 500 feet, where the transmissivity is highest). The inflow of water into the shafts should create a local depression in the groundwater table surface around the shafts referred to as a downward cone, or cone of depression. [See DEIR Figure 4.8-7]

What that says to those of us living on or using the surface above or in the surrounding "stigma zone" of the underground mine, is that they will be even more effective than we feared in drying out OUR groundwater and fractured rock aquifers there and creating subsidence risks. Remember that the Rise SEC Form 10K quoted in my # 2, admits that us competing surface owners own the first 200 feet down as part of our "surface" that they cannot enter or use without our consent, which the mine has not requested and is unlikely to obtain.

What is the legitimate use, relevance, or persuasive purpose of disputed DEIR Figure 4.8-8, entitled "Simulated Drawdown of Groundwater Levels Under Current Conditions?" Not only are those "current conditions" irrelevant in the new normal of drought and dryness from climate change impacts in the next 80 years, but the mining itself will radically change those current conditions in unexplained ways and by mining into new, expanded, and deeper places with unknown underground conditions. Nothing in the disputed DEIR satisfactorily addresses those issues and concerns. Therefore, the use of such old data, especially without addressing why it is not likely to be predictive of the future, seems to invite misunderstandings or worse. See my # 3.M.

Besides ignoring the reality that we can no longer judge the climate changed future from the past, the disputed DEIR makes an even wilder disputed and unsubstantiated

"assumption" that mining problems become less or fewer somehow the deeper they mine. (Why doesn't that new deeper and expanded mining increase the risks, like the old saying about the deeper you dig, the farther you fall?) Nowhere is that unsubstantiated DEIR assumption proven, and us local should not have to rely on nothing better than such faulty, self-serving so-called logic that seems to be just wishful thinking. Consider the disputed DEIR assurance (at 4.8-51) on which us locals are expected to risk our homes and future (for Rise's exported profits and no net benefits as discussed at my # 4.):

> The proposed mining areas would primarily be at equivalent or deeper depths than the existing underground mine workings, while the potential future expansion areas all involve mining at greater depths, typically more than 1,000 feet below the surface and deeper. At those greater depths, the hydraulic conductivity is several orders of magnitude lower than it is at the depths of the domestic supply wells, due primarily to the lack of open fractures because of the large pressures exerted by the overlying rock mass (ie, the lithostatic pressure). Given that the new mining activity would occur at equivalent or greater depths than the proposed [sic?] mining, there is little or no potential for the proposed mining and mining in the future expansion areas to affect the quality of the groundwater in the domestic supply wells that are completed at much shallower depths.

**Ind 254-72**

That is subject to many disputes I discuss throughout my Objection. I note here, however, that there is no supporting discussion of the effect of such deep mining on the actual, undescribed conditions that may be uncovered at those depths (eg, bigger fractures from blasting? underground rivers or aquifers increasing dewatering depletion?). More importantly, because of drought and climate change, us locals and our governments or other organizations will have to start competing with the mine for our own owned water at depth during the 80 years. See my #'s 3.N, 4, and 5.

Speaking of stigma complications that make our local problem even worse, the disputed DEIR admits in its dewatering discussion (at 4.8-42 to 51, especially at 46-49) that it intends to use "underground paste backfill" (ie, material glued with "cemented-paste backfill") that is (incorrectly) described as "environmentally benign" BUT WHICH IS TOXIC, 'HEXAVALENT CHROMIUM' OR "Cr+6." For those who never saw the reality horror movie "*Erin Brockovich,*" read Wikipedia's (or other) accounts of the "Hinkley groundwater contamination," about how a utility used that chemical and dumped wastewater in spreading ponds in Hinkley, California, (now a toxic ghost town) and ultimately had to settle a class action with the local victims or their estates for $333 Million (back when that was serious money). While the disputed DEIR alerts no one to this threat (and rarely mentions Cr+6 by name and then not in the main DEIR hazardous substances chapter 4.7, attempting (without revealing any health risks and issues) to minimize any future concern by describing the exposures as if they were tolerable, a Google search of "hexavalent chromium" will reveal even more serious health hazards than the movie. Indeed, the European Union is banning the chemical starting in 2024. See the EPA website's toxic discussion for a library of negative reports and studies. Even if one were to join the DEIR in ignoring the science, government should be more serious in its analysis, and, in any event, the already "significant" stigmas from this mine will now become much worse for real estate values and tourists, when people start talking about our area as the "next Hinkley."

Ind 254-72

Putting aside for the moment that toxic Cr+6 Hinkley problem and stigma (see my #'s 3.C, G, H, and 7), that whole dewatering mess is compounded by the disputed DEIR again incorrectly assuming that the past reliably reveals the future (see my # 3.M). For example, the DEIR admits (at 4.8-51) that:

> The water ... from the underground workings is anticipated to have similar quality to the water that currently discharges from the existing drains. ... Therefore, the conditions after mining is completed would be like existing, or baseline, conditions, such that seeps ...would not represent a potentially significant impact under CEQA [where it just addresses the iron and manganese issues and tries to further diminish the appearance of risk by describing how the new mining is going to be deeper]. *** Although the projects proposed water management and treatment, and adherence to permit requirements, would avoid significant impacts to water quality, the impact is considered **significant** for the purposes of this analysis and mitigation, specifying requirements for regulatory compliance, is identified as necessary to reduce the impact to less than significant.

Even if there were compliance and a proper end to mining as disputed DEIR assumes (but many locals are skeptical for various reasons, including in my case what is discussed in my # 2, from my bankruptcy/cross border bankruptcy, insurance insolvency and other professional experience in dealing with hundreds of failed mines as to why there are more than 40,000 abandoned and dangerous mines in California on the EPA list), the DERI cannot scientifically assume the climate changed future will duplicate the past, as it does for the average rain from 1967 to 2017. Besides the new normal of drought, dryness, and climate change that I discuss, only an irrational person or worse would assume that you can add Cr+6 and other things to the mining process and blast, dig, remove rock (whether 500 or 1000 tons a day), and mine 24/7/365 for 80 plus years without materially change things from their past condition. Indeed, who else but a wishful thinking miner or worse would imagine that the future environmental, toxic, and safety regulations and standards will still be as lax as they are now?

**D. Opportunity Costs If the Mine Is Approved And Prevents More Beneficial Community Uses of the Land, Water, And Other Resources, Including Our New Competing Wells And Air Quality Capacity**

Ind 254-73

As discussed in my # 4 and elsewhere herein, there is no net benefit from this mine to the local community that it burdens, risks, and harms in many ways addressed by objectors, including us neighbors most impacted (not to mention those businesses dependent on tourists who may be scared away.) Among the less obvious considerations for the applicable governmental authorities and regulators is the "opportunity cost" of the mine crowding out more beneficial uses in the next 80-years, and the inevitable disputes that will arise and persist as us local citizens resist and challenge mine burdens, risks, harms, and worse to enable better and more desirable uses. See my # 3.N. For example, the disputed DEIR makes much of what it calls the "relatively few domestic water wells" in what it considers the relevant East Bennett

Ind 254-73

Road area (DEIR at 4.8-8 et seq and Figure 4.8-4), but that ignores hundreds of other existing wells sharing the same groundwater plus the fact that all of us thousands of surface owners and users above or around the 2585-acre underground mine have our competing rights to drill competing wells for our use to counter the likely future depletion of our own groundwater by such mine dewatering transfers 24/7/365 downriver for 80-years. Indeed, whether we are competing with the mine in the future for water, also consider the right to burden the air within the quality standards etc, by our beneficial community uses competing with those nonbeneficial mine uses. Are we to stop using wood stoves and burning debris from our fire defense work, so that the mine can exhaust the local tolerance standard for such air pollution? How much should the community tolerate from such mine impositions that crowd out such superior or more desirable competing uses for the next 80 years? Stated another way, how can the mine claiming to be in compliance with the Water Elements of the Nevada County General Plan Goal 11.1 etc and Mineral Management Goal 17.1 etc (eg, the related Policies) as they clearly must adapt to the drought and climate change conditions in the future during the next 80 years?

**6. "Geology, Soils, And Mineral Resources" at DEIR #4.6 Again Ignores the Critical 2585-Acre Underground Mining Issues Over Which Locals Like Me Will Continue To Object**

Ind 254-74

Among the most serious and strategic deficiencies in this disputed DEIR are its chronic attempts to pretend this CEQA "project" is about the small surface lands called the Brunswick Industrial Site (and, although the DEIR incorrectly attempts to separate it from what is one CEQA project, the Centennial Industrial Site), ignoring the core environmental impact and threat: the 2585-acre underground mine below or adjacent to the affected homes of thousands of local residents (like me) living on and using that surface, forested, suburban community. See my # 3.A and E, and 14, as well as my supplemental CEQA brief. The disputed DEIR addresses 30 or 31 wells along East Bennett Road as if that were the only project or underground issue, when that is merely the distracting "tip of the threatening iceberg." This reality is demonstrated in DEIR section 4.6, where we learn nothing useful about that 2585-acre underground mine, which is the central focus of most of my and other locals' objections. Since the mine has been closed since 1956 and, because flooding prevents easy study, neither the existing mine nor the new, expanded, and deeper contemplated mining are addressed by satisfactory or CEQA sufficient analysis or commentary. See, eg, my # 3.A and E. As a result, when facing such absence of critical data, the old saying is true that "it is better to be safe than sorry." That absence of critical, credible, and useful data in the disputed DEIR regarding the burdens, risks, and problems threatening us surface owners and users above and around the 2585 acre mine convinces us locals that, to twist a cliché, "what we don't know will hurt us." Moreover, given the admitted financially questionable condition of both the miner and the mine in Rise's current 10K and 10Q (eg, my # 2), the disputed DEIR cannot be approved without understanding far more about that 2585-acre underground mine the DEIR largely fails to evaluate or even disclose.

As explained in that current Rise 10K (and my # 2), the "surface" areas in perpetual competition with the 2585-acre underground mine extend exclusively to the surface owners'

**Ind 254-74**

sole benefit for the first 200 feet and infinitely deeper for groundwater and other nonmineral rights (as is true for the adjacent landowners.) However, despite the obvious opposition of most informed locals, the disputed DEIR not only ignores the underground mining burdens, risks, and harms in this and other objections, but also the consequences on the mining and economics which the DEIR insists at 6-14 must continue constantly 24/7/365 for 80 years or else unexplained problems will arise that make the mine infeasible. See, eg, my #'s 4 and 13. Since our resolute, local legal and political opposition *and competition* will continue indefinitely as long as the mine operates, the disputed DEIR cannot ignore those issues and the local objections, because local legal, political, and competitive self-defense reactions and counters could continue to have their own impacts on the mine. See my # 3.N. Most importantly, when the disputed DEIR purports to describe "Impacts and Mitigation Measures," such as at 4.6-26 et seq., the DEIR utterly fails, because it not only refuses to confront reality (eg, climate change dryness and drought) and us local's many meritorious objections, but also even the basics CEQA concerns about the 2585-acre underground mining itself. See, eg, for example, my #'s 4, 2, 14, 3.A, B, C, D, E, F, G, H, J, and L, such as focusing on depleting the NID and groundwater supplies, hexavalent chromium toxic cement in mine shoring, air quality concerns, financial feasibility questions, and the no net benefit nature of the mine.

The disputed DEIR is also deficient as to the revealing adverse mining effects on our shared/co-owned groundwater (see, eg, my #'s 3.D, E, and F and 5), on the many deficient mitigation measures (at 4.6-47 et seq) that must fail, because the DEIR declines to admit the real burdens, risks, and problems, and on the mine "subsidence" (eg, failure to provide as the law requires subjacent and lateral support for our surface, as addressed at my #4) and "Collapse" risk (eg, discussed at DEIR 4.6-44 to 47, as limited to "near surface mine features," and by me as the 2585 acre mining threat to our local owners and users of the entire surface above and around that mine [aka protection against "subsidence"] down at least to our 200 feet level called the "surface" in the Rise SEC Form 10K described mineral deed (at my # 2), as well as other risks, burdens, and problems. I note that, before its insufficient mitigation proposals that DEIR "Conclusion" admits at 4.6-47: "**Therefore, a *significant* impact could occur with respect to being located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on or offsite landslide, lateral spreading, subsidence, liquification, or collapse, of be located on expansive soil, as defined in Table 18-1B of the UBC." Since the disputed DEIR does not evaluate the current condition of this mine flooded since 1956 or the underground conditions where the DEIR expects new, expanded, and deeper mining work 24/7/365 for 80 years, the DEIR cannot credibly assure any of us on the surface above or around that 2585-acre underground mine of CEQA or other legal compliance.**

If the governmental decision-makers have any doubts about the seriousness of the many errors and omissions in the disputed DEIR relating to the 2585-acre underground mine, I suggest that (besides reading my Objection and others, including the written follow-ups to the comments of the more than 100 local objectors at the March 24. 2022, County hearing) you should consider the grossly deficient discussion of the mine impacts whenever they stop mining, whether in 80-years with vaguely promised compliance with applicable laws, or because the mine ceases to be economic, or because the miner ceases to be able to afford to operate. See, eg, my #'s 2 and 13 and my rebuttals to the DEIR 4.3-103-104 deficient response

on that topic. There are more than 40,000 abandoned mines in California on the EPA list for such reasons. Years ago, I was lead counsel for the liquidator of nation's only then AAA surety/insurance company issuing mine reclamation and closing bonds for thousands of mines here and elsewhere. I see no sign of any insurance or security for the performance of those DEIR mitigation, closing, and reclamation promises. Instead, I see nothing but serious cause for concern about any such capacity to perform those obligations, even if (unlike many such foreign controlled mining subsidiaries) they didn't follow the common practice of retreating across the border with their profits and abandoning the mine, depending on the circumstances either with or without the common US and cross-border bankruptcy strategies designed by many industry miners to disappoint US creditors and governments. See my #2. Since local governments could inherit a local mess here if they approve the DEIR and mine, without surety bonds, insurance, or practical, sufficient recovery options from the foreign investors who took the profits, consider carefully whether CEQA compliance exists (see my #'s 3.E, 4 and 14 and my supplemental CEQA brief), and whether decisionmakers can rely on the DEIR accomplishing what it states, even to the small part of the burdens, risks, problems, and issues they deficiently purport to address. If you wish a case study, consider the hexavalent chromium being used to shore up the new, expanded, and deeper mining (eg, my #'s 3.C, G, and H and 7), the toxic substance that killed the town of Hinkley, California, and many residents, as illustrated in the movie, *Erin Brockovich. Despite the European Union ban starting in 2024 and thousands of negative reports and studies on the EPA website against using such Cr+6, this disputed DEIR does not even reveal that such a controversy exists in its Chapter 4.7 entitled, "Hazards And Hazardous Materials." Instead, it is just a passing reference in a deficient discussion of the underground mining plan to use that toxin in the cement paste rock shoring in the new, expanded, and deeper mining being dewatered 24/7/365 for 80 years and after some questionable "treatment" disposed of downriver somewhere else, where I gather it becomes a problem for NID and its downriver customers.*

**Ind 254-74**

7. **The DEIR "Hazards And Hazardous Materials" Discussion at its # 4.7 And Elsewhere Is Deficient, Omitting Entirely At Least One Serious Hazardous Material (Hexavalent Chromium/Cr+6 of Erin Brockovich Movie Infamy For Turning Hinkley, CA Into a Ghost Town at Great Cost to Local Victims And Property As Explained In My #'s 3.C, G, and H)**

The disputed DEIR presents at # 4.7 what it incorrectly represents to be a CEQA compliant discussion of all the environmental concerns relating to "Hazards And Hazardous Materials," although it defers as to the fire hazard issues to its Chapter 4.13 and deficiently addresses the fire smoke threats there. (This Objection at my # 10 addressed that as part of our air quality concerns (my # 11) with fire smoke problems created by the mine's 24/7/365 depletion of groundwater for 80-years making our forests above and around the 2585 acres of underground mining more vulnerable to fires, adding to our drier future weather, chronic drought, and other climate change problems). **What the DEIR also fails to address at all is the threat of highly toxic hexavalent chromium that the European Union has banned starting in 2024 on account of thousands of negative studies and reports (see the EPA website or even Google the words) and which has been blamed at a utility facility for destroying the lives and**

**Ind 254-75**

**Ind 254-75**

**property of everyone in Hinkley, California, (now a ghost town made famous by the *Erin Brockovich* reality horror movie), resulting in a massive class action settlement in favor of the local victims and their estates. I already focused earlier in this Objection on this dangerous chemical where the disputed DEIR did mention it in cement paste claimed to be "benign" in a deficient discussion of the underground mining and dewatering, where the DEIR occasionally reveals in passing that Cr+6 will be used throughout the mine in the cement shoring 24/7/365 for 80-years. Therefore, I will not repeat my Cr+6 concerns here, but refer you to my comments a #'s 3.C, G, and H. My reason for this mention here is that the DEIR appears to have chosen to misdirect readers away from the well-known controversies about hexavalent chromium to a few seemingly innocuous references buried in the DEIR's mining and water discussion, as if Cr+6 was just another construction material and without any warning to readers about these serious controversies.** By analogy, this is the equivalent of failing to mention the use of asbestos in a CEQA discussion of a construction project's hazardous substances during that period when asbestos industry defendants were commonly being forced into bankruptcy by massive (and meritorious) victim litigation victories and negative press and scientific reports, but before the asbestos reality and science was officially banned by the lax regulators (where there always seems to be a lag on account of politics and industry money, as with cigarettes and opioids).

Thus, I refer here to only a few other obvious errors in DEIR #4.7, relying on other objectors to deal with the arsenic and other substantive hazards issues as to such DEIR errors and omission. As noted above in my # 1, I incorporate the oral and written objections from those organizations and qualified experts who have exposed the many other hazards, such as asbestos, arsenic, and other things. First, I note that the disputed DEIR again misplaces the disputed discussion of the mine history and conditions at 4.7-2 et seq, when that information is more important to those reading the water and mining sections, where this context is more needed but omitted. Also, there is no discussion about the changes in the mine from being closed and flooded since 1956 or from what will happen when the new underground mining expands deeper into the unknown areas as to which the DEIR reports no data as to hazards. For all we (or presumably they) know that new, expanded, or deeper mining could be unleashing more dangerous quantities of the asbestos, arsenic, and other toxic substances already identified or even to expose us to new hazardous substances dangers not even mentioned as possible in this disputed DEIR. **Just because the DEIR miner is willing to blindly blast, tunnel, and mine into the unknown in that 2585-acre mine beneath our homes and property does not mean that us locals must tolerate that failure to comply with CEQA and the need for this kind of essential information. See my # 14.**

Second, there is a key error that I have discussed elsewhere in many parts of the Objection, where the DEIR erroneously, and in a seriously misleading way, describes the CEQA "project," as if it were just the small area of the Brunswick site plus 30 dry wells along East Bennett Road (and should include the Centennial site, which the DEIR incorrectly calls a separate CEQA "project"), rather than the 2585-acres of underground mine beneath us locals, where the bigger problems lurk, often unaddressed in the DEIR or discussed in an unsatisfactory and disputed manner there. See my # 14 and my supplemental CEQA brief. That disputed DIER discussion of "Project Area Conditions" incorrectly states that the Brunswick and Centennial sites are "surrounded by undeveloped land, industrial, low-density residential

developments and commercial uses," which it two sentences later describes as "rural residences." See my # 8 and 3.N. As stated in this and other objections Banner Mountain is a suburban area (although with huge trees) with thousands of people living in homes whose groundwater will be impacted by the 2585-acre mine whether they have competing wells now or drill them in the future when NID cuts back or climate change in the next 80 years forces us to do so. See #'s 3. M and N and 5.

In any event, I am also in the larger "stigma zone," where our community properties above and around the 2585-acre underground mine all suffer depressed real estate values due to the DEIR mining threat that would increase if the mine were allowed to reopen. As discussed in my #'s 3.N, 6 and 8, I remind the DEIR government decision makers that there are thousands of us local resident voters to be burdened, harmed and at risk from the DEIR underground mining, far more than the small number of new jobs for mine workers coming here from somewhere. From the standpoint of the local neighbors and our community (which the California Supreme Court considers having special rights in such cases, as discussed at my # 4, discussing the constitutional rights of those downwind of the new sewer plant for compensation on account of their disproportionate suffering), there is "no net benefit" to this project. As explained in my #'s 4, 8 and 14, a related topic which should concern such government decisionmakers is that, when the DEIR is mining in the 2585 acres below surface properties owned or used by neighbors and our community, they are subject to our competing surface legal rights (down at least 200 feet), for example, not just to our shared underground water, but also to subjacent and lateral support and other protections against subsidence. See, eg, my # 4 and 14. Why none of this is revealed in the disputed DEIR is unclear, but it raises certain credibility concerns at a minimum.

**Ind 254-75**

Note that, when the disputed DEIR discussed those "Mine Conditions," it only talks about its "NVS Phase I/II ESA" for the small surface sites and 10-foot-deep trenches; not the 2585-acres of long flooded underground mine that no one has apparently seen since closure in 1956 [DEIR at 4.7-2]. More importantly, not only is the current dangerous condition of the mine not satisfactorily described, but there is no satisfactory attempt to assess the hazards or risks from the new and expanded mining at deeper levels, as addressed in my #'s 4, 8, and 14. How can the disputed DEIR pretend that it is accurate or sufficient or CEQA compliant where it has not satisfactorily addressed the actual new underground mining concerns and risks in the 2585-acre underground mine beneath and near thousands of surface homes and improvements? The DEIR just assumes incorrectly that its cursory investigation of another part of the owned mine site and 30 wells along East Bennett Road is somehow sufficient, and that whatever it thinks it learned from the past before the 1956 closure and flooding will apply to the new mining in the future. Such erroneous and irresponsible assumptions are contrary to CEQA, logic, and prudent public policy. See my #'s 3.E, 4, 14, and my supplemental CEQA brief. See also, CEQA Guidelines section 15064(b) and many supporting court precedents requiring that the evaluation of the impact's "significance" must be based "to the extent possible on scientific and factual data." Also see, the California Supreme Court's in the *Sierra Club v. County of Fresno* case discussion in my #14 of the requirements for the sufficiency of an EIR to be judged by what is "reasonably feasible" (at 515) or what CEQA Guidelines #15364 calls "what is reasonably feasible." From the perspective of any reasonable person, much more was required from the disputed DEIR that is relevant and useful than the insufficient and often irrelevant mass of what was shared in the

DEIR. (Too often the DEIR just fills pages with either disputed or less useful history about things less relevant to the "new normal" about the new and expanded and deeper mining or chronic drought and climate change in the future that the DEIR either ignores entirely or addresses in an insufficient or unsatisfactory manner. In some ways I learned more about the mine in the Rise current SEC Form 10K report discussed at my # 2 than in this disputed DEIR.

**Ind 254-75**

**Also, while the DEIR acknowledges (at 4.7-19) that in CEQA Guidelines Appendix G there are special concerns for nearby airports (as we have here of great importance to us locals for its important use in our wild fire defense), the disputed DEIR ignores the underground mining occurring in the 2585-acres under the airport surface area (which is also not owned by Rise) and instead deals (# 4.7-3 at 4.7-36 and #4.7-5 at 4.7-49) with this airport as if the only impacts were from the small Brunswick and Centennial sites along East Bennett Road.**

8. **Land Use And Population And Housing" DEIR at # 4.9**

**The entirety of my Objection demonstrates material errors, omissions, and flaws in the disputed DEIR claims in its # 4.6 for the mine to be "compatible" with "existing land uses in the area and [to] identify any incompatibilities ..." While the DEIR deficiently mentions some, but not many, of the pertinent CEQA required things about the 2585-acre underground mine, most readers would not realize from those DEIR descriptions that there are thousands of our suburban residences (like my home) on the surface above or around that 2585-acre underground mine or within the larger adjacent surface "impact zone" (eg, where we locals have competing groundwater rights against the mine) or "stigma zone" (eg, where the nearby mine will depress our property values and threaten other rights.) See, eg, my #'s 2, 3.A and N, 4, 5, and 14.** I live on Banner Mountain in the neighborhood just above Idaho-Maryland Road and the Wolf Creek, which is a large suburban area that would be considered a normal suburb, except for the fact that it is full of huge trees that we want to protect from the consequences of

**Ind 254-76**

mine dewatering beneath us 24/7/365 for the next 80 plus years, without adding mining to such environmental stresses from the new normal drier weather and chronic drought from climate change that the DEIR entirely ignores. See my # 8 and 3.M. My property is two other properties uphill from Idaho Maryland Road and Wolf Creek mentioned often in the DEIR. Just within the fenced acre around my house I have 48 trees taller than 50 feet and some heirlooms, all in need of my groundwater that is at risk to the mine (with more such trees in my lower 2 acres). However, like most of my neighbors with similar trees and situations, I still do not know for sure (and the DEIR does not reveal) whether the DEIR will be trying to mine directly underneath my surface owned property, or whether instead (as seems most likely) I am only in the adjacent impact and stigma areas, where I will be competing with the mine, for example, for underground water with my own future well (as will all us locals who can afford to do so) when the droughts inevitably cause NID to cut back on its water deliveries (whether because NID lacks either lacks sufficient water of its own, or because government reallocates NID water to more desperate places). See my # 3.M and N, and 8

**These thousands of us voting residents above and around the 2585=acre mine cannot be dismissed by the DEIR (as we now incorrectly are) as implicitly expendable "rural residences around the site" (which is a misleading DEIR reference I expect only to the area**

121

**just around the small Brunswick and Centennial sites owned by Rise). In any case, such DEIR attempts to diminish our surface owners' rights is materially misleading and fatal to the entire DEIR. See my # 3.A, E and N, 4, and 14. Why? Because by threatening our property values, environment, and way of life for us thousands of local SUBURBAN resident voters, the DEIR could trigger not just perpetual legal and political disputes and resistance to the disputed DEIR mining, but also competition for our shared resources with us locals exercising our own property rights, such as to our shared NID and groundwater. See my #'s 3.N, 4, and 14. Because of the admittedly economically fragile (and I believe infeasible) condition of the DEIR plans (see my #2 and DEIR admissions at 6-14), those perpetual disputes and competition with us locals at risk doom the long-term viability of this DEIR mine, raising one of many questions not addressed by the DEIR: What happens when we stop the mine after it starts? See my #'s 13 and 15 and my many rebuttals (eg, my # 3.K) to DEIR's "Non-CEQA Analysis" at its 4.3-103-04. (Hint: the reality is that it would be best never to reopen the mine than to stop and start, but the sooner it stops the better.) That should be obvious from what should have been disclosed in the DEIR, which, however, never acknowledges the full reality for us living above and around the 2585-acre underground mining, including by usually focusing only on the fewer around the small Brunswick and Centennial sites and 30 wells along East Bennett Road.**

Such DEIR flaws lead to absurdity, since us surface owners and users above and around the 2585 acre underground mine have the greatest conflicts with the DEIR and the mine, as you would expect when this no net benefit mine is threatening to trash our property values, environment, and way of life, while imposing many new burdens, risks, and problems on us, such as draining our ground water for transport downriver somewhere else at a time of chronic climate change dryness and drought, as described in my #'s 3.A,B, D, E, F, and M, 4 and 5. Contrary to DEIR #4.9.4 "Impacts And Mitigation Measures" (including cumulatively as stated at 4.9-27), the disputed DEIR cannot satisfactorily resolve such burdens, risks, and problems about which locals like me complain, when the DEIR wrongly ignores or consistently underestimates our such concerns, as illustrated in this Objection and others. **Despite all these errors,**

**Ind 254-76**

**omissions, and deficiencies, somehow the disputed DEIR demands at 4.9-19 an 80-year mining permit for 24/7/365 operations in the alleged interest of ensuring "consistency with all other plans and policies," all without addressing our local concerns or even providing data beyond 20 years (or after 2040). See my # 3.M. The disputed DEIR "Conclusion" at 4.9-24 by errors, omissions, and deficiencies is wholly wrong to allege the following unsubstantiated opinion: "Overall, the proposed project would not cause a significant environmental impact due to conflicts with a land use plan, policy, or regulation ... therefore, this impact is less than significant. "(**I will not repeat the words of my initial reaction to reading that worse than nonsense, but that general contempt seems to be the most common reaction to this DEIR effort to promote another "alternative reality.")

**9. "Noise And Vibration" DEIR at 4.10**

**Ind 254-77**

**Noise and vibration are among the many issues of local concern that the DEIR chooses to ignore regarding the 2585-acre underground mine by pretending that the CEQA "project" is**

**mostly just about the Brunswick or Centennial site and 30 wells along East Bennett Road. (The disputed DEIR also purports to treat the Centennial site as if it were a separate CEQA "project," which it is not.) While DEIR #4.10 cites to technical experts (eg, Appendix L and M for noise and blasting), it is not even clear from the DEIR that they asked them the right questions about the 2585-acre underground mine beneath thousands of us surface owners and users, such as are illustrated in my Objection and others. That is why CEQA court**

**Ind 254-77**

**interpretations forbid such vague cross reference in a DEIR to such allegedly supporting materials, as I illustrate in my #1 # 14 and detail further in my supplemental CEQA brief. (Remember the old saying that often applies when someone manipulates data by how they ask the wrong question: "garbage in, garbage out.") If those responsible for the disputed DEIR do not ask the right questions, they cannot produce correct and useful answers. If those responsible did ask some of the right questions, but declined to share the full answers, that also must cause the rejection of the DEIR, among other things.**

Based on the noise and blasting reports in Appendix L and M and the absence of clarity on this issue, it appears that the disputed DEIR only attempted to study the small Brunswick and Centennial site areas owned by Rise, but not the key 2585-acre underground mine where thousands of us suburban residents live on the surface above or around that continuous mining noise and blasting. Certainly, the DEIR maps for sensors don't show any sensors where thousands of us live above the 2585-acre underground mine. (For example, the testing and proposed monitoring/"sensitivity receptor" locations, like shown on Figure 4.10-2 and -3, do not include the areas where us mine opponents are living above and around the 2585-acre underground mine.) Since the disputed DEIR admits (see, eg, my #'s 3.A, B, C, D, E, F, G, H, J, L, and M, and 4, 5, 6, 7, 8, 9, and 10) that mining involves 24/7/365 blasting, drilling, rock removal, shoring up with toxic hexavalent chromium cement, and other noisy and vibrational activities under the 2585-acre underground mine above or around which surface thousands of us live, we naturally want to know how much our houses and trees will shake, vibrate, or otherwise react, as well as what noises will be heard by us or our animals. DEIR Appendix L and M describe principles, some of which are alarming, but they do not apply those principles to where we live above and around the 2585-acre mine beneath us.

**Ind 254-78**

Consider, for example, the brief discussion of the so-called effects of ground cover, which the disputed DEIR admits at 4.10-24 is a key variable, stating the principle to be: "The degree of sound absorption applied to each noise source at each receptor varies depending on the type of ground cover and distance between the noise sources and receptors. … Where the ground between the noise and receptor consists primarily of hardscape, the model applied positive offsets to account for reflections of sound from those surfaces." **Applying such principles to the area above the blasting and mining in the 2585-acre mine area directly below or around our living surface where they omitted and ignored "receptors," why should we not expect the fractured hard rock directly between us to carry even what the DEIR 4.10 and Appendix L and M would consider prohibited amounts of noise and vibration into our homes above and around the 2585-acre underground mine? Telling us to relax, because the noise and vibration from the Brunswick site is too far away to hurt us, ignores the fact that the source of our threat is not just at the Brunswick site, but also under our own property!**

**Consider, for another example, the disputed DEIR at 4.10-52 to 59, where they discuss blasting at where they put "receptors" at the Brunswick and Centennial sites to consider**

123

**"nearby residences" TO THOSE LOCATIONS [BUT NOT ABOVE OR AROUND THE 2585 ACRE UNDERGROUND MINE WHERE THE ACTUAL BLASTING AND MINING IS OCCURRING UNDERNEATH US]. THIS CANNOT BE A MERE OVERSIGHT, BECAUSE THEY CONSIDER THE BLASTING EFFECT AT THE MORE DISTANT HOSPITAL AT 4.10-55 AND DOWNTOWN GRASS VALLEY AT 4.10-56. SO, WHY IGNORE THE MOST IMPACTED AREA ABOVE AND AROUND WHERE THE ACTUAL BLASTING OCCURS IN THE 2585-ACRE UNDERGROUND MINE? DO THEY THINK WE WON'T NOTICE UNTIL THEY THINK IT'S TOO LATE? What good are the more distant mitigation "Ground Vibration Monitoring Program" devices that do not report the most relevant blasting and mining noise and vibration at its source below the feet of the thousands of us resident voters living above and around the 2585-acre underground mine? Please note, mistaken approval of this disputed DEIR would not end the resistance to these 24/7/365 threats for 80 years from those of us above and around the 2585-acre mine and delaying legal and environmental justice for us locals will make everything worse for all concerned.**

**Ind 254-78**

There is no satisfactory answer offered in the disputed DEIR to those and other questions in this Objection (see, eg, my # 15), which evasions by themselves should be sufficient to reject the flawed and deficient DEIR. If the correct answer were that the hundreds of feet of rock between their mining and our surface were a sufficient insulator, why not tell us that? We can only assume that they would share any good news, even if there were something they could also try to "spin" (as the DEIR often does) as if it were good news. Therefore, we assume there are some inconvenient truths that they do not want to share with us. For example, with that maze of old and new underground tunnels in the 2585-acre DEIR mine beneath where we live on the surface, will all that underground noise and vibration be magnified or echo or otherwise broadcast to the surface? If government decision-makers do not compel complete and truthful answers on this and other burdens, risks, and harms, and they approve this deficient DEIR anyway, they will share the blame for the predictable reactions of thousands of local residents enforcing competition, legal and political rights as described in my # 3.N.

**10. Some Air-Quality Errors And Omission to Consider from DEIR #4.3 And Elsewhere**

**Ind 254-79**

As a general matter, I defer to other objectors whose work I incorporate on the air quality risks and problem. Nevertheless, I note some illustrative errors and omissions, and I describe the way that this private project with no net benefits to our community (see my # 4) could crowd out other opportunities for our people and more desirable businesses to use the air within the safety tolerance margins. **Consider, for example, that this 24/7/365 mining for 80 years is going to exhaust our pollution tolerance capacity, so that new and beneficial businesses cannot come here to operate. Worse, mine operations will reduce the opportunities for us locals to continue our historical practices, such as to burn our leaves and cuttings to reduce fire risks, and, as the regulations get stricter even prohibit burning wood fires (as is occurring already, for example, in Contra Costa County in the Bay Area, because of the oil and gas production facilities there exhausting the tolerance standards.)** In the future that is ignored by the disputed DEIR, which resolutely looks only to the often-irrelevant past, that is a poor means of predicting our future with climate change, when all of us would be

competing with this DEIR mine over what we can do without exceeding the aggregate limits of what is tolerable in our decreasing environment. Whatever that tolerance margin is from time to time, this mine will be exhausting too much of whatever is left available for the rest of us locals and for more desirable newcomers, unless we can at least subordinate the mine's pollution rights on the basis that people and desirable businesses should have priority over undesirable, burdensome resource exploiters like the mine that add no net value to our lives and export their profits elsewhere. See, eg, my #'s 3.N and 4.

**Ind 254-79**

**More importantly, mine efforts to reduce its air pollution, especially of dangerous materials (eg, asbestos), has adverse effects on our other local environmental concerns. For example, the disputed DEIR admits (at 4.3-49) that they "assumed that about 11 million gallons [of water] would be required [ie, wasted] for construction dust suppression." Even worse, the DEIR states on that same page in discussion of the mine's "Surface Fugitive Dust Controls": "To account for dust control measures ... the assumption was made that that active work sites would be watered at least two times daily, resulting in an approximately 55 percent reduction of particulate matter." However, when chronic climate change drought and water controls limit NID and other water use, as is ignored in the DEIR, but nevertheless is inevitable as an inconvenient truth, that means either (i) our precious water will be wasted for such "dust control," or (ii) our particulate air pollution will be 55% worse than projected from the mine, leaving the obvious solution to that dilemma of simply shutting the mine that never should have been reopened in the first place.**

Incidentally, this is another "bait and switch," since all that water waste was not disclosed where it should have been in the DEIR water discussion that was already deficient (see my # 3.E). By separately burying those details here, the DEIR creates confusion and conflict, because we don't know how this water use relates to the depletion concerns, we have not just from our groundwater, but also from our competing rights to NID, as we blunder further into shortages on account of climate change droughts and dryer weather that the disputed DEIR ignores.

**11. "Wildfire" DEIR at 4.13**

**Ind 254-80**

As discussed at my #'s 3.A, B, D, E, F, K, M, and 5, the depletion of our groundwater below the surface on which thousands of us live above or around the 2585-acre underground mine threats to amplify the harms to our local forests and plants from the drying and drought from climate change. That mine and dewatering work and water waste could harm our already overstressed forests and plants, adding many other adverse environmental side effects, such as more fire smoke (from drought effects increased by the mine increasing fire risks, as described in my #'s 8 and 10) to further erode our air quality concerns. The DEIR errors and omissions regarding its electrical generator backup discussion and Public Safety Public Shutoffs (PSPS) also need to be addressed, as described at my # 3.J and 10, for example, also harming our air quality with much greater backup generator use than the DEIR imagines and competing with more important uses for our tolerable air than this undesirable mine adding no net benefit (see my # 4). All these and related matters dealing with the 2585-acre underground mining activities are ignored or insufficiently addressed in this disputed DEIR's 4.13 wildfire discussion, including as

to what such matters add to the cumulative impact errors and omissions at 4.13-28. See my fire smoke discussion in my air quality objections above at #'s 3.J and 10.

**12. Errors And Omissions As To the "Statutorily Required Sections" At DEIR # 5**

**A. Introduction**

**Ind 254-81**

This section overlaps with the many errors, omissions, and deficiencies which I have addressed throughout this Objection, as well as responding to additional problems with DEIR #5. Unlike elsewhere in this Objection, where I have organized my comments around logical or other important concerns, rather than the often dysfunctional and strategically obscuring approach the DEIR uses in spreading its data in less subject related areas, for these CEQA Guideline section 15126.2 matters I will comment here on each topic in the order presented the DEIR, rather than in order of importance or of my personal priority impact concerns.

**B. "Growth Inducing Impacts" DEIR # 5.2**

**Ind 254-82**

I defer on this topic to other objectors who I are better qualified to address this topic. See my #'s 3.N and 8. However, I note that our problem may be the opposite: that the mine destroys the kind of quality growth opportunities we want for attracting desirable people and businesses by this undesirable mine exhausting our capacity to deal with climate change, margins of tolerance for environmental stress, water shortages, our already grade F air quality, etc. Apart from the trivial number of miners attracted here for mine work, the danger is that the mine attracts more undesirable businesses like the mine in the way of the old saying that "the rotten apple spoils the barrel." That is what happened in the Bay Area to Richmond from Chevron and to Benicia from Valero. We do not want to become known here as a place where exploitive businesses can come to add environmental burdens, problems, and risks, because our government has shown tolerance for such abuses of our local residents. That threat of attracting more such unwanted businesses will be another motivating reason for us voters to hold mine supporters accountable in the future elections. See # 3.N.

**C. "Cumulative Impacts" DEIR # 5.3**

**Ind 254-83**

There are many cumulative impacts addressed in this Objection (and other objections to which I defer and incorporate, like the CEA Foundation and Friends of Banner Mountain, as discussed in my #1) that the disputed DEIR has understated, ignored, or otherwise stated incorrectly or in an misleading manner, contrary to CEQA Guidelines # 15130 and other applicable law, as illustrated in almost every section of this Objection and addressed with some legal technicalities in my # 14 and my supplemental brief. There are many kinds of impacts, such as, for example, the kind of competition that I demonstrate over groundwater and NID water as climate change, drought, and drier weather (generally ignored by the DEIR) force those of us living above or around the mine or otherwise drawing from the same underground water sources into drilling our own wells for our own shares of our groundwater. See, eg, my

#'s 3.N and 4. Note that we surface residents resisting the mine are trying to save our trees and surface vegetation (and reduce the fire risks and smoke harms of a drought dead forest), which are water uses for the common good of our community. In contrast, the mine dewatering waste of our groundwater would remove it from our community to somewhere else downriver with little or no realistic chance of adequate recharge or balance. See my #'s 3.A, B, D, E, F, M, and 5. Similarly, such fire smoke pollution caused by the mine, added to the mine's own DEIR understated air pollution, has the effect of exhausting the cumulative margin limits for what can be tolerated, thus creating competition between historical residential uses (eg, burning fire risk dangerous vegetation, and wood fire heating of homes) versus the undesirable mine uses which should be avoided all together from this no net benefit mining. See, eg, my #'s 3.J and N, 4, 10, and 11.

Moreover, as discussed above and in my #'s 3.N, 4, and 8, these undesirable mine uses may prevent future approval of desirable businesses and residences, because the mine abuses (usually worse than revealed in the disputed DEIR as explained in this Objection) exhaust the capacity of our community to tolerate any more environmental burdens. **Stated another way, the mine prevents our community from improving with quality growth by this exploitive mining use that adds no net benefit and exhausts our environmental tolerance capacities. See, eg, my #'s 3.N, 4, and 8. Note that the disputed DEIR at 5-3 admits that the "incremental" mining impositions can create "cumulatively considerable, and, thus, significant [impacts] when viewed together with environmental changes anticipated from past, present, and probable future projects."**

**Ind 254-83**

**Since (as the DEIR admits at 5-3) CEQA requires the lead agency to "define the relevant geographic area of inquiry, I remind you that the DEIR generally misstates that area to be just the small Brunswick site and/or the Centennial site, plus 30 wells along East Bennett Road. See my #'s 3.A. B, E, 4, 8, and 14. That flaw is especially true as to water and land use issues that are incorrectly analyzed in the DEIR's purported and disputed "Project List" at 5-4 -8 and Tables 5-1 and 5-2. The key area (ignored by the DEIR) is never any less than the surface above and around the 2585-acre underground mine and is often the whole surrounding broader "impact zone" (where, for example, us surface residents and voters compete with the mine for shared groundwater) and "stigma zone" (eg, where our real estate values are to be depressed by the mining burdens, risks, and problems) or our whole community. See my #'s 4, 8 and 14. See also my # 4, discussing why that local area impact must be given special weight by government decision-makers over the views of others in the county at a safe distance beyond the mine impacts. If the locals suffer disproportionately for the imagined benefit of others at such distance, this will trigger the kinds of disputes and divisive conflicts our county should avoid, because, as with the State Supreme Court's analysis in the public sewer plant and other cases in my #4, us disproportionately affected locals have special rights.** Here that is even more true, because this mine has no net benefit to anyone besides the foreign investors receiving its profits, and we have potential legal and political disputes between the owner of an underground mine with the competing owners of the surface 200 feet above and around the mine and others in the impact or stigma zones. See, eg, my #'s 2, 3.N, 4, and 8. Please note that these residents and voters (like me) are here already contributing to the community with minimum adverse effects on the environment. However, if the disputed DEIR and mine were approved, we would be in perpetual conflict and competition

127

**Ind 254-83**

against this 24/7/365 mining for 80 years that, in many ways ignored, underestimated, or otherwise unsatisfactorily addressed threatens us locals' property values and uses, our safety and environments, and our quality of life for a project of no net benefit to our community (see my #3.N, 4, and 14). Since there is no way to reconcile us locals to suffering such harms, risks, and burdens, the government decisionmakers need to consider all the cumulative legal and political consequences of approving this deficient and unsatisfactory DEIR and its undesirable mine. See my # 3.N, 4, and 14.

**D. "Energy Conservation" # 5.4**

**Ind 254-84**

The DEIR comments basically incorporate other DEIR sections, and I, therefore, do the same where I have disputed and objected to those other referenced DEIR commentaries.

**E. "Significant Irreversible Environmental Changes" at # 5.5**

**Ind 254-85**

**While the DEIR admits causing some of these "irreversible environmental changes" at 5-8, although not in a satisfactory manner or to a realistic extent, the DEIR ignores many that are required to be disclosed and addressed pursuant to CEQA Guidelines 15126.2(c). Anything that threatens to endure 24/7/365 for 80 years in our suburban (not rural) community should be treated as the equivalent of irreversible, especially since once started the mine will have its own continuing adverse consequences after the shutdown. Moreover, since the DEIR stops future predictions and assessments in 15 or 20 years of an 80 plus year project (typically at 2040), there is no legal or other basis for the disputed DEIR or its advocates to contest that its harms are not "irreversible." To try and operate a mine like this is utterly incompatible with our existing and desirable suburban uses. For example, the hexavalent chromium shoring up the underground mine (eg, my #'s 3.C, G, and H and 7) will remain a perpetual threat, our depleted groundwater may never fully recover (ie, recharge and balance as incorrectly imagined in the DEIR) in the "new normal" climate change droughts and dryness (eg, my #'s ), and our dried out, surface loss of forest cover (especially with fire risks) from mine dewatering (eg, my #'s 3.A, B, D, E, F, L, and M, and 5).**

As admitted by the DEIR at 5-6 to be a consideration for such 15126.2(c) change, this "project would involve a large commitment of nonrenewable resources," such a underground water needed by surface owners and users above and around the 2585-acre mine that will be depleted without any satisfactory reason to expect it to be replenished (ie, recharged) in the climate changed "new normal" future of drought and dryness addressed in my #_____, especially as us more and more of us surface users compete for our own underground water by drilling more wells to our own groundwater as NID cuts back, either because it is short of supply or because government reallocates NID supplies elsewhere to more desperate places. See my # 3.N. Killing our already drought stressed local forests with such water depletion is another change that makes our local climate problems worse. As noted, as local victims realize their fate and their own legal rights, many other legal consequences will flow with adverse consequences both admitted (although understated by the DEIR), as well as those ignored or not satisfactorily addressed in the disputed DEIR. See, eg, my #'s 3.N, 4, and 14.

Ind 254-85

As admitted by the DEIR at 5-6 to be a consideration for such 15126.2(c) change, this "project would generally commit the future generations to similar uses." The problem here is that, if we locals stop the mine after it starts, whether by our competition (eg, my # 3.N, such as drilling our own wells to our own groundwater being wasted by the mine), by exercise of our legal and political rights (my #3.N), or otherwise, the DEIR advocates and miner will try to argue that the mine cannot be stopped without more adverse consequences, like those it already argues in disputed DEIR at # at 4.3-103-04 as "Non-CEQA Related Analysis" issues. The time to have that debate about the early DEIR mine shut down consequences is now before mining starts, because us locals regard the continued mining operations as worse than any shutdown consequences. In any case, the time for the miner to reveal its position is now in this DEIR. That way the miner will either be forced to admit now before starting the more serious and previously unexplained consequences of mine shut down to the community, or else the DEIR advocates will have legal difficulties trying to raise those undisclosed issues later, when the mine stops or is shut. Depending on what is revealed in that "now or never" demand for disclosure by the DEIR miner, government decisionmakers hopefully can avoid a difficult future choice among competing burdens, harms, and risks by stopping the mine process now.

**As admitted by the disputed DEIR at 5-6 to be a consideration for such 15126.2(c) change, this "project involves uses in which irreversible damage could result from any potential environmental accidents associated with the project." Those "accidents" are assumed here to include this miner mistaking the harmful consequences of its conduct unless such responsible people wish to accept the consequences of their admitting to intentionally and knowingly causing harm. For example, the utility officers alleged to be responsible for the water pollution of hexavalent chromium that killed the town of Hinkley, California, as illustrated in the *Erin Brockovich* movie, claimed excuses and mistakes. That is also an example that is applicable here. Similarly, ignoring the realities of climate change and depleting our groundwater with such harm to our surface environment and uses is also such an accident. There will be many "I told you so" situations to come, if this mine and the disputed DEIR are approved, and unless the advocates are willing now to accept the consequences of causing knowing and intentional harms, they should now address those possible "accidents," where they are proven wrong about the risks, issues, and problems they have ignored in the DEIR and otherwise in response to this and other objections.**

As admitted by the DEIR at 5-6 to be a consideration for such 15126.2(c) change, the "phasing of the proposed consumption of resources is not justified (eg, the project involves a wasteful use of electricity.)" Among the many resources that are wasted by this no net benefit and undesirable mine are both NID and ground water and clean air margins for tolerance (eg, competing mine air pollution versus the local burning of wood stoves for heat and vegetation for fire suppression). See, eg, my # 4. Remember that as to dewatering the mine, for example as discussed in my #'s 3.D, E, F, and M and 5 water waste discussions, the disputed DEIR contemplates massive depletion of our local water to move it somewhere else downriver, on the disputed and incorrect assumption (based on irrelevant and nonpredictive history about average rain between 1967 and 2017) that the local underground supply will recharge somehow, despite ignoring the "new normal" of climate change, drought and dryness and the consequent competition from those of us locals who will begin drilling wells for our own groundwater rights to save our surface forest and vegetation and to reduce our local fire risk

129

**Ind 254-85**

(remembering that our exclusive "surface" right above the 2585-acre underground mine is admitted in Rise's 10K to be 200 feet deep, and our groundwater rights continue below that for those above the mine and exist without limitation for those of us living around the mine.)

**F. "Significant And Unavoidable Impacts" at DEIR # 5.6**

In that section the disputed DEIR admits that it has summarized "significant and unavoidable impacts of the proposed project." While those listed are understated or unsatisfactorily stated and, in some cases, could be partly mitigated, there are many others that are ignored, deficiently addressed, or debatable. More importantly, as admitted by the data in Rise's current SEC 10K and 10Q filings and addressed in my # 2, Rise does not presently have the financial capacity to even open the mine, much accomplish safety actions assumed in the DEIR or to do such mitigations as it proposes. Also, as noted above, many problems are worsened by insistence on 24/7/365 operations for 80-years solely because of Rise's arbitrary and undisclosed profit goals and revealed financial stresses, which are not satisfactory reasons for refusing to mitigate all these environmental burdens, risks, and harms. See my #'s 2, 4, and 14, addressing the Rise financial issues (eg, see Rise's 10K, including the high interest rate escalating to 25% on the $1,000,000 loan secured by the mine and the lack of adequate working capital and cash for the project work and mitigation contemplated in the DEIR inspiring their accountant to issue a "going concern" warning qualification to those financial statements.)

**Ind 254-86**

Besides the problem identified in DEIR #4.1-2 **and 4.1-4,** degrading the visuals is also likely from the depletion of our local groundwater for wasteful dewatering that will not recharge in the "new normal" of climate change chronic drought and dryness as our local water is disposed of downriver somewhere else. See my #'s 3.A, B, D, E, F, and M and 5. We now live in a beautiful forest. When the already drought stressed trees and other plants die or suffer from the lower water table, nothing will be the same, especially if and when all those dry trees burn in a coming wildfire. When *Sunset Magazine* named Nevada City as one of the best places to retire in 2015 (as I recall), no one contemplated such mining in a suburban area above a 2585-acres underground mine under such circumstances.

Besides the problem identified in DEIR #4.10-1, the noise levels will be higher merely from the extraordinary 24/7/365 operations for 80 years, with all the rock crushing, machinery work, constant big truck loading and transport for 50 to 100 trips a day, and other things this DEIR mentions happening without adequate assurances of noise abatement. This will likely end up being monitored by locals and tested by locals under nuisance laws, as well as becoming a local political issue to create a suitable noise ordinance. Also, this DEIR discussion ignores the consequent noise caused by defensive work above and around the 2585 acre mine, such as everyone drilling wells for their groundwater to protect their surface trees and other plants from harm from mine dewatering depletion, from repairs to local infrastructure harms by differential settlement of the surface improvements by ground water depletion, and other defensive reactions.

Besides the problems admitted in disputed DEIR 4.12-1, 4.12-8, and 4.11-10, traffic is compounded and made worse for the same reasons stated above from unnecessary 24/7/365 operations for 80-years. If financial distress or lust for higher profits were excuses for 24/7/365 operations, many desirable local businesses would be demanding that right. Why favor such an

exploitive and undesirable mine with no net benefits with such extraordinary leniency on hours of operation that create burdens, risks, and harms to the thousands of local residents and voters living on the surface above and around the 2585-acre underground mine? Who wants 50 to 100 big trucks coming and going 24/7/365 for 80 years on our key roads not made for that?

One unaddressed example for partial mitigation is to reduce the 24/7/365 operations for 80 years. (By considering and rejecting a 12-hour day, the DEIR admitted that would make the mine economically infeasible. If that exhausts their feasibility margin, then the mine was never feasible at all, especially for someone in the weak financial condition revealed in the Rise 10K and 10Q.) Since our governments do not allow even most desirable business to operate on that basis, it is incomprehensible to us locals subject to these mining burdens, harms, and risks that government would allow such an extraordinary exception to an undesirable mine with no net benefit (see my #'s 3.N, 4, and 8), when that intensity makes many of our local burdens, risks, and problems admitted in the DEIR or in this or other objections much worse. Another partial mitigation would be to drop the plan to shore up the underground mine with toxic hexavalent chromium cement paste that made Hinkley, CA into a ghost town with oversized graveyards and casualties and into a reality horror movie called *Erin Brockovich*. Other examples abound in this Objection and others.

**Ind 254-86**

**13. Alternatives Analysis at DEIR # 6**

I defer to others as to this debate because there is no acceptable alternative to rejecting the DEIR and keeping this mine closed, preserving the status quo since 1956. However, the less mine operation burdens, risks, and harms like those I have identified, the better. The disputed DEIR analysis in its #6 of alternatives, in its summary (at 6-3 to 7) of what purports to have a less than significant or no impact with or without mitigation is disputed and demonstrated to be wrong by this and other objections. What the disputed DEIR admits being "significant and unavoidable" at 6-7 is also disputed as insufficient and wrong, especially as to any mitigation. The whole idea of operating such an undesirable goal mine in the middle of our **suburban** community (ie, the area above and around the 2585-acre underground mine, if not the Rise owned sites) is absurd on its face, even if that were done by an operator who had the financial capacity to preform, mitigate, and comply with its legal obligations and DEIR mitigation and safety goals. I have seen no proof of such financial capacity by Rise, and its financial credibility is subject to question considering its admissions in Rise's current SEC form 10K and 10 Q filings, as I explain in my # 2. Our community has better uses for our resources. The last thing we need, as our community confronts climate change, political conflicts, and other serious problems, is this kind of protracted legal and political disputes and competition for local resources that are inevitable over such an undesirable, no net benefit mine with the potential to cause us locals to suffer chronic burdens, harms, and risks. See my # 4.

**Ind 254-87**

The disputed DEIR dodges many questions about its requested 24/7/365 mining operations for 80-years, often by citing its disputed argument that under CEQA that "an EIR is not required to analyze alternatives when the effect of the alternative 'cannot be reasonably ascertained and whose implementation is remote and speculative.'" First, that exception does not apply to the climate change unprecedented dryness and drought addressed in my Objection

and others. Note that by the disputed DEIR resisting discussion of foreseeable burdens, risks, and harms at all or beyond the first 20 of its proposed 80 years of operations (typically, with 2040 cutoffs), the disputed DEIR admits that it regards those last 60 years as unknowable and speculative. How can government responsibly approve such mine operations 24/7/365 for 80 years where there are so many serious burdens, risks, and harms admitted in the DEIR and asserted by this and other objections? How so, especially when all the current science (and all our human experience in recent years) proves that climate change will make this area increasingly subject to continually worsening dryness and drought that make the DEIR predictions of the future from its calculation of average rain fall between 1967 and 2017 into an offensive joke? See my #'s 3.A, B, D, E, F, and M, and 5.

Second, even as to the first 20 years of mining the disputed DEIR purports to consider, the DEIR's disputed analysis contains errors, omissions, and other misleading data that grossly understate the mine's burdens, risks, and harms. That reality of the disputed DEIR failures and worse for the first 20 years (or 2040) should it harder for any responsible government to blindly give the mine a blank check for whatever happens in the next 60 years plus. No permits should be allowed beyond the willingness or ability of the miner to describe all the CEQA issues correctly and comprehensively for the entire period of mining. If this miner declines to provide any sufficient and correct data beyond 2040, then there needs to be another DEIR at that time before any extension.

**Ind 254-87**

Third, those thousands of us who live on the surface above or around the 2585-acre underground mine (with Rise mineral rights only below 200 feet and not even then exclusive as to groundwater and some other things, as admitted in its 10K at my # 2) generally do not believe the disputed DEIR is an accurate and satisfactory description of our burdens, risks, and harms at issue. The DEIR ignores the fact that us thousands of objecting neighbors have our own competing legal and political rights to our groundwater, to subjacent and lateral support under our surface to prevent subsidence, to quiet enjoyment of our property, and other community and environmental benefits that we moved here to enjoy without the disruptions and worse threatened by this mine. See, eg, my #'s 3.F and 5. Indeed, even those in the adjacent stigma zone around those of us impacted neighbors will suffer loss of real estate value, environmental quality, and other benefits to which they have been accustomed. See my # 4. What that means is that those of us above or around this 2585-acre underground mine (including those in the larger stigma zone) have too much to lose by tolerating this DEIR mine. Therefore, besides enforcing our legal and political rights and defenses to persistently resist these DEIR threats, risks, and intrusions, we can also be expected to exercise our competing property rights. For example, as explained in my # 3.N and 4, our resistance likely will include saving our surface forest and plants from the mine's wasteful ground water depletion threat by exercising our competing rights to sink more wells to catch our groundwater before the mine dewatering process sends it away downriver somewhere else. That surface owners versus underground mine competition over our local groundwater will become more intense when our NID water is cut back by shortages or governmental reallocations. See, eg, my # 3.M and 8. That local competition is not "speculative," since that is already the consistent pattern throughout the State wherever there is insufficient surface water for traditional human and plant use. Since none of us locals can be expected willingly to suffer for the benefit of this no net benefit mine (see my # 4), government DEIR or mine approval will likely trigger both disputes and

**Ind 254-87**

environmental resource competition with the mine that will endure and become more intense over the years, as us locals increasingly have more occasions to say, "we told you so."

**As the disputed DEIR admits at 6-2 as a CEQA requirement at Guideline 15126.6(e)(2): "The specific alternative of 'no project' shall also be evaluated with its impact. The purpose of describing and analyzing a no project alternative is to allow decision-makers to compare the impacts of approving the proposed project with the impacts of not approving the proposed project." This disputed and insufficient DEIR utterly fails to provide a fair comparison for those purposes, not only to what are errors and omissions in the disputed DEIR, but even as to what portion of reality it admits existing. Since from Rise's current 10K and 10Q financial reports (see my # 2 and those admitted "going concern" warnings from Rise's accountant and management and Rise's lack of any assurances of proven or other reserves of gold), it appears that Rise may not be capable of funding even what the disputed DEIR expects to accomplish as to safety, compliance, operating performance, and mitigation. Also, this DEIR must address what happens if it starts its operations and is unable to continue. In other words, one essential comparison is between the current no mining situation, and any alternative that cannot be accomplished by Rise for lack of sufficient money or otherwise. See my #'s 2, 13, and 14. Since the DEIR ignores most of the issues addressed in this and other objections, the increasing climate change, financial and political stresses, and other mine lender or investor risks will likely make fund raising more challenging for Rise. See my # 2.**

**Ind 254-88**

Thus, when the disputed DEIR insists that governmental DEIR and mine decisionmakers should ignore this and other objections as "speculative" or "remote," we counter that it's the miner's ability to perform and comply that is speculative and questionable, as is their ability to finance all that is required even by the insufficient DEIR for CEQA compliance or even feasibility. See my # 14 and my supplemental brief, where I offer to brief any legal questions as to why the DEIR fails to comply with CEQA or its Guidelines in scores of ways demonstrated in this Objection and others. The DEIR must be judged to be even more deficient and noncompliant, when it must be redone to consider all the corrections and altered economics that must occur to correct the disputed DEIR's errors, omissions, and deficiencies that I identify in this Objection and to deal with the harsher realities the disputed DEIR has ignored. **When the DEIR cites at 6-2 to CEQA Guidelines 15126.6(e)(2) as requiring in this "no project situation" choosing "an environmentally superior alternative among the other alternatives," it chose the wrong one (see my # 13) and must choose another one that is financially feasible without speculation. See my # 2, demonstrating why even from Rise's own financial 10K and 10Q filings any improvement in those questionable financial prospects would be speculative, as its own accountant admits with its "going concern qualification" and warning in those financial statements.**

Among the disputed DEIR deficiencies, errors, and omissions are many in the "Selection of Alternatives" discussion at 6-8 et seq. For example, all the DEIR mining alternatives should be eliminated by its own stated standards (at 6-8) from Guidelines 16126.6(c), since, among other things:

(i) There is a failure of the mine under any DEIR proposed approach **feasibly** to "meet most of the basic project objectives" (at 6-2) in compliance with applicable laws and regulations, as noted above and throughout this Objection and others.

133

(ii) The DEIR mining alternatives are all as "infeasible" as the main proposal for all the reasons stated in this Objection and others, including on account of Rise's admittedly uncertain capacity to fund its operations as I explain in my # 2, addressing its current SEC 10K and 10 Q and other factors.

(iii) There is such an "inability to avoid significant environmental impacts" for all the reasons state in this Objection and others.

Note that such "infeasibility" in (ii) is admitted (at DEIR 6-8) to include among other factors: (A) "site suitability" (eg, the mine is no longer in the more rural area when it closed in 1956, but in a modern suburban area where thousands of residents and voters live on and around the 2585-acre underground mine within a forest that needs the groundwater at risk in this mining); (B) "economic viability" (eg, reopening this long closed mine even in accordance with the unrealistic, insufficient, and otherwise disputed DEIR, much less to deal with the realities the DEIR ignores or understates as shown in this Objection and others, will be very expensive [although the DEIR incorrectly ignores all cost and financing issues]. As shown in my # 2, analyzing, among other things, Rise's problematic SEC 10K and 10Q revealed financial condition and lack of gold reserve proof, Rise has demonstrated neither any sufficient working capital nor cash nor equity or debt financing, nor timely gold revenue prospects, to pay for accomplishing even the opening or operation of the mine, including (as shown in my # 2) the 10K's admissions there are no "proven reserves" or other assurances of any economically viable gold production from such operations, even at the lesser DEIR planning level, as distinguished from what more reality and legal compliance would require; (C) "availability of infrastructure" (eg, see the previous feasibility discussion, as well as my objections and others to using hexavalent chromium in cement paste to shore up the new underground mining); (D) "general plan consistency" (eg, see most of my Objection and others); (E) "other plans or regulatory limitations (eg, see most of my Objection and others); and (F) "jurisdictional boundaries" (eg, the disputes between the many owners and users of the surface 200 feet above the 2585-acre underground mine, as well as other adjacent owners whose surface and groundwater rights compete with the mine dewatering waste beneath them).

**Ind 254-88**

**Another example of DEIR failed logic and absurd reasoning is the disputed DEIR conclusion at 6-13 to dismiss all noncontroversial, industrial surface use alternatives, because they would be "more intensive" than this extraordinarily controversial, 24/7/365 mining for 80 years. Ask anyone of us objectors living above and around the 2585-acres underground mine if we can imagine any such commercial/industrial use being more objectionable than the DIR mine, and we would all vote for anything being better than this DEIR mine. Also ask our local real estate brokers, if any such commercial uses would harm our real estate values even one tenth of what this DEIR mine will cost us, and they would all agree that nothing could be as bad as this mine. Even if government decisionmakers rejected all the concerns in this and other objections from those in our community opposition (which would change no one's mind on the merits), this unsubstantiated and absurd contention about that normal commercial use would still be obviously wrong. Nevertheless, please note that when decisionmakers consider the merit of the objections about the 2585-acre underground mine and its "intense" dewatering and other conflicts with us surface owners and users, it should be obvious that the DEIR simply refuses to consider any other reasonable use of the surface area to its own selfish gold profit ambitions that are use least compatible with our suburban**

**Ind 254-89**

134

**community than any mining. This may be why the DEIR so often ignores us thousands of surface owners above and around this 2585-acre underground mine, because it is easier (although still wrong) for the DEIR to pretend the mine is less "intense" if it ignores those most provocative burdens, risks, and harms.**

The list of disputed DEIR operating variable alternatives (at 6-13 to 15) for individual activities likewise appear just to be excuses for insisting on the preferred DEIR plan that all of us objectors find for good cause shown to be intolerable. To illustrate that reality for disputing the DEIR's credibility, I note some examples detailed elsewhere in this Objection. THE MOST SERIOUS AND ABSURD OF THESE DISMISSED ALTERNATIVES REVEALS SOME IMPORTANT REASONS FOR DISPUTING AND REJECTING THE DEIR AND ITS PURPORTED REASONING. AT 6-13 THE DISPUTED DEIR DISMISSES OPERATING LIKE OTHER BUSINESSES FOR 12 HOURS INSTEAD OF 24 BECAUSE: "CAPITAL AND OPERATING COSTS WOULD INCREASE SUBSTANTIALLY AND LIKELY MAKE THE PROJECT ECONOMICALLY INFEASIBLE." THIS ADMITTED VULNERABILITY SHOULD CONFIRM THAT THE WHOLE ECONOMICALLY FRAGILE PROJECT IS NOW INFEASIBLE, AND NO LAW REQUIRES US NEIGHBORS TO TOLERATE 24/7/365 OPERATIONS TO ACCOMMODATE SUCH PROFIT GOALS OF A BUSINESS FOR ITS FOREIGN INVESTORS. IF NORMAL MINING OPERATIONS ARE NOT ECONOMICALLY INFEASIBLE, THAT IS GOOD CAUSE TO DENY THE MINING NOW, ESPECIALLY WITH A FINANCIALLY RISKY MINER LIKE RISE ADMITS BEING IN ITS SEC 10K AND 10Q AS DISCUSSED IN MY # 2. ALSO, IF THE MINE IS THIS VULNERABLE TO ECONOMIC STRESSES, THEN WHAT ABOUT THE OTHER ECONOMIC STRESSES NOT ADDRESSED IN THE DISPUTED DEIR, WHICH GENERALLY FAILS TO DISCUSS ANY ECONOMIC VARIABLES OR COSTS, ESPECIALLY THOSE ASSOCIATED WITH THE OBJECTIONS MADE (AND TO CONTINUE TO BE MADE) BY US SURFACE OWNERS AND USERS ABOVE AND AROUND THE 2585-ACRE UNDERGROUND MINE. For example, if we succeed in preventing 24/7/365 dewatering of the mine, as some may do directly or by competing with more wells for what is also our groundwater, that by itself by the DEIR's own admissions could obstruct that objectionable 24/7/365 ambition. Note that, even if the County were to allow such 24/7/365 operation, the legal and political disputes that would continue could involve many options that could prevent such continuous operations, as could direct law reform as discussed in my # 3.N. For example, when our groundwater objections continue to be processed by our political and legal systems, one consequence could likely be reduced dewatering, a potential the disputed DEIR fails to consider, because (like it ignored climate change and drought) the DEIR refused to address sufficiently groundwater burdens, risks, and harms posed by the mine as discussed in my #'s 3.A, B, D, E, F, and M and 5.

**Ind 254-89**

ANOTHER STRANGE EXAMPLE OF FLAWED DEIR REASONING (AT 6-14) IS CUTTING BACK ON THE AMOUNT OF TRUCKING THAT IS NOT JUST A TRAFFIC PROBLEM FOR OUR COMPETING LOCAL DRIVERS, BUT ALSO THE POUNDING OF THOSE HEAVY TRUCKS FULL OF ROCK AND OTHER MINE LOADS WILL QUICKLY WEAR OUT OUR ROADS AND INFRASTRUCTURE THAT ARE NOT MADE FOR THAT KIND OF ABUSE. RECALL THAT SUCH HEAVY TRUCK RUNS ARE EXPECTED TO INCLUDE "AN AVERAGE OF 50 TRUCKS PER DAY" WITH A MAXIMUM OF A 100 TRUCKS PER DAY." THE WORST PART IS THAT, WHEN THOSE ROADS AND INFRASTRUCTURE MUST BE REPAIRED FROM THAT CONSTANT TRUCKING ABUSE, TRAFFIC ON THOSE KEY ROADS WILL BECOME ALMOST IMPOSSIBLE FOR EXTENDED PERIODS OF TIME WHILE THEY ARE BEING REPAIRED. THE DEIR FAILS TO ADDRESS SUCH CONCERNS ADEQUATELY. Incidentally the

135

supposedly "more intense" traditional commercial/industrial uses would be far less intense that that mine trucking just by itself.

At the end of this flawed DEIR discussion of alternatives (at 6-42): the DEIR concludes: "Based on the preceding alternatives analysis, the No Project (No Build) Alternative would be the environmentally superior alternative." In that case the DEIR insists that "another alternative must be selected to be the environmentally superior alternative." BASED ON THE BOGUS DEIR DISMISSAL OF ACTUALLY SUPERIOR "INDUSTRIAL," NON-MINING USES DISCUSSED ABOVE, INSTEAD THE DISPUTED DEIR PROPOSES ALTERNATIVE 2 "ELIMINATION OF THE CENTENNIAL INDUSTRIAL SITE" AS REDUCING "THE GREATEST NUMBER OF PROJECT IMPACTS." BUT THAT CONCLUSION IS WRONG, BECAUSE THE DEIR IGNORES ALL THE BURDENS, RISKS, AND HARMS WITH THE 2585-ACRE UNDERGROUND MINING AND BRUNSWICK SITE OPERATIONS THAT ARE EVEN MORE SERIOUS AND WOULD CONTINUE WITHOUT REGARD TO THE CENTENNIAL OPERATIONS. IF THE GOVERNMENTAL DECISION MAKERS HOPE TO SOMEHOW ARRANGE A COMPROMISE WITH MINING OPPONENTS, THE DEIR IMPLIED OFFER TO SACRIFICE ITS CENTENNIAL AMBITIONS ACCOMPLISHES NOTHING FOR THE RESOLUTION OF LOCAL RESIDENT OPPOSITION. OUR MOST SERIOUS CONCERNS ABOUT BURDENS, RISKS, PROBLEMS, AND OUR DEPRESSED REAL ESTATE VALUES ALL PRIMARILY RELATE TO THAT UNDERGROUND MINING OF 2585 ACRES FROM THE BRUNSWICK SITE, AND THE "NO MINING ALTERNATIVE" IS THE ONLY WAY TO PREVENT PERPETUAL CONFLICT, COMPETITION, AND DISPUTES WITH US LOCALS USING OUR OWN COMPETING LEGAL AND POLITICAL RIGHTS THAT CANNOT BE ELIMINATED BY ANY MINING APPROVAL. See my #'s 3.M and 4.

**Ind 254-89**

Since the manufacturing/business site Alternative avoids all this conflict, I urge the decisionmakers to disregard the meritless dismissal of that DEIR Alternative at DEIR # 6 by the mine advocates for no satisfactory reason. Too "intense" is absurd in comparison to the "intensity" of this DEIR mining. If any government official doubts that, consider the difference in the "intensity" of the local opposition to each alternative. (The DEIR preferred fallback Alternative idea of dropping the Centennial Industrial Site also won't work, because in reality it's not a separate CEQA "project," but an integrated part of the one mine project and cutting it out would mean a total rewrite of the whole DEIR to conform to that reality and comply with CEQA. See my #14 and my supplemental brief.)

**14. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers In Addressing Disputes Between The Mine Versus Those Of Us Living Above And Around The 2585-Acre Underground Mine.**

**A. Some Reasons For the County As Lead CEQA Agency To Reconsider And Accept My Objections As Consistent with CEQA, Even As To The DEIR's Economic Infeasibility, And A Preview of Some Rebuttals To The DEIR's CEQA Interpretations To Come In A Supplemental Objection.**

**Ind 254-90**

**As explained in my # 1.D, at the public hearing on March 24, 2022, the County began by excluding all consideration of evidence and argument regarding the financial condition and character of the DEIR miner and the financial feasibility of accomplishing key safety and**

136

**Ind 254-90**

**mitigation results assumed in the disputed DEIR, contrary to this and other objections. Since the County had not yet heard any arguments why that position in incorrect under these particular facts and circumstances, I ask the lead CEQA Agency reconsider for reasons stated in this section and in the more technical brief that I expect to prepare before the end of the comment deadline. That is especially important where the DEIR itself makes financial feasibility statements that this Objections rebuts with admissions by the DEIR or Rise in its SEC 10K and 10Q filings about this mine (which is its only significant asset).** Perhaps the County's such ruling was influenced by thinking that objectors might have a more efficient forum for such excluded objections in connection with the County's coming so-called economic study. But I later learned that study also may be too narrow, focused on other things, and may also mistakenly exclude those considerations. Therefore, I urge the County to expand that economic study as well for these and even more of such objections by me and others.

I am aware of the kinds of **factually distinguishable** court decisions where such challenges failed **under different circumstances than these**, and I invite the County to consider my counter authorities in a supplemental legal argument filing soon in support of my position. Please note here, however, that even Rise's own favorite cases do not allow bad faith DEIR claims which are illusory or speculation or bogus assumptions. That is what appears to exist here, since my #2 proves that Rise currently cannot afford to perform the DEIR and mitigations, even as they proposed them, as distinct from what more will ultimately be required by government or courts or local law reforms if the mine proceeds. That fact, largely based on Rise's own SEC filing admissions, makes the DEIR "illusory" and suggests a lack of "good faith." That is especially true given all the DEIR's other "strategic" errors, omissions, and deficiencies exposed in this Objection without any good excuse, such as the DEIR occasionally mentioning the use of hexavalent chromium in the mine shoring cement paste without any mention of it or its dangers in the DEIR's "Hazards And Hazardous Materials." See also my # 3.E and M, where I illustrate other examples of obscuring data, insufficient data, strategic omissions, and other inappropriate tactics prohibited by CEQA cases like *Banning Ranch Conservancy v. City of Newport Beach* (2017), 2 Cal.5th 918, 940-41 ("**Banning**") and *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007), 40 Cal.4th 412, 442 ("**Vineyards**"), each insisting on "a good faith reasoned analysis," rather than scattered or buried data, and unexplained data in exhibits.

In any event, under the applicable facts and circumstances in this case and a correct interpretation of CEQA and its Guidelines and relevant (as distinct from distinguishable or other lower court decisions to be correct by the California Supreme Court), I urge that everything in this Objection be considered. I will explain that position in more detail in a supplemental brief to be submitted before the deadline. (The DEIR contained their disputed legal interpretations of various CEQA requirements, and so it's only fair and appropriate for the CEQA lead agency to consider my counters.) In the meantime, I believe that the DEIR is irreconcilable with the following example California decisions (and relevant cases, statutes, and Guidelines) cited therein, among others to be explained in my supplemental brief. *E.g.*, Sierra Club v. County of Fresno (2018), 6 Cal.5th 502; Concerned Citizens of Costa Mesa, Inc v. 32nd Dist. Ag. Ass'n (1986), 42 Cal.3d 929; POET. LLC v State Air Resources Bd. (2013), 218 Cal.App. 4th 681; Gray v. County of Madera (2008), 167 Cal. App. 4th 1099.

137

**Ind 254-90**

**Please remember, even if the lead CEQA Agency were to disagree with me on the technical CEQA merits of such legal disputes, there is one additional reason no agency or court should ever resist full consideration of this and other objections: legal "impeachment" rebuttal (ie, the use of evidence to contradict false or misleading claims) and especially the use some of the DEIR's and Rise's own words to rebut others. What my Objection does, and other objections could do, is expose with such evidence DEIR's many internal contradictions to prevent the DEIR to prevail inappropriately by exposing contrary or inconsistent statements either (i) within the DEIR, or (ii) in the current Rise SEC Form 10K or 10Q (which, as I show in my #2) discusses many of the same mining related issues as the DEIR is different, inconsistent, or even contradictory ways.** The California Supreme Court's most important lesson about CEQA is the need for both clarity and truth. Objectors like me are entitled to challenge a DEIR that "crosses those lines." Especially at times like this in our divided world's larger conflicts, where constant barrages of false news/propaganda seek to create "alternative realities" (eg, Russia's distortions and worse about Ukraine), it is important to remember that the rule of law itself depends on one clear and truthful reality. The DEIR often can be shown to fail that test, and it needs to be redone to clarify the actual reality of this mine. To do that requires corrections and edits to the DEIR consistent with this and similar objections.

**Furthermore, the County should also allow appropriate consideration of accepted matters to which courts take "judicial notice" as matters of fundamental logic or reality, to prevent obviously false or misleading claims from being accepted by denying contrary such proof. For example, if Rise were to say, "Don't worry about any health or safety rules, because I'll just pay any victims to make them whole" (an exaggerated version of the disputed DEIR claim to cover anyone whose well dries up, which my #2 proves is equally illusory or speculative), that implies that Rise had the ability to accomplish that false claim. Why? Because people are not allowed to just invent nonrealities contrary easily proven facts in the real reality, especially by admission from the person asking a court or government official to join in that fantasy to officially (but incorrectly) pronounce it to become real. When the rule of law applies (and as CEQA must apply here), no naked "emperor" is allowed to insist that he's wearing a fancy suit, because we allow people to say the clear truth that "the emperor has no clothes." This is what my Objection and other objections seek to do about this DEIR. For example, the Rise admissions I cite in my #2 should be allowed to rebut that illusory DEIR assurance that somehow, without even knowing the huge number of affected old and new wells over even a shorter period than 80 years, the miner will supply the needed replacement water.**

**Please remember that the DEIR itself put its financial feasibility into issue for rebuttal by claiming (at DEIR page 6-14) that limiting mining to a 12-hour day made the project economically infeasible. Since DEIR uses that claim to defeat better "Alternatives" and mitigation, the law requires such rebuttals in my Objection and others.** That admission by the DEIR itself at page 6-14, by manipulating the data on "Alternatives" thereby legally "opened the door" for all my economic feasibility arguments, and it illustrates the DEIR's inconsistency. When the DEIR wants to plead poverty like that it does, and when it wants to make implied or express promises of being able to afford whatever mitigation may become necessary (eg, providing water to all dry well owners). The DEIR cannot have it both ways without us being able to expose that nonreality one way or the other. See, eg, my #'s 2 and 13. Yet, when the

138

DEIR discusses (eg, 4.8-66) replacing wells the dry up (besides the 30 along East Bennett Road), Rise's current financial condition and questionable future prospects discussed in my #2 prove (including by Rise admissions in its current SEC 10K and 10Q filings) that it does not have the financial capacity to accomplish such mitigation, especially as the climate change the DEIR ignores forces many of us to drill competing wells to reach our own groundwater as NID supplies are reduced. See, eg, my #'s 3.D, E, F, M, N, 4, 5, 8, and 13. Indeed, that is what the DEIR itself admits it cannot accomplish (at 6-14) if it's limited to a 12-hour workday, as objectors will still demand. A CEQA compliant DEIR would have to disclose such realities, and when (as here) the DEIR fails to do so objectors must be allowed to expose them.

Furthermore, **another DEIR "opening of the door" to my less CEQA-traditional rebuttals is the DEIR's "Non-CEQA Related Analysis" at 4.3-103-04, incorrectly purporting an attempt to show "good faith," but allowing us to prove the opposite if we are allowed to do so. My point on this also includes this related DEIR admission: that some of what the DEIR and apparently the County consider to be outside some disputed CEQA boundary is needed for essential clarity. This means one of two alternative admitted things, either the disputed DEIR CEQA boundary is wrong, or essential clarity of purpose and what they incorrectly consider "good faith" requires going beyond the CEQA constraints. Either way, if the DEIR can include what they call "Non-CEQA Related Analysis," then we objectors must be able to respond and counter in kind.**

**Ind 254-90**

**This cannot be a one-sided process where the DEIR can make any nonfeasible, false, or misleading claims they wish and us, while objectors are not permitted to rebut and expose those claims. The reality is that in many cases the DEIR fails to comply with applicable law, because its purported safety and mitigation assumptions and so-called facts, goals, and contentions addressed in this Objection and others are not only incorrect, deficient, and otherwise noncompliant with CEQA, but also are illusory. The CEQA lead agency must allow us to prove those wrongs by accepting our substantial evidence to the contrary, including fatal admissions by the DEIR and the miner, including as to economically infeasibility. As I prove in my #2 above, Rise and its accountant admit that there are "going concern" financial issues that make its performance at best too speculative and at least as to some things admittedly infeasible. When the miner's account warns the investors to beware that the mining may to be feasible for lack of sufficient funds, how can any responsible government not at least test at least the more obvious DEIR illusions?**

In any event, I make my offer of proof as to admissions, DEIR contradictions and inconsistencies, and other evidence (and their applications) in my #2 and other places in this Objection for the record in requesting such reconsideration to require consideration of my economic feasibility and other rebuttals and counters. More important, as in my #2 and elsewhere I urge the County to ask if Rise is the real party in interest here, or whether they are acting for the real party with the money "behind the curtain." If, for example, Rise were "fronting" for someone else or planning to "flip the deal," that would also create CEQA objections to this DEIR. Since Rise lacks the funding to accomplish this disputed DEIR plan (see my #2), it is reasonable to ask why or for whom they are investing in this DEIR effort.

139

**B. Supplement To Brief Rebuttals To DEIR Or Miner Incorrect Interpretations of CEQA Or Other Applicable Laws And Open Offer For Further Briefing.**

**Ind 254-91**

This Objection contends that the DEIR does not comply with CEQA and for various reasons should not be approved or at least entirely rewritten. To justify errors, omissions, and deficiencies in the DEIR, its proponents attempt to rely, for example, on disputed interpretations of CEQA or its Guidelines, sometimes stated and sometimes implied, and these disputes go beyond the economic feasibility debate discussed in the previous subsection, where some CEQA related issues are argued back against the DEIR's disputed contentions. While my Objections and others demonstrate facts, including by DEIR or Rise admissions, that make those DEIR or Rise legal arguments inapplicable or worse, I also offer to brief any legal issues as to which the government decisionmakers have any doubts. However, rather than add that legal briefing to support the scores of broader disputes with the many errors, omissions, and deficiencies in the DEIR, I will simply make an offer of proof to invite whatever briefing you decisionmakers would consider helpful on the remaining issues. To illustrate how that might work, I have offered a few examples below of such possible disputes.

**C. Some Other CEQA Noncompliance By The Disputed DEIR, Including As Merely One Example, the Massive Underestimation of Dry Wells And the Illusory And Impractical DEIR Mitigation To Which Even NID Objects.**

**Ind 254-92**

The most substantial and frequent flaw in the DEIR, the consistent making of infeasible and not credible assertions of purported facts, data, or plans, even those beyond the economic infeasibility issues discussed above, seem premised on the disputed legal theory that this DEIR can comply with CEQA and its Guidelines merely by making objectively disputable or unsubstantiated statements that are false, misleading, or otherwise illusory about what will or could be accomplished pursuant to the disputed DEIR. For example, as demonstrated above the DEIR purports to address mitigation of our common protests against dewatering the mine drying up more existing **and future** wells besides the 30 along East Bennett Road. Beyond the economic infeasibility of that illusory DEIR mitigation addressed above, there is also the practical CEQA noncompliance by the DEIR as to the lack of adequacy of such mitigation, even if it could afford to do what would be necessary. As the NID speakers and others explained at the March 24, 2022, hearing (in the insufficient 3 or 5 minutes allowed each objector to identify massive DEIR disputes), a dry well water truck or hugely expensive NID connection is not feasible mitigation. As one realtor speaker explained (and other such experts will complain throughout this process), that DEIR mitigation is going to make the affected property not just depressed in value (as the whole community suffer from mine stigma and other impacts), but unmarketable or, in the case of land, unbuildable. Nowhere does the DEIR address that reality or the impact on the mine and the miner when the consequences of that mine dewatering is litigated. (Remember, as stated earlier, us surface property owners have legal property rights that include groundwater, and any harm to those rights has legal consequences for the miner,

but also for any government allowing a "taking" or "inverse condemnation" of that surface property right.

When what is assumed or represented by the DEIR is illusory, false, or deficient for any reason, not only because most required things in the DEIR are not currently feasible or affordable by Rise, there is a CEQA problem. The DEIR cannot insist that us local victims (or our government who is supposed to protect us) must accept or suffer such an "alternative reality" or illusion. Whatever the reason, there is a valid CEQA or other legal challenge whenever the underlying disputed DEIR assumptions, speculations, or unsubstantiated or preposterous claims or "wishful thinking" are challenged by us objectors. The disputed DEIR saying something does not make it so, and whatever the DEIR says must be subject to challenge and rebuttal by any legally competent evidence, which includes DEIR admissions, contradictions, inconsistencies, illusions, and worse, as well as those of Rise. This Objection has quoted both specific and general errors, omissions, and deficiencies, often by using quotes of the DEIR or Rise documents to prove my rebuttal cases on the merits. There is such a serious and consistent pattern of such documented DEIR errors, omissions, and deficiencies that it is reasonable for government decisionmakers to be at least skeptical and to insist on more and better data. The California Evidence Code allows that kind of evidence, including of any objectionable "pattern or practice" by the party being challenged. That kind of rebuttal is essential here, because I believe that, for all the reasons stated in this Objection and the others stated at the March 24, 2022, hearing or duly filed, the DEIR has demonstrated that it has and deserves little credibility with most of the informed residents and voters living above and around the 2585-acre underground mine who can be expected to resist the mine with all appropriate legal and political tools we can muster.

**Ind 254-92**

Although it is sufficiently addressed throughout this and other Objections that I will not repeat it here, another feasibility obstacle from us local mine opponents living above and around the 2585-acre mine is that we also have competing property legal rights, for example, to the same groundwater that the DEIR expects to waste in dewatering and dispose of somewhere downriver in the Wolf Creek. Our competition for our own groundwater by more wells in this worsening climate change dryness and drought, which the DEIR entirely ignores in favor of irrelevant and nonpredictive average rainfall assumptions from 1967 to 2017, may defeat the DEIR plan by itself. See, eg, my # 3.D, E, F, and M and 5. Finally, us local voters expect to accomplish some law reforms (see my # 3.N, 4, and 8) that will also prevent the accomplishment of the DEIR plan, such as, for example, by limiting mining operations in such suburban areas to 12 hours a day, which the DEIR admitted (at DEIR 6-14) would be fatal to its mining plan.

**D. Examples Of The Disputed DEIR's Failure To Address the Predictable Future Contradictions To DEIR's Incorrect, False, Or Misleading Alleged "Facts," Opinions, And Assumptions On Which The DEIR Plans Purport To Be Justified.**

**Ind 254-93**

This Objection makes a special point of exposing the objectionable way that the DEIR consistently and incorrectly assumes that it can predict the future results and consequences of its DEIR 2585-acre underground mining project from its selected data from the past. This is not

**Ind 254-93**

just about ignoring climate change problems, such as dryness and drought, as discussed above. This is also about the fact that the disputed DEIR incorrectly assumes that it sufficiently knows the starting condition of this underground mine that's been closed and flooded since 1956 without adequate updated evaluations. Even more disturbing, the DEIR incorrectly assumes that what insufficient and questionable data the DEIR uses about that existing mine will continue to apply to what happens because of the DEIR's new, expanded, and deeper mining into unexplored places in those 2585-acres. See, eg, my # 3.M. Also, as illustrated by the disputed DEIR plan to use toxic, hexavalent chromium in the cement paste to shore up the new mining tunnels etc, the DEIR assumes that relevant environmental regulations will remain as lax in the future as they are now. If our applicable laws and regulations become more consistent with the science that assure successful civil litigation for victims (eg, the Hinkley, CA example from *Erin Brockovich*, or the US following the EU ban on such Cr+6 on account of the mass of horror stories on the EPA website), what happens to the DEIR mining assumptions? The answer is that no one knows from the DEIR, because the DEIR ignored the entire controversy, which (as explained in my #'s 3.C, G, and H, and 7) is like a developer installing asbestos in a new building without explanation, even though the whole asbestos industry was suffering mass tort judgments that had already driven many into bankruptcy, simply because that industry (like the cigarette industry) stalled effective regulation despite the clear science confirming the danger.

**E. Miscellaneous Other Legal Considerations For Defeating The DEIR.**

**Ind 254-94**

These serious DEIR errors, omissions, and deficiencies, like others addressed throughout this Objection, may be premised on the disputed citation of the DEIR (at 4.7-32) to California Building Industry Association v. Bay Area Quality Management District (2015), 62 Cal. 4th 369, for the idea that as a successor owner of a mine closed in 1956, Rise can duck liabilities it inherited. (The mining industry also often uses mining leases to operators to attempt to shield the landlord taking a share of the profits from the tenant miner who too often is not financially capable of paying its victims.) However, that case notes (at 377-78) that "when a proposed project risks exacerbating those environmental hazards conditions that already exist, an agency must analyze the potential impact of such hazards on future users. [That] ... compels an evaluation of how the future residents or users could be affected by exacerbated conditions." Here there are many substantial and sometimes total failures of the disputed DEIR to do that, both as to the groundwater depletion and related issues addressed in my #'s 3.D, E, F, and M and 5 (compounded by using hexavalent chromium in that new, expanded, and deeper mining and the climate change drought and other impacts. See my #'s #.C, G, and H.)

My supplemental CEQA brief will address various issues in more detail, so that we can eliminate any purported DEIR excuses for not addressing the full reality of this mining menace. Nevertheless, there are sufficient court cases that I have discussed in this Objection to defeat the disputed DEIR on its merits and for noncompliance with a correct interpretation with CEQA or its Guidelines. The decisionmakers should find my authorities more useful in that factual context than anything to the contrary cited in the DEIR, where the real facts and circumstances are not what is stated in the DEIR, but instead what is stated in this Objection.

142

**15. Some Example Concluding Questions For DEIR Decisionmakers To Ask As Follow-Ups To This And Other Objections.**

**A. How To Achieve Clarity About This Disputed DEIR That Has The Effect of Obscuring Important Truths: Some Reasons For Considering Example Questions Like These, As A Means Of Organizing The Mass Of Useful Objections By Many Impacted Locals On Their Respective Unique Concerns About The Many DEIR Errors, Omissions, And Deficiencies**

**Ind 254-95**

As I sat listening at the March 24, 2022, County hearing to the more than 100 local people objecting to this disputed DEIR threatening many of the things they love most about their homes, their environment, and their community, I wondered how one could organize that overwhelming mass of truths from so many different perspectives. I then multiplied what those 100 plus of objectors had to say by more they would have said if they had more than three minutes, as well as what many or their mine opposition organizations will say in written objections, and I became concerned. How could we reveal all the simple truths in a more coherent way under these circumstances in rebutting a DEIR with so many flawed narratives to address that, whether or not so intended, have the effect of making a unified and coherent rebuttal more than challenging? I know that difficulty because in my effort in this Objection I found it hard to achieve what in science might be called a "unified field theory" to explain why this DEIR is so dangerous and objectionable. I wish I had the time to develop such a more comprehensive and unified way than by what I have been able to do here in drilling down on my top 50 or so serious complaints on the topics and issues I have some qualifications to address. Perhaps some objector smarter than I can do so to merge all this objection data together into the view of reality we need our government to have against this DEIR. In the meantime, here is my suggestion for such a compilation that I illustrate in two ways: first, we ask the **hard questions** that the DEIR dodges and evades and that under CEQA and the demands of logic and fairness this "alternative reality" DEIR should be required to address, and second, we expose (and file our challenges to) the disputed excuses that DEIR seems to be using to hide from those hard questions.

What follows are some examples of such hard questions dodged or evaded in the disputed DEIR to illustrate my concept. What follows separately in a supplemental brief on some CEQA issues will be an illustration of how DEIR's evasion and omission techniques do not comply with CEQA, as the DEIR expressly and implicitly claims incorrectly that it has done. For example, the DEIR attempts to avoid entirely contrary realities for which it has not even one of its deficient, but positive or reassuring sounding (though erroneous) answers. **For example, somehow the deficient DEIR incorrectly imagines that CEQA can be satisfied by a theoretical discussion of what some feasible mining plan might be by someone theoretically capable of achieving what the disputed DEIR claims in its "alternative reality."** Wrong, as I will try to demonstrate in my supplementary filing and here illustrate in my #'s 2, 4, and 14, it is sheer speculation that this DEIR miner could afford actually to accomplish what is stated so confidently in the disputed DEIR. **CEQA is not just about useless, abstract miner theory. The law requires clarity about what the actual miner will actually do, what burdens, harms, risks,**

**Ind 254-95**

**and issues will actually be encountered, and how the actual miner will actually mitigate those problems and accomplish the real project as detailed in a DEIR that enables everyone who could be impacted to be able to make informed decisions. What responsible government must know the COMPREHENSIVE REALITIES before it allows this kind of underfunded miner (see my # 2) to reopen a mine closed and flooded since 1956 to begin new, expanded, and deeper mining into unknown conditions in that 2585-acre underground mine below thousands of objecting surface residents 24/7/365 for 80-years. What this and other objections are doing in our various ways is to convince our government that the disputed and deficient DEIR does not ever adequately inform any of us about what is actually going to happen and not happen underneath our homes and property and to our environment.**

**B. Examples Of Some General Opening Questions About The DEIR And Miner, Reflecting What Locals Distrust As Errors, Omissions, Or Deficiencies.**

**(1) Fact Base of Questions Regarding Local Resistance (see my # 3.N):** Most of the informed people among the thousands living above or around the 2585-acre underground mine beneath our homes and properties appear (like me) to have specific fears and concerns about the mine and disputed DEIR. Such locals like me find no sufficient and reliable answers in the DEIR to their predictable questions and concerns. Instead, we are discovering or learning about many errors, omissions, and deficiencies in the DEIR, especially about the potential risks, threats, and problems that would be occurring beneath us 24/7/365 for 80 years, if the DEIR and mine were approved, especially (i) regarding groundwater and NID water depletion or waste in what we expect to be prolonged dryness and drought from climate change generally ignored by the DEIR, (ii) regarding the use of hexavalent chromium cement paste to shore up the underground mine and perhaps ending up in wells or the Wolf Creek, and (iii) regarding the way the DEIR seems to pretend that the only considerations that matter are the small parts of the mining situation and plan (eg, the owned surface sites and 30 dry wells along East Bennett Road) that almost entirely ignore our local interests and concerns living above and around the underground mine. In other words, there is no apparent net benefit from this mine to us locals, but many obvious risks, harms, and problems for which no solution or insufficient mitigation is proposed or revealed in the DEIR. See my #2.

**Ind 254-96**

**Related Questions:**

**Why has the DEIR not even attempted to recognize, much less address, any of us locals' concerns? Why must this be an "apples versus orange" debate, in which the apple is real and the DEIR orange is alternate reality?**

**Why has the DEIR not addressed the scientific evidence of climate change affecting our shared NID water and groundwater supplies? How can the DEIR justify only looking at the past to predict the mine future, when the future realities will be different not only because of climate change, but also because of what the DEIR mining is changing 24/7/365 for 80 years in its mining, including into new, deeper, and expanded parts of the**

144

2585-acre mine with unknown and unexamined condition underneath thousands of surface residents?

Why does the DEIR not identify and notify the surface owners' and users' above and around the 2585-acre mine and otherwise recognize their legal rights in competition with the underground mine?

Why has the DEIR mine done nothing to address the stigma consequences of its DEIR mining plan on thousands of people living on the surface above and around the 2585-acre mine, such as the loss of value in their homes? By submitting such a disputed DEIR full of such errors, omissions, and deficiencies what can a home seller say to a buyer about the mining occurring literally beneath the house? Because, unlike the disputed DEIR which would say "don't worry, my CEQA report says everything the law requires me to tell you is fine," wouldn't the home sellers' truths have to be that until someone stops it: (i) there could be 24/7/365 blasting, tunneling, rock removal, shoring with toxic hexavalent chromium, dewatering and other mining activities in a 2585-acre mine beneath your new property, (ii) the DEIR says not to worry, and the government for some reason approved it, by I and everyone else around here objected and are resisting, and (iii) there are hundreds of detailed objections by us locals and other experts denouncing that DEIR and its government approval because we consider the DEIR to be full of error, omissions, and deficiencies and the miner by its own admission unable to afford to accomplish even what the DEIR states, much less what such objections insist would have to be done for the mine to be tolerable, if that were even possible when adequate reliable information is available correcting the DEIR's deficiencies?

**Ind 254-96**

How can Rise fund even what is proposed in the insufficient DEIR, considering what it has admitted in its SEC 10K and 10Q (see my #2)? What is the track record of Rise and its officers, directors, and major shareholders in safe mining consistent with environmental laws and regulations? What it their litigation and governmental investigation or enforcement history, since sometimes settlements of serious allegations are relevant in judging suitability and credibility for such DEIR mining? (That and more is relevant to any investor or lender making a credit judgment about such a miner seeking funding, and, therefore, that information must be relevant to any consideration of the feasibility of any DEIR mining plan.)

Considering the many concerns about the performance and compliance capabilities of this DEIR miner and plan, will the DEIR advocates accept DEIR and other approvals as conditional on timely performance standards and compliance? Stated another way, will DEIR advocates accept more meaningful consequences for noncompliance and wrongs than a mere breach of contract remedy, which almost always produces disappointing results in bankruptcy, especially in the context of a cross-border bankruptcy, or in other abandonment of the types common in the mining industry whenever things go badly or the mine has played out? (See, eg, my # 2 and the EPA website listing more than 40,000 abandoned mines in California, many once in bankruptcy before the trustee or others decisionmaker decided that such assets were now worthless or worse liabilities.)

145

**(2). Fact Base of Questions Regarding Surface Owner Rights:** Any underground miner, including this DEIR miner, is subject to various legal duties to those who own the surface above or around the mine, such as, for example, duties of this 2585-acre underground mine to continue to provide subjacent and lateral support to prevent "subsidence," to avoid misuse or pollution of the local groundwater, and otherwise not to make nuisances or disturbances interfering with surface uses or harming the value of the surface estates. Here the disputed DEIR seems to pretend that there is no one on the surface above or around the 2585-acre underground mine (in fact, there are thousands of us), and that the DEIR miner is free to do whatever it wishes, whether or not described in the DEIR.

**Ind 254-96**

**Related Questions:**

**Why does the DEIR not address the thousands of surface owners' and users' legal rights in competition with the underground mine?**

**What amount of subsidence (or worse) should people living above and around the 2585-acre underground mine expect to experience from the DEIR described mining activities under realistic conditions, for example, assuming that the actual average rainfall/snowfall is only 80%, 60%, 40%, or 20% of what the DEIR claims for the period between 1967-2017 on account of climate change creating drier and more drought condition?**

**Ind 254-97**

**What would be the effect on the mine of hundreds of us locals living above and around the 2585-acre underground mine drilling our own competing wells to our own ground water, either (i) within the first 200 feet considered our surface when the property is above that mine, or (ii) deeper when the surface property is not above, but around the mine?**

**Ind 254-98**

**What would be the effect on the DEIR mine of a surface owner or user obtaining a court injunction against the mine allowing any intrusion of hexavalent chromium into our shared groundwater or our properties either (i) within the first 200 feet considered our surface when the property is above that mine, or (ii) deeper when the surface property is not above, but around the mine?**

**(3). Fact Base of Questions Regarding Local Law Reforms (See my # 3.N) To Clarify And Limit What Constitutes A Nuisance Or Other Wrong:**

**Ind 254-99**

While government has the power to grant permits and approve EIR's for such projects, our laws, including our State and Federal Constitutions, also protect the competing rights of surface owners above and around mines and other neighbors from trespass, nuisances, and other kinds of objectionable conduct. If the government were to approve the DEIR and the mine, the thousands of affected people and others may consider whether some of the expected conduct at the DEIR mine could be a trespass or nuisance or otherwise sufficiently objectionable to begin passing self-defense laws that clarify or confirm what is a nuisance or is otherwise no longer to be tolerated as an intrusion on such personal or property rights. Rather

Ind 254-99

than only address that in legal disputes, voters can be expected to elect like-minded officials and pass initiatives that add such protections to our laws. See my # 3.N. Obviously, the DEIR mine threat is merely the inspiration and example for the general need for such greater protections, and the laws would be of more general application, although that general application would include what such voters regard to be intolerable in the DEIR example. As noted above, once one mine is allowed in our community, it becomes a magnet for others and other undesirable businesses with negative environmental and other consequences, as happened in Richmond after Chevron and Benicia after Valero.

**Related Questions:**

**When the thousands of locals living above and around the 2585-acre underground mine exercise their voting rights to protect and defend their interests with new local defense laws of general application, such as limiting mining hours, noise, vibration, and other protections and clarifications against what us locals would consider to be nuisances or other unacceptable conduct, what is the effect of that on the feasibility of the DEIR mine?**

**When the thousands of locals living above and around the 2585-acre underground mine exercise their voting rights to protect and defend their interests with new 'pay your share' laws, such as taxing certain commercial enterprises, including mines, that regularly use more than (say) 20 heavy truck trips during any 12 hour period during a day for more than an average of 20 days a month during any 6 months period on busy, two land roads within significantly populated areas [to be defined, but including the mining trucks planning to use roads like Brunswick and Idaho Maryland Roads in the Grass Valley area], what is the effect of that on the feasibility of the DEIR mine?**

**When the thousands of locals living above and around the 2585-acre underground mine exercise their voting rights to protect and defend their interests with new reporting and monitoring laws and regulations for the protection of those surface residents, as well as making that data public information readily available for our community, what is the effect of that on the feasibility of the mine?**

**C. Fact Basis of Examples of Specific Questions About The Financial Feasibility of the DEIR Miner And Miner Accomplishing the Mitigations Or Other Protections For Neighbors And The Shared Environment Assumed Or Represented In The DEIR, Including As Mitigation:**

Based upon the admissions by Rise in its current SEC Form 10K and 10Q Filings, as demonstrated in my Objection at # 2, it appears that Rise has insufficient reported cash and credit to afford to accomplish what is represented or expected by its DEIR, even just to reopen the mine, not to mention to complete the needed safety and mitigation work. Indeed, the reported financial margins are so tight that the DEIR admits that the project is not feasible even if they were prohibited (as many of us locals demand) to only mining 12 hours a day instead of 24/7/365. Considering those and other factors, the government decisionmakers either must

reject the DEIR as not feasible, or demand to know who else besides Rise is going to provide the cash or credit to make this DEIR plan feasible. Stated another way, the decisionmakers should insist on knowing who is the "real" miner here, and on what terms and conditions. If this DEIR is a means to package a "flip" of the actual mining operations to someone else, such as a partner, operating tenant, loan-to-own lender, or other third party, the government decisionmakers should know that and all relevant details before any DEIR approval, as well as the CEQA data from the third-party funding operator. This is especially critical because the disputed DEIR already lacks essential information about Rise to enable the government decisionmakers to judge its character, financial condition, and track record to evaluate its ability to raise the funding it would need if it planned to mine itself.

**Related Questions:**

**What is the source of funding for each aspect of the mining and related activities stated in the DEIR? If it comes from third parties, what are the terms and conditions for such funding, and why is that third party not participating as a disclosed party in the DEIR?**

**Ind 254-99**

**Do the DEIR advocates deny that the character, financial performance capability, and track record of the miner are important factors in CEQA compliance and feasibility?**

**Considering the questions about its financial condition, what types and amounts of insurance coverage and surety bond coverage will this DEIR mining have? What is the risk of human error, and how is it mitigated for such hazardous activities and even the high-risk mitigations, like treating the mine water dumped into the Wolf Creek and NID system?**

**D. Examples of Specific Questions About The Margin For Mine DEIR Assumptions Or Contention Errors And For Changes In Applicable Laws, Regulations And Circumstances Affecting The Mining:**

The disputed DEIR assumes the timely availability of everything it needs to timely accomplish everything as assumed, represented, or expected in the DEIR. In most cases there is no disclosure as to how or why such things must be true, feasible, or affordable, much less any relevant evidence. In other words, most of the DEIR are just words with no credible supporting foundation in relevant facts or evidence, such as demonstrated in the previous section # 2 about Rise's financial condition and funding and in the earlier discussion of the DEIR (at 6-14) admitting that the project was not feasible if it had to operate on a 12-hour instead of 24-hour day. See my discussions in my # 13 about the deficient Alternatives Analysis in DEIR #6. Whether or not so admitted or exposed from other Rise's public documents, the DEIR frequently seems to contemplate that everything must be done precisely as and when it is planned and explained in the DEIR. Since us local objectors do not imagine that any ultimate mining operation can be ultimately permitted in accordance with the DEIR's "only do it my way" approach, that makes the DEIR nonfeasible for more reasons than just insufficient funds. The time to find this out is now, rather than later when us locals successfully enforce our competing rights, such as, for example, during shortages for our competing rights to NID and

groundwater and if and when the miner complains for the first time about bad consequences for not giving the mine and others what the DEIR expected, unless the DEIR plan is allowed to take our competing shares of NID or groundwater and take other competing advantages of us for their unwanted mine.

**Ind 254-99**

**Related Questions:**

**Since it seems unlikely that all the mining and other activities in the DEIR will be permitted exactly as stated in the DEIR, what variances are possible for the DEIR to remain feasible, and what variances would make the project nonfeasible?**

**For example, how much less in NID or groundwater by volume, duration, or frequency can the project tolerate before the DEIR dewatering or other plans fail and the project ceases to be feasible.**

**Does the DEIR mine deny that, if (as we believe) the DEIR does not now fully and accurately reveal its true vulnerabilities in the inevitable competition for scarce, shared resources (eg, water or air quality) with those of us living on the surface above and around the 2585-acre underground mine, that the mine should be barred from complaining later when us locals insist on our competing rights and priorities?**

**Ind 254-100**

**Since, among the things, what matters most to those of us living on the surface above or around the 2585-acre underground mine are the preservation of the water table level sufficient for the survival of our forest trees and home plants, as well as human uses from NID or well water, what is the impact of the DEIR water usage of those concerns? Assuming no one impacted is convinced about the disputed DEIR's assumed "balancing" by imagined "recharge" by average rainfall incorrectly assumed to continue as between 1967-2017, what is the effect of the thousands of us drilling wells to tap our share of the groundwater we own on the mining plan of the DEIR that ignores any such competition?**

**Why is the DEIR claiming "credit" in its "balancing" claim of benefit for its DEIR dewatering plan sending our local owned community groundwater off downriver somewhere in the Wolf Creek, since that does nothing to reduce the dry and drought conditions for those of us who live above and around the 2585-acre underground mine?**

**Why does the DEIR imagine that NID wants the dangerous hexavalent chromium in the Wolf Creek that the miner is putting into the cement shoring for the underground mine, even if it were treated to the currently lax (but certain to change) standards of tolerance that offer no liability protection for the polluters? See my #'s 3.C, G, H, and 7.**

**E. Examples of CEQA Related Questions About Deficiencies And Noncompliance.**

**Ind 254-101**

**As discussed in my #'s 3.E and M, 4, 14, and elsewhere, including my supplemental filing to address certain CEQA issues, the disputed DEIR is challenged for error, omissions, and**

149

deficiencies regarding essential data. Without the ability to make informed decisions responsible government should not act to approve the DEIR, especially because any such approval would not convince any objector to tolerate the DEIR mining under the circumstances.

Related Questions:

In the many places where CEQA requires data in the DEIR that is omitted, deficient, or erroneous, is there any reason why the decisionmakers or local residents at risk should not assume that such noncompliance implies that the information is negative and sufficient to prevent approval of the DEIR? If the DEIR advocates contend that they should be excused somehow from compliance, why doesn't the DEIR request permission for such noncompliance and explain the purported justification? Why does the DEIR not explain omissions to the data us locals consider essential?

**Ind 254-101**

Since the DEIR often fails to support its contentions and assumptions with evidence or even credible reasoning, especially as to conditions relevant to the 2585-acre underground mine in the future, why should those unsubstantiated contentions and assumptions be rejected as mere speculation? Do the DEIR advocates deny that the burden of proof and persuasion for CEQA approval of the DEIR is on them, and not on the objectors?

What happens when and if the DEIR's asbestos, arsenic, and other hazardous substances (see DEIR #'s 7 and 10) mitigation or safety plans cease to be feasible, as, for example, if the miner cannot or fails for any reason to water the dangerous dust it brings to the surface?

Since the mine owes a legal obligation to provide continuous subjacent and lateral support for the surface owned and used by us locals above and around the 2585-acre underground mine to prevent subsidence and protect groundwater (see, eg, my #'s 3.D, E, F, M, 4, 5, 6, 8, and 12), why does the DEIR not address that risk when it reopens the mine closed and flooded since 1956 and that now is to be mined in new, expanded, and deeper places as to which the conditions are not revealed in the DEIR and probably have not even been investigated properly? See my # 3.E, 4, 5. 6, 7, and 8.

CONCLUSION:

For the reasons stated and others detailed in related objections to the DEIR and the mine, I urge that the disputed and nonfeasible DEIR be rejected as noncompliant with CEQA and as containing material errors, omissions, and deficiencies.

Sincerely,
*/s/ Larry Engel*
G. Larry Engel

## INDIVIDUAL LETTER 254: G. LARRY ENGEL

### Response to Comment Ind 254-1

This comment is introductory in nature and the commenter states that the DEIR is inadequate. The commenter provides several examples but explains that the inadequacies in the DEIR will be fully explained in the comments below. In general, the commenter states that the DEIR is inadequate in the following areas: impacts to groundwater, the scope of the project (i.e., exclusion of the cleanup of the Centennial Industrial Site), the use of outdated hydrogeologic data, the presence of hexavalent chromium ($Cr^{+6}$) in the Cement Past Backfill (CPB), and the project's impacts to hydrology in the light of the drought.

Regarding the impacts to groundwater, the DEIR found this impact to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding the proper scope of the project and cleanup of the Centennial Industrial Site, the commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. Regarding the data used to estimate groundwater impacts, the commenter is referred to Master Response 13 – Historic Hydrogeologic Assessments. Regarding the hydrology impacts during the drought, the commenter is referred to Master Response 16 – Drought and Climate Change.

Regarding the presence of hexavalent chromium in the CPB, the DEIR states that chromium is a naturally-occurring trace component in the materials used to make cement, the binder for the CPB. Hexavalent chromium is typically less than two percent of the total chromium content in cement, while the total chromium itself is a very small component in the finished cement (approximately 220 parts per million.) Thus, the fraction of hexavalent chromium in cement is usually only about 0.000004 (or 0.0004 percent) of the total mass of the cement before forming any admixtures (e.g., concrete or CPB). (DEIR, p. 4.8-47.)

As the DEIR notes, it is only during the mining phase that $Cr^{+6}$could have any potential to leach from CPB, because that is when there would be air (oxygen) in the mine workings (Cr+6 can only form under oxidizing conditions). Once the mine re-floods, reducing conditions (very low dissolved oxygen levels creating a negative oxidation reduction potential) would return in the mine workings, which would prevent any leaching of $Cr^{+6}$. However, during mining, if there were any $Cr^{+6}$ in the water within underground workings due to groundwater inflow, it would be reduced to $Cr^{+3}$ (due to low oxygen levels in the water), which is relatively immobile in water and has a much lower impact on water quality than $Cr^{+6}$. Once the water was pumped from the mine any $Cr^{+3}$ would generally precipitate out of the water in the pond or be removed by the physical filtration unit in the WTP. (DEIR, p. 4.8-48.)

Blasting or backfilling with CPB would be conducted exclusively within the underground mine workings. Thus, any water that contacts those components would be present only within the mine workings and would be pumped out of the mine workings by the dewatering system. As a result, that water would not have the potential to flow into the fractured bedrock and flow toward any domestic supply wells. The dewatering causes a low-pressure area around the underground workings such that groundwater inflow is toward the mine, not from the mine toward the domestic wells. (DEIR, p. 4.8-58.) Additionally, in obtaining the Waste Discharge Requirements (WDRs) from the Regional Water Quality Control Board, the Project Applicant would ensure that the

leaching of hexavalent chromium would not cause any impact and would meet regulatory standards. (DEIR, p. 4.8-47–48.)

The commenter also discusses the project's impact to property values and whether the Project Applicant is adequately capitalized to undertake the project, should the County approve it. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 254-2

The commenter provides a Table of Contents for the Comment Letter. Responses to specific comments are provided below.

## Response to Comment Ind 254-3

The commenter states that the DEIR inadequately analyzes a variety of project impacts but fails to specify how the DEIR is inadequate. The commenter states that the DEIR is inadequate for the following reasons: the scope of the project is not adequately described as it excludes the remediation of the Centennial Industrial Site and the commenter states that the project area is actually the entire 2,585-acre mineral rights boundary. The commenter also states that the DEIR underestimates the number of wells potentially impacted by the project and that the DEIR relies on outdated hydrological data in light of the current drought. The commenter states that the DEIR fails to analyze potentially hazardous constituents such as hexavalent chromium, asbestos, and arsenic. The commenter also states that the dewatering of the mine will adversely impact vegetation in the area. The commenter also states the DEIR inadequately analyzes noise and vibration impacts and the traffic impacts.

Regarding the DEIR's estimation of the number of groundwater wells impacted, the use of historical hydrology data, and the project's affect on groundwater in general, the DEIR analyzed the impact to groundwater supplies in Chapter 4.8 (Hydrology and Water Quality) and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 13 – Historic Hydrogeologic Assessment, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

Regarding the assertion that the DEIR underestimates the true scope of project by excluding the cleanup of the Centennial Industrial Site and the entire 2,585-acre mineral rights boundary, the commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA, and Master Response 7 – Location of Future Mining Areas.

Regarding the DEIR's treatment of hexavalent chromium, asbestos, and arsenic, the DEIR examined asbestos both in the Health Risk Assessment (DEIR, p. 4.3-61.) and in the context of emissions (DEIR, p. 4.3-80) and found the impacts to be less than significant after mitigation. Regarding hexavalent chromium, the commenter is referred to the portion of Response to Comment Ind 254-1 that discusses hexavalent chromium in CPB.

Noise and vibration impacts of the project are analyzed in detail in Chapter 4.10 of the DEIR, and transportation impacts are evaluated in Chapter 4.12. Regarding subsidence concerns, the commenter is referred to Master Response 29 – Near Surface Workings.

The commenter's concerns related to climate change and drought are addressed in Master Response 16 – Drought and Climate Change.

The commenter also describes at length the Project Applicant's financial status and the potential adverse impacts to real estate values that will result should the County approve the project. The commenter is referred to Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 254-4

This comment seeks to incorporate "follow-up written filings" from the Nevada County Planning Commission hearing held on March 24, 2022 from organizations such as Community Environmental Advocates, Minewatch Nevada County, and the Sierra Club. It is unclear if the commenter is referring to those organizations' written comments received on the DEIR during the public review period which closed on April 4, 2022. To the extent that those organizations submitted written comments on the DEIR, the commenter is referred to the applicable responses to comments [e.g., Group Letters 6, 7 and 8 (CEA); Group Letters 28 through 32 (Wolf Creek Community Alliance; Group Letter 23 (Sierra Club); Group Letter 25 (South Yuba River Citizen's League; Group Letters 11 and 12 (Friends of Banner Mountain)].

## Response to Comment Ind 254-5

The commenter discusses at length the financial condition of the Project Applicant and its filings to the Securities and Exchange Commission ("SEC"). The commenter states that the DEIR is flawed because of the lack of information indicating the Project Applicant is sufficiently capitalized to undertake the project. However, CEQA requires that the DEIR only evaluate the environmental impacts of the project. (Pub. Resources Code, § 21100.) "Environment" is defined as the physical conditions that exist within an area affected by a proposed project, including land, air, water, minerals, flora and fauna, noise, and objects of historic or aesthetic significance. (Pub. Resources Code, § 21060.5.) Economic and social effects that are nor related to physical impacts need not be evaluated in the DEIR. (CEQA Guidelines, § 15131(a).) Accordingly, the Project Applicant's financial condition, or the project impact on property values, does not fall within the scope of environmental impacts required to be discussed in the DEIR. The commenter is referred to Master Response 2 – Social and Economic Impacts.

Regarding the commenter's tenuous references to dewatering and drought/climate change, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 254-6

The commenter states that the DEIR is inadequate for three reasons. First, the Project Description of the scope of the DEIR does not account for the entire 2,585-acre mineral rights boundary. Second, the DEIR excludes the remediation and cleanup of the Centennial Industrial Site. Third, the DEIR underestimates the impact to groundwater wells. Regarding the mineral rights boundary area, the commenter is referred to Master Response 7 – Location of Future Mining Areas. Regarding the Centennial Industrial Site, the commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. Regarding the project's impacts to groundwater wells, the commenter does not explain how the DEIR is inadequate in this regard. The DEIR examined impacts to groundwater supplies and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 254-7

The commenter references asbestos, arsenic, and hexavalent chromium but does not provide additional detail or explain the DEIR is inadequate in examining any impacts associated with asbestos, arsenic, or hexavalent chromium. The commenter is referred to Responses to Comments Ind 254-1 and Ind 254-3. The commenter also states that the DEIR fails to analyze the extent of the underground mine workings. The commenter implies that the project will include underground mining throughout the 2,585-acre mineral rights boundary. The commenter is referred to Master Response 7 – Location of Future Mining Areas. The commenter also states that the DEIR will result in groundwater depletion which will dry out vegetation and exacerbate wildfire risk but provides not additional information. The DEIR examined impacts to groundwater supplies and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding impacts to vegetation, the commenter is referred to Master Response 33 – Groundwater Dependent Vegetation.

## Response to Comment Ind 254-8

The commenter states that the project will have adverse impacts to Property values within the mineral rights boundary and that the County should consider information submitted by the Project Applicant in various SEC filings. The commenter also states that the DEIR fails to adequately address the extent of mining operations throughout the entire mineral rights boundary. The commenter also states that the DEIR erroneously excludes the Centennial Industrial Site and the entire mineral rights boundary from the Project Description. Finally, the commenter is concerned that underground mining could lead to instability or collapse on the surface. Regarding property values and SEC filings, the commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response - 2 Social and Economic Impacts. Regarding the adequacy of the DEIR in regard to operations within the mineral rights boundary, the commenter is referred to Master Response 7 – Location of Future Mining Areas. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project under CEQA, regarding the assertion that the cleanup of the Centennial Cleanup Project should be analyzed in the DEIR. Regarding surface stability, the commenter is referred to Master Response 29 - Near Surface Workings.

## Response to Comment Ind 254-9

The commenter references information in the Project Applicant's SEC 10-K Report. The commenter also expresses concern regarding the possibility of subsidence due to underground mining and states that the dewatering of the mine will cause adverse impacts to private groundwater wells. Lastly, the commenter is concerned about underground mining operations within 200 feet of the surface. Any information contained in the Project Applicant's SEC 10-K Report is irrelevant to the adequacy of the DEIR. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues. Regarding the possibility of subsidence, the commenter is referred to Master Response 29 - Near Surface Workings. The commenter's concern regarding impacts to private groundwater wells is addressed in Master Responses 14 and 15. Lastly, the DEIR states that no mining activity will occur at a depth less than 500 feet. (DEIR, p. 3-19; also see COA included in Master Response 7 – Location of Future Mining Areas.).

## Response to Comment Ind 254-10

The commenter references the Project Applicant's SEC 10-K Report and asserts that the Project Applicant is either undercapitalized or will not receive adequate investment to make the project viable. The applicant also states that the project's impact to the water table will dry out vegetation,

making the area more prone to wildfire. The commenter also reiterates concerns regarding the project's potential negative impacts to property values. The commenter states that lowering of the water table will create new wildfire threats. It is assumed that this commenter refers to potential impacts to vegetation. The commenter states that the project will also result in subsidence within the mineral rights boundary. Regarding the potential impacts to vegetation, the commenter is referred to Master Response 33 – Groundwater Dependant Vegetation. References to the SEC 10-K Report or impacts to property values are not relevant to the adequacy of the DEIR's discussion of physical impacts to the environment. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts. Regarding subsidence, the commenter is referred to Master Response 29 – Near Surface Workings. Regarding hexavalent chromium, the commenter is referred to the portion of Response to Comment Ind 254-1 that discusses hexavalent chromium in CPB.

## Response to Comment Ind 254-11

The commenter states that the DEIR is inadequate because it does not fully explain the extent of new underground mining within the mineral rights boundary. The commenter also asserts there is a discrepancy within the DEIR regarding the daily production amounts of the project (i.e., 500 tons per day as stated on DEIR p. 3-19 or 1,000 tons per day as stated on DEIR p. 6-2.) Regarding the extent of new underground mining, the commenter is referred to Master Response 7 – Location of Future Mining. Regarding the daily production amounts, the project will general a total of 1,000 tons of mineralized material. (DEIR, p. 3-19.) As the DEIR states, the 500 tons figure refers to expected amount of barren rock, which will result from mine development. (DEIR, p. 3-19.) The 1,000-ton figure refers to the expected amount of mineralized material to be produced by gold mineralization production. (DEIR, p. 3-19.)

## Response to Comment Ind 254-12

The commenter references the financial feasibility of the project. The commenter is also concerned that the truck traffic from the project will cause damage to local roadways. Regarding the financial feasibility of the project, the commenter is referred to Master Response 1 – Non-EIR/Administrative Issues. Regarding the potential for damage to local roadways, Mitigation Measure 4.12-6(b) of the DEIR requires the Project Applicant to enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between project driveway and Brunswick Road.

## Response to Comment Ind 254-13

The commenter quotes the second paragraph of DEIR page 4.8-51. The DEIR states in this paragraph that additional mining at depths greater than the existing underground mine workings is unlikely to impact groundwater due to reduced hydraulic connectivity. The commenter states that the DEIR is inadequate because it provides no discussion supporting this discussion. However, the DEIR's Appendix K.3 (Groundwater Model Report), prepared by environmental consultant Itasca Denver, Inc., specifically discusses and simulates the drawdown of groundwater levels at the end of future mining relative to the 2019 water level based on expected mining depths. (DEIR, Appx. K.3, p. 24 and Fig. 5-4.)

Regarding drought and climate change, please see Master Response 16 – Drought and Climate Change.

Regarding 1,000 tons versus 500 tons, please see the above response to comment.

## Response to Comment Ind 254-14

The commenter states that the DEIR fails to disclose the harmful effects associated with the presence of hexavalent chromium in the Cement Paste Backfill (CPB). The commenter is referred to the discussion on hexavalent chromium in Response to Comment Ind 254-1. The commenter also states that the DEIR's Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) is inadequate because the study that the DEIR relied on (EMKO Environmental, Inc. *Groundwater Hydrology and Water Quality Analysis Report for the Idaho-Maryland Mine Project*, March 2020) does not take into account hexavalent chromium as a possible toxic air contaminant. However, as explained in the DEIR, whereas the small trace amount of hexavalent chromium present in the cement used for CPB presents a potential water quality concern, it would not pose an emissions concern. (DEIR, 4.8-47.)

## Response to Comment Ind 254-15

The commenter reiterates concerns regarding the presence of hexavalent chromium in the CPB but the commenter does not state how the DEIR is inadequate in this regard. The commenter is referred to the discussion on hexavalent chromium in Response to Comment Ind 254-1.

## Response to Comment Ind 254-16

The commenter generally states that the portions of the DEIR, including Chapter 4.8 (Hydrology and Water Quality) are inadequate but provides no specific information; thus no further response is necessary. Please see Master Response 1.

## Response to Comment Ind 254-17

The commenter states that the DEIR's assumption regarding "balancing" and "recharge" ignores the realities of the climate change. The commenter is referred to Master Response 16 – Drought and Climate Change. As described in the WSA (Section 6.2 Additional Planned Future Potable Water Supplies) and in NID's 2020 UWMP (NID 2020 UWMP Section 4.9.1 Climate Change Effects), NID has analyzed climate change impacts to its water supplies. NID's Plan for Water is NID's vehicle to assess climate change impacts and develop and implement mitigation strategies and modifications to operate within climate change (NID 2020 UWMP Section 6.2 Resilience Planning). As part of the Plan for Water process, NID has developed a climate change hydrologic model to project and analyze supply availability under different climate change scenarios. Findings from this process will then be used to identify and evaluate mitigation measures. Mitigation measures could include the following: data gathering and information analysis enhancement to further inform decision making, hydrologic modeling enhancements, demand reduction measures, supply augmentation opportunities, and policy enhancements. The Plan for Water process is ongoing. As the Plan for Water process is developing mitigation measures for drought resiliency, NID will continue to implement its current drought and water shortage contingency efforts as described in NID's 2020 UWMP. See Master Response 16 (Drought and Climate Change) for additional discussion on climate change and drought.

The commenter also alleges the DEIR's discussion of NID's project water supplies and the statutorily required water supply assessment is inadequate. However, it is unclear what the commenter finds inadequate about these portions of DEIR Chpater 4.11 (Public Services and Utilities). The commenter faults the DEIR for only analyzing project water supplies until 2040. However, these planning horizons are derived from NID's Urban Water Management Plan and are not chosen by the Project Applicant. The DEIR analyzed the issue of sufficient water supplies

for the project and found the impact to be less than significant. (DEIR, p. 4.11-35.) In addition, the potential impacts to groundwater resulting from the mine dewatering operations for the project were evaluated through the use of a groundwater model as described in Appendix K of the DEIR. The groundwater model was based on the expected mining plan during year one to year 25, and Sensitivity Scenario 6 considered the significant expansion of mining in areas with potential for mineralization as shown in Figure 5.10 of Appendix K.3 of the DEIR for an additional 40 years of mining. As shown in Figure 5-12, and discussed on page 29 of the Groundwater Model Report (Appendix K.3 of the DEIR), the 5-ft drawdown contour extent of Scenario 6 at the end of potential additional mining (to Year 65) relative to the 2019 water level expands less than 500 ft from that of the Base-Case Scenario. The drawdown contour of the Base-Case Scenario is at the end of the original planned future mining (Year 25) relative to the 2019 water level. The comparison of drawdown contours between Scenario 6 and the Base-Case Scenario suggests that the added potential mining (beyond the 65 years modeled) will not lead to significant incremental drawdowns as the mining progresses because the mining activities occur in deep, low hydraulic conductivity rocks. Please see Master Response 14 (Adequacy of Groundwater Model) for additional discussion on the groundwater model.

## Response to Comment Ind 254-18

The commenter quotes and annotates the "Water Supply Sufficiency" paragraph from DEIR page 4.11-39. The commenter states that DEIR's assertion that NID will have sufficient water supplies during a 15-year projection is a "bait and switch" because the Water Supply Sufficiency discussion only considers surface water. NID does not utilize groundwater as an existing or planned source of water due to limited groundwater availability. (DEIR, p. 4.11-9.)

As stated in the WSA, the non-potable water demands for the project will not be served by NID, but will instead be met by groundwater through the proposed mine dewatering operations. Mine dewatering operations for the project were evaluated through the use of a groundwater model as described in Appendix K of the DEIR.

## Response to Comment Ind 254-19

The commenter states that the DEIR's summary of NID water demand versus water supply during various hydrologic conditions does not take into account numerous residences that may have to rely on potable water due to impacts to groundwater wells. However, the commenter does not provide any evidence that additional groundwater wells may be impacted besides those identified in the DEIR. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

As described in the WSA (Section 2.3 and Projected Water Demand and Table 2-2 Projected Water Demand), and as described in the DEIR (Table 4.11-3), water demands for buildout of the project have been estimated in terms of potable water demands (to be served by NID) and non-potable water demands for mine operations (to be served from groundwater). Potable water demands are estimated to be 23,600 gallons per day (gpd), which includes 5,700 gpd for the Brunswick Industrial Site and 17,900 gpd for the residential uses on East Bennett Road. Non-potable water demands (to be served from groundwater) are estimated to be 84,000 gpd, which includes 40,000 gpd for water vapor in ventilation, 20,000 gpd for cemented paste backfill, and 24,000 gpd for concentrates and engineered fill. Because water uses for dust control and compaction of engineered fill are temporary and will occur only during the initial construction, and

are not part of the buildout mine operations, those water demands (42,000 gpd) were not included in the buildout water demand projections for the project.

## Response to Comment Ind 254-20

The commenter states that the DEIR is generally inadequate, erroneous, or misleading. However, the commenter provides no specific information to support its assertions. The commenter reiterates that the DEIR underestimates the number of private groundwater wells impacted by the dewatering of the mine. Regarding the DEIR's estimation of the number of groundwater wells impacted and the project's affect on groundwater in general, the DEIR analyzed the impact to groundwater supplies in Chapter 4.8 (Hydrology and Water Quality) and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 13 – Historic Hydrogeologic Assessment, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells. The commenter also states that the DEIR ignores the realities of climate change. The commenter is referred to Master Response 16 – Drought and Climate Change. The commenter also states that the water supply planning horizons should be the entire life of the project (i.e., 80 years.) However, the analyzed planning horizons are derived from NID's Urban Water Management Plan and are not chosen by the Project Applicant. The DEIR analyzed the issue of sufficient water supplies for the project and found the impact to be less than significant. (DEIR, p. 4.11-35.) Please also see Response to Comment Ind 254-17.

## Response to Comment Ind 254-21

The commenter states that the DEIR fails to discuss potential impacts to additional property owners with groundwater wells who live within the mineral rights boundary. The DEIR analyzed the impacts to groundwater and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells. The commenter also asserts, without evidence, that it is a certainty that additional property owners with groundwater wells will be impacted by the project. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

## Response to Comment Ind 254-22

The commenter recites numerous figures regarding the potable and non-potable water demand required for the project in DEIR Chapter 4.11 (Public Services and Utilities), but does not specifically identify any inadequacies with the DEIR. For example, the commenter points out that the DEIR's estimate for total non-potable is 84,000 gpd (DEIR, p. 4.11-36) and claims that the DEIR does not identify or omits any non-potable water demand for the Centennial Industrial Site. However, the DEIR states that 42,000 gpd of non-potable water use is estimated for the Brunswick Industrial Site while another 42,000 gpd is estimated for the Centennial Industrial Site for a total of 84,000 gpd. (DEIR, p. 4.11-39.) Because the commenter does not articulate a clear criticism or identify any inadequacy with the DEIR, no further response is necessary (see Master Response 1).

## Response to Comment Ind 254-23

The commenter states that project will reduce groundwater and surface water supplies to the point that local residents will be pitted against each other but provides no evidence to substantiate this assertion. The commenter also states that the DEIR ignores climate change and states that

relying on past rain data is misleading but does not provide any specific examples. The DEIR analyzed the impacts to groundwater and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is referred to Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, Master Response 16 – Drought and Climate Change, and Master Response 13 – Historic Hydrogeologic Data.

The commenter implies that most or all of the property owners within the mineral rights boundary will lose their well water but provides no evidence to substantiate these claims. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

The commenter expresses concern about the treated water to be discharged to South Fork Wolf Creek and claims that the DEIR ignored hexavalent chromium. The DEIR does not ignore hexavalent chromium and the commenter is referred to Response to Comment Ind 254-1. Regarding the discharge to South Fork Wolf Creek the commenter is referred to Master Response 35 – Discharge to South Fork Wolf Creek.

Please also see Response to Comment Ind 254-17.

## Response to Comment Ind 254-24

The commenter states that the DEIR is inadequate because it assesses project water supplies using a 20-year projection rather than the entire life of the project (i.e., 80 years.) However, as noted in the DEIR, the DEIR is not required to examine projected water supplies over an 80-year period. Instead, Water Code section 10912 requires a lead agency to identify the public water system that will provide water service to the project (i.e., Nevada Irrigation District or NID) and request the water provider to prepare a WSA for the project. (Wat. Code § 10910(a)-(c).) Water Code section 10910 (c)(4) requires that a WSA include a discussion with regard to "whether total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses." Accordingly, the Idaho-Maryland Mine WSA addresses these three hydrologic conditions through the year 2040. (DEIR, p. 4.11-20.) The commenter also states that the DEIR ignores climate change in assessing water supplies for the project. The commenter is referred to Master Response 16 – Drought and Climate Change. The commenter also questions the validity of the Water Supply Assessment itself (Appendix N) but does not state how it is inadequate. Lastly, the commenter references hexavalent chromium. The commenter is referred to Response to Comment Ind 254-1. Please also see Response to Comment Ind 254-17.

## Response to Comment Ind 254-25

The commenter states that the DEIR references "water treatment complication problems" on page 3-15. However, DEIR page 3-15 contains no such reference. The commenter also states that the water treatment system could fail. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this

comment amounts to speculation, no further response is necessary. The commenter also references hexavalent chromium. The commenter is referred to Response to Comment Ind 254-1. The portion of the comment related to storms is somewhat unclear. Notwithstanding, the following is offered. DEIR Impact 4.8-3 analyzes the capacity of the water treatment pond and determines that sufficient capacity exists based on the storm events modelled. See also Appendix K.5 detailing Brunswick Industrial Site drainage and stormwater facility sizing. The clay-lined pond does not discharge and is designed to retain sufficient freeboard not to overtop (see page 4.8-73 of the DEIR).

## Response to Comment Ind 254-26

The commenter states that the project's water usage is wasteful regarding activities such as dust suppression, but the commenter does not state how the DEIR is inadequate. The commenter also states that the DEIR ignores the realities of drought and climate change. The commenter is referred to Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 254-27

The commenter states that the DEIR underestimates the scope of impacts to private groundwater wells and that the project will result in dire consequences to groundwater supplies. The commenter also states that the DEIR ignores drought and climate change. However, the commenter does not identify specifically how the DEIR is inadequate. Regarding the impacts to groundwater, the DEIR found this impact to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells. The commenter is also referred to Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 254-28

The commenter states that the DEIR underestimates the scope of impacts to private groundwater wells but provides no evidence to substantiate this assertion. The commenter also states that water usage associated with the project is wasteful but does not state how the DEIR is inadequate. Lastly, the commenter states that the DEIR obfuscates the estimated water usage of the project. Regarding the impacts to groundwater, the DEIR found this impact to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding water usage for the project, the total estimated project water demand is discussed in Impact 4.11-7 on pages 4.11-35 to 43. The impacts associated with water supplies for the project were found to be less than significant.

## Response to Comment Ind 254-29

The commenter states that the project will negatively impact groundwater supplies, but the commenter does not specifically identify how the DEIR is inadequate. The DEIR analyzed impacts to groundwater and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells. The commenter also references the dewatering process and the discharge to South Fork Wolf Creek but does not state how the DEIR is inadequate in this regard. The commenter is referred to Master Response 35 – Discharge to South Fork Wolf Creek.

## Response to Comment Ind 254-30

The commenter reiterates that the DEIR fails to capture the true scope of the project i.e., the 2,585-acre mineral rights area and that the impacts to groundwater supplies may affect all property owners within this area. Regarding the assertion on the proper scope of the project, the commenter is referred to Master Response 7 – Location of Future Mining Areas. Regarding groundwater impacts, the commenter does not state how the DEIR's discussion of impacts to groundwater is inadequate. The DEIR analyzed impacts to groundwater and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Please also see Response to Comment Ind 254-17.

## Response to Comment Ind 254-31

The commenter states that the dewatering of the mine would interfere with recharge of groundwater supplies but does not specifically state how or why the DEIR is inadequate in this regard. The DEIR determined that any impacts associated with groundwater recharge would be less than significant after mitigation. (DEIR, 4.8-54.) The commenter also references the property rights of owners near the project but does not comment on the adequacy of the DEIR. The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 254-32

The commenter states that the DEIR contains no satisfactory scientific or informed discussion regarding the DEIR's discussion of recharge to groundwater. The commenter also discusses the groundwater property rights of surface owners within the project's mineral rights boundary. The commenter also states that the Itasca study regarding groundwater prepared in support of the DEIR is inadequate and that structure of the DEIR in general obscures the impacts to groundwater data. Lastly the commenter states that the DEIR uses inconsistent data throughout to describe the impacts to groundwater.

The commenter does not specifically explain why the DEIR is inadequate in any of the areas listed above. For example, the commenter does not identify why the DEIR is lacking scientific discussion regarding groundwater or why the Itasca study (DEIR Appendix K.3) is lacking. The commenter states that DEIR uses inconsistent data but does identify which data is inconsistent. The DEIR analyzed impacts to groundwater and found those impacts to be less than significant after mitigation. (DEIR, 4.8-54; 80.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells. The project-specific groundwater modeling was independently peer reviewed by the County's third-party consultant. The data used for the groundwater model and the conclusions of the groundwater model, as reflected in the DEIR, were peer-reviewed by the County's independent groundwater expert, who concurred with the conclusions of the DEIR.

The commenter's concerns about surface water depletion and drying out forests is addressed in Master Response 33 – Groundwater Dependent Vegetation.

## Response to Comment Ind 254-33

The commenter reiterates concerns that the DEIR fails to accurately discuss the extent of potential impacts to groundwater supplies. The commenter also references a statement from the DEIR on page 4.8-66 regarding the DEIR's conclusion that impacts to groundwater supplies could be significant absent mitigation measures. The commenter states that this statement on page 4.8-

66 is inconsistent with other portions of the DEIR that discuss groundwater. The commenter also states that the project will negatively impact tourism and economic values in the community. The commenter also states that the DEIR fails to acknowledge climate change and drought.

The commenter does not specifically state how the DEIR understates the scope of impacts to groundwater supplies. Additionally, the commenter does not specifically state how the statement on DEIR page 4.8-66 is inconsistent with other portions of the DEIR. Regarding impacts to tourism and economic values, the commenter is referred to Master Response 2 – Social and Economic Impacts. Regarding climate change and drought, the commenter is referred to Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 254-34

The commenter quotes several passages from DEIR page 4.8-62 regarding the DEIR's discussion of impacts to groundwater supplies. The first passage states that mining would occur at deeper locations where fractures or geologic discontinuities decrease with depth due to the weight of overlying geologic materials, which in turn would not transmit significant quantities of water and impact groundwater wells. The passage then refers the reader to an Appendix which supports this assertion. The commenter asserts that the supporting models from the Appendix must be in the DEIR itself. However, there are no CEQA authorities that support this assertion. The commenter also states that the DEIR also fails to acknowledge climate change. The commenter is referred to Master Response 16 - Drought and Climate Change.

With regard to the other two passages, the commenter states that the DEIR fails to accurately discuss the extent of potential impacts to groundwater supplies. However, the commenter does not state how the DEIR's discussion of impacts to groundwater is inadequate. The DEIR analyzed impacts to groundwater and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Response to Comment Ind 254-17.

## Response to Comment Ind 254-35

The commenter reiterates concerns that the DEIR fails to accurately discuss the extent of potential impacts to groundwater supplies. However, the commenter does not specifically state how the DEIR's discussion of impacts to groundwater is inadequate. The DEIR analyzed impacts to groundwater and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model. The commenter also states that the DEIR groundwater monitoring and mitigation plan is inadequate but does not state why the DEIR is inadequate. The commenter is referred to Master Response 15 – Adequacy of Groundwater Monitoring Wells. The commenter also states that the project will impact wells throughout the entire mineral rights boundary, thus forcing County residents to switch to NID service, which will ultimately overwhelm NID's water supplies. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

Please see Master Response 33 – Groundwater Dependent Vegetation, regarding the concerns about drying out forests and increasing fire risk. Please see Master Response 16 – Drought and Climate Change, regarding climate change concerns.

## Response to Comment Ind 254-36

The commenter states that the DEIR fails to adequately analyze the risks posed by hexavalent chromium present in the CPB. The commenter does not explain how the DEIR is inadequate with regard to hexavalent chromium. The commenter is referred to Response to Comment Ind 254-1. Please also see Response to Comment Ind 254-17.

## Response to Comment Ind 254-37

The commenter reiterates concerns that the DEIR failed to adequately discuss hexavalent chromium and that discussion of hexavalent chromium should have been included in DEIR Chapter 4.7 (Hazards and Hazards Materials). The commenter also discusses the PG&E Hinkley Chromium Cleanup and the movie *Erin Brockovich*. The commenter does not explain how the discussion of hexavalent chromium in Chapter 4.8 (Hydrology and Water Quality) is either inappropriate or insufficient. The commenter is referred to Response to Comment Ind 254-1.

## Response to Comment Ind 254-38

The commenter details its general opposition to the project, stating that the project would result in no net benefit to the community and that there are better land uses available for the project site. The commenter's opposition to the project is noted for the decision makers. Please see Master Response 1.

## Response to Comment Ind 254-39

The commenter states that DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) is generally inadequate. The commenter also states that the DEIR admits that air quality impacts would be significant absent mitigation. One of the primary functions of an Environmental Impact Report is to inform lead agencies about the potential significant impacts of a project, and whether those impacts can be mitigated to a less than significant level. It is not uncommon for a project to have significant impacts before mitigation. The commenter also states that the DEIR inadequately discusses asbestos but does not explain how the DEIR is inadequate. The commenter also states that the DEIR fails to discuss air impacts from wildfire caused by the project or from fugitive dust because water supplies may be exhausted. Both of these concerns are speculative and do not pertain to the adequacy of the DEIR. Please also see Response to Comment Ind 254-17.

## Response to Comment Ind 254-40

The commenter references inadequate mitigation measures for air quality impacts and Nevada County's existing poor air quality. DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) discussed impacts to air quality, including potentially impeding an air quality plan and exposing sensitive receptors to substantial pollutant concentrations. The DEIR determined these impacts to be less than significant after mitigation. (DEIR, 4.3-66, 78.) Regarding the commenter's question about "…what does the mine's carbon offsets elsewhere (see 4.3-96 plus) have to do with making our local air quality and climate change problems less severe…?," climate change is a global issue, and unlike criteria pollutant effects, is not localized. Thus, offsetting GHG emissions elsewhere in California is an entirely appropriate and industry standard approach to mitigating GHG emissions.

## Response to Comment Ind 254-41

The commenter states that the Asbestos Dust Mitigation Plan ("ADMP") is inadequate because it does not consider the potential for deeper mining. The commenter also states the DEIR does not examine the potential possibility that the project will not have sufficient water supplies to control

fugitive dust. The commenter also states the DEIR fails to consider the possibility of human error. The ADMP consists of mitigation actions that take place on the surface and it is unclear how deeper underground mining would affect those actions. (DEIR, p. 4.3-83.) Regarding the unavailability of water supplies to control fugitive dust or the possibility of human error, these comments are speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." Furthermore, water for fugitive dust control will be obtained from multiple sources (e.g., NID, treated groundwater at the Brunswick Site).

## Response to Comment Ind 254-42

The commenter states that the DEIR is flawed because it assumes that emergency generators at the project site would only be operated for 100 hours per year. The commenter does not explain how this figure is erroneous. The commenter also states that the DEIR underestimates climate change. The commenter is referred to Master Response 16 – Drought and Climate Change. The commenter also states that the DEIR fails to discuss Public Safety Power Shutoffs ("PSPS") but does not state how the DEIR is inadequate in this regard, or why such discussion relates to an environmental impact. In addition, PSPS are addressed in Impact 4.11-6 of the Public Services and Utilities chapter of the DEIR. The commenter also discusses the PG&E bankruptcy litigation and the financial condition of the Project Applicant, both of which are not relevant to the DEIR. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

## Response to Comment Ind 254-43

The commenter states that the "Non-CEQA Related Analysis" related Public Safety Power Shutoffs and the operation of generators onsite should have been included as a foreseeable impact of the project. However, as explained in Footnote 48, physical impacts stemming from a PSPS are too speculative for evaluation. Pursuant to CEQA Guideline 15145, an "EIR is not required to engage in speculation in order to analyze a worst-case scenario." (see *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342, 373.)

## Response to Comment Ind 254-44

The commenter states that the DEIR's discussion of impacts due to odors is inadequate because the DEIR does not consider the possibility of odors from expanded and deeper mining. However, the DEIR only identifies potential odors emanating from diesel emissions from project trucks, the water treatment plant, and the ore processing. (DEIR, p. 4.3-84-85.) There are no odors associated with the underground mining component of the project and more expansive or deeper mining would not produce new odors. The commenter also questions why Mitigation Measure 4.3-7(b) (Carbon Offsets – Construction Emissions) is being proposed. Pursuant to CEQA Guideline Section 15126.4(c)(3), carbon offsets are permitted to mitigate for project emissions. (DEIR, 4.3-97.)

## Response to Comment Ind 254-45

The commenter states that the DEIR's use of Footnote 48 on DEIR page 4.3-104 regarding impacts that are too speculative for evaluation is an excuse to sidestep a discussion of climate change. The commenter is referred to Master Response 16 – Drought and Climate Change. The commenter also states that the DEIR does not consider project impacts within the entire mineral rights boundary. The commenter is referred to Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 254-46

Please see Response to Comment Ind 254-17 and Master Response 16 – Drought and Climate Change. Regarding hexavalent chromium, the commenter is referred to the portion of Response to Comment Ind 254-1 that discusses hexavalent chromium in CPB. The commenter also appears to raise legacy contaminant concerns that could be generated by deep mining. For this, please see Response to Comment Grp 25-30.

## Response to Comment Ind 254-47

The commenter states that the project will deplete groundwater supplies but does not state how the DEIR is inadequate in this regard. The DEIR examined the project's potential impacts to groundwater supplies and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The remaining portion of the comment is identical to Comment Grp 254-17. The commenter is referred to Response to Comment Ind 254-17.

## Response to Comment Ind 254-48

Comment Grp 254-48 is identical to Comment Grp 254-18 and a portion 254-19. The commenter is referred to Response to Comment Ind 254-18 and the applicable portion of Response to Comment 254-19.

## Response to Comment Ind 254-49

A portion of Comment Grp 254-49 is identical to Comment Grp 254-19. To the extent that both comments are identical, the commenter is referred to Response to Comment Ind 254-19. The commenter states that the DEIR erroneously relies on past hydrological data and ignores climate change. The commenter is referred to Master Response 13 - Historic Hydrogeologic Assessments and Master Response 16 - Drought and Climate Change. The commenter discusses the statutorily required Water Supply Assessment and questions the validity of NID's statements regarding future water supplies. (DEIR, p. 4.11-49.) However, the commenter does not identify any inadequacies with the DEIR's discussion of water supply on which to formulate a response.

## Response to Comment Ind 254-50

The commenter expresses opposition to the project but does not otherwise comment on the adequacy of the DEIR. The comment is noted for the decision makers. Please see Master Response 1.

## Response to Comment Ind 254-51

The commenter expresses opposition to the project but does not otherwise comment on the adequacy of the DEIR. The comment is noted for the decision makers. Please see Master Response 1.

## Response to Comment Ind 254-52

The commenter expresses opposition to the project but does not otherwise comment on the adequacy of the DEIR. The comment is noted for the decision makers. Please see Master Response 1.

## Response to Comment Ind 254-53

The commenter addresses the financial condition of the Project Applicant. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues. The commenter also discusses a number of legal issues and precedents but does not specifically discuss the adequacy of the DEIR; thus, no further response is warranted.

## Response to Comment Ind 254-54

The commenter expresses opposition to the project. The comment is noted for the decision makers. The commenter also states that the cleanup of the Centennial Industrial Site should be considered part of the project. The commenter is referred to Master Response 4 – Cleanup is a Separate Project Under CEQA.

## Response to Comment Ind 254-55

The commenter states that the discharge to South Fork Wolf Creek will contain hexavalent chromium. However, any hexavalent chromium that would be present in the water pumped from the mine would be treated before being discharged to South Fork Wolf Creek. The commenter is referred to Master Response 35 – Discharge to South Fork Wolf Creek. The commenter also states that the dewatering of the mine will dry out vegetation in the area thus increasing wildfire risk. The commenter is referred to Master Response 33 – Groundwater Dependent Vegetation. The commenter also references legal precedent regarding nuisance. The comment is noted.

## Response to Comment Ind 254-56

The commenter reiterates concerns that the dewatering of the mine will dry out nearby vegetation. The commenter is referred to Master Response 33 – Groundwater Dependent Vegetation.

## Response to Comment Ind 254-57

The commenter expresses general opposition to the project but also references hexavalent chromium and the depletion of groundwater supplies. However, the commenter does not provide specifics regarding these topics. The DEIR examined the project's potential impacts to groundwater supplies and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) See also Response to Comment Ind 254-17. Regarding hexavalent chromium, the commenter is referred to Response to Comment Ind 254-1.

## Response to Comment Ind 254-58

The commenter discusses hypothetical scenarios related to climate change. Please see Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 254-59

The commenter discusses legal precedents related to nuisance and inverse condemnation in the context of the possible subsidence. Subsidence is discussed in DEIR Chapter 4.6 Geology, Soils, and Mineral Resources. That Chapter of the DEIR determined that impacts pertaining to subsidence, liquefaction, or landslides were less than significant after mitigation. The commenter is also referred to Master Response 29 – Near Surface Workings.

## Response to Comment Ind 254-60

The commenter references the Project Applicant's filings with the SEC. The Project Applicant's SEC filings are not relevant to the adequacy of the DEIR. The commenter references several potential impacts associated with the project but does not offer additional information. The commenter also states that cleanup of the Centennial Industrial Site should be analyzed in the DEIR. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. Regarding hexavalent chromium, please see Response to Comment Ind 254-1.

## Response to Comment Ind 254-61

The commenter urges the County to consider any potential impacts to property values resulting from the project. The commenter also references several potential impacts associated with the

project such as air quality, traffic, noise, and vibration. The commenter does not provide additional information or identify any inadequacies with the DEIR. The DEIR analyzed the referenced impacts in Chapters 4.3, 4.10, and 4.12. The commenter also discusses the financial condition of the Project Applicant. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues. In addition, regarding subsidence, please see Master Response 29 – Near Surface Workings; regarding hexavalent chromium, please see Response to Comment Ind 254-1; regarding climate change, please see Master Response 16 – Drought and Climate Change; regarding water supply, please see Master Responses 14 and 15.

## Response to Comment Ind 254-62

The commenter discusses potential economic impacts of the project and states that there are more desirable land uses that should be considered. The commenter is referred to Master Response 2 – Social and Economic Impacts. In addition, the repeated reference to a "larger" groundwater impact zone than identified in the supporting studies of the DEIR is speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

## Response to Comment Ind 254-63

The commenter states that the project's impact to air quality in the region will prevent residents from using wood stoves or burn their leaves. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary. The commenter also states that the project will negatively impact the tourism industry and will attack business that are large polluters. The commenter is referred to Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 254-64

The commenter reiterates concerns regarding the project's potential impacts to property values. The commenter also states that the benefit of local employment is outweighed by the potential negative impacts of the project. The commenter is referred to Master Repose 2 – Social and Economic Impacts. The commenter also states that the cleanup of the Centennial Industrial Site should be included in the DEIR. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. The commenter also urges the County not to approve the project. The commenter's opposition to the project is noted for the decisionmakers.

## Response to Comment Ind 254-65

The commenter expresses concern that the County will not enforce the Mitigation and Monitoring Plan should the project be approved. The comment is noted for the decisionmakers. Please see Master Response – Operator Responsibility.

## Response to Comment Ind 254-66

The commenter states that many aspects of the DEIR's Chapter 4.8 (Hydrology and Water Quality) are inadequate. For example, the commenter states that impacts to groundwater wells are likely to occur throughout the entire mineral rights boundary and that groundwater supplies will not adequately recharge after the dewatering of the mine. However, the commenter does not

state how the DEIR is inadequate with regard to Chapter 4.8. The DEIR discusses impacts to hydrology extensively and found that impacts would be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Please also see Response to Comment Ind 254-17. The commenter also references hexavalent chromium concerns. The commenter is referred to Response to Comment Ind 254-1. Regarding climate change concerns, please see Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 254-67

The commenter references a number of potential impacts discussed in the DEIR but does not comment on the adequacy of the DEIR. The commenter also references future underground mining throughout the mineral rights boundary. The commenter is referred to Master Response 7 – Location of Future Mining Areas. The commenter also references potential subsidence. The commenter is referred to Master Response 29 – Near Surface Workings. The commenter also states that the project will interfere with groundwater recharge; however, the DEIR analyzed groundwater recharge and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter also references the Sustainable Groundwater Management Act ("SGMA"), but that legislation only applies to recognized groundwater basins, which is not applicable for this project.

## Response to Comment Ind 254-68

The commenter is skeptical that the project will not interfere with groundwater recharge, but does not state how the DEIR is inadequate. The DEIR analyzed groundwater recharge and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter asks where will the water come from to replace what the project takes away. The water will come from the fractured bedrock. As discussed in Appendix K.2 to the DEIR (page 19), the primary source of recharge is percolation of local rainfall into the fractured bedrock. In addition, as described in Section 3.3.2 of Appendix K.2, the amount of recharge each year also appears to be relatively constant since almost all of the wells maintain a consistent magnitude of seasonal fluctuation from year to year and there are no long-term trends observed in most of the wells that can be correlated to variations in annual water-year rainfall.

## Response to Comment Ind 254-69

The commenter states that the project will result in adverse impacts to groundwater supplies but offers no additional information; thus, no additional response is required. The commenter also states that property values will be negatively impacted. The commenter is referred to Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 254-70

The commenter is concerned about subsidence caused by the project. The commenter is referred to Master Response 29 – Near Surface Workings. The commenter also expresses general opposition to the project. The comment is noted.

## Response to Comment Ind 254-71

With the exception of the first paragraph, Comment Ind 254-71 is identical to Comments Ind 254-17 through Ind 254-19. To the extent that the comments are the same, the commenter is referred to Responses to Comments Ind 254-17 through Ind 254-19. The commenter states that the DEIR is deliberately organized to be difficult to comprehend. The commenter does not explain how the how the DEIR's organization is inadequate.

## Response to Comment Ind 254-72

The commenter references several potential impacts associated with the project but does not state specifically how the DEIR is inadequate. The commenter states that the DEIR fails to consider climate change. The commenter is referred to Master Response 16 – Drought and Climate Change. The commenter also states that the DEIR fails to account for additional mining within the mineral rights boundary. The commenter is referred to Master Response 7 – Location of Future Mining Areas. The commenter also states that the project will interfere with recharge of groundwater supplies. The DEIR analyzed the project's impacts to groundwater recharge and found the impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model. The commenter also references hexavalent chromium concerns. The commenter is referred to Response to Comment Ind 254-1.

It is noted that, in reference to rock fracturing, mining uses explosives to break rock into smaller pieces so it can be moved. The small amounts of explosives used in mining do not open cracks and fissures beyond the immediate vicinity of the blast itself and would not open cracks outward, allowing water to flow from outside areas into the mine. As discussed in Section 4.2 of Appendix M, the breaking of rock includes drilling a number of parallel holes in the mine face. Generally, one or more of these drillholes are located near the center of the drill pattern and used as void or "relief" hole (open holes not loaded with explosives). The holes drilled around that hole are then loaded with explosives and are set off. That first hole "relieves" the blast and allows the least amount of explosives possible to break the first rock out of the mine face. The remaining holes located around the first blast are then initiated using a series of delays to progressively enlarge the blasted area until the final dimensions and profile of the drift are created. Any fracturing of rock outside of the blasted excavation is limited to a very few inches beyond of the drill hole and therefore the process cannot create the extensive cracks or fissures ostensibly envisioned by the commenter.

## Response to Comment Ind 254-73

The commenter expresses general opposition to the project and states that project will negatively impact tourism and will eliminate an opportunity for more preferable land uses. The commenter is referred to Master Repose 2 – Social and Economic Impacts. For climate change concerns, please see Master Response 16 – Drought and Climate Change. Impacts to groundwater and thoroughly address in Chapter 4.8 of the DEIR, as demonstrated in Master Responses 14 and 15. The commenter also states that the project's impact to air quality in the region will prevent residents from using wood stoves or burn their leaves. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

## Response to Comment Ind 254-74

The commenter states that the DEIR improperly segments the Centennial Industrial Site. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. The commenter also states that the DEIR fails to assess the impacts to groundwater supplies within the mineral rights area. However, the commenter does not state how the DEIR is inadequate in this regard. The DEIR analyzed groundwater impacts and found them to be less than significant after mitigation. (DEIR, p. 4.8-54.) Regarding the mineral rights areas, please see Master Response 7 – Location of Future Mining Areas. The commenter is also concerned about subsidence from underground mining. The commenter is referred to Master Response 29 – Near

Surface Workings. Regarding hexavalent chromium, please see Response to Comment Ind 254-1.

## Response to Comment Ind 254-75

The commenter states that DEIR Chapter 4.7 (Hazards and Hazardous Materials) is inadequate because it does not discuss hexavalent chromium. However, the DEIR adequately discusses hexavalent chromium in Chapter 4.8. Additionally, the commenter states that the DEIR improperly segments the Centennial Industrial Site. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. Please also see Master Response 33 – Groundwater Dependent Vegetation, regarding the commenter's drought and dried vegetation concerns. The commenter also appears to raise legacy contaminant concerns that could be generated by deep mining. For this, please see Response to Comment Grp 25-30.

The commenter also alleges that the DEIR ignores the underground mining occurring in the 2,585-acres under the airport surface area. The commenter seems to imply that mining could adversely affect the airport, but does not specifically identify how. Thus, while the comment is unclear, the following is offered. Master Response 7 - Location of Future Mining Areas, and the attendant figures, show that the underground mining would not occur beneath the airport.

## Response to Comment Ind 254-76

The commenter states that DEIR Chapter 4.9 (Land Use and Population and Housing) is inadequate because the commenter alleges that the project is incompatible with the project site. However, the commenter provides no additional detail on which to form a response. DEIR Chapter 4.9 found that general plan and zoning of the site is generally consistent with the proposed use, considering the requested land use approvals. (DEIR, p. 4.9-18).

Please also see Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 254-77

The commenter states that DEIR Chapter 4.10 (Noise and Vibration) is inadequate because the Centennial Industrial Site is not a separate project. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. Please also see Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 254-78

The commenter states that the DEIR's analysis of noise and blasting does not account for potential areas of future mining. The commenter is referred to Master Response 7 – Location of Future Mining Areas and Response to Comment Grp 21-44. The commenter also points to the "Effects of Ground Cover" paragraph on DEIR page 4.10-24 and states that the DEIR did not apply this to other portions of the mineral rights boundary. However, the ground cover absorbs sound on the surface, so this concept does not properly relate to blasting noise. Any additional blasting within the mineral rights boundary would occur underground.

## Response to Comment Ind 254-79

The commenter states that the project's impacts to air quality will eliminate opportunities for local residents to continue historical practices such as wood stoves and leaf burning but provides no evidence of this assertion. The commenter also states that project's water usage for dust control will exhaust NID water supplies. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or

inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

## Response to Comment Ind 254-80

The commenter states that the project's dewatering of the mine will dry out surrounding vegetation and exacerbate wildfire. The commenter is referred to Master Response 33 – Groundwater Dependent Vegetation. The commenter also states that the DEIR fails to discuss the true emergency generator use due to PSPSs. PSPS are not scheduled nor are PSPS regular occurrences, but rather are instituted on an as needed basis when weather patterns present a particularly high danger for starting wildfires. Thus, the amount of generator use for PSPS is speculative. Nevertheless, page 4.3-103ff of the DEIR included an informational analysis of PSPS generator uses. The commenter does not state how this portion of the DEIR is inadequate.

## Response to Comment Ind 254-81

This comment serves as a transitional paragraph within the comment letter. The comment is noted.

## Response to Comment Ind 254-82

The commenter raises the topic of growth inducing impacts and states that the project is "undesirable" and would attract similarly undesirable businesses. These types of "quality of life" issues do not fall within the scope of CEQA. The commenter is referred to Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 254-83

The commenter states that the DEIR fails to adequately list cumulative impacts but does not list any cumulative impacts; thus, no response is possible. The main contention of the commenter appears to be the commenter's oft-repeated claim that the DEIR only analyzed impacts within the Centennial and Brunswick Sites, rather than the entire mineral rights area. As has been repeatedly stated in the preceding responses, this assertion is addressed in Master Response 7 – Location of Future Mining Areas. The commenter also states that the project's impacts to air quality will eliminate opportunities for local residents to continue historical practices such as wood stoves and leaf burning but provides no evidence of this assertion, which is speculative and unsubstantiated. The commenter also states that project will attract undesirable businesses to the area. The commenter is referred to Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 254-84

The commenter states that the "DEIR comments basically incorporate other DEIR section, and I, therefore, do the same where I have disputed and objected to those other referenced DEIR commentaries." The comment does not specifically address the adequacy of the DEIR and is noted.

## Response to Comment Ind 254-85

Climate change concerns are addressed in Master Response 16 – Drought and Climate Change, and groundwater depletion is address in Master Responses 14 and 15. Regarding groundwater depletion as it relates to drying of vegetation and increasing fire risk, please see Master Response 33 – Groundwater Dependent Vegetation. The commenter states that the DEIR does not discuss "irreversible environmental changes" in Chapter 5 in a satisfactory manner but does not explain how the DEIR is inadequate. The commenter also states that the DEIR's statutorily required

section regarding significant irreversible environmental changes should include the dewatering of the mine. However, as the DEIR indicates, while the mine would be dewatered, the groundwater would be treated on-site and pumped back into the South Fork of Wolf Creek. Thus, the dewatering does not constitute a "large commitment of non-renewable sources." (DEIR, p. 5-8.)

## Response to Comment Ind 254-86

The commenter states that the significant and unavoidable impacts listed in Section 5.6 underestimates the true number of impacts. However, the commenter does not list which additional impacts must be included in Section 5.6. The commenter states that the dewatering of the mine will dry out nearby vegetation causing additional visual impacts. The commenter is referred to Master Response 33 – Groundwater Dependent Vegetation. The commenter also states that noise levels will be higher than stated in the DEIR due to project operations, but does not state why, nor provide substantiation for this unmerited claim. The commenter also states that traffic will be worse than stated in the DEIR, but does not explain why, nor provide substantiation for this unmerited claim. No further response is possible or required.

## Response to Comment Ind 254-87

The commenter defers to other commenters regarding the DEIR's Chapter 6 Alternatives Analysis. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. (see CEQA Guidelines, Section 15126.6(a).) The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis given that they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers. The commenter does not suggest any specific alternative.

The commenter also appears to suggest that the DEIR does not evaluate the full time period of project impacts. That this is not supported can be demonstrated by considering the groundwater analysis. The groundwater model relied on a 25-year hydrogeologic model to assess groundwater impacts from project implementation, based on known locations of mineralized gold ore and represents the underground location of where mining would occur during the first 25 years of mine operation. Sensitivity Scenario 6 used in the groundwater model considered the significant expansion of mining in areas with potential for mineralization, as shown in Figure 5.10 of Appendix K.3 of the DEIR for an additional 40 years of mining. This groundwater model scenario represents the reasonably foreseeable location of where future mining would likely take place after the initial 25-year period. As shown in Figure 5-12, and discussed on page 29 of the report, the 5-ft drawdown contour extent of Scenario 6 at the end of potential additional mining (to Year 65) relative to the 2019 water level expands less than 500 ft from that of the Base-Case Scenario. The drawdown contour of the Base-Case Scenario is at the end of the original planned future mining (Year 25) relative to the 2019 water level. The comparison of drawdown contours between Scenario 6 and the Base-Case Scenario suggests that the added potential mining (beyond the 65 years modeled) will not lead to large incremental drawdowns as the mining progresses because the mining activities occur in deep, low-K rocks.

As stated in Response to Comment Grp 7-82, the groundwater flow model would be updated periodically after dewatering commences and additional groundwater level data is collected to evaluate dewatering impacts. New groundwater level data and updated modeling would incorporate changes to the long-term mining plan, data from monitoring wells, and measured pumping rates. For further discussion, please see Master Response 7 – Location of Future Mining Areas.

The commenter also expresses general opposition to the project. The comment is noted for the decisionmakers. Please see Master Response 1.

## Response to Comment Ind 254-88

The commenter states that the DEIR does not adequately portray the "No Project Alternative" but the commenter does not explain why. It is unclear whether the commenter is requesting evaluation of an additional alternative, or taking issue with the alternatives selected for evaluation in the DEIR. If the former, please see Response to Comment Ind 254-87. If the latter, the proffered reasons as to why the alternatives analysis is inadequate are unclear. There seems to be a suggestion that a version of the No Project Alternative should have been considered whereby the mine commences but has to subsequently shut down due to financial infeasibility. The lack of clarity in the comment precludes any further meaningful response effort on the part of the lead agency.

The commenter references the Project Applicant's SEC filings. However, those filings are not relevant to the adequacy of the DEIR.

## Response to Comment Ind 254-89

The commenter states that the DEIR's Alternatives Analysis is flawed because it rejects a number of alternatives. Specifically, the commenter states that the DEIR erroneously dismisses other industrial uses because they are not more intensive than the project. However, the commenter does not state why such uses are less intense than the project. Please see Response to Comment Ind 388-6. The commenter references the Project Applicant's SEC filings. However, those filings are not relevant to the adequacy of the DEIR. Comment noted.

## Response to Comment Ind 254-90

The commenter states that for this particular project CEQA allows for the consideration of the financial condition of the Project Applicant. However, under CEQA, the DEIR is limited to considering the project's physical impacts to the environment. The Project Applicant's financial condition or SEC filings are not relevant to the adequacy of the DEIR. Please see Master Response 1. Regarding hexavalent chromium, please see Response to Comment Ind 254-1.

## Response to Comment Ind 254-91

The commenter generally states that the DEIR does not comply with CEQA and should not be approved. The comment is noted for the decisionmakers. Please see Master Response 1.

## Response to Comment Ind 254-92

The commenter reiterates its concerns with the DEIR addressed elsewhere in the Comment Letter and states that that the DEIR is flawed and does not comply with CEQA. The comment is noted for the decisionmakers and the specific assertions regarding the DEIR's inadequacy are addressed in Responses to Comments Ind 254-1 through Ind 254-91.

## Response to Comment Ind 254-93

The commenter reiterates its concerns with the DEIR addressed elsewhere in the Comment Letter and raises concerns regarding hexavalent chromium. The comment is noted for the decisionmakers and the specific assertions regarding the DEIR's inadequacy are addressed in Responses to Comments Ind 254-1 through Ind 254-92.

## Response to Comment Ind 254-94

The commenter appears to state that the DEIR incorrectly applies the holding in *California Building Industry Association v. Bay Area Quality Management District* (2015) 62 Cal. 4th 369, but does not provide clear explanation on this point, thus precluding a meaningful response. The commenter indicates that they will provide more detail in a separate comment letter. Regarding the generally referenced groundwater depletion, please see Master Responses 14 and 15. Regarding climate change, please see Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 254-95

This is an introductory comment for a series of concluding comments relating to the DEIR. The commenter also describes the County Planning Commission hearing in March 2022. The comment is noted.

## Response to Comment Ind 254-96

The commenter states that the residents of the County are concerned about certain primary issues. Specifically, the depletion of the groundwater, the use of hexavalent chromium and the discharge to South Fork Wolf Creek, and the true scope of the project. The comment is noted for the decisionmakers and the specific assertions regarding the DEIR's inadequacy are addressed in Responses to Comments Ind 254-1 through Ind 254-91. Regarding the true scope of the project (i.e., the wells on East Bennet Road) and impacts to groundwater, the DEIR analyzed these impacts and found them to be less than significant after mitigation. Regarding hexavalent chromium, the commenter is referred to Response to Comment Ind 254-1. Regarding the discharge to South Fork Wolf Creek, the commenter is referred to Master Response 35 – Discharge to South Fork Wolf Creek.

The commenter disapproves of the DEIR and believes it does not accurately portray the project. The comment is noted. The commenter also asks why the DEIR has not considered climate change in connection with the project. The commenter is referred to Master Response 16 - Drought and Climate Change. The commenter asks why the DEIR does not identify and notify surface owners of the legal rights. This comment does not pertain to the adequacy of the DEIR. The commenter is concerned about the potential impacts to property values. The commenter is referred to Master Response 2 – Social and Economic Impacts. The commenter refers to the Project Applicant's SEC filings. The Project Applicant' SEC filings do not pertain to the DEIR. The commenter references performance standards and penalties for noncompliance. This comment does not pertain to the adequacy of the DEIR.

## Response to Comment Ind 254-97

The commenter asks what amount of subsidence residents can expect should the project be approved. The commenter is referred to Master Response 29 – Near Surface Workings.

## Response to Comment Ind 254-98

The commenter asks what effect the project will have on residents living throughout the mineral rights boundary with regards to groundwater. The commenter is referred to Chapter 4.8

(Hydrology and Water Quality), Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 254-99

The commenter asks what the effect an injunction obtained by a local resident would have on the DEIR in regard to hexavalent chromium. This comment does not pertain to the adequacy of the DEIR. The commenter discusses the rights of local residents pertaining to nuisance and trespass. This comment does not pertain to the adequacy of the DEIR. The commenter asks a series of questions regarding local residents exercising their rights. This comment does not pertain to the adequacy of the DEIR. The commenter references the SEC filings of the Project Applicant. This commenter does not pertain to the adequacy of the DEIR. The commenter asks a series of questions about the Project Applicant's financial condition. This comment does not pertain to the adequacy of the DEIR. The commenter states that the DEIR assumes that all of the preliminary project components will be completed on time. This comment does not pertain to the adequacy of the DEIR. The commenter asks, since it is unlikely that all mining activities will be permitted as envisioned by the DEIR, what variances are possible to ensure the viability of the project. This comment does not pertain to the adequacy of the DEIR.

## Response to Comment Ind 254-100

The commenter poses a series of questions regarding the viability of the project under certain scenarios. These questions are speculative and do not pertain to the adequacy of the DEIR.

## Response to Comment Ind 254-101

The commenter states that the DEIR contains omissions and inadequacies. The commenter asks about the enforcement of mitigation measures and obligations of the Project Applicant regarding subsidence. Regarding subsidence, please see Master Response 29. The commenter urges that the project not be approved. The comment is noted for the decisionmakers and the specific assertions regarding the DEIR's inadequacy are addressed in Responses to Comments Ind 254-1 through Ind 254-100.

RE: Supplemental Brief On CEQA Issues And Authorities ("CEQA Brief" or "Supplement") Supporting G. Larry Engel's Objection (the "Objection" or "Engel Objection") to the Draft Environmental Impact Report ("DEIR") SCH #2020070378 for the Idaho-Maryland Mine Project dated December 2021 (the "Project") In Response to the County of Nevada (the "County") Community Development Department's Related Notice dated February 7, 2022 (the "County DEIR Notice").

Dear Matt:

**Table of Contents**

1. Some Introductory Reasons For Allowing My Objection As Consistent With The Correct Interpretation Of CEQA And Rejecting The Disputed DEIR Interpretations. ..... 3

2. The Disputed DEIR Fails The General Requirements For An Adequate DEIR Under CEQA And Its Guidelines As Interpreted By Key Court Cases Like *Sierra Club v. County of Fresno, Gray v. County of Madera*, And Others. (More Specific Guideline And Court Decision Applications Are Discussed Further Below) ..... 4

A. A Brief Review of the CEQA Guidelines At Issue Generally That Defeat The DEIR. ..... 4

B. DEIR General Informational/Content Guidelines For Relevant CEQA Principles of General Application. ..... 7

C. Sierra Club v. County of Fresno (*"Sierra Club"*) And Related Cases, As Well As Those Listed In Guideline # 15003(a), (b), (c), (d), (e), (f), (g), (h), (i) and (j): Demonstrating The DEIR's General Noncompliance With CERA And Other Applicable Law In Fundamental Ways. ..... 8

**Ind 255-1**

3. *Gray v County of Madera*: One Detailed Example Of An Illustrative CEQA Case Before My More Systematic Analysis of Authorities Supporting My View Of How CEQA Should Be Interpreted And Applied As To Particular Issues. ..... 12

4. While the Parties Can Debate About The Extent Of Any CEQA Required Discussion Of "Economic Feasibility" By Itself As A Category For Analysis, Economics Factors And Feasibility Can Be Required Under Other CEQA Disclosure Categories And Are Certainly Appropriate Counter Evidence For Objections Impeaching Or Rebutting The Disputed DEIR. ..... 20

5. My Objection Properly Uses Economic Feasibility And Other Challenged Rebuttals Not Just For CEQA Compliance, But Also As Evidence To Counter And Impeach The Disputed DEIR With Contradictions, Inconsistencies, And Admissions That Expose Errors, Omissions, And Deficiencies. ..... 23

6. A Quick Appeal For Consideration of Climate Change Realities Creating A "New Normal" Where Chronic Drier Weather And Drought Rebut The DEIR Illusions That Our Future Can Be Predicted From Our Past, Especially As To Groundwater. ..... 27

7. The DEIR's Other Suspicious Noncompliance With Specific CEQA Or CEQA Guideline Requirements Support My Objections To Errors, Omissions, And Deficiencies In the DEIR's Disputed Presentation. ..... 28

A. What Is The Real CEQA "Project" And Its "Environmental Setting"? ..... 28

B. Who Is The "Applicant" Versus The "Real Party In Interest"? ..... 33

8. Miscellaneous Noncompliance With the CEQA Guidelines That Further Evidence A Pattern And Practice Of DEIR's Comprehensive Obscurity Contrary To The *Sierra Club* And Other Standards For Required Information. ..... 34

A. Introduction To Objectionable Techniques To Set Up False Assumptions And Conclusions Or Otherwise Evade Disclosure Obligations ..... 34

B. "Hide The Ball" Noncompliance, Such As By Burying Data Where It Is Less Likely To Be Seen Or Understood In Context, Often May Be Revealed By Less Serious Types Of Noncompliance With the Guidelines. ..... 34

9. Concluding Remarks. ..... 35

**Ind 255-2**

On March 30, 2022, I filed my **"Objection"** to the DEIR regarding the Idaho-Maryland Mine referenced in the County DEIR Notice mentioned above, entitled, "Objections to the Draft Environmental Impact Report ('DEIR') [SCH #20200070378] for the Idaho-Maryland Mine Project dated December 2021 (the 'Project') In Response to the County of Nevada (the 'County') Community Development Department's Related Notice dated February 7, 2022 (the 'County DEIR Notice')" by G. Larry Engel. I incorporate by reference that Objection into this **"Supplement,"** including my March 30, 2022, cover letter, as if that and this "CEQA Brief" were one document as my "Objection." That incorporation by reference also incorporates by reference what my Objection incorporated by reference into itself, such as the other appropriate objections at the March 24, 2022, hearing or in follow-up written objections, such as those by the CEA Foundation, the Friends of Banner Mountain, and their constituent

organizations and members. The reason the documents were filed separately by me is that I needed more time for this briefing after learning at the March 24, 2022, County public hearing that the County may have a different interpretation than I do about the application under my described facts and circumstances of CEQA to my Objection and others. This is the supplemental brief I announced in that Objection would be coming to support my request for reconsideration of certain economic feasibility arguments in my Objection and to illustrate what I consider to be the correct interpretation of CEQA, in contrast to what the DEIR incorrectly asserts or implies to be the meaning and effect of CEQA.

After describing some general issues and less technical reasons for rejecting the disputed DEIR for CEQA noncompliance (before the technical ones to follow later in this Supplement), I have presented below some of my legal arguments based on the CEQA Guidelines and some key court decisions that reveal DEIR noncompliance with CEQA or other applicable law and illustrative case support for my competing interpretations used in my Objections. For example, I do a detailed examination of the **"common sense" and "good faith" CEQA test from the similar mining case of *Gray v. County of Madera*. That *Gray* analysis applies more strongly to defeat this disputed DEIR than it did to defeat the EIR in that case, especially by insisting on what my Objection addressed as a need for feasibility, good faith, clarity and reality/truth that avoided the illusions, distracting irrelevancies, misleading data, and other flaws resulting in the DEIR's "alternative reality" that often lacks "common sense" (as *Gray* said when insisting that its EIR mine mitigation had to place the neighbors' losing water in the same position they were in before the mining).**

1. **Some Introductory Reasons For Allowing My Objection As Consistent With The Correct Interpretation Of CEQA And Rejecting The Disputed DEIR Interpretations.**

Throughout the DEIR are citations to CEQA (or its "Guidelines," which for all purposes here (and in my Objection) I include as part of what I collectively refer to as "CEQA," to rebut DEIR's disputed positions. See generally the California Environmental Quality Act, Public Resources Code # 21000 et seq (the "CEQA" statutes) and 14 Cal Code Reg #'s 15000 et seq (the "CEQA Guidelines" or "Guidelines," respectively). Also, the DEIR in many places implies disputed CEQA interpretations as excuses for why the DEIR omits or deficiently describes information that I believe (and demonstrate below) are required by CEQA or other applicable law. One common example is the DEIR's frequent excuse for omissions on the abused theory that the missing data is too "speculative." Even worse, the disputed DEIR asserts incorrect, misleading, unsubstantiated, or otherwise objectionable positions, often cast as "assumptions" or "conclusions" that are even outside of the DEIR's own boundaries for what it considers to be required by CEQA. Under such disputed DEIR positions, any rebuttal by my Objection or others could be resisted without regard to its merits, simply as excludable by the DEIR (or the County, as lead CEQA agency) as beyond the disputed CEQA boundary.

What follows below explains more about correct boundaries for objections, as well as presenting other grounds for permissible rebuttal in my Objections, such as, for example, using DEIR or Rise admissions as evidence to impeach or rebut DEIR assertions or excuses for omissions. Note, for example, that the DEIR has a whole section at 4.3-103-104 called "Non-

CEQA Related Analysis," which opens the door to my Objection countering that without being limited by CEQA interpretations. Also, for example, consider that at the same time the DEIR (and apparently the County planners at the March 24 hearing) is insisting (incorrectly as I show below) that there should not be any economic feasibility rebuttal allowed, the DEIR asserts (at 6-14) that the project would not be economically feasible if it were limited to a 12-hour workday. However, there must always be an even playing field to allow my such rebuttals and counters in my Objection to any such DEIR errors, omissions, and deficiencies, both because I contend and demonstrate below that my Objection is CEQA compliant and that the DEIR is not compliant, and because I must also be entitled to impeach and rebut the DEIR no matter how counters to such errors, omissions, and deficiencies relate to CEQA. This brief supports that approach.

**2. The Disputed DEIR Fails The General Requirements For An Adequate DEIR Under CEQA And Its Guidelines As Interpreted By Key Court Cases Like *Sierra Club v. County of Fresno, Gray v. County of Madera*, And Others. (More Specific Guideline And Court Decision Applications Are Discussed Further Below).**

**A. A Brief Review of the CEQA Guidelines At Issue Generally That Defeat The DEIR.**

**Ind 255-3**

**CEQA Guideline # 15151 specifies "Standards For Adequacy Of An EIR"** that require the DEIR to be prepared "with a sufficient degree of analysis to provide decisionmakers with information which enables them to make a decision which intelligently takes account of the environmental consequences [of the 'project,' a term separately discussed later below]. ... [T]he sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible. ... [T]he EIR should summarize the main points of disagreement among the experts." With reference to the court rulings addressed below, that Guideline notes that they are looking for "adequacy, completeness, and a good faith effort at full disclosure." This disputed DEIR fails each of those requirements in scores of ways addressed in my Objection and others. For example, my Objection demonstrates how the DEIR ignores entirely the hexavalent chromium threats in the cement paste the DEIR expects to use to shore up the 2585-acre underground mine, as well as the many mine dewatering and groundwater depletion issues, that are exposed in my Objections.

By a painstaking comparison of detailed DEIR provisions against reality (and against the other inconsistent parts of the DEIR) I demonstrate in my Objection more than 50 individual errors, omissions, and deficiencies, each of which should be fatal to the DEIR and which, together illustrate an objectionable or worse DEIR "pattern and practice" of avoiding any such "good faith effort at full disclosure" or any such "sufficient degree of analysis for intelligent decisionmaking about environmental consequences." See my discussion below of the "forecasting" required in Guideline # 15144. By ignoring its CEQA obligations, the DEIR tries to save itself from having to "summarize the main points of disagreement among the experts," but my Objection and others will force that compliance now. For example, the DEIR cannot survive the thousands of negative studies about hexavalent chromium on the EPA website, the

EU ban, the *Erin Brockovich* movie case study, and other data cited in my Objection and others, especially when the DEIR refuses even to acknowledge the existence of any controversy.

The "one size fits all" approach of the Guidelines sometimes makes them a poor fit for an unusual project like this attempt to reopen a gold mine closed and flooded since 1956. I doubt CEQA drafters expected some miner would attempt such a DEIR, for such mining (i) where there are now thousands of surface owners above and around the 2585-acre underground mine, and (ii) where the DEIR admits a massive lack of knowledge about the conditions that now exist in that mine or will result from the 24/7/365 blasting, tunneling, rock removal, dewatering, shoring up with hexavalent chromium cement paste, and otherwise doing mine work for 80-years. Rather than confront the "hard questions" and objections that would come from "good faith" compliance with CEQA, the disputed DEIR tries to evade those things and to create an artificial reality with massive information gaps and other errors, omissions, and deficiencies in the DEIR, such as by imaging that reality is too "speculative" to require any comment. My Objection and other reveal those wrongs and flaws, but many mysteries remain that create more unanswered questions (see, eg, my Objection #'s 14 and 15).

**Guideline #15364 defines "feasible"** as meaning "capable of being accomplished in a successful manner within a reasonable period of time [by or for the 'Applicant,' another term addressed further below], taking into account **economic,** environmental, **legal,** social, and technical factors." (Emphasis added) I address later the debate over "economic feasibility" and how my Objection # 2 data must be considered for many different reasons, including if only under the rules of evidence and *Gray's* common-sense test or *Sierra Club's* good faith requirement for impeachment and rebuttal of blatant DEIR errors, omission, deficiencies, and worse. But I note here that what the DEIR claims to be "infeasible" is often "objectively feasible," but simply infeasible personally for this financially challenged speculator looking for a speculator's profit. For example, in addressing the Alternative of working the mine for a 12-hour day instead of a 24-hour day, at 6-14, the disputed DEIR makes the unsubstantiated claim that the 12-hour day would cause the project to be economically infeasible. However, that is more of a comment about the unique, personal economic challenges of Rise exposed in its current SEC Form 10K and 10Q filings (see my Objection # 2) than about any objective feasibility, if done by a competent and financially capable miner. (However, that 12-hour day limit is high on the law reform goals of our local resistance by the thousands of resident voters living on the surface above and around the 2585-acre mine who don't want 24/7/365 blasting, tunneling, rock removal, dewatering, and other objectionable activities beneath us for 80-years, as explained in my Objection # 3.N.)

Ind 255-4

**Guideline # 15144 defines "forecasting" to "necessarily involve... some degree of forecasting ... [because] [w]hile foreseeing the unforeseeable in not possible, an agency must use its best efforts to find out and disclose all that it reasonably can." That effort is part of the "good faith" required by cases like *Sierra Club*, "common sense" required by *Gray*, and others using similar concepts with different words or phrases. In any event, the DEIR made no such required effort, clinging instead to the unknowns of the mine closed since 1956 as an excuse lacking in good faith to avoid having to confront inconvenient truths, as demonstrated in my Objections, especially by the DEIR incorrectly insisting, without good faith or common sense, on ignoring the hexavalent chromium risks or on insisting that the future groundwater supplies had to replicate the past "recharges," even when the DEIR did not update ancient**

Ind 255-5

5

**and unreliable mining condition data about the past, and despite climate change and the "new normal" making that past irrelevant and misleading, as described in my Objection # 3.M and below. Incidentally, Guideline # 15145 about "speculation" requires that the DEIR "should note its conclusion" that a "particular impact is too speculative for evaluation." That alert in the DEIR is the only way to flag for the lead agencies the need to make a decision as to who takes the risk of the unknown: the public living above or around the 2585-acre underground mine or the exploitive mining speculator who may prefer not to know and then have to explain what horrors may lurk in that long closed and flooded mine or may escape from the new, expanded, and deeper mining. Such willful DEIR ignorance of such unknowns should not give any benefit of any doubt to such speculator like in the DEIR. For example, as I demonstrated in my Objection at # 3.M, the DEIR considered the groundwater recharge adequacy for the rest of the 80-years of 24/7/365 mining after 2040 (when the largely inapplicable NID surface water data expired that the DEIR was incorrectly applying) to be too speculative to discuss. Similarly, the DEIR refused seriously to analyze the current conditions in the existing 2585-acre underground mine closed since 1956 and to investigate the unknown conditions of its new, deeper, and expanded DEIR mining there. In each such case, the lead agency now has to decide whether to deny the DEIR as too risky or worse (as the thousands of us locals living on the surface above or around the 2585-acre underground mine insist in objections) or else reward this foreign controlled, no net benefit mine with little capacity to pay for its mistakes or worse by allowing the DEIR mining without anyone knowing the resulting environmental consequences. (Because most of us prefer not to discover harms the hard way when they assault us, potential victims may prefer the self-defense actions by exercising our legal and political rights to stop the menace.) See my Objection at #'s 2, 3.A, B, M, and N and 4.**

**Ind 255-6**

This abuse of "forecasting" and evading disclosures as "too speculative" for DEIR comment is an especially intolerable excuse when the DEIR evades CEQA requirements without warning, such as by implicitly assuming without disclosure that inconvenient science and facts are too speculative, such as about climate change, future groundwater recharge, or the lethal toxicity of hexavalent chromium. For example, no rational person should have any good faith belief (as the DEIR claims) that our mine dewatering depleted groundwater around the 2585-acre underground mine will be reliably "recharged" in a future for the next 80-years of average rain from between 1967-2017. Yet, that is what the DEIR fantasy it insists that us thousands of surface residents and voters must tolerate for the next 80-years, while we suffer the new normal dryness and drought climate change as it menaces our property, our trees, our environment, and our community. See my Objection #'s 3.M, A, B, D, E, and F, 4, 5, and 14. Fortunately, the thousands of us on that surface above that dewatering depletion each own our shares of that same groundwater. Therefore, we can compete with the DEIR for our own owned groundwater with new and deeper wells, especially as the climate change droughts the DEIR insists on ignoring result in NID cutbacks. See Objection #'s 3 and 4. (The future for water is a zero-sum game, and none of us locals can tolerate this threat of 24/7/365 depletion of our shared groundwater that we have no less right to use than any mine, and, when our law reform efforts are accomplished, we may have superior rights). See my Objection #'s 3.N and Id. To put this in the wording of the Guideline # 15124 below, that is an example of a "reasonably foreseeable indirect impact" triggered by the DEIR groundwater depletion direct impacts.

6

B. DEIR General Informational/Content Guidelines For Relevant CEQA Principles of General Application.

Guideline # 15121 describes how an EIR works as an informational document (and why us local resisting residents and voters above and around the 2585-acre underground mine are working so hard to prevent this disputed DEIR from becoming an EIR). Guideline # 15003 lists many court rulings that clarify the meaning and effect of CEQA, most of which are violated by this DEIR as described in my Objection and others. See generally, the descriptions in # 15002, including the stated public's right (at #15002(j)) to respond to this DEIR as I have in my Objections, because of the DEIR's many errors, omissions, and deficiencies. My Objection and others hopefully will defeat the DEIR, but anything that may survive a rewrite or challenge still does not limit the agency's ultimate discretion, which is critical, because of all the many aspects of relevant reality that the DEIR refuses to address at all or in a compliant and satisfactory manner. As noted herein, no responsible government can assign to us locals such burdens, risks, and harms for the benefit of these mining speculators proving no net benefit to our community from this mine (see my Objection #'s 2 and 4), such as the risks of the DEIR's unaddressed unknowns in the existing 2585-acre mine closed and flooded since 1956 and in that area for new, deeper, and expanded mining into unknown conditions, where the DEIR insists on exploring for gold at our risk as those living on the surface above or around that no net benefit, 2585-acre underground mine.

**Ind 255-7**

Guideline # 15120(c) requires the draft EIR to contain the information required by Sections 15122 through 15131, which my Objections and others demonstrate this disputed DEIR fails to do properly and completely as required. See, eg, my Objection # 12 responding to the disputed and deficient DEIR's # 5.1.

**Ind 255-8**

Guideline # 15148 "Citation" requires that: "The EIR shall cite all documents used in its preparation including, where possible, THE PAGE AND SECTION NUMBER OF ANY TECHNICAL REPORTS WHICH WERE USED AS THE BASIS FOR ANY STATEMENT IN THE EIR." (Emphasis added) As my Objection demonstrates, the disputed DEIR rarely does that, and, as a result, most of the DEIR should be regarded as unsubstantiated, because it generally fails to comply fully with that citation rule. The public should not have to hunt for purported authority among that mass of disputed and mostly irrelevant exhibits for the many dubious or otherwise suspect statements in the DEIR. (The point is that the DEIR's exhibits can be so challenged as flawed in some or many ways, such as being irrelevant to this DEIR mine's unique facts and circumstances, outdated, superseded by better science, incomplete or initially defective or self-serving, such as the mine's questionable pre-closing records before 1956, often before modern regulations and standards, etc.)

**Ind 255-9**

Guideline # 15150 addresses "incorporation by reference," which does not permit the DEIR to do what it did to purport to add substance to the deficient DEIR by adding a mass of its selected exhibits that are often inapplicable, irrelevant or worse to the facts and circumstances here at the 2585-acre underground mine that has been flooded and closed since 1956 and subject to all the issues addressed herein or in my Objection and others (and even some admitted in the current and past Rise SEC Form 10K and 10Q filings addressed in my Objection at #2). The DEIR's vague cross-references or missing cites to specific pages in that mass of exhibits are not compliant with that # 15150(c).

**Ind 255-10**

7

**Ind 255-11**

**Guideline # 15143 "Emphasis" dooms the disputed DEIR, which repeatedly fails properly to judge correctly what is "significant" and then to "focus on the significant effects on the environment," which must be discussed "with emphasis in proportion to their severity and probability of occurrence."** My Objection notes such DEIR noncompliance many times as to many issues, but the most obvious is the DEIR's barely mentioning the hexavalent chromium and never discussing its risks and harms with any "emphasis." The groundwater depletion and other risks stated in my Objection also fail to receive proper "emphasis," because the DEIR never satisfactorily recognizes the fact of the thousands of us locals living on the surface above and around the 2585-acre underground mine, and that underground mine itself receives insufficient DEIR emphasis. Another need for "emphasis" is the failure to address the conditions in that 2585-acre underground mine (closed and flooded mine since 1956), both at the start of the new process, and when confronting the unknown conditions being created by the new, expanded, and deeper mining, all of which pose serious and unaddressed threats to both the environment and those of us locals living on the surface above or around that neglected, mine's "environmental setting."

**Ind 255-12**

**Guideline # 15154 "Projects Near Airports" requires additional information in the DEIR,** which is lacking, especially since some of the airport is above or around the 2585-acre underground mine, as noted in my Objection. That airport is essential to local fire defense and evacuation.

**Ind 255-13**

**Guideline # 15142 "Interdisciplinary Approach"** should also be applied to objectors for a "level playing field," to allow such interdisciplinary objections to have equivalent impact as the DEIR advocates.

**C. Sierra Club v. County of Fresno (*"Sierra Club"*) And Related Cases, As Well As Those Listed In Guideline # 15003(a), (b), (c), (d), (e), (f), (g), (h), (i) and (j): Demonstrating The DEIR's General Noncompliance With CERA And Other Applicable Law In Fundamental Ways.**

**Ind 255-14**

**Without limiting the generality of those Guideline # 15003 and its cited court ruling principles, to which I will add additional data from *Sierra Club* and certain other precedents (before detailed analysis of the key *Gray* mining decision below to illustrate the application of these principles), I note that Guidelines 15002 and 15021 (among others) impose specific duties on the lead agency for the protection of our environment, our local community, and the public. By violating those duties, the DEIR disables our government from doing its own duties effectively, because of the errors, omissions, and deficiencies cited in my Objection and others. For example, without a total rewrite of the DEIR to add missing data and make corrections of errors and deficiencies, the County cannot do its duty "to respond to comments from the public" (# 15002(j)), to "respond to the information ["that the project could cause substantial adverse changes in the environment"]" by the actions listed in # 15002(h), and to make the findings in # 15002(g), as well as to do its duties to minimize environmental damage and balance competing public objectives in # 15021, such as to "not approve a project as proposed if there are feasible alternative or mitigation measures available that would substantially lessen any significant effects that the project would have on the environment" (at # 15021(a)(2)). For example, consider: (i) the DEIR's incorrectly**

8

**rejected Alternative of using the Brunswick site not as a mine, but rather as an industrial site (see my Objection # 13). [Note: of all the many absurd and unsubstantiated things in the DEIR, one most lacking in what the *Gray* case called "common sense" was rejecting that industrial site for the sole stated reason that it was too "intense." Compared to the DEIR's far more ultra-intense, divisive, risky, burdensome, harmful, and controversial mining, the industrial use looks tolerable versus such no net benefit DEIR mining proposal, especially if the goal is just a reasonable return on its mine purchase price, rather than a super-windfall gamble at our community's expense, as explained in my Objection at #'s 2, 4, and 13], and (ii) the DEIR rejecting a normal 12-hour day mitigation as economically infeasible, not objectively, but just for Rise's admittedly challenged financial condition and speculative goals [see Id.] Also, pursuant to #15021(b) and (d) the County may consider "SPECIFIC ECONOMIC, ENVIRONMENTAL, LEGAL, SOCIAL AND TECHNICAL FACTORS," as well as to use them to "balance a variety of public objectives." (Emphasis added) In addition, as described in Guideline # 15355 and elsewhere less than "significant" individual impacts can have cumulative significant effect as explained in my Objection, including from this project when "added to the other closely related past, present and reasonably foreseeable probable future projects." While Guideline # 15370 defines "mitigation" broadly for these purposes, the disputed DEIR mitigations are exposed in my Objections as deficient or worse.**

**With that background I will now offer a brief tour of the leading California Supreme Court case, *Sierra Club v. County of Fresno* (2018), 6 Cal. 5th 502 ("*Sierra Club*"),** which I offer as a way of reducing the need for sorting through scores of seemingly inconsistent lower court CEQA cases, which are often debated without considering the distinguishing facts and circumstances that make most such contrarian, pro-EIR cases inapplicable to our DEIR dispute (that is one reason why I chose to add the *Gray* decision below to illustrate these principles in a more factually similar context.) The *Sierra Club* case involved a master planned seniors' community on 942-acres of former agricultural land to be built in five phases over 10-years. The County approved (and trial court upheld) an alternative plan that wisely "prohibited the discharge of treated effluent into the river from the wastewater treatment plant" (at 508), which the County should do here as well to protect Wolf Creek from the hexavalent chromium menace and other toxins that escape DEIR insufficiently described "treatment" for any reason. While the key issue left to the Supreme Court was the project's air quality menace that defeated the EIR, the court provided a useful description of the controlling standards and principles that should also apply here to protect us locals from such disputed DEIR mining.

**Ind 255-15**

The Sierra Club's conclusion was as follows:

> We conclude as follows [at 510]: When reviewing whether a discussion is sufficient to satisfy CEQA a court must be satisfied that the EIR (1) includes sufficient detail to enable those who did not participate in its preparation to understand and to consider meaningfully the issues the proposed project raises [citing Laurel Heights I] ... and (2) makes a reasonable effort to substantively connect a project's air quality impacts to likely health consequences. As explained below, the EIR in this case failed to do so. ... or explain in meaningful detail why it is not feasible at the time of drafting to provide such analysis...

9

The same defects apply to our disputed DEIR as to many risks, burdens, and harms addressed in my Objection and others. At to the "understanding" test, I had trouble understanding many DEIR issues, despite all my experience in other failed mines and their often-fanciful environmental impact reports, whose errors, omissions and deficiencies were exposed by realities revealed in the bankruptcies or other end-games, as they joined the rest of the more than 40,000 abandoned mines on the EPA list that the EPA and other governments seem unable to clean up or resolve. Little health data can be found in the DEIR, which is due in part to the general DEIR flaw of understating the problems, such as by ignoring hexavalent chromium entirely as a threat or blindly mining in the 2585-acre underground mine area without sufficient knowledge of what conditions now exist there or will be released by new, deeper, and expanded mining.

The next *Sierra Club* test of an EIR is stated at 511-12 as:

> The foremost principle under CEQA is that the Legislature intended the act 'to be interpreted in such manner as to afford the fullest possible protection to the environment within the reasonable scope of the statutory language. ... [T]he [EIR] ... is a document of accountability. ... The EIR 'protects not only the environment but also informed self-government. ...
>
> ... 'An agency may abuse its discretion under CEQA either by failing to proceed in the manner CEQA provides or by reaching factual conclusions unsupported by substantial evidence. (# 21168.5.) Judicial review of these two types of error differs significantly: While we determine de novo whether the agency has employed the correct procedures, 'scrupulously enforc[ing] all legislatively mandated CEQA requirements [as a matter of law, with cite omitted], we accord greater deference to the agency's substantive factual conclusions. ...
>
> ***
>
> [After discussing the procedural issues, especially the question of whether the EIR's discussion of environmental impacts is adequate, the court continued at 513-14] Even if the Regents are correct in their conclusion that there are no feasible alternatives to the Laurel Heights site, the EIR is nonetheless defective under CEQA. As we stated in a context similar to CEQA, there must be a disclosure of the 'analytic route the ...agency traveled from evidence to action.'
>
> ***
>
> [T]he adequacy of an EIR's discussion of environmental impacts is an issue distinct from the extent to which the agency is correct in its determination whether the agency is correct in its determination whether the impacts are significant. '[A]n EIR's designation of a particular adverse environmental effect as 'significant' does not excuse the EIR's failure to reasonably describe the nature and magnitude of the adverse effect. ... [citation for the ruling that 'The EIR's approach of simply labeling the effect as 'significant' without the accompanying analysis of the project's impact on the health of the Airport's employees and nearby residents is inadequate to meet the environmental assessment requirements of CEQA.' With another cite] An adequate description of

**Ind 255-16**

10

adverse environmental effects is necessary to inform the critical discussion of mitigation measures and project alternatives at the core the EIR. See Guidelines #15151...

... But whether a description of an environmental impact is insufficient because it lacks analysis or omits the magnitude of the impact is not a substantial evidence question. A conclusory discussion of an environmental impact that an EIR deems significant can be determined by a court to be inadequate as an informational document without reference to substantial evidence. (At 514-15)

Our Courts of Appeal have consistently recognized that adequacy of discussion claims are not typically amenable to substantial evidence review. ... Noncompliance with substantive requirements of CEQA or noncompliance with information disclosure provisions ... may constitute prejudicial abuse of discretion within the meaning of Sections 21168 and 21168.5 ... [W]hen an agency fails to proceed [as CEQA requires], harmless error analysis is inapplicable. ... [and] the error is prejudicial. (At 515)

What that means to our DEIR is that most of my Objection and others can be resolved by the court as a matter of law de novo. The disputed DEIR has made its errors, omissions, and deficiencies so obvious that there is no way for the County to save them, and the DEIR must be rejected and redone, if they wish to try again. The DEIR is so deficient in most cases that the County has little to work with for its own analysis to satisfy the courts.

As the *Sierra Club* court stated at 515: "The courts have looked not for an exhaustive analysis but for adequacy, completeness, and a good-faith effort at full disclosure." The disputed DEIR here fails at each of those requirements, as demonstrated in my Objections and others. There is no sufficient such adequacy, completeness, or good faith in the disputed parts of the DEIR. What the Supreme Court considered deficient in its EIR for air quality is worse by comparison here, not only as to the air issues in my Objection at # 10, but also as to the many other such DEIR impacts that my Objection reveals to suffer from the same flaws. In each case it is prudent to remember what the *Sierra Club* court said (at 520-21) quoting the *Vineyard* decision I discuss below: "The relevant informational document here is the EIR, and the EIR must communicate not to the reviewing court, but 'the public and the governmental officials deciding on the project. ... The question is ... not whether the project's significant environmental effects can be explained, but whether they were." As demonstrated in my Objections and others, the DEIR is a massive and self-inflicted example of "hiding the ball" (see, eg, my Objection #'s 3.E, 14, and 15). Often those fatal omissions seem to be because the DEIR tries to abuse the excuse of the future being too speculative, but many problems about the mine that matter most have been ignored as inconvenient truths for which much could have been said consistent with CEQA, if the DEIR performed to the required standard. Unfortunately, being unwilling to address the "hard questions" (see, eg, my Objection #'s 14 and 15), the DEIR advocates left the County with a defective and noncompliant DEIR.

**Ind 255-17**

Please note here, however, that even Rise's own likely favorite cases do not allow DEIR claims that lack good faith or that are illusory, or speculation, or bogus assumptions. That is what appears to exist here, since my Objection # 2 proves that Rise currently cannot afford to perform the DEIR and mitigations, even as they proposed them, as distinct from what more will ultimately be required by government or courts or local law reforms, if the mine proceeds. That fact, largely based on Rise's own SEC 10K and 10Q filing admissions, makes the DEIR comments

**Ind 255-18**

often "illusory" and suggests a lack of "good faith." That is especially true given all the DEIR's other "strategic" errors, omissions, and deficiencies exposed in my Objection without any good excuse, such as the DEIR only occasionally mentioning the use of hexavalent chromium in the mine shoring cement paste without any mention of it or its dangers in the DEIR's "Hazards And Hazardous Materials." See also my Objection # 3.E and M, where I illustrate other examples of obscuring data, insufficient data, strategic omissions, and other inappropriate tactics prohibited by CEQA cases like *Banning Ranch Conservancy v. City of Newport Beach* (2017), 2 Cal.5th 918, 940-41 ("**Banning**") and *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007), 40 Cal.4th 412, 442 ("**Vineyard**"), each insisting on "a good faith reasoned analysis," rather than scattered or buried data, and unexplained data in exhibits.

In any event, under the applicable facts and circumstances in this case and a correct interpretation of CEQA and its Guidelines and relevant precedents (as distinct from distinguishable or other lower court decisions in need of correction by the California Supreme Court), I urge that everything in my Objection be considered. (The DEIR presented its disputed legal interpretations of various CEQA requirements, and so it's only fair and appropriate for the CEQA lead agency to consider my counters.) In the meantime, I believe that the DEIR is also irreconcilable with the following example California decisions (and relevant cases, statutes, and Guidelines cited therein). *E.g., Sierra Club v. County of Fresno* (2018), 6 Cal.5th 502; *Concerned Citizens of Costa Mesa, Inc v. 32nd Dist. Ag. Ass'n* (1986), 42 Cal.3d 929; *POET. LLC v State Air Resources Bd.* (2013), 218 Cal. App. 4th 681; *Gray v. County of Madera* (2008), 167 Cal. App. 4th 1099.

**3. *Gray v County of Madera*: One Detailed Example Of An Illustrative CEQA Case Before My More Systematic Analysis of Authorities Supporting My View Of How CEQA Should Be Interpreted And Applied As To Particular Issues.**

Ind 255-19

Consider the somewhat similar case of ***Gray v. County of Madera*** (2008), 167 Cal. App. 4th 1099 (**"*Gray*"**), where the court reversed the trial court's denial of the project opponents' challenges on **both CEQA and non-CEQA grounds, which defects the court found (at 1120) to be CEQA "prejudicial."** Those objectors sought the usual relief in such CEQA challenge cases, ie, (i) a petition for a writ of mandate to overturn a county's issuance of conditional use and mining permits for an 86-acre "excavation pit"/rock quarry (and related 35 acre "hot-mix asphalt plant," processing facility, administration complex, stock piles and processing areas, a road, and other project "accessories") for "aggregate" with approved rezoning pursuant to a certified environmental impact report (EIR), and (ii) a complaint for injunctive declaratory relief. The *Gray* mining would remove **900,000 tons of aggregate per year for 50 years involving 320 round trips by truck per day and consuming 72,000 gallons of water per day**. Unlike our DEIR mine so close to our suburban town with thousands of residents living on the surface above and around the 2585-acre underground mine, the *Gray* mine was in a cattle grazing area zoned agricultural with only "dozens of residences and 55 domestic wells within one mile of the project." As like our DEIR, there were many (175) public objections raising many of the same issues raised by my Objection and others, **including things this disputed DEIR (and perhaps some at the County) seems to resist as outside some imagined CEQA boundary, such as about (i) "economic or other feasibility," and (ii) similar "comments**

**describing the impacts to their property value that would occur as a result of the project," thus rebutting the appropriateness of such property value as an objection topic, even without my added Objection twists, such as that trashing of our property values harms home and commercial construction jobs and the local economy.** (Unlike our DEIR for a gold mine, which product has no local use and no net benefit here (see my Objection # 4), there was an arguable local need for aggregate in *Gray*, making that a stronger case for the approval than exists in our DEIR case.)

As usual in these disputes, the *Gray* court applied the statutory standard of review for "challenging an agency decision under CEQA" by asking: "(1) whether there is any substantial evidence in light of the whole record to support the decision; and (2) whether the agency abused its discretion by failing to proceed in the manner required by law. Pub. Resources Code 21168, 21168.5. *** The appellate court reviews the administrative record independently; the trial court's conclusions are not binding on it." at 1108-10. The "County has the burden of showing that there is substantial evidence to support its decision." at 1111. "The court then summarized its focus in applying those principles as follows:

> 'When assessing the legal sufficiency of an EIR ... the reviewing court focuses on adequacy, completeness, and a good faith effort at full disclosure.' [citation] 'The EIR must contain facts and analysis, not just the bare conclusions of the agency.' [citation] 'An EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.' [citation] 'Analysis of environmental effects need not be exhaustive, but will be judged in light of what was reasonably feasible. ...'
>
> As frequently occurs, many of the disputes in this case center on the question whether relevant information was omitted from the [EIR]. ... [Prejudice from such noncompliance is sufficient for reversal] if the failure to include relevant information precludes informed decisionmaking and informed public participation, thereby thwarting the statutory goals of the EIR process.' [citations] at 1109.

In my Objection and others all those requirements are satisfied for rejecting the DEIR, including dozens of instances of strategic or tactical errors, omissions, and deficiencies in the disputed DEIR that evidence what that standard calls lack of good faith, such, among many other things, as burying controversial data in obscure places (eg, not mentioning the use of toxic hexavalent chromium in the DEIR's "Hazards And Hazardous Materials" section or most other places where one would look for such lethal substances) or manipulating and omitting crucial 2585-acre underground mining and groundwater data without mentioning the thousands of affected surface owners, hundreds of wells, and their competing surface and groundwater rights, as if the only DEIR concern were 30 dry wells along East Bennett Road. In any event, what follows illustrates how the Gray court applied those principles in a less controversial case than our stronger case against this disputed DEIR.

The first *Gray* court issue was to address two general challenges (at 1110) that "the EIR [the DEIR and FEIR collectively] failed to fulfill CEQA's requirement as an informational document and violated CEQA by failing to take into consideration the 'whole of the project,'" although, because of the way the objectors' case was presented, the court backed into those

conclusions by way of the specific issue arguments. So, I will discuss those specifics after putting aside the general discussion of the County's response to the DEIR public objections, because we are not yet at that stage in our DEIR process, although I note that, as the *Gray* court stated at 1110: "Under CEQA, the County is required to evaluate comments to the DEIR and prepare written responses. (# 21091, subd. (d), CEQA Guidelines # 15088.)" In our case that means those general violations occur as described in my Objection, because no court could possibly consider compliant the DEIR discussions, for example, of hexavalent chromium harms and risks, or the deficient groundwater depletion and other impacts on the neglected surface owners' and users' rights and ownership interests above and around the 2585-acre underground mine that the DEIR generally ignores. Consider this example question in testing adequacy, what do us thousands of such surface residents tell a buyer when we try to sell our homes in the impact or stigma zones above or around the 2585-acre underground mine? I studied the thousands of pages of DEIR materials to prepare a 150-page Objection about my top 50 or so outrages, and yet I still could not adequately inform a buyer if I tried to sell my house. For example, apparently to reduce DEIR controversy with us locals, we still do not even know from the DEIR where the 2585-acre underground mine is located by reference to surface streets in our suburban community above and around that mine. Indeed, the best information I could readily find about even parts of the burden, risk, and harmful realities of the 2585-acre mine (which I included in my Objection #2) came not from the DEIR, but from the Rise Gold Corp current SEC Forms 10K and 10Q on its website.

As is true as to my Objections to the DEIR (except for the hexavalent chromium horrors in our case not present in *Gray)*, the main *Gray* controversy (starting at 1111) also concerns the mine's impact on water. Unlike our disputed DEIR' errors, omissions, and deficiencies in discussing groundwater threats to us surface owners and users above and around the 2585-acre underground, rather than just the distinguishable situation of the 30 wells along East Bennett Road on which the DEIR attempts to distract our attention (see, eg, my Objection #'s 3.A, B, D, E, F, and M, 4, 5, and 14), the *Gray* EIR admitted the risk of depletion of neighboring wells and causing quality issues, although it tried to minimize the threat by attempted and deficient mitigation with replacement water and monitoring in ways that were unsatisfactory, although (as NID stated at the March 24 hearing) superior to what is proposed in our disputed DEIR. (Unlike our DEIR, where there is no monitoring for the hundreds of existing wells owned by the thousands of surface residents above or around the 2585-acre underground mine [with more wells to come as climate change drought cuts NID supplies] and no real analysis with any substantial evidence of that new, deeper, and expanded 2585-acre mining impact or of any viable mitigation of the problems, the *Gray* monitoring at least seemed to have included everyone, despite other deficiencies which the court found to violate CEQA.)

**Ind 255-20**

For reasons noted below and that also apply to our disputed DEIR and are addressed in my Objection (see, eg, #'s 3.A, B, D, E, F, and M, 4, 5, and 14) and others, the *Gray* court concluded (at 1119-1120):

> **We are rejecting the County's conclusion on the water issues because we have concluded that the mitigation measures that were proposed to address the potentially significant adverse impacts on the water levels of private wells of neighboring landowners are not viable or effective. The**

**Ind 255-21**

14

**mitigation measures do not allow the landowners to use water in a manner substantially similar to how the landowners are currently using water because the mitigation measures (1) would allow Baker to replace potable water with nonpotable water, (2) could expose the landowners to new regulatory oversight in the use of their water, (3) would create a water supply system that does not reliably provide water at the times and in the amounts needed by the neighboring landowners, and (4) could cause new and potentially significant impacts on the environment. The only mitigation option that would address many of these problems is the proposal to build a new water system, but there is no substantial evidence to conclude that this option is even feasible. Thus, the mitigation measures are inadequate under CEQA. (Emphasis added)**

All of those factors against approving the *Gray* EIR that fail to comply with CEQA are also applicable in my Objection and others to the disputed DEIR, except that there is no offer to build a new water system here on the surface above and around the 2585-acre underground mine (and, if there were such a proposal, as in *Gray* that would require its own new EIR and violate the CEQA rules against deferred mitigation [at 1118], among other objections. The DEIR mine dewatering treatment system here flows into the Wolf Creek and away from us locals.)

More importantly, as my Objection (at my # 2) demonstrated by Rise and DEIR admissions, no such mitigation is adequately analyzed by the applicable CEQA standards and, in any event, such mitigation is not reliable; eg, not currently affordable or otherwise feasible by the DEIR miner. More importantly, although it was not an issue in *Gray*, because the mine was entirely on owned property competing for groundwater with neighbors, in our DEIR situation there are also many of us surface owners above and around the 2585-acre underground mine who have additional rights to compete for our own share of the same groundwater as discussed in my Objection (see my #'s 3.A, B, D, E, F, M and N, 4, 5, 8, and 14), in addition to our rights to drill new or deeper wells, especially when climate change dryness and drought results in NID cut backs.

**Ind 255-22**

One of the most important rulings in *Gray* is as follows (at 1117-1118) in **rejecting some EIR mitigations as defying "common sense" (which as my Objection demonstrates is a common flaw in this disputed DEIR):**

**We agree with RWQCB [California Regional Water Quality Control Board] that providing replacement water through bottled water is not a viable or effective mitigation measure. It defies common sense for the County to conclude that the providing of bottled water is an effective mitigation measure. As presented, ... [it] does not explain how and in what amount the bottled water will be delivered to the neighboring landowners. The measure requires replacement at least equal to the lost amount of water production from the landowners' wells. ... [discussing variable uses etc] Often landowners will be unable to predict their amount of water needs in advance. It is also unlikely that neighboring landowners have water meters that will help them calculate their water usage. Mitigation Measure 3.9-1b does not explain how it will address the issue of fluctuating water usage by supplying bottled water. A**

**Ind 255-23**

15

**Ind 255-24**

> **water system, as proposed by the Board, could solve the problem [although the court adds that: "The EIR also fails to examine whether building a new water system would cause significant environmental impacts"]. However, the proposal for a water system was never studied by the County staff. Thus, there is no substantial evidence that it is feasible to build a water system. Therefore, [it] ... does not present viable mitigation options.**
>
> **Furthermore, ... the EIR fails to explain how the use of nonpotable [project] water to irrigate the [neighboring] land [a mitigation measure] ... would have an impact on livestock, wildlife, and habitats. ... [or] how the water bottles that are used will be replaced or recycled. (Emphasis added)**

This same analysis applies to the disputed water truck alternative in our disputed DEIR addressed in my Objections, plus (as in my # 2) this DEIR miner has demonstrated no financial capacity to make any such mitigations feasible for the thousands of us living on the surface above and around the 2585-acre underground mine.

As *Gray* also explains further (at 1116-1117) regarding its "common sense" CEQA test of feasibility that should also defeat this DEIR, as explained in my Objections and others:

> **We agree with ...[objectors] that there is no substantial evidence that the mitigation measures are feasible or effective in remedying the potentially significant problem of decline in water levels of neighboring wells. In order to mitigate this problem ... [the miner] must present a viable solution that can effectively replace the decline in the water available to the neighboring residents. ... [W]e decline to ... [defer to the Board's findings because they] are not supported by substantial evidence or defy common sense. LAW IS NOT REQUIRED TO ABANDON COMMON SENSE. HERE, OUR COMMON SENSE INFORMS US THAT THE MITIGATION MEASURES WILL NOT EFFECTIVELY REPLACE THE WATER THAT COULD BE LOST BY THE NEIGHBORING LANDOWNERS. IT IS TRUE THAT THE MITIGATION MEASURES WILL PROVIDE A REPLACEMENT FOR THE LOST AMOUNT OF WATER. HOWEVER, NEITHER MITIGATION MEASURE ... WILL PROVIDE NEIGHBORING RESIDENTS WITH THE ABILITY TO USE WATER IN SUBSTANTIALLY THE SAME MANNER THAT THEY WERE ACCUSTOMED TO DOING IF THE PROJECT HAD NOT EXISTED AND CAUSED A DECLINE IN THE WATER LEVELS OF THEIR WELLS. (Emphasis added)**

**Our disputed DEIR mine is even in greater violation of that "CEQA common sense" test than in the *Gray* case for all the reasons explained in my Objection, including what I demonstrate there in my # 2, where Rise admits its financial challenges and impaired prospect that make achieving anything to be accomplished in the disputed DEIR speculative at best, especially the vague and CEQA noncompliant mitigations as to water issues for us thousands living on the surface above and around the 2585-acre underground mine, whose fate the DEIR never sufficiently even considers, much less adequately resolves as required by *Gray* and "common sense." Note that, as quoted above, *Gray* insists that any such water mitigation must put us neighbors in the same water position as we would have been in if there had been no mine,**

16

**and the DEIR does not even have a plausible approach to propose such a thing, which lack of feasible solutions to DEIR groundwater and NID water problems may explain why the disputed DEIR so often ignores those issues and generally avoids addressing the thousands of us living a normal suburban surface life (although in our beautiful forest) above and around that 2585-acre underground mine.**

For example, as to the need so to preserve equivalent water realities for impacted neighbors consistent with "common sense," consider some of the many deficient mitigations the Gray court rejected, such as (at 1117):

> **"Mitigation Measure 3.9-1(a) provides that Baker could rehabilitate or deepen the neighboring wells to provide additional water. But there is no substantial evidence to conclude that the neighboring wells would provide additional potable water. [That mitigation measure] ... also would ... permit Baker to replace the lost water by providing a connection to the Project wells. The DEIR concedes that the water from the Project wells is not acceptable for consumptive uses and already provides that water for consumptive use would come from the remaining production in private wells or through Mitigation Measure 3.9-1(b) [the rejected water system idea]. Thus, the neighboring residents would have to change their water usage to use the water from their private wells for consumptive purposes only and the water from the Project wells for other uses. Besides this inconvenience, neighboring landowners may also need to comply with regulatory oversight because of their use of the nonpotable water, for example in landscaping irrigation, which may require the neighboring landowners to mitigate and remediate any degradation to underlying groundwater. ...** [In response to the County's argument that there are "confined" water conditions that enable such mitigation to escape regulation, the court responded that it was "unclear" that interpretation is correct, and the court continued] **However, of more concern is that there is no substantial evidence to conclude that the aquifer that supplies water to the Project and to the neighboring wells, which is currently confined, would remain confined over the [50 year] operational life of the Project. According to the [State] RWQCB, as the pit is excavated, it may function as a well that could connect the production wells with neighboring wells. Thus, the neighboring landowners could become subject to regulatory oversight in the future. ... Therefore, Mitigation Measure 3.9-1(a) is not viable because it does not replace the lost water from private wells with a substantially similar quality of water. (Emphasis added)**

The court explained (at 1119) that:

> [A lead CEQA agency can defer **detailing** certain mitigation measures] ...as long as the lead agency commits itself to mitigation and to specific performance standards. ... **[But] we conclude that here the County has not committed itself to a specific performance standard. Instead,** the County has committed itself to **a specific mitigation goal--the replacement of water lost by neighboring landowners because of mine operations. However, this goal is not a specific performance standard such as the creation of a water supply mechanism that**

17

**would place the neighboring landowners in a situation substantially similar to their situation prior to the decline in the water levels of their private wells because of the mining operations, including allowing landowners to use water in a substantially similar fashion to how they were previously using water. Moreover, the listed mitigation alternatives must be able to remedy the environmental problem. We have concluded that the listed mitigation alternatives, except the building of a new water system, cannot remedy the water problems because they would not place neighboring landowners into a situation substantially similar to what the landowners experienced prior to the operation of the mine. And the option to build a water system, which is the only effective mitigation that was proposed if it was feasible, was never studied or examined. Thus, the County is improperly deferring the study of whether building such a system is feasible until the impact occurs. (Emphasis added)**

For such reasons as so stated by the *Gray* court, my Objections and others must also defeat the DEIR here.

**Ind 255-25**

My Objection at #'s 4, 8, 12, 13, and elsewhere also addresses some traffic issues, usually as they impact other environmental impacts like fire evacuation routes, road and infrastructure cost increases, and other harms and impacts on which I rely on other objectors whose greater knowledge I incorporate here. However, as part of my Objection's no net benefit from the DEIR mine analysis (at my #4), I note that the 50 to 100 trucks a day 24/7/365 for 80 years would be a substantial CEQA problem that was not mitigated by the DEIR, even if sufficient money was reliably available (about which locals are skeptical for reasons explained in my Objection # 2 from the miner's own admissions). However, because my *Gray v. Madera County* situation has a comparable problem for 50-years of "320 truck round trips per day" (at 1106), although in a more rural setting than our DEIR mine (at its # 4.12), I direct the County's attention to the following *Gray* analysis (at 1121-22), where the EIR admitted the traffic impact problems, but tried to mitigate them by the applicant paying an "equitable share" of the cost of construction of future improvements if requested by Caltrans or Madera County [with a formula] and to the long term maintenance fee based upon aggregate tonnage mined with no formula. I refer the County to that *Gray* court analysis at 1121-22, where the court analyzed the proposed mitigation and said: "the mitigation measures relating to traffic impacts are inadequate" (although more than what our DEIR proposes), expressing that the court "generally agree[s]" with the following objections of CEQA violations because such mitigation:

> **(1)** It is not enforceable; (2) it illegally defers development of the details and performance standards; (3) no substantial evidence supports the conclusion that the "fair share" fee will actually be spent on mitigation. In support of these three suppositions, Appellants complain that ["t]here is nothing in the mitigation measures that requires Caltrans or Madera County to actually impose impact fees." Also, "[t]he EIR fails to include any discussion of how or when the possible mitigation fees would be collected or spent, nor does it identify the extent to which the mitigation measures would alleviate the traffic impacts if some fair share fees were

18

ultimately imposed." Finally, "**the County made no finding regarding the limitation or the feasibility of the county guaranteeing the funding for roadway improvements." We generally agree. (Emphasis added) [NOTE THAT THIS COUNTY GUARANTEE IS AN EXAMPLE OF ECONOMIC FEASIBILITY BEING USED IN REBUTTAL TO DEFEAT A CEQA MITIGATION CLAIM.]**

This same kind of criticism applies to the disputed DEIR as to many proposed mitigations to impacts about which my Objection and others complain.

For another example, consider the *Gray v Madera County* court's rejection (at 1122-23) of the "incorrect methodology in determining significance of noise levels." This analysis exposes similar flaws in our disputed DEIR at its # 4.10 and elsewhere for noise and other impacts addressed in my Objection # 9 and elsewhere. **For example, consider the court's demonstration (at 1123) how in that case "there is no single noise increase that renders the noise impact significant," but that the "cumulative noise impact" was significant.**

**Ind 255-26**

**Thus, the EIR should consider whether the cumulative noise impact would be significant when increases of up to 2.1dBA are added to the existing noise level. For example, even though a 2.1 dBA noise in isolation will not be noticeable, when added to the already high noise level, it could cause a tipping point of noise problems for the general public. The EIR, however, does not analyze this issue and merely concludes that it would not be significant because "[i]t is generally recognized that an increase of at least 3 dB is usually required before most people will perceive a change in noise levels." This bare conclusion cannot satisfy the requirement that the EIR serve as an informational document. Moreover, the Board's statement of overriding considerations ... does not assist the County because it only considered one residence ... and did not consider the potentially significant impact of cumulative noise level. Thus, the EIR failed to adequately analyze the Project's impact on noise levels. (Emphasis added)**

**Ind 255-27**

This same kind of criticism applies to the disputed DEIR as to many such unsubstantiated "conclusions" or "assumptions" (a consistent flaw in the DEIR about which I complained many times in my Objection) about impacts both as to noise and many other things. **Even more importantly, as I explain in my Objection #'s 3.N and 4, the disputed DEIR rarely is correct about its "cumulative impacts," and that is critical, because, as my Objection details (see # *4*), that is how this no benefit mine crowds out the more desirable future additions to our community by exhausting our environmental tolerance standards limits on a cumulative basis, so that adding even good uses becomes a future CEQA violation for such desirable additions, while we're stuck in indefinite disputes with this no net benefit mine that so blocks our community's opportunities.**

**Ind 255-28**

**The *Gray* court concluded in its non-CEQA analysis** that the County failed to comply with Senate Bill No. 610, Water Code sections 10919-10914 by failing to prepare a water supply assessment for the project that applies to "public water system" that was not applicable to the mine, except (the court held at 1131) as to the possible mitigation construction of a water system for the affected neighbors. As the court explained (at 1131) quoting the *Vineyards* precedent, that "requires the lead agency to identify likely water sources for a project" and

19

required "assum[ing] that all phases of the project will eventually be built and will need water, and must analyze, to the extent reasonably possible, the impacts of providing water to the whole project." In *Gray* the County failed to analyze the impacts of providing water to the proposed water system. Thus, the County there, perhaps like the County here for this disputed DEIR, "must do a water supply assessment or provide substantial evidence to explain why it did not have to comply with Senate Bill 610." (Id.) See Guideline # 15155. **In this DEIR that means all those water uses addressed in my Objections not just for the Brunswick treatment facility for the dewatered groundwater it dumps into the Wolf Creek, perhaps for NID use, but also its insufficiently analyzed and deficient mitigation for the thousands of us surface locals who now have hundreds of wells above and around the 2585-acre underground mine and the multiples more such wells that will be drilled to compete with the mine, as it removes our shared/co-owned groundwater 24/7/365 for 80 years, assuming as *Vineyards and Gray* require that "all phases of the project will eventually be built and need water." See, eg, my Objection at #'s 3.A, B, D, E, F, and M, 4, 5, 8, 12, 13, and 14. There is clearly nothing sufficient or compliant about those issues in the disputed DEIR, which barely discussed those of us surface residents, voters, and competitors above and around the 2585-acre underground mine, which is an essential part of the project and our worst menace, as explained in many objections and addressed further below.**

4. **While the Parties Can Debate About The Extent Of Any CEQA Required Discussion Of "Economic Feasibility" By Itself As A Category For Analysis, Economics Factors And Feasibility Can Be Required Under Other CEQA Disclosure Categories And Are Certainly Appropriate Counter Evidence For Objections Impeaching Or Rebutting The Disputed DEIR.**

**Ind 255-29**

There is a legal debate about when and how economic feasibility considerations must be disclosed as its own category like water, air quality, traffic, etc. in order to comply with CEQA. Some argue, for example, that such discussions are part of CEQA # 21061.2 or CEQA Guidelines # 15064 or 15131 or others discussed below. But see CEQA Guidelines 15131. I argue that it depends on the specific legal context and required as to the issues raised in the DEIR and Objections like mine in this case, as discussed below where (as here) the particular facts and circumstances compel such disclosures, especially where those are factors compelled by what *Gray v. Madera County* above called "common sense" or by other applicable law our court rules, such as to prevent bad faith or worse. The California Supreme Court can eventually resolve that question later of how best to deal with DEIR's totally lacking in performance credibility. But this much is already certain and clear: there is no direct or indirect prohibition on economic feasibility discussions or other such topics outside of CEQA effects on the environment.

Before addressing below some cases and other approaches to requiring consideration of such evidence of economics, **consider in detail Guideline # 13131 "Economic And Social Effects,"** with which the DEIR fails to comply and which entitles my Objection to be fully considered by the County. **Section 13131(b) states:**

> **Economic or social effects of a project may be used to determine the significance of physical changes cause by the project. For example, if the construction of a new freeway or rail line divides an existing community, the construction would be the physical change, but the social effect on the community would be the basis for determining that the effect would be significant.** [After another example of project noise disrupting church service the conclusion is] ... Where an EIR uses economic or social effects to determine that a physical change is significant, the EIR shall explain the reason for determining that the effect is significant." (Emphasis added)

**Guideline # 15382 "Significant Effect On The Environment" states: "A social or economic change related to a physical change may be considered in determining whether the physical change is significant."**

**Guideline # 15021 (b)and (d) likewise invites consideration of "specific economic, environmental, legal, social, and technological factors," and: "(d) CEQA recognizes that in determining whether and how a project should be approved, a public agency has an obligation to balance a variety of public objectives, including economic, environmental, and social factors ... and ...shall prepare a statement of overriding considerations as described in Section 15093 to reflect the ultimate balancing ..." To set a baseline for such balancing the "Project Description" at # 15124(c) the EIR must contain a general description of the project's technical, ECONOMIC, and environmental characteristics ..." (emphasis added)**

Such economic factors addressed in my Objection (see, eg, # 2) include more than the challenged financial condition of the miner admitted in its SEC Forms 10K and 10Q that appear to make the DEIR accomplishments unaffordable and, therefore, illusory. For example, as explained in my Objection, the real estate value losses caused by the mining to the thousands of us above or around the 2582-acre underground mine will cause many adverse effects, such as, for example, a loss of construction jobs in the area, self-defense competition against the mine by surface owners to salvage groundwater from depletion (eg, digging or deepening competing wells to preserve precious surface owned groundwater from being wasted in dewatering a no net benefit mine), and many other changes addressed in my Objection at # 3.N or 4, as us locals enforce our legal and political rights to mitigate what we regard to be the adverse impacts, risks, burdens, and harms of the DEIR mine.

**The same can be said as to Guideline # 15131(c) stating: "Economic, social, and particularly housing factors shall be considered by public agencies together with technological and environmental factors in deciding whether changes in a project are feasible to reduce or avoid the significant effects on the environment identified in the EIR."** As demonstrated in my Objection and others, there is no way to reconcile such DEIR mining underneath a suburban community on the surface above or around such a 2585-acre underground mine. Considering everything we locals stand to lose and suffer from this no net benefit DEIR mine, the physical competition and other legal and political exercises of defense rights to counter the mine will have many indirect physical impacts. See my Objection at #'s 3.N and 4. **Such effects will be cumulative and expose the DEIR to more disclosure objections under Guideline # 15130 "Discussion of Cumulative Impacts," especially since such DEIR**

21

**Ind 255-30**

**mining 24/7/365 for 80-years will cause continuous counter reactions by us adversely and continuously impacted locals until the mining stops.**

In other words, there is no immunity for such omissions for the DEIR in other compliance or applicable law, and no prohibition on including such things in any opposition. See Kostka & Zischke, *Practice Under the Cal. Environmental Quality Act*, # 13.24 p.634 and Gray at 1120-1121, which states: **"CEQA requires that the lead agency analyze any significant physical changes that may be caused by social or economic impacts that are the result of the Project."**

**While the open pit quarry in *Gray* did not have all such underground mining impacts in that court's view of those facts, our disputed DEIR project does involve facts and circumstances where social and economic impacts of the project do cause significant physical changes under that *Gray* test. Remember that us surface victims of mining impacts by the DEIR mining beneath us in the 2585-acre mine have our own rights to mitigate our damages (which is a necessary response to the DEIR related mitigations being illusory as unaffordable by this miner) as demonstrated in court precedents cited in my Objection #'s 2, 3.N, 4, and 14, where I discuss surface owners defending against the DEIR mine with competing new or deeper wells (a specific example of a mine caused "physical change" resulting from an economic impact on us living above and around the 2585-acre underground mine of knowing that none of the DEIR stated mitigation may be economically feasible (or credible or reliable) for this DEIR miner, which admits data in its current SEC Forms 10K and 10Q inspiring doubts about reliability of the needed funding or credit (or even mine "proven reserves" for attracting investment), as my Objection # 2 proves.**

**Unlike the *Gray* situation that failed to see in that case that "physical changes to the environment will result from any loss in the property value of neighboring lands that will arise from a potential decline in water levels in private wells," my Objection makes that case for physical changes here, because we are better focused on the difference between cause and effect. The DEIR trashing our property values is a motivation, and it incites us locals to resist, compete, and counter with the appropriate exercise of our legal and political rights, as described in my Objection # 3.N and elsewhere. However, it's implementing that defense and counter from that exercise of our legal and political rights and competition that "causes" the physical changes that courts like the *Gray court* wished to see. When us locals are battling to save our homes and trees, our groundwater and environment, and community way of life from the DEIR menace, it's reasonably foreseeable that we locals may counter with every legal and political tool at our disposal. Many of those have counters and competitions physical change consequences that must be addressed pursuant to CEQA, because this is more than just a battle for our environment. It may include us surface owners enforcing our legal and political property rights, for example, for more and deeper wells in direct competition against dewatering of the underground mine proposed by the DEIR, and the environment will be caught in that crossfire between those two sides. [I understand that NID has its own concerns about such local well competition against the mine as described in my Objection at #'s 3.N and 4, but instead of trying to moderate us locals in our well competitions that also affect the environment, I suggest that NID focus instead on stopping the mining threats to which we are reacting. But for this DEIR, nothing needs to change. However, if the mine is permitted, nothing will ever be the same again until the mining stops again.]**

22

**Ind 255-31**

For example (and saving more argument on this for discussion below), my Objection #3.N illustrates (ie, evidence) that (perhaps with some local law reforms from responsive officials or, if need be, by initiatives) I (and others like me) may exercise one of three defense options as such a surface owner to tap my own groundwater as necessary for the use of my home and to save my 48 plus tall trees (all over 50 feet and some heirlooms twice that) in competition with the DEIR mine's wasteful and harmful misuse of my groundwater 24/7/365 for 80-years for dewatering the mine when climate change dryness and drought result in an NID cutback (as I report previously suffering years ago when my East Bay MUD cut my water back to 50 gallons a day per person in order to comply with a mandate to ship our water to Marin County which had none; an experience I will not repeat by using one of my other such options): (i) I could drill my own competing well as deep as necessary and appropriate, (ii) I could make a sharing deal with one or more adjacent surface neighbors in exchange for funding to improve such wells to a sufficient depth to compete effectively, or (iii) I could organize a group of adjacent property owners to drill a competing community well for sharing such water in competition with the mine. (While NID or others may resist such ideas as environmental harmful, as I point out in my Objection # 3.N, it is intolerable for us surface owners to watch our property, trees, and environment suffer, while the mine dewatering depletes our shared groundwater and disposes of it down the Wolf Creek somewhere else. The solution for NID is to stop the mine, so none of this is necessary. Our voting numbers should enable us thousands of locals above and around the 2585-acre underground mine to arrange appropriate law reforms and political alliances that empower our defenses and enable such competitions against the DEIR mine. In any event, there seems no worse result for us that suffering this DEIR and mining approval.)

**Ind 255-32**

**As explained throughout my Objection, including at my # 14, I note that the DEIR itself directly incites an economic feasibility dispute by its own disputed claims, such as at DEIR 6-14 claiming that the mine is economically infeasible if it were limited to 12-hour days (a key item on our new local agenda for political reforms, as explained in my Objection # 3.N), thereby requiring the County to realize that the cause of that problem is not the 12 hour day, but rather the DEIR miner's lack of working capital, credit, and financial resources as demonstrated in my Objection at # 2, quoting admissions from the current Rise SEC Form 10K and 10Q. Similarly, the DEIR attempts (and fails) to argue compliance with CEQA by citing to the DEIR's "Non-CEQA Related Analysis," and that empowers us to require the County to allow us locals to expose the errors, omissions, and deficiencies in that part of the DEIR with our own counter Non-CEQA Related Analysis, so there is a level battlefield. Indeed, as shown below and by a review of my 150-page Objection will confirm that many of my evidence and rebuttals at issue in this debate are counters that often use inconsistent quotes or admissions from the DEIR (or Rise as to its SEC 10K and 10Q filings addressed in my Objection at # 2).**

**Ind 255-33**

5. **My Objection Properly Uses Economic Feasibility And Other Challenged Rebuttals Not Just For CEQA Compliance, But Also As Evidence To Counter And Impeach The Disputed DEIR With Contradictions, Inconsistencies, And Admissions That Expose Errors, Omissions, And Deficiencies.**

23

**When a court evaluates a challenge to an EIR approval, it considers (under various standards, depending on the circumstances, such as discussed in *Sierra Club and Gray*) whether there was compliance with applicable law as a matter of law, or there was sufficient "substantial evidence" to support the lead CEQA agencies decision. THAT MEANS IT IS NOT JUST ABOUT WHAT CEQA REQUIRES OR PERMITS, IT IS ALSO ABOUT THE LAW OF EVIDENCE. See the California Evidence Code. When the County addresses whether to consider something like "economic feasibility" or other evidence in my Objection, it must also consider whether the courts will later accept such evidence, without regard to CEQA debates, because it is relevant use of DEIR miner admissions or otherwise admissible rebuttal evidence to "impeach" or counter the DEIR's false, incorrect, or misleading statements or omissions. Truth and reality still matter for CEQA compliance, and the DEIR cannot just present a false or misleading "alternative reality," such as by asserting something false as a fact or something impossible as if were real, true, and happening. To state the obvious, only a DEIR that comprehensively speaks the truth and presents reality can be approved, as *Gray* illustrated in its insistence on "common sense" and as *Sierra Club* insisted on "good faith."**

**The DEIR cannot prevail by simply insisting on presenting one-sided, miner propaganda that the objections can expose as false, misleading, or otherwise objectionable with counter evidence, especially when the objection quotes the miner's own admissions, inconsistencies, and falsehoods against the DEIR to expose its errors, omissions, or deficiencies. Each statement in the DEIR that is incorrect or misleading can be impeached by rebuttal evidence, which cannot be excluded if as a matter of evidence law (as distinct from CEQA) it is relevant and admissible. That is true even as to the admissions in Rise Gold Corp's current SEC Form 10K and 10Q filings that reveal why the DEIR must be rejected, because those documents admit (with its own accountant's adding a "going concern qualification" as to Rise's financial statements) that there is no apparent sufficient funding to accomplish even the startup expenses of reopening the mine and beginning operations as planned in the DEIR, much less doing the DEIR mitigations that are needed. See my Objection #'s 2, 4, and 14. The very existence of the DEIR mining threat is already harming our real estate values and causing other burdens, risks, and harms, so this process cannot be about some hypothetical plan where government empowers an insufficiently funded miner with an option "to shop" this disputed opportunity.**

**What my Objection does, and other objections could do, is expose with such evidence DEIR's many internal contradictions to prevent the DEIR from prevailing inappropriately, such as by my Objection exposing contrary or inconsistent statements either (i) within the DEIR, or (ii) in the current Rise SEC Form 10K or 10Q, which (as I show in my #2) discusses many of the same mining related issues as the DEIR in different, inconsistent, or even contradictory ways.** The California Supreme Court's most important lesson about CEQA in *Sierra Club* is the need for both clarity and truth. Objectors like me are entitled to challenge a DEIR that "crosses those lines." Especially at times like this in our divided world's larger conflicts, where constant barrages of false news/propaganda seek to create "alternative realities" (eg, Russia's distortions and worse about Ukraine), it is important to remember that the rule of law itself depends on having one clear and truthful reality. The DEIR often can be shown to fail that test, and the DEIR needs to be redone to clarify the actual reality of this mine. To do that requires corrections and edits to the DEIR consistent with my Objections and similar other objections.

24

Furthermore, the County should also allow appropriate consideration of accepted matters to which courts would take "judicial notice" as matters of fundamental logic or reality, to prevent obviously false or misleading claims from being accepted by denying contrary such common sense and proof. For example, if Rise were to say, "Don't worry about any dry wells or health or safety rules, because I'll just pay any victims to make them whole" (an exaggerated version of the disputed DEIR claim to cover anyone whose well dries up, which my #2 proves is also illusory or speculative), that would imply that Rise had the ability to accomplish that implausible claim. Why? Because people are not allowed to just invent nonrealities contrary easily proven facts in the real reality, especially by admissions from the person asking a court or government official to join in that fantasy to officially (but incorrectly) pronounce it to become real. See what *Gray* insists must be "common sense" and what *Sierra Club* and others address as "good faith," but what most of us objectors consider basic truths that define "reality," as opposed to the "alternative reality" created by the disputed DEIR, such as when it insists on pretending there will be sufficient "recharge" of our local owned groundwater simply because the disputed DEIR claims average rain between 1967 and 2017 will somehow reoccur and be sufficient. See my Objection at #'s 3.A, B, D, E, F, M, and N, 5, and 14. When the rule of law applies (and as CEQA must apply here), no naked "emperor" is allowed to insist that he's wearing a fancy suit, because we allow people to say the clear truth that "the emperor has no clothes." This is what my Objection and other objections seek to do about this DEIR. For example, the admissions I cite in my Objection # 2 should be allowed to rebut that illusory DEIR assurance that somehow, without even knowing the huge number of affected old and new wells over even a shorter period than 80 years, the DEIR miner will be able to supply the needed replacement water.

**Ind 255-34**

Please remember that the DEIR itself put its financial feasibility into issue for rebuttal by claiming (at DEIR page 6-14) that limiting mining to a 12-hour day made the project economically infeasible. Since DEIR uses that claim to defeat better "Alternatives" (ie, the traditional industrial use) and mitigation, the law requires allowance of such rebuttals in my Objection and others. That admission by the DEIR itself at page 6-14, by manipulating the data on "Alternatives" thereby legally "opened the door" for all my economic feasibility counter arguments, and it illustrates the DEIR's inconsistency.

**Ind 255-35**

When the DEIR wants to plead poverty like that, it does. But then the DEIR also implies its financially capable when it wants to make implied or express promises of being able to afford whatever mitigation may become necessary (eg, providing water to all dry well owners). The DEIR cannot have it both ways without us being able to expose that nonreality one way or the other. See, eg, my #'s 2, 4, 13, and 14. Yet, when the DEIR discusses (eg, 4.8-66) replacing such hundreds of wells as the dry up over time (besides the 30 along East Bennett Road), Rise's current financial condition and questionable future prospects discussed in my #2 prove that mitigation is not reliable, as it lacks sufficient evidence of financial capacity to accomplish such mitigation and other DEIR project work, especially as the climate change that the DEIR ignores forces many of us to drill more and deeper competing wells to reach our own groundwater as NID supplies are reduced. See, eg, my #'s 3.D, E, F, M, N, 4, 5, 8, and 13. Indeed, that is what the DEIR itself admits it cannot accomplish (at 6-14) if it's limited to a 12-hour workday, as objectors may still demand as law reform. A CEQA and legally compliant DEIR would have to

25

disclose such realities, and, when (as here) the DEIR fails to do so, objectors must be allowed to expose them.

Furthermore, **another DEIR "opening of the door" to my less CEQA-traditional rebuttals is the DEIR's "Non-CEQA Related Analysis" at 4.3-103-04, incorrectly purporting an attempt to show "good faith," but allowing us locals to prove the opposite, if we are allowed to do so before court processes apply the rules of evidence in favor of my such objections. My point on this also includes this related DEIR admission: that some of what the DEIR (and perhaps some at the County) considers to be outside some disputed CEQA boundary is needed for essential clarity. This means one of two alternative admitted things: either the disputed DEIR CEQA "boundary" is wrong, or essential clarity of purpose and what they incorrectly consider "good faith" requires going beyond the CEQA constraints. Either way, if the disputed DEIR can include what they call "Non-CEQA Related Analysis," then we objectors must also be able to respond and counter in kind without limitations about CEQA.**

**This cannot be a one-sided process where the DEIR can make any infeasible, false, or misleading claims they wish, while us objectors are not permitted to rebut and expose those claims. The reality is that in many instances the disputed DEIR fails to comply with applicable law, because its purported safety and mitigation assumptions and so-called facts, goals, and contentions addressed in my Objection and others are not only incorrect, deficient, and otherwise noncompliant, but also are illusory (as in not reliably funded). The CEQA lead agency must allow us to prove those objections by accepting our substantial evidence to the contrary, including fatal admissions by the DEIR and the miner, including as to economically infeasibility. As I prove in my Objection # 2, Rise and its accountant admit that there are "going concern" financial issues that make its performance at best too speculative and at least as to some things admittedly probably infeasible. When the miner's accountant warns the investors to beware that the mining may not be feasible for lack of sufficient funds, how can any responsible government not at least test the more obvious DEIR performance capability illusions?**

**Ind 255-36**

In any event, I made my offer of proof as to such admissions, DEIR contradictions and inconsistencies, and other evidence (and their applications) in my Objection # 2 and other places in requesting such County reconsideration to require consideration of my Objection's economic feasibility and other rebuttals and counters. More important, as in my Objection #2 and elsewhere, I urge the County to ask if Rise is the "real party in interest" here, or whether they are acting for the real party with the necessary financial resources "behind the curtain." If, for example, Rise were "fronting" for someone else or planning to "flip the deal," that would also create CEQA objections to this DEIR. See the Guideline discussion of "Applicant" # 15351. Since Rise reports presently lacking the funding to accomplish this disputed DEIR plan (see my #2), it is reasonable to ask why or for whom they are investing in this disputed DEIR effort.

There are multiple reasons that I am so focused on economics that the DEIR resists disclosing, as did most of the other miners I've encountered whose mines are now among the more than 40,000 abandoned mines on the EPA list, since in my experience such economics end more mining adventures than any other cause. Another reason is that, regardless of what is required or not in the DEIR under CEQA, in one proper way or another economic evidence will, if necessary, dominate any locals' court challenges and politics and law reform efforts. What drives us locals living on the surface above and around the 2585-acre underground DEIR mine is

26

the "reality" of what impacts us and creates our opportunities to counter the mine appropriately. Such reality includes what we know from the Rise SEC Form 10K and 10Q filings, such as that its reported working capital, credit, and resources are not sufficient to accomplish even the DEIR work, including essential mitigations and safety work described in the DEIR, much less what would be necessary in reality at the end of the approval process. See, eg, my Objection #'s 2, 3.N, and 4. Therefore, to keep that 2585-acre mine from becoming even worse in reality, us locals are entitled to use any and all flaws and deficiencies in the DEIR to defend ourselves. However, to match the DEIR's mistaken emphasis on local jobs the mine touts creating, please consider that one inevitable consequence of this DEIR mining is that the mine will cost more local residential and light commercial construction and remodeling work jobs than such alleged mining adds local jobs. Why? Because the building trades will suffer with us locals as the DEIR mine trashes our local property values and marketability, even from merely the stigmas from the DEIR threatened blasting, tunneling, rock removal, dewatering, and other mine work literally beneath us thousands living on the surface above or around that 2585-acre mine. Who wants to build or even remodel above or around an active mine? See my Objection at # 3.N and 4. Since the County must balance the pros and cons, it must consider the opposite of the economic case that the DEIR has tried to make for mining jobs, which is less construction jobs and, for us now poorer residents whose home values are suffering, less money in the local economy.

6. **A Quick Appeal For Consideration of Climate Change Realities Creating A "New Normal" Where Chronic Drier Weather And Drought Rebut The DEIR Illusions That Our Future Can Be Predicted From Our Past, Especially As To Groundwater.**

**Ind 255-37**

**In my Objection at # 3.M and elsewhere I protested the fallacy in the climate change denying DEIR that our "new normal" environment for the next 80-years can be predicted from the past. However the CEQA debate on that subject is ultimately resolved, the disputed DEIR is not credible. (I do not mean the DEIR expressly denies climate change and drought; it just ignores such inconvenient truths and reality by exclusive focus instead on the irrelevant, and no longer predictive, past.) For example, the DEIR contends (and we locals dispute) that we can afford to suffer the loss of our precious groundwater for wasteful mine dewatering 24/7/365 for 80-years, because the average rain between 1967 and 2017 allegedly will be sufficient for such recharge and balancing for 80 more years. See my Objection # 3.M. No rational, informed person should believe that, much less bet their homes and personal way of life here above the 2585-acre underground mine on that illusion, regardless of what the DEIR incorrectly claims about the past. So, at the present time we have two irreconcilable views of our future reality, but, in this unique context, we locals also have an extra advantage against the DEIR, because we surface owners above and around the 2585-acre mine own our shares of that same groundwater that the mine seeks to waste in dewatering to send elsewhere down the Wolf Creek. Besides contesting the DEIR, we locals are already competing with hundreds of existing wells that are improperly ignored (like us locals above and around that underground mine) in the DEIR, and we can increase our competition with deeper old wells and more new wells to tap our own local groundwater beneath us. Nothing in the disputed**

DEIR confronts or even mentions such competitions. See my Objection # 3.M and N, 4, and 14.

Also note the related fatal flaw in the disputed DEIR: it does not sufficiently address (as required by CEQA) the impact on our shared groundwater or other environmental issues of either (i) its old mine work in the existing mine flooded and closed since 1956, or (ii) the new, expanded, or deeper mining into the unknown condition areas in the 2585-acre underground mining area. Such changes in such underground conditions by mine work 24/7/365 for 80 years cannot be ignored because the DEIR considers such consequences to be "speculative." As surface owners we have the right to oppose this no benefit mine taking our groundwater for such a gamble into the unknown. Even if CEQA somehow allowed that, which we dispute, we are not limited to a CEQA contest to resist and compete against the DEIR mine, since we also have our own surface owner property rights to advance in other legal and political forums, where reality and the rules of evidence apply, including as to climate dryness and droughts. See my Objection # 3.M and N, 4, and 14.

Part of the reason the DEIR history-based illusions are doomed is that the law is catching up with climate change drier and drought realities, even though the legislation tends to be either general reforms regarding climate change or other applications. For example, CEQA Guideline # 15064.4(a) and (b) acknowledges climate change by requiring a project's greenhouse gas emissions See, eg, *Center for Biological Diversity v. Department of Fish & Wildlife* (2015), 62 Cal. 4th 204; California Health & Safety Code # 38500 et seq. As to the more general battle over climate issues and CEQA I defer to the other more expert objections that I incorporate by reference. The key factor, however, is that this disputed DEIR lacks credibility as to its refusal to confront reality by insisting on the past water results predicting our future as old normal for the next 80 years, instead of the much drier and worse future, thereby creating an alternative reality some call a "legal fiction" where climate change can be ignored. Fortunately, we have other means to defeat the DEIR on such groundwater issues besides CEQA, as well as to prevail on our second reason (besides climate change) in the CEQA dispute over groundwater recharge, because under these circumstances the disputed DEIR cannot ignore the risks of greater depletion on account of the unrevealed effects on groundwater supply and recharge of the DEIR's reopening mining and the new, deeper, and expanded mining in the 2585-acre underground mine, especially considering such surface owner existing and future well competition against the mine.

7. The DEIR's Other Suspicious Noncompliance With Specific CEQA Or CEQA Guideline Requirements Support My Objections To Errors, Omissions, And Deficiencies In the DEIR's Disputed Presentation.

**Ind 255-38**

A. What Is The Real CEQA "Project" And Its "Environmental Setting"?

Guideline # 15124 requires a "project description" with certain mandatory details that this Supplement and my Objections demonstrate in scores of instances to be omitted or erroneously or deficiently described in the disputed DEIR. For example, the activities at the "Brunswick Industrial Site" (plus 30 dry wells along East Bennett Road) and the "Centennial

28

Industrial Site" are one integrated CEQA "project" that the DEIR improperly tries to split into what it incorrectly describes as two separate CEQA "projects." That **one integrated "project" also includes the disputed DEIR's most neglected, yet most environmentally dangerous part, the 2585-acre underground mine above and around which thousands of surface owing residents and voters live**. See also Cal Pub Resources Code # 21065, that defines "Project" as "**an activity** which may cause either a **direct change** in the environment, or a **reasonably foreseeable indirect physical change** in the environment ..." That makes the 2585-acre underground mine that is generally neglected and insufficiently addressed in the disputed DEIR the core of the "project," because that is where most of the direct (and reasonably foreseeable indirect) adverse impacts are happening, as addressed in my Objection and others. Accord Guideline #'s 15002(d) and 15378, which clarifies that the "project does not mean each separate government approval" in the process. See, eg, *Nelson v. County of Kern* (2010), 190 Cal. App. 4th 252 (mining and reclamation work were parts of a single project); *River Watch v. Olivenham Municipal Water District* (2009), 170 Cal. App. 4th 186 (the Water District water trucks loading and unloading activities at the landfill are part of the landfill project that needed CEQA approval). Note, however, that even separate projects can have cumulative effects, as explained in Guideline # 15355.

**Guideline # 15124(a) requires a "precise location and boundaries of the proposed project" "on a detailed map," but, as my Objection repeatedly demonstrated, none of us thousands of surface owners above or around the 2585-acre underground mine know what is happening underneath us, because we lack any meaningful data, even a street map locator. (The dotted lines on the disputed DEIR map are meaningless, because it's an aerial view obscured by our forest trees that shows no surface location clues. While still deficient, the current Rise SEC Form 10K addressed in my Objection # 2 contains a better description of that underground mine and the mining than does the disputed DEIR, all of which is intolerable as well as noncompliant, since us most impacted surface neighbors at the core of the project above and around that 2585-acre mine still have no satisfactory idea where we are in relation to all this 24/7/365 blasting, tunneling, Cr+6 hexavalent cement shoring, dewatering, and other mining work that is not only an environmental threat, but also may conflict with our surface owner and groundwater property rights.**

**Ind 255-39** **Guideline # 15124(b) requires a particular type of "statement of objectives," which the disputed DEIR fails to do properly, as explained in my Objection, especially as to the 2585-acre underground mining beneath us thousands of surface residents and voters, all of whom are asking the same kinds of questions (see, eg, my Objection # 15) that are never satisfactorily addressed in the disputed DEIR.**

**Ind 255-40** **Guideline # 15124(c) requires a general description of the project's technical, ECONOMIC, and environmental characteristics" (emphasis added),** but again the disputed DEIR fails to do so, as demonstrated in my Objection (eg, #'s 2, 3, and 4), especially with respect to the core disputes regarding the 2585-acre underground mine and with respect to "economics" (which the DEIR never addressed at all).

**Ind 255-41** **Likewise, Guidelines #15124(d) and (d)(2)** require more things that the disputed DEIR fails to do properly or at all in various respects addressed in my Objection, although since much information appears to be missing or deficiently stated, it is hard for us to be precise about what is known only to the DEIR advocates. However, to illustrate the point, since the

29

DEIR entirely ignores the hexavalent chromium threats to us locals, it's hard for us to know with what agencies the DEIR should be consulting or what permits they should be seeking. The same is true with groundwater depletion and related problems deficiently addressed in the DEIR, although I would like to know what the DEIR applicant's dealing with NID may be. This data is important, so we know to whom else we should be complaining about specific objections. In any event, the many public agencies likely making decisions on the project will be making more than one, and those must be disclosed pursuant to # 15124(d)(2).

**Ind 255-42**

**Guideline # 15125(a) requires a "description of the physical environmental conditions in the vicinity of the project," such as to set a "baseline" and "to give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." See also # 15125(c), where the Guidelines state: "Knowledge of the regional stetting is critical to the assessment of environmental impacts ... [with] special emphasis ... on environmental resources that are rate or unique to that region and would be affected by that project." The disputed DEIR is a miserable failure at that for scores of specifically demonstrated reasons in my Objection, especially because the DEIR ignores the thousands of us on the surface above and around the 2585-acre underground mine as part of that "vicinity" and "region." To pick one, in contrast to the details (still insufficient) about the surface Brunswick Industrial Site, the 30 wells along East Bennett Road, and the Centennial Industrial Site, there no meaningful disclosure about the surface areas where thousands of us live above or around the 2585-acre mine. That omission is among the more damning reasons for rejecting this DEIR, besides the DEIR obscuring both the hexavalent chromium threat and the massive depletion of our groundwater (as to which each of us neglected surface owners above and around the 2585-acre mine have equivalent or better property rights never mentioned at all in the DEIR).**

**Ind 255-43**

**Guideline # 15125(a)(1) and (2) are unfortunate in this particular project context, because they are designed to keep project advocates from imagining a hypothetical future which is their unrealistic fantasy to justify their environmental impacts. But here we have the reverse, because this disputed DEIR is about reopening a closed and flooded mine since 1956 about which the historical data in many cases is deficient, missing, or misleading (eg, consider how science and knowledge has changed since 1956, making most such data unreliable and often irrelevant for predicting the future; eg, back then asbestos was considered a good thing). [The Guidelines fortunately are not law, and so, when what was designed for traditional subdivision projects is counterproductive in such exploitive mining context, we can insist of truth and common sense, rather than blindly following guidelines if they make no sense in our context. Stated another way, as read by this DEIR, such Guidelines would be contrary to the CEQA statutes and invalid for this purpose as a disputed excuse for the DEIR to create a false, alternative reality from the past that defeats the purpose of CEQA to confront the future with scientific truth and reality, like climate change's new normal of dryness and drought.] That DEIR lack of accuracy about using such past to predict the future is especially dangerous as to mining issues such as water depletion, illusory recharge, and climate changes, as demonstrated in my Objection (eg, 3.M) and my discussion of climate change here. This is where *Gray* and its "common sense come in."** Consider that the DEIR basically offers no data about what the conditions exist now in the flooded 2585-acre underground mine beneath thousands of us surface residents above and around the mine, and

30

the DEIR offers no reliable or sufficient data about what that more problems mining will create as it blasts, tunnels, removes rock, and adds Cr+6 toxins in the shoring cement paste, dewaters, and otherwise mines in new, expanded, and deeper areas. In effect, the old and new mining is about the unknown, and the DEIR essential asks that the miner be allowed to engage in all those dangerous activities blindly, with no idea of the environmental consequences now or even worse in the future. In effect, that would transfer all such mining caused environmental and other risks to those of us living on the surface above or around the 2585-acre mine and elsewhere. That is the opposite of what CEQA was intended to accomplish.

**Ind 255-44**

**Fortunately, that DEIR misuse of # 15125(a)(1) and (2) can be partly moderated by enforcement of #15125(a)(3), which states: "An existing conditions baseline shall not include hypothetical conditions, such as those that might be allowed, but have never actually occurred, under existing permits or plans, as the base line." Because of the mine being closed and flooded since 1956, as demonstrated throughout my Objection, almost everything about the 2585-acre underground mine is "hypothetical" and speculative in the DEIR, as is admitted in many cases in the DEIR itself or in the current or past Rise SEC Forms 10K or 10Q filings on its website analyzed in my Objection at # 2. So, there is no tolerable base line as required, because there was no investigation for the DEIR. For example, the disputed mine admits that it plans to mine into new, expanded, and deeper places in the 2585-acre underground mine as to which it has no information and no base line, in effect transferring the risk of the unknown onto us locals, giving the DEIR mining a "blank check" as to whatever the impact of that unpredictable activity may be on the concerns expressed in my Objection as others, such as risks as to (i) whatever worse or new toxic materials may be removed from those new areas and dumped or dewatered on the surface (eg, new hazardous materials? Or more intense ones, like worse levels of asbestos, arsenic, etc?), (ii) new underground water depletion or recharge problems being created by such blind new blasting, tunneling, dewatering, or mining, or (iii) any other nuisances or problems described in my Objection (such as at # 4 "subsidence" from loss of subjacent or lateral support harming us locals owning the surface above and around the 2585-acre mine).** See also my Objection #'s 3.N, 4, and 14.

**Ind 255-45**

**For example, because the DEIR entirely ignores the competing surface ownership rights of us locals above or around the 2585-acre underground mine neglected in the DEIR, consider again the leading such Supreme Court decision of *Keystone Bituminous Coal Ass'n* v. *DeBeneditis*, 480 U.S. 470 (1987), where the Court upheld against a coal miner challenge the Bituminous Subsidence And Land Preservation Act (aka the Subsidence Act, as it's called in Pennsylvania and many places where it has been replicated), where mining was limited to prevent "subsidence" (the loss of surface lateral and subjacent support and loss of groundwater or depletion of surface water. Those are legal rights we surface residents already have here, but it helps to have more laws to detail specific applications and thereby avoiding the need for expensive defense litigation, as discussed in my Objection # 3.N). That Supreme Court decision defined the "subsidence" concerns (also equally at issue for this DEIR project, especially because of the massive and objectionable groundwater depletion and [even what little is so far revealed of] the DEIR's new, deeper, and expanded DEIR blasting, tunneling, rock removal, dewatering, and other mining activities) as follows (at 474-5):**

31

> Coal mine subsidence is the lowering of the strata overlying a coal mine, including the land surface, caused by extraction of underground coal. This lowering of the strata can have devastating effects. It often causes substantial damage to foundations, walls, and other structural members, and the integrity of houses and buildings. Subsidence frequently causes sinkholes or troughs in land which make the land difficult or impossible to develop. Its effect on farming has been well documented—many subsided areas cannot be plowed or properly prepared. **Subsidence can also cause the loss of groundwater and surface ponds.** In short, it presents the type of environmental concern that has been the focus of so much federal, state, and local regulation in recent decades. (Emphasis added). [That conclusion about groundwater has a fn 2 which states:]
>
> Fn2. "Whenever [subsidence effects] extend, damage can occur to buildings, roads, pipelines, cables, streams, water impoundments, wells, and aquifers. Buildings can be cracked or titled; roads can be lowered or cracked, **streams, water impoundments, and aquifers can all be drained into the underground excavations**. Oil and gas wells can be severed, causing contents to migrate into underground mines into aquifers, and even into residential basements. Sewage lines, gas lines, and water lines can all be severed, as can telephone and electric cables. ... (emphasis added).

While that subsidence law generally required 50% of the coal to remain for support in strategic places, it did many other things to protect the surface and limit the mining. That decision explained that the government was entitled to so act "to protect the public interest in health, the environment, and the fiscal integrity of the area," such as by "exercising its police powers to abate activity akin to a public nuisance," although the court made clear that the police power was broader than nuisances. (At 488) [As to see mining "nuisances" from which the DEIR cannot save this mine, reread California Civil Code # 3480, Penal Code #372 and 372a, and NRS 202.470. Also see my Objection # 3.N, recognizing that us local voters could exercise our rights to provide greater and more specific defenses against mining nuisances, as well as, considering the DEIR's understated asbestos threats and ignored hexavalent chromium issues, see *People v. ConAgra Grocery Products Co.* (2017), 17 Cal. App. 5th 51, where a maker of lead paint promoted and sold it as a nuisance.]

Of special note, the Supreme Court (at 493-94) noted that this challenge was to the enactment of the law before it was enforced, and that meant that it was premature to complain about how the law might be abused, when the facts of that surface and underground mining competition of rights were not yet established. Citing its own precedent in Hodel v. Virginia Surface Mining & Reclamation Ass'n Inc, 452 U.S, 264 (1981), the Court explained:

> "[The] court ignored this Court's oft-repeated admonition that the constitutionality of statutes ought not be decided except in an actual factual setting that makes such a decision necessary. [citations omitted] Adherence to this rule is particularly important in cases raising allegations of an unconstitutional taking of private property. *** (at 497): [W]here an owner possesses a full 'bundle' of property rights, the destruction of one 'strand' is not a taking because the aggregate must be viewed in its entirety. [The Court

32

then followed that discussion how valid zoning laws always affect without any "taking" property uses with things like setbacks, lot size vs building size, etc.]

**Finally, # 15125(d) states that: "The EIR shall discuss any inconsistencies between the proposed project and applicable general plans, specific plans and regional plans** ... [such as for] air quality attainment maintenance plan or State Implementation Plan, area-wide waste treatment and water quality control plans, ... [and many others]." My Objection and others identify many such inconsistencies, but such objections cannot be complete, because of the other omissions, errors, and deficiencies about which we complain in our objections. For example, since, as described above and in my Objection and others, the new, expanded, and deeper mining results are not revealed in the disputed DEIR, we locals cannot be blamed for not detailing the resulting DEIR inconsistencies, or even those that now exist, but are not revealed in the DEIR, which has disclosed no sufficient current information on the state of the existing underground mine that has been closed and flooded since 1956.

Ind 255-46

**B. Who Is The "Applicant" Versus The "Real Party In Interest"?**

**Guideline # 15351 defined "Applicant" as the "person who proposes to carry out a project which needs a lease, permit, license, certificate, or other entitlement for use or financial assistance from one or more public agencies when that person applies for the governmental approval or assistance." As in court litigation filings and many such governmental entitlements, the "real party in interest" is supposed to be the applicant or at least be disclosed. As my Objection asks (see my # 2's and 15), is Rise only an agent, "front," or a "flipper" for an "undisclosed principal" or someone else "behind the curtain?" If so, that reality should be disclosed in the disputed DEIR. My Objection (at # 2) demonstrates why that is a reasonable question, since the current Rise SEC Form 10K and 10Q report insufficient working capital, credit, or resources to accomplish what is stated in the DEIR to be done, even the long initial startup work to dewater the mine and begin preparations for operating, much less the many more months required thereafter of subsequent work before gold revenue (if any) is available to pay the mine's bills, since Rise admits in such 10K that there are no "proven reserves" and that the profitable gold volume is speculative. That reality is what inspires common local questions about whether this DEIR is part of some undisclosed arrangement or plan to flip or otherwise arrange some change in control transaction, such as a profit-sharing lease, a loan to own control arrangement, or other creative partnership deal with someone even less likely directly to obtain approval of the DEIR with appropriate disclosure as the Applicant.**

Ind 255-47

**While, as described in my Objection (at # 1), I have no personal knowledge about Rise that is not in the public records I cite, the circumstances are puzzling. In any event, as a bankruptcy lawyer with extensive relevant experience (see my Objection # 1) I have been involved in hundreds of distressed asset sales and other such creative distress transactions, and it is customary that the seller does extensive due diligence regarding the creditworthiness and character of the bidder. As the *Gray*, *Sierra Club*, and other cases discussed above demonstrate in requiring "good faith," the starting point of such "good faith" is to be sure the "applicant" is the real party in interest who is financial and otherwise**

**capable of performing the DEIR. Otherwise, approving the DEIR may be merely giving away an "option" for such an agent to flip the deal or otherwise act for someone else "behind the curtain."**

**8. Miscellaneous Noncompliance With the CEQA Guidelines That Further Evidence A Pattern And Practice Of DEIR's Comprehensive Obscurity Contrary To The *Sierra Club* And Other Standards For Required Information.**

**A. Introduction To Objectionable Techniques To Set Up False Assumptions And Conclusions Or Otherwise Evade Disclosure Obligations**

**Ind 255-48**

My Objection and specific examples above both demonstrate scores of times when explicitly or implicitly the disputed DEIR abused "speculation" as an alleged excuse for dodging the *Sierra Club*'s general requirements CEQA data and information and for evading inconvenient truths. I object whether that is a coincidence or a tactic to enable the DEIR incorrectly to "assume" away problems or to leap to unsubstantiated conclusions by treating its incorrect positions as if they were beyond contest, when they were the opposite and fatal flaws for which the DEIR had no answers. The following are lesser examples of Guideline noncompliance that, by themselves seem minor, but which in that context of massive such specifically debated DEIR errors, omissions, and deficiencies reveal more evidence of both a comprehensive, prohibited "pattern and practice" and evidence for "objectionable techniques" or worse. As I complain about throughout this Supplement and my Objection, the DEIR's words like "assumption" and "conclusion" are often a way of announcing an objectionable statement that itself is disputed opinion, speculation, or worse in the DEIR. In a trial such evidence would be impeached by using contrary miner or DEIR admissions, inconsistencies, or other rebuttal evidence, as well as by objecting to a sufficient "lack of foundation" under the Rules of Evidence. (That "lack of foundation" for disputed opinions or worse by the DEIR is especially troubling when the DEIR pretends that it is offering "expert opinions," when there is no qualified expert available to cross-examine, and no specifics or sufficient cross-references to any expert study or report that is relevant and applicable to these facts and circumstances as to this specific "project.")

**B. "Hide The Ball" Noncompliance, Such As By Burying Data Where It Is Less Likely To Be Seen Or Understood In Context, Often May Be Revealed By Less Serious Types Of Noncompliance With the Guidelines.**

**Guideline #15122 requires a table of contents or index** "to assist readers in finding the analysis of different subjects and issues," which means that the failure to include information where it should be identified is noncompliance and well as an objectionable tactic. See also my discussion of the DEIR's noncompliance with **Guideline # 15120(a) and (b), requiring the DEIR to "state where in the document each element is discussed" and or "at a minimum a table showing where each of the subjects is discussed."** In my Objection to this tactic (eg, at # 3.E) the classic example is the failure of the DEIR to address the toxic hexavalent chromium (Cr+6)

threat in its "Hazards And Hazardous Materials" section at # 4.7, but rather instead in only a few other places where it is mentioned in passing, as if there were no issue with including Cr+6 in the cement paste for shoring up the 2585-acre underground mine beneath thousands of suburban residents and voters living on the surface above and around that mine. (Many times, the DEIR did not even use the words hexavalent chromium or Cr+6, when discussing that cement paste.). See, eg, my Objection #'s 3.C, G, H, and 7. There are many other examples, especially regarding disputed DEIR water problems and the core issues in dispute regarding the 2585-acre mine, which is better described (although still deficiently) in in the current Rise 10K than in the DEIR. See, eg, my Objection #'s 3.A, B, D, and M, 4, 5, and 8.

**Ind 255-49**

**Guideline # 15123 requires a summary "**of the proposed actions and its consequences" (at (a)), with "each significant effect with proposed mitigation measures and alternatives" (at (b)(1)), with "areas of controversy known to the lead agency, including issues raised by agencies and the public" (at (b)(2)), and with "issues to be resolved including the choice among alternatives and whether or how to mitigate the significant effects (at (b)(3)). The same problems and objections apply to this with even greater force and in more instances than addressed here. But, without repeating the top 50 examples in my Objection, my complaints in the prior paragraph about the table of contents and hiding the ball problems apply even more strongly here, since the summary is supposed to a better "finder" tool. However, the DEIR fails miserably as a guide to find what matters. See my Objection # 15, listing unanswered questions, where, when confronting errors, omissions, and deficiencies in one topic place, you later find some (but less than required) of what you want to know somewhere else in the process of looking for something else.

9. **Concluding Remarks.**

**Ind 255-50**

**As explained in my Objection # 1.D, at the public hearing on March 24, 2022, the County representative began by excluding all consideration of evidence and argument regarding the financial condition and character of the DEIR miner and the financial feasibility of accomplishing key safety and mitigation results assumed in the disputed DEIR, contrary to this and other objections. Since the County had not yet heard any arguments why that position is incorrect under these particular facts and circumstances, I ask the lead CEQA Agency to reconsider for reasons stated above.** I also urge the County to expand that economic study as well for such objections by me and others.

Thank you for considering my views.

Sincerely,

*// Larry Engel*

G. Larry Engel

## INDIVIDUAL LETTER 255: G. LARRY ENGEL

### Response to Comment Ind 255-1
The commenter provides a Table of Contents for the Comment Letter. The comment is noted.

### Response to Comment Ind 255-2
This comment is introductory in nature. The commenter explains that this comment letter will focus primarily on legal arguments for why the DEIR is inadequate pursuant to CEQA. The comment is noted. The commenter also references their previous letter. Please see responses to Individual Letter 254.

### Response to Comment Ind 255-3
The commenter restates CEQA Guideline section 15151 which sets the standard for adequacy of an environmental impact report ("EIR"). The commenter states that the DEIR violates Section 15151 due to inadequate discussion of hexavalent chromium. The commenter also states that Individual Comment Letter 254 details over 50 "errors, omissions, and deficiencies" that violate Section 15151. Regarding the presence of hexavalent chromium in the Cement Paste Backfill ("CPB") to be used in the project, the commenter is referred to Response to Comment Ind 254-1. Each asserted inadequacy raised by the commenter in Commenter 255-1 is addressed in Response to Comment Ind 254-1. Please see Response to Comment Ind 254-1.

### Response to Comment Ind 255-4
The commenter references CEQA Guidelines section 15364 which defines "feasible" to mean "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors." (Cal. Code Regs., tit. 14, § 15364.) The commenter construes the term "economic" to mean that the project must be feasible based on the commenter's perceived financial condition of the Project Applicant. There are no CEQA authorities to support this interpretation of Section 15364. Feasibility, within Section 15364, refers to the feasibility of project alternatives or mitigation measures. CEQA review is limited to a project's impacts to the physical environment and the DEIR is not required to analyze the financial condition of the Project Applicant.

### Response to Comment Ind 255-5
The commenter references CEQA Guidelines section 15144 which states that "[d]rafting an EIR or preparing a negative declaration necessarily involves some degree of forecasting. While foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can." (Cal. Code Regs., tit. 14, § 15144.) The commenter states that the DEIR made no effort to forecast the condition of the underground mine workings, the rate of recharge to groundwater supplies, the presence of hexavalent chromium in the CPB, or the future conditions associated with climate change. The commenter also raised various assertions submitted in their Individual Commenter Letter 254. However, the commenter does not explain how the DEIR is inadequate and relies on conclusory statements. Regarding the hydrological condition of the mine workings, the commenter is referred to Master Response 14 - Adequacy of Groundwater Model. Regarding groundwater recharge, the DEIR analyzed the project's potential to interfere with recharge and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) As also discussed in Response to Comment Ind 254-87, while the groundwater model relied on a 25-year hydrogeologic model to assess groundwater impacts from project implementation, based on known locations of mineralized gold ore and represents the underground location of where mining would occur during the first 25 years of mine operation, the

modeling also considered longer-term mining. Sensitivity Scenario 6 used in the groundwater model considered the significant expansion of mining in areas with potential for mineralization, as shown in Figure 5.10 of Appendix K.3 of the DEIR for an additional 40 years of mining. This groundwater model scenario represents the reasonably foreseeable location of where future mining would likely take place after the initial 25-year period. As shown in Figure 5-12, and discussed on page 29 of the report, the 5-ft drawdown contour extent of Scenario 6 at the end of potential additional mining (to Year 65) relative to the 2019 water level expands less than 500 ft from that of the Base-Case Scenario. The drawdown contour of the Base-Case Scenario is at the end of the original planned future mining (Year 25) relative to the 2019 water level. The comparison of drawdown contours between Scenario 6 and the Base-Case Scenario suggests that the added potential mining (beyond the 65 years modeled) will not lead to large incremental drawdowns as the mining progresses because the mining activities occur in deep, low-K rocks.

The commenter is referred to Response to Comment Ind 254-1 for a discussion about hexavalent chromium. Regarding climate change, the commenter is referred to Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 255-6

The commenter reiterates the same concerns identified in Comment Ind 255-5 including groundwater recharge, hexavalent chromium, and climate change. The commenter is referred to responses in Response to Comment Ind 255-5. The commenter references the DEIR's "Non-CEQA Related Analysis" section on DEIR pages 4.3-103–104. The commenter states that the DEIR does not adequately forecast potential impacts and mislabels certain impacts as too speculative to be determined. As an example, the commenter states that any reasonable person would determine recharge of groundwater within the entire mineral rights boundary will not be possible following the dewatering of the mine. However, the commenter does not specifically identify how the DEIR's discussion of groundwater recharge in Impact 4.8-2 (DEIR, p. 4.8-54) or the Groundwater Model Report (DEIR, Appendix K.3) is inadequate.

As discussed in Appendix K.2 to the DEIR (page 19), the primary source of recharge is percolation of local rainfall into the fractured bedrock. In addition, as described in Section 3.3.2 of Appendix K.2, the amount of recharge each year also appears to be relatively constant since almost all of the wells maintain a consistent magnitude of seasonal fluctuation from year to year and there are no long-term trends observed in most of the wells that can be correlated to variations in annual water-year rainfall.

## Response to Comment Ind 255-7

The commenter states that the DEIR violates certain CEQA provisions but does not specifically state how the DEIR violates these provisions. The commenter also states that the DEIR makes no effort to address the "unknowns" throughout the mineral rights boundary. The commenter is referred to Master Response 14 – Adequacy of Groundwater Model. The commenter is also referred to Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 255-8

The commenter references CEQA Guidelines sections 15122 through 15131, which establish the required contents of the Environmental Impact Report. The commenter generally asserts that Individual Letter 254 shows that the DEIR violates these CEQA provisions. Please see responses to Individual Letter 254.

## Response to Comment Ind 255-9

The commenter references CEQA Guidelines Section 15148, which requires that an EIR cite to "all documents used in its preparation including, where possible, the page and section number of any technical reports which were used as the basis for any statements in the EIR." The commenter states that the DEIR violates Section 15148. California courts have not construed Section 15148 so rigidly. CEQA requires an EIR to reflect a good faith effort at full disclosure; *it does not mandate perfection ….*" (*El Moro Community Assn. v. California Dept. of Parks & Recreation* (2004) 122 Cal.App.4th 1341, 1354 (emphasis in original) (upholding an EIR even though technical reports were only referenced by general subject matter and did not contain specific citations.) The DEIR identifies the name of each technical document relied upon and its corresponding appendix identifier in the Table of Contents (DEIR, p. iv–vi.) The County also made available all of the appendices listed in the DEIR to the public. The DEIR does not violate Section 15148.

## Response to Comment Ind 255-10

The commenter references CEQA Guidelines Section 15150, which establishes how an EIR may incorporate by reference another document. Section 15150 provides that where a document is incorporated by reference, the portion incorporated must be briefly summarized and the document must be made available to the public. The commenter states that the DEIR violates Section 15150 by incorporating by reference documents that are inapplicable or irrelevant and that documents incorporated are inadequately summarized. However, the comment lacks specificity as it does not identify which documents incorporated by reference are inadequate.

## Response to Comment Ind 255-11

The commenter references CEQA Guidelines Section 15143, which requires the DEIR to discuss significant effects "with emphasis in proportion to their severity and probability of occurrence." The commenter asserts that the DEIR "barely" mentions hexavalent chromium and never discusses its risks with any "emphasis." The commenter asserts that groundwater depletion never receives proper "emphasis", and the full extent of the mineral rights boundary receives insufficient "emphasis". The DEIR discusses hexavalent chromium on page 4.8-47–48; the commenter is also referred to Response to Comment Ind 254-1. The DEIR analyzed the project's impacts to groundwater supplies and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) Regarding the conditions of the underground mine workings, the commenter is referred to Master Response 14 - Adequacy of Groundwater Model. Regarding future mining areas within the mineral rights boundary, please see Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 255-12

The commenter references CEQA Guidelines Section 15154, which requires that a lead agency preparing an EIR shall utilize the Airport Land Use Planning Handbook published by Caltrans' Division of Aeronautics to assess whether the proposed project results in a safety hazard or noise problem for persons using the airport or persons residing or working in the project area. The commenter states that the DEIR violates Section 15154 due to a nearby airport.

The DEIR states that the Nevada County Air Park is less than one mile away from the Project Site. (DEIR, p. 4.7-36.) "The [Project Site] is partially within Zones D and E of the Nevada County Airport Land Use Compatibility Plan (NCALUCP). For Zone D, airspace review is required for objects at elevations above 3,207 feet mean sea level (msl). The tallest point of the project site (the proposed 165-foot-tall headframe building) would be at 2,912 feet msl. In addition, the project is not a noise-sensitive use, would not pose a hazard to flight, and would not exceed the density

requirements; therefore, the project would comply with the requirements of the NCALUCP for Zones D and E.

Nevertheless, the proposed project would be required to be reviewed by the ALUC because it would have a building floor area of 20,000 square feet or greater, would include more than 100 people on-site, and would include new development of buildings more than 100 feet tall in Zones D and E. The purpose of the ALUC review would be to review the proposed project for consistency with the compatibility criteria in the NCALUCP, and not for the purpose of identifying potential environmental effects.

Based on the above, the proposed project would not result in a safety hazard or excessive noise for people residing or working in the project area related to the Nevada County Air Park. Therefore, impacts related to airport safety hazards and noise would be less than significant." (DEIR, p. 4.7-36.)

In addition, Master Response 7 - Location of Future Mining Areas, and the attendant figures, show that underground mining would not occur beneath the airport.

## Response to Comment 57-13

The commenter references CEQA Guidelines section 15142, which requires that an EIR be prepared using an interdisciplinary approach. The commenter states that Section 15142 "should also be applied to objectors for a 'level playing field,' to allow such interdisciplinary objections to have equivalent impact as the DEIR advocates." This comment does not address the adequacy of the DEIR and is somewhat unclear. Please see Master Response 1.

## Response to Comment Ind 255-14

The commenter states that the DEIR erroneously dismissed from consideration a No Project (Alternative Use). Specifically, if the project were not approved, the Project Site could be used for an industrial use. Development of the Brunswick Industrial Site with industrial uses, consistent with the current M1-SP zoning, could reasonably be expected to result in above-ground uses that are more intensive in certain respects than the proposed project. (DEIR, p. 6-13.) This would be contrary to CEQA's objectives for an alternative, which is to avoid or substantially lessen any of the significant effects of the project (Section 15126.6(f).) Therefore, the DEIR dismissed this alternative from further consideration. (Id.) The commenter does not state how the DEIR is inadequate in dismissing this Alternative from further consideration. Please see Response to Comment Ind 388-6.

## Response to Comment Ind 255-15

The commenter provides the factual background and holding from *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502 ("*Sierra Club*".) The commenter states that the DEIR violates the holding of *Sierra Club* but does not explain how. The commenter references hexavalent chromium and new underground mining and asserts that the DEIR does not assess the condition of the underground workings. Regarding hexavalent chromium, the commenter to Response to Comment Ind 254-1. Regarding the condition of the mine, the commenter is referred to Master Response 7 – Location of Future Mining Areas and Master Response 14 – Adequacy of Groundwater Model.

## Response to Comment Ind 255-16

The commenter quotes a number of passages from *Sierra Club* and states that the DEIR should be dismissed as a matter of law but provides no additional information. The comment is noted.

## Response to Comment Ind 255-17

The commenter quotes from *Sierra Club* for the notion that a reviewing court looks not for an exhaustive analysis but for adequacy, completeness, and a good-faith effort at full disclosure. The commenter states that the DEIR for the project fails at all three but does not provide any specific information on which to formulate a response.

## Response to Comment Ind 255-18

The commenter lists several CEQA cases and states that the holdings of the cases indicate that the DEIR is inadequate but provides no additional information. The commenter also references the Project Applicant's SEC filings which are not relevant to the DEIR. Regarding hexavalent chromium, please see Response to Comment Ind 254-1.

## Response to Comment Ind 255-19

The commenter references the CEQA case of *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099 and quotes the legal standard of review. The commenter states that the DEIR would fail under this standard of review because the DEIR did not discuss hexavalent chromium in Chapter 4.7 (Hazards and Hazardous Materials) and states that the DEIR lacks adequate data and underestimates the number of private groundwater wells impacted by the project. The presence of hexavalent chromium in the CPB presents a potential impact to water within the underground mine workings. Accordingly, the DEIR appropriately discussed hexavalent chromium in Chapter4.8 (Hydrology and Water Quality). (DEIR. p. 4.8-47–49.) The commenter is also referred to Response to Comment Ind 254-1. Regarding groundwater, the DEIR assessed the project's impacts to groundwater supplies and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) Regarding the adequacy of groundwater data, the commenter is referred to Master Response 14 – Adequacy of Groundwater Model. Regarding mining within the mineral rights area, please see Master Response 7 – Location of Future Mining Areas, and Response to Comment Ind 254-17.

## Response to Comment Ind 255-20

The commenter compares the facts of *Gray v. County of Madera* to the current project and asserts that, unlike *Gray*, the groundwater monitoring for the project is inadequate. The commenter is referred to Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding analysis of deeper and expanded mining in the mineral rights boundary, please see Master Response 7 – Location of Future Mining Areas, and Response to Comment Ind 254-17.

## Response to Comment Ind 255-21

The commenter cites to *Gray v. County of Madera* where the Court rejected the lead agency's mitigation measures regarding the impact of a proposed quarry to nearby groundwater wells. The facts of *Gray* are not relevant to the adequacy of the DEIR for the project. However, it should be noted that the lead agency in *Gray* proposed to replace potable water with non-potable water which, could expose landowners to new regulatory oversight, would a create an unreliable water system, and may create new and potentially significant impacts to the environment. Here, the DEIR's Mitigation Measure 4.8-2(a) proposes to implement a Groundwater Monitoring Plan 12 months prior to the dewatering of the mine. (DEIR, p. 4.8-67.) Additionally, Mitigation Measure 4.8-2(c) would connect 30 properties along East Bennett Road to NID service which would provide potable and reliable water. (DEIR, p. 4.8-68.) Lastly, Mitigation Measure 4.8-2(b) requires the Project Applicant to supply a comparable water supply to any property impacted by mining operations. (DEIR, p. 4.8-68.) The commenter is also referred to Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 255-22

The commenter states that the project's mitigation measures regarding groundwater do not satisfy CEQA and are not feasible or affordable by the Project Applicant. However, the commenter does not specifically state why the DEIR's mitigation measures are inadequate. The commenter also states that the facts of *Gray* are different from the facts of the project because the project features more overlying property owners that depend on groundwater. The commenter is referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of the Groundwater Monitoring Wells.

## Response to Comment Ind 255-23

The commenter references a rejected groundwater mitigation measure from *Gray* which involved the Project Applicant providing bottled water to residents whose groundwater wells were impacted by that project. The commenter compares the mitigation measure in *Gray* to a "water truck alternative" in the DEIR. It is unclear what the commenter is referring to in regard to the "water truck alternative." The proposed mitigation measures for impacts to groundwater can be found at DEIR pages 4.8-67–68.

## Response to Comment Ind 255-24

The commenter quotes language from *Gray* in which the court found that the project's mitigation measures relating to groundwater were not supported by substantial evidence in the record. The commenter states that the project's groundwater related mitigation measures also are not supported by substantial evidence because those mitigation measures are inadequate. However, the commenter does not explain why the DEIR's proposed groundwater mitigation measures are inadequate or provide additional information on which to formulate a response. The groundwater mitigation measures in Chapter 4.8 of the DEIR reflect input from the County's third-party hydrology consultant for the project, West Yost, who deemed the measures adequate to mitigate the project's impacts to a less than significant level. Please also see Master Response 15.

## Response to Comment Ind 255-25

The commenter points to language in *Gray* where the court found that mitigation measures relating to traffic impacts were inadequate because the record did not indicate any definite commitment on the part of the Project Applicant as to when traffic improvements would take place. The commenter asserts that the DEIR's traffic related mitigation measures suffer from the same flaw. The lead agency in *Gray* relied on two letters from Caltrans, stating that while Caltrans had not identified any specific plan for traffic improvements, there was a clear methodology for collecting fees from the quarry project and there was sufficient commitment to completing the traffic improvements. (*Gray v. County of Madera* (2008) 167 Cal.App.4th, 1099, 1122.) The court disagreed, stating that the Caltrans letters showed intent but no definite commitment to make traffic improvements.

Here, the DEIR requires the Project Applicant to, "[p]rior to commencement of engineered fill hauling, . . . enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways including Brunswick Road between E. Bennett Road and SR 49 and E. Bennett Road between project driveway and Brunswick Road. (DEIR, p. 4.12-91.) Unlike *Gray*, Mitigation Measure 4.12-6(b) indicates a clear commitment, and enforceable requirements within the DEIR, that the Project Applicant enter into road maintenance agreements. Moreover, the project's DEIR found certain traffic impacts to be significant and unavoidable due to the

uncertainty of implementation, which is distinguishable from the situation in *Gray v. County of Madera.*

## Response to Comment Ind 255-26

The commenter points to language in *Gray* where the court found the project's noise related mitigation measures inadequate because the mitigation measures did not account for existing noise levels and whether project-related noise would cumulatively exceed regulatory thresholds. The commenter states that this holding in *Gray* exposes similar flaws in the DEIR. However, the commenter does not offer any additional information as to why the DEIR is similarly inadequate. The DEIR examined "existing ambient noise levels and the anticipated existing plus-project traffic noise levels at the nearest residences to each roadway segment, as well as the project-related increase in traffic noise levels and the impact assessment threshold for each roadway segment…" (DEIR, p. 4.10-35.) "As shown in the [Table 4.10-5], the traffic noise level increases from the transport of fill from the Brunswick Industrial Site to the Centennial Industrial Site and employee trips would not exceed the applicable thresholds of significance at any of the receptors." (DEIR, p. 4.10-35.) While the DEIR acknowledges that the use of "jake brakes" by project trucks could lead to significant noise impacts, Mitigation Measure 4.10-2 requires truck operators to operate their trucks in such a manner as to not require the use of jake brakes. (DEIR, p. 4.10-37.)

## Response to Comment Ind 255-27

The commenter states that the DEIR does not adequately assess "cumulative impacts." The CEQA Guidelines define cumulative impacts as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." (Cal. Code Regs., tit. 14, §15355.) The individual effects may be changes resulting from a single project or more than one project. (Cal. Code Regs., tit. 14, §15355(a).) Cumulative impacts may result from individually minor but collectively significant projects taking place over a period of time. (Cal. Code Regs., tit. 14, §15355(b).) Cumulative impacts were assessed in each resource section of the DEIR as appropriate, and in Section 5.3 of the DEIR. The commenter offers no additional information as to how the DEIR's analysis of cumulative impacts is inadequate; thus, no further response is possible. Please also see Response to Comment Ind 254-83.

## Response to Comment Ind 255-28

The commenter states that the DEIR failed to prepare an adequate Water Supply Assessment ("WSA") as required by SB 610. However, the commenter does not explain how the WSA prepared for the project is inadequate but appears to suggest that the DEIR underestimate well impacts, and thus, the number of homes that will need to be provided with potable water. Regarding the adequacy of the groundwater model and groundwater monitoring wells, please see Master Responses 14 and 15, respectively. Note also that water supply is discussed in DEIR Chapter 4.11 (Public Services and Utilities) at pages 4.11-8–11. The commenter is also referred to the WSA itself, prepared by West Yost (Appendix N, *Idaho-Maryland Mine Water Supply Assessment*. December 1, 2021.)

## Response to Comment Ind 255-29

The commenter states that the economic feasibility of a project under CEQA should be assessed similar to other components typically addressed within an EIR (e.g., air quality, traffic, biological resources, etc.). The commenter also states that the economic impacts (i.e., property values) of the project must be considered in the DEIR. The commenter points to various CEQA authorities, such as Public Resources Code section 21061.2 and CEQA Guideline sections 15064 and

15131(a). The commenter also points to CEQA Guideline section 15131(b), which states that "[e]conomic or social effects of a project may be used to determine the significance of physical changes caused by the project."

Regarding the financial condition of the Project Applicant, there are no CEQA authorities that require an analysis of a Project Applicant's financial condition as part of an EIR.

Regarding economic impacts, the commenter states that any negative impacts to property values as a result of the dewatering of the Idaho-Maryland Mine are the type of impacts recognized by Section 15131(b). The commenter misconstrues Section 15131(b). Economic impacts may be used to determine the extent of a physical impact caused by the project. Losses in property values are purely economic impacts, and the commenter does not explain how negative impacts to property values could be used to determine the extent of a physical impact to the environment. Please see Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 255-30

The commenter asserts that the project's potential impacts to property values fall within the scope of Section 15131(b). The commenter argues that the possibility of diminished economic value will motivate property owners to extract more groundwater or drill deeper wells, thus depleting groundwater supplies. The commenter essentially argues that the economic threat of diminished property values will prompt a social response to compete for groundwater which will cause a significant impact. However, the commenter confuses cause and effect. Here, the economic or social effect would not determine the significance of the physical changes caused by the project (i.e., the impact to groundwater wells caused by the dewatering of the mine). Moreover, the assertion that the project would result in property owners competing for, and eventually depleting, groundwater supplies is speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

## Response to Comment Ind 255-31

This comment is a continuation of Comment Ind 255-30. The commenter is referred to Response to Comment Ind 255-30.

## Response to Comment Ind 255-32

The commenter states that the DEIR's discussion of the "Reduced Hours" alternative on DEIR page 6-13–14 puts the financial condition of the Project Applicant at issue. However, the commenter does not explain how the Project Applicant's financial condition is relevant to the adequacy of the DEIR and does not point to any CEQA authorities requiring such an analysis. While an EIR may exclude a project alternative that is economically infeasible (*Center for Biological Diversity v. County of San Bernardino* (2010) 185 Cal.4th 866), that issue is distinct from the financial condition of the Project Applicant.

## Response to Comment Ind 255-33

The commenter reiterates that the financial condition of the Project Applicant or other asserted evidence that the project is economically infeasible renders the DEIR inadequate. However, the commenter does not point to any CEQA authorities to support the notion that the project's financial condition is relevant to project's impact to the environment. CEQA defines "environment" to mean the "physical conditions which exist within the area which will be affected by a proposed project,

including land, air, water, minerals, flora, fauna, noise, objects of historic or aesthetic significance." (Pub. Resources Code, §21060.5.)

## Response to Comment Ind 255-34

The commenter states that the discussion of the Reduced Hours alternative on DEIR page 6-13 puts the financial condition of the Project Applicant at issue. The commenter does not provide any CEQA authorities to support this argument. The commenter is referred to Responses to Comments Ind 255-32 and Ind 255-33.

## Response to Comment Ind 255-35

The commenter states that the discussion of the Reduced Hours alternative on DEIR page 6-13 puts the financial condition of the Project Applicant at issue. The commenter does not provide any CEQA authorities to support this argument. The commenter is referred to Responses to Comments Ind 255-32 and Ind 255-33.

## Response to Comment Ind 255-36

The commenter references the “Non-CEQA Related Analysis” (i.e., public safety power shutoff) on DEIR pages 4.3-103–4 and reiterates concerns regarding the financial condition of the Project Applicant. The commenter states that the Non-CEQA Related Analysis indicates that the DEIR is inadequate but offers no additional information. Regarding the financial condition of the Project Applicant, the commenter is referred to Responses to Comments Ind 255-32 and Ind 255-33.

## Response to Comment Ind 255-37

The commenter states that the DEIR does not properly assess the impacts of climate change in connection with groundwater supplies. The commenter also states that the DEIR inadequately assesses the project’s impacts to groundwater. The commenter does not explain how the DEIR is inadequate with regard to these topics. Regarding climate change, the commenter is referred to Master Response 16 – Drought and Climate Change. Regarding groundwater, the DEIR analyzed the project’s impacts to groundwater supplies and found those impacts to be less than significant after mitigation. (DEIR, p. 4.8-54.) Regarding the conditions of the underground mine workings, the commenter is referred to Master Response 14 - Adequacy of Groundwater Model. Please also see Response to Comment Ind 254-17.

## Response to Comment Ind 255-38

The commenter states that the remedial cleanup action at the Centennial Industrial Site should be included in the DEIR for the Idaho-Maryland Mine Project. The commenter also states that the Project Boundary in the DEIR is inadequate because the DEIR underestimates the number of impacted groundwater wells. Regarding the Centennial Industrial Site, the commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA. Regarding the number of groundwater wells impacted by the Project, the commenter is referred to Master Response 7 – Location of Future Mining Areas, and Master Response 14 – Adequacy of Groundwater Model.

## Response to Comment Ind 255-39

The commenter states that the DEIR fails to properly list a “Statement of Objectives” as required by CEQA Guideline section 15124(b) but provides no reasons why the DEIR is inadequate in this regard. The Project Objectives may be found at DEIR pages 3-11–2.

## Response to Comment Ind 255-40

The commenter states that the DEIR fails to include the mandatory elements in the Project Description as required by CEQA Guidelines section 15124. Specifically, "a general description of the project's technical, economic, and environmental characteristics…" (Cal. Code Regs. tit. 14, § 15124(c).) However, the commenter does not explain how the DEIR is inadequate with regard to Section 15124(c).

## Response to Comment Ind 255-41

The commenter states that the DEIR fails to meet the requirements of CEQA Guideline sections 15124(d) and (d)(2), which requires, among other things, a list of permits or discretionary approvals required for the project. The commenter states the DEIR makes it difficult to know what permits or discretionary approvals are being sought. Per the requirement in Section 15124(d)(1)(B), a "list of permits and other approvals required to implement the project" is available in DEIR Chapter 3.0 (Project Description), pages 3-46 to 3-48.

The commenter incorrectly states that hexavalent chromium is ignored in the DEIR. Please see Response to Comment Ind 254-1.

## Response to Comment Ind 255-42

The commenter states that the DEIR contains an inadequate description of the environmental setting as required by CEQA Guidelines section 15125. The commenter specifically states that the DEIR's baseline is inadequate because it does not include the entire mineral rights boundary. However, the DEIR does not limit analysis of impacts to an area smaller than the mineral rights boundary, and includes analysis of impacts in all appropriate geographic areas. (DEIR, Figure 3-2.) The commenter is also referred to Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 255-43

The commenter reiterates that the project violates CEQA Guidelines section 15125 regarding the environmental setting but does not provide any specific information on which to formulate a response. The commenter expresses general opposition to the project which is noted for the decision makers. The commenter does refer to concerns about what problems will be created as the project blasts, tunnels, removes rock, and adds Cr+6 in the shoring cement paste, dewaters, and otherwise mines in new, expanded, and deeper areas. For concerns regarding hexavalent chromium, please see Response to Comment Ind 254-1. For concerns regarding blasting, see Response to Comment Ind 254-72. Regarding dewatering concerns, please see Master Responses 14 and 15.

## Response to Comment Ind 255-44

The commenter states that the DEIR violates CEQA Guideline section 15125(a)(3), which states that the "existing conditions baseline shall not include hypothetical conditions, such as those that might be allowed, but have never actually occurred, under existing permits or plans, as the baseline." The commenter states that because the Idaho-Maryland Mine was last operated in 1956, the environmental baseline is hypothetical and speculative. However, the commenter does not specifically state how the project's baseline is inadequate. In addition, investigation of the underground conditions has occurred to the extent feasible. For example, water samples were collected from the New Brunswick shaft in 2018 and analyzed for a range of total petroleum hydrocarbons (TPH), semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and mercury (see Table 3.6 of Appendix K.2).

The CEQA Guidelines specify that the baseline generally should be described as the physical conditions that exist in the area affected by the project at the time the EIR process begins. (Cal. Code Regs., tit. 14, § 15125(a)(1).) The commenter does not identify any specific deficiency in the DEIR.

## Response to Comment Ind 255-45

The commenter discusses the rights of overlying property owners above the mineral rights boundary and references United States Supreme Court caselaw regarding the interpretation of a Pennsylvania statute about coal mining and support for structures on the surface. These comments do not pertain to the adequacy of the DEIR. To the extent the commenter is concerned about subsidence, the commenter is referred to Master Response 29 – Near Surface Workings.

## Response to Comment Ind 255-46

The commenter states that the DEIR violates CEQA Guidelines section 15125(d), which requires an EIR to discuss any "inconsistencies between the proposed project and applicable general plans, specific plans and regional plans." The commenter provides no additional information on which to formulate a response. The referenced inconsistency analysis is provided in Impact 4.9-2 of the DEIR. The DEIR found that the project is generally consistent with the Nevada County General Plan land use designations, with consideration of the requested approvals. (DEIR, Figure 3-5.) The DEIR also found the project would have a less than significant impact on regional plans such as the applicable air quality plan. (DEIR, p. 4.3-66.)

## Response to Comment Ind 255-47

The commenter suggests that the Project Applicant is not the actual "Applicant" as defined by CEQA Guideline section 15351 by referencing the Project Applicant's SEC filings. SEC filings are irrelevant to the adequacy of the DEIR. The commenter does not provide any additional evidence to substantiate this claim and no further response is required.

## Response to Comment Ind 255-48

The commenter states that the DEIR is drafted in a way to conceal errors, omissions, and deficiencies. This comment is vague and does not identify any inadequacies with the DEIR. No further response is required. Regarding hexavalent chromium, which is addressed in the DEIR, please see Response to Comment Ind 254-1.

## Response to Comment Ind 255-49

The commenter states that the DEIR violates CEQA Guideline section 15123. The commenter does not state how the DEIR is inadequate in this regard. All of the DEIR components required by Section 15123 can be found in the DEIR's Chapter 2.0 (Executive Summary.)

## Response to Comment Ind 255-50

The commenter states that the Nevada County Planning Commission should have allowed public comment regarding the financial condition of the Project Applicant at the March 24, 2022 hearing. The commenter does not identify any CEQA authorities that requires an analysis of a Project Applicant's financial condition.

**Individual Letter 256**

**Dist**

~~I support re-opening the Idaho-Maryland Mine~~

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighborhood and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new jobs in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous living.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

NO TO REOPENING THE MINE.

RE: Inadequate Assumptions of DEIR

Dear Mr. Kelley,

**Ind 257-1**

I am Gail Johnson Vaughan, a 40-year resident of our County, the last 20 of which have been in District 3. I hold a doctoral degree in Organizational Psychology with a special interest in Behavioral Economics and the psychology of decision making.

As a forty-year resident of Western Nevada County I have severe concerns about the inadequacy and lack of accuracy of the Draft Environmental Impact Report . My overriding concerns fall in two areas: 1) assumptions on which the report is based, and 2) the lack of inclusion of exacerbating impact on the climate crisis.

**Ind 257-2**

The draft EIR fails to give your department and the Board of Supervisors the adequate analysis you need to determine whether this project benefits our County sufficiently to outweigh the consequences of its negative impacts now and for the next four generations of our residents. The science supporting the DEIR is only as good as the accuracy of the assumptions on which it is based. This DEIR uses a limited and faulty set of assumptions.

Daniel Kahneman, PhD in psychology, was awarded the Nobel Prize in Economics, for his work on the psychology of judgment and economic decision-making. He tells us that "intuition cannot be trusted in the absence of stable regularities of the environment."[1]

At no time in human history has there been a greater absence of stable environmental regularities than we are experiencing now. The DEIR does not assess these irregularities of our environment before assigning a level of significance to a range of environmental impacts. Kahneman goes on to say "In a less regular, or low-validity, environments, the heuristics of judgment are invoked", [such as the substitution heuristic] where "quick answers to difficult questions are produced by substitutions, creating coherence where there is none and the question answered is not the one intended."[2]

The reality of this is made clear in the statement at the NID Board Meeting on February 9, 2022 by Itasca principle hydrologist Liu Houmau, PhD. He said: "... but definitely we did not look into

[1] Kahneman, Daniel, (2011). *Thinking, Fast and Slow*. Pg 241
[2] Kahneman, Pg 243

**Gail Johnson Vaughan, PsyD**
**11793 Lower Colfax Rd. Grass Valley, CA 95945**

the extensive [impact] of climate change because those are not defined into the future." The fact that they are not defined into the future explodes the expectation that the DEIR analysis of impacts and mitigations can be relied upon for 80 years.

Intuition based on historical data permeates this DEIR. To be adequate in this era of environmental irregularities this EIR must go beyond a single set of assumptions drawn from historical data and include multiple sets of assumptions which take into consideration the continuum of possible and perhaps unthinkable impacts of a changing climate over 80 years.

The DEIR relies on intuition in a number of ways.

**Ind 257-3**
- It is the sort of intuition that concludes that assumptions of impact based on historical data are sufficient to predict the full negative impact of this project when we sit at the 11th hour of life-threatening climate change.

**Ind 257-4**
- It is the kind of intuition that argues that although Dr Liu, DEIR expert hydrologist states that it is not possible to create a predictive hydrology impact model that takes climate change into consideration, that it acceptable to base the DEIR analysis of well integrity and water quality for the next 80 years on historical data that assumes a cycle of a few dry years followed by many wet years.

**Ind 257-5**
- It is the kind of intuition that argues that it acceptable to assume that the consequences of the project's negative air quality impact are not significant even when added to our County's failing air quality grade from American Lung Association.

**Ind 257-6**
- It is the kind of intuition that overlooks the facts that the project's negative impacts exacerbate the speed of climate change, that even now is resulting in unprecedented ongoing drought, and resultant horrific smoke-smothering wild fires.

**Ind 257-7**
- It is the kind of intuition that assumes it is acceptable for the project's energy use to make the Nevada County Energy Action Plan's electricity savings objectives impossible to meet as well as double current non-residential emissions and undercut the Energy Action Plan's goal of reducing water use countywide and encouraging smart efficient use of precious water resources.

**Ind 257-8**
- It is the kind of intuition that assumes that it is acceptable to allow "fugitive dust" including microparticles of asbestos to enter our air mitigated only by spraying water on them as well as omitting effective mitigations for "fugitive dust" escaping during the hundreds of daily truckloads of crumbled rock extracted from the mine.

**Ind 257-9**
These examples of faulty assumptions highlight some, but not all of the inadequacies of the DIER assumptions. Good enough for now is not good enough to predict the extensive impact of climate change on the already massive number of negative environmental impacts of this project. While we cannot know exactly what those extensive impacts of climate change will be it is imperative that the EIR include a range of assumptions across the continuum of possible

**Gail Johnson Vaughan, PsyD**
**11793 Lower Colfax Rd. Grass Valley, CA 95945**

and perhaps unthinkable impacts of a changing climate over 80 years. It is also imperative that the EIR include a range of flexible mitigations, all acceptable by Rise Gold prior to starting the project, that can be implemented based on conditions in the moment.

Thank you for considering my comments.

Gail Johnson Vaughan

## INDIVIDUAL LETTER 257: GAIL VAUGHAN

### Response to Comment Ind 257-1
This comment is introductory in nature. The commenter states the DEIR is inadequate. Please see Master Response 1.

### Response to Comment Ind 257-2
The commenter states that the DEIR relies on a faulty set of assumptions but does not provide sufficient additional detail to enable a specific response. The commenter also states that the DEIR cannot be relied upon over the life of the project because of unknowns related to climate change. California courts have consistently held that "an EIR is not required to engage in speculation in order to analyze a worst case scenario." (see *Napa Citizens for Honest Government v. Napa County Bd. of Supervisors* (2001) 91 Cal.App.4th 342.) The commenter is also referred to Master Response 16 - Drought and Climate Change.

### Response to Comment Ind 257-3
The commenter reiterates that the DEIR cannot be relied upon because of the climate change. The commenter is referred to Response to Comment Ind 257-2. The commenter is also referred to Master Response 27 – Greenhouse Gas Thresholds.

### Response to Comment Ind 257-4
The commenter states that hydrological impacts cannot be predicted to the climate changed. The commenter is referred to Response to Comment Ind 257-2. The commenter is also referred to Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 257-5
The commenter states that the County has existing air quality issues and the project will exacerbate those issues. The commenter is referred to Master Response 18 – Air Quality Thresholds.

### Response to Comment Ind 257-6
Please see Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 257-7
The commenter states that the project's energy consumption will impede Nevada County's Energy Action Plan. The commenter is referred to Master Response 25 – Nevada County Energy Action Plan.

### Response to Comment Ind 257-8
The commenter states that the project will result in adverse impacts to air quality such as fugitive dust and asbestos. The commenter is referred to Chapter 4.3 of the DEIR, Master Response 18 – Air Quality Thresholds, Master Response 22 – Conservatism of Asbestos Assumptions, and Response to Comment Ind 187-3.

### Response to Comment Ind 257-9
The commenter reiterates concerns with project's contribution to climate change. The commenter is referred to Master Response 27 – Greenhouse Gas Thresholds and Master Response 16 – Drought and Climate Change. A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

**Individual Letter 258**

Nevada County Planning Commission Public Hearing 3-24-2022
Public Comment

Honorable Chair and Commission members. I am Gail Johnson Vaughan, a 40-year resident of our County. I hold a doctoral degree in Organizational Psychology with a special interest in Behavioral Economics and the psychology of decision making.

You are tasked with the awesome responsibility of recommending to our Board of Supervisors whether this project benefits our County sufficiently to outweigh the consequences of its negative impacts now and for the next four generations of our residents. You have been provided with a draft EIR that fails to give you the adequate analysis you need to make that recommendation. **Ind 258-1**

Psychologist Daniel Kahneman was awarded the Nobel Prize in Economics, for his work on the psychology of judgment and economic decision-making. He tells us that "intuition cannot be trusted in the absence of environmental regularity." At no time in human history has there been a greater absence of environmental regularity than we are experiencing now.

The DEIR relies on intuition in a number of ways.

- It is the sort of intuition that concludes that assumptions of impact based on historical data are sufficient to predict the full negative impact of this project when we sit at the 11th hour of life-threatening climate change. **Ind 258-2**

- It is the kind of intuition that argues that although Dr Lui, DEIR expert hydrologist, states that it is not possible to create a predictive hydrology impact model that takes climate change into consideration, that it acceptable to base the DEIR analysis of well integrity and water quality for the next 80 years on historical data that assumes a cycle of a few dry years followed by many wet years. **Ind 258-3**

- It is the kind of intuition that argues that it acceptable to assume that the consequences of the project's negative air quality impact are not significant even when added to our County's already failing air quality grade from American Lung Association, and even when the project's negative impacts exacerbate the speed of climate change, that already is resulting in unprecedented ongoing drought, and horrific smoke-smothering wild fires. **Ind 258-4**

- That it is acceptable to allow "fugitive dust" including microparticles of asbestos to enter our air mitigated only by spraying water on them and no mitigation from "fugitive dust" escaping during the hundreds of daily truckloads of crumbled rock extracted from the mine. **Ind 258-5**

- It is the kind of intuition that permeates the DEIR. The science supporting the DEIR is only as good as the accuracy of the assumptions on which it is based. Perhaps the greatest inadequacy of the DEIR is basing its analysis on a single set of assumptions rather than multiple sets of assumptions which take into consideration the continuum of possible and perhaps unthinkable impacts of a changing climate over 80 years. Those multiple sets of assumptions must be added to the DEIR. Thank you. **Ind 258-6**

Dear Mr Kelly, and Nevada County planning dept,

**Ind 259-1** I have been a Nevada county resident for 9 years, a homeowner (I lost my home in the river fire), and a father of 2 middle school kids. We now live near Cedar ridge, and pass by the mine site daily. I am now involved in Real Estate and I see that this proposed project will drastically impact this industry and all of the property values in the area. It is my position that the DEIR has severely underestimated all of the environmental impacts that would come about.

**Ind 259-2** Firstly, the groundwater. This kind of disruption underground can have unforeseen impacts on the aquifers, water table and wells in a wide ranging area, the DEIR analysis is inadequate and obviously slanted towards the outside mining company. Nobody wants the kind of noise and heavy traffic that will come with such a project. We all live in nevada county because we want to have unspoilt nature around us, and some form of peace. Silicosis is a very real concern from all the dust that will abound, it can damage lungs indiscriminately, and easier than you may think. I should also mention my opinion that the wildlife here also has a right to a habitat and a peaceful existence, and the mine is a threat to that.

**Ind 259-3** In a time when we collectively have no choice but to reduce greenhouse gas emissions, this is a step backwards. in our own back yard! The mine represents nothing more than a humiliating admission that our county would rather have its own mineral resources plundered, sacrifice our 'backyard' for a few blue collar jobs; than be a forward thinking example of how a California county can adapt to changes in the modern world. In other words, I feel that attracting businesses and families to relocate and bring their wealth here is a good thing, and this would be dealt a huge blow by the environmental impacts of this mine.

**Ind 259-4** We must weigh up the economic benefits if there are any, with the damage that would come to the geloogy, soils, air quality, noise levels, aquatic biology and domestic wells, traffic, forestry and aesthetics right here at home, and climate change statewide and globally. I see that the negative impacts far outweigh any positives, and I see that the DEIR report has not been thorough enough to be realistic, it has let us down as a community.

sincerely,
Garrett Stuessy

concerned Grass Valley resident/ homeowner/ investor/ father

## INDIVIDUAL LETTER 259: GARRETT STUESSY

### Response to Comment Ind 259-1

The comment notes the DEIR underestimates the impacts of the proposed project but does not detail the specific inadequacies. Therefore, a detailed response cannot be provided. Please also see Master Responses 1 and 2.

### Response to Comment Ind 259-2

Please see Master Response 14 with regard to the adequacy of the groundwater model. Please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR for more information related to air pollution impacts, specifically Impact 4.3-2 addresses concerns regarding health risks associated with silica exposure. Please also see Master Response 21 – Conservatism of Silica Assumptions. In addition, impacts related to noise, traffic, and wildlife habitat are addressed in Chapter 4.10, Noise and Vibration, Chapter 4.12, Transportation, and Chapter 4.4, Biological Resources, of the DEIR, respectively.

### Response to Comment Ind 259-3

Please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR for more information related to climate change. In addition, please see Master Response 2 with regard to social and economic impacts.

### Response to Comment Ind 259-4

The comment is a closing remark and does not specifically address the adequacy of the DEIR. The comment expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

Nevada City, CA 95959

RE: RE-OPENING OF THE IDAHO-MARYLAND MINE

Dear Commissioners:

**Ind 260-1** 1) De-watering the mine would send 2500 gallons of water per minute into Wolf Creek which is equivalent to a "flood surge". Ongoing de-watering would send about 850 gallons of water per day into the creek for the duration of the project. The effect of this abnormal water flow is unpredictable and could adversely affect local water resources.

Furthermore, mine contaminants in the water adds to the problem of water quality.

**Ind 260-2** 2). The amount of energy to run this gold mine is 10 megawatts per day. The mine is estimated to contribute about 150 metric tons of CO2 daily into the atmosphere.

These are my two main concerns about this mine project. Either one is enough to deny approval of this project. We are paying a price for past environmental abuse that has caused climate change. Please don't contribute further to this global problem.

**Ind 260-3** Vote "no" on re-opening this mine.

Sincerely,

Gary K. Ambuehl
10701 Bragg Avenue

**Individual Letter 262**

**From:** Gary Baker <gary@plan-aire.com>
**Sent:** Thursday, January 20, 2022 12:14 PM
**To:** Idaho MMEIR
**Cc:** Ed Scofield
**Subject:** Response to Idaho-Maryland Mine Draft EIR
**Attachments:** Response to Draft EIR January 19, 2022.pdf

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Matt Kelly and Ed Scofield

**Ind 262-1** Attached are my comments on the Draft EIR for the Idaho-Maryland Mine Project. There are only 6 pages of comments provided after my review of the entire 1070 pages of the Draft document.

Any project being proposed should have a benefit to the community and while the project as described will employ about 300 people, many of those workers will come from outside the County.

**Ind 262-2** This is a large private operation which has some significant impacts which are not mitigated. Additionally there were very few alternatives examined to reduce those significant and unavoidable impacts. The project does not contain any public improvements other than the fire engine for Ophir Hill and a water line to serve about 40 people. With the amount of land included in the project, areas could have been set aside for parks, trails or other public improvements but they are not included.

**Ind 262-3** As stated in my comments attached, the Draft EIR does not appear to be neutral and reads as a biased presentation supporting a private mining operation. This Draft EIR is certainly superior to the EIR prepared for the Cannabis Ordinance three years ago, however there should have been more alternatives presented to mitigate some of the visual concerns which were considered significant and unavoidable. Some ideas are presented in my responses to mitigate some of the visual impacts.

**Ind 262-4** Clearly this project will attack a lot of public attention and while I have no particular vested interest in whether the project is approved or not, I do believe there could have been more sensitivity in the project design to mitigate some of the visual impacts. I also believe that the community should receive some benefits from a project and not just unavoidable impacts from a private development.

Nevada City, California 95959

Via e-mail: Idaho.MMEIR@co.nevada.ca.us

Regarding: Reponses to Draft EIR for the Idaho-Maryland Mine Project
SCH# 2020070378

To: Matt Kelley

From: Gary Baker

**Ind 262-5** I have read the 1070 pages of the Draft EIR for the proposed project and have included below my comments below on various sections of the document. There were no links in the document which allowed for the download of any of the appendices and there was no link on the County website for downloading these either.

**Ind 262-6** This Draft EIR is far superior to the EIR prepared for the Nevada County Cannabis Ordinance which was circulated three years ago. However, it is my personal opinion that the Idaho-Maryland Mine Project Draft EIR is not a neutral document and presents a very favorable and biased picture of the proposed project and lacks alternatives to mitigate environmental impacts which have been identified as significant. This project if approved will expose the community to potential traffic impacts from the trucking of material, the delivery of explosives to the site, visual impacts as well as other impacts which may not be significant as identified in the EIR but in fact may be just more than nuisance for some residents of the County.

**Ind 262-7**

Plan-aise

**Ind 262-8** For instance, the projects evaluation in the Draft EIR says that Heavy Truck traffic was not included in the traffic study. There were no alternatives provided for the buildings

**Ind 262-9** higher than 45' or justification provided for the increased building heights. There was no

**Ind 262-10** evaluation of the impacts of the industrial land and potential buildings which may be located on the land and pad areas created by this project. The alternatives presented in the Draft EIR only include the No Project, Reducing one fill area while increasing the

**Ind 262-11** other and reducing the mine output while still building all of the improvements. That does not appear to be a reasonable set of alternatives.

**Ind 262-12** The main beneficiary of the project appears to be the Ophir Hill Fire Department who will receive $1.0 million dollars when the project is approved. There was no financial benefit analysis presented in the Draft EIR as to any benefit to the community as a result of the project except the creation of about 300 new jobs which a portion of those jobs would employ people who do not currently live in Nevada County. Mining at the site of the

**Ind 262-13** magnitude presented in the Draft EIR should create very large profits for the mine owner over the 80 year life of the operation, yet there is not a single improvement proposed which enhances Nevada County such as a new park, trail system or library as a result of the project. Other than the fire truck, the project only provides private improvements for a private project.

**Wolf Creek Discharge**

**Ind 262-14** During the NOP public review timeframe ending in August 2020, we submitted various comments on the proposed project that we believed should be addressed in the EIR. While a few of those suggestions were in fact discussed in the Draft EIR, several suggestions were not addressed which related to alternatives for the water being discharged by the operation of the dewatering of the mine and long term dewatering during the operation of the mine. All of the project descriptions and alternatives, other than the no project alternative, discharge water from the mine into South Wolf Creek. While Wolf Creek may in fact be utilized today as a storm drain because of the discharges being introduced by the Grass Valley Sewage Treatment Plant and some dewatering operations at the North Star Mine, it is also considered a natural creek and watershed. Adding additional flows to Wolf Creek from the initial mine dewatering will have some impact on the water level of the creek, but more importantly, the creek is still being used as a storm drain to transfer volumes of water from the proposed mine.

We had previously asked to evaluate water discharge disposal alternatives for the prosed project. These could have included a variety of alternatives including but not limited to piping the water to agricultural or grazing lands for use and eventual ground

Plan-aise

water recharge or sending the water to evaporation ponds. Additionally, piping of the treated water to the Nevada Irrigation District for distribution via their vast network of canals may also be a viable option for the discharged waster from the project. Another alternative would be to use the recycled water for park, golf course or landscaping irrigation. Even if none of these alternatives are feasible, there should at least be some discussion in the Draft EIR on alternative discharges for the treated pumped water from the proposed mine other than disposal into a watercourse.

**Visual Impacts**

**Ind 262-15** The proposed Idaho-Maryland Mine project includes the construction of two large pads designated as Centennial and Brunswick as well as a 64' high industrial building and a 165' high tower for mine operations. Both the 64' high building and 165' high tower exceed the maximum building height of 45' in the existing zoning. The two pads also create 31 acres of Industrial land on the Brunswick site and 44 acres of Industrial land on the Centennial site and both pads are identified in the Draft EIR as significant unavoidable visual impacts relating to the development of the project.

**Ind 262-16** The Draft EIR does not contain and type of description or justification for the 64' building height or the 165' high tower. There were no drawings or diagrams provided which indicate the types of machinery or equipment that would be used with either of these structures to provide the reader of the Draft EIR of an understanding of why these building heights were required to operate the facility. Additionally, there were no

**Ind 262-17** alternatives provided for different types of equipment which could be used as an alternate to keep the building height within the 45' height limit. Also, there was no examination of alternative constructions methods such as locating a portion of the 64' building underground to maintain the 45' height or placing the building in a depression so the buildings visibility from the adjacent view shed and roadway would not exceed the

**Ind 262-18** 45' height limit. The 165' tower appears to be excessive in height and no alternatives have been proposed to either redesign the components in the tower to lower the overall height. The proposed 80' tower which provides access to the mine appears to be consistent with the previous mine operation so the 165' high tower appears to be very excessive.

**Ind 262-19** The two pads proposed to be created from material obtained from the underground mining operation are both identified in the Draft EIR as significant visual impacts. While the Draft EIR looked at two alternatives relating the proposed pads the result of those alternatives still used the same amount of fill material from the mining operation and where one pad would decrease in height the other pad would increase in height. There was no evaluation of building pads using less material thus creating an overall decrease

Plan-aise

in the visual impact of the proposed grading operation. The only rationale presented was the saving of costs by placing fill onsite rather than trucking the material offsite. It appears that viable pads to be used for industrial development would still be achieved if both of these pads were lower and it may be that the pads would actually be larger than what is proposed if they were not as high. The overall visual impact would be reduced if the pads were lower.

**Ind 262-20**

The site sections in the visual impact analysis is very misleading because the sections and graphics only show the 60' high pad and not the potential 45' high buildings that would potentially be constructed on top of the pad. Further, since one of the stated objectives of the project includes the construction of these pads, analysis should have been provided in the Draft EIR for all the impacts associated with the development of these pads. There would be impacts relating to sewer disposal, utilities and traffic among others which should have been included in the cumulative analysis at the very least.

**Ind 262-21**

The traffic portion of the Draft ER did not even show the development of these industrial pads as a future project, yet the pads which would readily be available to market after the construction. The total pad area is 75 acres which could contain hundreds of thousands of square feet of new development. Probably only a fraction of that square footage would be available without constructing the pads as proposed as part of the Idaho-Maryland Mine Project. There is a direct nexus between the mine operation and construction of these two pads for industrial use so the impacts of the industrial use should be fully considered in the EIR.

**Water Supply**

**Ind 262-22**

It is not clear why the amount of available water increased from 176,143 Ac Feet in the NID water storage in year 2 of the project to 381,346 Ac Feet in year three as shown on Table 4.11-6 during the drought years in the 2035 year forecast. The year 2 figure represents a potential deficit of 20,306 Ac Feet while year 3 of the drought condition shows a surplus of 155,447 Ac Feet. NID has disclosed that they are no longer pursuing the Centennial Dam project, so what water source was added to the NID system to increase the total amount of available water?

**Noise**

**Ind 262-23**

Noise levels were measured at receptor points which were located between 500' to 2,000 feet from the noise source. Other projects in Nevada County including cannabis projects are required to address noise concerns from a project as measured at the

Plan-aise

property line. It is unclear why a separate method of measuring noise levels is used for the Idaho-Maryland Mine Project compared to other county projects.

**Future Mining Operations**

Ind 262-24

Figure 4.8.13 shows potential future underground mining operations. The exhibit depicts several areas of future underground mining which extend beyond the current mineral claim of the Idaho-Maryland Mine. If there is an extension of mineral rights contemplated as part of the project the project description should be revised and impacts of that expansion should be included in the EIR.

**Demand on Housing**

Referencing Page 5-2 f the Draft EIR

*As shown in Table 4.9-5 of Chapter 4.9, as of 2018, Nevada County had 53,745 total housing units with a 22.5 percent vacancy rate (12,098 vacant housing units). The unincorporated area of Nevada County had a total of 32,182 housing units with 4,645 vacant housing units (14.4 percent vacancy rate). Therefore, the addition of 312 persons as a result of the proposed project would not impact the existing housing stock for Nevada County.*

Ind 262-25

In the Union newspaper, published is Grass Valley on January 18, 2022 the following information was printed.

*The new record high median price of a home sold in western Nevada County — $565,000 — was set in July and matched again in August, before December sales closed out the year with a $515,000 monthly median price.*

*Prices aren't likely to come down soon, as western Nevada County struggles to establish any semblance of a normal inventory of homes on the market.*

*As of Wednesday, Jan. 12, there were 145 homes for sale locally, down 14% from the same time last year and 60% lower than the 360 homes listed for sale in pre-pandemic January 2019.*

The housing situation is far different in Western Nevada County according to the recent report which shows 145 homes available and the findings in the Draft EIR which is showing 4,645 homes available. The Draft EIR should be reexamined to correlate with the current housing supply.

**Traffic**

Ind 262-26

5 of 6

Plan-aise

The traffic study appears to be inconsistent. On Table 4.12-8 there are 10 one way truck / trips per day and on page 4.13-15 there are 100 round trips per day shown. On page 4.12-55 the text shows that heavy trucks are not included in the Draft EIR.

It does appear that truck traffic and the impacts of the trucks entering and leaving the site from the proposed project should be included in the EIR.

**Mine Operations**

Many if not most gold mines start with one operator and after a period of time the mine is sold to another operator, or the mine is closed for long periods of time, sometimes for years due to market pricing of the commodity or other factors. When the mine is not operating, security and other services must still be provided for the site. When new operations begin, there may be changes proposed which were not addressed in previous environmental documents or local permits.

**Ind 262-27**

The Draft EIR is addressing the project as if it will operate continuously for 80 years under the same conditions and ownership. There is no discussion in the Draft EIR which looks beyond the current design or impacts of the project as currently proposed. For the mine to be viable for future operations if it closed for periods of time, dewatering must still be maintained for the life of the project, even if gold is not currently being extracted. Some provision should be included to ensure that adequate water treatment and site security is maintained for the life of the project which could be guaranteed by the posting of some type of bond. Furthermore, if the project design were to change which requires additional buildings or other improvements which were not addressed in the original EIR an updated EIR should be required for the project.

While these may not be considered environmental impacts as such, in periods where the mine is not operating certain protections should be put in place to protect the community from both environmental impacts and site safety from the proposed Idaho-Maryland Mine Project whether the mine is operating or not.

6 of 6

## INDIVIDUAL LETTER 262: GARY BAKER

### Response to Comment Ind 262-1
The comment is an introductory comment. No response is required.

### Response to Comment Ind 262-2
The commenter alleges that very few alternatives were examined to reduce the proposed project's significant and unavoidable impacts. The DEIR evaluates alternatives to the proposed project in Chapter 6. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers.

### Response to Comment Ind 262-3
The commenter suggests that the DEIR is biased. The CEQA Guidelines allow a Project Applicant to prepare a DEIR as long as the lead agency, in this case Nevada County, independently reviews the DEIR. (14 CCR 10584(d)(3); (e).) Not only did the County independently peer review the information provided by the applicant, but the County hired Raney Planning and Management to prepare the DEIR.

Regarding alternatives, please see Response to Comment Ind 262-2.

### Response to Comment Ind 262-4
The comment does not address the adequacy of the DEIR but expresses the opinion that more sensitivity in project design could have been employed to mitigate some of the visual impacts. The comment is noted for the record and has been forwarded to the decision-makers for their consideration.

### Response to Comment Ind 262-5
The comment does not address the adequacy of the DEIR. As part of Nevada County's efforts to make the DEIR available for public review, all DEIR materials, including appendices, were made available to be downloaded at the following web address: https://www.nevadacountyca.gov/3436/Idaho-Maryland-Mine-Draft-EIR.

### Response to Comment Ind 262-6
Please see Response to Comment Ind 262-3.

### Response to Comment Ind 262-7
The comment does not directly address the adequacy of the DEIR. Regarding transport of explosives to the site, please see Master Response 10 – Explosives, Reagents, and Brunswick Fill. Regarding truck traffic, please see the analysis in Chapter 4.12, Transportation, of the DEIR. Visual impacts are addressed in Chapter 4.1, Aesthetics, of the DEIR.

## Response to Comment Ind 262-8

As discussed on page 4.12-52 of the DEIR, an analysis of VMT from heavy truck trips is not required pursuant to SB 743 and the CEQA Guidelines and, thus, was not included in the DEIR. For further details, please see DEIR pages 4.12-53 through 4.12-55. However, it is important to note that the remaining transportation analyses contained in the DEIR (e.g., level of service, queuing) did evaluate the potential effects of the project's heavy truck traffic. For an example of supporting evidence, please refer to Table 4.12-8, Project Trip Generation, which includes project haul traffic.

## Response to Comment Ind 262-9

Please see Response to Comment Ind 262-2.

## Response to Comment Ind 262-10

With respect to potential future development of industrial uses on the proposed engineered fill pads, such projects will be required to demonstrate compliance with applicable policies, regulations, and standards set forth at the federal, State, and local level as part of obtaining necessary permit approvals before construction of such uses could commence. In addition, future development applications for industrial uses on the engineered fill pads would require separate discretionary approval, thus requiring separate CEQA environmental review. As future potential industrial uses are not a component of the proposed project, such uses are not evaluated in the DEIR.

## Response to Comment Ind 262-11

Please see Response to Comment Ind 262-2.

## Response to Comment Ind 262-12

A financial benefit analysis is not required pursuant to CEQA - please see Master Responses 1 and 2. Nevertheless, an economic analysis for the project is being prepared by the County separate from the CEQA process.

## Response to Comment Ind 262-13

The comment does not address the adequacy of the DEIR, but rather asserts that the project does not enhance Nevada County. The comment is noted for the record and has been forwarded to the decisionmakers for their consideration. Please see Master Response 1.

## Response to Comment Ind 262-14

Regarding alternatives, please see Response to Comment Ind 262-2. In addition, please see Master Response 35 – Discharge to South Fork Wolf Creek and Master Response 36 – Flows in South Fork Wolf Creek.

## Response to Comment Ind 262-15

The commenter correctly cites the significant and unavoidable impact determined by the DEIR to occur as a result of the proposed project with respect to Impact 4.1-2, which starts on page 4.1-14 of the DEIR. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project. Because significant and unavoidable impacts have been identified in the DEIR, for which feasible mitigation measures cannot reduce the potential impact to a less-than-

significant level, the County, should it decide to approve the proposed project, would be required to adopt a Statement of Overriding Considerations.

Please see Response to Comment Ind 262-2.

## Response to Comment Ind 262-16

Pursuant to CEQA, an EIR is required to evaluate the physical environmental impacts of the project, as proposed by the applicant. CEQA does not require an EIR to explain why the applicant is proposing certain project features. Notwithstanding, the requested heights of the proposed 64-foot-tall process plant, the proposed 165-foot-tall headframe for the Brunswick shaft, the proposed 80-foot-tall headframe for the proposed service shaft, and the proposed 50-foot-tall hoist buildings associated with the two mine shafts require a variance from the County. The County will need to make certain findings in order to approve the variance, during which time the County will consider the applicant's justification for the increased heights.

The types of machinery and equipment within each of the structures is identified throughout the DEIR as necessary (e.g., operational noise analysis). However, engineering level detail, such as actual brands and types of equipment, is not required in an EIR. (Dry Creek Citizens Coalition v. County of Tulare (1999) 70 Cal.App.4th 20, 26.)

## Response to Comment Ind 262-17

Please see Response to Comment Ind 262-2.

## Response to Comment Ind 262-18

Please see Response to Comment Ind 262-2 and 262-16.

## Response to Comment Ind 262-19

Please see Response to Comment Ind 262-2.

## Response to Comment Ind 262-20

Please see Response to Comment Ind 262-10.

## Response to Comment Ind 262-21

Please see Response to Comment Ind 262-10.

## Response to Comment Ind 262-22

Table 4.11-6 of the DEIR references NID's 2020 Urban Water Management Plan, specifically Tables 5-1, 5-2, and 5-3. Please refer to said tables, in particular, Table 5-3, which shows that the increased water supply in multiple dry year 3 is due to carryover water storage.

## Response to Comment Ind 262-23

Please see Response to Comment Ind 617-5.

## Response to Comment Ind 262-24

Please see Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 262-25

As shown in Table 4.9-5, the DEIR relies upon housing unit totals and vacancy rates presented in the Nevada County 2019-2027 Housing Element Update, which is the currently adopted Housing Element for the County. As such, the data presented in Table 4.9-5 of the DEIR is sufficient.

Furthermore, it should be noted that the commenter challenges the legitimacy of the DEIR's data pertaining to housing supply and vacancy rates for the entire County, by conflating the DEIR's data with information provided in the Union newspaper for an unspecified area "locally" in western Nevada County. Thus, the sets of data cited by the commenter do not involve the same geographical area, and thus, cannot be compared in the manner in which the commenter presents the argument.

## Response to Comment Ind 262-26

The commenter misinterprets the data presented in Chapter 4.12, Transportation, and Chapter 4.13, Wildfire, of the DEIR. With respect to Table 4.12-8, the 10 one-way truck trips per day apply specifically to gold concentrate-related haul traffic to the Brunswick Industrial Site. Meanwhile, the 100 round trips per day discussed on page 4.13-15 of the DEIR pertain to transport of engineered fill and represent the maximum amount of such trips that could be required. Thus, the commenter is citing different types of trips that would be expected to occur as part of the proposed project, which accordingly, would involve different trip amounts.

With respect to the discussion cited by the commenter that occurs on page 4.12-55, as detailed on pages 4.12-53 through 4.12-55 of the DEIR, an analysis of VMT from heavy truck trips is not required pursuant to SB 743 and the CEQA Guidelines and, thus, was not included in the DEIR. However, truck trips were included in the DEIR's analysis of potential project impacts related to LOS, traffic-related safety hazards, and cumulative impacts.

## Response to Comment Ind 262-27

Please see Master Response 3 – Operator Responsibility. It is also noted that, as stated on page 4.6-24 of the DEIR, to ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably determines are adequate to perform reclamation in accordance with the mining operation's approved Plan.

The comment has been noted for the record and forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 263**

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Some of the top concerns include:

CONTINUING LAWSUITS AGAINST MINE OPERATORS

**Ind 263-1**

WILDLIFE DISRUPTION

**Ind 263-2**

REAL ESTATE PROPERTY VALUES DECREASING

**Ind 263-3**

DEIR FLAT OUT MISTAKES

**Ind 263-4**

- The groundwater model has fundamental flaws in the initial start point and baseline data assumptions – all of which throw off the entire analysis.

**Ind 263-5**

- Dealing with mine waste – Asbestos will be a huge and expensive problem that requires far more comprehensive management than described in the report.

**Ind 263-6**

- Greenhouse gas emissions - The report excluded elements that would put the project over an arbitrary threshold limit, but recent climate change goals say the threshold should be "net zero".

**Ind 263-7**

- Cleanup of the toxic, pre-superfund Centennial site that would be used to dump mine waste is not included in the DEIR but is required by the California Environmental Quality Act (CEQA).

**Ind 263-8**

- Missing construction time estimates throw off the entire analysis of noise, traffic, and air.

**Ind 263-9**

- The DEIR incorrectly assesses nighttime noise and underestimates the noise of dumping mine waste near established residential neighborhoods.

**Ind 263-10**

- Air traffic hazards and aesthetic impacts need to be studied further due the likelihood of a moisture cloud plume that could be created by warm, saturated air ventilation.

**Ind 263-11**

- Blasting plans don't follow U.S. mining guidelines that restrict blasting during evening hours.

1

**Ind 263-12**

- The plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant.

**Ind 263-13**

- Meteorological data used to assess the health risk of airborne pollutants doesn't fit Grass Valley's profile or accurately reflect local conditions

Gary cartzdafner @ grass valley

## INDIVIDUAL LETTER 263: GARY CARTSDAFNER

### Response to Comment Ind 263-1
The comment does not address the adequacy of the DEIR. Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 263-2
Please refer to Chapter 4.3, Biological Resources, of the DEIR for more information related to wildlife disruption. The comment expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 263-3
The comment does not address the adequacy of the DEIR. Please see Master Response 2 – Social and Economic Issues.

### Response to Comment Ind 263-4
Please see Master Response 14 – Adequacy of Groundwater Model.

### Response to Comment Ind 263-5
Please see Master Response 8 – Mine Waste Characterization and Master Responses 22 and 23 regarding asbestos.

### Response to Comment Ind 263-6
Please see Master Response 27 – Greenhouse Gas Thresholds.

### Response to Comment Ind 263-7
Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 263-8
The comment expresses a general opinion that missing construction time estimates throw off the entire analysis of noise, traffic, and air, but does not provide specific examples that would allow for a detailed response. Please also see Master Response 24 – Project Construction Schedule.

### Response to Comment Ind 263-9
The comment expresses a general opinion that the DEIR incorrectly assesses nighttime noise and underestimates the noise of dumping mine waste near established residential neighborhoods, but does not provide specific examples that would allow for a detailed response.

### Response to Comment Ind 263-10
See Response to Comment Grp 7-95.

### Response to Comment Ind 263-11
The comment expresses a general opinion that blasting plans don't follow U.S. mining guidelines that restrict blasting during evening hours, but does not provide specific examples that would

allow for a detailed response. It addition, it is unclear what blasting plan, as well as what U.S. mining guidelines to which the commenter is referring. Impacts related to blasting are addressed in Chapter 4.7, Hazards and Hazardous Materials, as well as Chapter 4.10, Noise and Vibration, of the DEIR. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project, including consistency with all applicable regulations regarding blasting.

## Response to Comment Ind 263-12

The comment expresses a general opinion that the plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant, but does not provide specific examples that would allow for a detailed response. In addition, it is unclear what plan the commenter is referring to. As discussed in Chapter 4.4, Biological Resources, the DEIR sets forth mitigation measures to reduce the severity level of all identified impacts to less than significant.

## Response to Comment Ind 263-13

Please see Master Response 17 – Meteorological Data Used in HRA.

### Response to Comment Ind 265-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 266**

Nevada County Planning Commission
& Nevada County Board of Supervisors

Attn: Matt Kelley, Senior Planner
950 Maidu Ave, Suite 170
Nevada City, CA 95959
Ph: 530 265-1423
matt.kelley@co.nevada.ca.us

3/30/2022

**Comments on the draft Environmental Report for the proposed Idaho-Maryland Mine**

Thank you for the opportunity to comment on the adequacy of this long, complex document. My wife, Christine & I have been residents of Nevada County at 11010 Gold Hill Drive for 23 years, working locally as teachers at the Nevada City School of the Arts. Our neighborhood is directly adjacent to the Empire Mine Historical State Park, situated on the ridge that ends at the Brunswick site and stands opposite the Centennial site discussed in the proposal. We are less than a ¼ mile away from the mineral rights boundary of this project, ½ mile from the Centennial site and just under a mile from the Brunswick site. So, it is fair to say that this proposed project is right in our backyard.

**Ind 266-1**

During our years living here, we have become very familiar with the 'Area of Projected Impact' that the proposed mine would operate within. We walk and ride in the 'Union Hill' portion of the state park. We visit the meadow that encloses the South Fork of Wolf Creek at all seasons, even skiing there after the occasional heavy snow storm. My daughter grew up going to that creek, in the forested section of the state park upstream of the meadow and downstream of the Brunswick site, a place we can walk to from our house. We frequently drive East Bennett, Brunswick, Idaho-Maryland and Whispering Pine roads making errands or visiting friends. 18 years ago I began monitoring the water quality of South Fork Wolf Creek, for its turbidity, its flow, its nitrates, pH, TDS and dissolved oxygen, walking reaches of the stream, documenting its sinuosity of flow, its diverse flora and its wildlife. I've worked with the state park on restoration projects in the meadow, taken students from my 5th Grade class there, to sketch, measure, observe, and cut back blackberry thickets. All this area close to me is home in an intimate,

shared way. Neighbors meet on the trails and compare notes about the latest bear sightings or the arrival of spring migrating birds. People walk their dogs or help an elderly relative up and down the forested hill at the end of our street. Taken together, we all feel how precious and irreplaceable this area is, aesthetically, for our health, and for the forest, stream and meadow species that inhabit them.

It is with this eye that I read the DEIR, with my science teacher and naturalist background, but really as a long-term resident who calls the wider area where we walk, ride and travel daily our home. And how does the DEIR fare in that analysis? As a complex, intensely technical document that somehow in spite of its many pages repeatedly does its best to ignore or downplay many of the potential impacts that could hinder its proposed project.

Here are some of the ways in which the DEIR feels inadequate:

**Ind 266-2**

1) Cultural and Tribal Resources. Although the chapter in the DEIR states that letters were sent to tribal groups without response and that no archeological survey was considered necessary, it is well-known locally that the 'area of potential impact' as delineated in chapter 5 contains both sites of cultural significance and archeological sites important to the Nisenan people. I know of two bedrock mortars (grinding rocks) within the Bennett Street Grassland area. They are also known to the State Park and many of the people who visit that part of the South Fork. If one walks over to the bus stop in downtown Grass Valley there are large public displays about Wolf Creek, one of which shows Nisenan village sites, shared in consultation with the local Nisenan, one on the main stem of Wolf Creek near the Centennial site, the other on South Fork Wolf Creek, somewhere close to the Brunswick site. Other traditional and archeological sites doubtless exist in the area. Yet the DEIR is not successful in finding any. Wolf Creek Community Alliance has had a working relationship with the Nevada City Rancheria Nisenan Tribe for years and have collaborated with them on a number of projects. To say that they did not respond to an email or letter is not enough, especially when it is common, public knowledge that tribal resources exist in the area. The DEIR needs to include archeological surveys of the two sites and the area of projected impact. The DEIR also needs to include full consultation with indigenous tribes.

**Ind 266-3** 2) Aesthetics — The draft does little to account for the importance of recreation and the impact the project would have on that. Many of the trails in the state park are very much in the 'airshed' or 'viewshed' of the two project sites. The DEIR doesn't address seriously the aesthetic

**Ind 266-4** impact to state park visitors or to the many in neighborhoods who regularly take informal trails in the area, listen to birds, or exercise. The

**Ind 266-5** DEIR should look not just at scenic vistas, but also visual and noise impacts and its impact on park visitors or neighbors given that the area of projected impact is a crucial recreational area for the community.

3) Related to this is Noise. The ridge-top on which many of the "Union Hill' trails in the state park are located are elevated above or at a height equal to the two proposed mine sites. The analysis of noise doesn't appear to take that into account or measure impacts from those elevated locations. My house, for example, being right on Gold Hill Drive, following the top of the ridge, makes it so that we hear very

**Ind 266-6** clearly any of the extra-loud noises of the surrounding area. The noises that stand out, such as the work at the Loma Rica development right now, or the roar of a motorcycle going up Hwy 20, do not fade into the background. They disrupt one's attention, and if frequent enough annoy and actually lessen our well-being. That mine noise will somehow be less than the noise background is now, makes no sense. The DEIR should better analyze the presence and frequency of distracting noises that cut through the background. Yes, the DEIR admits this will be a

**Ind 266-7** significant issue during construction - which, by the way, seems quite serious as it is projected to last somewhere between six months and two years. There should be something in the DEIR that limits or penalizes the applicant if their 'significant and unavoidable' construction

**Ind 266-8** noise goes on past a certain timeline.Beyond that, the DEIR should discuss limiting the permitted hours for this noise to match neighborhood patterns, for example, stopping operational noise after 5

**Ind 266-9** pm. Further, the idea that mining operation noise would be just below the level of annoyance or somehow under what county ordinance permits is offensive in that it doesn't address the cumulative impact of day to day, yearlong, decade-long noise levels. At one point in the

**Ind 266-10** Biological Resources section the draft suggests that birds subjected to the constant noise will be able to 'adapt.' Humans in the area of the mine shouldn't be judged in that way and told that there will be no significant impact, or that they can adapt to the increases. The DEIR

needs a more detailed, human-oriented analysis of noise impacts that doesn't just apply to ordinances and overall sound levels.

4) Biological Resources. The biological surveys in the DEIR are incomplete and need to be redone. Surveys for plants are done out of blooming season for species of special concern. Surveys for amphibians are based on single walks down streams. Deer are not observed and so their movement through the area as well as their fawning or feeding areas are not accounted for. The biological richness of the area in many ways is better known by locals than by the surveyors, who seem mostly intent on NOT finding species of special concern that might hinder the project.

Ind 266-11

The same can be said for the description and characterization of the South Fork Wolf Creek. I have monitored the stream for 18 years for Wolf Creek Community Alliance. The South Fork is a perennial stream starting above Brunswick Road. Trout have been observed from that point above Brunswick through a number of stream reaches, including the Bennett Street Grassland reach, all the way to its confluence with Wolf Creek. Although obviously disturbed and degraded in sections (mostly by previous mining!) in the two sections that run through the state park there is a great diversity and richness of species. Stately old madrones, alders, ash, native walnut, cottonwood and douglas fir grow along the banks, along with the uncommon pacific yew. Birds are abundant, and well-documented by the Gold Country Avian Society bird banding project at the Grassland. The benthic Macroinvertebrate (BMI) collections done in the South Fork by Wolf Creek Community Alliance (WCCA) have consistently scored the highest in richness and abundance of sensitive species compared to any other sites tested in the watershed. Yet, the DEIR doesn't include any hydrological data for the forest reach of the South Fork where WCCA has its monitoring site.

Ind 266-12

The biological memo for South Fork doesn't include any survey of the grassland reach. And not a single survey of BMI is done to create a baseline for stream aquatic ecology health. This is the stream the project proposes to flood with treated mine water for 80 years. The DEIR should include much more biological analysis for the stream, starting with a baseline of biological conditions along the whole creek, from its headwaters above Brunswick Road down through the grassland reach. Surveys should be thorough and undertaken at the correct seasons, for blooming, breeding and nesting. Trail cameras should record movement of animals, such as the deer the DEIR doesn't

Ind 266-13

Ind 266-14

Ind 266-15

Ind 266-16

**Ind 266-17** observe, in order to understand the real extent of the biological resources potentially impacted by the project. Actual noise data that relates to impacts to birds and other species needs to be done, not

**Ind 266-18** simply reference to selected studies that create a biased picture of minimal impacts. The lack of effort in these regards is really appalling.

5) Related to possible impacts to streams due to the proposed project is, of course, the bigger question of water impacts themselves. Although the hydrological chapter goes to great length to attempt to show that a

**Ind 266-19** zone of low transmissivity exists below a certain depth and that well water levels have not varied much from dry to wet season, and that the fractured rock below ground is uniform enough to predict very low drawdowns of groundwater, none of the analysis is very convincing. The DEIR needs to more honestly factor in uncertainty. It needs to do water

**Ind 266-20** samples in other locations than the Brunswick Mine Shaft to get a better picture of the chemical composition of water underground. It needs to

**Ind 266-21** sample more wells over a longer period of time. And all of its conclusions need to be re-considered in the context of an 80 year

**Ind 266-22** period (how can a permit of such length be granted?) which is predicted to see increased wildfire, increased periods of drought, and increased episodes of extreme weather events. Water is life, especially in California. NID, our local water agency is currently undertaking an overall review of its water supply and water delivery for the future, with a very active concern for its ability to continue to supply water into the

**Ind 266-23** future due to both climate change and increasingly impactful new regulations guaranteeing delta stream flows downstream and applying water rights to groundwater. The DEIR doesn't include any of these crucial considerations. In this sense the DEIR is not just inadequate. It is actually dangerous. It endangers our water security by ignoring future impacts. A full analysis of these future impacts needs to be included.

6) Traffic. The report states that traffic impacts would be significant and unavoidable at one intersection. That is impact enough. Reading the chapter on traffic, however, I feel that other significant impacts are not

**Ind 266-24** sufficiently discounted. I find the many abstract intersection charts and calculations to be divorced from my everyday experience as a driver. How many trucks will I encounter on average driving to do errands or other trips? How will the roads themselves be impacted due to the 100 truck trips a day? How will it feel on Whispering Pine after it has been widened to accommodate the daily truck traffic heading to the

Centennial site to dump mine rock? My sense is that there would be significant impacts on all the roads locally that RiseGold would use for transporting hazardous materials, for refueling, for conveying waste mine rock, or even due to employee trips on the roads. The DEIR needs to go beyond the very technical intersection studies to show what impacts there would be not in terms of technical attainment numbers, but in terms of community driver experience. How much longer will it take to get to our destinations due to the increased traffic? How often will we be sitting behind trucks smelling their fumes?

**Ind 266-25** Related to this are two critical questions I also don't see addressed satisfactory in the DEIR. The first is infrastructure. Yes, the applicant will pay their fair share of road improvements, but how much additional maintenance and repair will be needed due to 80 years of heavy truck use and will the applicant be required to pay for it? Even if payment is guaranteed, we are still talking about extensive traffic delays over long periods of time, both for initial road realignments and needed repair and maintenance. Generally, I feel that 80 years of increased traffic as described would have significant impacts on road infrastructure and I don't see that fully addressed. In this regard

**Ind 266-26** cumulative impacts including increased residential development at the the approved Loma Rica project, the proposed Pine Hill project on East Bennett, and doubtless others over the 80 years lifetime of the project need to be considered. Detailed analysis of the cumulative impacts of all this needs to be included.

**Ind 266-27** Finally, there is the crucial question of evacuate routes. This needs to be carefully studied and not simply dismissed as insignificant. Everyone living here locally is acutely aware of their primary and secondary evacuation routes and recognize this as a matter of life and death. Additional traffic on roads, or bottle-necks can lead to situations where people are stuck on the roadway in the path of an approaching fire. Careful study and analysis of the slowdowns and bottle-necks potentially caused by truck traffic on-route and employee evacuation needs to be presented in the DEIR. These scenarios should also include situations where trucks carrying hazardous or explosive materials are involved.

**Ind 266-28** 7) Health and Hazards. The DEIR includes many mitigations that promise to reduce health issues and hazards to "less than significant" levels. The DEIR should analyze those mitigations more thoroughly, instead of simply stating that permits or regulations will be followed.

**Ind 266-29** More explanation of those mitigation plans should be included IN the report, not promised for later. Additional monitoring, tables for fines, and

**Ind 266-30** triggers for operation shut-down should be included. Specific funding

**Ind 266-31** analysis to ensure that all this is made possible should be identified.

**Ind 266-32** Mechanisms allowing for public access to real-time data analyzing water and air quality, sampling for asbestos and silica should be

**Ind 266-33** detailed in the DEIR. Tracking of hazardous materials should also be included. As a citizen, I start with a skeptical view of any industries

**Ind 266-34** ability to eliminate or safeguard against health hazards. The DEIR is not convincing in eliminating that skepticism. Much more additional description of proposed measures, along with additional ones, is needed in order for any of us to feel safe living close to this proposed mine.

**Ind 266-35** 8) Energy and Greenhouse Gas impacts. Climate change is an existential crisis for the whole planet. Our national government, the state and our county have all created goals for meeting that challenge. Fundamentally that included less burning of fossil fuels and lower energy use. Yet the applicants proposal would significantly increase both of these. The goals set forth in Nevada County's Energy Action Plan would be severely undermined. Yet the DEIR does not mention this or see it as a problem. The DEIR needs to address this. Buying carbon offsets does nothing to solve that problem. Also, the very calculation for

**Ind 266-36** GHG emissions and offsets needs to be re-examined. Do calculations take into account all sources of emissions, including those caused by the creation of materials needed for the project? Do calculations

**Ind 266-37** underestimate the GHG impact of various mine activities. In independent review is needed here. In any case, purchasing carbon offset credits should be be seen as adequately addressing state goals

**Ind 266-38** of reducing not just offsetting emissions. The country, in its assessment of this project needs to take seriously the impacts large industrial projects such as the once proposed here would have on combating climate change. This DEIR does not do this.

**Ind 266-39** 9) Cumulative Impacts. Last, but hardly least, I continually come up against the absurdity of a project with so many potential impacts being permitted for 80 years. We are talking about the year 2102, or later, a period of four generations, the 22nd century, a time of significant unknowns. As a county it should be prudent to only consider a permit of much shorter length. 5 years to see if the applicant can follow through

on its many commitments to mitigate impacts. Perhaps 10 years or 20 at the outside. I read that the applicant needs an 80 year permit to prove profitability. That really should not affect the communities reasonable need to protect itself against the many probable or unforeseen impacts this project could have in spite of the most optimistically written EIR. That really should not cause us to state that, given the predicted increases in drought, wildfire and extreme weather events, an 80 year permit is unacceptable, unacceptable because it involves too much risk of too much impact. The DEIR appears to think that little if anything will change in 80 years and does not consider the dramatic changes that science, that government predicts. The DEIR needs to fully address the potential impact involved in permitting a project for 80 years. It should analyze the cumulative nature of impacts that project could cause in 20 years, 40 years, 60 years, 80 years, and consider alternative versions of the project that are not longer (!) as one of the 4 alternatives suggests, but SHORTER.

**Ind 266-40**

Dear planning commission and board of supervisors. Clearly, this proposal if approved in any fashion would have profound impacts on our country. I ask that you task the reviewers and writers of this DEIR to improve its analysis, include missing elements that should be included, and seriously rather than minimally address the real potential impacts of the project. Thank you for your time and your work to keep the community I live in a beautiful, healthy place to live, for all of us and our children's children's children.

Sincerely,

Gary Griffith
11010 Gold Hill Drive
Grass Valley, CA 95945
Nevada County

## INDIVIDUAL LETTER 266: GARY GRIFFITH

### Response to Comment Ind 266-1
Comment noted. This is an introductory comment and does not provide a comment on an environmental issue associated with the project, but has been forwarded to the decisionmakers.

### Response to Comment Ind 266-2
Please see responses to Group Letter 14. In addition, as noted in DEIR section 4.5.4, and Appendix G, a Historic Properties Inventory and Finding of Effect report included a cultural records search, literature review, consultation with the Nevada County Landmark Commission, consultation with the NAHC, and a field survey. The commenter mentions two tribal resources that are not on the project site, and would not be impacted by the project.

### Response to Comment Ind 266-3
The comment infers that use of parks, public lands, and trails in the area may be impacted because users will see impacts on the views from these publicly available facilities. The commenter does not identify any trails, public facilities or lands or parks located in the vicinity of the project site, or any that may be impacted by the project. The nearest trail to the project area is the Loma Rica Trail running north-south along Brunswick Road from Loma Rica Drive north to Bubbling Wells Road; additionally, the edge of Empire Mine SHP is approximately 850 feet from the boundary of the Brunswick Site. (DEIR p. 4.11-8.) However, the distance from that nearest trail to the proposed project's noise-generating operations within the Brunswick Site is over 2,500 feet. The nearest trail within the Empire Mine SHP is nearly half a mile, or approximately 2,250 feet, from the nearest proposed noise-generating activities within the Centennial Site. The project site is surrounded by undeveloped forested land, industrial, rural residential development and commercial uses. (DEIR p. 4.1-1; see also Table 3-2.) As part of the Aesthetics Technical Study, public viewer groups and vantage points from the surrounding area were considered to assess how the public would perceive changes in site conditions associated with the proposed project. The vantage points include public views considered to be the most visually sensitive locations. The commenter does not name any park, trail or public land that has a view of the project site. None of the parks or trails in the general vicinity of the project have line-of-sight to either the project site or any anticipated project operations, and the views from any of the listed facilities would not be impacted by the project. (DEIR p. 4.11-8)

### Response to Comment Ind 266-4
Please see Master Response 1 – Non-EIR/ Administrative and Master Response 2 – Social and Economic Impacts, regarding quality of life concerns.

### Response to Comment Ind 266-5
Please see Response to Comment Ind 266-3 above regarding aesthetics impacts to user of trails and park visitors.

The comment infers that use of parks, public lands, hiking, equestrian and mountain biking trails in the area may be impacted by noise. The commenter does not identify any trails, public facilities or lands or parks located in the vicinity of the project site, or any that may be impacted by the project. The nearest trail to the project area is the Loma Rica Trail running north-south along Brunswick Road from Loma Rica Drive north to Bubbling Wells Road, additionally, the edge of Empire Mine SHP is approximately 850 feet from the boundary of the Brunswick Site. (DEIR p. 4.11-8.) However, the distance from that nearest trail to the proposed project's noise-generating operations within the Brunswick Site is over 2,500 feet. The nearest trail within the Empire Mine

SHP is nearly half a mile, or approximately 2,250 feet, from the nearest proposed noise-generating activities within the Centennial Site. The DEIR analyzed other sensitive receptors located much closer to the noise-generating aspects of the proposed project than the State Park; and these closer receptors were determined to be less than significantly impacted by project noise generation. Accordingly, more distant receptors, including the Empire Mine SHP trail network, or the Loma Rica Trail would similarly be less than significantly impacted by project noise generation. The Loma Rica Trial runs near the County airport and would be much more impacted by the noise from air traffic and the nearby industrial park than the project. DEIR Figures 4.10-7 and 4.10-8 show that both daytime and nighttime noise generation of operations at the Brunswick Site would be well below 40 dBA at the Empire Mine site. DEIR Table 4.10-4 (General Plan Noise Element Exterior Noise Limits) shows that the County's noise standard applicable to recreation use is 70 dBA Leq during the hours in which the park would be open to the public (i.e., 7 am - 7 pm). As such, the project's noise level of less than 40 dBA at the park site from Brunswick operations would be more than 30 dBA ***below*** the County's noise standard applicable to recreation uses. At the portions of the Empire Mine SHP nearest to the Centennial Site, predicted daytime noise levels are 27 dBA at the grasslands and 22 dBA at the nearest trail within the park. (DEIR Figures 4.10-7 and 4.10-8.) The noise levels at both locations are well below the County's 70 dBA daytime noise level standard. As a result, the Empire Mine SHP and the Loma Rica Trail, which are the only public recreational facilities somewhat near the project site, would not be adversely impacted by noise from operations at the Centennial Site.

## Response to Comment Ind 266-6

As discussed on page 5 of the project's Noise and Vibration Assessment (DEIR Appendix L), audibility is very subjective and can vary from person to person. Thus, audibility is not used as a significance criteria in evaluating noise impacts. In addition, a noise source can be audible without a substantial increase in ambient noise levels occurring. It is important to note that residents in the general project area, including the City of Grass Valley, are currently exposed to noise from existing trucks on the area roadway network, as well as noise from automobile traffic, all of which are audible. An extensive ambient noise survey was undertaken for the project's noise impact assessment to establish baseline ambient conditions to ensure that any identified substantial noise level increases above those ambient conditions would be identified as significant and that appropriate noise mitigation measures would be developed.

The noise prediction model used to quantify the transmission of sound from the project area to the surrounding areas accounts for topography, atmospheric conditions, ground cover, shielding by intervening buildings, noise attenuation provided by building walls and ceilings, and vegetation (see pages 5-7 of DEIR Appendix L). Local topographic survey data was imported to develop a 3-dimensional model of not only the project site but the surrounding neighborhoods as well. (DEIR 4.10-23.) Accordingly, contrary to the commenter's assertion, the sound analysis did take into account topographical variation such as the referenced ridge top. Reverberation (echo) can occur when sound impacts a reflective surface. However, vegetated ground with extensive tree cover, such as that present in the project vicinity, tends to be acoustically absorptive rather than reflective. (DEIR 4.10-24.) Where sounds can be heard over long distances, that phenomenon is frequently attributable to either a lack of intervening topography, vegetation, and ground cover between the source and receiver, or atmospheric conditions conducive to sound propagation. Such conditions are not anticipated to occur due to reflections or echoes at locations with soft ground, irregular topography, and extensive tree cover.

## Response to Comment Ind 266-7

The significant and unavoidable construction noise impact is limited to receptors proximate to the East Bennett Road water pipeline construction area. The DEIR made the reasonable assumption that these limited construction activities would be complete within approximately 6 months. The County is not required to speculate as to whether potable water pipeline construction would extend beyond these reasonable estimates. Nevertheless, the comment has been forwarded to the decisionmakers.

## Response to Comment Ind 266-8

The comment is unclear but appears to suggest that project operational noise should stop at 5pm. The commenter's request is noted and has been forwarded to the decisionmakers. The requested hours of operation, as noted in Table 3-7 of the DEIR, have been evaluated in this DEIR, and potential effects of such operational hours are evaluated throughout the technical chapters of the DEIR. For example, Chapter 4.10, Noise and Vibration, found that the project's operational noise would be below applicable County noise standards, using reasonable assumptions. Nevertheless, out of an abundance of caution, DEIR Mitigation Measure 4.10-3.2 requires implementation of a comprehensive noise monitoring program to ensure that the project's noise levels satisfy the County's noise standards once the project is operational and monitoring can be conducted. Specifically, the measure requires the following: "A comprehensive noise survey shall be conducted of each facet of the operation to both verify the modelling assumptions of the project noise analysis…and to ensure that compliance with the applicable Nevada County noise standards is being achieved at nearby sensitive receptors…If the results indicate that the County noise standards are being exceeded either by individual equipment or processes, or cumulative noise generation of the entire facility, operations shall cease until additional engineering controls can be implemented as needed. Such measures could take the form of noise barriers, installation of sound absorbing materials, use of additional silencers, etc.". The noise monitoring measurements will provide a safeguard for the residents, the County and the applicant in ensuring the project's noise generation will be maintained at acceptable levels.

## Response to Comment Ind 266-9

Please see Response to Comment Ind 266-8 above.

## Response to Comment Ind 266-10

Please see Response to Comment Ind 266-8.

## Response to Comment Ind 266-11

Please see Master Response 30 – Biological Technical Study Adequacy, Master Response 31 – Rare Plant Surveys, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog regarding surveys conducted, timing, and peer review.

Migration corridors, including deer migration, was analyzed in DEIR Impact 4.4-4.

## Response to Comment Ind 266-12

The DEIR contains voluminous baseline surface water quality data. The baseline surface water quality data are described within Section 3.4.1.2 and presented in Tables 3.5 through 3.10 of Appendix K.2 of the DEIR. The baseline data include results from samples collected from the underground workings, from drains that discharge water from the underground workings, from Wolf Creek, and from South Fork Wolf Creek. The results include field parameters, general water chemistry parameters, and metals. In particular, Table 3-8 of Appendix K.2 contains pH, temperature, dissolved oxygen (DO), electrical conductivity, and oxidation-reduction potential (ORP) measurements from three locations along South Fork Wolf Creek and two locations on the

former SPI site that discharge to South Fork Wolf Creek. Table 3-8 of Appendix K.2 presents laboratory analytical results for 18 general water chemistry parameters and 19 different metals from two samples collected along South Fork Wolf Creek at locations that will be upstream and downstream of the proposed treated water discharge location.

Table 3-10 of Appendix K.2 provides field measurements of flow, temperature, specific conductance, pH, and turbidity for two locations (upstream and downstream) along South Fork Wolf Creek, measured during five different storm flow conditions, including summer baseflow, early-season post-storm (comparable to first-flush) flows, winter baseflow, rising flows during a "qualifying rain event of 1.25 inches, and peak flows during the same "qualifying rain event". Additional details regarding flow conditions and baseline water quality conditions in South Fork Wolf Creek are also provided in Appendix K.1 of the DEIR.

Further analysis of the baseline water quality data is provided in Section 3.4.2 of Appendix K.2 of the DEIR. In particular, data from South Fork Wolf Creek are presented on Figures 3-12 and 3-19 while the baseline data from the underground workings, drains, and Wolf Creek are presented on Figures 3-12 through 3-18.

Please also see Master Response 36 – F lows in South Fork Wolf Creek, Master Response 35 – Discharge to South Fork Wolf Creek, Master Response 34 – Resident Fish, and Master Response 32 – Temperature of Mine Water Discharge. Regarding benthic macroinvertebrates, please see Response to Comment Grp 31-12.

## Response to Comment Ind 266-13

The commenter does not specifically state which biological technical study should have a "survey of the grassland reach." Significant biological analysis of the project site and surrounding area was conducted to prepared DEIR Chapter 4.4. Please see Master Response 30 – Biological Technical Study Adequacy and Response to Comment Grp 31-12 regarding BMI.

## Response to Comment Ind 266-14

Please see Master Response 36 – Flows in South Fork Wolf Creek, Master Response 35 – Discharge to South Fork Wolf Creek, and Master Response 32 – Temperature of Mine Water Discharge describing groundwater treatment and discharge into South Fork Wolf Creek.

## Response to Comment Ind 266-15

The biological study included surveys of the project site, offsite surveys where applicable, local professional expertise, and review of various databases to generate data sufficient to understand potential biological impacts. Areas that will not be impacted by a project do not need to be surveyed just because they are somehow "connected" to the property unless there is a potential for the project to impact that resource. Please see Master Response 30 – Biological Technical Study Adequacy and responses to Group Letter 2.

## Response to Comment Ind 266-16

Please see Master Response 30 – Biological Technical Study Adequacy, Master Response 31 – Rare Plants, and Master Response 37 – Birds and Raptors.

## Response to Comment Ind 266-17

The commenter states that trail cameras should be used to observe movement of animals such as deer. The CEQA guidelines require analysis of substantial interference to "the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." Migration is defined as the seasonal movement of animals from one habitat to another. Various animal, bird, and fish

species are not automatically considered migratory just because they move from one location to another. Migration serves a purpose for the species such as winter/summer habitat for foraging or breeding. It is acknowledged and analyzed in the DEIR impact analysis (see section 4.4.4) that species exist within the project site that are common to the area. Potential impacts to these species were analyzed and mitigation measures have been provided where it was determined impacts to species could occur as a result of project activities, including the implementation of preconstruction surveys and agency permitting requirements. The only migratory species acknowledged by the County General Plan is deer migration corridors. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded it would be less than significant.

## Response to Comment Ind 266-18

As discussed in DEIR section 4.10.2, ambient noise monitoring was conducted at twelve locations surrounding the project site (see Figure 4.10-2). The results of the noise monitoring were presented in Table 4.10-1. The commenter provides no information why the noise monitoring conducted for this project, which documents ambient conditions, should differ for animals. DEIR impact 4.4-2, subsection Wildlife Disturbance, addressed potential noise and nighttime lighting impacts on wildlife populations and found the potential impact less than significant.

## Response to Comment Ind 266-19

The hydrology analysis presented in the DEIR was prepared by a qualified expert and peer reviewed by the County's own independent hydrogeological expert. Please see Master Response 14 – Adequacy of Groundwater Model.

## Response to Comment Ind 266-20

Please see Response to Comment Ind 266-12 above.

## Response to Comment Ind 266-21

Please see Response to Comment Ind 266-12 above. In addition, please see Master Response 15 – Adequacy of Groundwater Monitoring Wells, for an updated description of the proposed monitoring approach, which now also includes a proposal by the applicant to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 266-22

The comment appears to request additional analysis regarding future conditions as a result of climate change. Please see Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 266-23

The commenter asserts that the DEIR should analyze the changing environment due to climate change and future regulations regarding delta stream flows. Please see Chapter 4.8 and Appendix N of the DEIR and Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 266-24

Comment noted. DEIR Chapter 4.12 is primarily based on the Traffic Impact Analysis (TIA) prepared for the proposed project (see Appendix O). The TIA's methodology, intersection and road segments for analysis, and significance criteria were appropriately based on Nevada County, City of Grass Valley, and CalTrans guidance. The commenter does not identify any specific issues with the traffic analysis as presented in the DEIR.

## Response to Comment Ind 266-25

As required under Mitigation Measure 4.12-6(g), the applicant is required to enter into road maintenance agreements with both Nevada County and the City of Grass Valley. The TIA analyzed seven different level of service scenarios, including three related to future cumulative conditions. These scenarios included cumulative no project, cumulative plus project (scenario #1), and cumulative plus project (scenario #2). These scenarios account for reasonably foreseeable future growth and are described in DEIR section 4.12.4 and Impact 4.12-9.

## Response to Comment Ind 266-26

A detailed analysis of cumulative impacts is provided throughout the technical chapters of the DEIR. Please refer to Chapter 5, Statutorily Required Sections, for a map (Figure 5-1) and list of projects included in the cumulative scenario, pursuant to CEQA Guidelines Section 15130.

## Response to Comment Ind 266-27

Please see Master Response 5 – Evacuation Routes.

## Response to Comment Ind 266-28

Compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards (CCR Title 14 Section 15126.4).

## Response to Comment Ind 266-29

Please see Response to Comment Ind 266-28 above.

## Response to Comment Ind 266-30

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

## Response to Comment Ind 266-31

CEQA requires an analysis of the project's impact to the environment. An analysis of the Applicant's financial feasibility is not required by CEQA. Please see Master Response 1 – Non-EIR/ Administrative Issues and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 266-32

Any compliance documents associated with permit monitoring and submitted to the appliable agency will be considered a public record and available to the public for review.

## Response to Comment Ind 266-33

DEIR Chapter 4.7 analyzed potential hazardous materials impacts associated with the project. As outlined in DEIR section 4.7.3, the County Environmental Health Department is responsible for County programs regulating the storing and handling of hazardous materials. As stated in DEIR section 4.7.3, the County's hazardous material program includes:

> "regulating hazardous materials business plans and chemical inventory, hazardous materials storage, hazardous materials management plans, and risk management plans. The hazardous materials business plan program requires businesses in Nevada County to prepare plans detailing facility information, a hazardous materials inventory, and an emergency response plan if hazardous materials storage equals or exceeds minimum reportable quantities."

Mitigation Measure 4.7-1(d) requires the applicant to submit a hazardous business plan to the County for review and approval prior to any transport, storage, or use of hazardous materials.

## Response to Comment Ind 266-34

The comment does not address the adequacy of the DEIR and has been forwarded to the decisionmakers.

## Response to Comment Ind 266-35

Please see Master Response 25 – Nevada County Energy Action Plan, regarding the project's consistency with this plan.

Please also see Master Response 27 – Greenhouse Gas Thresholds, Master Response 28 – Greenhouse Gas Credits, and Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 266-36

Please see Response to Comment Ind 266-35 above.

## Response to Comment Ind 266-37

The air quality and greenhouse gas analysis was independently reviewed by the County environmental consultant prior to preparation of the DEIR.

Contrary to the commenters assertion, Mitigation Measure 4.3-7(b) requires the project to retire carbon offsets in a quantity sufficient to offset the project's greenhouse gas emissions to a less than significant level. Please see Master Response 27 – Greenhouse Gas Thresholds, and Master Response 28 – Greenhouse Gas Credits.

## Response to Comment Ind 266-38

The DEIR does address climate change, without entering in speculation, and the context of the project and the County relating to the global impact. (see DEIR Chapter 4.3.)

## Response to Comment Ind 266-39

As identified in CEQA Guidelines section 15125, the environmental analysis presented in the DEIR should normally compare physical environmental conditions as they exist at the time of the Notice of Preparation. The DEIR analyzed the project's potential impacts consistent with this requirement in addition to reviewing potentially significant cumulative impacts based on known or planned development in the region. CEQA Guidelines section 15130 requires an EIR discuss cumulative impacts of a proposed project. Cumulative impacts are considered impacts created because of the combination of the proposed project with reasonably foreseeable future projects. DEIR section 5.3 summarizes the cumulative impacts analysis, and each resource analysis includes an analysis of cumulative impacts specific to that resource.

## Response to Comment Ind 266-40

The comment generally expresses concerns related to the project and the DEIR, and has been forwarded to the decisionmakers for their consideration.

**Individual Letter 267**

**From:** ghp2013@gmail.com
**Sent:** Friday, April 1, 2022 3:07 PM
**To:** Idaho MMEIR
**Subject:** Mine Environmental Impact Comments

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Please enter the following comments for the record:

**Ind 267-1** The draft Environmental Impact Report does not sufficiently address the risks related to hydrology in the immediate area of the mine. The geology in the area is known for numerous random (and unmapped) fractures in to local bedrock. Without a detailed knowledge of these fractures, the consequences of de-watering the Idaho-Maryland Mine cannot be known.

**Ind 267-2** Within a 5-mile radius of the mine, many houses are dependent on family-owned water wells. The proposed de-watering of the mine could easily result in the inadvertent reduction of the water table or the complete dewatering of water wells on surrounding properties.

Although the project proposes to provide NID as an alternative source in this event, this is insufficient. The quality of NID water is inferior to family wells in this area. And, furthermore building the infrastructure required to distribute NID water in this area would be very costly and difficult. Many residences are located away from main roads, along unimproved private roads. Such an installation of NID water service would present numerous legal issues, destructive of private property and in some cases completely impractical.

**Ind 267-3** We respectfully request that this EIR be rejected.

Sincerely,

GARY and TINA SPRIGGS
13480 Lower Anchor Ln
Grass Valley CA 95945
Ghp2013@gmail.com

## INDIVIDUAL LETTER 267: GARY AND TINA SPRIGGS

### Response to Comment Ind 267-1

The commenter states that the DEIR does not sufficiently address impacts to groundwater because there are random and unmapped fractures. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality), Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 267-2

The commenter states that the project will adversely affect private wells but does not state how the DEIR is inadequate. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality), Master Response 7 – Location of Future Mining Areas, Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 267-3

The commenter states that the provision of NID water is inadequate because NID water is inferior to private well water but provides no evidence to substantiate this claim. The commenter also states that extending NID service to properties near the project is impractical. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality), Master Response 7 – Location of Future Mining Areas, Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

The Well Mitigation Plan (Appendix K.9 of the DEIR) has been modified and is attached to the Final EIR as Appendix D. More detail on actions and potential mitigations, is provided in the modified Well Mitigation Plan and mitigation of wells outside the E. Bennett area may not include a connection to NID potable water supply.

Drinking water supplied to Nevada Irrigation District (NID) customers meets and exceeds state and federal public health standards, based on testing results that serve as the basis for the District's Water Quality Report. (see https://www.nidwater.com/files/1e68c2c9b/NID+WQR+2021.pdf )

**Phone: 530-265-1423**
**Email: Idaho.MMEIR@co.nevada.ca.us**

## GENERAL COMMENTS on the DEIR and the Proposal from Gary Zimmerman of Nevada City, CA:

Thank you for the opportunity to **comment on the DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR) for the proposed re-opening of the now closed Idaho-Maryland Mine and Toxic Superfund Waste Site.**

**Ind 268-1**

From my experience reviewing and commenting on a number of environmental impact reports, as well as the economic impacts of a number of proposed projects over the past four decades, I would like to provide comments on the DEIR and the associated proposed project.

- ✓ **I would like to begin with comments on several general aspects of this DEIR, which is clearly incomplete and inadequate, and likely will end up in court.**

**GENERAL OBSERVATIONS:**

**Ind 268-2**

- ✓ **CLIMATE CONCERNS: This one proposed project would consumer about 1/8th of the county's current energy consumption and generate ADDITIONAL GREENHOUSE GAS EMISSIONS that would offset existing County Efforts to REDUCE EMISSIONS. Straining Nevada County's power grid and spiking greenhouse gas emissions and worsening air quality ARE SIGNIFICANT ADVERSE IMPACTS!**

**Ind 268-3**

- ✓ **BLASTING UNDERGROUND & IMPACTS on TECH FIRMS ABOVE GROUND -- ECONOMIC LOSSES: My recollection was that this was an important adverse impact from the failed effort to reopen the Idaho-Maryland Mine in the 2005-2012 time frame. Is there a proposed estimate of the potential costs to existing "above ground" tech firms of product losses related to vibrations caused by proposed continuous underground blasting if the mine were to be reopened?**

**Ind 268-4**

- ✓ **If not, why not? If so, when will it be available to Grass Valley and Nevada County businesses, governments, and the public?**

**Ind 268-5**

- ✓ **CENTENNIAL SITE: This site is ALREADY A TOXIC "SUPERFUND" SITE, WAS IT SUPPOSED TO BE CLEANED UP FIRST by Rise Gold?**
  **Has Rise Gold developed a clean up plan? Implemented a clean up plan? Paid to begin the clean up? If not, why not?**

**Ind 268-6**

✓ **WILL THE PROPOSED MINE PAY FOR THE EXISTING CLEAN UP, OR WILL IT "FAIL" AND LEAVE OTHERS (GOVERNMENTS AND TAX PAYERS) TO PAY FOR THE CLEAN UP?**
**How can Nevada County protect itself from the RISK that FAILURE or EARLY CLOSURE results in "Others" paying for the proposed Rise Gold clean up(s)?**

**Ind 268-7**

✓ **NOTE: RISE GOLD bought this property knowing that it included nearly 270,000 cubic yards of mine tailings that include a variety of toxics that should be cleaned up…**
**Has the applicant made a good faith effort to begin the toxic superfund site clean up on the Centennial parcel? What is the cost of the clean up of existing toxics on the site? The annual cost of clean up associated with proposed annual operations?**

**Ind 268-8**

✓ **ASBESTOS: SERPENTINE ROCK, common in Nevada County and closed mines, often contain asbestos.** **Is the type(s) of asbestos found in the Idaho-Maryland mine tailings considered a toxic waste today? What is the typical asbestos content of the mine tailings that would be produced by the proposed reopening of the mine? What are the annual costs of cleaning up the existing mine tailings, and their asbestos content, and the costs of cleaning up additional "new" mine tailings that would be located on the proposed mine site?**

**Ind 268-9**

✓ **ECONOMIC BENEFITS: HAS THE PROPOSED ECONOMIC IMPACT STATEMENT BEEN PREPARED, BEEN AVAILABLE FOR PUBLIC COMMENT, INCLUDING FROM Financial Analysts, Accountants, and Economists? Has it been reviewed for accuracy by Nevada County officials?**

**Ind 268-10**

✓ **ECONOMIC IMPACTS: WHAT ARE THE ECONOMIC COSTS, in lost property values arising lost or contaminated wells, from close proximity to an active mine site, toxic waste tailings, noise, traffic, air and water quality?**

**Ind 268-11**

✓ **FALLING PRPERTY VALUES, both private homes and local businesses operating near or in the vicinity of the toxic sites, and properties losing property rights to their groundwater, also likely will impact Nevada County property tax assessments and property tax receipts. ,Overtime, or in event that the proposed mine fails or is closed before the 80-year timeframe is completed, these costs will be CUMULATIVE and could be SUBSTANTIAL!**

**Ind 268-12**

✓ **Have these costs to individuals, businesses, and governmental organizations like Nevada County, school districts, special districts, NID, been evaluated in the DEIR? Have the proposed project proponents offered to provide mitigation or compensation (and for how long?) to those who will suffer damage and lost property values and tax receipts as a result of reopening this mine, that will require mitigations and expensive treatment of toxics into perpetuity? IF not, why not, and when will this analysis be provided to Grass Valley neighbors and officials?**

Ind 268-13

✓ **MARKET RISK: PRICE of GOLD? Aside from the many other RISKS associated with the proposed mine reopening, is the price of gold. The potential success or failure of this proposed project, from the standpoint of the firm, may depend on the price of gold on the global market. Please note that gold prices have a history of moving, both up & down, with a longer-term upwards trend. The downward movements, like during the 2008 Financial Crisis, create another RISK, that a fall in the price of gold also could cause a failure of the proposed mine operations. For example, note the substantial fall in gold prices from the 2012 peak through 2016. Sales of gold stocks by central banks in a financial emergency or crisis also could dramatically lower the market price of gold for other uses.**

Ind 268-14

✓ **FAILURE or CLOSING (well before 80 years…)**
**The price of gold is high now, but that does not guarantee that it will remain high forever. How might higher and rising interest rates, anticipated in the years ahead, also make non-interest paying (but including costs of gold storage) gold less attractive to financial instruments like bonds or stocks that pay interest or dividends. Does the DEIR consider this RISK to the success of a proposed gold mine, when the cost of failure or closing, are likely to result in significant adverse environmental and clean up costs to Nevada County and its taxpayers?**

6

**Ind 268-15**

***Chart 1: Historic Price of Gold Chart. 1992-to-2022***

*Comments on the DEIR for the Proposed Reopening of the Idaho-Maryland Mine in Nevada County.*

Ind 268-16

**CONCLUSIONS: Again, having reviewed many DEIRs for a number of organizations over many years, my professional opinion is that this DEIR is INADEQUATE and INCOMPLETE!**

Ind 268-17

**It underestimates or ignores CUMULATIVE SIGNIFICANT ADVERSE IMPACTS & RISKS in a number of areas, including WATER, AIR, TRAFFIC, and QUALITY of LIFE CONCERNS!**

Ind 268-18

**The DEIR makes ASSUMPTIONS that without complete information or study. It makes ASSUMPTIONS that NECESSARY, but RISKY MITIGATIONS, some that last forever, will be successful, when FAILURES involving WATER AVAILABLITY and QUALITY, AIR QUALITY, GREENHOUSE GAS EMISSIONS, PROPERTY VALUES, TAX REVENUES, ENERGY USAGE, & EVEN ASTETHICS…**

Ind 268-19

**The DEIR indicates that the PROPOSED PROJECT was POORLY CONCIEVED and HIGHLY SPECULATIVE, and SHOULD NOT BE APPROVED!**

**Thank you for the opportunity to comment on this important document.**

**Nevada City, California 94595**

## INDIVIDUAL LETTER 268: GARY ZIMMERMAN

### Response to Comment Ind 268-1

This comment is introductory in nature and the commenter opposes the project. The commenter also states the DEIR is inadequate and identifies the Centennial Industrial Site as a "Toxic Superfund Waste Site." The commenter's opposition to the project is noted for the decisionmakers. Regarding the Centennial Industrial Site, the commenter is referred to Master Response 9 – Historical Mine Waste at Centennial Site. Responses to specific comments are provided below.

The commenter incorrectly asserts that the Centennial Site is a "Superfund" site. The Centennial Site has never been on the National Priorities List[1] (A "Superfund site"). The Centennial Site has never been proposed to be placed on the National Priorities List (NPL). The USEPA has prepared a Site Inspection Report in 2019 for the Centennial site but did not score the site using the Hazard Ranking System (HRS). The HRS is the primary method used to place sites on the NPL[2].

### Response to Comment Ind 268-2

The commenter objects to the project's energy consumption and states that the project will result in adverse air quality impacts (e.g., GHG emissions). The commenter does not identify how the DEIR is inadequate with regard to these impacts. The DEIR analyzed air quality impacts in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and found those impacts to be less than significant after mitigation. The commenter is also referred to Master Response 27 – Greenhouse Gas Thresholds and Master Response 25 – Nevada County Energy Action Plan.

### Response to Comment Ind 268-3

The commenter raises concerns regarding businesses that sell electronic equipment and any potential impacts related to underground blasting and vibrations. The vibration impacts to electronic equipment was analyzed for analog devices and underground blasting associated with the project would result in a less than significant vibration-related impact to analog devices. (DEIR, pp. 4.10-54, 4.10-55.) Regarding purely economic losses as a result of the project, the commenter is referred to Master Response 2 – Social and Economic Impacts.

### Response to Comment Ind 268-4

The commenter asks if a proposed estimate of business losses to electronics businesses near the project site. The commenter is referred to Response to Comment Ind 268-3.

### Response to Comment Ind 268-5

The commenter asks if the Project Applicant has developed a cleanup plan for the Centennial Industrial Site. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 268-6

The commenter asks if the Project Applicant will pay for the cleanup of the Centennial Industrial Site. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

[1] https://www.epa.gov/superfund/superfund-national-priorities-list-npl
[2] https://www.epa.gov/superfund/about-superfund-cleanup-process#pasi

## Response to Comment Ind 268-7

The commenter raises concerns with the Centennial Industrial Site. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA, and Master Response 9 – Historical Mine Waste at Centennial Site.

## Response to Comment Ind 26-8

The commenter asks whether asbestos is found within the Idaho-Maryland Mine tailings and whether new waste rock from the Idaho-Maryland Mine would contain asbestos. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA, and Master Response 9 – Historical Mine Waste at Centennial Site.

The DEIR discusses asbestos in detail in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and found the impacts to be less than significant after mitigation. The commenter is also referred to Master Response 22 – Conservatism of Asbestos Assumptions.

## Response to Comment Ind 268-9

The commenter is concerned about the economic benefits of the project. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 268-10

The commenter is concerned about the project's potentially adverse economic impacts. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 268-11

The commenter is concerned about the project's potentially adverse economic impacts. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 268-12

The commenter is concerned about the project's potentially adverse economic impacts. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 268-13

The commenter is concerned that the price of gold may fluctuate and impact the viability of the project. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 268-14

The commenter is concerned that the price of gold may fluctuate and impact the viability of the project. The commenter is also concerned about reclamation when the Idaho-Maryland Mine closes. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues and Master Response 2 – Social and Economic Impacts.

Regarding reclamation, the project requires an approved Reclamation plan. To ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably

determines are adequate to perform reclamation in accordance with the mining operation's approved Plan. (DEIR, p. 4.6-24, Appendix C.)

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

## Response to Comment Ind 268-15

The commenter provides an image of chart showing the historic price of gold from 1992 to 2022. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 268-16

The commenter states that the DEIR is inadequate but provides no specifics or evidence. Responses to specific comments are provided above. The commenter is also referred to Master Response 1 – Non-EIR/Administrative Issues

## Response to Comment Ind 268-17

The commenter states that the DEIR is inadequate but provides no specifics or evidence. Responses to specific comments are provided above. In regards to quality of life concerns, the commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

## Response to Comment Ind 268-18

The commenter states that the DEIR is inadequate but provides no specifics or evidence. Responses to specific comments are provided above. In regards to economic issues, the commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 268-19

The commenter states that the project is poorly conceived, speculative, and should not be approved. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

## GENERAL COMMENTS on the DEIR and the Proposal from Gary Zimmerman of Nevada City, CA:

**Ind 269-1**

Thank you for the opportunity to **comment on the DRAFT ENVIRONMENTAL IMPACT REPORT (DEIR) for the proposed re-opening of the now closed Idaho-Maryland Mine and Toxic Superfund Waste Site**.

From my experience reviewing and commenting on a number of environmental impact reports, as well as the economic impacts of a number of proposed projects over the past four decades. I would like to provide comments on the DEIR and the associated proposed project.

- ✓ **I would like to begin with comments on several general aspects of this DEIR, which is clearly incomplete and inadequate, and likely will end up in court.**

**GENERAL OBSERVATIONS:**

- ✓ **CLIMATE CONCERNS: This one proposed project would consumer about 1/8th of the county's current energy consumption and generate ADDITIONAL GREENHOUSE GAS EMISSIONS that would offset existing County Efforts to REDUCE EMISSIONS. Straining Nevada County's power grid and spiking greenhouse gas emissions and worsening air quality ARE SIGNIFICANT ADVERSE IMPACTS!**

- ✓ **BLASTING UNDERGROUND & IMPACTS on TECH FIRMS ABOVE GROUND -- ECONOMIC LOSSES: My recollection was that this was an important adverse impact from the failed effort to reopen the Idaho-Maryland Mine in the 2005-2012 time frame. Is there a proposed estimate of the potential costs to existing "above ground" tech firms of product losses related to vibrations caused by proposed continuous underground blasting if the mine were to be reopened?**
- ✓ **If not, why not? If so, when will it be available to Grass Valley and Nevada County businesses, governments, and the public?**

- ✓ **CENTENNIAL SITE: This site is ALREADY A TOXIC "SUPERFUND" SITE, WAS IT SUPPOSED TO BE CLEANED UP FIRST by Rise Gold?**
**Has Rise Gold developed a clean up plan? Implemented a clean up plan? Paid to begin the clean up? If not, why not?**

- ✓ **WILL THE PROPOSED MINE PAY FOR THE EXISTING CLEAN UP, OR WILL IT "FAIL" AND LEAVE OTHERS (GOVERNMENTS AND TAX PAYERS) TO PAY FOR THE CLEAN UP?**
  **How can Nevada County protect itself from the RISK that FAILURE or EARLY CLOSURE results in "Others" paying for the proposed Rise Gold clean up(s)?**

- ✓ **NOTE: RISE GOLD bought this property knowing that it included nearly 270,000 cubic yards of mine tailings that include a variety of toxics that should be cleaned up…**
  **Has the applicant made a good faith effort to begin the toxic superfund site clean up on the Centennial parcel? What is the cost of the clean up of existing toxics on the site? The annual cost of clean up associated with proposed annual operations?**

- ✓ **ASBESTOS: SERPENTINE ROCK, common in Nevada County and closed mines, often contain asbestos. Is the type(s) of asbestos found in the Idaho-Maryland mine tailings considered a toxic waste today? What is the typical asbestos content of the mine tailings that would be produced by the proposed reopening of the mine? What are the annual costs of cleaning up the existing mine tailings, and their asbestos content, and the costs of cleaning up additional "new" mine tailings that would be located on the proposed mine site?**

- ✓ **ECONOMIC BENEFITS: HAS THE PROPOSED ECONOMIC IMPACT STATEMENT BEEN PREPARED, BEEN AVAILABLE FOR PUBLIC COMMENT, INCLUDING FROM Financial Analysts, Accountants, and Economists? Has it been reviewed for accuracy by Nevada County officials?**

4

- ✓ **ECONOMIC IMPACTS: WHAT ARE THE ECONOMIC COSTS, in lost property values arising lost or contaminated wells, from close proximity to an active mine site, toxic waste tailings, noise, traffic, air and water quality?**

- ✓ **FALLING PRPERTY VALUES, both private homes and local businesses operating near or in the vicinity of the toxic sites, and properties losing property rights to their groundwater, also likely will impact Nevada County property tax assessments and property tax receipts. ,Overtime, or in event that the proposed mine fails or is closed before the 80-year timeframe is completed, these costs will be CUMULATIVE and could be SUBSTANTIAL!**

- ✓ **Have these costs to individuals, businesses, and governmental organizations like Nevada County, school districts, special districts, NID, been evaluated in the DEIR? Have the proposed project proponents offered to provide mitigation or compensation (and for how long?) to those who will suffer damage and lost property values and tax receipts as a result of reopening this mine, that will require mitigations and expensive treatment of toxics into perpetuity? IF not, why not, and when will this analysis be provided to Grass Valley neighbors and officials?**

*Comments on the DEIR for the Proposed Reopening of the Idaho-Maryland Mine in Nevada County.*

5

✓ **MARKET RISK: PRICE of GOLD? Aside from the many other RISKS associated with the proposed mine reopening, is the price of gold. The potential success or failure of this proposed project, from the standpoint of the firm, may depend on the price of gold on the global market. Please note that gold prices have a history of moving, both up & down, with a longer-term upwards trend. The downward movements, like during the 2008 Financial Crisis, create another RISK, that a fall in the price of gold also could cause a failure of the proposed mine operations. For example, note the substantial fall in gold prices from the 2012 peak through 2016. Sales of gold stocks by central banks in a financial emergency or crisis also could dramatically lower the market price of gold for other uses.**

✓ **FAILURE or CLOSING (well before 80 years…)**
**The price of gold is high now, but that does not guarantee that it will remain high forever. How might higher and rising interest rates, anticipated in the years ahead, also make non-interest paying (but including costs of gold storage) gold less attractive to financial instruments like bonds or stocks that pay interest or dividends. Does the DEIR consider this RISK to the success of a proposed gold mine, when the cost of failure or closing, are likely to result in significant adverse environmental and clean up costs to Nevada County and its taxpayers?**

6

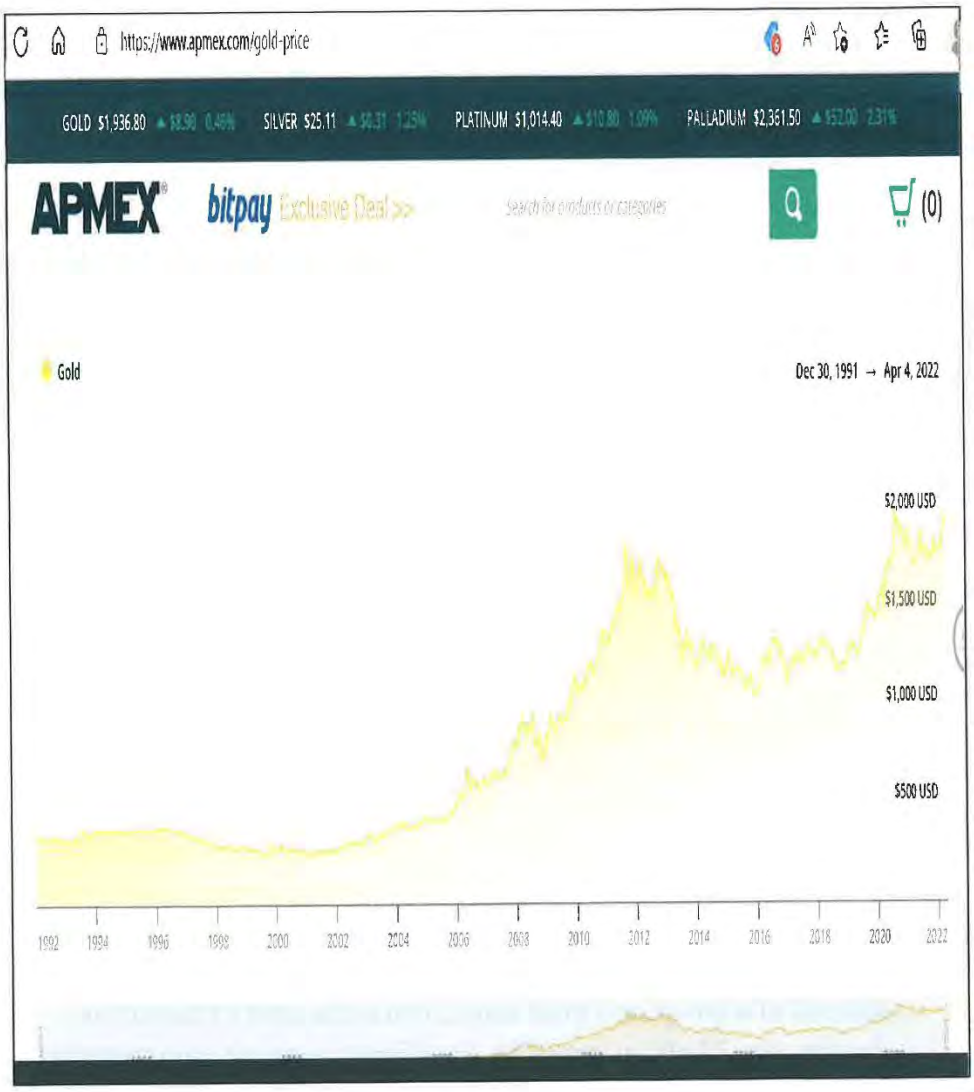

***Chart 1: Historic Price of Gold Chart. 1992-to-2022***

7

**CONCLUSIONS: Again, having reviewed many DEIRs for a number of organizations over many years, my professional opinion is that this DEIR is INADEQUATE and INCOMPLETE!**

**It underestimates or ignores CUMULATIVE SIGNIFICANT ADVERSE IMPACTS & RISKS in a number of areas, including WATER, AIR, TRAFFIC, and QUALITY of LIFE CONCERNS!**

**The DEIR makes ASSUMPTIONS that without complete information or study. It makes ASSUMPTIONS that NECESSARY, but RISKY MITIGATIONS, some that last forever, will be successful, when FAILURES involving WATER AVAILABLITY and QUALITY, AIR QUALITY, GREENHOUSE GAS EMISSIONS, PROPERTY VALUES, TAX REVENUES, ENERGY USAGE, & EVEN ASTETHICS…**

## INDIVIDUAL LETTER 270: GAVEN MOORE

### Response to Comment Ind 270-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 271**

Nevada County Planning Commission 02-04-2022
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

**Ind 271-1**

There are many reasons this mine should NOT be reopened. My reason is simple. The risk (environmental calamities, reduced property values, noise and traffic issues) is not worth the reward (a few new jobs and more gold to be stored in vaults around the world).

I am a resident of Nevada County and believe that Rise Gold corporation lacks either respect or understanding of the impact their mine project will have on the environment and people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Geoff Pollard

RE: Idaho Maryland Mine DEIR Comments

Dear Mr. Kelley

**Ind 272-1** This letter is to provide comments on the Draft Environmental Impact Report prepared for the Idaho Maryland Mine project. I live at 14401 Pierite Road in Nevada City, and have been a resident of Nevada County for approximately eight years. I am also a former city planner (City of San Francisco) with nearly 20 years of experience with CEQA and planning review of California projects.

My comments are limited to two areas of the DEIR – Project Background and Hydrology. Both sections have significant flaws that, at a minimum require additional analysis and recirculation of the DEIR.

**Chapter 3.4 Project Background – Piecemealing**

**Ind 272-2** Section 3.4 of the DEIR briefly discusses the directly related project of the Voluntary Cleanup Agreement and potential Remedial Action Plan under consideration for the Centennial Industrial Site. The section says, in pertinent part, "Under the plan, the project applicant would **excavate soils within the former eastern and western tailing ponds and consolidate contaminated materials on-site, as well as stabilize contaminated materials within a small hot spot area by cement treatment prior to on-site consolidation**. Without explanation as to why this significant earthwork, excavation and construction project would be excluded from the DEIR, the report concludes that this unapproved, uncompleted, hypothetical project would be presumed to represent the baseline condition for the Idaho Maryland Mine analysis. This is nonsensical and clearly piecemealing. Cumulative construction and operational impacts, including those related to air quality, water quality, truck trips, etc. have not been analyzed, must be added to the current analysis and the DEIR must be recirculated.

**Chapter 4.8 Hydrology and Water Quality**

**Ind 272-3** Section 4.8 and specifically Mitigation Measure 4.8-2(a) proposes a well and groundwater monitoring scheme that effectively proves (because of the monitoring scheme proposed) that the ultimate impacts of the dewatering of mines that have been for decades underwater is unknown. Indeed, the impact of mine dewatering in this region has no remotely recent precedent. In the current mega-drought, it is very reasonable to assume that the removal of millions of gallons of groundwater from the mines will have the very predictable impact of

drawing nearby subsurface flows to the mines, potentially affecting not just 30 nearby wells but potentially hundreds or thousands of nearby well.

**Ind 272-4**

The mitigation measure goes on to state that any well that is reduced via dewatering by more than 10% (which could be as much as a 20' reduction in a 200' deep well) will be remediated or potable water produced by some other means, all at the project sponsor's cost. The fatal flaw with this logic is that there is a very reasonable likelihood that the number of wells impacted in this way could number in the multiple hundreds and therefore 1) cannot reasonably be replaced by NID water, 2) would represent in and of itself a significant increase in NID service area requiring its own CEQA review, and 3) could conceivably involve enough wells so as to be technically infeasible or financially impossible for the project sponsor to address. This would result in a reasonably foreseeable scenario where the project sponsor drags the community through a science experiment only to find out that it cannot afford the mitigations reasonably required by MM 4.8-2(a).

This impact must be correctly classified as Significant and Unavoidable unless and until the project sponsor agrees to a bond or similar irrevocable financial commitment equal to the cost of mitigating the impacts described above, and certainly well beyond just placing 30 of the most directly impacted neighbors on NID water.

**Ind 272-5**

Thank you for your care and consideration in the review and analysis of this project. As you probably can see from all the public concern it has engendered, a lot of us are very worried that this project is the wrong project for Nevada County at this time. While the promised economic benefits are not guaranteed whatsoever, we the residents of Nevada County will be left with the reality of another failed mining experiment and all the environmental impacts it will bring.

## INDIVIDUAL LETTER 272: GEOFFREY NELSON

### Response to Comment Ind 272-1
This comment is introductory in nature and the commenter is concerned with two areas of the DEIR, Project Background and Hydrology. The comment is noted and responses to specific comments are provided below.

### Response to Comment Ind 272-2
Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 272-3
The DEIR discusses the impact to private wells in Chapter 4.8 and found that the impacts would be less than significant after mitigation. (DEIR, 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 272-4
The commenter is referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 272-5
The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

Matt Kelley,

**Ind 273-1** I am a 10 year resident of Nevada County residing in Nevada City. I have atrial fibrillation and have concerns about the air quality that this huge operation would have on our already poor air quality. For me carbon offsets which are mentioned in the report are simply not preventing pollution but merely buying permission to pollute. There is no way that this proposed hardrock mine will not degrade the air quality we currently have. Also once this mine if approved and begins operation, I do not believe that the levels of monitoring and enforcement necessary will take place. Because of the money involved which will mostly end up in the pockets of Canadian investors there will surely be lawsuits resulting form attempted enforcement of any mitigation required. The amount of money from this operation that Grass Valley or Nevada County will ever see will be a minuscule portion. As others have mentioned this company left the Canadian government with a mess to cleanup from a failed operation by the same CEO running Rise Gold. We need to do everything possible to combat the massive threat of climate change and allowing this gold mine to reopen would be one of the worst possible uses of this land with respect to climate change and air quality. I therefore strongly reject Rise Gold's bid to reopen this mine.

Sincerely
Gerald Thomas
316 Monroe Street
Nevada City, CA 95959

## INDIVIDUAL LETTER 273: GERALD THOMAS

### Response to Comment Ind 273-1

The comment expresses general concerns regarding air quality and climate change. Please see Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. CEQA Guidelines Section 15126.4 (c)(3) specifically mentions "Offsite measures, including offsets that are not otherwise required, to mitigate a project's emissions" as one option for GHG mitigation. As such, the carbon offset mitigation within the DEIR is adequate and meets the requirements set forth by the CEQA Guidelines. Chapter 4 of this Final EIR contains a Mitigation Monitoring and Reporting Plan for all the required mitigation measures. In addition, the project will undergo annual inspections as required by SMARA. The commenter expresses general concerns regarding impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues and Master Response 3 – Operator Responsibility.

RECEIVED
APR 04 2022
NEVADA COUNTY
PLANNING DEPARTMENT

To Matt Kelley, Senior Planner for the Nevada Planning Commission

mattkelley@ co.nevada. ca.us

To: Members of the Nevada County Planning Commission, the Board of Supervisors, and the Nevada County Planning Commission Staff, Matt Kelley, Senior Planner

I am writing to give my support to Wolf Creek Community Alliance's (WCCA) and Community Environmental Activists Foundation's (CEA Foundation) recent comments to you regarding the DEIR for reopening Idaho Maryland Mine.

WCCA's comments on the Biological Resources section 4.4 are detailed and extensive, 36 pages long, and extremely well done. As a biologist with a masters in renewable resources and one of the founding members of this organization I heartily endorse this. So rather than add more I am asking that you carefully read them and take all that is said into account when making you decision.

I am also writing to you to read carefully the CEA Foundation's comments, again extensive and based on research and commitment to our community and its environment. Their goal is, "**CEA Foundation advocates for responsible land use and environmental protection policies and actions in Nevada County. Our goal for Nevada County's future is a thriving community, a strong economy, and a healthy environment.**"

**Ind 274-1**

I have attended the ZOOMs that have been presented by Mine Watch sponsored by CEA Foundation.

I support all that they have presented to you about the DEIR and recommend that you not only carefully read their comments but go to: https://www.cea-nc.org/category/the-idaho-maryland-mine/ for more information.

So rather than add more to the already extensive materials that you have received from these two groups, I am asking to be added on as a supporter of their comments.

Thank you for your time and energy in this extremely long and intense process. Please know and understand the negative impacts to our environment, our health, and economy if the Rise Gold application is approved.

Thank You,

Geri Stout

Re: Proposed mine project at the Idaho-Maryland Mine owned by Rise Grass Valley

Dear People,

I began reading the draft EIR. After an hour or so of plodding through the report I realized the reading and comprehension of the report is not for the layman, of whom I consider myself one. Although I gave up my attempt to absorb as much as I could, I do have strong opinions on subject of the mine. My opinions have been formed through reading articles, 'op-eds' and letters in The Union newspaper; by witnessing the environmental devastation caused by previous mining activity in the county; by my understanding of the track record of the principal owners of Rise Grass Valley; by conversations with my neighbors and by common sense.

**Ind 277-1**

I fear that allowing the mine to go forward would be devastating to:

1. the air and water quality in the county.
2. the people living in proximity of the mine by having their wells impacted by the lowering of the water table, by having the noise and vibration affect their quality of life and by lowering the value of their properties.
3. traffic conditions that will become far worse due to the volume of trucking created by the mining operations

**Ind 277-2**

(It is my understanding that mitigating some of these problems was left ambiguous in the draft EIR).

**Ind 277-3**

I do not believe the mine will produce hundreds of jobs paying approximately $90,000 a year for local workers as advertised in Rise's mailer. I can only imagine a great many out of town workers would need to be be imported into the county, which already has an acute housing shortage.

The question in my mind is not this whether project should go forward or not, but rather why is any serious consideration being given to it at all.

Sincerely,

Glen Garrod

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To Whom It may Concern.
I live on Dogwood Road (off of Greenhorn) in Grass Valley - approximately 1.75 miles from the mine. To get to my house I will have to pass the mine.

I do not this mine in my neighborhood. It will create:
A. Endless noise and mine waste
B. Most likely deplete our wells
C. Create toxic waste
D. Devalue our property. Who will want to buy our houses when we want to sell

**Ind 278-1**

Why are you so interested is destroying this community?
An active mine does not belong in Grass Valley - PERIOD.

Would you like to live within miles of an active mine? I think not.

Thank you

Dist 2

Dear Nevada County Board of Supervisors,
How much of this is proven, and if wells are not impacted, why run the NID water line? Perhaps opening the mine is not a bad idea. Allowing RISE to open the mine is a bad idea.

# THE IDAHO-MARYLAND MINE: A PROUD HISTORY

The Idaho-Maryland Mine was one of the most productive and best-known gold mines in the United States, producing approximately 2.4 million ounces between 1866 and 1955. The mine closed in 1956 as the fixed price of gold at $35 per oz made the mining of American gold unprofitable.

Rise Grass Valley will reinitiate mining and will do so with a focus on green-friendly practices and minimizing the impacts to neighbors. The project will use modern, clean, state-of-the-art mining equipment and proven techniques to produce "green gold." The result is a project that has no significant impacts to water, air quality, and the natural environment or from noise or vibrations during operations.

When in full operation, Rise Grass Valley's Idaho-Maryland Mine project will create hundreds of good-paying jobs and realize broad economic benefits for Nevada County.

I do not trust Rise to send them any reply & have them count it!

**Ind 279-1**

**Please fill out and send back to us your support for the Idaho-Maryland Mine**

## I support re-opening the Idaho-Maryland Mine

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Comments on the Idaho-Maryland Mine Project Draft EIR

Via email to matt.kelley@co.nevada.ca.us Matt Kelley, Senior Planner Nevada County Planning Department 950 Maidu Avenue, Suite 170 Nevada City, CA 95959

To: Matt Kelley, Senior Planner, Nevada County Planning Department

Dear Mr. Kelley,

Thank you for the opportunity to review the Idaho-Maryland Mine Project Draft EIR. My compliments to you and the consultants that prepared and contributed to the document; it is generally a thorough and considered analysis of a complicated and large project. Yet, there are elements of the Draft EIR that are inadequate as written.

**Ind 280-1**

I offer comments primarily in subjects with which I have had direct experience during my career, CEQA process and analysis, and biological resources protection and mitigation. More specifically, my comments are on three topics: 1. Proposed biological resources mitigation measures, 2. Impacts to fish habitat, and 3. The alternatives analysis in the DEIR.

1. **Feasibility shortfalls in proposed biological resources mitigation measures.**
    a. Vague site protection requirements, raising questions of mitigation measure feasibility. There are multiple impacts to biological resources that are significant without mitigation, but which are found to be less-than-significant after proposed mitigation. These include significant impacts to the following biological resources:
        i. Special-status plant species, including the pine hill flannelbush and other species (4.4-1).
        ii. Candidate, sensitive, or special-status wildlife species, including the foothill yellow legged frog, California red-legged frog, California black rail, coast horned lizard, special-status bats, and raptors and migratory birds (4.4-2).
        iii. Riparian, wetlands, and other sensitive natural communities (4.4-3).
        iv. Cumulative loss of habitat for special-status species (4.4-6).

**Ind 280-2**

Most of the mitigation measures needed to reduce biological resources impacts below the level of significant rely on protecting the habitat where the species occur or may occur. For example, Mitigation Measure 4.4-1 (a) reads as follows:

> *Prior to issuance of grading permits, the applicant shall record a Conservation Easement for the on-site Pine Hill flannelbush avoidance area, or use a similar land protection mechanism that runs with the land in perpetuity, to protect the Pine Hill flannelbush plants within the avoidance area. The management guidelines for the Conservation Easement or similar mechanism shallrequire that the habitat be managed for the Pine Hill flannelbush and its associated habitat. The applicant shall also record a Conservation Easement or use a similar land protection mechanism for any off-site areas not owned by the applicant where the transplants are to be located.* Page 4.4-66.

The feasibility of this measure cannot be determined as written. The measure initially calls for a conservation easement, but subsequently includes language that raises doubt: "or use a similar land protection mechanism..." What is this other mechanism? In the past, deed restrictions were sometimes used, but they have been found to be

inadequate in recent times due to lack of oversight and enforcement. Deed restrictions are no longer allowed for wetland mitigation in California due to their poor performance. If a conservation easement is to be used, there is no easement holder identified - this also could be a feasibility issue, since there needs to be an entity that is willing to hold the easement. Finally, it isn't enough to just put and easement on. There needs to be a funding mechanism for long-term monitoring and management. No funding of long-term monitoring and management is presented in the Draft EIR.

Conclusion #1a: With the uncertainties outlined above, the feasibility of the site protection measures is in doubt and the biological resources impacts 4.4-1 and 4.4-2 should be considered unmitigated in the Draft EIR. Note: in support of this conclusion, it would be logical for the reasoning in the Draft EIR's traffic impact section to also apply equally to biological mitigation measures. Impacts to the SR 174/ Brunswick intersection were found to be significant and unavoidable because "*Because the remaining funds for the intersection improvements are unknown, in terms of timing and contributing parties, the successful implementation of the intersection improvements is uncertain.*" Page 4.12-66. As explained above, the successful implementation of biological resources mitigation measures is also uncertain.

b. Undefined mitigation measures for wetlands and waters of the U.S. and the State. The mitigation for jurisdictional wetlands and waters (Mitigation Measure 4.4-3 (c) reads, in part:

**Ind 280-3**

> *To the extent feasible, as determined by the qualified biologist in coordination with the Corps, the project shall be designed to avoid and minimize adverse effects to waters of the U.S. or jurisdictional waters of the State of California within the project area.* Page 4.4-90.

This statement raises fundamental question regarding the status of the project design and the likelihood that impacts can be minimized. Has the project been designed to avoid and minimize adverse effects? The Draft EIR should be able to answer this question, but does not.

A second part of the mitigation measure introduces even more questions. It reads:

**Ind 280-4**

> *Compensatory mitigation can include but is not limited to the following: onsite and/or offsite wetland creation and/or restoration, purchase or placement of conservation easements, payment of an in-lieu fee, and/or purchase of mitigation credits at an approved Corps wetland mitigation or conservation bank.* Page 4.4-90.

This is too vague to assure feasibility. Are applicable mitigation credits readily available? If not, where could onsite and/or offsite wetland creation or restoration feasibly occur given physical constraints, land availability, and technical considerations? Onsite or offsite wetland creation/restoration requires a physically suitable real estate footprint, which is often difficult, especially in the foothills where topography can be a limiting factor. Permittee responsible mitigation has been shown again and again to have poor implementation and success. One of many studies documenting this is the National

Academy of Sciences, National Research Council's (NRC) "Compensating for Wetland Losses Under the Clean Water Act." https://nap.nationalacademies.org/catalog/10134/compensating-for-wetland-losses-under-the-clean-water-act

In the NRC study, and others, a major cause for the failure of mitigation measures is the lack of oversight. This is the context of short duration permits, especially compared to the proposed 80-year mining permit. This 80-year period will transcend the careers of the permittees, the County staff overseeing the permit, and the state and federal professionals that share oversight responsibilities. This will compound the difficulties seen in the context of much shorter duration permits.

Conclusion #1b: With the unanswered questions outlined above, the feasibility of the wetland mitigation measures is not demonstrated and the biological resources impact 4.4-3 should be considered unmitigated in the Draft EIR.

**Ind 280-5**

2. **Lack of analysis of impacts to fish habitat**. The Draft EIR contains an analysis of the potential for the project to interfere with the movement of fish. However, there appears to be no analysis of the potential effects on fish habitat from the alteration of Wolf Creek hydrology. The proposed discharges of water from the mine site will change the timing and duration of flows in Wolf Creek and these changes could have an impact on fish habitat. Changes in water quality and temperature may also affect fish. Perhaps the Draft EIR is relying on the effectiveness of discharge permits to offset impacts, but the document should include a disclosure of these impacts.

   Conclusion #2: The lack of analysis of impacts from hydrology alterations to fish populations in the Draft EIR leaves a fundamental environmental effect unaddressed, one that is reasonably foreseeable based on comparable experiences in other locations.

**Ind 280-6**

3. **Insufficient range of alternatives**. Section 6.3 contains a helpful discussion of the purposes of the alternatives analysis and the need to evaluate a range of reasonable alternatives. The alternatives included in the EIR need to meet *most* of the *basic* objectives of the project and be effective in addressing significant effects. The decision on whether or not to include alternatives should be taken in the overall context of the most fundamental purpose of an EIR – that of a disclosure document. In this context, the Draft EIR does not contain a full range of reasonable alternatives. Specifically, the Draft EIR does not contain an alternative that lessens the magnitude of proposed extraction. There is an alternative – number 4 – that discusses a reduced rate of extraction; but this alternative still envisions full extraction of resources and this assumption increases the operational life of the mine from the proposed 80 years to 130-160 years. The Draft EIR then goes on to note the various impacts that would be exacerbated by the longer operating period, such as risks from the ongoing transportation, underground storage, and use of explosives. The same extended operation assumptions drive the Draft EIR conclusion that effects of dewatering on groundwater would be worsened.

   The Draft EIR needed to include an alternative addressing the scale of the project, not just the rate of extraction. So, for instance, a mine that would extract 500 tons per day (compared to the

proposed project rate of 1,000 tons per day), yet still only operate for 80 years could reduce the significance of the aesthetics impacts. Also, per my comments under item number 1 above, how much would the potential for mitigation measure oversight shortfalls would be reduced compared to Alternative 4. What would a reduced footprint, or a reduced pad height, alternative mean for the various impacts forecast? We don't know the answers to these questions because the Draft EIR does not contain a basic alternative to the scale of the proposed project. The Draft EIR states that reduced extraction would not meet the project alternatives, but does not disclose the financial details that would allow the public to review and verify this assertion.

Conclusion #3: The Draft EIR does not have a reduced scale alternative, an omission that deprives the public from understanding how a smaller sized project would influence the various impacts disclosed throughout the document. Alternative 4 is a reduced rate of extraction project, but the ultimate scale of that alternative is the same as the proposed project. Consequently, the Draft EIR is deficient in not analyzing a reasonable range of alternatives.

In closing, thank you for your professionalism in providing this massive document and the opportunity to review it.

Respectfully,

Greg DeYoung, AICP

545 Jordan Street

Nevada City, California 95959

(530) 559-7770

## INDIVIDUAL LETTER 280: GREG DEYOUNG

### Response to Comment Ind 280-1

Comment noted. This is an introductory comment and does not provide a comment on an environmental issue associated with the project.

### Response to Comment Ind 280-2

The commenter raises concerns regarding the feasibility of biological mitigation measures but does not provide specific detail about why those mitigation measures are infeasible. The mitigation measures require a variety of actions depending on the impact, ranging from additional state or federal agency permitting to preconstruction surveys, and each contains performance standards and timing making them consistent with CEQA.

The commenter specifically questions the feasibility of the conservation easement requirement in Mitigation Measure 4.4-1(a) for the Pine Hill flannelbush. It should be noted, the conservation easement is required prior to the issuance of grading permits; as a result, no impacts to Pine Hill flannelbush can occur until the conservation easement is in place. As noted by the commenter, the conservation easement (or similar mechanism) will require an easement holder, management and operations plan, and will be recorded with the County recorder. Please see Response to Comment Agcy 3-5.

### Response to Comment Ind 280-3

Mitigation Measure 4.4-3(c) is stating that every attempt will be made to avoid impacts to waters of the U.S. and state during project implementation. The mitigation measure continues with additional language requiring agency permitting when those "waters" cannot be avoided. Reasonable estimates of impacts to waters of the U.S. and water of the state were assessed in the DEIR, and standard mitigation to avoid and minimize impacts in coordination with Corps was included. The precise avoidance and minimization actions will be specifically determined after consultation with the Corps, which is engineering level detail. Engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.)

### Response to Comment Ind 280-4

The commenter questions the feasibility of compensatory mitigation. The comment does not include the full text of Mitigation Measure 4.4-3(c) which shows compensatory mitigation, if required, is part of the section 404 permit process for impacts to waters of the United State or jurisdictional waters of the State if they cannot be avoided. The regulatory agencies issuing these permits would include as conditions of those permits monitoring and performance criteria for wetland creation and/or restoration if chosen or required, as well as identification of contingencies that would be implemented in the event such mitigation failed. Note that this mitigation is required to be in place prior to ground disturbing activities, so no impacts would occur until mitigation acceptable to the regulatory agencies is in place. Additionally, compensatory mitigation could be implemented through the purchase of mitigation credits through the in-lieu fee mitigation program, which would not require any monitoring or performance criteria by the applicant, if such credits are purchased per permit requirements. An in-lieu fee compensatory mitigation program is up and running and available for permitted projects in Nevada County. The specific mechanism that is implemented to compensate for impacts to aquatic resources will ultimately be determined in consultation with the regulatory agencies. The list is provided not to imply that one or more of these methods might not be successful, but rather to be transparent about the full range of options available. It is inappropriate to finalize the mechanism of mitigation prior to permit discussions

with the agencies that have authority over the resources being mitigated. The CWA Section 404 permit from the USACE and the CWA Section 401 permit from the RWQCB will require full compensatory mitigation for all impacts to aquatic resources as conditions of the permits for the project.

## Response to Comment Ind 280-5

Please see Master Response 34 – Resident Fish, Master Response 36 - Flows in South Wolf Creek, Master Response 32 – Temperature of Mine Water Discharge, and Master Response 35 – Discharge to South Wolf Creek, regarding the impacts to fish, discharge flow volumes, temperature, and quality, potential for erosion, and species impacts. CEQA guidelines require analysis of impacts to special-status fish, and as no special-status fish have potential to occur within South Fork Wolf Creek or Wolf Creek, no analysis of impacts to fish is appropriate.

## Response to Comment Ind 280-6

DEIR Chapter 6 considered project alternatives. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers. Further, the alternative proposed by the commenter, to reduce throughput to 500 tons per day, but maintain the project life at 80 years, is substantially similar to Alternative 4, which was already addressed in the DEIR. The commenter's proposed alternative would also cause a potential inconsistency with General Plan Policy 17.9 to "Encourage the mining of previously mined land, if such land still contains economically mineable minerals, so the land can be reclaimed for alternative uses." The proposed alternative would leave economically mineable minerals unextracted after the life of the permit and would therefore conflict with this policy. This Alternative would also have fewer employment and economic benefits as compared to the proposed project, which would not satisfy Objective 7. Similar to Alternative 4, this alternative may reduce some traffic impacts due to less traffic volume per day. However, as this alternative could cause a new land use impact due to inconsistency with the General Plan Policy 17.9, and would not meet Objective 7, this alternative is dismissed from further consideration.

**Ind 281-1**

I am adamantly against the proposed mine project. You are all quite aware of the potential problems—water, pollution, noise, etc. Does our county have the resources to monitor all the various impacts? All those trucks constantly rumbling through town alone should be enough reason to deny any permits. Please do not allow the mine to reopen.
Greg Wolfe

**Ind 282-1**

Dear Nevada County Board of Supervisors.
I am writing to inform you that I am against the opening of the Idaho-Maryland mine by rise gold. I own a business and property in Grass Valley in the vicinity of the mine project. I am opposed to the mine as it will have negative effects on the local environment, lifestyle , traffic, watershed, air quality and more. Please do not let this deal go through. If it does it will push me to consider if Grass Valley is the place to continue my business and home of over 18 years.
Sincerely,
Dr. Gregory Weisswasser ND
Owner of Whitewater Naturopathic

## INDIVIDUAL LETTER 283: GUARIONEX DELGADO

### Response to Comment Ind 283-1

The comment does not address the adequacy of the DEIR. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project. Please see Master Response 1 – Non-EIR/Administrative Issues.

**Individual Letter 284**

March 25, 2022
950 Maidu Avenue, Suite 170
PO Box 599002
Nevada City, CA 95959-7902

To the Nevada County Planning Department,

**Ind 284-1**

I am a registered voter in Grass Valley and own my home on Hubbard Road. I will be impacted by the use of the precious water resources in the area and the pollution in the Glenbook Basin created by the additional truck/car traffic. I ask that the BOS and the Planning Commission reject the draft EIR for the following reason:

In section 4.3 the Draft EIR outlines the major sources of pollutants, which include, repeatedly, 'automobile and diesel trucks'. Further in section 4.3.2, there is the discussion of particulate matter including asbestos and crystalline silica.

**Ind 284-2**

The draft EIR indicates that the carbon offsets of the forests around will sequester 2,664 MT CO2e (page 4.3-17) over 80 years. This baseline is preproject. The project overview suggests that logging operations, mine preparation and soil/mine debris will disturb 104 acres of the 176 acre site. These acres will be deforested, the mine debris will cause more particulate pollution and the suggested trucking operations will only contribute to the county's existing struggle to reach a healthier air quality for Western Nevada county. It is notable that there will be up to 100 truck loads of material moved from the Brunswick site to the Centennial site daily. The pollutants and noise from these operation alone will significantly affect traffic noise and congestion along the roads used, changing the rural nature of the area in addition to adding pollutants.

**Ind 284-3**

It appears to me to be a project that uses valuable resources that are in short supply, particularly water, in our community, as well as contribute to the questionable air quality that exists in our valley community.

**Ind 284-4**

In an effort to encourage the BOS AND PLANNING COMMISSION to **REJECT the Idaho-Maryland Mine Draft EIR,** I respectfully submit my concerns. The quality of life in my neighborhood will be adversely affected and, I believe, these adverse effects will be felt throughout the county.

Gwen Moore

Gwen Moore
320 Hubbard Road
Grass Valley, CA 95945

RECEIVED
MAR 30 2022
NEVADA COUNTY
PLANNING DEPARTMENT

## INDIVIDUAL LETTER 284: GWEN MOORE

### Response to Comment Ind 284-1

The commenter states that the project will impact water resources and pollute the Glenbrook Basin with additional traffic. The commenter also states that the project will result in negative air quality impacts, specifically asbestos and crystalline silica. The commenter does not state how the DEIR is inadequate with regard to the stated impacts. Air quality impacts, including asbestos and crystalline silica, are examined in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy). Impacts to water resources are analyzed in Chapter 4.8 (Hydrology and Water Quality). The commenter is also referred to Master Response 21 – Conservatism of Silica Assumptions, Master Response 22 – Conservatism of Asbestos Assumptions, Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 284-2

The commenter summarizes a portion of Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) which estimates the carbon sequestration loss from deforestation of the 24 acres at both project sites. (DEIR, p. 4.3-17.) The commenter also states the project's trucking component will further degrade the County's air quality. However, the commenter does not identify any inadequacies of the DEIR. Carbon sequestration losses from the removal of forest areas by the project are included in the greenhouse gas emissions of the project. Air emissions from trucking is included in the analysis of air quality in Chapter 4.3.

### Response to Comment Ind 284-3

The commenter states that the transport of engineered fill to the Centennial Industrial Site will result in pollutants, noise, and congestion. The commenter does not provide any additional information. Air pollution from trucking in analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR; noise from trucks is analyzed in Chapter 4.10 (Noise and Vibration) of the DEIR; and traffic impacts from trucks are analyzed in Chapter 4.12 (Transportation) of the DEIR.

### Response to Comment Ind 284-4

The commenter states that the County should reject the project. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

April 2, 2022

*Civil engineers like to say, "What can't be measured can't be managed", while Alexander von Humboldt observed that, "What speaks to the soul, escapes our measurements."*

Dear Nevada County Board of Supervisors,

To quote the introduction to the EIR, "The proposed project would reinitiate underground mining and gold mineralization processing for the Idaho-Maryland Mine over an 80-year permit period with gold mineralization processing and underground exploration and mining proposed to operate 24 hours a day, 7 days a week during full operations". Calm down a moment and try to visual what this will look like 1, 5, 20, 40 and 80 years out. What provisions are there to continually monitor "Necessary Impacts" that include a degradation of the environment on the physical and mental health level? What other permitee has been granted an 80-year window to do business (the profits of which will most assuredly leave this region).

**Ind 285-1**

I've lived in Nevada County for over 50 years, it's my home. People will frequently remark, "You must have seen a lot of change", which is true, but nothing compared to impacts associated with the Rise Gold proposal. As a former Tahoe National Forest archaeologist, I frequently worked with mining claimants and I never saw a mining operation that didn't produce more resource damage than that predicted by the "Plan of Operation." Almost any "necessary change" caused by "unforeseen conditions" was more calamitous than could have been predicted.

Mining creates an impact that gains its own momentum, self-importance and dare I say, arrogance. Rise Gold's proposal represents colonization by heavy industry. This proposal will create enormous and irreversible change in Grass Valley and Nevada City. Gold mining is gambling, despite the cascade of science in this EIR. I don't envy the task of our five County Supervisors (is that sufficient representation?) who must

1

interpret this ill-advised proposal and determine if industrial scale gold mining, admittedly part of our past, will dominate our future.

• • •

Here are a few specific issues that loom large for me:

**Ind 285-2**

• TOXIC SUBSTANCES: "Extensive site investigation, overseen by DTSC, has identified mill tailings, waste rock and affected soil at the site that contain lead, arsenic, mercury and other metals at concentrations exceeding background soil metals concentrations and regulatory benchmark concentrations. Elevated soil metals concentrations present a potential human health risk resulting from routine, long-term exposures, as well as ecological concerns in terms of impacts to plant and animal species. (*Chapter 1 – Introduction Page 1-4*)."

Comment: After all the good work done by The Sierra Fund and the South Yuba Citizens League to call attention to toxic substances and remediation in the Bear and Yuba Rivers you can't really tolerate this. Too many people are now aware of the true costs of industrial level gold mining.

**Ind 285-3**

• BIOLOGICAL AESTHETICS, AGRICULTURAL and FORESTRY RESOURCES: "… for the purposes of the analysis of biological resources [& Aesthetics & Agricultural and Forestry Resources], the environmental baseline for the Centennial Industrial Site has been adjusted to reflect the *reasonably anticipated* conditions of the site following the remediation activities (*CEQA Guidelines Section 15125(a)). Chapter 1 – Introduction Page 1-6*)."

Comment: The proposed remediation appears to be more concrete to make nature behave?

**Ind 285-4**

• NOISE, a very big concern that will affect:
Quality of sleep, disturb wildlife and pets, mental health, residences and assisted living facilities located above the mining excavations, it will also negatively affect people subject to seizures, pregnant women, degrade the experience for Empire Mine State Park visitors and agitate students and teachers in nearby schools.

**Ind 285-5**

• INCREASED LIGHTING
"In addition, while lighting at the Brunswick Industrial Site has been designed to minimize light spill over onto adjacent properties, as discussed in the Aesthetics chapter of this EIR, new light structures are proposed throughout the Brunswick Industrial Site at strategic locations for pedestrian safety along internal walkways and around equipment areas, and to enhance the security of the property. Outdoor lights would be provided at project entry points, within the surface parking lot, and around the Brunswick Shaft and Process Plant and proximate buildings." (*Chapter 4.11 – Public Services and Utilities Page 4.11-27*).

2

Comment: Advances in lighting technology will surely advance in the next 80 years so this issue will need to be periodically reevaluated. I'm certain that lighting associated with the proposed project will be visible in Nevada City, a town based on tourism, requiring a particular lighting design

**Ind 285-6**

• SIGNIFICANT AND UNAVOIDABLE IMPACTS: "Significant and unavoidable cumulative impacts are impacts on the environment that result from *the incremental impacts* of a proposed project when added to other past, current, and future projects and cannot be alleviated to a less than cumulatively considerable level. Such impacts can result from individually minor but collectively significant actions that occur over time." (*Chapter 4.0 – Introduction to the Analysis Page 4.0-3*).
Comment: This is a significant issue that requires frequent monitoring for the duration of the proposed task, which RISE GOLD claims will take 80 years to complete.

**Ind 285-7**

"Nonetheless, cumulative buildout in the geographic area would result in a change in the visual character of the region, which would be considered a significant cumulative impact. As discussed under Impact 4.1-2 above, the proposed project would substantially degrade the character of the Centennial and Brunswick Industrial Sites, though they are zoned for industrial development and there are surrounding industrial land uses in the vicinity of the project sites. Therefore, the project's incremental contribution to the significant cumulative impact would be cumulatively considerable and significant and unavoidable." (*Chapter 4.1 – Aesthetics Page 4.1-30*)
"Based on the above, the proposed project's incremental contribution to this potentially significant cumulative impact would be ***less than cumulatively considerable.***"
"Mitigation Measure(s) None required." (Chapter 4.1 – Aesthetics Page 4.1-32).
Comment: I fail to see how this conclusion is reached?

Do your Best,

Hank Meals

3

## INDIVIDUAL LETTER 285: HANK MEALS

### Response to Comment Ind 285-1

The comment does not specifically address the adequacy of the DEIR. Nonetheless, the commenter's concerns have been noted for the record and forwarded to the decision makers for their consideration. Please see Master Response 1 – Non-EIR/Administrative Issues.

### Response to Comment Ind 285-2

As discussed further on pages 1-5 and 1-6 of the DEIR, separate CEQA review of a Remedial Action Plan (RAP) is being conducted with DTSC as the CEQA lead agency. DTSC released the CEQA document (Initial Study/Mitigated Negative Declaration [MND]) for the "Centennial M1 Property Clean-Up Project Remedial Action Plan" project, SCH# 2021070473) for public review on July 26, 2021. The IS/MND identifies mitigation measures with which Rise, as the property owner responsible for implementing the Centennial M1 Property Clean-Up Project Remedial Action Plan (Centennial Clean-Up Project) would need to comply, prior to and during remedial activities associated with the RAP, that would ensure that physical impacts to the environment are mitigated to a less-than-significant level. Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA. The comment does address the adequacy of the DEIR. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 285-3

Please see Master Response 4.

### Response to Comment Ind 285-4

Please refer to Chapter 4.10, Noise and Vibration, regarding impacts related to noise. The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 285-5

Impacts related to light and glare were addressed in Impact 4.1-3 within Chapter 4.1, Aesthetics, of the DEIR. As discussed therein, light spillover is not projected to occur off-site. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency, such as lighting requirements, in deciding whether to approve the project.

### Response to Comment Ind 285-6

The comment is a general comment about significant and unavoidable impacts, stating they should be monitored over time. Chapter 4 of this Final EIR contains a Mitigation Monitoring and Reporting Program for all required mitigation measures and the site will be inspected annually as required by SMARA. The comment does not specifically address the adequacy of the DEIR. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

## Response to Comment Ind 285-7

Long-term changes in visual character associated with the proposed project in combination with cumulative development and the creation of new sources of light or glare associated with the proposed project in combination with cumulative development are discussed under two separate impact statements, as shown in Chapter 4.1, Aesthetics, of the DEIR. As the commenter noted, Impact 4.1-4 related to long term changes in visual character was determined to be cumulatively considerable and significant and unavoidable (DEIR p. 4.1-30); however, Impact 4.1-5 related to the creation of new sources of light or glare was determined to be less than cumulatively considerable (DEIR p. 4.1-32).

**Individual Letter 286**

**From:** Harry Woodum
**To:** bdofsupervisors
**Subject:** Idaho-Maryland Mine

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To the Board of Supervisors:

Hello,

I hope everyone has managed to stay well during the last couple of years. We have faced many big challenges in the last few years, the pandemic, climate change and drought ramping up wildfire season and all that that brings, to name just a few.

I have been a Nevada County resident for 30 years.

As residents of this community, we are now facing another big challenge that some might even call a crisis. I am referring to the proposal to re-open the Idaho-Maryland mine.

This looms so large; I don't even know where to begin but I will try to be brief. I know there is much to consider and I'm sure, I hope, you have heard from a lot of residents. To me, it's a real no-brainer that it even requires any consideration.

**Ind 286-1** I have received brochures in the mail from Rise stating just how little impact the mine would have on the area and it could not be anymore obvious that it is a sales job and a bad one at that, driven by the desire for money. It's a sales job by a company whose members live thousands of miles away and have no connection to or concern about this community. The desire to make money trumps all sense of integrity, morals, and responsibility to the people who live here.

There are many arguments against the mine and I can't think of any arguments in favor of it that justify the long-term permanent damage and destruction to a place people call home. I'm sure by now you have been informed about the impact of the process in much greater detail than I could ever provide.

This is not an industrial area and this proposal is counter to what makes this area such an appealing and attractive place to live. The arguments against are obvious, like excessive water usage that cannot be replenished, air pollution not only from the mining process itself, but from the constant truck traffic needed for transport, and the 24-hour noise levels that will drastically change

the environment for residents.

Speaking of wildfires, drought and water depletion, I think water usage alone is enough reason to say NO. I read a report that stated this process would use 700 million gallons of water in six months and we know that it will be pulling from the aquifer or will directly affect it. That is 700 million gallons that will in all likelihood, never be replaced when taking into consideration the long-term projections of climatologists regarding drought and declining snowpack. That is 700 million gallons that our ever-growing population needs for everyday living. That is 700 million gallons that we desperately need during fire season which is becoming longer and longer. That said, I don't know how reopening the mine could even be a remote possibility.

**Ind 286-2**

**Ind 286-3** And how much would truck traffic impede fire evacuation?

The member-owners of Rise are too disconnected from this community to even have a voice. Would they want to live in the middle of an industrial area? Do they currently live in the middle of an industrial area? Perhaps that should be a pre-requisite before this could ever happen. Maybe they should be required to become permanent residents/homeowners who actually live here directly in the path of all the traffic and noise. I wonder how they could justify such a project then.

**Ind 286-4** To sum up and reiterate, I believe it is imperative that we put environment above profit, profit that will most benefit Rise member-owner/investors who live far away and who will be unaffected by the destruction of what the community here calls home. The investors stand to gain a lot, while we stand to lose more than can ever be recovered and, in the end, will experience destruction that far outweighs any ultimate financial gain. No amount of money or addition of jobs can compensate for the air, ground, water and noise pollution, disruption to community, devaluation of residential property, and overall environmental destruction that will affect this area for generations.

As residents here, I implore you to take the long view into account when making your decision.

Thank you and best regards,

Harry Woodum

## INDIVIDUAL LETTER 286: HARRY WOODUM

### Response to Comment Ind 286-1

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 286-2

Please refer to Chapter 4.8, Hydrology and Water Quality, as well as Chapter 4.11, Public Services and Utilities, of the DEIR for more information related to impacts regarding water usage. Please also refer to Master Response 13 through 16 regarding groundwater. The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 286-3

Please see Master Response 5 – Evacuation Zones.

### Response to Comment Ind 286-4

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 287**

**From:** Wyeth, Harry
**To:** Idaho MMEIR
**Subject:** RISE GOLD Draft Eir Comment
**Date:** Wednesday, March 16, 2022 7:43:13 AM

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Ladies/Gentlemen:

Please accept the following individual comment on the portion of the draft EIR on this proposed project identified on page 253 in section 4.1-5, dealing with "new sources of light or glare".

**Ind 287-1**

The conclusion reached in the DEIR is that "the project's contribution to the significant cumulative impact [of light pollution] would be "**cumulatively considerable and significant and unavoidable**" [emphasis original] (section 4.4.4). Yet, the following section reasons that the cumulative lighting impact would be "**less than…considerable**" (page 253).

The inconsistencies are obvious, and the overall reasoning of the total effect of lighting from the mining site is poor. The mine site has almost no lighting at present, and the general area is dark-sky friendly, quiet, and serene. Not only would construction and operation of the mine dramatically change this, the presence of nighttime lighting, not matter how shielded, would cause a serious increase in lighting and a huge and serious detrimental effect on aesthetics.

The DEIR is deficient in these matters.

HARRY B. WYETH
14393 Osborne Hill Rd.
Grass Valley, CA 95945
530-798-6566

## INDIVIDUAL LETTER 287: HARRY WYETH

### Response to Comment Ind 287-1

The commenter is comparing conclusions to two different impacts. Impact 4.1-4 related to long term changes in visual character was determined to be cumulatively considerable and significant and unavoidable (DEIR p. 4.1-30); however, Impact 4.1-5 related to the creation of new sources of light or glare was determined to be less than cumulatively considerable (DEIR p. 4.1-32).

**Individual Letter 288**

**From:** Heidi Belforte Breuer <heidipi85@yahoo.com>
**Sent:** Thursday, March 24, 2022 9:43 AM
**To:** Idaho MMEIR
**Subject:** Opposition to Idaho Maryland mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hello,

**Ind 288-1** As a Grass Valley resident and voter, Im writing to voice my significant concerns regarding the proposed Idaho Maryland mine. I am a constituent in Heidi Halls jurisdiction. I am gravely worried about findings in the mine's environmental impact report. The impacts to air via pollution, noise due to mining activities (trucks, explosions etc), and truly unknown

**Ind 288-2** impacts to water supply are all unacceptable. These impacts will be extremely difficult to mitigate. As we enter into another draught year with unknown outcomes, we cannot predict with scientific means the long term effects over 80 years and I thus distrust the thoroughness of this EIR.

I hold a bachelors degree in zoology from UC Davis and have studied animal habitat management. The EIR did not study impact to birds, animals and other creatures beyond the site. Im convinced that there will be impacts beyond the mine grounds to our natural environment in surrounding areas.

**Ind 288-3** Please do not allow this abomination. Grass Valley is not the right place for this potential rape of our land.

Kind regards,

Heidi Belforte Breuer
18354 Raccoon Trail
Grass Valley

## INDIVIDUAL LETTER 288: HEIDI BREUER

### Response to Comment Ind 288-1

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 288-2

Impact to birds, animals, and other creatures is addressed in Chapter 4.4, Biological Resources, of the DEIR. Please see Master Response 30 – Biological Study Technical Adequacy and Master Response 37 – Birds and Raptors. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

Matt Kelley, Senior Planner
950 Maidu Ave, Suite 170
Nevada City, CA 95959

**Ind 289-1**

I am concerned about the increase in traffic, asbestos release, and noise/vibrations if the Idaho Maryland mine were reopened. . I live near the proposed mine, just above Union Hill School and next to Empire Mine State Park. I have lived in my home for over 40 years. I am able to currently hear noise from the mine area and intersection at Brunswick as well as along highway 174.

I find the DEIR is inadequate in how it collected data and proposed mitigations in the areas of increased traffic, the release of asbestos from rock, and the noise the mining operation will generate.

**Ind 289-2**

The DEIR in the Wildfire chapter identifies the following expected traffic each day for haul trucks and transports for waste rock (see below). *This list does not include the cars of employees coming and going, other service vehicles making deliveries, picking up items or performing inspections and audits.*

Chapter 4.13 – Wildfire Page 4.13-16 & 17 (pdf pages 382-385)

- the average transport of engineered fill will be 1,000 tons per day
- Truck payloads will be approximately 20 tons per truck and therefore will require up to a maximum of 100 round trips per day and an average of 50 round trips per day, over a 16-hour period (6:00 AM to 10:00 PM). (*NOTE: Is it 100 one-way trips that when driven out and back become 50 round trips?*)
- Up to 18 additional truck trips could occur per day for various operations (gold concentrate shipping, materials deliveries, etc.)
- approximately five years, trucks would transport barren rock from the Brunswick Industrial Site to the Centennial Industrial Site or Brunswick Industrial Site engineered fill areas. 7 days a week/16 hours per day
- After full placement of fill at the Centennial and Brunswick Industrial Sites to the pad design elevations, the need for hauling of engineered fill would continue due to ongoing mining over the use permit term of 80 years, and thus, hauling would shift entirely to local and regional markets, with the maximum truck trips per day remaining at 100, with a daily average of 50
- Off-site haul of gold concentrate will average one truck trip per a day using Brunswick Road to SR 20/49.
- Hauling of fuel and other freight, including explosives, would occur using Brunswick Road to SR 20/49.
- Over the life of the project, up to 118 haul truck round trips would occur on Brunswick Road during the hours from 6:00 AM to 10:00 PM, seven days a week.

That is a tremendous amount of traffic to add to a secondary arterial. Its also a tremendous amount to go through mostly residential neighborhoods. That much constant large truck traffic

and the noise they generate and additional personal vehicles has a negative impact on the traffic flow and visual aesthetics along Bennett and Brunswick.

**Ind 289-3**

When Rise investigators looked at Nevada County intersections that Rise considers in planning its routes, the LOS rating was D or better and was a C in rural regions. (pdf page 877) But when the additional traffic is added from mining operations, the LOS will decrease.

**Ind 289-4**

The plan to safeguard against asbestos airborne release in the removal, transport, and dumping of waste rock is not adequate. The plan by Rise assumes that the asbestos content will continue to be less than 0.01% (3-20). That assumption may not hold true for the actual rock removed. Testing for the actual content percentage may take significant time and there is nothing in the plan that says Rise will stop the operation until that data is determined and then have workers return to work. If these tailings were dumped at Centennial or on the Brunswick site it is unclear how the asbestos will be abated. Spraying with water for dust control will only work as long as the dust stays wet and wind isn't an issue. The plan described in the DEIR lacks descriptions of testing and controlling for the significant health hazard, asbestos.

**Ind 289-5**

In addition to greatly increased traffic, the noise of blasting, crushing and processing the rock will be increased as well. Now the noise from the Brunswick /Bennett-Greenhorn area can be heard from my home above the mine and next to Empire State Park near Union Hill. Friends on Banner Mountain can hear noise where he lives. The sensors were placed near the borders of the mine sites but the sound tends to carry much further and often is deflected up the hills. Secondly, as people have made a great effort to remove ladder fuel and thin trees, noise from traffic and the airport is much more noticeable. The data used is from the summer of 2018 and December 2018. New surveys should be conducted to determine the new ambient noise levels in the existing sensor areas and more that move up in elevation. Then recalculated to include nearly 8 diesel trucks an hour and the noise of heavy equipment, crushers, blasting and generators. The current data is inadequate for the area today.

**Ind 289-6**

Another concern is the 6 am to 10 pm window for excessive noise and/or vibrations from the mine transporting waste fill, blasting and processing. It seems that residents should be able to have reasonable quiet for the evenings in their homes and outside in their yards.

Respectfully,

Helen Carl Martini

## INDIVIDUAL LETTER 289: HELEN AND GERALD MARTINI

### Response to Comment Ind 289-1

The commenter states that the DEIR is inadequate in the areas of traffic, asbestos and noise but provides no specific reasons for inadequacy. The commenter is referred to Chapters 4.12 (Transportation), 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy), and 4.10 (Noise and Vibration) of the DEIR. The commenter's opposition to the project is noted for the decisionmakers. Please see Master Response 1 – Non-EIR/Administrative Issues.

### Response to Comment Ind 289-2

The commenter states that the DEIR fails to analyze traffic impact from employees commuting to the project site. Traffic impacts, including employee and service vehicles, are extensively analyzed in Chapter 4.12 (Transportation) of the DEIR. The commenter is referred to Table 4.12-8 and Table 4.12-9. The commenter is also concerned about traffic noise generated from the project. Noise from traffic is analyzed in Chapter 4.10 (Noise and Vibration) in the DEIR. The aesthetic effect of trucks traveling along the surrounding roadways is a temporary condition and does not result in a permanent change in the overall aesthetics of the surrounding area. Project traffic on Brunswick Road would be from trucking (6:00AM to 10:00PM) and employees during shift change. Over the life of the project, up to 118 haul truck round trips would occur on Brunswick Road during the hours from 6:00 AM to 10:00 PM, seven days a week. On an hourly basis, this equates to approximately 7.4 haul truck round trips per hour on Brunswick Road.

### Response to Comment Ind 289-3

The commenter states that the DEIR indicates Level of Service (LOS) will decrease with the addition of project traffic. The LOS for each individual intersection studied in the DEIR varies and is not consistently LOS D or C, as stated by the commenter. The addition of traffic from mining operations does not lower the LOS of most intersections analyzed. The commenter is referred to Chapter 4.12 (Transportation) of the DEIR.

### Response to Comment Ind 289-4

The commenter states that the DEIR's analysis of asbestos impacts is inadequate. Detailed descriptions, analysis, management plans, and mitigation measures for the management of asbestos are provided in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR. Prior to underground gold mining, intensive planning efforts will be conducted as required under the ASUR plan and as required to meet state and federal regulations and achieve safety, environmental, and economic goals. Please see Section 6.0 of the ASUR Plan (Appendix E.2 of the EIR). Underground mine planning, as required in the ASUR plan, includes exploratory drilling, geologic mapping, material logging, and testing. These same processes also ensure future mining operations avoid and manage rock types that may contain naturally occurring asbestos to ensure that applicable thresholds are not exceeded. (Id.) In other words, the mandatory mine planning that is required by the DEIR in the ASUR Plan will provide information to the mine operator on asbestos content of rock prior to mining that area. That information can then be used to avoid areas, if any exist, with asbestos content that would make it infeasible to comply with the 0.01% asbestos content limit required by the ASUR Plan.

The commenter is also referred to Master Response 22 – Conservatism of Asbestos Assumptions, and Master Response 23 – Adequacy of sampling – Asbestos.

## Response to Comment Ind 289-5

The commenter is concerned about noise impacts from the blasting, crushing, and processing of the underground mining operation. The commenter also states that the DEIR's noise data is outdated and new surveys should be conducted. Regarding the noise impacts, no crushing of rock is proposed on the surface. The remaining noise impacts related to the operation at the Brunswick site were analyzed in Chapter 4.10 (Noise and Vibration) and impacts were found to be less than significant. The commenter is also referred to Response to Comment Ind 617-4.

## Response to Comment Ind 289-5

The commenter is concerned about noise impacts of the project but does not state how the DEIR is inadequate. Noise impacts, except for the construction of the water pipeline, have been determined to be less than significant after mitigation. The commenter is referred to Chapter 4.10 (Noise and Vibration) of the DEIR.

**Individual Letter 290**

**From:** Holly Ahrens <hollywoodnot@gmail.com>
**Sent:** Wednesday, March 23, 2022 8:44 AM
**To:** Idaho MMEIR
**Subject:** Mine

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr. Kelly:

My name is Holly Ahrens and my husband and I have been residents here in Nevada County for 17 years. The great outdoors and the natural habit drew us to this fabulous area.

I fear this habitat is now in jeopardy with the proposed mine and I am very much against it due to its effect upon it. I am concerned about its impact on our air quality and our water quality. It very likely will drain our ground water sources which may affect our wells that are already being threatened by droughts. I am also troubled by the thought of the diesel fumes and constant noise the equipment will put out. This mine will definitely affect our quality of life in many ways in Nevada County.

**Ind 290-1**

As I understand this proposal, there is no independent monitoring of any of these issues and I would like this inadequacy to be addressed. I would also appreciate a response to my concerns as they are the same as just about everyone I know around this area. We already have so many reasons to flee California with the drought, fire and tax issues, and we don't need another reason to leave.

Sincerely

Holly Ahrens

1

## INDIVIDUAL LETTER 290: HOLLY AHRENS

### Response to Comment Ind 290-1

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment also notes that there is no independent monitoring of these issues, but does not make clear to what issues are being referred. All of the technical reports used to support the preparation of the DEIR were independently peer reviewed by technical experts hired through the County. In addition, on-going inspections of the site will occur annually as required by SMARA. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 291-1

Please see Response to Comment Ind 290-1.

**Individual Letter 292**

**From:** Hunter Jones <hunterdjones1@gmail.com>
**Sent:** Monday, April 4, 2022 3:55 PM
**To:** Idaho MMEIR
**Subject:** DEIR - letter of opposition to proposed mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr. Kelley,

This letter is to add my own opposition to the proposed Idaho Maryland Mine.

**Ind 292-1**

I grew up in Nevada County and have benefitted from it in nearly every way imaginable, through its environment, culture, and the prosperous business community, which has allowed for me to build a life here.

Many have brought up the many flaws in the DEIR, from flawed data and projections, to glaring omissions, and tremendous flaws portrayed as minor hurdles.

All of these are important and valid, but I would like to suggest that there are some broader issues at play here. To cite a cliche, Rise Gold has no stake in Nevada County. Their stake is in Nevada County's resources, which they will exploit at our expense, and then they will leave.

Unfortunately, if we cannot look to Hirchman's Pond, Malakoff Diggins, or other toxic, mercury-laden sites and see them for what they are, and learn from their history, we are doomed to repeat it. Our environment, locally and globally, is tenuous. To suggest that mining is part of our legacy is as enlightened as suggesting that slavery is a fundamental american value. It is a part of our history. We have to reckon with the damages of the past, and fight to not repeat those mistakes.

**Ind 292-2**

Likewise, our community cannot withstand an additional influx of traffic and commotion. The few jobs that will be created will mostly not be given to locals. Those that are given to locals will be fewer. They will tell you anything you need to hear, and when they fail to deliver, they will apologise and move on. A corporation cannot be held to account. They only exist to make money, and they will do everything in their power to succeed.

Furthermore, much has been said about tax benefits and tangential or serendipitous consequences to local business as a result of the few jobs that will be created. All of this implies that our county is desperate for funds. This is simply not the case.

**Ind 292-3**

We are not desperate. We don't need to bet everything on remote potentialities. Allowing Rise Gold, a company with no accolades, not history beyond bankruptcy, and no stake in our region to come in and exploit this area is cowardly and blatantly ignorant, given the history we all know.

Please do not force our county to endure another mining project when we don't need it, don't stand to benefit from it, and when we are still recovering from the last iteration of this practice.

Thank you very much for taking the time to read and consider my letter of opposition to the proposed mine.

1

Sincerely,
Hunter Jones

matt.kelley@co.nevada.ca.us

**To All Concerned:**

**Comments on Heavy Metals toxicity and Centennial Site**
Inge Ivens, Ph.D., retired member of the American Board of Toxicology

I have provided 2 comments below specific to inadequacies in the draft environmental impact report. I am expressing my own opinion and use my expertise as a trained biologist and toxicologist. I am a resident of Nevada City as of 2019 (10863 Willow Valley Road)

**Ind 293-1**

I have a masters degree in Zoology and Plant Physiology and a Ph.D. in Neurobiology. In addition I have many years of training and experience in various areas of Toxicology, which include evaluating the impact of mercury compounds on human health.

Thank you for the opportunity to comment on the draft environmental impact report for the Idaho-Maryland Mine Project (SCH# 2020070378).

Generally, I am of the opinion that the Rise Gold mining proposal will destroy the recognition of Grass Valley and Nevada City as tourist designations. Even "modern" gold mining is not a clean industry compared to tourism. Both cities and the surrounding Sierra Foothills are still addressing the environmental impact of old mining operations from more than 100 years ago and creeks and streams are contaminated with heavy metals.

I hope that the Planning Commission has our future jot the past in mind and will not get blinded by shiny gold and brochures.

**Comment 1**
**Issue identified**

**Ind 293-2**

The long-term impact of accumulation and release of Arsenic from the mine operations is of concern since Arsenic compounds are human carcinogens and aquatic toxins. The draft environmental impact report (DEIR) does not take the long-term impact of released Arsenic and other toxic metals into account.

The number of current samples and the data on Arsenic levels in current mine water, as well as levels of Arsenic in existing rock and tailings at the Brunswick site are insufficient. For example page 590 and Figure 4.7-1 of the DEIR discusses elevated levels of Arsenic at one part of the Brunswick site. The report says *"the material beneath this southeastern paved area was likely imported to the site and did not originate from mining operations at the Brunswick Mine Shaft"*. This is speculation and more areas of the site need to be assessed for toxic metals including Arsenic compounds.

As known from local history, high Arsenic concentrations are associated with nearby mining sites.

**Action needed**

- Figure 4.7-1 of the DEIR indicates that less than half of the Brunswick site was sampled for toxic metals. Comprehensive data on Arsenic levels and levels of other toxic metals for example Mercury (Hg) in soil and rock of the entire Brunswick site are needed to conduct a risk assessment.
- There needs to be concurrent measurements in place to evaluate As and other potential contaminants in mine tailings and the industrial fill proposed to be deposited at the Brunswick and Centennial sites.
- As and other contaminant levels should be determined in rock/engineered fill before it is used as building material.

**Ind 293-3**

**Background**

Arsenic is commonly a contaminant of concern in lode Au mine waste, including waste rock and mill tailings.

Arsenic compounds are carcinogenic and also have other toxicities. The **International Agency for Research on Cancer (IARC), the US National Toxicology Program (NTP) and the US Environmental Protection Agency (EPA)** list Arsenic as human carcinogen. For more detailed information, see the IARC monograph Arsenic and Arsenic Compounds. The EPA classifies inorganic arsenic as a "human carcinogen," based on evidence in human studies of links to lung, bladder, kidney, skin, and liver cancers.

The Arsenic concentrations in arsenian pyrite in waste-rock samples from Empire State Mine Historic Park ranged from <0.04 to 5.1 wt%, with a median value of 0.51 wt% based on more than 500 EMPA observations (Reference 1).

At the Lava Cap Mine in. Grass Valley (current superfund site) mine waste, ore, and contaminated sediments had average As concentrations in the range of 500 – 1500 mg kg−1 (= 0.5 – 1.5 wt%) (Reference 2).

2

The EPA limits the maximum level of arsenic allowed in US drinking water to 10 micrograms per liter (µg/L), or 10 parts per billion (ppb). Further the EPA has set limits on the amount of arsenic that industrial sources can release into the environment.

**Relevant References to Draft Environmental Impact Report (DEIR)**

- Page 34, 4th bullet (Centennial site): " Extensive site investigation, overseen by DTSC, has identified mill tailings, waste rock and affected soil at the site that contain lead, arsenic, mercury and other metals at concentrations exceeding background soil metals concentrations and regulatory benchmark concentrations. Elevated soil metals concentrations present a potential human health risk resulting from routine, long-term exposures, as well as ecological concerns in terms of impacts to plant and animal species."
- Table 2-1 (points 4.7-2; 4.8-1)
- Pages 534, 586, 588, 590

**Ind 293-4**

**Comment 2**
**Issue identified**
The DEIR misses to address the hazardous conditions of the Centennial site and respective actions and their cleanup. Hazardous levels of As (see above), lead, nickel, cyanide (free), nickel and mercury are present in the soil of the Centennial site. There is currently no proposed plan nor money for the cleanup of this site that shows how this can be done safely (*Note: post-project Superfund cleanup of nearby Lava Cap has cost more than one million dollars per year so far for the past decade. Centennial cleanup would likely be similar in expense (cost estimates come directly from EPA)*).

**Action needed**
The DEIR needs to address the cleanup of the Centennial site before being used by Rise Gold.

**Background**
The Centennial site ranked 1st as the top priority abandoned mine sites by the EPA, because of the proximity to Grass Valley and also because of the known contamination and physical hazards that are on site.

Its Superfund designation has been conditionally deferred for the time being because Rise Gold signed a contract with the California Department of toxic substance controls to clean up the site. This has to happen before any gold mining operation can start (*Reference 3*). More recent reports from the DTSC determined that lead, arsenic, nickel, cyanide (free), nickel and mercury are present at hazardous levels. Contaminated tailings cover roughly 2/3 of the 56.4 acres with depths ranging from 2 to 20 feet at the Centennial site.

## INDIVIDUAL LETTER 293: INGE IVENS

### Response to Comment Ind 293-1

This is an introductory comment, expressing general concerns. Please see Master Response 1 – Non-EIR/Administrative Issues. The commenter's specific comments are addressed in Responses to Comments Ind 293-2 through Ind 293-4.

### Response to Comment Ind 293-2

The commenter states the DEIR does not take the long-term impact of released arsenic and other toxic metals into account. Metal content in dust generated by all activities of the project were evaluated in the Health Risk Assessment. Please see Chapter 4.3 and Appendix E.1 of the DEIR. Please see also Master Response 20 – Conservatism used for Metals in Dust.

The commenter states that the number of current samples and data on arsenic levels in current mine water is insufficient. Water samples have been taken in the Brunswick shaft and from the mine drains along Idaho-Maryland Road. The water treatment plant is designed to treat arsenic, if necessary, and an NOA is required for the mine water discharge to ensure that the discharged water meets applicable water quality standards. Please see Master Response 35 – Discharge to South Fork Wolf Creek.

The commenter states that the number of samples for arsenic in existing rock and tailings at the Brunswick site is insufficient and that half of the Brunswick site was not sampled for toxic metals. The commenter believes that the source of the area of elevated arsenic on the Brunswick site, as stated by NV5, is speculative. Figure 4.7-1 of the DEIR shows sampling locations conducted by NV5 inside the estimated boundary of historic waste rock fill as delineated on the figure. Areas outside of the sampled area of the Brunswick site either would not be disturbed by the project or are not potentially contaminated with historic mine waste rock. Therefore, the sampling of these areas of the Brunswick site is not necessary. As discussed on page 15 of the Phase I-II ESA, the mine waste rock reportedly originated primarily from the New Brunswick Mine portion of the Idaho-Maryland Mine, which is known to have low arsenic concentrations, and also from the Empire Mine, which is known to contain elevated arsenic concentrations (see page 15 of Appendix J of the DEIR). As discussed on page 38 of the ESA, the mixed soil and rock fill beneath the southeastern paved area contain total and soluble arsenic concentrations that exceed regulatory benchmarks. Based on the higher arsenic concentrations and anomalous acid Based Accounting (ABA) results for this material, the geotextile fabric incorporated into the fill, and historical aerial photographs that suggest the grading was performed after mining operations were suspended, the material was likely imported to the site and did not originate from mining operations at the New Brunswick Shaft. As such, the DEIR's conclusion is based on evidence, not on mere speculation.

The commenter states that high concentrations of arsenic are associated with nearby mining sites. However, the Idaho-Maryland Mine is a different gold deposit and hosted in different rock types than the Empire-Northstar and Lava Cap Mines. Arsenic levels from samples taken in various rock types at the Idaho-Maryland Mine Project are low. (see Section 4.4 of Appendix K.2 of the DEIR.)

The commenter states that there needs to be concurrent measurements to evaluate metals in engineered fill proposed to be placed at the Brunswick and Centennial sites and that metals content should be determined before it is used as building material. A WDR is required prior to placement of engineered fill. Please see Master Response 8 – Mine Waste Characterization, and Master Response 11 – Engineered Fill Utilized in Local and Regional Construction Markets.

## Response to Comment Ind 293-3

The commenter explains the toxicity of arsenic and cites arsenic concentrations from the Empire State Mine and the Lava Cap Mine. However, the Idaho-Maryland Mine is a different gold deposit and hosted in different rock types than the Empire-Northstar and Lava Cap Mines. Arsenic levels from samples taken in various rock types at the Idaho-Maryland Mine Project are low. Please see Section 4.4 of Appendix K.2 of the DEIR.

Metal content in dust generated by all activities of the project were evaluated in the Health Risk Assessment for the DEIR. Please see also Master Response 20 – Conservatism used for Metals in Dust.

The commenter also cites the EPA standards for arsenic levels in drinking water. The MCL for arsenic in water is noted and is discussed in the DEIR and in Appendix K.2 of the DEIR. (see DEIR, p. 4.8-21.)

## Response to Comment Ind 293-4

As discussed in the DEIR, the Project Applicant has entered into a Voluntary Cleanup Agreement with the California Department of Toxic Substances Control (DTSC) for the voluntary cleanup of soil contamination on Centennial Industrial Site. A Remedial Action Plan (RAP) has been prepared and is under review by DTSC. The DTSC project is a separate project from the Idaho-Maryland Mine Project, is not under the authority of the County, and is subject to its own separate CEQA review. As such, the cleanup project is not the proper subject of the DEIR. Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

The Centennial site is not designated, nor under consideration to be listed, as a “superfund site” by the US EPA. The estimated total capital cost for clean-up of the Centennial site is estimated in the RAP at $3 million (see page 53 of the Draft Final RAP).

The proposed project would likely produce mine waste with lower sulfide and metal content than those produced historically, and the historic mine waste has been determined to be Group C mining waste from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity. Please see Master Response 9 – Historical Mine Waste at Centennial Site.

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 294-1**

Dear Board of Supervisors,

Please add my voice to those who oppose the Rise Gold Mine development. I have numerous concerns about this project and its impact, both on the environment and on our current economic strengths.

We are a small community that values our tourism, light industry and tech businesses. As our housing market shows, people are flocking to Nevada County to work remotely, and our environment is paramount in attracting these new people. (Broadband would attract even more!) While we have a rich mining history, it no longer fits with our current culture. Since those early days, homes have sprung up around the county that would be affected by any mining operation. What other industry would be allowed to threaten clean ground water or create toxic runoff?

We are so lucky to have such a beautiful county. Please help us keep it that way.

Thank you for your service.

Sincerely,

Irene Frazier (40 year resident)

Grass Valley, CA

## INDIVIDUAL LETTER 294: IRENE FRAZIER

### Response to Comment Ind 294-1

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues and Master Response 2 – Social and Economic Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

RE: Draft Environmental Impact

**Ind 295-1** The first section of the DEIR should reflect the reliability of the company's ability to follow rules. We know this CEO is either ignorant or lying when he says, "There will be no environmental impact from the mine. " Also he does not have a good track record. How can we put our community at risk?

**Ind 295-2** The Centennial Site: "The soil clean up activity would be completed before implementation of the project related activities at the Centennial Site, removing contaminated surface soils, contaminated trees, and other vegetation on a large portion of the property & creating an elevated pad area where the consolidated soil would be collected and capped."

**Ind 295-3** 4.7-4 Impair implementation of or physically interfere with an adopted emergency evacuation plan. The DEIR says "Less than significant" I'd like clarification on why this wouldn't be significant given that Brunswick is one of the few evacuation corridors and evacuating over 600 people on to one of the few evacuation corridors seems significant to me. How will this evacuation occur?

**Ind 295-4** 4.5-4 Cause a substantial adverse change in the significance of a tribal cultural resource as defined in PRC Section 21074 as either a site, feature, place cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place or object with cultural value to a California Native Tribe.

I did not see an interview with the Nisenan Tribe as to how they ascertained that this was insignificant. An interview with the tribal leaders should be included in the

DEIR. In 1849 the Nisenan Tribe was nearly exterminated during that gold rush. The mine is in fact on stolen land.

4.9-1 Physically divide an established community. This is considered "Less than significant." A major industry with an insurmountable number of risks will surely

**Ind 295-5** divide this community from our quaint tourist town to a major divide between the tourist section and the polluted industrial section. (If it's not polluted, why are the tires washed when leaving the site?)

4.12-6 The project applicant shall obtain an encroachment permit from Nevada

**Ind 295-6** County to install a "Slow trucks" sign on the road. The sign should face the industry and read- "cars on the road, trucks use caution before entering."

4.1"That a project is visually inconsistent with the surrounding community"
1. Buildings 165' tall are inconsistent with the rural/neighborhood setting setting.
2. Trucks entering the highway 16 hrs a day for eighty years are visually inconsistent with our beautiful community.

**Ind 295-7** 3. Lights on at night will be visually inconsistent with the night sky in our rural area.

4. The Centennial Site: "The soil clean up activity would be completed before

**Ind 295-8** implementation of the project related activities at the Centennial Site, removing contaminated surface soils, contaminated trees, and other vegetation on a large portion of the property & creating an elevated pad area where the consolidated soil would be collected and capped." This will be ugly, and will visually not fit in to the surrounding community.

Sincerely
Tina O'Connell

## INDIVIDUAL LETTER 295: ITARA O'CONNELL

### Response to Comment Ind 295-1

The comment does not specifically address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues and Master Response 3 – Owner Responsibility.

### Response to Comment Ind 295-2

The comment restates a sentence in the DEIR regarding the Centennial Site, but provides no context which would allow a response.

### Response to Comment Ind 295-3

Please see Master Response 5 – Evacuation Zones.

### Response to Comment Ind 295-4

Please see Chapter 4.5, Cultural and Tribal Cultural Resources, and, specifically, the following excerpt from page 4.5-21 of the DEIR:

> […] InContext contacted the NAHC on September 10, 2019 to request a search of the Sacred Lands File for tribal cultural resources within or near the project area. The results of the Sacred Lands File search were negative, which indicates that known cultural resources do not exist on the project site.[5] In addition, InContext contacted each of the following Native American tribes with the potential to have knowledge of cultural resources in the project area:
>
> - Colfax-Todds Valley Consolidated Tribe;
> - Tsi Akim Maidu;
> - United Auburn Indian Community of the Auburn Rancheria (UAIC); and
> - Nevada City Rancheria Nisenan Tribe.
>
> In an effort to gather data regarding cultural resources of importance to these entities that could be affected by the project, the above parties were contacted via regular mail, email, and telephone between September 16, 2019 and December 16, 2020. Reponses were not received from any of the above tribes.
>
> On November 25, 2019, Nevada County sent project notification letters with offers to consult pursuant to AB 52 to the Tsi Akim Maidu Tribal Council, Shingle Springs Band of Miwok Indians, Nevada City Rancheria Nisenan Tribe, and UAIC. The Tsi Akim Maidu Tribal Council, Shingle Springs Band of Miwok Indians, and Nevada City Rancheria Nisenan Tribe did not respond within the 30-day consultation period. The UAIC responded on December 18, 2019, and requested consultation and copies of the Cultural Impact Report, technical reports, requests for and results of records searches, and Geographic Information System (GIS) Shapefiles. The County provided such information. In addition, the UAIC noted that they are not aware of any Native American archaeological sites in or near the project site.

As presented above, consistent with CEQA Guidelines and Assembly Bill 52, as part of the DEIR process, local tribes were notified and invited to consult on the proposed project, and such information was presented in the DEIR.

## Response to Comment Ind 295-5

A project risks dividing an established community if the project would introduce infrastructure or alter land uses so as to change the land use conditions in the surrounding community, or isolate an existing land use. As discussed under Impact 4.9-1, the proposed project would operate on land designated for industrial use and currently used to store industrial materials on both the Brunswick and Centennial Industrial Sites. The project would not affect access to the nearby roadways and would not change access to a nearby community from these roadways. Therefore, the proposed project would not physically divide an established community.

## Response to Comment Ind 295-6

The comment expresses a general opinion that Mitigation Measure 4.12-6(e) shall be revised such that the sign installed would face the industry and, “cars on the road, trucks use caution before entering.” The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

## Response to Comment Ind 295-7

Long-term changes in visual character associated with the proposed project were discussed in Chapter 4.1, Aesthetics, of the DEIR. As noted therein, given the proposed heights of the structures and the permanent alteration of the views, the impact would remain significant and unavoidable. According to CEQA Guidelines Section 15093, if the specific economic, legal, social, technological, or other benefits, including region-wide or statewide environmental benefits, of a proposal project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable." As such, the County would be required to adopt a Statement of Overriding Considerations to address the aforementioned significant and unavoidable impact.

Impacts related to light and glare were addressed in Impact 4.1-3 within Chapter 4.1, Aesthetics, of the DEIR. As discussed therein, light spillover is not projected to occur off-site. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency, in deciding whether to approve the project.

## Response to Comment Ind 295-8

The DEIR concludes that impacts to visual character of the site would be significant and unavoidable. In addition, please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

**Individual Letter 296**

TO: US Department of Interior, Bureau of Safety and Environmental Enforcement

Necada County, CA Idaho.MMEIR@co.nevada.ca.us

RE: A proposed project in Nevada County, CA, to re-open a mining operation, named the "Idaho-Maryland Mine Project. (IMMP)"

OBJECTIVE: Submitting a comment to Nevada Coty and reporting an instance of intended, inappropriate land-use to state- and federal authorities.

PROJECT SUMMARY

**Ind 296-1**

The project involves the re-opening of a mining operation in Nevada County, CA, near Grass Valley, CA. It promises moderate impact on the environment and substantial benefit to the local economy. However, massive quantities of surface water are to be utilized, there will be substantial pollution from dust and smog, and great amounts of mining gravel must be disposed of.

DISCUSSION

From the Environmental Impact Report Draft:

"Six impacts in this category are listed as either "less than significant," or "less than cumulatively considerable" prior to mitigation, with no mitigation measures required, while another — the generation of greenhouse gas emissions that may have a significant impact on the environment — is listed as "cumulatively considerable" prior to listed mitigation measures and "less than cumulatively considerable" afterward." https://www.theunion.com/news/report-delves-into-idaho-maryland-mine-project/

**Ind 296-2**

In a time in which natural resources are swiftly depleting due to human activity, in which yard-thick trees are snapping like tooth picks in the wind due to air quality issues, dry climate, and subsequent parasite infestation, an "Environmental Impact Study" ought to entail somewhat more than a utility to push for the venture's ultimate approval. Arguments like "economic growth" belong to an era which has ended some time ago. If one raises his head and looks beyond the luring local kudos such a project might bring to the area, and considers the global ramifications of what is being planned, he/she is bound to realize that there exists no need for any more economic growth, for further population influx, and foremost of all, no need for MORE GOLD!

About Gold:

The United States possesses some 8,000 metric tons of raw gold, which lays uselessly in its bunkers. https://tradingeconomics.com/country-list/gold-reserves.The proprietors of the IMMP might sooth their desires by utilizing their funds to purchase some of it.

Via its replacement with inferior metals, later with celluloses, and finally with nothing more than electronic data, gold's function of serving as primary currency has long ended and it further on provides no essential value to humans.

Project Evaluation:

Proper project evaluation starts with determining the proposal's feasibility and merit. Although the IMMP might well be practicable (it primarily takes logistical efforts; no extraordinary managerial skill or leadership are required to re-initiate a previously abandoned endeavor), it features absolutely no merit. The pursuit of a fictitious value bares no necessity the local community or the environment.

**Ind 296-3**

A business project preposition ought to come about upon verifiable, local need for the venture's intended product. Proposing to restart a venture within an industry segment whose prior stint's rubbish is still corrodingly littering Grass Valley's surrounding forests, is simply childish – Cleaning up one game prior to beginning another, is taught in preschool.

Indirect Merits / Pre-existing Environmental Conditions:

The aspect of providing employment to local resident, swiftly loses momentum when one considers that the global human population is growing at a rate of 100 Million per annum, along with it all the waste and pollution that humans produce. A sincere political leader's prospective should thereupon shift from providing for a growing population, to CONTROLLING ITS HEAD COUNT!

It is no longer an idealistic "tree-hugger" standpoint to earnestly consider one's very own actions in respect to environmental impacts. Since the past several decades, human activity has pushed the global biosphere's integrity to the brink of collapse. Thereupon it becomes obvious that the planet does not need any more symbolism, technology, industry, or humans! And ironically, not even human civilization can utilize any more of these "commodities." What civilization needs to recover from this self-created misery, is *sophistication* instead of quantitative growth. Granted, mankind has come forth with some brilliant scientists, engineers, and architects; Nevertheless, if they keep using their talents against Nature, their cumulative IQ remains somewhere below that of a maggot or a blob of chicken snot.

**Ind 296-4**

Due to extensive drought conditions, the local flora is severely dry, surface water scarce, and the summers are getting hotter each year. This is due to air and water pollution generating a greenhouse effect, and mining-, quarrying-, agricultural-, and deforestation activities damaging the Earth's protective layers. Thereupon moisture cannot be retained in the soil. Furthermore, the petrochemical industry's practice of depriving the planet of its oil, makes the Earth crust rigid, which enhances the effect of ever hotter summers and increasingly colder winters. As long as civilization stubbornly refuses to initiate effective countermeasures, the trend WILL REMAIN worsening.

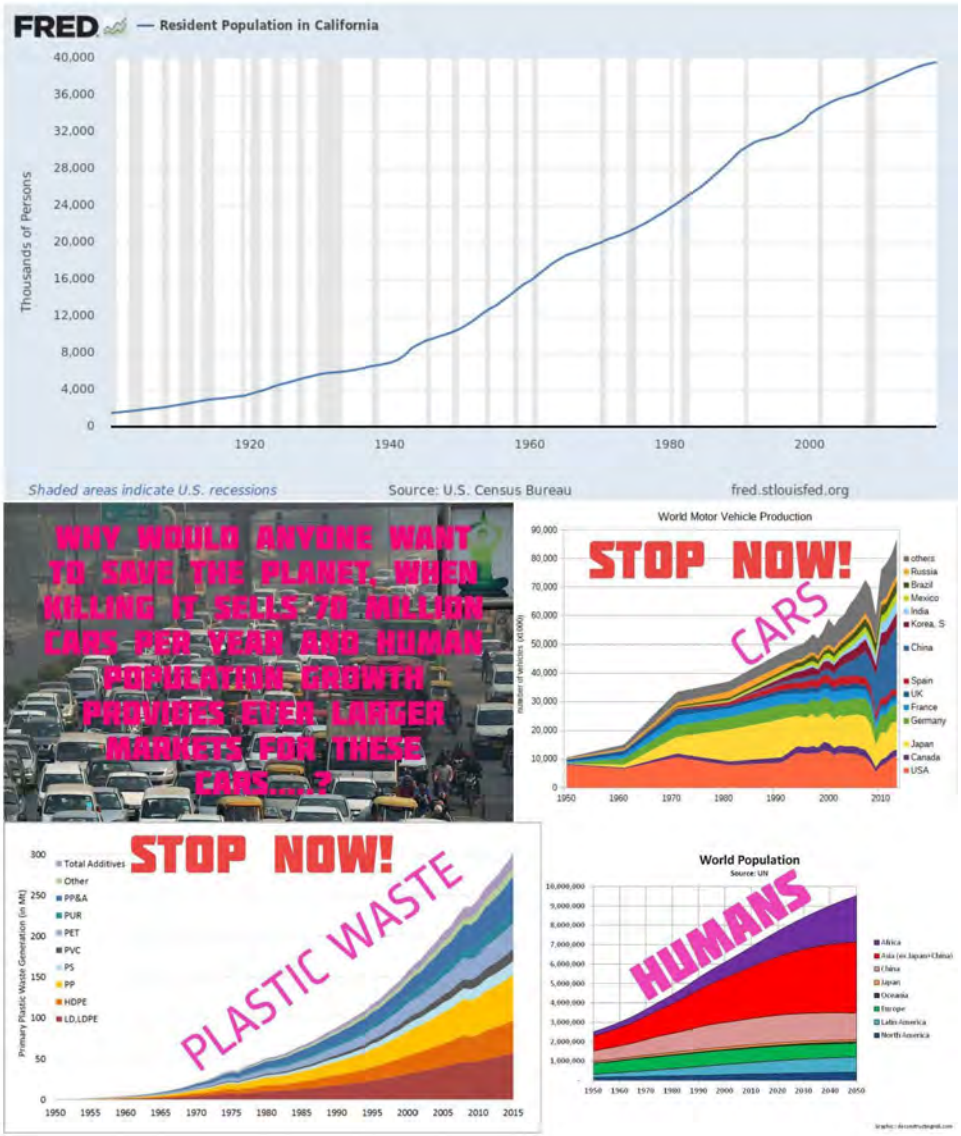
These aspects alone should suffice to preemptively preclude the IMMP from commencing.

CONCLUSION

The Pursuit of Fictitious Values:

It is a caustic fact that precisely the human quality of possessing advanced intellect, which is proclaimed to raise them above all other animals on the planet, also generates their propensity to succumb to the lure of fictitious values. They then pursue these values with such vigor and commitment that they mindlessly compromise their very own and only planet and habitat. Such behavior, by any measure, constitutes a substantial psychiatric condition.

Formal Complaint and Recommendations:



The fundamental problem here lies with the fact that in midst numerous conditions of critical state, there still exist entities who have nothing on their mind than serving their own playfulness. They conveniently hide behind the "limited liability" curtain of corporations and the dubious achievement that these corporations possess full rights as persons before the law. Although these "persons" can be sued and prosecuted, it is obviously impossible to incarcerate a corporation; financial fines costing them a mere giggle. What can be done however, is to subject them to a psychological evaluation.

Psychology possess the ability analyze an entity's character without needing access to the physical person. Anything from documents and letter composed, over actions taken and behaviors displayed, to buildings, gear, and artwork constructed, can be utilized to establish somebody's personality, so why not a corporation's? Subsequent diagnoses can range from minor psychological disorders to criminal insanity. Thereupon a court may easily impose restrictions to the entity's ability to conduct business, engage in politics, and otherwise interact with society and the environment.

What is left to mention, is the county personnel's acute inability to professionally analyze a proposal's viability, and their thorough incompetence to mindfully consider the condition and state of affairs of the land entrusted to their care. Instead they display a strong propensity to collaborate with ill-minded, potentially criminal elements.

*Today, we live in a world that steadily inches towards the abyss. We can either let humans have it their way for as long as they can make the planet last, or we can stop them from having it their way, and make the planet last!*

Nevada County, CA Idaho.MMEIR@co.nevada.ca.us

RE: The Union, February 18, 2022, "Community Conversation,"

**Ind 297-1**

In addition to my previous arguments, and in response to THE UNION's article, I hereby point out that "economic" growth" might well have been the "call of the day" some decades, or even centuries ago; Today, however, we face severe problems of ecological and sociological nature, resulting from over-population and restless industrial expansion. If humans are to prevail as a species on this planet, we must revert to a respectful treatment of all our Mother Earth. This does not mean that we ought to climb back up the trees and throw bananas at each other, no, it merely entails that now is the time to relax a few notches and enjoy the fruits of our past achievements. This includes measures towards population reduction, ceasing of harmful, industrial activities, streamlining of production methods and product lines of essential items, and, foremost of all, focusing on SUSTAINABILITY AND SOCIOLOGICAL SOPHISTICATION.

Just because some project proves to be "reasonable and achievable," and that it claims to have invested millions of dollars into its environmental review, does not supply it with MERIT. And creating jobs that produce something unimportant as gold, propels us straight back to old Egypt and its pyramid builders: There is no more need for such "economic slavery." The need and beneficence of our current profit-based economy model is also outdated. As it is based on the illusion of infinite growth in a finite space, it inevitably was bound to reach its limits.

That humans need to work in order to obtain money to purchase their food is also a mere hallucination. Food comes from Nature, not from the supermarket or candy factory. And if one possesses the capacity of rational thought, he/she will realize that it is each creature's inalienable prerogative to seek food and pursue maturation. Humans have violated this universal law by enslaving animals and each other to lift a small, self-proclaimed elite. They

1

thereby arranged for a situation in which wild (or free) animals comprise merely 4% of all living creatures on the planet; a whopping 60% are occupied by life stock, and the rest? Humans!

To counteract these shocking facts dictates the mission of the day: Reduce and re-naturalize.

Sincerely, J. T. Mayr, Friday, February 18, 2022

Please find below my original contribution, submitted to Nevada County earlier this month.

TO: US Department of Interior, **Bureau of Safety and Environmental Enforcement**

Nevada County, CA Idaho.MMEIR@co.nevada.ca.us

RE: A proposed project in Nevada County, CA, to re-open a mining operation, named the "Idaho-Maryland Mine Project. (IMMP)"

OBJECTIVE: Submitting a comment to Nevada Coty and reporting an instance of intended, inappropriate land-use to state- and federal authorities.

PROJECT SUMMARY

**Ind 297-2**

The project involves the re-opening of a mining operation in Nevada County, CA, near Grass Valley, CA. It promises moderate impact on the environment and substantial benefit to the local economy. However, massive quantities of surface water are to be utilized, there will be substantial pollution from dust and smog, and great amounts of mining gravel must be disposed of.

DISCUSSION

From the Environmental Impact Report Draft:

**Ind 297-3**

"Six impacts in this category are listed as either "less than significant," or "less than cumulatively considerable" prior to mitigation, with no mitigation measures required, while another — the generation of greenhouse gas emissions that may have a significant impact on the environment — is listed as "cumulatively considerable" prior to

2

listed mitigation measures and "less than cumulatively considerable" afterward." https://www.theunion.com/news/report-delves-into-idaho-maryland-mine-project/

In a time in which natural resources are swiftly depleting due to human activity, in which yard-thick trees are snapping like tooth picks in the wind due to air quality issues, dry climate, and subsequent parasite infestation, an "Environmental Impact Study" ought to entail somewhat more than a utility to push for the venture's ultimate approval. Attached are my feelings about the Rise Gold Corporation's mine proposal.

Jacqueline Finley
10901 Thornicroft Way
GV 95949

530-274-8574

**Ind 300-1**

My Cornish great-great-grandfather arrived about 1850 in Grass Valley. After several years he built and worked a nineteen-acre gold mine several miles outside of town. This mine is still owned by his descendants, not by choice, but by the fact the land is so polluted with mercury and arsenic that it cannot be sold. It stands as a sad commentary on what happened in the past.

I excuse him and his contemporaries for not fully understanding the incredible damage gold mining does to a region. At the time the early mines were functioning, citizens were less concerned about long-term environmental effects, and more on providing financial security for themselves and their families.

Over the decades, however, we've learned how mining destroys the earth, not just here, but worldwide. Mining is a complicated and often unpredictable endeavor, even in 2022. To be productive it must be noisy and encompassing. While Rise Gold Corporation claims the environment won't be harmed, nor residents impacted by lines of loud trucks or water supply worries, history points otherwise.

Gold is not a life necessity, but a healthy, natural world and happy community should be. The people of this beautiful area have spoken. We do not want the Rise Gold Mine.

## INDIVIDUAL LETTER 300: JACQUELINE FINLEY

**Individual Letter 301**

Jake Jacus
District 1
Grass Valley

Nevada County Planning Department

To Whom It May Concern,

**Ind 301-1** I have several points of view regarding the mining situation. Number one, is the amount of noise and traffic on the roads that will be generated from the mine, it is completely unacceptable. Number two, is taking that much water from underground, and to do so during a drought and dredging up all the toxins that will come with it, is completely wrong. This will not only affect the environment; the streams, rivers, agriculture, air quality, and wildlife, but it will also directly affect citizens of Nevada County's personal underground wells. In my opinion, it will irrevocably change our way of life and change the serenity of this beautiful area we call home. As far as this company, Rise Gold, their past history alone should be enough to deem them unworthy to even work on this ill fated project. It should not be about one company's greed, it should be about preserving the quality of life that we have all come to love. I personally think their promise of boosting our economy is a sham, it will not bring jobs to our county, but will likely outsource jobs from elsewhere. The end effect being, lining the pockets within the company while negatively affecting our community. And who is to say that they will not just shut down the mine leaving behind a huge toxic dump with no plan to clean it up. I want to see my children and grandchildren to be able to grow up in a beautiful community and area that has so much to offer, without reopening a mine that has the potential to destroy everything we love about this area.

Sincerely,
Local Citizen and Business Owner Since 1979

## INDIVIDUAL LETTER 301: JAKE JACUS

### Response to Comment Ind 301-1

The commenter expresses general concerns regarding the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Responses 1 through 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

## IDAHO-MARYLAND MINE PROJECT
## DRAFT EIR COMMENT FORM

To document the author of comments received, please provide the following information. Thank you.

Name: Jalana Smith

Address: 18690 Jones Ridge road, Grass Valley, CA 95945

Organization (if applicable): _____

Please provide us with your written comments on the Idaho-Maryland Mine Draft EIR by **5:00 PM, April 4, 2022**. Comments may be placed in the comment box located in the back of the Board of Supervisors Chambers during the Special Public Meeting of the Nevada County Planning Commission. Written comments may also be submitted (email or hardcopy) to the address below:

**Matt Kelley, Senior Planner**
**Nevada County Planning Department**
**950 Maidu Avenue**
**Nevada City, CA 95959-8617**
**Idaho.MMEIR@co.nevada.ca.us**

I am a lifelong resident of Nevada County for 40 years. I have seen how mining in the past has negatively impacted the land, environment and community locally. This new mine will cause serious damage to our local environment and also the quality of life of the residents of Nevada County.

Ind 302-1

The damage from this mine WILL impact our community very negatively. This community has made it very clear that we do NOT want this mine. I see many negative effects, and no benefit to our community that would offset the negative outcome.

Please DO NOT allow this mine to come into our community.

RECEIVED
MAR 24 2022
NEVADA COUNTY
PLANNING DEPARTMENT

## INDIVIDUAL LETTER 302: JALANA SMITH

### Response to Comment Ind 302-1

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues and Master Response 2 – Social and Economic Impacts. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 303**

**From:** James Blimthorpe
**To:** Idaho MMEIR
**Subject:** Community Opinion
**Date:** Wednesday, January 5, 2022 12:15:12 PM

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 303-1**

Obviously, the supervisors are trying to push through something that the people of Nevada County do NOT WANT.

The environmental report is probably tilted toward opening the mine and belittling all of the justifiable reasons against the mine.
Our community is solidly against this monstrosity of a mine. The supervisors should surely recognize the opinions of the residents here in Nevada County, rather than those of a corrupt corporation.

James Blimthorpe

## INDIVIDUAL LETTER 303: JAMES BLIMTHORPE

### Response to Comment Ind 303-1

The commenter expresses general concerns regarding the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

## INDIVIDUAL LETTER 304: JAMES BLIMTHORPE

### Response to Comment Ind 304-1

The commenter notes the EIR is fake, but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 305**

**From:** James Haufler
**To:** Idaho MMEIR
**Subject:** Idaho-Maryland Mine Project EIR
**Date:** Saturday, January 8, 2022 2:29:45 PM

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Greetings:

I have a few questions:

**Ind 305-1**

1. Have any of the soil samples or rock samples, or cores been tested for radioactive elements such as uranium? If so, what were the results? If no such testing was done, why not?

**Ind 305-2**

2. Will Rise Grass Valley purchase a bond that will pay for reclamation/restoration of the sites affected by this project if Rise Grass Valley or their successors, or assigns permanently cease operations at the site for any reason including bankruptcy?

**Ind 305-3**

3. Is there any information that would support the idea that there will actually be a local or regional market for the sale of surplus engineered fill as construction aggregate or fill? If there is not such a market, how will Rise Grass Valley dispose of that material at their expense, and without any impact on Nevada County for waste management operations or expenses.

Thank you,

Jim

James Haufler
3555 Arden Villa Court
Roseville, CA 95747
916-865-4721 (home)
916-801-3669 (cell)

## INDIVIDUAL LETTER 305: JAMES HAUFLER

### Response to Comment Ind 305-1

The commenter asks if the Project Applicant tested any of the rock/core samples for radioactive elements. Water sampling conducted for the project included radiological testing, including uranium, as shown in Table 3-6 of Appendix K.2 and all results are well below regulatory standards, as shown in the table. Uranium was not analyzed in rock samples because elevated uranium is not present in the rock types in the mine area. The commenter is referred to Response to Comment Grp 8-15.

### Response to Comment Ind 305-2

The commenter asks if the Project Applicant will purchase a bond for reclamation of the project site. A reclamation bond is required for the project. The commenter is referred to page 4.6-24 of the DEIR and Appendix C of the DEIR.

### Response to Comment Ind 305-3

The commenter asks if there is any information supporting the notion that engineered fill could be used for local or regional construction projects. The commenter is referred to Master Response 11 – Engineered Fill Utilized in Local and Regional Construction Markets.

**Subject:** Rise Mine DEIR Comments

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

I moved to the Union Hill area of grass Valley in June 2020 from the east bay of San Francisco looking for a better quality of life that includes: clean air, clean water, quiet surroundings, and lack of traffic congestion. The proposed Rise Mine violates all of those.
I am renting a house and would have purchased one in my neighborhood, which I love, except for the threat of the coming mine. Specific DEIR concerns are:
– The groundwater model has fundamental flaws in the initial start point and baseline data Sumption stash all of which throw off the entire analysis.

**Ind 306-1**

**Ind 306-2** – Dealing with mine waste – about asbestos will be a huge and expensive problem that requires far more comprehensive management than described in the report.

**Ind 306-3** – Greenhouse gas emissions – the report excluded elements that would put the project over the arbitrary threshold limit, but recent climate change Cole say the threshold should be "net zero".

**Ind 306-4** – Cleanup of the toxic, pre-super fund Centennial site that would be used to dump mine waist is not included in the DEIR but is required by the California environmental quality act.

**Ind 306-5** – Missing construction time estimates throw off the entire analysis of noise, traffic, and air.

**Ind 306-6** – The DEI are incorrectly assesses nighttime noise and underestimates the noise of dumping main waste near established residential neighborhoods.

**Ind 306-7** – Air traffic hazards anesthetic impacts need to be studied further due to the likelihood of a moisture cloud plume that could be created by warm saturated air ventilation.

**Ind 306-8** – Blasting plans don't follow US mining guidelines that restrict blasting during evening hours.

**Ind 306-9** – The plan doesn't demonstrate that the impact on biological and aquatic resources would be less than significant. In this time of scarce water in climate change do we really want to be dumping millions of gallons of water into the creek? I think not.

**Ind 306-10** – Meteorological data used to assess the health risk of airborne pollutants doesn't fit grass Valley's profile or accurately reflect local conditions.

**Ind 306-11** Please consider my concerns above and I am happy to talk with you in person. Please rule that the DEIR is inadequate in the mine should be stopped.

A couple of years ago I took a vacation through Butte Montana. At its peak there were over 3500 people working in the mine, today there are seven people. Those of the guys who operate the robots. As you look around there's no trees because acid rain has killed them off from the 1800s to today. Don't let grass Valley become a wasteland like Butte.

Sincerely,

James McMaster
10845 Bartlett Dr.
grass Valley CA 95945
925.286.4958

## INDIVIDUAL LETTER 306: JAMES MCMASTER

### Response to Comment Ind 306-1
The commenter states that the groundwater model is flawed due to the initial start point and baseline data but provides no further information. The DEIR analyzed the project's impacts to groundwater in Chapter 4.8 (Hydrology and Water Quality) and found impacts to be less than significant after mitigation. The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model.

### Response to Comment Ind 306-2
The commenter states that the DEIR understates the degree to which asbestos emissions from the project will need to be managed but does not identify any inadequacies of the DEIR with regard to asbestos. The DEIR analyzed asbestos emissions in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and found the impacts to be less than significant after mitigation. The commenter is also referred to Master Response 18 – Air Quality Thresholds, Master Response 22 – Conservatism of Asbestos Assumptions, Master Response 23 – Adequacy of Asbestos Sampling, Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

### Response to Comment Ind 306-3
The commenter states that the DEIR excluded elements which puts the project's GHG emissions over an arbitrary threshold, but recent climate change goals purportedly require net zero GHG emissions. The commenter is referred to Master Response 27 – Greenhouse Gas Thresholds.

### Response to Comment Ind 306-4
The commenter states the DEIR improperly excludes the cleanup of the Centennial Industrial Site. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 306-5
The commenter states that missing construction schedules skew the DEIR's analysis of the project's impacts. The commenter is referred to Master Response 24 – Project Construction Schedule.

### Response to Comment Ind 306-6
The commentor states that the DEIR incorrectly assesses nighttime noise and underestimates the noise impacts of dumping waste near residential neighborhoods but provides no further details or explains how the DEIR is inadequate. The DEIR analyzed noise impacts in Chapter 4.10 (Noise and Vibration) and found the noise impacts associated with engineered fill placement to be less than significant after mitigation (see Impact 4.10-2). Regarding nighttime noise, please see Response to Comment Grp 21-130.

### Response to Comment Ind 306-7
The commenter states that the DEIR must discuss air traffic hazards due to a potential moisture cloud plume. The commenter is referred to Response to Comment Grp 7-95.

### Response to Comment Ind 306-8
The commenter states the project does not adhere to federal mining guidelines regarding blasting. The commenter is referred to Response to Comment Grp 21-144.

## Response to Comment Ind 306-9

The commenter states that the DEIR fails to demonstrate impacts to wildlife would be less than significant and is concerned about discharging water to South Fork Wolf Creek during a drought. The commenter does not provide any additional information to identify how the DEIR is inadequate with regard to wildlife impacts. The DEIR analyzed biological impacts in Chapter 4.4 (Biological Resources) and found the impacts to be less than significant after mitigation. The DEIR also analyzed the impacts to South Fork Wolf Creek in Chapter 4.8 (Hydrology and Water Quality) and found the impacts less than significant after mitigation. The commenter is also referred to Master Response 30 – Biological Study Technical Adequacy, Master Response 35 – Discharge to South Fork Wolf Creek, Master Response 36 – Flows in South Fork Wolf Creek and Master Response 16 – Drought and Climate Change.

## Response to Comment Ind 306-10

The commenter states that the DEIR utilizes meteorological data in the health risk assessment that does not reflect local conditions. The commenter is referred to Master Response 17 – Meteorological Data Used in HRA.

## Response to Comment Ind 306-11

The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 308-1**

Opening the mine is the worst possible idea. The amount of water needed and expended is ENORMOUS. Doesn't anyone realize that we're in a DROUGHT!!! The amount of jobs created is pitifully small next to the amount of people/families impacted by the lower water table. The supposed "facts" the mine uses for justification are ludicrous, falsely stated and improperly studied. This idiot proposal shouldn't even be on the table...

## INDIVIDUAL LETTER 308: JAMIE LEGON

### Response to Comment Ind 308-1

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Sent:** Monday, April 4, 2022 12:57 PM
**To:** Idaho MMEIR
**Subject:** Reopening the mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr Kelly,

Of my many concerns about the reopening of the gold mine at the Brunswick site, the top one is the amount of water required to run the mine and the discharge of waste water into our streams and soils. California is in the worst drought ever experienced, according to an 800 year study headed up by UCLA climate scientist Park Williams. Even without this disturbing new evidence, the fact that California is in a very serious drought is indisputable. Our Board of Supervisors must put our citizen's and environmental water needs first. Whatever amount of money the county may make cannot create more water.

**Ind 309-1**

I'm concerned how this proposal impacts wells in the area. The FEIR needs to analyze all the wells potentially impacted by the project. The impact analysis on wells in the DEIR is inadequate.

Please consider all the many serious impacts of re-opening the mine sent your way. This is a very serious decision that will affect our county for generations. Thank you.

Sincerely,

Jan K Todd

## INDIVIDUAL LETTER 309: JAN TODD

### Response to Comment Ind 309-1

Please see Master Responses 13 through 16 regarding groundwater, including drought and climate change. See also Master Response 35 - Discharge to South Fork Wolf Creek. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 310**

**DRAFT EIR COMMENTS - Proposed Idaho-Maryland Mine (DEIR)**

**April 4, 2022** (*Emailed,* 4 pages)

**Matt Kelley**
**Senior Planner, Nevada County Planning Department**
**950 Maidu Avenue, Suite 170**
**Nevada City, CA 95959-7902**
**Phone: 530-265-1423**
**Email: Idaho.MMEIR@co.nevada.ca.us**

Original Sent by Email on April 4, 2022 See Page 6

**GENERAL COMMENTS on the Proposal & DEIR:**

**Ind 310-1** Having reviewed many Environmental Impact Reports as a Municipal Advisory Council (MAC) Member in a large California unincorporated area, I am very concerned about the proposed project and the general inadequacy of the draft Environmental Report that has been prepared. A DEIR with these problems likely will end up in litigation...

**Ind 310-2**
- **INADEQUATE ASSESSMENT of CUMULATIVE EFFECTS** on Water Quality and Water Use, Ground Water Availability and Quality, Air Quality, Traffic, Noise, Quality of Life...

**Ind 310-3**
- **INADEQUATE ASSESSMENT of MITIGATION RISKS...** What happens when the proposed project proponents FAIL to complete promised MITIGATIONS? What are the RISKS to the COMMUNITY?

**Ind 310-4**
- **INADEQUATE ASSESSMENT of RISKS & CUMULATIVE EFFECTS – FOREVER. The 80-year time span of the proposed project, and the need to mitigate toxics affecting water, air, and quality of life issues will last forever... WILL the PROPOSED MITIGATIONS? Or, will they end with an early closing or failure of the proposed project? Then, who pays?**

**Ind 310-5**
- **CONCLUSION: This DEIR MUST BE REJECTED, UPDATED AND REVISED AND ADEQUATELY COMPLETED AND RECIRCULATED to the PUBLIC.**

1

**DRAFT EIR COMMENTS - Proposed Idaho-Maryland Mine (DEIR).**

**MITIGATIONS:**

Ind 310-6

- The proposed project will take away the long-term groundwater / property rights and economic value of the hundreds of properties in the area of the proposed mine as a result of "dewatering."

Ind 310-7

- Proposed project Mitigations may become too expensive or fail, or both, leaving significant adverse consequences that are not mitigated. How does the DEIR assess the RISKS associated with potential mitigations?

Ind 310-8

- CUMULATIVE IMPACTS do NOT MATCH the proposed MITIGATIONS...

**For EXAMPLE, concerning WATER:**

Comments from NID Nevada Irrigation District General Manager Jennifer Hanson illustrates my concerns on the inadequacy of the DEIR with respect to a critical issue like WATER and WATER QUALITY, RISKS to the COMMUNITY from Rise Gold's proposal. Should Rise Gold fail and fall into bankruptcy, for business reasons or because of the cost of cleaning up environmental damage, the public, public agencies, likely will be faced with the ultimate clean up efforts and costs. How are these risks to Nevada County taxpayers mitigated?

Ind 310-9

"Hanson said Rise Gold Corp., the entity trying to reopen the mine, should purchase a bond worth around $14 million to account for the assumptions and unknowns of hydrological modeling and the risk incurred to their neighbor's water supply."

"Hanson said the district serves over 700 irrigation customers, on top of purveying potable water to most of Nevada County, and requested that a water quality mitigation measure be included in the next EIR that would require daily monitoring and public availability to data regarding discharged water."

**For ADVERSE WATER IMPACTS alone, my professional position would be to recommend REJECTING the PROPOSED DRAFT EIR as well as the PROPOSED PROJECT!**

**DRAFT EIR COMMENTS - Proposed Idaho-Maryland Mine (DEIR).**

**FOR EXAMPLE: Massive WATER FLOWS & TOXICS drain into WOLF CREEK, the Bear & Feather Rivers, & eventually San Francisco Bay:**

**Ind 310-10**

Dewatering the proposed mine and daily pumping from the proposed mine would place millions of gallons of water into Wolf Creek. The water would include toxics. HOW MUCH of WHAT TYPES? While the DEIR proposes "cleaning" the water, before putting back into Wolf Creek (water that may be used for drinking water, for irrigation, for environmental needs on its way to San Francisco Bay...)

**Ind 310-11**

How will the proposed project pay for and guarantee that the mine "waste water" will not damage the downstream Wolf Creek? How will the firm pay for equipment failures or plant failures that place toxics into Wolf Creek? What is the firm's proposed liability and what insurance are they providing Nevada County?

**Ind 310-12**

Again, the history of other "re-opened" mines in the area is not a stellar one.

- **The LAST PROPOSAL for REOPENING this MINE FAILED for the same reasons this proposal should not be approved after an ADEQUATE EIR is prepared, commented on by the public, and analyzed by the Nevada County Planning Commission and the Board of Supervisors:** Idaho-Maryland Mine in the 2005-2012 timeframe: This proposed project **failed to complete the Environmental Impact Report due to environmental concerns and financial problems.** (Source: CEA) **The DEIR SHOULD EXPLAIN HOW & WHY THIS PROPOSAL & MITIGATIONS HAVE CHANGED FROM THE LAST FAILED ATTEMPT TO REOPEN THE MINE?**

**Ind 310-13**

- The **San Juan Mine (Siskon) opened and was forced to shut down in 1995** after a disastrous draining of local wells due to mining. The impacts of this failure are still felt amongst the residents. Wells were permanently damaged. (Source: CEA) This is a major problem for this DEIR.

**Ind 310-14**

**Again, SIGNIFICANTLY ADVERSE WATER & TOXIC ISSUES are an IMPORTANT REASON for OPPOSING/REJECTING the proposed project.**

3

**DRAFT EIR COMMENTS - Proposed Idaho-Maryland Mine (DEIR).**

**TOXICS EXAMPLE : The CENTENNIAL SITE is TOXIC! LARGE VOLUMES OF TOXICS would be "located" on both the proposed Centennial site near Downtown Grass Valley and the proposed Brunswick site...**

**Ind 310-15** "The Centennial property covers 56 acres and is located at 10344 Centennial Drive in Grass Valley, along Idaho Maryland Road. It is currently County land, but the ***City of Grass Valley has included it in their near-term annexation plans.*** Up until its closure in 1956, the site was the primary processing and access site for the Idaho Maryland Mine. **The site now contains over 270,000 cubic yards of legacy tailings material. Soil samples show contamination from arsenic, cobalt, barium, mercury, thallium, chromium, copper, lead, zinc, cyanide, vanadium and nickel.** These tailings cannot be used for the base layer of the proposed mine waste pile and must be removed." (Source: CEA)

**Ind 310-16** "An agreement between Rise Gold and the **California Department of Toxic Substances (DTSC) mandates that the contaminated tailings be cleaned up**, and a work plan is being prepared. This cleanup project permit is a separate project from the mine permit. The mine proposal includes dumping more mine waste on this site." (Source: CEA) Where is the completed work plan & is it in the DEIR?

**Ind 310-17**
- **Nevada County already has a legacy of toxic sites left over from the gold mining industry.** Some of those sites remain highly toxic to this day. ***Does Nevada County need or want to increase the size and/or number, or both, of TOXIC WASTE SITES, including one very near to central Grass Valley?***

**Ind 310-18**
- Other waste has accumulated from former gold country operations in the bottom of San Francisco Bay. **Will the mining industry – the proposed Rise Gold mine -- clean up their new toxics as well as the existing toxics on the property they purchased in 2017, knowing the toxics had been there for decades.** Will Rise Gold's proposed project help to pay to clean up the existing toxics accumulated on their property, and washed downstream from Wolf Creek to the San Francisco Bay?

**Ind 310-19** **CONSIDERING the RISKS that MITIGATIONS are NOT COMPLETED and are INADEQUATE, I consider there are sound environmental and economic reasons to reject the DEIR and the proposed mine reopening project on this site, very near downtown Grass Valley, and several important Grass Valley business districts.**

4

**DRAFT EIR COMMENTS - Proposed Idaho-Maryland Mine (DEIR).**

**CONCLUSION: Again, having reviewed many DEIRs as a Municipal Advisory Council member, I consider this DEIR to be INADEQUATE in its assessment of CUMULATIVE IMPACTS, SIGNIFICANTLY ADVERSE IMPACTS, and PROPOSED MITIGATIONS and RISK ASSESSMENTS, and the PROPOSED PROJECT should be REJECTED by the Nevada County Planning Commission and Board of Supervisors, along with Nevada County residents!**

**Ind 310-20**

## INDIVIDUAL LETTER 310: JAN ZIMMERMAN

### Response to Comment Ind 310-1
This comment is introductory in nature and does not address the adequacy of the DEIR. Responses to specific comments are provide below.

### Response to Comment Ind 310-2
The commenter states that cumulative effects analysis in the DEIR is inadequate in various areas of the DEIR but provides no further information. Therefore, no specific response is possible. In regard to quality of life concerns, please see Master Response 1 – Non-EIR/Administrative Issues and Master Response 2 – Social and Economic Issues.

### Response to Comment Ind 310-3
The commenter states that the DEIR inadequately assesses mitigation risk and questions what will happen if the Project Applicant fails to implement required Mitigation Measures, but provides no additional information. The commenter is referred to Master Response 3 – Operator Responsibility.

### Response to Comment Ind 310-4
The commenter states that the project's impacts analyzed in the DEIR will last forever and asks whether the mitigation will last forever. The commenter is referred to Master Response 3 – Operator Responsibility and Appendix C of the DEIR.

### Response to Comment Ind 310-5
The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

### Response to Comment Ind 310-6
The commenter states that the dewatering of the Idaho-Maryland Mine will leave nearby residents' private wells without groundwater and will adversely impact the economic value and property rights of nearby residents. Regarding the impacts to groundwater, the commenter is referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells. Regarding the economic value of the properties, the commenter is referred to Master Response 2 – Social and Economic Impacts.

### Response to Comment Ind 310-7
The commenter states that the mitigation measures analyzed in the DEIR are too expensive or will fail but provides no further information or evidence. The environmental impacts of the proposed mitigation measures are analyzed in the DEIR. The commenter is referred to Master Response 3 – Operator Responsibility.

### Response to Comment Ind 310-8
The commenter states that cumulative impacts do not match proposed mitigations, but provides no further information or evidence. Therefore, no specific response is possible.

### Response to Comment Ind 310-9
The commenter references Comment Letter 10 from the Nevada Irrigation District (NID) and incorporates the same concerns as the NID. The commenter is referred to Chapter 4.8 of the DEIR (Hydrology and Water Quality), Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Responses to Agency Letter 10 from the NID.

## Response to Comment Ind 310-10

The commenter states that the dewatering of the Idaho-Maryland Mine will result in the discharge of toxic substances into South Fork Wolf Creek. The commenter is referred to Chapter 4.8 of the DEIR and Master Response 35 – Discharge to South Fork Wolf Creek.

## Response to Comment Ind 310-11

The commenter assumes that the discharge of water into South Fork Wolf Creek will harm the creek. The commenter is referred to Chapter 4.8 of the DEIR and Master Response 35 – Discharge to South Fork Wolf Creek.

## Response to Comment Ind 310-12

The analysis in the DEIR is specific to the currently proposed project for the Idaho-Maryland Mine. The commenter is referred Master Response 13 – Historic Hydrogeologic Assessments.

## Response to Comment Ind 310-13

The commenter states that the groundwater impacts associated with the San Juan Mine Ridge Mine constitutes a major problem with the Idaho-Maryland Mine DEIR. The San Juan Ridge Mine Project is not relevant to the analysis of the Idaho-Maryland Mine DEIR**.** The commenter is referred to Chapter 4.8 of the DEIR and Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 310-14

The commenter states that adverse water and toxic issues require the County to reject the project, but does not provide any additional information. The analysis in the DEIR determined that water and air impacts are less than significant after mitigation. The commenter is referred to Chapters 4.3 and 4.8 of the DEIR.

## Response to Comment Ind 310-15

The commenter states that the current condition of the Centennial Industrial Site is not suitable for the placement of engineered fill. The commenter is referred to Master Response 9 – Historical Mine Waste at Centennial Site, and Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 310-16

The commenter references the approved remediation plan from the Department of Toxic Substances Control for the Centennial Industrial Site and asks if the DEIR includes analysis of the remedial action plan. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 310-17

The comment does not address the adequacy of the DEIR and has been forwarded to the decisionmakers. The commenter is referred to Chapter 4.8 of the DEIR (Hydrology and Water Quality), Master Response 9 – Historical Mine Waste at Centennial Site, and Master Response 8 – Mine Waste Characterization.

## Response to Comment Ind 310-18

The commenter states that former gold mining operations have deposited waste into the San Francisco Bay and asks if the Project Applicant will clean up certain toxics on the property it purchased in 2017, alluding to the Centennial Industrial Site. The commenter is referred to Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 310-19

The commenter's opposition to the proposed project and speculation regarding whether the mitigations will be completed does not address the adequacy of the DEIR and has been noted for the decisionmakers. All mitigation measures for the project have been included in the Mitigation Monitoring and Reporting Program (MMRP) prepared for the project and included as Chapter 4 of this Final EIR. The MMRP gets adopted along with EIR certification, should this occur, and is used by County staff to track project compliance with mitigation measures. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 310-20

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues. Please also see the above responses.

**Cc:** DEIRcomments@ceanc.org
**Subject:** Comments on the DEIR

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

I have lived and worked in Nevada county for 30 years. My husband was an , and elected Fire Commissioner in Penn Valley from 2002-2006.I have worked in the local hospital as a Registered nurse.

**Ind 312-1** Our children have attended school , my daughter teaches 2nd grade and my grandchildren are now in elementary school here. We have gathered many friends and coworkers during these years and frequently

discuss the changes and progress of our local community. I can definitely state that the overwhelming majority of these friends and family are extremely concerned with the plan that Rise Gold Company has of re-opening

the Idaho-Maryland mine.

**Ind 312-2** I have read the DEIR and as a professional health worker , see many omissions of the health risks such a mine will pose to us as residents. There is inadequate protection in place for the monitoring of the air quality

(That is already bad in our community). In these times of inadequate rainfall and serious impacts to ground water, the plan does not sufficiently address the impact the millions of gallons of water that must be pumped from

**Ind 312-3** the mine, just to begin the digging. Peoples wells will be impacted and that poses a real threat to residents and businesses.

**Ind 312-4** The many negative impacts this opening will have on traffic, noise, toxic chemical waste piles, will wipe Grass Valley off the map as a place to tour and vacation, as well as a healthy place to raise

a family.

**Ind 312-5** I will not go into detail, but the DEIR is a flawed piece of work that does not adequately provide for study and adequate protection on multiple subjects that are necessary for maintaining a healthy and

thriving community.

**Ind 312-6** Rise Gold is posed to sacrifice our quality of life here in Grass Valley and the surrounding areas for their self-profit motives. They have a poor reputation for polluting in their own country and are

1

**Ind 312-7**

eager pursue doing the same to our community.

It is notable that we are still trying to clean up the environmental disaster left us by the last "gold-rush". We have more that allowable levels of Mercury, Arsenic and Heavy Metals in all our surrounding waters

and land.

Please do not allow this to go further without careful and complete examination of the risks to us all. We stand to lose our way of life, our health, our future just for the greed of a company that will take

its profits and leave us a poisonous place to try and live in.

Sincerely in hopes that you will keep our wellbeing in your decision.

Jane Baylis-Garcia

## INDIVIDUAL LETTER 312: JANE BAYLIS-GARCIA

### Response to Comment Ind 312-1
The comment does not address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 312-2
Please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR for more information related to air pollution. As evaluated under Impact 4.3-2, and shown in Table 4.3-21, emissions of toxic air contaminants (TACs) would not result in health risks to nearby receptors in excess of NSAQMD thresholds. Nonetheless, Mitigation Measure 4.3-2 was included to ensure an Asbestos Dust Mitigation Plan is prepared, as required by the California Air Resources Board (CARB). Further information regarding the assumptions used when conducting the Health Risk Assessment for the proposed project is included in Master Responses 20 through 22. Finally, please also see Master Response 19 – NSAQMD Criteria Pollution Thresholds during Operations.

### Response to Comment Ind 312-3
Please see Master Responses 13 through 16 regarding groundwater, including drought and climate change.

### Response to Comment Ind 312-4
The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 312-5
The comment expresses a general opinion that the DEIR is inadequate, but does not provide specific examples. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 312-6
The comment does not address the adequacy of the DEIR. Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 312-7
The comment is a closing remark and does not specifically address the adequacy of the DEIR. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 313**

I ~~support~~ DO NOT re-opening the Idaho-Maryland Mine

RECEIVED
FEB 22 2022
NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Please Vote against this Disasterous Mine !!

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 plus benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Members of the Planning Commission

As a resident of Grass Valley, I urge you to listen to the independent experts who have researched the many potential impacts of the proposal to re-open the Idaho-Maryland mine – air, water, health, explosives, hydrology, energy, mine waste, monitoring, oversight – and who have determined that the DEIR under your consideration today is woefully inadequate for its purpose. The DEIR must be revised to include analyses of impacts that were underestimated or not evaluated, and to correct misleading conclusions.

**Ind 315-1**

Hardrock mining is a dirty business. Air, water, and soil impacts, and industrial accidents with the potential to cause great harm, are inevitable in this business.

It is my hope that Nevada County will at long last determine that hard rock gold mining in a populated region that is surrounded on all sides by homes, businesses, and schools, is in no way compatible with the community that Grass Valley has become. The mine property should be permanently zoned for a sustainable alternative job-producing purpose that will allow our region to thrive.

Dear Supervisor Scofield,

I am writing you to express my thoughts regarding the decision whether to reopen the Idaho Maryland Mine.

**Ind 316-1**

To me there is only one issue. This is not about the pros and cons of gold mining. This is about opening a mine in the middle of a fragile population center where a significant portion of the population relies on wells for water. I consider our community to be fragile because of the ongoing threat of wildfire and the continued drought. To allow a mining operation where there is even the remotest chance that the tunnels could pierce the underground water supply cannot be allowed. Such a potential event would be devastating to our towns. I hope you have had an opportunity to visit the Empire Mine Visitor Center and view the model of the warren of mining tunnels already under Grass Valley.

Please do not allow the mine to reopen.

Thank you

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Nevada County Board of Supervisors.

I want to make it known that I DO NOT SUPPORT the opening of the Idaho Maryland Mine for so many environmental reasons.

There have been many letters to the editor of the Union that I agree with and have put it so much more elegantly than me.

**Ind 317-1** Steven Rugge: Water Vs Gold March 23, 2022 and Lew Sitzer March 25, 2022 I agree with these letters. In our drought and climate change situations, the thought of flushing away 3 million gallons of water A DAY does not make sense to me at all. We have a farm and must cut back on our water as to allow water for the environment, for the people, let alone the fish and wild animals. To allow this type of waste is inhumane.

**Ind 317-2** There are many more letters such as this that we agree with. The Rise Gold EIR where there are obvious omissions of wildlife migration per the letter and video of Michael Shea: Draft EIR displays inadequacies March 20, 2022. This letter proves that the Rise Gold EIR structured their report to their needs and an independent EIR is in need to prove that Rise Gold would have impacts not only on wildlife and water, but noise and air pollution.

My vote is no on the Rise Gold Mine.

Thank you,

Janet Brisson

### Response to Comment Ind 317-1

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 317-2

Wildlife migration is address in Chapter 4.4, Biological Resources of the DEIR. Specifically in Impact 4.4-4 starting on page 4.4-92 of the DEIR. The DEIR was prepared by an independent consultant hired by Nevada County and all the technical reports were independently peer reviewed by consultants hired through the County. In its role as the lead agency, Nevada County decisionmakers will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project.

March 24, 2022

My name is Janet Cinquegrana and I reside at 140 Buckingham Ct in Grass Valley, district 3.

**Ind 318-1** I want to voice my opposition to the reopening of the Idaho Maryland Mine. The mine poses so many threats to our air, water and quality of life. I am a homeowner and Wolf Creek flows through my property. I am concerned about the dewatering of the mine and the polluted mine water being pumped into Wolf Creek. I am concerned about the blasting that would occur and the pollution to our air, including releasing carcinogenic asbestos. I am concerned about the diesel truck exhaust and increased traffic. I am worried the opening of the mine would result in our property values being reduced by 20% or more. Furthermore, the mining industry does not create a lot of jobs. In fact in a list of 179 industries it is dead last at job creation. There are so many risks to the mine and little to none rewards. Please vote NO the reopening of the mine.

Please see Response to Comment Ind 318-1.

**Individual Letter 320**

February 12, 2022

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

**Ind 320-1**

- Trucks hauling 1,000 tons of waste rock, 100 trips every day, down Brunswick Road, piling it higher than a 6-story building at the Centennial site.
- Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area.
- Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells.
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- While Rise Gold shareholders profit, the local community gets little revenue.
- Where will the imported workers live when housing is so limited in our area?

I am a member of the local faith-based organization the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. Rise gold has demonstrated disrespect for the environment and the people of Grass Valley, for example, their unrepresentative survey. Stopping rise Gold would make a huge difference for all of us. I hope you will be among those who will be known to have stood against the well-funded deception Rise Gold Mine has developed.

Sincerely,

Janet L. Dunstan

950 Maidu Avenue, Suite 170
Nevada City, CA 95959

April 3, 2022

Dear Mr. Kelly,

My name is Janice Bedayn, I am a 23-year resident of downtown Grass Valley, and work for the nonprofit organization Sierra Harvest. I am concerned about the Idaho-Maryland Mine DEIR submitted for review for many reasons, but my primary concern is the proposed mitigation for air quality.

**Ind 324-1**

As many residents of Nevada County have done, I installed an Air Quality app on my phone, so that I can determine the safety of leaving my home to work or recreate in the outdoors. It is frightening that we already are burdened with an average of 102 days in which the air is considered "unhealthy" and with the advent of wildfires, our air quality is too often considered "very hazardous".

**Ind 324-2**

Mitigation of CHG emissions in the DEIR are weak, especially when qualifiers such as "where feasible" are inserted, such as 4.3-7 (a) b) which employs electrical or alternative fueled construction equipment. Who monitors "where feasible"? Electrical construction equipment would indeed go a long way to mitigate CHG emissions, but how much of that equipment is available? If it is expensive, is it still feasible? Who determines that?

**Ind 324-3**

More concerning is 4.3-7 (b) which employs carbon offsets for construction emissions. How does a carbon offset improve the air quality in Nevada County? Carbon offsets may be a valuable tool in addressing global climate change, but the Idaho-Maryland Mine Project's carbon offsets will do nothing to mitigate the impact of unhealthy air in our local community.

**Ind 324-4**

Please require that this project employ more stringent mitigation efforts for air quality, and ensure that those efforts will be monitored, with an identified monitoring agency, and what their responsibility entails to keep the community informed. The suggested mitigations in the current DEIR are simply inadequate to the task. A further assault on our air quality in Nevada County will harm our health and well-being, economy, and quality of life.

Thank you,

Janice Bedayn
311 Bernice Drive
Grass Valley, CA 95945

## INDIVIDUAL LETTER 324: JANICE BEDAYN

### Response to Comment Ind 324-1

The comment does not address the adequacy of the DEIR and has been forwarded to the decisionmakers. Please see Master Response 1.

### Response to Comment Ind 324-2

The commenter states that GHG mitigation measures are "weak" because they include qualifying terms such as "feasible" for implementation of mitigation. While the commenter describes the mitigation as weak due to the qualifying language that the mitigation must be feasible, this term come directly from the CEQA Guidelines. (see 14 CCR Sec. 15041(a).) Per CEQA Guidelines Section 15041, a CEQA lead agency has authority to require "feasible" mitigation, and conversely does not have authority to impose mitigation that is infeasible. Availability of electric equipment and vehicles and alternative fuel equipment is changing as technology improves, so it is appropriate that this mitigation measure includes a feasibility and commercial availability standard. Based on these qualifying terms, use of electric equipment that is not now available may at a later date be required by the County under this mitigation measure. The County has enforcement authority for Mitigation Measure 4.3-7, so it would be at the County's discretion to determine whether a particular electric vehicle or type of equipment is feasible in economic or practical terms. Note that the project is already proposing to use all electrical equipment underground, which reduces GHG emissions compared to use of diesel equipment below the surface.

### Response to Comment Ind 324-3

Greenhouse gas emissions contribute to climate change but are not directly related to health impacts. Please see Chapter 4.3 of the DEIR in regard to the analysis of health risks from the project's air emissions. The carbon offsets are required to mitigate emissions of greenhouse gases and the related global climate change impacts, so the local air quality is not related to this mitigation.

### Response to Comment Ind 324-4

Please see Master Response 18 – Air Quality Thresholds, and Master Response 19 – NSAQMD Criteria Pollution Thresholds During Operation. A mitigation monitoring and reporting program is included as Chapter 4 of this Final EIR, which sets forth all mitigation measures imposed in the DEIR and will be used by the County for enforcement purposes.

**Dist 3**

RECEIVED

MAR 0 3 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

February 24, 2022

Dear Nevada County Board of Supervisors:

**Ind 325-1** My name is Jason Privett and I live near the Empire Mine State Park in District 3 with my wife and our baby daughter. I am writing this letter to urge you to vote NO on the Idaho-Maryland Mine.

My wife and I moved to Grass Valley in August 2021 to escape the crime and noise of San Francisco. We were drawn to the natural surroundings of Grass Valley and the peaceful landscape. We didn't know at the time that the mine was being considered, otherwise, we would've chosen to move elsewhere.

**Ind 325-2** Our daughter's pediatrician recently informed us of the negative health consequences the mine will have on our family if it is approved. This saddens us deeply. We are very health conscious and moved here because we thought it would be a healthier environment to raise our daughter. I am a longshoreman at the Port of Oakland where I am subjected to loud industrial noises. As a result, I have experienced negative health consequences. This influenced me to extensively study sound healing and the negative health impacts of loud noises and vibrations. I worry such vibrations and noises produced by the mine will severely damage the health and happiness of our community and the reasons people are drawn here.

**Ind 325-3** Please do not damage our scenic community and pollute our water and air. We moved here for a healthier life for our beloved baby daughter, not increased toxins and industrial vibrations. Please vote No on the Idaho-Maryland Mine.

Sincerely,

Jason Privett

## INDIVIDUAL LETTER 325: JASON PRIVETT

### Response to Comment Ind 325-1

The comment does not specifically address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 325-2

Please refer to Chapter 4.10, Noise and Vibration, regarding impacts related to noise. The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 325-3

The commenter expresses general concerns regarding the impacts of the proposed project but does not specifically address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 326**

# Sierra Metal Fabricators Inc.

529 SEARLS AVE., NEVADA CITY, CALIF. 95959 • PHONE (530) 265-4591 • FAX (530) 265-4034

Matt Kelley,
Senior Planner
Nevada County Planning Department
950 Maidu Avenue
Nevada City, CA 94959-8617

Mr. Kelley:

I am writing today in support of Rise Grass Valley's application to re-start the Idaho-Maryland mine and rehabilitation of the Centennial site adjacent to Highway 49. Our company believes this project will be vital to the future of Nevada County and we urge the Board of Supervisors to approve the project with haste.

Sierra Metal Fabricators was founded in 1974 in Nevada City. We have a long and solid history and investment in Nevada City and Nevada County, and we know how difficult it is for people to make ends meet here. In recent years our county has changed a great deal as more and more out-of-county retirees have purchased homes in the area. While their arrival is more than welcome, we've unfortunately seen the county become less understanding of the need to build industry locally that can offer a young workforce a reason to invest and grow in this county. Simply put, too many of our young people in this county are forced to leave for better opportunities elsewhere.

**Ind 326-1**

The Idaho-Maryland Mine is a chance to turn that around – provide young people in our county with a chance to prosper without moving to Roseville, Sacramento or Reno to make ends meet. Think about it: 312 direct new jobs, and maybe as many as 1,000 more created from companies that partner with Rise Gold – Is there any other local project offering that kind of growth on the horizon?

If the Board of Supervisors rejects the Idaho-Maryland Mine, what kind of jobs plan do you have to replace it with? What other businesses will dare to invest in Grass Valley if they see our County leaders turn up their noses at the opportunity to inject new wealth into our region.

I have already had the opportunity to do business with Rise Gold, in support of their recent core drilling program. I found their personnel to be both professional and competent. I believe them to be an organization not just interested in operating a profitable business, but one that is dedicated to operating in a responsible manner and being an important member of the local community.

For the good of our residents and our local economy, I urge you to support Rise Gold's Idaho-Maryland Mine re-opening.

Jason White – Owner
Sierra Metal Fabricators
529 Searls Ave.
Nevada City, CA 95959

## INDIVIDUAL LETTER 326: JASON WHITE

### Response to Comment Ind 326-1

The comment expresses support for the project, but does not specifically address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 327**

**From:** jay jacquet
**To:** BOS Public Comment
**Subject:** Objection to proposed mine and mailer
**Date:** Wednesday, February 16, 2022 4:22:11 PM

Unable to identify Dist

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Hello,

I have received a mail-in card from the proponents of the Idaho Maryland Mine which only has one option- support. Which is misleading and not in keeping with the citizen's goals which are clean air, clean water and protection of the land.

If the Board is aware of this mailing, it may want to intervene and offer an option of opposing the project.

I am a senior citizen and a former City, State of California, and U.S. Dept of the Interior employee. I urge the Board to abandon this campaign to reopen the mine for the obvious reasons: that mitigations and proposed green-friendly practices are not the same as no interference with water, air quality and quality of life in this Community. Developer's proposals in this case are false and misleading.

**Ind 327-1** As a former City Clerk, I understand the way Developers present false statistics and promise more than can be delivered when trying to persuade Agencies to vote their way in the name of jobs and not ruining the land.

I sincerely hope that intelligent decisions by the Board which forbid these types of developments in our County will prevail. If the project is approved, there will be no way to reverse all the damage to the environment. Mitigations proposed are false in this type of a project. There will be negative results.

If this Mine proposal comes to the voters, it will fail. If the Board approves the mine, all of Nevada County will fail.

I urge a no vote on the mine and the Board's refusal to allow a company from out of the Country to do business and to do harm in Nevada County.

J E de Sevren Jacquet
Resident and Voter

## INDIVIDUAL LETTER 327: JAY JACQUET

### Response to Comment Ind 327-1

The commenter expresses general concerns regarding the proposed project but does not specifically address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 328**

**From:** louis Quaintance

To: Nevada County Planning Commission
Attn: Matt Kelley, Senior Planner
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

To the Planning Commissioners and Staff

**Ind 328-1** As a resident of Nevada County, I am very concerned about Rise Grass Valley's proposal to reopen the Idaho-Maryland Mine.
The Draft EIR for the proposal should adequately address the mine's potential environmental impacts and include adequate mitigations for all impacts.
Instead the DEIR shows a lack of responsible due diligence to address many community concerns about this project.

**Ind 328-2** **Chapter 1.3 Approach to Centennial Industrial Site Baseline**
The proposed DTSC remediation project to clean up the Centennial Site should have been included as part of this DEIR. How can total impacts of the Mine Project be understood if baseline conditions at both sites are not established prior to all work done for both projects? What are the cumulative environmental impacts when the Centennial Site DTSC project is included as part of this DEIR?

**Ind 328-3** **Chapter 4.3 Air Quality and Green house Gas Emissions**
Additional car, truck, onsite diesel and gas engines will contribute significant emissions because of this project. During Public Safety Power Shutdowns, the mine intends to use emergency generators for continuing operations. Nevada County is vulnerable to the effects of Climate Change, including increased risk of wildfires.
Already, Western Nevada County has been designated a "non-attainment area for ozone", as monitored by the California Air Resources Board.

**Ind 328-4** Given the increase in emissions of the proposed project, how can Nevada County attain the goal of 51% reduction in greenhouse gas emissions, as called for in the Nevada County Energy Action Plan, if this project is approved?

**Ind 328-5** How does the County attain 3% annual reduction in ozone if this project is approved?

**Ind 328-6** The DEIR should require measurement and effective mitigations over all 80 years of mine operation. Why are air quality measures being limited to one year of construction?

**Ind 328-7** What are the planned alternative transportation options to cars and trucks?
What is planned beyond minor adjustments to traffic flows?

**Ind 328-8** Alternatives to "open burning of vegetative matter shall only be used unless deemed infeasible". What are the conditions that make this mitigation infeasible?

**Ind 328-9** Use of the Grid is offered as mitigation, as if the Grid does not create emissions to generate power. Certainly, climate change and drought conditions will reduce available hydro-electric power. How can the Grid be depended upon to generate power that does not produce emissions?

**Ind 328-10** Buying carbon offsets will do little to mitigate local impacts of this project's emissions. How can offset benefits stay local to improve air quality within Nevada County?

**Ind 328-11** The mitigations for Greenhouse Gas Emissions are dependent on future actions of households and other commercial businesses to reduce their emissions throughout California. Why isn't this proposed project taking responsibility for its emissions? Any reductions that others can attain should not be used to justify this project's level of emissions.

**Ind 328-12** Does the DEIR address emissions in conjunction with the development of properties in the surrounding area in Nevada County? What are likely future emissions when all planned development is accounted for in measuring total impacts?

**Ind 328-13** **Chapter 4.4 Biological Resources**
The goal of the California Biodiversity Initiative "is to secure the future of California's biodiversity". One of its broad goals is to "Preserve ecosystems at the regional scale, with sufficient linkages, buffers, and refugia to provide a robust future for all native species in the face of climate change". This DEIR does not adequately address mine impacts on the "linkages, buffers, and refugia" located on and near the property.

**Ind 328-14** Empire Mine State Historic Park borders the Rise GV property.
Wolf Creek flows through, and adjacent to, the Rise GV property. Wolf Creek's watershed includes varied habitats along the creek, its associated meadows, and the pond located on the Brunswick site. The DEIR misrepresents the nature of the property's wetlands. For example, the "clay-lined pool" is actually a vibrant habitat for native California flora and fauna.

**Ind 328-15** The Peer Review of the Biological Resources Reports Prepared for the Proposed Idaho-Maryland Mine, done by Madrone Ecological Consulting, states the DEIR "fails to analyze the Project's effects on the special-status species with potential to occur within South Fork Wolf Creek or downstream areas".
"Lack of documentation of a species during a non-protocol level survey should not be considered justification for low rankings".

**Ind 328-16** The DEIR cites surveys which were done in December 2018, July/August 2019, August 2020; not the best months for trying to document migrating and breeding birds. At minimum, surveys should have been done when native plants and wildlife are "evident and identifiable".

**Ind 328-17** In an area of Empire Mine State Historic Park, 1/2 mile from the proposed project, Gold Country Avian Studies has data that documents
Willow Flycatcher, a California Endangered Species

Olive-sided Flycatcher, a CDFW Species of Special Concern
Yellow-breasted Chat, a CDFW Species of Special Concern
Yellow Warbler, a CDFW Species of Special Concern
Data of these bird species has been submitted to the California Natural Diversity Database. This documentation of vulnerable bird species, and mitigations for impacts to them, should have been included in the DEIR.

**4.10 Noise and Vibration**

**Ind 328-18** The DEIR does not adequately address the impacts of noise and vibration on wildlife, especially on nesting bird species. The noise levels considered "less than significant" in the DEIR go beyond those that impact wildlife. Mitigations should result in levels below 40 dBA in the South Fork Wolf Creek watershed within the Mine properties and all areas of the Mine that border Empire Mine State Historic Park.

**Ind 328-19** The majority of studies documented effects from noise, including altered vocal behaviour to mitigate masking, reduced abundance in noisy habitats, changes in vigilance and foraging behaviour, and impacts on individual fitness and the structure of ecological communities. **This literature survey shows that terrestrial wildlife responses begin at noise levels of approximately 40 dBA, and 20% of papers documented impacts below 50 dBA.** Our analysis highlights the utility of existing scientific information concerning the effects of anthropogenic noise on wildlife for predicting potential outcomes of noise exposure and implementing meaningful mitigation measures." A synthesis of two decades of research documenting the effects of noise on wildlife, Shannon, et al Biological Reviews, 26 June 2015

**Ind 328-20** CEA, Community Environmental Advocates, has written an extensive list of comments on behalf of many concerned Nevada County community groups. As a member of Sierra Foothills Audubon Society and Redbud Chapter of the California Native Plant Society, I urge that all these comments be considered seriously, and the DEIR corrected.

**Ind 328-21** Nevada County is a beautiful place to live and work despite its history of gold mining. We are surrounded by signs of the environment's recovery from the destructive nature of past mining projects. Why should Rise Grass Valley be permitted to add to the sad history of environmental destruction in Nevada County for 80 years into the future and beyond?

Sincerely,

Jean Matsuno
10777 Banner Mine Way
Nevada City, CA 95959
email: ltquam@gmail.com

## INDIVIDUAL LETTER 328: JEAN MATSUNO

### Response to Comment Ind 328-1
The commenter states the DEIR is inadequate but provides no specifics or evidence in this comment. Please see Master Response 1 – Non-EIR/Administrative Issues.

### Response to Comment Ind 328-2
Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 328-3
Criteria pollutant emissions and greenhouse gases from the project are analysed in Chapter 4.3 of the DEIR and impacts have been determined to be less than significant after mitigation. The DEIR assumed 100 hours of generator use in the air quality analysis; however, extended use of generators is speculative and CEQA does not require analysis of speculative impacts. Given that it is unknown if/ when a PSPS would occur, it is considered a speculative event, and per the CEQA Guidelines, if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145). California courts have consistently held that "an EIR is not required to engage in speculation in order to analyze a worst-case scenario." (see Napa Citizens for Honest Government v. Napa County Bd. of Supervisors (2001) 91 Cal.App.4th 342, 373.). The use of emergency generators is speculative and beyond the reasonable control of the applicant. However, criteria air pollutant emissions associated with 24-hour operation of the emergency generators is provided in Table 4.3-25 of the DEIR on page 4.3-104 for informational disclosure purposes only.

DEIR Chapter 4.13 analyzed the project's potential contribution to wildfire risk. Regarding climate change, please see Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 328-4
Please see Master Response 25 – Nevada County Energy Action Plan.

### Response to Comment Ind 328-5
Please see Master Response 18 – Air Quality Thresholds. The County's attainment of compliance with ozone standards is to be achieved by County-wide implementation of Northern Sierra Air Quality Management District thresholds and mitigation, as well as continuing improvements in technology and emissions standards. The Project Applicant is not solely responsible for meeting the County's air quality objectives.

### Response to Comment Ind 328-6
Air quality measures are not limited to one year of construction. Please see Chapter 4.3 of the DEIR. Also see Master Response 19 – NSAQMD Criteria Pollution Thresholds during Operations.

### Response to Comment Ind 328-7
As discussed on page 4.12-82 of the DEIR, because the proposed project is anticipated to directly employ approximately 312 employees during full operations, pursuant to Section L-II 4.1.9 of the Nevada County LUDC, the Project Applicant would be required to submit to the County a detailed analysis of transportation alternatives, documenting feasible measures for reducing auto dependence. Please see pages 4.12-82 through 4.12-83 for further information. Further, the proposed project would incorporate an area for bicycle racks at the Brunswick Industrial Site, which would provide a minimum of 11 racks (44 bicycle spaces).

## Response to Comment Ind 328-8

The Final EIR will clarify that burning of vegetative material will be prohibited in a condition of approval, which shall be included in the mitigation monitoring and reporting program.

## Response to Comment Ind 328-9

Electrical grid power generates no on-site air emissions. Electrical grid power indirectly generates greenhouse gases (GHG) from power generation, but substantially less greenhouse gas emissions than diesel or gasoline powered generators and machinery.

## Response to Comment Ind 328-10

Climate Change is a global impact, so purchase of carbon offsets is related to a global impact rather than local air quality. Also see Master Response 28 – Greenhouse Gas Credits.

## Response to Comment Ind 328-11

Please see Master Response 27 – Greenhouse Gas Thresholds.

## Response to Comment Ind 328-12

Please see Chapter 4.3 regarding analysis of cumulative air quality impacts. Also see Master Response 18 – Air Quality Thresholds.

## Response to Comment Ind 328-13

The DEIR biological impact analysis is based on the guidance provided in the CEQA guidelines, Appendix G. DEIR Chapter 4.4 analyzed six different biological impacts including potential impacts to special status species and associated habitat and migratory corridors.

## Response to Comment Ind 328-14

The DEIR, and Appendix F.7, correctly identify the onsite pond as a historic man-made clay-lined pond that was associated with historic saw milling operations. The pond is non-jurisdictional pursuant to the federal Clean Water Act but may be considered a “water of the State of California.” Special status species that may use the pond and surrounding habitat were considered in Impact 4.4-2 and impacts to “waters” was considered in Impact 4.4-3.

## Response to Comment Ind 328-15

The Madrone peer review was in regard to the draft copies of the various biological studies completed by the applicant’s biological consultant and not the updated analysis that served as a basis for the DEIR. As stated on page 4.4-1 of the DEIR, the reports were updated, as necessary to address the comments included in the third-party independent peer review performed by Madrone Ecological Consulting, Inc. under contract with Raney. Please see Master Response 30 – Technical Study Adequacy.

## Response to Comment Ind 328-16

Please see Master Response 30 – Technical Study Adequacy, and Master Response 37 – Birds and Raptors.

The CEQA guidelines require analysis of substantial interference to "the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." Migration is defined as the seasonal movement of animals from one habitat to another. Various animal, bird, and fish species are not automatically considered migratory just because they move from one location to another. Migration serves a purpose for the species such as winter/summer habitat for foraging or breeding. It is acknowledged and analyzed in the DEIR impact analysis (see section 4.4.4) that species exist within the project site that are common to the area. Potential impacts to these

species were analyzed and mitigation measures have been provided where it was determined impacts to species could occur as a result of project activities, including the implementation of preconstruction surveys and agency permitting requirements. The only migratory species acknowledged by the County General Plan is deer migration corridors. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded it was less than significant.

## Response to Comment Ind 328-17

Please see Master Response 37 – Birds and Raptors.

## Response to Comment Ind 328-18

Noise and vibration impacts to species was analyzed in DEIR section 4.4.4, Impact 4.4-2, and was determined to be less than significant. It should be noted, increases in daytime and nighttime ambient noise level increases caused by activities at the Brunswick Industrial Site do not extend to the Empire Mine State Park (EMSP) boundary (see DEIR Figure 4.10-7). Engineered fill placement at the Centennial Industrial Site is the closest project activity to the EMSP and could last approximately 6 years. The nearest receptor to the EMSP is number 8 (see DEIR Figure 4.10-3) and the closest noise and vibration measurement location is number 7 and 8 (see Figure 4.10-3). As shown in DEIR Table 4.10-12, Centennial Industrial Site engineered fill activity does not exceed existing baseline noise levels (see Table 4.10-6). As a result, wildlife species that may use the EMSP should not experience an increase in noise levels above ambient levels and therefore, such impacts would be considered less than significant.

## Response to Comment Ind 328-19

Please see Response to Comment Ind 328-18 above.

## Response to Comment Ind 328-20

Comment noted. Please see responses to comments in Group Letters 7 and 8.

## Response to Comment Ind 328-21

The commenter’s opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

**Individual Letter 329**

Dear Rise Mine Project

**Ind 329-1** We would like to voice my opposition to this project.
Our main concern is the impact on the groundwater water and the straining the limited water resources we are currently facing in a decade long drought.
Specifically the disruption of water tables ,fissures and aquifers that are in place currently meeting the demands of the Nevada county population.

Referring to The Rise Mine DEIR

**Ind 329-2** Putting a strain on the already existing water resource by:
1) The need to purchase 5,700 gallons per day for the Rise Mine Project potable water needs as well as 42,000 gallons per day for dust suppression; this combined estimated total per year is over 17 million gallons annually.

**Ind 329-3** 2) The disruption of existing wells by draining the mine and impacting water tables in place for decades

3) The mine development plan calls for new tunnels being drilled at all times in any and all directions. This **will** impact water tables and water sources further siphoning an already fragile water eco system.

**Ind 329-4** As a homeowner we are dependent on groundwater.
Working for 50 years in a profession that consumes millions of gallons of potable water .I believe this water need estimate to be severely under projected.
This is a lot of water farmers, ranchers, wildlife and the public would no longer have access to.

**Ind 329-5** I am deeply concerned that the Rise Mine Project will impact groundwater and run wells dry leaving homeowners with worthless property that is uninhabitable, devalued and unable to be sold.

Sincerely
Michael and Jeannine Mayer

## INDIVIDUAL LETTER 329: JEANNINE MAYER

### Response to Comment Ind 329-1

The commenter opposes the project primarily due to the project's impacts to groundwater water supplies during the drought. The commenter does not discuss the adequacy of the DEIR. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 329-2

The commenter is concerned about the project's water usage but does not identify any inadequacies with the DEIR analysis. The commenter's concerns about the project have been forwarded to the decisionmakers.

### Response to Comment Ind 329-3

The commenter states that the project will adversely impact groundwater wells but does not state how the DEIR is inadequate in this regard. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality), which found impacts to groundwater supplies to be less than significant after implementation of mitigation. The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 329-4

The commenter states that the project will expand underground mine workings and disrupt groundwater wells, but provides no additional detail on why the DEIR's analysis of impacts to groundwater in inadequate.

The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR and Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, Master Response 33 – Groundwater Dependent Vegetation, and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 329-5

The commenter reiterates concerns regarding groundwater and states that impacts to private wells will devalue property. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

**Individual Letter 330**

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170 Nevada City, CA 95959-7902
Phone: 530-265-1423
Email: Idaho.MMEIR@co.nevada.ca.us

March 23, 2022

Dear Mr. Kelly, and the Planning Commission/Board of Supervisors,

**Ind 330-1** My name is Dr. Jeff Brownwood, a family practice physician and Nevada County resident of 24 years. As a physician, parent and a concerned citizen, I have significant concern about the viability and the advisability of reopening the Idaho Maryland Mine with an 80 year mining operations permit, based on the Draft Environmental Impact Report.

The DEIR for this permit is inadequate to consider granting this permit. There are so many impact concerns, both presumably mitigatable and unmitigatable, it is inconceivable to me that the Board would consider granting the permit. The impact concerns revolve around the quality of life in Nevada County, noise, traffic , environment, water risks, and property values.

**Ind 330-2** When land use zoning was initially created in our area, industrial mining was the charter in the late 1800s. We are now a residential and light business area. Allowing a large industrial mining operation to reopen for all practical purposes in residential Grass Valley is so short sighted and irresponsible, to me, it ultimately defies comprehension.

As a physician, if a medicine or treatment has more risks than benefits, you do not use that medicine. You might fix something specific but overall kill the patient.

**Ind 330-3** The thing that really got my attention is the permit is to run , 24/7 for 80 years, heavy cargo truck loads of ore out highway 174 or 49, something like 14,000 loads per year. The noise and congestion would make our rural towns low quality places to live. House values would go down 10-20% in my opinion. For all intents and purposes this is a hidden $50k tax on every homeowner in Nevada County to fund this project. And, within a several mile radius, I have concerns that dewatering the mine and vibration from operations will impact well water supply to many homes.

**Ind 330-4** The DEIR specifically identifies 3 unmitigatable impacts and 85 presumably mitigatable impacts. I have real concern that a large industrial business such a Rise Gold figures is it will much easier and better to ask for forgiveness than for permission when it comes to the presumably correctable environmental impacts.

The unmitigatable three impacts are Aesthetics, noise and vibration, traffic congestion. The reality is: mining involves what the DEIR itself calls "reasonably foreseeable" accidents, lack of proper management, oversight and mitigation. Multiply those concerns over 80 years and this transforms Grass Valley and Western Nevada County into an industrial area.

**Ind 330-5** A large, heavy industrial operation with its blasting, processing and transporting immediately adjacent to Grass Valley (and very close to the Gold Hill and Greenhorn Rd neighborhoods) would significantly impact the quality of life of our community at large, degrade the environmental integrity of the Wolf Creek watershed, and potentially be a hazard and a danger to all. The DEIR lists "significant impacts" also to water quality, air quality, the emission of green house gasses , wetlands, and species of concern. The project also proposes sending all the mine water it needs to pump out of the mine daily into the Wolf Creek watershed, through Grass Valley, and involves other impactful details the DEIR does not consider a problem.

**Ind 330-6** The DEIR also suggests that all but three of the 85 significant impacts can be mitigated to at least reasonable levels. However, if we multiply those concerns over 80 years, Grass Valley and Nevada County are transformed into heavy industrial area. This is not reasonable or desirable. The DEIR is inadequate to consider proceeding further with the permit. Please address these concerns as you and the Board move forward with your deliberations.

With concern for our county and quality of life,
Sincerely ,

Jeff Brownwood, DO
16400 Lake Vera Purdon Rd.
Nevada City, CA 95959
jobcomm1203@yahoo.com (530) 815-6649

## INDIVIDUAL LETTER 330: JEFF BROWNWOOD

### Response to Comment Ind 330-1

The commenter is opposed to the project based on several impacts discussed in the DEIR. The commenter's opposition to the Proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues. Impacts of the project to the environment, traffic, noise, and water are analyzed in the DEIR. In regard to quality of life and property values, the commenter is referred to Master Response 1 – Non-EIR/Administrative Issues and Master Response 2 – Social and Economic Impacts.

### Response to Comment Ind 330-2

The commenter states that the Nevada County is now a residential and light industrial area and does not want a mining operation in the community. The commenter's opposition to the Proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

### Response to Comment Ind 330-3

The commenter is concerned that the Idaho-Maryland Mine would operate 24 hours a day, 7 days a week for 80 years and the traffic impacts the project would generate. The commenter is specifically concerned about traffic impacts to State Routes 49 and 174. The DEIR states that operation truck traffic would, at the most, occur from 6:00 AM to 10:00 PM. (DEIR, Table 4.12-7.) The DEIR also states that no project truck traffic would occur on State Route 174. (DEIR, Table 4.12-9.) The DEIR's Chapter 4.12 (Transportation) analyzed traffic impacts and found those impacts to be less than significant after mitigation, with the exception of the intersection at Brunswick Road and State Route 174 and the Brunswick Road and Sutton Way intersection, where impacts would be significant and unavoidable even after implementation of mitigation. (DEIR, pp. 4.12-56, 116.) The commenter is also concerned about impacts to noise and impacts to private wells from the dewatering of the mine but does not provide any additional information. Those potential impacts were analyzed in Chapter 4.8 (Hydrology and Water Quality) and Chapter 4.10 (Noise and Vibration). Finally, the commenter states that the project would result in decreased property values. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, Master Response 2 – Social and Economic Impacts, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 330-4

The commenter references Impact 4.7-2 which discusses hazards to the public through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment. (DEIR, p. 4.7-35.) However, the commenter does not provide any additional information on why the DEIR is inadequate. As stated on page 4.11-25 of the DEIR:

> In addition, underground metal mining has injury rates similar to residential construction and injury rates are significantly less than agriculture, truck transportation, and logging. The non-fatal lost time injury rate for underground metal mining of approximately 1.5 injuries per year per 100 workers is similar to that experienced in the residential construction industry.[29,30] From the period of 2016 to present, only two fatal injuries have occurred in all the underground metal mines combined in the United States (both in 2018).[31,32]

The commenter is also referred to Master Response 3 – Operator Responsibility.

## Response to Comment Ind 330-5

The commenter states that the discharge of the treated water to South Fork Wolf Creek will degrade the watershed but does not state how the DEIR is inadequate. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) and Master Response 35 – Discharge to South Fork Wolf Creek. The commenter also raises concerns regarding hazards, water quality, air quality, and GHGs, wetlands, and species of concern, but provides no information on which to formulate a specific response. These impacts are discussed in Chapter 4 of the DEIR. In regard to quality of life and property values, the commenter is referred to please see Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

## Response to Comment Ind 330-6

The commenter states that the DEIR's impacts, which are less than significant after mitigation, will become significant over the course of the 80-year project but does not explain why. Cumulative impacts have been analyzed in the DEIR. The commenter's opposition to the Proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues.

**Individual Letter 331**

**From:** Jeff Claussen <jclaussen395@gmail.com>
**Sent:** Monday, April 4, 2022 9:12 AM
**To:** Idaho MMEIR
**Subject:** Comments for Draft EIR on Mine reopening

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Please see my comments for the Draft EIR on the proposed Idaho Maryland Mine reopening: **Ind 331-1**

1. What agency regulates and inspects storage and safety of explosives on the mine property? **Ind 331-2**
2. How often would these inspections take place? **Ind 331-3**
3. What are the OSHA guidelines for above ground explosive inventory storage and the distance to residential areas? **Ind 331-4**
4. Regarding explosive material delivery to the site, who would ensure that delivered explosives are immediately taken underground for storage? **Ind 331-5**
5. How quickly would this take place upon opening the mine if the tunnels are not structurally safe and dewatered yet? **Ind 331-6**
6. There will be above ground explosive inventory storage at some point in the mine operation schedule, so where and how would that happen? **Ind 331-7**
7. Who would inspect that storage facility? **Ind 331-8**
8. How would any above ground explosive inventory storage affect wildland firefighting efforts and response considering potential explosive hazards in the event of a wildland fire event? **Ind 331-9**
9. How would this potential hazard of above ground explosive inventory storage affect the major public evacuation route of Highway 174 in the event of a large regional wildfire considering the proximity of Highway 174 to the mine property? **Ind 331-10**
10. Regarding the Centennial Property, how would the mine waste rock be disposed of there? **Ind 331-11**
11. What are the hours of operation? **Ind 331-12**
12. Will there be night lighting? **Ind 331-13**
13. What about noise and dust from equipment operation? **Ind 331-14**
14. How would arsenic in the mine waste rock be controlled from spreading via dust and wind to the surrounding community and downtown Grass Valley? **Ind 331-15**
15. How would the dust levels be monitored and mitigated if found to be unhealthy? **Ind 331-16**
16. What are the OSHA and Nevada County Environmental Health Regulations regarding arsenic and asbestos dust from construction activities?

Thank you,
Jeff Claussen
jclaussen395@gmail.com
Nevada City resident

## INDIVIDUAL LETTER 331: JEFF CLAUSSEN

### Response to Comment Ind 331-1
The commenter asks which agency is responsible for regulating and inspecting the storage of explosives at mining operations. The onsite storage and use of explosives is regulated by state and federal laws and regulations as discussed on pages 4.7-23 through 4.7-28 of the DEIR. The U.S. Mine Safety and Health Administration (MSHA) is responsible for the inspection of explosives storage and use in underground mines.

### Response to Comment Ind 331-2
The commenter asks how often inspections occur for the use of explosives at mining operations. As stated on page 4.7-13 of the DEIR, MSHA is required to inspect each underground mines at least four times a year.

### Response to Comment Ind 331-3
The commenter asks what OSHA guidelines govern above ground explosives. The project does not propose to store explosives on the surface.

### Response to Comment Ind 331-4
The commenter asks who would ensure that explosives delivered to the project site are immediately taken underground for storage. The management and employees of the mine are responsible for transferring explosives from surface to underground.

### Response to Comment Ind 331-5
The commenter asks how soon explosives would be needed should the Idaho-Maryland Mine reopen. Explosives would not be required before the mine is dewatered. Explosive magazine and ground support requirements for explosives storage areas are discussed on pages 4.7-26 through 4.7-28 of the DEIR.

### Response to Comment Ind 331-6
The commenter asserts that the project will, at some point, store explosives on the surface. The project does not propose to store explosives on the surface.

### Response to Comment Ind 331-7
The commenter asks who would inspect the explosives storage facility. MSHA would inspect underground explosive storage facilities.

### Response to Comment Ind 331-8
The commenter asks how aboveground storage of explosives would impact wildland firefighting efforts. The project does not propose to store explosives on the surface.

### Response to Comment Ind 331-9
The commenter asks how aboveground storage of explosives would impact an evacuation during a wildfire. The project does not propose to store explosives on the surface.

### Response to Comment Ind 331-10
The commenter asks how the engineered fill would be placed at the Centennial Industrial Site. As stated on page 3-33 of the DEIR, the engineered fill would be transported from the Brunswick Industrial Site to the Centennial Industrial Site using haul trucks. Approximately 1.6 million tons

of engineered fill would be trucked from the Brunswick Industrial Site to the Centennial Industrial Site over a five-year period for placement and compaction. The average transport of engineered fill would be 1,000 tons per day or 365,000 tons per year. A maximum transport rate of up to 2,000 tons of engineered fill per day is required to make up for periodic weather or operational delays. Truck payloads would be approximately 20 tons per truck and, therefore, would require up to 100 trips per day and an average of 50 trips per day. Engineered fill may be mixed on-site using mobile equipment to ensure uniformity and meet specifications for compaction. Engineered fill would continue to be placed, graded, and compacted in a series of lifts to an elevation ranging between 2,520 and 2,570 means sea level (approximately 30 to 70 feet above ground surface). Fill slopes would be 3:1 (horizontal to vertical) or flatter (see Figure 3-14). Following completion of fill activities, the fill slopes would be revegetated to control erosion and ensure slope stability. The final grading would result in 37 acres of flat developable land on property zoned industrial.

## Response to Comment Ind 331-11

The commenter asks what the hours of operation are for the project. Hours of operation for project activities are shown in Table 3-7 of the DEIR.

## Response to Comment Ind 331-12

The commenter asks if the project will have night lighting. The project will have night lighting at the Brunswick Industrial Site. The commenter is referred to Section 4.1-3 of the DEIR.

## Response to Comment Ind 331-13

The commenter is concerned about noise and dust from the project equipment. Noise from equipment operation is analyzed in Chapter 4.10 (Noise and Vibration) of the DEIR. Dust emissions are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR.

## Response to Comment Ind 331-14

The commenter asks how arsenic would be controlled from spreading via dust and wind. The commenter is referred to Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and Appendix E.1 of the DEIR regarding air emission modelling and health risk assessment including dust control methods, assumptions, and required mitigation measures. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring.

## Response to Comment Ind 331-15

Please see Response to Comment Ind 331-14.

## Response to Comment Ind 331-16

The commenter asks what OSHA and Nevada County Environmental Health regulations govern arsenic and asbestos dust from construction activities. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The Nevada County Environmental Health Department does not regulate arsenic or asbestos in dust. The action level for inorganic arsenic is 5 micrograms per cubic meter and permissible exposure limit under OSHA regulations

for inorganic arsenic is 10 micrograms per cubic meter. (29 CFR 1926.1018.) The time weighted average limit for asbestos is 0.1 fiber per cubic centimeter and excursion limit is 1 fiber per cubic centimeter under OSHA regulations for asbestos. (29 CFR 1926.1101.)

**Individual Letter 332**

14933 Pathan Pl.
Nevada City, CA 95959

February 24, 2022

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Dear Mr. Kelley,

I'm a medical doctor, and have lived in Nevada County most of my life.

I oppose Rise Gold Corporation's proposal to re-open the Idaho-Maryland mine because it will irreparably damage our community in many ways. For the purpose of addressing the DEIR, I'll limit these comments to its effects on our air quality.

The mine's damage to our air quality is, frankly, unmitigatable. Virtually any quantum of its emissions will raise Nevada County's incidence of illness and death despite any mitigation, as I'll explain.

**Ind 332-1**

The air quality in California in general is already poor. According to the American Lung Association, the five cities in the country with the worst annual particulate pollution and highest ozone levels are in California, and include the Sacramento-Roseville region.

California's most air-polluted cities are also those most affected by our now-endemic wildfires, which severely aggravate monthly and annual air pollution averages. With its warmer and drier conditions, ongoing climate change intensifies wildfires, so worsens California's air quality and the consequent health effects.

Nevada County is even more affected than the state. The American Lung Association gives our community an F grade for ozone levels, designating 105 days per year "unhealthy." Our county has long been considered "Sacramento's tailpipe," as auto exhaust emitted there funnels here. And during the past two summers, wildfires contributed to entire weeks which the Northern Sierra Air Quality Management District labeled "very hazardous."

**Ind 332-2**

Nevada County can't tolerate additional air pollution. That bears repeating: Nevada County can't tolerate additional air pollution.

Airborne elements from the mine will include dust, ozone, and noxious particulates and chemicals, not to mention considerable greenhouse gases. The project will emit copious diesel particulate matter (DPM), of which most is small enough to readily enter human lungs. Current and future Nevada County children will absorb more of the mine's DPMs than today's adults do, both because of their more rapid respiratory rate and eight decades of exposure.

The particles we'll all inhale include asbestos, silica, and various heavy metals. DPM is also composed

of numerous organic compounds, including more than forty known cancer-causing substances like polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. The California Air Resources Board has classified DPMs as a Toxic Air Contaminant. The CARB estimates that about 70% of the cancer risk that the average Californian faces stems from these diesel exhaust particles.

**Ind 332-3**

The DEIR Table 4.3-19 estimates that maximum mitigated emissions of all reactive organic gases, oxides of nitrogen, carbon monoxide, oxides of sulfur, and particulate matter of 2.5 to 10 microns diameter will total 341 lb per day during the project's first four years, 332 lb daily during the next five years, and 293 lb during each day of the project's final sixty-nine years. That is, the DEIR estimates that despite all mitigations, however effective, the mining operation will release 8.5 million pounds--3900 metric tons--of pollutants known to be toxic into our community over the next eighty years. And this does not include emissions generated in post-mining reclamation.

Nor does it include emissions from idling diesel engines. In its Air Quality report of 2020, the DUDEK Corporation estimated (p. 135) that the project's diesel idling would amount to 200,000 minutes annually. The DEIR, though, explicitly omits the effects of idling (p. 4.3-95): "Starting and idling emissions, which are minor, are excluded because the focus is on the Vehicle Miles Traveled rather than the ultimate origin and/or destination of each trip." We've all heard and smelled diesel delivery trucks as they idle; imagine the same from a fleet of twenty-ton haulers.

**Ind 332-4**

The DEIR specifies abundant mitigation requirements, as it should. But in practice, the mining industry in general has a record of neglecting or circumventing mitigations. The DEIR requires, for example, that the operation must utilize environmental state-of-the-art "Tier 4" diesel engines "...if commercially available," meaning that if they're unavailable for some reason (for example, p. 4.3-78: "...taking into consideration factors such as critical path timing of construction and geographic proximity of the equipment location to the project sites"), dirtier engines will suffice. In practicality, Rise Gold won't need to use the environmentally cleanest engines if it's inconvenient.

**Ind 332-5**

That's only one mitigation out of a number larger than any public agency can monitor, enforce or, most importantly, afford. The history of mining, especially in Nevada County, indicates that mitigation measures are generally underfunded, poorly enacted, and often virtually ignored, leaving the local community ruined and its taxpayers left to clean up the mess. Rise Gold's CEO's British Columbia Banks Island mine misadventure is a prime example of such irresponsibility.

**Ind 332-6**

Whatever benefits this project might bring to Nevada County, it is certain to damage our health. Our mortality rate from chronic lung disease is double the rate in California statewide: 69 versus 35 deaths per 100,000 people. Many of us are already at risk simply for our age. According to the 2020 census, one in three of us is 65 or older, compared to the statewide proportion of one in seven. Our heart disease mortality rate is half-again higher than statewide. In 2014 Sierra Nevada Memorial Hospital saw 369 adults and children for acute asthma and admitted 88, at cost of over $3 million, and that represents only one single illness. Mining emissions, featuring a wide assortment of irritants and carcinogens both known and unknown, will raise the incidence of local pulmonary and cardiac illnesses, with all their personal and financial costs.

**Ind 332-7**

The DEIR asserts that none of Rise Gold's operations, properly mitigated, will violate standards. Its repeated conclusions, "no significant impact," were written by people who won't live here the next

eighty years. As an avalanche of numbers, the DEIR can look like science, but as a trained scientist, I'm dubious. The data are based on estimates supplied by Rise Gold. Considering its environmental record and *misleading advertising, due diligence requires our skepticism. We should also recognize that* Federal, State, and county agencies' complex standards and thresholds for air quality do not exemplify science. They are useful and sensible, but necessarily arbitrary, and deliberately ignore varieties of human experience like anxiety, irritation, aesthetics, and sensitivity to noise and odor. And alarmingly, the DEIR does not take into account air quality effects on the thousands of voiceless Nevada County residents who will be born during the next eighty years.

**Ind 332-8**

The DEIR's air quality section describes the effects of only this project, ignoring that its toxicities will add to the onerous burden the County already carries. Even if all its mitigation recommendations were enacted, *they won't reduce the project's air toxicities and greenhouse gases to zero.* Again, Nevada County can't tolerate additional air pollution.

Considering the proposal's predictable injuries to Nevada County's health, beauty, economics, and well-being, no one who values our community can claim it has redeeming value. I urge Nevada County's Planning Department and Supervisors to find the DEIR unacceptable, and to reject the proposal.

Respectfully,

Jeff Kane MD

## INDIVIDUAL LETTER 332: JEFF KANE

### Response to Comment Ind 332-1

This comment is introductory in nature and the commenter opposes the project. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

The commenter states that the project's damage to air quality will be unmitigable but does not address the adequacy of the DEIR. The DEIR's analysis of air quality impacts included a health risk assessment and found air quality impacts to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The commenter is referred to Master Response 18 – Air Quality Thresholds.

### Response to Comment Ind 332-2

The commenter states that the project will expose Nevada County residents to dust, ozone, asbestos, silica, diesel particulate matter, GHGs, and noxious particulates and chemicals but does not specify how the DEIR is inadequate. The DEIR's health risk assessment analyzed dust, criteria air pollutants, toxic air contaminants, and GHGs. The DEIR evaluated diesel exhaust, silica, asbestos, and heavy metals and the related impacts were found to be less than significant after mitigation. (DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy).) The health risk assessment specifically addresses health impacts to children. The commenter is referred to Master Response 18 – Air Quality Thresholds.

### Response to Comment Ind 332-3

The commenter references DEIR Table 4.3-19, which indicates the maximum mitigated daily project emissions per source and type of emission and states that the project will emit 8.5 million pounds of emissions over the course of the lifespan of the use permit. As shown in Table 1.3-19 and discussed in DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy), the Northern Sierra Air Quality Management District (NSAQMD) has established thresholds of significance for ROG, NOx, and PM10. The project emissions of these constituents are not significant after mitigation and applicant proposed measures. There is no threshold established for the sum of all emissions as prepared by the commenter.

The commenter also states that the DEIR omits the GHG impacts of idling diesel engines by citing to the following in the DEIR: "starting and idling emissions, which are minor, are excluded because the focus is on the Vehicle Miles Traveled rather than the ultimate origin and/or destination of each trip." (DEIR, p. 4.3-95.) However, this same language is contained in the Air Quality and Greenhouse Emissions Analysis prepared by Dudek (DEIR, Appx. E.1., p. 45.) Starting and idling GHG emissions were included in the project's GHG emission estimates. DEIR page 4.3.95 discusses the exclusion of starting and idling GHG emissions from the calculation of emissions of off-site mobile source GHG emissions by air district. As stated in the DEIR, this information is provided only to facilitate full public disclosure and to present the magnitude of potential GHG emissions occurring within other air districts.

### Response to Comment Ind 332-4

The commenter states that the mining industry in general either neglects or circumvents mitigation measures and implies that the Project Applicant will do the same. However, the commenter provides no evidence to substantiate this claim. The commenter specifically points to Mitigation Measure 4.3-1(b) as evidence that the Project Applicant will only use Tier 4 Final engines if

commercially available. However, the APM-AQ-1 (applicant proposed measure) would require all off-road diesel-fueled and emergency generators owned by the Project Applicant to be Tier 4 Final engines. (DEIR, p. 4.3-65.) Moreover, Mitigation Measure 4.3-1(b) requires the submission of a Construction Exhaust Emissions Minimization Plan in which the Project Applicant must demonstrate compliance with the Mitigation Measure. The Mitigation Measure is also enforceable by the County. Regarding the assertion that the Project Applicant would not follow mitigation measures, the commenter is referred to Master Response 3 – Operator Responsibility.

## Response to Comment Ind 332-5

The commenter questions whether mitigation measures can be enforced by the County and provides an opinion of the Project Applicant's character. The commenter is referred to Master Response 3 – Operator Responsibility.

## Response to Comment Ind 332-6

The commenter states that any benefit of the project is outweighed by impacts to air quality but does not state how the DEIR is inadequate. Please see Master Response 1.

## Response to Comment Ind 332-7

The commenter claims that the DEIR is based on estimates supplied by Rise Gold. The DEIR was prepared by Nevada County and all Project Applicant-supplied technical reports were peer reviewed by the County's third-party consultants. Thresholds of significance and project impacts are thoroughly discussed in the DEIR. In regard to the commenter's opinion on the Project Applicant's reputation, the commenter is referred to Master Response 3 – Operator Responsibility. The DEIR takes into account the air quality effects of the project on Nevada County residents, including children. The commenter is referred to Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR and Master Response 18 – Air Quality Thresholds.

## Response to Comment Ind 332-8

The commenter reiterates concerns regarding the project's air quality impacts and opposes the project. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues. There is no requirement to reduce emissions, including greenhouse gases to zero. Please see Master Response 27 – Greenhouse Gas Thresholds.

To: Nevada County Planning Dept. & Supervisors
Re: Comments on Idaho-Maryland Mine DEIR

From: Jeff Kane MD
14933 Pathan Pl.
Nevada City, CA 95959
530-265-0478

Dear Supervisor:

I'm a medical doctor, and have lived in Nevada County most of my life.

I urge you to reject Rise Gold Corporation's proposal to re-open the Idaho-Maryland mine because it will irreparably damage our community in many ways. For the purpose of addressing the Draft Environmental Impact Report, I'll limit these comments to its effects on our air quality.

The mine's damage to our air quality is, frankly, unmitigatable. Its least emissions will raise Nevada County's incidence of illness and death despite any mitigation, as I'll explain.

**The air quality in California in general is already poor.**
According to the American Lung Association, the five cities in the country with the worst annual particulate pollution and highest ozone levels are in California, and include the Sacramento-Roseville region. California's most air-polluted cities are also those most affected by now-endemic wildfires, which severely aggravate monthly and annual air pollution averages. With its warmer and drier conditions, ongoing climate change intensifies wildfires, so worsens California's air quality and the consequent health effects.

Ind 333-1

**Nevada County is even more affected than the state.**
The American Lung Association gives our community an F grade for ozone levels, designating 105 days per year "unhealthy." Our county has long been considered "Sacramento's tailpipe," as auto exhaust emitted there funnels here. And during the past two summers, wildfires contributed to entire weeks which the Northern Sierra Air Quality Management District labeled "very hazardous." Nevada County can't tolerate additional air pollution.

**The mine will emit massive amounts of numerous respiratory toxins**
Airborne elements from the mine will include dust, ozone, and noxious particulates and chemicals, not to mention considerable greenhouse gases. The project will emit copious diesel particulate matter (DPM), of which most is small enough to readily enter human lungs. The particles we'll all inhale include asbestos, silica, and various heavy metals. DPM is also composed of numerous organic compounds, including more than forty known cancer-causing substances like polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. The California Air Resources Board has classified DPMs as a Toxic Air Contaminant. The CARB estimates that about 70% of the cancer risk that the average Californian faces stems from these diesel exhaust particles.

Ind 333-2

**Even optimally mitigated, the mine's toxic airborne emissions will be massive.**

The DEIR Table 4.3-19 estimates that maximum mitigated emissions of all reactive organic gases, oxides of nitrogen, carbon monoxide, oxides of sulfur, and particulate matter of 2.5 to 10 microns diameter will total 341 lb per day during the project's first four years, 332 lb daily during the next five years, and 293 lb during each day of the project's final sixty-nine years. That is, the DEIR estimates that despite all mitigations, however effective, the mining operation will release 8.5 million pounds--3900 metric tons--of pollutants known to be toxic into our community over the next eighty years. And this does not include emissions generated in post-mining reclamation.

Nor does it include emissions from idling diesel engines. In its Air Quality report of 2020, the DUDEK Corporation estimated (p. 135) that the project's diesel idling would amount to 200,000 minutes annually. The DEIR, though, explicitly omits the effects of idling (p. 4.3-95): "Starting and idling emissions, which are minor, are excluded because the focus is on the Vehicle Miles Traveled rather than the ultimate origin and/or destination of each trip." We've all heard and smelled diesel delivery trucks as they idle; imagine the same from a fleet of twenty-ton haulers and other industrial engines.

**Ind 333-3**

**The mining industry in general and Rise Gold in particular has a record of neglecting or circumventing mitigations.**

The DEIR specifies abundant mitigation requirements, as it should. The Report requires, for example, that the operation must utilize environmental state-of-the-art "Tier 4" diesel engines "...if commercially available," meaning that if they're unavailable for some reason (for example, p. 4.3-78: "...taking into consideration factors such as critical path timing of construction and geographic proximity of the equipment location to the project sites"), dirtier engines will suffice. In practicality, if Rise Gold finds it inconvenient, it won't need to deploy the environmentally cleanest engines.

**Ind 333-4**

**The DEIR specifies more mitigation requirements than Nevada County can monitor, enforce or, most importantly, afford.**

Mining's history, especially in Nevada County, indicates that mitigation measures are generally underfunded, poorly enacted, and often virtually ignored, leaving the local community damaged and its taxpayers left to clean up the mess. The British Columbia government halted Rise Gold's CEO's previous endeavor, the Banks Island mine, and prosecuted and fined him for gross environmental irresponsibility.

**Ind 333-5**

**Whatever benefits this project might bring to Nevada County, it is certain to damage our health.**

Our mortality rate from chronic lung disease is double the rate in California statewide: 69 versus 35 deaths per 100,000 people. Many of us are already at risk simply for our age. According to the 2020 census, one in three of us is 65 or older, compared to the statewide proportion of one in seven. Our heart disease mortality rate is half-again higher than statewide. In 2014 Sierra Nevada Memorial Hospital saw 369 adults and children for acute asthma and admitted 88, at cost of over $3 million, and that represents only one single illness. Mining emissions, featuring a wide assortment of irritants and carcinogens both known and unknown, will raise the incidence of local pulmonary and cardiac illnesses, with all their personal and financial costs.

**Ind 333-6**

**The mine's toxic airborne emissions will especially impair children's health.**

The DEIR does not take into account air quality effects on the thousands of voiceless Nevada County residents who will be born during the next eighty years. Current and future Nevada County children will absorb more of the mine's DPMs than adults do, both because of their more rapid respiratory rate and eight decades of exposure.

**Ind 333-7**

**The DEIR's assertions of "no significant impact" come from dubious data and arbitrary standards.**
Its data are based on figures supplied by Rise Gold. Considering this company's environmental record and misleading advertising, due diligence requires our skepticism. Further, federal, state, and county agencies' complex standards and thresholds for air quality, while useful and sensible, are necessarily arbitrary and impermanent. (For example, in 2007 The Mining Safety and Health Administration reduced the permissible ambient DPM concentration from 350 to 160 micrograms per cubic meter.) In any case these objective standards deliberately ignore unmeasurable varieties of human experience like anxiety, irritation, aesthetics, and sensitivity to noise and odor.

**Ind 333-8**

**The DEIR's air quality section describes the effects of only this project, ignoring the fact that they add to our already onerous burden.**
Even if all its mitigation recommendations were enacted, the mine is certain to worsen our air quality even further, and add to illness incidence. Again, Nevada County can't tolerate additional air pollution.

Considering the proposal's predictable injuries to Nevada County's health, beauty, economics, and well-being, no one who values our community can claim it has redeeming value. I urge Nevada County's Planning Department and Supervisors to find the DEIR unacceptable, and to reject the proposal.

Respectfully,

**Individual Letter 334**

14933 Pathan Pl.
Nevada City, CA 95959

February 24, 2022

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Dear Mr. Kelley,

I'm a medical doctor, and have lived in Nevada County most of my life.

I oppose Rise Gold Corporation's proposal to re-open the Idaho-Maryland mine because it will irreparably damage our community in many ways. For the purpose of addressing the DEIR, I'll limit these comments to its effects on our air quality.

The mine's damage to our air quality is, frankly, unmitigatable. Virtually any quantum of its emissions will raise Nevada County's incidence of illness and death despite any mitigation, as I'll explain.

The air quality in California in general is already poor. According to the American Lung Association, the five cities in the country with the worst annual particulate pollution and highest ozone levels are in California, and include the Sacramento-Roseville region.

**Ind 334-1**

California's most air-polluted cities are also those most affected by our now-endemic wildfires, which severely aggravate monthly and annual air pollution averages. With its warmer and drier conditions, ongoing climate change intensifies wildfires, so worsens California's air quality and the consequent health effects.

Nevada County is even more affected than the state. The American Lung Association gives our community an F grade for ozone levels, designating 105 days per year "unhealthy." Our county has long been considered "Sacramento's tailpipe," as auto exhaust emitted there funnels here. And during the past two summers, wildfires contributed to entire weeks which the Northern Sierra Air Quality Management District labeled "very hazardous."

<u>Nevada County can't tolerate additional air pollution. That bears repeating: Nevada County can't tolerate additional air pollution.</u>

Airborne elements from the mine will include dust, ozone, and noxious particulates and chemicals, not to mention considerable greenhouse gases. The project will emit copious diesel particulate matter (DPM), of which most is small enough to readily enter human lungs. Current and future Nevada County children will absorb more of the mine's DPMs than today's adults do, both because of their more rapid respiratory rate and eight decades of exposure.

The particles we'll all inhale include asbestos, silica, and various heavy metals. DPM is also composed

of numerous organic compounds, including more than forty known cancer-causing substances like polycyclic aromatic hydrocarbons, benzene, formaldehyde, acetaldehyde, acrolein, and 1,3-butadiene. The California Air Resources Board has classified DPMs as a Toxic Air Contaminant. The CARB estimates that about 70% of the cancer risk that the average Californian faces stems from these diesel exhaust particles.

The DEIR Table 4.3-19 estimates that maximum mitigated emissions of all reactive organic gases, oxides of nitrogen, carbon monoxide, oxides of sulfur, and particulate matter of 2.5 to 10 microns diameter will total 341 lb per day during the project's first four years, 332 lb daily during the next five years, and 293 lb during each day of the project's final sixty-nine years. That is, the DEIR estimates that despite all mitigations, however effective, the mining operation will release 8.5 million pounds--3900 metric tons--of pollutants known to be toxic into our community over the next eighty years. And this does not include emissions generated in post-mining reclamation.

Nor does it include emissions from idling diesel engines. In its Air Quality report of 2020, the DUDEK Corporation estimated (p. 135) that the project's diesel idling would amount to 200,000 minutes annually. The DEIR, though, explicitly omits the effects of idling (p. 4.3-95): "Starting and idling emissions, which are minor, are excluded because the focus is on the Vehicle Miles Traveled rather than the ultimate origin and/or destination of each trip." We've all heard and smelled diesel delivery trucks as they idle; imagine the same from a fleet of twenty-ton haulers.

The DEIR specifies abundant mitigation requirements, as it should. But in practice, the mining industry in general has a record of neglecting or circumventing mitigations. The DEIR requires, for example, that the operation must utilize environmental state-of-the-art "Tier 4" diesel engines "...if commercially available," meaning that if they're unavailable for some reason (for example, p. 4.3-78: "...taking into consideration factors such as critical path timing of construction and geographic proximity of the equipment location to the project sites"), dirtier engines will suffice. In practicality, Rise Gold won't need to use the environmentally cleanest engines if it's inconvenient.

That's only one mitigation out of a number larger than any public agency can monitor, enforce or, most importantly, afford. The history of mining, especially in Nevada County, indicates that mitigation measures are generally underfunded, poorly enacted, and often virtually ignored, leaving the local community ruined and its taxpayers left to clean up the mess. Rise Gold's CEO's British Columbia Banks Island mine misadventure is a prime example of such irresponsibility.

Whatever benefits this project might bring to Nevada County, it is certain to damage our health. Our mortality rate from chronic lung disease is double the rate in California statewide: 69 versus 35 deaths per 100,000 people. Many of us are already at risk simply for our age. According to the 2020 census, one in three of us is 65 or older, compared to the statewide proportion of one in seven. Our heart disease mortality rate is half-again higher than statewide. In 2014 Sierra Nevada Memorial Hospital saw 369 adults and children for acute asthma and admitted 88, at cost of over $3 million, and that represents only one single illness. Mining emissions, featuring a wide assortment of irritants and carcinogens both known and unknown, will raise the incidence of local pulmonary and cardiac illnesses, with all their personal and financial costs.

The DEIR asserts that none of Rise Gold's operations, properly mitigated, will violate standards. Its repeated conclusions, "no significant impact," were written by people who won't live here the next

eighty years. As an avalanche of numbers, the DEIR can look like science, but as a trained scientist, I'm dubious. The data are based on estimates supplied by Rise Gold. Considering its environmental record and misleading advertising, due diligence requires our skepticism. We should also recognize that Federal, State, and county agencies' complex standards and thresholds for air quality do not exemplify science. They are useful and sensible, but necessarily arbitrary, and deliberately ignore varieties of human experience like anxiety, irritation, aesthetics, and sensitivity to noise and odor. And alarmingly, the DEIR does not take into account air quality effects on the thousands of voiceless Nevada County residents who will be born during the next eighty years.

The DEIR's air quality section describes the effects of only this project, ignoring that its toxicities will add to the onerous burden the County already carries. Even if all its mitigation recommendations were enacted, they won't reduce the project's air toxicities and greenhouse gases to zero. Again, Nevada County can't tolerate additional air pollution.

Considering the proposal's predictable injuries to Nevada County's health, beauty, economics, and well-being, no one who values our community can claim it has redeeming value. I urge Nevada County's Planning Department and Supervisors to find the DEIR unacceptable, and to reject the proposal.

Respectfully,

Jeff Kane MD

Comments on the Draft Environmental Impact Report for the Idaho-Maryland Mine Project

Dear Friends,

I think the Draft Environmental Impact Report of the Idaho-Maryland Mine Project is a good indicator of this company should not be trusted, as the true negative impacts of the project have been severely understated. Let's go back just a short time ago, to 1993.

In June of 1993, the Nevada County Planning Commission certified the environmental impact report and permit for the San Juan Ridge mine.

**Ind 335-1**

Riki Colby opens the tap and out pours brown water, filled with toxic minerals. "I got kidney pain, I had intestinal problems, I had insomnia." The San Juan Gold Mine was reopened despite concerns from the community, and CEO Tim Callaway gave every assurance to the community and to the county that their operation would be safe, and it would not impact nearby residents. They were wrong, and they poisoned our fellow citizens after their operation ran into major problems in 1995. By 1997 the company's stock price had cut in half, and the mine folded. Once Tim Callaway abandoned the mine and shut off the water pumps, the mine refilled with toxic water, which leached into many wells in the area and into the homes of our community. The well water is still undrinkable for nearby residents because of manganese, iron, and dissolved sulfates. For all intensive purposes, the community had been poisoned. We paid the price, the company left us with an environmental disaster that leached into the Yuba, and all we have to show for it is the bitter test of toxic water and the unfulfilled promises of a gold miner.

https://vimeo.com/111603225

Please watch the film. I am including it as supporting evidence in my submission.

Water testing was done at Grizzly Hill school, and indeed, they children's water was contaminated far beyond any allowable health standards.

| | Acceptable Amount | Amount Found |
|---|---|---|
| Iron | 300 ppb | 40,200 ppb |
| Manganese | 50 ppb | 8,130 ppb |
| Nickel | 100 ppb | 726 ppb |
| Aluminum | 1000 ppb | 2,700 ppb |

If we cannot learn from our own history, right here in our own county, then we have no right to be authorized to make these decisions.

**Ind 335-2**

Now, in the DEIR, they say they will be discharging effluent from the mining site into our Wolf Creek. They do not say what chemicals will be included in that effluent, and this reflects either insufficient testing, or withholding the dangerous information that is likely to become known. Observing the test results from the San Juan Mine, Iron, Manganese, Nickel, and Aluminum would be poured into our waterways for an unpredicted amount of time. Let's also observe the chemicals that are leached from the explosives, Ammonium Nitrate. The DEIR is extremely deficient in its analysis of chemicals that will be leached from the mine waste and dumped into our rivers as effluent.

Ammonium Nitrate is not something you want to consume, so why would we put it into our drinking water or our irrigation water? What flows into Wolf Creek, flows into the Bear River, and from the Bear River, about 42,000 acres of farmland get their irrigation water. Furthermore, with the Centennial water supply pipeline, a huge volume of that water will be sent to Lincoln, Roseville, and North Sacramento. Let us not forget the groundwater recharge that takes place all along those corridors between Wolf Creek and the Bear River. A true analysis of the number of wells within recharge proximity of the entire downstream watershed has not been done, and proves how deficient this DEIR is.

Furthermore, Ammonium Nitrate has been shown to cause death in tadpoles, frogs and toads, just like our endangered Yellow Legged Frog.

https://link.springer.com/article/10.1007/s002449900188

**Lethal and Sublethal Effects of Nitrogen Fertilizer Ammonium Nitrate on Common Toad (*Bufo bufo*) Tadpoles**

**Here is another study published in the Journal of Environmental Toxicology and Chemistry, who also demonstrated chronic toxicity from Ammonium Nitrate.**

**https://setac.onlinelibrary.wiley.com/doi/abs/10.1002/etc.5620141217**

**Acute and chronic toxicity of ammonium nitrate fertilizer to amphibians from southern ontario**

**And here is a third study, The effect of ammonium nitrate fertiliser on frog (*Rana temporaria*) survival**

**https://www.sciencedirect.com/science/article/abs/pii/S016788099601095X**

This demonstrates just how toxic are the materials that the mine will be using and dumping into our rivers, our streams, our farmland, and potentially our drinking water. The insufficient explanation of water treatment and expected toxin levels within the effluent illustrates the DEIR is dangerously inadequate.

We love living in this community because it is rebounding from its mining days. Yes mining has left our rivers poisoned with mercury, our fish too dangerous to eat in quantity, and we even endanger our kids and pregnant wives with the latent mercury from one or fish too many, but we live with that threat. We don't need to make it worse. We don't need to ruin our quality of life by turning a beautiful forest into a toxic industrial wasteland poising our community and waterways. Thank you for your time.

~ Jeff Litton

## INDIVIDUAL LETTER 335: JEFF LITTON

### Response to Comment Ind 335-1

The commenter states that the DEIR should not be trusted, asserts that the impacts have been understated, and then cites the San Juan Ridge Mine as an example of water contamination caused by a mining operation. Contrary to the commenter's assertion that the DEIR was prepared by the applicant to underestimate impacts, the DEIR was prepared by County's independent EIR consultant and technical studies submitted by the applicant have been peer reviewed by the County's own independent technical experts. With regard to the comparison between the San Juan Ridge mine and the project, these are separate projects, and the project's water quality impacts have been analyzed in the DEIR and found to be less than significant after mitigation. The DEIR's conclusions regarding water quality were also peer reviewed by the County's independent experts, who concurred with the analysis and conclusions.

### Response to Comment Ind 335-2

The commenter asserts that the DEIR does not disclose what chemicals will be in the water discharged to South Fork Wolf Creek and that the project could result in ammonium nitrate pollution. The constituents and requirements for the mine water discharge are discussed in detail and analyzed in the DEIR. Please see Master Response 35 – Discharge to South Fork Wolf Creek. An analysis of the number of wells within recharge proximity of the entire downstream watershed is not required as the water discharge will be required to meet all water quality goals.

As discussed on page 4.8-48 of the DEIR, the primary residual components of the ammonium nitrate-fuel oil (ANFO) used for blasting, ammonia and nitrate, are very soluble and mobile in water. This means that any blasting residuals would be continually removed from the mine over time through the dewatering system. The proposed WTP is designed to treat ammonia and other blasting residuals that might occur due to incomplete detonation. Thus, when the mine is allowed to flood again following the completion of mining, there is no reasonable potential that residuals from former blasting activities would cause a violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.

**Date:** Saturday, February 12, 2022 6:48:00 PM

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 336-1**

I am really surprised that the mine is even considered. It's all about the water, IMHO. There may be researchers that say the water table won't be affected... If they are wrong, we will be in a worse situation than we already are. Water is becoming a scarce commodity in California and we are going to allow a mining company to come in and pump millions of gallons of water out of the mine? Seems counter intuitive to me.

**Individual Letter 337**

**From:** Jeff Russell
**To:** Idaho MMEIR
**Subject:** Idaho Maryland mine DEIR
**Date:** Monday, April 4, 2022 4:26:40 PM

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Mr. Matt Kelley
Senior Planner

**Ind 337-1** I have opposed the reopening of the Idaho Maryland mine for the more than 30 years I have lived in Nevada County. Listening to the many comments made at the public meeting on March 24th only served to convince me more what a very bad idea for everyone in the area excepting the owners and stock holders of Rise Gold.

**Ind 337-2** Personally, I live right above Bennett Meadow. Walking along the stream (South Fork of Wolf Creek) that would be continuous flooded just makes me sad!
A decision to move forward will do irrevocable damage to the entire ecology of the western Nevada County and the health of all of us.

**Ind 337-3** There is no good reason to reopen this mine and dredge up all the heavy metals and contaminants sleeping therein! With a lot less effort and with very little consequences, the few jobs that Nevada county residents would glean from the reopening could be generated in more productive and less harmful ways; let's put our efforts there. Not on the travesty we are now facing for the third time. Protect our air, our land, our streams and our people, children and adults alike.

Sincerely, Jefrey Russell
10728 Footwall Dr. 95945

## INDIVIDUAL LETTER 337: JEFF RUSSELL

### Response to Comment Ind 337-1

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 337-2

Please see the analysis under Impact 4.8-3, which starts on page 4.8-69 of the DEIR. As detailed therein, the proposed project would be subject to the requirements set forth in Mitigation Measure 4.8-3, ensuring that the Project Applicant submits a Final Drainage Report to the Nevada County Planning Department for review and approval that demonstrates the on-site storm drain systems are sized such that site runoff (in addition to treated mine discharge for the Brunswick Industrial Site) under the post-development conditions will not exceed pre-development levels in the downstream channel(s) during design storm events. With incorporation of Mitigation Measure 4.8-3, the DEIR concludes that potential impacts related to on- or off-site flooding would be less than significant.

### Response to Comment Ind 337-3

Please see Master Responses 1, and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 338**

**From:** J M
**To:** Idaho MMEIR; Planning
**Subject:** comment on Idaho Maryland mine
**Date:** Wednesday, March 16, 2022 11:36:45 AM

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

I'm writing to oppose the opening of the Idaho Maryland mine.

Others have addressed many details and reasons, so at this time, I'd simply like to point out that the draft Environmental Impact Report (dated December, 2021) is couched to present the mine project as feasible. Throughout, the tone and content work from the underlying assumption that the project is worthwhile, so we all need to figure out how to bring it to fruition. In other words, there is bias. Indeed, the second paragraph of the introduction clarifies that the purpose of the EIR is to inform the public but then to point out ways to minimize adverse environmental effects and offer alternatives to reduce those effects.

**Ind 338-1**

**Ind 338-2** Nowhere does the EIR consider the alternative of denying approval to the project. I regard the EIR as misleading in that it encourages the reader to regard any problems as susceptible to

**Ind 338-3** adjusting to what the report disingenuously suggests is nothing more than a somewhat new situation.

I therefore implore the members of the Planning Commission to study the EIR with a view

**Ind 338-4** toward making independent evaluations of the various impacts it describes. To mention just one example, I point out the many comments, tables and descriptions regarding truck traffic and noise. Throughout, the finding is that there will be more traffic, more noise, and more damage to roads, but the conclusion is that we can all live with that. I disagree.

The broad question is this: why should we endure the sacrifices described in the EIR and elucidated elsewhere so that Rise Gold (a company of questionable integrity) can profit?

**Ind 338-5** I am a sixth-generation resident of the Grass Valley/Nevada City area, a descendant of the men who owned and ran the North Star during the 1860s. Their day is done. Let's chart a twenty-first century course of action that respects and values our community.

Jeffrey Mason

## INDIVIDUAL LETTER 338: JEFFREY MASON

### Response to Comment Ind 338-1

Please see Master Response 1.

As discussed on page 1-1 of the DEIR, pursuant to CEQA Guidelines Section 15121, the purpose of the DEIR is to a) inform public agency decision-makers, and the public generally, of the significant environmental effects of the project, (b) identify possible ways to minimize the significant adverse environmental effects, and (c) describe reasonable and feasible project alternatives which reduce environmental effects. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project.

As part of assessing potential project impacts that could occur to all environmental issue areas required for analysis under CEQA, the DEIR evaluates the proposed project's consistency with applicable policies, regulations, and standards established at the federal, State, and local levels and incorporates analyses from the County's expert consultants. Where potential impacts are identified, the DEIR sets forth mitigation measures to reduce the severity level of the identified impacts to the extent feasible and discloses the level of impact that would occur subsequent to incorporation of mitigation. As such, the analysis within the DEIR is adequate, meets the requirements set forth by the CEQA Guidelines, and is not biased.

### Response to Comment Ind 338-2

The purpose of a DEIR is not to approve or deny a project. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project.

### Response to Comment Ind 338-3

The comment expresses a general opinion that the DEIR is misleading, but does not provide specific examples that would allow for a detailed response. Please see Response to Comment Ind 338-1.

### Response to Comment Ind 338-4

A rise in the levels of truck traffic and noise, relative to existing levels, that could occur through approval of the proposed project does not, in itself, constitute a significant impact. The determination of a potential impact associated with increases in truck traffic and noise would be considered significant is based on applicable thresholds, which are detailed in Chapter 4.10, Noise and Vibration, and Chapter 4.12, Transportation, of the DEIR. For example, the DEIR includes analysis of potential impacts associated with short-term increases in ambient noise levels under Impact 4.10-1, which starts on page 4.10-27. Table 4.10-11 includes applicable noise level thresholds and discloses the receptor locations at which noise generated by project construction activities would exceed such thresholds. Because exceedance of the applicable thresholds could occur, the DEIR sets forth Mitigation Measure 4.10-1 on page 4.10-30, which requires that the project incorporate noise reduction measures during construction of the potable water line along East Bennett Road. However, because the noise reductions that would be achieved by the measures cannot be definitively determined to confirm that noise levels would be reduced to below a level of significance, the DEIR discloses that the impact is considered significant and unavoidable for the purposes of CEQA evaluation. In its role as the lead agency, the County of

Nevada will weigh the overall merits of the project against the impacts identified in the DEIR as part of determining whether the County should approve the project.

## Response to Comment Ind 338-5

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 339**

Nevada City, CA 95959

Comments on the Draft Environmental Impact Report for the Idaho-Maryland Mine Project

**Ind 339-1** I am a Nevada County resident and have lived in the Grass Valley/Nevada City area since 2008. My husband and I purchased our home in 2010 and are raising our two young children here because we enjoy the natural beauty, open space, and ecology of the region.

**Ind 339-2** I appreciate the opportunity to provide a comment on the Draft Environmental Impact Report (DEIR) released by Nevada County, which addresses the environmental impacts of re-opening and operating the proposed Idaho-Maryland Mine. As a professional vegetation ecologist with over 20 years of botanical experience, I am concerned about impacts of the mine project on native plants of our region. The environmental analysis of the DEIR is inadequate, and the impacts of this large-scale gold mining project will be significant and unavoidable.

**Ind 339-3** The proposed project will significantly affect local groundwater resources by dewatering the Mine and lowering groundwater levels. This will have a direct impact on a very rare plant species (*Juncus digitatus*) located less than 2 miles away from the proposed mine site at the intersection of Idaho-Maryland Road and Brunswick Avenue. This species has only 3 occurrences in the world and is completely dependent on freshwater seeps and springs
( see: https://rareplants.cnps.org/Plants/Details/3355, and
https://rareplants.cnps.org/Uploads/ReferenceDocs/JuncusDigitatus_20090102_StsRevAdd.pdf)

**Ind 339-4** The DEIR does not provide a comprehensive analysis to determine the extent and the severity of the impacts upon groundwater resources and wells. Without this analysis, the DEIR must identify such impacts as significant and unavoidable. The DEIR lacks an accurate project description, lacks data and analyses needed to make informed determinations, and fails to provide effective and feasible mitigation measures. For these reasons, the document is inadequate under CEQA. The DEIR should be revised and recirculated to comply with CEQA.

**Ind 339-5** Thank you for your time and consideration.

Sincerely,

Jennifer Buck-Diaz
Vegetation Ecologist, Nevada County Resident

## INDIVIDUAL LETTER 339: JENNIFER BUCK-DIAZ

### Response to Comment Ind 339-1
The comment does not address the adequacy of the DEIR.

### Response to Comment Ind 339-2
The commenter expresses general concerns regarding the project and the adequacy of the DEIR, but does not provide specific detail regarding the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative issues. With regard to native plants, please see Master Responses 30 and 31.

### Response to Comment Ind 339-3
Please see Master Response 33 – Groundwater Dependent Vegetation.

### Response to Comment Ind 339-4
Please see Master Responses 13, 14, and 15.

### Response to Comment Ind 339-5
The project, as proposed, is detailed in Chapter 3, Project Description, of the DEIR. As part of assessing potential project impacts that could occur to all environmental issue areas required for analysis under CEQA, the DEIR evaluates the proposed project's consistency with applicable policies, regulations, and standards established at the federal, State, and local levels and incorporates analyses from the County's expert consultants. Where potential impacts are identified, the DEIR sets forth mitigation measures to reduce the severity level of the identified impacts to the extent feasible and discloses the level of impact that would occur subsequent to incorporation of mitigation. Where potential impacts would remain significant, even with the incorporation of mitigation, such impacts are concluded within the DEIR to be significant and unavoidable. Table 2-1, which starts on page 2-10 of the DEIR, summarizes all potential impacts evaluated in the DEIR and discloses the potential impacts that would remain significant and unavoidable. The analysis within the DEIR is adequate and meets the requirements set forth by the CEQA Guidelines. The commenter does not provide specific information related to the asserted inadequacies; therefore, a detailed response cannot be provided.

**Individual Letter 340**

**From:** Jennifer W. Burt <jenniferwburt@gmail.com>
**Sent:** Monday, April 4, 2022 5:06 PM
**To:** Matt Kelley; Idaho MMEIR
**Subject:** I-M Mine DEIR comments

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Dr. Jennifer Burt

Loma Rica Drive
Grass Valley, CA 95945
Email: jenniferwburt@gmail.com

April 4, 2022

Mr. Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959
Email: matt.kelley@co.nevada.ca.us; Idaho.MMEIR@co.nevada.ca.us

Dear Mr. Kelly:

**Ind 340-1** I am a Nevada County resident and well-owner in the immediate vicinity of the proposed Idaho-Maryland Mine project. We moved here 10 years ago to raise our children, because we were drawn to the the natural beauty, open space, and ecology of the region, in addition to the local neighborhood draw of pristine well water, the ability to farm on our land, and the quiet ambiance of our neighborhood. Additionally, I am an ecologist by training and career, and have over 20 years of environmental consulting experience and hold M.S. and Ph.D. degrees in ecology.

**Ind 340-2** It is hard to know where to begin on the extremely insufficient analyses presented in the Draft Environmental Impact Report (DEIR) for the Idaho-Maryland Mine Project, and I find I did not leave myself enough time to be thorough. I submitted a letter to the County during the scoping process requesting that detailed analysis of specific project impacts be carried out, with independent peer-review by topic experts, given the wide and long-term scope and expected negative impacts of this project. These requests were far from met. It is exceedingly clear that this project would create great and lasting harm to the Grass Valley community and our environment, even to Western Nevada County as a whole, yet the DEIR declares most impacts to be less than significant. The analyses and proposed mitigation measures that impact assessments were based on are both inadequate and apparently intentionally misleading.

**Ind 340-3** The project would have significant aesthetic impacts, including impacts to night sky visibility, scenic vista impacts, and aesthetic impacts of operating an industrial scale mine right in the center of a beautiful rural community that is a tourist destination due to its rural character and charm.

Nevada County already suffers from very poor air quality, and a high rate of lung disease. Fugitive dust and asbestos emissions from the mine operations will worsen this problem. Asbestos was not adequately considered. I agree with the comments made by the CEA letter on this topic.

**Ind 340-4** The project did not conduct an adequately detailed and peer-reviewed analysis of how subsurface mining activities within the area may affect potential for increasing local seismic activity and decreasing surface geological stability, as well as potential to affect the structure and function of local groundwater aquifers.

**Ind 340-5** The analysis of hazards and hazardous materials was grossly inadequate. The assumption that mine tailings would be saleable should not be assumed for project analysis.

**Ind 340-6** I am also in agreement with the points made by the Community Environmental Advocates letter and the Wells Coalition on the insufficiency of the DEIR analysis of groundwater quality and wells impacts. The groundwater modeling analysis does not consider an adequate baseline dataset, neither spatially nor temporally, and should be including many more wells, a larger spatial area, and include a wide range of current water years and months including during prolonged droughts, which are increasingly common. In essence, at least 10 years of baseline data should be required to be collected and analyzed, and modeling improved based on additional data to ensure no significant effects, before the project should be allowed to commence dewatering.

**Ind 340-7** The wells monitoring plan does not include a sufficiently wide region around the groundwater effects area to capture potential project effects on depth to groundwater and groundwater quality. It makes an assumption that the over simplistic model has identified the full spatial range of potential project effects and then sets out a plan to conduct monitoring in that same area, which assumes the simplistic model in a complex fractured bedrock groundwater aquifer is correct. This is incredibly circular reasoning and completely inappropriate for a project of this size and scope.

**Ind 340-8** The onus of collecting sufficient baseline groundwater/well operation data and ongoing interim- and post-project data to prove that the project is not significantly affecting nearby wells or water quality should be Rise Gold's responsibility, and financial assurances for all mitigation and monitoring should be ensured to the County and its taxpayers, that would remain in place even after the nearly inevitable bankruptcy filing by this mine.

**Ind 340-9** Detailed monitoring should occur prior to and during project operation for an area at least five miles out from the mineral rights boundary and thus the potential extent of project-associated groundwater pumping operations over the course of the project.

**Ind 340-10** Rise Gold intends to mitigate for well effects by piping water to a small number of homes. It has already been established by many experts weighing in on the analysis conducted that many more wells are likely to be significantly affected by the project than these that have been identified by a simplistic model based on a small number of data points and water years. But furthermore, it should be said that providing piped NID water to homes whose wells are affected by the project does not even fully mitigate for loss of well water availability or well water quality, because NID fees are high, and baseline water quality of NID water is lower than the water obtained via local wells currently.

**Ind 340-11** Groundwater dependent ecosystems and sensitive species associated with these are likely to be affected by groundwater drawdown due to the project as well. Insufficient analysis of groundwater dependent ecosystems

**Ind 340-12** Noise impacts of the project would cause stress and health impacts to the human and wildlife populations in the region. This was not adequately analyzed or addressed.

**Ind 340-13** If the project goes forward, quality of life will be decreased for the entire community due to ongoing noise, reductions in air quality, increased traffic, decreased aesthetics, decreased water quality, well impacts, and etc. People who have the ability to do so will move away. Property values and associated property taxes going to the County will plummet. Small businesses will shutter. These impacts were not sufficiently addressed in the DEIR.

**Ind 340-14** County taxpayers will end up footing the bill for all the road and traffic control improvements that will be needed if this project moves forward.

**Ind 340-15**

The project would require more electrical grid capacity than is available, and its energy use would reverse all climate change mitigation that the County and region might be able to achieve if the project did not occur.

In summary, this project DEIR is inadequate and should not be approved.

Thank you for your time and consideration.

Sincerely,

Jennifer W. Burt, PhD
Ecologist, Nevada County Resident

3

## INDIVIDUAL LETTER 340: JENNIFER BURT

### Response to Comment Ind 340-1
Comment noted.

### Response to Comment Ind 340-2
The commenter states that the DEIR is inadequate and intentionally misleading but provides no specifics or evidence. Therefore, a specific response is not possible. Comment noted.

### Response to Comment Ind 340-3
The analysis in the DEIR determined the project will have a significant and unavoidable aesthetics impact due to substantially degrading the existing visual character or quality of public views of the project sites or site surroundings, or conflict with applicable zoning and other regulations governing scenic quality. However, the DEIR determined that the project will have a less than significant impact on scenic vistas and would not create a new source of substantial light or glare which would adversely affect day of nighttime views in the area (see DEIR Impact 4.1-3).

Regarding air quality and asbestos: Please see Chpater 4.3 of the DEIR, Master Response 18 - Air Quality Thresholds, Master Response 23 - Adequacy of Asbestos Sampling, and Master Response 22 - Conservatism of Asbestos Assumptions. Additionally, please see the response to the referenced CEA comment letter (Group Letters 7 and 8).

### Response to Comment Ind 340-4
The project would not increase seismic activity, decrease geological stability, or the structure of the aquifer. Please see Chapter 4.6 of the DEIR, the NV5 memo attached to the FEIR as Appendix P, and Response to Comment Ind 248-13.

Project impacts to groundwater have been extensively analyzed in the DEIR. Please see Chapter 4.8 of the DEIR, Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 340-5
The commenter states the DEIR analysis of hazards and hazardous materials is grossly inadequate but provides no further information. Therefore, a further response is not possible.

Please see Master Response 11 - Engineered Fill Utilized in Local and Regional Construction Markets.

### Response to Comment Ind 340-6
The commenter asserts that the groundwater model analysis does not consider an adequate baseline dataset and requests that the project monitor water levels for 10 years before commencing dewatering. With regard to the data used of the groundwater model, please see Chapter 4.8 of the DEIR and Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. The commenter does not provide a justification for the need for 10 years of baseline data and such extensive baseline data is not required to adequately assess the project's groundwater impacts.

## Response to Comment Ind 340-7

The commenter asserts that the groundwater monitoring should cover a larger area but does not explain why. The groundwater impact analysis and groundwater well monitoring plan were reviewed by the County's independent experts, who concurred with the impact conclusions and required mitigation, including the geographic scope of the monitoring area. Please see Chapter 4.8 of the DEIR and Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 340-8

The applicant is already required to collect baseline well monitoring data and collect water level data throughout the project operations and is responsible for costs of well mitigation. Please see Mitigation Measures 4.8-2(a), 4.8-2(b), and 4.8-2(c) in the DEIR. Any financial assurances required for the mine are the responsibility of the mine operator.

## Response to Comment Ind 340-9

The commenter states that the groundwater should be completed for an area of 5 miles from the mineral rights boundary but provides no evidence why an arbitrary 5 miles from this boundary line is required. Please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 340-10

The commenter states that many experts conclude that many more wells than those discussed in the DEIR would be significantly affected by the project but provides no evidence of these expert conclusions. Please see Master Response 13 - Historic Hydrogeologic Assessments, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

The Well Mitigation Plan requires compensation for water charges. Please see Appendix K.9 of the DEIR.

The commenter states that water quality of NID potable water is lower than the water quality from domestic water wells, but provides no evidence to support this statement. Drinking water supplied to Nevada Irrigation District (NID) customers continues to meet and exceed state and federal public health standards, based on testing results that serve as the basis for the District's Water Quality Report. See NID water quality report at: https://www.nidwater.com/files/1e68c2c9b/NID+WQR+2021.pdf.

## Response to Comment Ind 340-11

Please see Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 340-12

Noise impacts to people have been evaluated in Chapter 4.10 of the DEIR and, except for construction of the water pipeline, have been found to be less than significant after mitigation. Noise impacts to wildlife is analyzed in the DEIR (see page 4.4-74 of the DEIR).

## Response to Comment Ind 340-13

The commenter states that certain impacts were not sufficiently addressed in the DEIR, but provides no evidence to support these claims. Please see Master Response 1 - Non-EIR/Administrative Issues and Master Response 2 - Social and Economic Impacts. Air quality impacts, traffic impacts, aesthetic impacts, water quality impacts and water supply impacts were all analyzed in the DEIR in Chapters 4.3, 4.12, 4.1, and 4.8, respectively.

## Response to Comment Ind 340-14

Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between project driveway and Brunswick Road.

The applicant is also required to pay traffic improvement fees and fair share payments for various traffic improvements, including intersections. Please see Chapter 4.12 of the DEIR.

## Response to Comment Ind 340-15

PG&E provided a will serve letter for the project, PG&E has confirmed that there are electric facilities available to serve the proposed project in accordance with all applicable design standards, rules, and tariffs on file with the State of California Public Utilities Commission. The proposed project would not require or result in the relocation or construction of new electric power facilities. Please see page 4.11-35 of the DEIR.

Please also see Master Response 27 - Greenhouse Gas Thresholds, and Master Response 25 - Nevada County Energy Action Plan.

**Individual Letter 341**

**Ind 341-1**

DO NOT !!
**I support re-opening the Idaho-Maryland Mine.**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

NO mine!

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Name(s) JENNIFER DALMAU
Address 16425 COLFAX HIGHWAY GV ZIP 95945
Phone 530-205-8986
Email Address KARMENSGARDEN@GMAIL.COM

## INDIVIDUAL LETTER 341: JENNIFER DALMAU

### Response to Comment Ind 341-1

Please see Master Response 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 342**

**From:** Jennifer Iams-McGuire
**To:** bdofsupervisors
**Subject:** no mine
**Date:** Friday, February 18, 2022 9:15:30 AM

**Dist 4**

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Board of Supervisors,

**Ind 342-1**

I am writing to contribute my voice to the thousands of local residents like myself who absolutely DO NOT support the opening of the Idaho-Maryland mine. When will we prioritize the health and well-being of the land, our environment, and the local residents versus the profits of a few? You have the opportunity to be truly forward thinking leaders, to end the legacy of toxic exploitation of our home. The benefits of re-opening the mine are insignificant compared to the less-addressed problems it will create.

**Ind 342-2**

Besides, what is the hurry? Why is our community scrambling to accommodate the desires of non-local interests when our long-term relationship with mining - past and future- has barely been addressed? If there is gold and profit to be extracted, it will still be there, years ahead, new decisions can be made when technology advances and values of self-preservation are prioritized. This is a watershed moment to make the right choice about our watershed! Poisoning our environment is not the right choice. Thank you for choosing long-term well-being and not accepting the smoke and mirrors "benefits" of a sketchy out of area self-serving corporation that cares nothing about our community. Don't get duped!

Thank you,

Jennifer Iams-McGuire

13222 Hidden Valley Rd.
Grass Valley, CA 95949

## INDIVIDUAL LETTER 342: JENNIFER IAMS-MCGUIRE

### Response to Comment Ind 342-1

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 342-2

Please see Master Responses 1, 2, and 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 343**

**From:** Jennifer Kelly
**To:** Matt Kelley; Idaho MMEIR
**Subject:** Mine Concerns
**Date:** Thursday, February 17, 2022 9:46:31 AM

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

10688 James Lane

Nevada City

CA 95959

February 16th, 2022

Dear Mr. Kelley and Council Members,

I am making use of the period for public comment on the issue of reopening a local gold mine, to convey my concerns to you. There are so many obvious reasons why this should not be permitted it seems necessary to write a list rather than a letter.

**Ind 343-1**

This will not be in any particular order of importance; they are all important,

but as the massive DEIR is currently the center of attention, I will start with those.

AIR QUALITY. The months of huge fires all over the west, every year, mean the air quality in Grass Valley is deemed extremely hazardous for multiple days, unfit for anyone to breathe outside and extremely dangerous for those with existing respiratory problems & children. There can be no question that a mining operation that will include large trucks, laden with toxic rubble, driving along local roads to dump their cargo at a site quite close to the hospital will further pollute the air. Many of the particulates will be of an ideal size to be easily absorbed by human lungs. Unlike the fire season, there will be no respite from the truck season, they will roll all year, so our once pristine air will become a danger to everyone's health all the time. The human misery will be matched by increased costs for health care.

**Ind 343-2**

How can that be mitigated?

NOISE. The business of crushing rock into manageable sized pieces to be carried by even the largest truck must create noise at a decibel level harmful to the human ear, not to mention, sanity. The added noise of the trucks along their routes will be shared by a large percentage of the population. Our peaceful town will be burdened with the problems of an industrial zone.

**Ind 343-3**

How is that to be mitigated?

HAZARDOUS MATERIALS ON SITE & IN TRANSIT

**Ind 343-4**

The Union published an excellent article by Mr. Ray Bryars covering these concerns, in the Other Voices column of the paper of Feb. 16. I echo his worries and add to them the fear that a wildfire could cause a massive explosion, no matter how carefully these dangerous materials are stored.

There is NO mitigation possible here.

WATER

**Ind 343-5**

As the long drought is teaching us, water is our most precious resource. For this reason alone the mining operation should be firmly denied. No one knows, or can possibly study, the impact of releasing thousands of gallons of water into Wolf Creek. If this water is even slightly polluted it could have serious impacts on water systems & agriculture far downstream. Since the geology of the area, already somewhat unstable due to many small faults, could well be impacted adversely by underground explosions, polluted water could reach far into the ground water, destroying wells and depriving us of an important part of our water supply. There is also a high risk that many local property owners could find their wells dried up or the water unfit for consumption.

How can any of these terrible consequences be mitigated?

ADVERSE EFFECTS UPON WILDLIFE

**Ind 343-6**

I have seen no studies about this but there are surely problems. Does Rise Gold plan to erect fences or barriers around all or part of the mine site? If so, how will they impact the life of our already endangered creatures? Apart from noise, which we know to be disruptive, especially at breeding times, there will be lights. How bright will they be & how much of the night will they affect? Added traffic, especially heavy trucks will mean more roadkill. We are already finding traces of harmful chemicals in the eggs of songbirds. How much more dangerous will it become for them if our air is laden with mining toxics? They also face peril from polluted water.

To mitigate any of this, lengthy studies would be needed.

TRAFFIC CONGESTION

**Ind 343-7**

Despite being dismissed in the environmental report as a minor road of little significance, Brunswick is an important connector road in an area without many alternatives. Having a steady stream of large, heavily laden trucks constantly on the road will cause added congestion, inconvenience to local residents and, in the case of a need to evacuate the area quickly, will become a serious threat to a safe operation. They will also cause considerable wear and tear to the roads they use. Will Rise Gold be paying for the repairs and resurfacing needed?

DRAIN ON ELECTRICAL POWER

As we are all well aware, our power supply is already in deep trouble. How will the requirements of a large mining operation be met without impacting local residents and businesses?

**Ind 343-8**

Even if mitigation of some of these issues IS possible. How would regulations be overseen, inspected & enforced? Who will recruit, train and pay all the staff necessary?

In addition to all the environmental concerns there are other problems. Mr. Mossman has a track record of irresponsibly managing mining projects, then walking away, declaring bankruptcy, leaving the local community to clear up & pay for the damage his operation has done. How can we ensure he will not treat Grass Valley in the same way?

In my opinion, approving this ill - considered project is tantamount to civic suicide. Who will ultimately accept responsibility for that?

**Ind 343-9**

Sincerely,

Jennifer P. Kelly

## INDIVIDUAL LETTER 343: JENNIFER KELLY

### Response to Comment Ind 343-1
The commenter's opposition to the project is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 343-2
Air quality and health risk impacts from the project have been analyzed in the DEIR and have been found to be less than significant after mitigation. Please see Chapter 4.3 of the DEIR and Master Response 18 - Air Quality Thresholds.

### Response to Comment Ind 343-3
Crushers would be placed underground and not on the surface, which greatly reduces noise transmission (see page 3-25 of the DEIR). Noise from truck traffic has been analyzed in the DEIR and was determined to be less than significant after mitigation. Please see Chapter 4.10 of the DEIR.

### Response to Comment Ind 343-4
Wildfire is analyzed in Chapter 4.13 of the DEIR and hazards and hazardous materials are analyzed in Chapter 4.7 of the DEIR. Please also see Master Response 6 – Wildfire Impacts.

### Response to Comment Ind 343-5
The commenter asserts that the project would result in water supply and water quality impacts. Please see Chapter 4.8 of the DEIR regarding water supply and water quality impacts, as well as Master Response 16 - Drought and Climate Change, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 35 - Discharge to South Fork Wolf Creek. Regarding the commenter's fault concerns, the magnitude of the mine rock excavation and placement is far smaller than the magnitude of the mass of bedrock underlying the site. The magnitude of the energy released during mining excavations by rock removal and rock placement is much smaller than the magnitude of energy activation required to trigger the release of a local pre-Holocene fault. No analysis was performed nor is necessary, as there is no potential for inducement of seismic activity on these faults from the proposed mining activity. Please see the NV5 Memo attached as Appendix P to the Final EIR.

### Response to Comment Ind 343-6
As stated on page 3-42 of the DEIR, all access locations at the project sites will be gated and secured. Additional fencing around the aboveground facilities may be installed as part of the proposed project, if deemed necessary for security and safety. Fencing would generally be placed on the publicly accessible borders of the site along E. Bennett Road and Brunswick Road, which are already partially fenced and in the areas of the two headframes and associated buildings. Fencing would exclude some wildlife from the operations areas of the proposed project. No fencing would be placed that would exclude wildlife from the South Fork of Wolf Creek.

Project lighting is discussed and analyzed in Chapter 4.1 of the DEIR, on pages 4.1-23 through 4.1-29 of the DEIR. As demonstrated therein, the proposed project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area.

The commenter states that additional traffic, especially heavy trucks, will lead to more roadkill. However, the commenter does not provide any evidence that weight of vehicles increases roadkill or that project traffic on existing roads would result in a significant impact to wildlife.

Noise impacts to wildlife is analyzed in the DEIR (see page 4.4-74 of the DEIR).

## Response to Comment Ind 343-7

The commenter asserts that the project will result in traffic impacts and roadway wear. Traffic impacts have been evaluated in Chapter 4.12 of the DEIR. Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between project driveway and Brunswick Road.

With regard to evacuation, please see Master Response 5 - Evacuation Zones.

With regard to quality-of-life concerns, please see Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 343-8

PG&E provided a will serve letter for the project, PG&E has confirmed that there are electric facilities available to serve the proposed project in accordance with all applicable design standards, rules, and tariffs on file with the State of California Public Utilities Commission. The proposed project would not require or result in the relocation or construction of new electric power facilities. Please see page 4.11-35 of the DEIR.

County, state, and federal regulations and mitigation measures are discussed in detail in the DEIR. Please also see Master Response 3 - Operator Responsibility.

## Response to Comment Ind 343-9

Please see Master Response 3 - Operator Responsibility, and Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 344**

Matt Kelley
Nevada County Planning Department
950 Maidu Avenue
Suite 170 Nevada City, CA 95959

RECEIVED
APR 01 2022
NEVADA COUNTY
PLANNING DEPARTMENT

March 31, 2022

Dear Matt Kelley,

I have made my home in or nearby Nevada City for over 45 years. I am retired from Nevada County Library Service.

**Ind 344-1** I have many concerns about how Benjamin Mossman does business and have addressed those concerns (with references) in previous emails to your department.

My main argument against the re-opening of the Idaho Maryland Mine is that our local tourist and visitor economy will be damaged by having an industrial mining operation so close to Grass Valley.

My specific feedback on the Draft Environmental Impact Report is as follows:

**Ind 344-2** 4.3.2 Existing Environmental Setting
"Ambient Air Quality Standards" - Our county already suffers from bad air quality and my concern is the lack of reference to addressing Asbestos being released. I would like to see an examination of the hazards of exposure and how to mitigate them.

* I am not sure where I found this reference to our General Plan in the DEIR but it addresses my main argument that taxpayers may be "left holding the bag" as happened in Canada with the project overseen by Mr. Mossman:

**Ind 344-3** **Policy 17.13 The County shall require satisfactory forms of accessible security, including irrevocable letters of credit, cash deposits, escrowed negotiable securities, or performance bonds, from all mining projects to cover all such damages which may stem from the projects.**

How much of a bond or guarantee would need to be in place to cover the very real possibility of damage, not only to our economy, but to the environment we all care for? My great-grandchildren are growing up here (!).

I have many other concerns regarding the possible reopening of the Idaho Maryland Mine — I have attempted to limit myself to the areas listed in the DEIR.

Sincerely,

Jennifer Long 16665 Eden Ranch Road Nevada City, CA 95959 530-265-5059

**To:** Matt Kelley
**Subject:** Letter for the 4pm deadline regarding Idaho-Maryland Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Matt Kelley Senior Planning Commissioner:

My family and I are against the re-opening of the Idaho-Maryland mine, also known as the RISE Mine project. I have lived in Nevada county for 25 years and for 6 years, I attended UNR to complete my Bachelor's and Master's Degree in Biology. I have researched the Rise Mine website and have also researched the long-term devastation caused by deep-ground mining (even if it is termed as "green gold mining"). The negative, long-term environmental consequences outweigh the positive, short-term economic benefits. I believe that the RISE firm has appealed to the community with said economic benefits. There are examples from scientifically researched and supported organizations, like safewater.org, that show deep water mining does ultimately and greatly affect the water tables of the environment. If it is not our immediate water tables that are affected (at a more shallow fractured water tables), we will be taking from some neighboring location that can only be determined when the damage has been done. Mines in Arizona and Nevada can still be traced as sources draining water from areas of northern california even decades after the mines have ceased to function. If this is the case, and we deplete another community's water supply, I do not think it would be unlikely that it could be traced right back to our community and this mine. We would be

1

**Ind 345-1**

**Ind 345-2**

economically responsible for restoring their water. I also feel that the RISE website appeals to the community because of LIP SERVICE. The statements are not scientifically supported, or they have kept their sources a secret which contradicts the importance of having proper research to back facts up in the first place. RISE uses misleading verbiage and notions to suggest that they would positively benefit our community via employment opportunities. They have said nothing about how they would select any local employees. They have not said if these employees would be local because they would be temporarily moved to our community to work on the mind. They have claimed that they will provide 612 local jobs, then in the same paragraph they restated that 300 of these employees are implied local business hires because of the influx of cash flow at local businesses. This is a contradiction to what they have said about hiring locally. If these people already live locally then they already use community services. So where would this new revenue be coming from? They are either not hiring locally or they will not generate new revenue locally, which one is it? Let's not be hoodwinked by superficial jargon and deceptive information. There is a reason that a corporation with an unpleasant history (abandonment of job site cleanup and neglect for the environment) is trying to establish temporarily here, ruse our community, and expend our land. When things sound too good to be true, they typically are. There is no such thing as an environmentally friendly way to do a large mine operation. My last thought is in regard to the deep ore that RISE claims will be removed from the ground and used for development of land surrounding the mining site. The breaking up of this solid ore means crushing and releasing other contaminants in the ground. The solid ore that is broken up to be brought out of the deep mining site contains elements that when exposed to oxygen release contaminants into our environment. We might not see the

**Ind 345-3**

**Ind 345-4**

2

effects of these harmful contaminants on a short-term time scale. Perhaps 10 years down the line, we will be experiencing irreparable damage visible by the absence of insect and animal life in the community. We will have to wonder how to explain to our children and their children why the land and water is unusable, or why it is hard to find insects or birds in our area. We will have to reflect on the forgotten few years of supposed financial gain and wonder if it was worth the tradeoff. The long-term effects of mining are what really need to be considered. For our community, reopening one of CA's largest god mines could be the worst path possible.
Thank you for your time,

Jennifer Todd, M.S.
(530)477-1940

## INDIVIDUAL LETTER 345: JENNIFER TODD

### Response to Comment Ind 345-1

This comment is introductory in nature. The commenter's opposition to the project is noted for the decisionmakers. The commenter also states the economic benefits of the project are outweighed by the environmental impacts. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 345-2

The commenter states that the project will have an adverse effect on the water table. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 345-3

The commenter states that the local employment benefits of the project are overstated and the commenter references the Project Applicant's prior mining project. The comment does not address the adequacy of the DEIR. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 2 - Social and Economic Impacts, and Master Response 3 - Operator Responsibility.

### Response to Comment Ind 345-4

The commenter states that the waste rock from the Idaho-Maryland Mine contains toxic substances and will have adverse impacts to biological resources on the surface. The commenter is referred to see Master Response 8 - Mine Waste Characterization. The commenter's opposition to the project is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 346**

**From:** Jennifer Weir <j.weir@me.com>
**Sent:** Saturday, April 2, 2022 9:22 PM
**To:** Idaho MMEIR
**Subject:** Draft EIR for the reopening of the Idaho Maryland Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hello,

**Ind 346-1** I am a resident at 13913 Gopher Hill Ct. Grass Valley. I would like to voice my objection to reopening the mine. My greatest oppositions lie with groundwater concerns due to dewatering the mine, to the backfilling of the mine, as well as, the increased traffic and noise associated with the number of trucks arriving and departing the facility.

**Ind 346-2** We moved to this location specifically for the beauty, tranquility, and community feel of the Grass Valley/Nevada City area. I feel that these characteristics are under attack.

**Ind 346-3** After reading the Draft EIR, I am not content with the remediation options provided. I do not have faith that RISE will meet its obligations to help residents with depleted wells. I do not have faith that RISE will be around to deal with the inevitable "unforeseen" environmental consequences that will result from this mining process. History is littered with stories of companies fighting resident claims, denying culpability, and going bankrupt leaving local, state and federal government agencies with the task of footing the bill and cleaning up the mess.

**Ind 346-4** There are many unknowns that are likely unaccounted for. For example, the possible extended drought conditions in California and the impacts on groundwater in the area exacerbated by the RISE dewatering. Additionally, many of our local waste water treatment facilities have trouble dealing with dramatic inflows of water that occur with unexpected atmospheric river events. Will RISE's WTF be able to accommodate 50 year or 100 year rain events? Weather events in CA have become more extreme over my life in California.

**Ind 346-5** This type of project should not be allowed in our area. We risk losing the character and aesthetic that draw thousands to our area every year. Large scale mining should remain part of our region's history but not a part of our present and future.

I don't know how anyone could read this report and say that this is a good idea for our community.

Sincerely,

Jennifer Weir

## INDIVIDUAL LETTER 346: JENNIFER WEIR

### Response to Comment Ind 346-1
Please see Master Response 1 – Non-EIR/Administrative Issues. In regard to groundwater, please see Master Reponses 14 and 15. Traffic is addressed in Chapter 4.12 (Transportation) of the DEIR and noise is addressed in Chapter 4.10 (Noise and Vibration).

### Response to Comment Ind 346-2
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 346-3
The comment does not address the adequacy of the DEIR. Please see Master Response 3 – Operator Responsibility. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 346-4
Please see Master Response 16 – Drought & Climate Change.

The proposed project includes a septic system and leach field to accommodate wastewater treatment. The DEIR, on page 4.6-49, notes that according to the septic system evaluation, a relatively large, acceptably permeable soil area has been identified within the proposed leach field area. The evaluation concludes that the project site is suited for a Pressure Dose sewage disposal system with a minimum of 1,935 lineal feet of leach line. A minimum 10,000-gallon septic pump tank with watertight risers over each lid and outlet effluent filter would be required. The pump tank would be oversized in order to accommodate for potential power loss, backups, and surge flows in the future. In addition, Mitigation Measure 4.6-4 requires that all drainage be diverted away from the septic tank, pump tank, and leach field.

### Response to Comment Ind 346-5
Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 347**

**Ind 347-1**

Dear Board of supervisor members,

My husband Paul and I strongly oppose reopening the Idaho Maryland Mine by the Rise Gold company!
We live off Banner Mountain road in an area that is included in the mineral rights map and Do Not want to endanger our water and air quality in any way.
The environmental impact report is just a series of assumptions, not guarantees that our precious natural resources will be unharmed. Any damage that occurs could be irreparable and how tragic that would be!

We passionately ask that you reject.the Rise Gold plan to reopen the mine.

Paul and Jere Mcgrew

## INDIVIDUAL LETTER 347: JERE MCGREW

### Response to Comment Ind 347-1

Please see Master Response 1 – Non-EIR/Administrative Issues. Water quality is addressed in Chapter 4.8 (Hydrology and Water Quality) of the DEIR. Air quality is addressed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy). The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 348**

**From:** Jeree Waller <jeree@careandprayer.com>
**Sent:** Friday, April 1, 2022 7:44 AM
**To:** Idaho MMEIR
**Subject:** my public comment about mine

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 348-1**

As a 42 year resident of Nevada County, I am voicing my strong opinion that the mine should not be allowed to reopen. I have asthma, and our air quality is already very poor, so any added pollution is out of the question for myself and many, especially children. The noise, traffic, water usage and the fact that this company has already polluted a Native American site, are certainly other reasons to vote down the mine. Our Nisenan Rancheria should have a voice in shutting down this irresponsible move, as well.

Thank you for supporting the majority of local residents who do not want the Idaho Maryland Mine to reopen.

Blessings,

Jeree Waller
17247 Patricia Way GV 95949

Virus-free. www.avg.com

1

## INDIVIDUAL LETTER 348: JEREE WALLER

### Response to Comment Ind 348-1

Please see Master Response 1. Air quality is addressed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR. Traffic is addressed in Chapter 4.12 (Transportation). Water is addressed in Chapter 4.11 (Public Services and Utilities). The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

In addition, as detailed in Chapter 4.5, Cultural and Tribal Cultural Resources, of the DEIR on page 4.5-21, InContext contacted Native American tribes with the potential to have knowledge of cultural resources in the project area, which included the Nevada City Rancheria Nisenan Tribe. Reponses were not received from any of the tribes. Furthermore, on November 25, 2019, Nevada County sent project notification letters with offers to consult pursuant to Assembly Bill (AB) 52 to Native American tribes who had previously requested to be notified by the County. The tribes contacted by the County pursuant to AB 52 included the Nevada City Rancheria Nisenan Tribe. The Nevada City Rancheria Nisenan Tribe did not respond within the 30-day consultation period.

The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 349**

**From:** Jesse Mendez <builderjess@yahoo.com>
**Sent:** Monday, April 4, 2022 11:13 AM
**To:** Idaho MMEIR
**Cc:** DEIRcomments@cea-nc.org
**Subject:** Voting NO on reopening Idaho-Maryland mine

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Board of Supervisors,
I am encouraging our BOS to vote NO on reopening the Idaho-Maryland mine. I have many concerns, but I'll try to keep my email brief and will highlight just a few of the items I'm most concerned with.

**Ind 349-1** 1. Our mining history cannot be denied, but with a more populated area, and many residents dependent on well water, there is no way to guarantee that wells will not be compromised, either in performance, or quality. The San Juan Ridge mine is a prime example of a disaster that COULD happen. I understand that aquifer systems differ, but the one common trait is that there is no way to map the fractures that groundwater moves in, and as a result, dewatering can drain systems in unanticipated ways. It can also unlock impurities trapped in rocky areas, etc. While initial commitments to maintain well integrity are well meaning, there really is no way to guarantee that well water and quality of life for many residents will not be affected.

**Ind 349-2** 2. We're a tourist town, and as such we get a decent amount of traffic with good weather. The idea that trucks will be hauling material essentially 24 hours per day is not appealing. Impacting neighborhood traffic and busy residential and commercial areas, there is bound to be additional debris on our roadways and freeways. The constant hauling by semi trailers will also further degrade our roadways, and I imagine increased chipped and fractured front windshields from the dropped rock in roadways is to be expected. I don't see this as a positive trade off for a a few jobs.

**Ind 349-3** 3. DEIR-As a draft report, we seem to be missing some key information, one of which is utilizing the Centennial site that is planned for additional mine waste. How is the existing site to be cleaned up and maintained? I also don't understand how the ability to "blast" essentially 24 hours a day is not going to impact established residential areas. We are still a small town, so any active mining claim that incorporates old school hard rock mining is bound to be disruptive to established communities. There is no way around it. It will be noisy and messy, and with seemingly no hard guidelines on hours/restrictions, it is a nightmare waiting to happen, being allowed to happen.

**Ind 349-4** 4. The amount of released water into Wolf creek is sizeable. I don't believe the Impact Report can accurately predict how this already fragile ecosystem and watershed will be affected. With any sustainable release, existing biology will be affected for years to come, and estimated flows are just that, estimates. Until water is pumped from underground mines, there is no way to know just how much flow the creek will experience. With help from the community, the creek is looking healthier than it has in years.

**Ind 349-5** 5. Management team has poor track history- every situation is different, but what is not different is whether or not a business model really works and is environmentally responsible. Ben Mossman and his team do not have a proven track record, and in fact, their record is one of environmental and community failure. Knowing what he has left in other areas is fair warning to what he could leave for Grass Valley.

**Ind 349-6** I would expect our BOS for vote NO on this matter, placing priority on what is best for our community for sustained long term health of our residents and town.
Sincerely,

Jesse J. Mendez
Grass Valley Resident
461 Brighton Street

## INDIVIDUAL LETTER 349: JESSE MENDEZ

### Response to Comment Ind 349-1

The commenter urges the Nevada County Board of Supervisors to not approve the project. The commenter is concerned about the project's impacts to groundwater and states that it is not possible to anticipate the impacts from dewatering the Idaho-Maryland Mine. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues. Regarding impacts to private wells, the DEIR states that impacts to groundwater supplies would be less than significant after mitigation (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 349-2

The commenter is concerned about the project's traffic-related impacts and states that the roadways can already become congested due to tourism. The commenter also states that the project's truck traffic will degrade the roadways. The DEIR discusses traffic impacts in Chapter 4.12 and found that the impacts would less than significant after mitigation, with the exception that the impacts to the intersections at SR 174/Brunswick Road and Brunswick Road/Sutton Way would be significant and unavoidable even after implementation of mitigation. Regarding damages to the pavement from project traffic, Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between Project Driveway and Brunswick Road. Lastly, project trucks would not be hauling 24 hours per day. (DEIR, Table 3-7)

### Response to Comment Ind 349-3

The commenter states that DEIR is lacking a discussion of the Centennial Industrial Site cleanup. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA. The commenter also states that blasting 24 hours per day will be disruptive to residences nearby. The DEIR analyzed underground blasting for the project and found that the noise from blasting would fall below applicable criteria. (DEIR, p.4.10-45.) Regarding groundborne vibrations from blasting, the DEIR found that impacts would be less than significant after mitigation. The commenter is also referred to Master Response 7 - Location of Future Mining Areas. Regarding the assertion that blasting would occur 24 hours per day, blasting activities are proposed to take place twice daily, with blasting between shifts at 7AM and 7PM, with 3 to 4 drift rounds blasted every 12 hours between shift changes and longhole blasts of approximately 3,300 tons of rock taking place once every 3-4 days. (DEIR, p. 4.7-28.) Notwithstanding the above well-supported conclusions in the DEIR, mitigation measures (4.10-3 and 4.10-4) have been included requiring the applicant to perform robust noise and vibration monitoring programs throughout the life of the project.

### Response to Comment Ind 349-4

The commenter is concerned about the impacts to South Fork Wolf Creek from the discharge of treated water. The commenter is referred to Master Response 36 - Flows in South Fork Wolf Creek.

## Response to Comment Ind 349-5

This comment references the Project Applicant's prior mining project and does not pertain to the adequacy of the DEIR. The commenter is referred to Master Response 3 - Operator Responsibility.

## Response to Comment Ind 349-6

The commenter reiterates opposition to the project. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 350**

**From:** Jesse Nugent <jessenugent@gmail.com>
**Sent:** Monday, April 4, 2022 11:53 AM
**To:** Idaho MMEIR
**Subject:** Comment on proposed mine operations

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 350-1** There are too many risks and compromises to the ecosystem, wildlife, and community for this mine re-opening to be beneficial. There is no way to guarantee that many mitigation measures will actually serve to do anything other than act as "damage control".

**Ind 350-2** There are many alarming changes proposed in this seemingly endless list of compromises to be passed on to the community. The owner of this mining company(Ben Mossman) downplays many key issues and claims on a recent news story that only "up to 7 wells could be effected". His solution is to supply treated NID water to these properties. In reality, we will be sacrificing hundreds of millions of gallons of groundwater during a drought. It's not possible to fully understand how this will effect other wells or nearby portions of the watershed. The one thing that is known is that it will not benefit the community/residents, wildlife, or ecosystem to lose that water or stir things up underground.

**Ind 350-3** No amount of mitigation measures will compensate for the amount of pollution, traffic, noise, and other unpleasant side effects an operation like this is going to bring with it.

**Ind 350-4** You don't have to look far to find that Ben Mossman has a troubled past. He has a history of illegal practices and negligence that have caused damages to ecosystems that can't be repaired- https://www.cbc.ca/news/canada/british-columbia/b-c-s-high-court-upholds-new-trial-for-two-managers-after-spill-at-mine-1.5784666

**Ind 350-5** Since the gold rush, the community has become very agricultural and this mine will harm the farming industry. There is no good reason to dump ground water and create exponentially more green house gasses in our area especially during a drought. What happens underground effects what's above as well. We are very lucky the town didnt go up in smoke last year during the river fire...

I hope this decision is made responsibly for the longevity of grass valley and future generations.

Jesse Nugent

## INDIVIDUAL LETTER 350: JESSE NUGENT

### Response to Comment Ind 350-1
Please see Master Responses 1.

The comment expresses a general opinion that the mitigation measures set forth in the DEIR serve more as "damage control," than as tangible steps required of the proposed project to reduce the severity level of potential impacts identified in the DEIR, but does not provide specific examples that would allow for a detailed response. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 350-2
Please see Master Responses 14, 15, and 16. The commenter expresses general concerns regarding groundwater but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 350-3
The comment expresses a general opinion that the mitigation measures set forth in the DEIR will not "compensate" for potential impacts, but does not provide specific examples that would allow for a detailed response. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 350-4
Please see Master Response 3 – Operator Responsibility.

### Response to Comment Ind 350-5
The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1.

**Individual Letter 351**

**From:** Jessica Higgins
**To:** bdofsupervisors
**Subject:** letter from district IV
**Date:** Monday, March 14, 2022 8:35:05 PM

Dist 4

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

March 14th 2022
To Whom It May Concern

My name is Jessica Higgins and I live in District IV with my 8 year old daughter and my husband. My daughter, Lili, and I are writing this letter together to share our stance on the potential reopening of the Idaho Maryland Mine. We love living here and care deeply for our community. I work at Sierra Nevada Memorial Hospital as a nurse and my daughter attends Grass Valley Charter School. We are heartbroken thinking that a company like Gold Rise might have a chance to exploit this precious place we call home.

**Ind 351-1**

We are strongly opposed to the reopening of the mine for many reasons.

**Ind 351-2** Reopening the mine threatens hundreds of private wells.

**Ind 351-3** The expected energy draw of the mine operations would put a serious strain on our power grid and move us further away from environmentally responsible power use.

**Ind 351-4** The water that would be removed from the flooded mine shafts is polluted and when released into the streams and creeks that make up our watersheds, it would decimate the flora and fauna of that precious ecosystem.

**Ind 351-5** The actual mine work will be loud and detrimental to the people who live in the area.

**Ind 351-6** The increased traffic of heavy vehicles on our roads is also undesirable.

There are so many better ways to boost our economy. Take for example the mountain bike trails we have added and the huge boost to the local economy that tourist attraction has provided. People come into our community and spend money locally. Or, as another example, look at the pre-pandemic impact of hosting the Wild and Scenic Film Festival here. Let's work on healthy, sustainable ways to draw money into our economy. The mine will provide few jobs and the wealth generated will mostly be going to a foreign company.

**Ind 351-7**

Please, we can do better than this! Put your local constituents and our precious environment first. Vote no on the reopening of Idaho Maryland Mine.

Thank you for your time,
Jessica Higgins, RN BSN
and
Lili Doleman

## INDIVIDUAL LETTER 351: JESSICA HIGGINS

### Response to Comment Ind 351-1
Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 351-2
Please see Master Responses 14 and 15.

### Response to Comment Ind 351-3
Please see the analysis under Impact 4.3-4, which evaluates the proposed project's potential to result in inefficient or wasteful use of energy and starts on page 4.3-86 of the DEIR. Based on the incorporation of various measures, including the applicant's proposed APM-AQ-1 (Exhaust Emission Control) and Tier 4 engines as required by Mitigation Measure 4.3-1(b), the DEIR concludes that the proposed project would not result in an inefficient, wasteful, and unnecessary consumption of energy, and a less-than-significant impact would occur.

### Response to Comment Ind 351-4
Please see Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 351-5
Noise is addressed in Chapter 4.10 (Noise and Vibration) of the DEIR. The commenter expresses general concerns regarding noise but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 351-6
Traffic is addressed in Chapter 4.12 (Transportation) of the DEIR. The commenter expresses general concerns regarding traffic but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 351-7
Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 352**

## I DO NOT support re-opening the Idaho-Maryland Mine

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

**Ind 352-1**

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Name(s) Jill Francis

## INDIVIDUAL LETTER 352: JILL FRANCIS

### Response to Comment Ind 352-1

Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 353**

2.7

TO: Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

April 2, 2023

Idaho.MMEIR@co.nevada.ca.us

FROM: Jim Bair, Scientist (ret); Business Owner
128 Sierra Blanca Ct.
Grass Valley, CA 95945

**Subject: Idaho-Maryland Gold Mine Project, DEIR Comment on *Appendix E2: Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan***

## Introduction

The purpose of this Comment on the DEIR is to show that asbestos air pollution cannot be mitigated to safe levels as claimed by the DEIR. The inadequacy of asbestos mitigation results from the fundamental nature of the project: it is not feasible to contain asbestos with the huge above ground transporting and dumping (1500 tons a day) of asbestos containing material (defined as 0.25% or greater by California Air Resources Board (CARB)). See the DEIR body Page 4.3-8 for a description).

**Ind 353-1**

The DEIR does describe asbestos pollution to be significant. It states upfront that "Potential cancer risk, as well as chronic and acute health risks would be less than significant without mitigation. However, implementation of MM-AQ-2 would further reduce health risk. Also, since asbestos was found in lab samples from the mine, an Asbestos Dust Mitigation Plan (MM-AQ-3) would be required to limit potential exposure. (page v, Air Quality and Greenhouse Gas Emissions Analysis Technical Report).

However, the mitigation proposals and the referenced CA code make an implicit and profound assumption that asbestos is dust which it is not. As documented below, asbestos fibers may be in dust, but dust particles are much larger and therefore visible. While dust may be manageable, asbestos fibers (ave. .5 microns) become fugitive and airborne to be carried many miles from origination. Asbestos pollution is comparable to wildfire smoke which contains gaseous and particulate matter.

Regardless of issue of dust (versus smoke), the DEIR does not even contain an Asbestos Dust Mitigation Plan (ADMP). Therefore, this vital part of mitigation cannot be used to determine DEIR adequacy. The DIER cannot be certified unless a ADMP is reviewed and approved. Quote: "Prior to the initiation of any clearing, grading, or construction activities, Rise Grass Valley Inc. [sic] shall submit an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD)." It is not consistent with the intent of CEQA to use a report or document that is not available as an impact mitigation.

1

2.7

**Ind 353-2**

Furthermore, the portion of Mine tailings intended to be used as engineered fill is uncertain because fill contaminated by asbestos is prohibited when one of the uses would be in road construction such as surfacing. The CA law (California Air Resources Board, CARB) is unambiguous: "…no person shall use, apply, sell, supply, or offer for sale or supply any restricted material (as defined in subdivision (i)(20)) for surfacing, unless it has been tested using an approved asbestos bulk test method and determined to have an asbestos content that is less than 0.25 percent." [i] The Rise Gold Mine processing of aggregate, "engineered fill", would not qualify for a CARB exemption. (c.f. ref. i)

## General Comments on DEIR Appendix E2, *ASUR Management Plan*

**Ind 353-3**

**Section 1.0** recognizes the inevitable introduction of asbestos into the air by stating that this plan will only "…**minimize** the potential for public exposure to airborne asbestos from the Project…" not eliminate it. (p.1) The section further states that it includes "… testing methods that Rise will implement throughout the life of the project…" which is 80 years. I note below that testing is and will be extremely constrained because it is dependent upon a lengthy, complex process involving small samples of rock that will have to be shipped to testing companies such as those in Berkley and Oakland unless an electron microscope lab is set up on site (see below).

**Ind 353-4**

**Section 4.0** Project Overview represents a clear description of the Idaho-Maryland Mine Project. It is a matter-of-fact depiction of a project so massive the average person including non-expert government officials will have a hard time comprehending the enormity. I judge the representation of the sheer magnitude of the project to be inadequate. As stated, quote, "Gold mineralization production through tunneling and long-hole blasting produces 1,000 tons per day (365,000 tons per year) of mineralized material. Approximately 50 percent of the mineralization [see note below] will be returned to the underground mine as backfill after processing and the remainder of the sand tailings will be used for engineered fill." Blasting will continue 24 hrs. per day, 7 days a week under 2,585 acres, roughly 2/3 the size of Grass Valley.

Ongoing explosions are to occur as little as 200 ft. below inhabited areas, in multiple areas simultaneously. Quote: "The tunnels are constructed in 10-foot advances per blast (a "round"). Parallel holes are drilled into the rock face, loaded with explosives, and then detonated to fragment the rock. The broken rock is moved to the surface, the tunnel is supported with rock bolts and screen, and then the process starts again to continue advancing the tunnel. **A number of tunnels will be under construction throughout the mine area at all times during the life of the mine.**" (p5) [bold added]. The project should be evaluated by comparison to other massive extraction projects in populated areas a number of which have failed. **The DEIR**

2

2.7

**should provide evidence by example that no residential areas have been rendered unhabitable.**

**Section 5.0: Asbestos measurement** is detailed in the ASUR Plan (ref. source 4 below, Idaho-Maryland Exploration Asbestos Sampling… 8.1). Asbestos fibers are very small (often <0.0005 mm in diameter) [0.5 microns]. In order to quantify the asbestos concentration, a sample has to be studied at 1000–2000 times magnification. An electron microscope has to be equipped with an "energy dispersive sector", which allows the chemical composition of the fibers to be determined.[ii]

**Ind 353-5**

While the ASUR Plan states that asbestos analytical methods can detect fibers "0.0002 microns" in diameter (p. 7; see Note 9 below), **the Plan does not address the measurement of airborne fibers.** This is an indication of an inadequate treatment of asbestos fiber size which greatly influences asbestos motility, and consequently public health in the populated area. The size of asbestos fibers predicts airborne movement. Fibers as small as a micron (1 millionth of a meter), are extremely difficult to measure and even more difficult to manage in a natural outdoor environment. (1mm = 1000 microns).

The DEIR does not explain how fibers of this size can be detected on site during above ground processing (planned movement of 3,000,000 lbs. of rock a day). The ASUR Plan indicates there will be testing, perhaps hourly, for asbestos – this would require that a lab including an electron microscope be on site. Note that the Plan equivocates by stating, "Sampling and analytical testing will be done on or off-site by trained and qualified persons under the direction of a State Licensed Geologist." (p. 13) Until an adequate testing plan for asbestos during rock processing (crushing, shafting, dumping, loading, etc.) is submitted and approved, this air quality pollution impact from asbestos is Significant and Unavoidable.

**Ind 353-6**

Cancer potency is critical to assessing air pollution impact. But the ASUR Plan states that "TEM [Transmission Electron Microscopy] is the preferred analytical method for outdoor asbestos samples because of its ability to detect small fibers (greater than or equal to 0.0002 microns in diameter) and to distinguish between asbestos fibers and non-asbestos fibers. The term "TEM structures" is often used to describe asbestos fibers detected by this method. TEM is the method recommended by the California Office of Environmental Health Hazard Assessment (OEHHA). However, **TEM measurements cannot be directly related to the cancer potency** factors because the studies upon which OEHHA's risk assessment was based used PCM analysis. Thus, the TEM measurements must be converted to PCM-equivalent units (OEHHA 2015)." [bolding added]

**Ind 353-7**

The *2002-07-29 Asbestos ATCM for Construction, Grading, Quarrying, and Surface Mining Operations(June 3, 2015) Final Regulation Order* for toxic control is copied into the ASUR Plan Appendix B. While the code requires extensive measures to

3

2.7

control asbestos, **we cannot find any commitment or plan in the DEIR to implement these measures, or CA agencies that have the resources/manpower for enforcement,** e.g., Air Pollution Control Officers (APCO). The DEIR must be evaluated with the realty of comprised enforcement (reported to be 3 Officers for the entire air district).

## Detailed Comments on Asbestos Measurement

**Ind 353-8** 1. Asbestos measurement levels are the basis of proposed mitigation and significance. But asbestos measurements are from underground core samples described in the ASUR Plan -- the relationship between asbestos found in rock samples and how much becomes airborne must be described. Note that despite the unacceptable sample size, several samples were positive: "Actinolite Asbestos Detected, Non-Regulated Amphibole (5 Hornblende) Observed. Concentration in Millions of Fibers per gram: 29 actinolite fibers >5um in length. Possible contamination."

**Ind 353-9** 2. Samples have been taken in known vein areas with preference to existing tunnels/exploration (see maps in ASUR Plan Appendix C). Rise Gold Inc. has no constraints on the location of new tunnels in the Mineral Rights area. There is a huge amount of lithogenic variability in the area, e.g., serpentine rock (high asbestos likelihood) is not in the sample set, but present in the Mineral Rights area. **Additional core holes and samples are necessary to project asbestos quantity in extracted rock**.

**Ind 353-10** Current testing samples are not even close to representative. The mineral rights area of 2585 acres is represented by 19 exploration drill holes, or 1 drill hole per 136 acres, from which 40 to 42 samples are taken (see tables in ASUR Plan Appendix C) beginning downward at 200 ft depth. That is less than .02 samples per acre ( 2 100ths of one sample per acre) equal to 1 sample per 65 acres. **A representative sampling of the mineral rights area must be described and committed to in the DEIR.**

**Ind 353-11** 3. Section 4 is history based, but immediately thereafter in Section 5 there's a discounting of the serpentine areas, even though serpentine rock has indigenous asbestos, and then a statement that there are 19 sample drillings. The next paragraph states that there were 43 drill core samples. Currently, there is no explanation of how likely asbestos is to be in rock *adjacent/proximal* to the samples. There needs to be a description in the DEIR of the sampling location regimen and generalization process that was used.

**Ind 353-12** 4. Section 5.0 (p.7) states, in a circumspect way, that the inappropriate measurement technology, PCM, was used initially and then the more sensitive technology, TEM, was used. TEM was then declared as the incorrect methodology for the California Office of Environmental Health Hazard Assessment (OEHHA). "In 2021, Rise requested the 40 samples previously

4

2.7

submitted to be reanalyzed using the TEM method." Then the Plan says, "**TEM measurements cannot be directly related to the cancer potency factors because the studies upon which OEHHA's risk assessment was based used PCM analysis."** This is simply confusing and obfuscating in complexity and there's no further discussion of cancer potency.

A decision was made based on regulation and the type of measurement, TEM or PCM, to do both, although Section 6.0., p.8, repeats the plan to convert TEM to PCM.

**Ind 353-13**

6. Further ambiguity is evidenced by unclear description of the effect of asbestos presence in either gold ore or barren rock. If planned barren rock tunneling is projected to be Asbestos Containing Material, a location for underground disposal will be found. If gold ore has asbestos, "An operational plan **will be** prepared and approved to ensure that all sand tailings derived from processing of gold mineralization which is projected to be Asbestos Containing Material will not be trucked for use as engineered fill." In other words, the detection of asbestos in rock would result in useless gold ore or barren rock? The plan does state: "Barren rock will be co-disposed with cemented paste backfill or placed (uncemented) in abandoned tunnels."

So, between asbestos-contaminated gold ore and barren rock, will there still be enough rock to warrant the massive trucking of 1000 tons a day to the Centennial dump site and beyond? This is not a facetious question and must be answered in the DEIR by modifying Section 6.0, item 7 and including the *Surfacing in Engineered Fill Placement Plan* in the DEIR. DEIR cannot be approved until that operational plan is completed. "An operational plan **will be** prepared and approved to ensure that all sand tailings derived from processing of gold mineralization which is projected to be Asbestos Containing Material will be used for underground cemented paste backfill and not for Engineered Fill." (p.7) [bold added]

**Ind 353-14**

7. Despite the difficult detection of asbestos in core samples leading to detection of significant presence in approximately 32% of the core samples, there is no established method to determine how much will be airborne. **We cannot find any evidence that underground/in solid/gravel rock sampling is a valid basis for generalizing to airborne asbestos presence.**

**Ind 353-15**

**Conclusion:**

Asbestos creates a risk for Rise Gold Inc. such that finding all the dangerous asbestos is too problematic and expensive for mine operation. Common business sense, especially in such a highly leveraged operation, would minimize sampling of the **3,000,000 pounds of rock moved per day, thus contributing to lethal air pollution from asbestos.** One can only imagine the number of licensed geologists chasing 3 million pounds of rock daily only to have to transport it to Berkeley/Oakland for TEM or PCM testing or both.

5

27

The sampling methodology is inadequate to predict the quantity of asbestos in 547,500 tons of rock removed from the earth every year, **or the quantity of asbestos that will become airborne.** The fact that asbestos was found in a number of core samples proves it is present. Moreover, there is too high a probability that there will be sufficient airborne asbestos to cause regional contamination leading to sickness and increased mortality.

Research concludes that asbestos fibers from mining are small enough to spread widely when airborne and penetrate deeply into the population's lungs. [iii]

Respectfully submitted,

James Bair, Scientist at Stanford, Bell-Northern Research, and Rome Research Center (USAF)

---

**Notes:**

1. "Mineralization", has a different meaning in science. "**Mineralization is the process by which chemicals present in organic matter are decomposed or oxidized into easily available forms to plants.**" In the DEIR **Mineralization** denotes rock that contains gold ore. **Mineralization should be used to denote extraction of minerals using a chemical process.** For mineralized rock to be returned to the tunnels, it must be chemically processed to separate the gold, or be unusable because of excessive amounts of toxins like asbestos.

**Ind 353-16**

2. Quote from DEIR body, **Page 4.3-80: setting "minimize" as the standard -- it should be quantified**

"Asbestos: With regard to potential asbestos emissions from mining, Rise Grass Valley Inc. would be required to comply with applicable regulations, including those established by the MSHA and CARB, that limit potential exposure for workers. Further, as described in APM-AQ-3, the project would include implementation of an ASUR Plan that has been designed to **minimize** asbestos in the engineered fill produced by the project, as well as asbestos fibers generated from underground mining exhausting to the surface. Finally, pursuant to the CARB ATCM for Construction, Grading, Quarrying and Surface Mining Operations, an ADMP is required to be submitted to the NSAQMD for any project with greater than one acre of surface disturbance if any portion of the area to be disturbed is mapped as having serpentine or ultramafic rock or if any portion of the area to be disturbed has naturally-occurring asbestos, serpentine or ultramafic rock as determined

**Ind 353-17**

6

2.7

by the owner/operator or the Air Pollution Control Officer. Because asbestos was found to be present in some of the underground mining material samples that Rise Grass Valley Inc. sent for laboratory analysis,41 **an ADMP is required to be implemented to reduce potential asbestos exposure and protect public health**." [bold added]
[Note reference: "Samples containing naturally-occurring asbestos were from underground rock only; naturally-occurring asbestos is not known to outcrop at the surface of the Brunswick Industrial Site or Centennial Industrial Site." Repeat of 4.3-2 Asbestos Dust Mitigation Plan from DEIR body: See Page 4.3-82]

**Ind 353-18**

3. Paving with engineered fill is illegal; Air Pollution Control Officer (APCO) warning sign:

**WARNING! This material may contain asbestos.**
It is unlawful to use this material for surfacing or any application in which it would remain exposed and subject to possible disturbances.
Extreme care should be taken when handling this material to minimize the generation of dust.

[iii] G. Gibbs, C. Hwang. *Dimensions of airborne asbestos fibres.* 1980; **Environmental Science**, IARC scientific publications." "Systematic measurements were made of the dimensions of fibres found in the air in mines and mills for crocidolite, amosite and chrysotile. Samples were collected on membrane filters and examined in light, transmission electron and scanning electron microscopes. The proportion of short fibres was shown to decrease with extent of processing, especially for amosite. No airborne fibres had a diameter greater than 3 micrometers, and all would therefore be capable of reaching the pulmonary alveoli."

## INDIVIDUAL LETTER 353: JIM BAIR

### Response to Comment Ind 353-1

The commenter suggests that the asbestos mitigation, including the Asbestos Dust Mitigation Plan (ADMP), is insufficient to mitigate asbestos impacts. Prior to underground gold mining, intensive planning efforts will be required to meet state and federal regulations and achieve safety, environmental, and economic goals. Underground mine planning includes exploratory drilling, geologic mapping, material logging, and testing. These same processes also ensure future mining operations avoid and manage rock types that may contain naturally occurring asbestos. Please see Section 6.0 of the ASUR Plan (Appendix E.2 of the DEIR). The Health Risk Assessment (included in Appendix E.1 of the DEIR) is based on conservative assumptions, as described in Master Response 22 – Conservatism used for Asbestos Assessment. Nevertheless, the DEIR concluded that the project could result in a significant impact with respect to exposing receptors to substantial concentrations of asbestos and requires mitigation to reduce the impact to a less than significant level. Mitigation Measure 4.3-2 of the DEIR requires the submission of an ADMP to the Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP.

Various project activities create dust particles which are assumed to contain naturally occurring asbestos for the purposes of the Health Risk Assessment. These naturally occurring asbestos fibers are minerals contained within the rock and must be liberated and become airborne to pose a public health risk. The Health Risk Assessment for the project assumes that every asbestos structure present in dust (coarse particulate matter, $PM_{10}$) is liberated and would be counted as 1 structure in a given airmass. This is a very conservative assumption as a large proportion of asbestos structures would not be liberated and would be enclosed in dust particles. These enclosed fibers would not be counted as asbestos in an air sample because they have no effect on human health. Please see Master Response 22 – Conservatism used for Asbestos Assessment.

The commenter suggests that management of dust does not result in the management of asbestos fibers and that any asbestos fibers in the air would be similar in geographical distribution as wildfire smoke. These opinions and concerns expressed by the commenter are noted by the County. However, substantiation of these assertions is not presented in the comment letter. It appears that the commenter does not understand the nature of naturally occurring asbestos fibers, which are part of the mineral composition of certain rocks. While the air quality analysis assumes a conservative level of asbestos fiber liberation into air (see Master Response 22 – Conservatism used for Asbestos Assessment), most asbestos fibers present in rocks would not be liberated from either the rock or dust particles created from the rocks and would not be counted as asbestos in an air sample because they have no effect on human health. Additionally, as asbestos fibers are considered a subset of coarse particulate matter, reduction in dust concentration at a receptor location would result in a reduction of asbestos at the receptor location with a corresponding reduction in calculated health risk.

Finally, the commenter believes that the ADMP must be reviewed and approved during the CEQA process. However, the commentor is incorrect, as ADMPs are typically prepared and approved after the CEQA process is complete. CEQA regulations state that compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards (see CCR

§ 15126.4.) Mitigation Measure 4.3-2 of the DEIR requires the submission of an ADMP to NSAQMD for review and approval. The ADMP has minimum requirements as described in the mitigation measure. The requirements for the ADMP are regulated by the Asbestos ATCM for Construction, Grading, Quarrying and Surface Mining Operations [17 CCR 93105]). Notably, compliance with the CARB ATCMs for naturally occurring asbestos, including development of an ADMP, is the standard approach within CEQA documents to address health concerns associated with exposure to asbestos from unpaved surfaces, construction and grading operations and quarries where asbestos is found or likely to be found in order to ensure potential health risk impacts to the public would be minimized to a less than significant impact. Multiple other projects in the NSAQMD jurisdiction, as well as throughout the state, have relied upon compliance with these naturally occurring asbestos ATCMs in order to control any potential asbestos emissions to the extent possible. As described in Mitigation Measure 4.3-2 of the DEIR, the proposed project shall also comply with all applicable criteria in the CARB ATCMs for naturally occurring asbestos.

## Response to Comment Ind 353-2

The commenter refers to the requirements of the Asbestos ATCM for Surfacing. All materials would be tested in accordance with the Asbestos ATCM for Surfacing. Materials with detectable asbestos by PLM testing would not be used for Surfacing (see page 4.3-61 of the DEIR).

## Response to Comment Ind 353-3

The commenter believes that asbestos testing proposed for the project will constrain the project unless an electron microscope lab is set up on site. Two methods of asbestos testing are required under the ASUR Plan. Polarized Light Microscopy (PLM) testing is required to comply with the Asbestos ATCM for Surfacing and trucks may not transport material without a receipt based on the PLM results. Any materials with detectable asbestos would not be allowed to be used for surfacing. As discussed on page 4.3-61 of the DEIR, the average asbestos content of the total mined material is of primary concern given that asbestos does not have established acute noncancer effects. The purpose of Transmission Electron Microscopy (TEM) testing, which utilizes an electron microscope, in the ASUR Plan is not to control the fate of the rock and tailings after it reaches surface (that is the purpose of the PLM testing described above). Rather, the TEM testing is done for forward planning purposes to verify that mine planning is effectively minimizing the potential for public exposure to airborne asbestos from the project. Therefore, the TEM results are not required immediately and would not constrain the project operations as asserted by the commenter.

## Response to Comment Ind 353-4

The commenter states that blasting will continue 24 hrs per day 7 days a week under 2,585 acres and those ongoing explosions are to occur as little as 200 feet below inhabited areas. As discussed in the DEIR, regular drift round blasting would occur approximately twice daily over several seconds. Longhole blasting might occur every three or four days and would last for only seconds. Blasting would typically take place between work shifts (7:00AM and 7:00PM). Except for the construction of the proposed Service Shaft, located on the applicant's surface property, no blasting would take place closer than 500 feet below ground surface. Economic gold mineralization does not exist everywhere within the mineral rights and therefore blasting would not take place under an area of 2,585 acres. As shown on Sheet 15 of Appendix K.2, assumed mining areas are based on the projected down-dip extensions to mineralized veins historically mined. Further, please see Master Response 7 – Location of Future Mining Areas. As discussed therein, to address public concerns regarding the scope of future mining within the mineral rights area, the applicant has agreed to an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area (shown on maps

A101, A201 and A202), and will also prohibit blasting closer than 500 feet below ground surface except for construction of the service shaft.

The commenter believes that the project should be evaluated by comparison to other massive extraction projects in populated areas which have failed. The commenter does not provide any information on these other extraction projects. The commenter believes the DEIR should provide evidence by example that no residential area has been rendered unhabitable by similar projects. The Idaho-Maryland Mine and the adjacent Empire and Northstar mines were previously in production and closed around 1956. Residential zones in the areas surrounding these mines have been inhabited during and after these historic operations. The DEIR evaluates impacts from the actual activities proposed by the project in accordance with CEQA. A comparison to other projects would not achieve the goal and purpose of the DEIR.

## Response to Comment Ind 353-5

The commenter asserts that until an ADMP is approved, that air quality impacts from asbestos must be considered significant and unavoidable. However, CEQA regulations state that compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards (see CCR § 15126.4.) Mitigation Measure 4.3-2 of the DEIR requires the submission of an ADMP to the NSAQMD for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring. Components of the ASUR Plan will become part of the approved ADMP and other components will be used as company policy and procedures to assist with compliance with the ADMP.

The commenter believes that all asbestos fibers present in rock can be fully liberated from dust particles. The commenter is incorrect and appears not to understand the nature of naturally occurring asbestos fibers, which are part of the mineral composition of certain rocks. While the air quality analysis assumes a conservative level of asbestos fiber liberation into air (see Master Response 22 – Conservatism used for Asbestos Assessment), most asbestos fibers present in rocks would not be liberated from either the rock or dust particles created from the rocks and would not be counted as asbestos in an air sample because they have no effect on human health.

The commenter believes that asbestos fibers are too small to de detected to ensure compliance with the approved ADMP. However, the procedures for air monitoring for asbestos are specified by California regulations and require the use of procedures developed by the US EPA. These procedures have been developed to ensure the protection of the public health from naturally occurring asbestos fibers. Please see Master Response 22 – Conservatism used for Asbestos Assessment.

## Response to Comment Ind 353-6

TEM measurements are converted to PCM equivalent units in order to calculate health risk. Conversion factors and cancer potency factors are provided in OEHHA – Air Toxic Hot Spots Program – Risk Assessment Guidelines Appendix C. OEHHA is the lead state agency for the assessment of health risks posed by environmental contaminants in California. The health risk associated with asbestos exposure from the project, as presented in the DEIR, was based on the OEHHA guidelines.

## Response to Comment Ind 353-7

Mitigation Measure 4.3-2 of the DEIR requires the submission of an ADMP to the NSAQMD for review and approval. The requirements for the ADMP are regulated by the Asbestos ATCM for Construction, Grading, Quarrying and Surface Mining Operations [17 CCR 93105]). The NSAQMD may revise the ADMP on the basis of air monitoring. The NSAQMD is responsible for approval and enforcement of the ADMP. The NSAQMD is responsible for providing the resources/manpower (such as Air Pollution Control Officers) in order to fulfill its regulatory role. Compromised enforcement is a speculative assertion without justification provided. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment regarding compromised enforcement amounts to speculation, no further response is necessary.

Notably, compliance with the CARB ATCMs for naturally occurring asbestos, including development of an ADMP, is the standard approach within CEQA documents to address health concerns associated with exposure to asbestos from unpaved surfaces, construction and grading operations and quarries where asbestos is found or likely to be found in order to ensure potential health risk impacts to the public would be minimized to a less than significant impact. Multiple other projects in the NSAQMD jurisdiction, as well as throughout the state, have relied upon compliance with these naturally occurring asbestos ATCMs in order to control any potential asbestos emissions to the extent possible. As described in Mitigation Measure 4.3-2 of the DEIR, the proposed project shall also comply with all applicable criteria in the CARB ATCMs for naturally occurring asbestos.

## Response to Comment Ind 353-8

The Health Risk Assessment for the project assumes that every asbestos structure present in dust (coarse particulate matter, $PM_{10}$) is liberated and would be counted as 1 structure in a given airmass. This is a very conservative assumption as a large proportion of asbestos structures would not be liberated and would be enclosed in dust particles. This is the most conservative assumption possible and overstates calculated health risk. A refinement of the relationship between asbestos found in rock samples and how much becomes airborne is therefore unnecessary for the analysis of the DEIR. Please see Master Response – Conservatism of Asbestos Assumptions.

## Response to Comment Ind 353-9

Samples from various lithologies at the Idaho-Maryland Mine Project were selected for asbestos testing. Sampling was based on lithologies where mining could take place and not on percentages of drill holes completed during exploration. As stated on page 7 of the ASUR Plan, Rise completed 19 exploration drill holes, totalling 67,500 feet of drilling, from 2017 to 2019. Forty-two (42) samples, mainly from diamond drill core from various lithologies at the Idaho-Maryland Mine Project, were submitted for asbestos testing in 2019. PLM testing was done on forty samples and TEM testing was done on two samples. In 2021, Rise requested the 40 samples previously submitted (and analyzed by PLM) to be reanalyzed using the TEM method. The location of exploration samples tested for asbestos are shown on sheets 1-3 of the ASUR Plan; sample name, drill hole, downhole depths, sample interval, rock type, and test results are provided in the appendix of the ASUR Plan (Appendix E.2 of the DEIR).

Prior to underground gold mining, intensive planning efforts will be required to meet state and federal regulations and achieve safety, environmental, and economic goals. Underground mine planning includes exploratory drilling, geologic mapping, material logging, and testing. These

same processes also ensure future mining operations avoid and manage rock types that may contain naturally occurring asbestos. Please see Section 6.0 of the ASUR Plan (Appendix E.2 of the DEIR). Please also refer to Master Response 7 – Location of Future Mining Areas.

## Response to Comment Ind 353-10

Please see Response to Comment Ind 353-9.

## Response to Comment Ind 353-11

The asbestos content in rock is related to lithology and not proximity. Please see Response to Comment Ind 353-9 regarding sampling for naturally occurring asbestos. Naturally occurring asbestos (chrysotile) has been found in serpentinite and the management of this material will be required as discussed in the DEIR and ASUR Plan. Serpentinite is not a favorable host rock for gold mineralization and therefore a significant amount of serpentinite is not expected to be mined. Certain historic gold veins were hosted in serpentinite, which has altered to ankerite. This alteration process also alters chrysotile fibers into a non-asbestos mineral form. Very little asbestos is present in historic mine tailings derived from millions of tons of historic mining, including veins hosted in ankeritized serpentine. Please see Master Response 9 - Historical Mine Waste at Centennial Site.

## Response to Comment Ind 353-12

Asbestos by Polarized Light Microscopy (PLM) cannot be directly compared to Transmission Electron Microscopy (TEM) or Phase Contrast Microscopy (PCM) results. The OEHHA Guidelines provide a conversion of TEM structures to PCM equivalent fibers and from PCM fibers to PCM weight percent.

The use of PLM is required to comply with the Asbestos ATCM for Surfacing. This ATCM is designed to protect the public from exposure to asbestos from materials used for Surfacing. The use of TEM testing is required in order to calculate health risk in accordance with OEHHA guidelines.

PLM and TEM testing serve different purposes and are appropriately used for those different purposes in the analysis of the DEIR.

TEM measurements are converted to PCM equivalent units in order to calculate health risk. Conversion factors and cancer potency factors are provided in OEHHA – Air Toxic Hot Spots Program – Risk Assessment Guidelines Appendix C. OEHHA is the lead state agency for the assessment of health risks posed by environmental contaminants in California. These conversions are provided in footnotes and references of the Air Quality Technical Report (Appendix E.1 of the DEIR).

## Response to Comment Ind 353-13

The commenter is referring to a draft version of the ASUR plan which is not included in the DEIR. Please see Appendix E.2 of the DEIR.

Page 4.3-61 of the DEIR has been modified in the Final EIR as follows:

> The applicant has prepared an Asbestos, Serpentinite, and Ultramafic Rock Management Plan (ASUR Plan) which is designed to ~~exclude~~ minimize asbestos containing material, serpentinite, or ultramafic rock from the engineered fill produced as part of the project.

The above change is for clarification purposes and comports with the language in the ASUR Plan (see Appendix E.2 to the DEIR).

Asbestos Containing Material is material with detectable asbestos using Polarized Light Microscopy (PLM). This material will not be used for Surfacing. If planned mining is projected to result in the Asbestos Inventory 3-month rolling average to exceed 0.01% by mass of equivalent PCM units, gold mineralization will not be mined and barren rock will either not be mined or mined using a dust collection system and materials disposed underground (see page 9 of the Appendix E.2).

The commenter asks if detection of asbestos in rock would result in useless gold ore or barren rock. The purpose of the ASUR Plan is to manage mined materials to ensure public health risk from asbestos is minimized in compliance with the ADMP required by Mitigation Measure 4.3-2. If gold ore or barren rock contains asbestos that would potentially result in non-compliance with the ADMP, it would be managed in a manner as described in the ASUR plan, as discussed above.

The commenter asks if there is still enough rock to warrant mining given the restrictions of the ADMP and management procedures to comply with the ADMP outlined in the ASUR Plan. The assumed asbestos content in materials used for the purpose of health risk assessment, using the maximum allowable content in rock for the ASUR Plan, are much greater than actual content of asbestos in materials based on sampling of drill core and historic mine tailings. Please see Master Response 22 – Conservatism used for Asbestos Assessment. Therefore, it is expected that the measures required by the ADMP will not appreciably impact future production of the proposed mining operations.

The commenter states that the DEIR cannot be approved until the operational plans discussed in the ASUR Plan are completed and incorporated into the DEIR. Mitigation Measure 4.3-2 of the DEIR requires the submission of an ADMP to the NSAQMD for review and approval. Components of the ASUR Plan will become part of the approved ADMP and other components will be used as company policy and procedures to assist with compliance with the ADMP. The details of applicant operational plans are not required to be completed for the approval of the DEIR because they are only indirectly related to the ADMP, which is required by Mitigation Measure 4.3-2, and this mitigation measure ensures that potential health impacts to the public from naturally occurring asbestos would be less than significant after mitigation. Further, CEQA regulations state that compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards (see CCR § 15126.4.)

## Response to Comment Ind 353-14

The Health Risk Assessment for the project assumes that every asbestos structure present in dust (coarse particulate matter, $PM_{10}$) is liberated and would be counted as 1 structure in a given airmass. This is a very conservative assumption as a large proportion of asbestos structures would not be liberated and would be enclosed in dust particles. This is the most conservative assumption possible and overstates calculated health risk. Please see Master Response 22 – Conservatism used for Asbestos Assessment. Although the Health Risk Assessment prepared for the project is conservative, the analysis does not preclude the NSAQMD from requiring air monitoring, as detailed in Mitigation Measure 4.3-2 of the DEIR.

## Response to Comment Ind 353-15

Please see Responses to Comments Ind 353-1 through Ind 353-14. The County acknowledges the comment and notes it provides concluding remarks that do not raise new or additional environmental issues concerning the adequacy of the DEIR. For that reason, the County provides no further response to this comment.

## Response to Comment Ind 353-16

The commenter provides a definition for "mineralization" from a google search online[1], which refers to vermicomposting and soil mineralization, as set for the below:

> Mineralization is the process by which chemicals present in organic matter are decomposed or oxidized into easily available forms to plants. Transformation of organic molecules in soil is mainly driven by its microbiota such as fungi and bacteria along with earthworms.

The project is a mining project and the definition of mineralization provided by the commenter, related to composting, is not a conventional definition of mineralization and is not relevant to the analysis.

A conventional[2] definition of a mineral is as follows:

1) Ore
2) An inorganic substance
3) Something neither animal or vegetable
4) A solid homogenous crystalline chemical element or compound that result from the inorganic processes of nature.

The term mineralization or mineralized rock in the DEIR refers to vein materials ("ore") which contain gold and sulphide minerals such as pyrite hosted and adjacent to quartz veins. These sulphide minerals are extracted from the rock during mineral processing by flotation (see page 3-25 of the DEIR). The sale of the resulting sulphide concentrate removes the majority of sulphide minerals that could potentially cause environmental concerns (see page 4.8-46 of the DEIR). Mineral processing does not remove asbestos fiber from rock because asbestos fibers are not sulphide minerals which can be separated by the flotation process. Asbestos emissions are mitigated through the required Asbestos Dust Mitigation Plan and minimized through management of materials as described in the ASUR Plan.

## Response to Comment Ind 353-17

The standard for the maximum allowable content of asbestos in rock mined is 0.01% by mass of PCM equivalent units (see page 4.3-61 of the DEIR). The Health Risk Assessment has shown the risk to the public is less than significant assuming this content of asbestos in rock. The Health Risk Assessment is based on conservative assumptions. Please see Master Response 22 – Conservatism used for Asbestos Assessment.

## Response to Comment Ind 353-18

The commenter is referring to section (d)(3) of the Asbestos ATCM for Surfacing. Any person who sells, supplies, or offers for sale or supply restricted material for non-surfacing applications must provide with each sale or supply a written receipt containing the following statement:

> **"WARNING! This material may contain asbestos.** It is unlawful to use this material for surfacing or any application in which it would remain exposed and subject to possible

[1]https://www.sciencedirect.com/topics/engineering/mineralization#:~:text=Mineralization%20is%20the%20process%20by,along%20with%20earthworms%20%5B38%5D.
[2]https://www.merriam-webster.com/dictionary/mineral

> disturbances. Extreme care should be taken when handling this material to minimize the generation of dust."

Surfacing is defined in the Section (i)(26) of the ATCM as follows: **"Surfacing"** means the act of providing or creating a temporary or permanent covering for a surface used for pedestrians, motor vehicles, non-motor vehicles, decoration, landscaping, soil stabilization, or erosion control. Examples of surfaces include, but are not limited to, roads, road shoulders, streets, access roads, alleys, lanes, driveways, parking lots, playgrounds, trails, squares, plazas, and fairgrounds. For the purposes of this section, "surfacing" does not include creating a covering composed of asphalt concrete or portland cement concrete.

Paving with asphalt concrete or Portland cement concrete is not Surfacing as defined in the ATCM and therefore not illegal as the commenter states.

The project would not use Asbestos Containing Material for Surfacing (see page 4.3-61 of the DEIR).

## Response to Comment Ind 353-19

The reference to Portola Valley is correct and refers to the so-named area within Plumas County, which is in the Mountain Counties Air Basin. See https://www.arb.ca.gov/desig/adm/2020/state_pm25.pdf?_ga=2.165607803.555060607.1660866051-1593822733.1612388870.

## Response to Comment Ind 353-20

The text "TEM is the preferred analytical method for outdoor asbestos samples because of its ability to detect small fibers (greater than or equal to 0.0002 microns in diameter)" is taken directly (and reproduced exactly) from the OEHHA – Air Toxic Hot Spots Program – Risk Assessment Guidelines Appendix C.

**Individual Letter 354**

**Ind 354-1**

March 20, 2022

Dear Board Members -

I have enclosed a clipping stating another reason to NOT vote yes on reopening the mine. How could anyone with common sense, say the Nevada Co. Air Park is a small aircraft airport?

There are so many reasons - read letters to the editor - to not open this mine. Please do not open it - too many lives will be adversely affected - dry wells, poorer air quality, breathing issues for all etc. etc. etc. Think of your ~~the~~ grandchildren and what you are leaving them. A MESS! Jim & Kelli Bradshaw

Dist 1

**Ind 354-2**

# A small aircraft airport, really?

**OTHER VOICES**
*Ray Bryars*

I'm gradually working my way through the Idaho-Maryland Mine project draft environmental report and can't believe the amount of misinformation that I am encountering.

The latest is in the Hazards and Hazardous Materials section, on page 4.7-10, under the heading of "Nearest Airports." The first paragraph states, "The closest public use airport to the project site is the Nevada County Air Park, a small aircraft airport, located east of Brunswick Road and north of Loma Rica Drive, less than one mile (approximately 4,000 feet) from the Brunswick Industrial Site."

By referencing "a small aircraft airport," it appears that there is an attempt to minimize the importance of the Nevada County Airport. There is no acknowledgment that this is a major base for the U.S. Forest Service and CalFire. The location places the airport 20 minutes from other airports, which during fire season provides robust coverage of Nevada County and adjacent counties.

The county website, mynevadacounty.com, has the following information regarding the airport:

"Nevada County Airport is home to the Forest Service and CalFire Grass Valley Air Attack Base. This center of wildland firefighting from the air is the permanent location for two Grumman S-2 air tankers that drop fire retardant, and two air attack aircraft that coordinate the efforts of the tankers and other firefighting assets and personnel. Aircraft from Nevada County Airport are on standby, ready to respond to fires throughout the foothills and mountains. When larger fires occur nearer to the airport, many other firefighting aircraft use the airport as a base for operations. Search and Rescue and med-evac aircraft also use the airport year-round for public safety missions."

In addition, I found the airport is used for law enforcement, business, transportation, tourism and education for youth through programs such as the Young Eagles Program.

It is shocking that Rise Gold ignores the huge positive benefit that the airport provides by stating that it is a "small aircraft airport."

Does Rise Grass Valley want to minimize the importance of the airport so that we will ignore the fact that they will be transporting and storing explosives within 4,000 feet of the airport and right under some of the flight paths?

In the fall of 2021 we had two potentially disastrous fires just below the airport, plus the River Fire just a few miles south. Imagine what it would have been like if the planes that were fighting these fires became grounded due to the possibility of explosives being ignited. Many of us witnessed the great job that the firefighters did and are very aware of the extremely brisk spread that was only brought under control by rapid action by many brave firefighters and the pilots from the Nevada County Airport.

It amazes me that Nevada County allows a penny stock speculator with his history of running away from the Banks Island Gold toxic spill in British Columbia, Canada, followed by declaring bankruptcy, can be allowed to hold hostage the residents of Grass Valley and Nevada County.

There must be a way to stop wasting everyone's time and put an end to the possibility of re-opening the Idaho-Maryland Mine forever. I implore our county supervisors to do the right thing for the community and end this whack-a-mole madness. The airport is vital to the safety, vitality and future of Nevada County.

*Ray Bryars lives in Nevada City.*

## INDIVIDUAL LETTER 354: JIM AND HELEN BRADSHAW

### Response to Comment Ind 354-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1 – Non-EIR/Administrative Issues.

In addition, as detailed on page 4.7-36 of the DEIR, the applicable threshold for the purpose of CEQA analysis in evaluating potential hazards impacts related to the project site's proximity to the Nevada County Air Park is whether the project would result in a safety hazard or excessive noise for people residing or working in the project area. As discussed therein, the project is not a noise-sensitive use, would not pose a hazard to flight, and would not exceed applicable density requirements; therefore, the DEIR concludes that a less-than-significant impact would occur.

### Response to Comment Ind 354-2

The comment is a scanned copy of a local editorial, which the commenter has provided to support the sentiments expressed in Individual Letter 354. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Dist 3**

Nevada County Board of Supervisors
950 Maidu Ave., Suite 200
Nevada City, CA 95959

March 9th, 2022

Dear Supervisor Heidi Hall, Ed Scofield, Dan Miller,Susan Hoek, and Hardy Bullock,

I see no benefit coming to the County from the opening of the Idaho-Maryland Mine by Rise Gold.

**Ind 355-1**

From the DEIR I see that water availability for the mine project is based on past years, not on current extreme drought years. Rise Gold has grossly underestimated the impact water use and water removal will have on the water table and adjacent homes, while offering a paltry mitigation time period within the 80 years of their lease.

**Ind 355-2**

The noise and vibration from trucks and blasting will disturb my patient.

**Ind 355-3**

The diesel Fumes and heavy metal mine dust pollution are all dangerous to our health and businesses.

**Ind 355-4**

Dumping massive amounts of water into Wolf Creek will stir up past mining toxins in the stream channel and destroy habitat. We already live in a cancer hot spot. We have already experienced the toxic effect of the past mining era. New safety technologies can not mitigate all this. And why does anyone trust Ben Mossmen of Rise Gold? His Banks Island Gold, polluted tribal waters, went bankrupt and left a mess for Canadians to clean up. He and others involved have 18 pollution charges that are going to trail in April.

My business is located at 518 South Auburn St., Grass Valley. I already am negatively impacted from the noise, vibration and bad air along the 49/South Empire corridors. I DO NOT WANT an industrial

**Ind 355-5**

gold mine at my front door and I don't know a single person, no matter their political persuasion, who thinks this mine is a good idea. For God's sake please find another source of tax dollars that will actually benefit the community instead of polluting our County and making us sick.

Thank you for you dedication to Nevada County,

Jim Cunningham
800 Freeman Ln., Ste 307
Grass Valley, CA 95949
530-277-3936
jimacpt@sbcglobal.net

## INDIVIDUAL LETTER 355: JIM CUNNINGHAM

### Response to Comment Ind 355-1
Please see Master Responses 1, 14, 15, and 16.

The comment expresses a general opinion that the mitigation measures set forth in the DEIR require a "paltry" time period for addressing potential impacts associated with water levels, but does not provide specific examples that would allow for a detailed response. The DEIR evaluates the proposed project's potential to substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin under Impact 4.8-2, which starts on page 4.8-54. Because the DEIR concludes that a significant impact could occur, Mitigation Measures 4.8-2(a) through 4.8-2(c) require that the Project Applicant implement the Groundwater Monitoring Plan (GMP) prepared by Itasca Denver, Inc., as approved by the County, and install a network of monitoring wells. Should mining operations result in a significant impact to any wells, the mitigation set forth therein additionally requires that the Project Applicant provide a comparable supply of water to such homes or businesses whose wells are significantly impacted, and if necessary, provide an immediate water supply until the source of the problem is determined and rectified. With incorporation of Mitigation Measures 4.8-2(a) through 4.8-2(c), the DEIR concludes that a less-than-significant impact would occur.

### Response to Comment Ind 355-2
The commenter expresses general concerns regarding noise and vibration but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Noise and vibration are addressed in Chapter 4.10, Noise and Vibration, of the DEIR.

### Response to Comment Ind 355-3
The commenter expresses general concerns regarding diesel fumes and heavy metal dust but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Responses 18 and 20.

### Response to Comment Ind 355-4
The commenter expresses general concerns regarding discharge into Wolf Creek but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 35.

### Response to Comment Ind 355-5
Please see Master Responses 1 and 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 360**

mr. matt kelley
senior planner
nevada county planning department
950 maidu avenue, suite 170
nevada city, ca 95959-790

dear mr. kelley,

**Ind 360-1** we are writing once again to express our disapproval, nay disgust, with the consideration to re-open the idaho-maryland mine as proposed by the canadian mining firm rise gold. even before we had done our due diligence by studying the literature available on this proposed mine, we were against it. all our suspicions were confirmed that the impacts of the mine would be irreparable and extensive. this not only includes the toxicity from the tailings for which rise gold would self-

**Ind 360-2** monitor, the impact of noise pollution on a corridor that will be even further impacted by the dorsey marketplace currently under construction, but also the immoral devastation caused by the dewatering of our land. it has been noted by numerous experts (including engineers at NID) that

**Ind 360-3** the hydrology studies from the DEIR is insufficient and / or out of date, likely to be much worse than the paucity of information that was offered.

water seeks its own level. this is a phrase linked to hydrology though it has been appropriated within sociology. on the date that we write this letter, there has been zero precipitation for over 30 days in a time period that has historically been the wettest for this part of california. when the water is removed from a mine, the water from other sources will seep into this void. the DEIR's hydrology is insufficient in predicting the impacts of this and inadequate in offering mitigation. how can you in good conscious allow this proposal to continue as the climate change worsens the environmental conditions in which we live? no mitigation will offset the impacts that will be exacerbated by a needless mine. we need water. the fauna of california needs water. the forests need water. our

**Ind 360-4** future needs water. throwing all of that away for a scant amount of jobs, promised by a disreputable company to a few people outside our community, is profoundly mistaken.

as our representatives in this matter, we demand that you immediately put a stop to this proposal. end it now, and end it forever.

yours in magnanimity,

jim and erika haynes

## INDIVIDUAL LETTER 360: JIM AND ERIKA HAYNES

### Response to Comment Ind 360-1

Please see Master Response 1. The commenter expresses general concerns regarding toxicity from mine tailings but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 360-2

The commenter expresses general concerns regarding noise but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 360-3

Please see Master Responses 13, 14, and 15.

### Response to Comment Ind 360-4

Please see Master Responses 1 and 13 through 16. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 361**

**From:** Jim Morris
**To:** Idaho MMEIR
**Subject:** Idaho Maryland Mine Draft EIR
**Date:** Monday, April 4, 2022 4:17:02 PM

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Nevada County Planning Commission,

**Ind 361-1** I consider the groundwater hydrology studies in this Draft EIR to be woefully inadequate in addressing the potential impact on the local groundwater. The complexity of the groundwater hydrology in this geology cannot be understood with this level of study. I have worked as a Civil Engineer in California since 1983 in the field of Geotechnical Engineering.

James E. Morris, PE

10732 Willow Valley Rd.
Nevada City, CA 95959

## INDIVIDUAL LETTER 361: JIM MORRIS

### Response to Comment Ind 361-1

Please see Master Responses 13 through 16.

**Individual Letter 362**

DEIR Comments to Reopen the Idaho-Maryland Mine

April 3, 2022

**Ind 362-1** My name is Jim Otto and I live at 14069 Diamond Court in Grass Valley which is located off East Bennett Road. I live directly on top of the Idaho-Maryland Mine workings. As a result, my wife and I are living at Ground Zero for this project. This is the third time in the past 30 years that we have had to fight for our water, air, and quality of life, due to a proposed reopening of the Idaho-Maryland Mine.

**Ind 362-2** We own one of the 30 wells identified in the DEIR that is at high risk for dewatering. As such, the well mitigation plan is our biggest concern. It is inadequate for the following reasons:

**Ind 362-3** The well mitigation plan calls for providing NID water to 30 properties along East Bennett Road. The problem is that the hydrogeology in the area is complex. There have been many dewatering studies conducted over the past 30 years, and the one clear conclusion is that nobody knows for certain what will happen to domestic wells when the mine is dewatered. As such, there is an unknown risk to well owners. There are approximately 500 wells within ½ mile of the mineral rights boundary. It's critically important that these wells be identified in the EIR so well owners can assess their risk of dewatering.

**Ind 362-4** A well failure would be a catastrophic event for a homeowner. Without water a property is essentially worthless. Thirty properties will receive NID water, but the DEIR does not address what steps will be taken if a well fails that is outside that area. The applicant needs to define a service level agreement to provide immediate temporary water, as well as a permanent solution. The applicant should provide financial assurances (e.g. bonds) that they can provide NID water to all failed wells in the area in a timely manner.

**Ind 362-5** The DEIR states that prior to dewatering, Rise Gold would offer 30 properties along East Bennett Road to be connected to NID (Page 3-36). "*If the property owner decides to connect to the potable water line, the project applicant would fund the permitting and construction costs*". If the homeowner decides to connect to the potable water line and does not want to abandon their well: Prior to dewatering, it needs to be setup so simply turning a valve will provide IMMEDIATE water to the home. Thus, avoiding ANY interruption of water supply, particularly on a weekend or holiday. Any NID required backflow device should be paid for by Rise Gold. If the property owner declines the original offer to connect to NID, and then their well fails after dewatering commences: Will Rise Gold still pay for NID permitting, construction costs, and all monthly fees? It should.

**Ind 362-6** The DEIR section 4.8-2(c) states that "*the applicant will pay for all monthly NID charges until the property is sold or annexed by the city of Grass Valley*". Rise Gold should pay for all NID monthly charges for the lifetime of the project and regardless of whether the property sells. This section also states that Rise Gold would pay for up to 400 gallons of NID water per day. NID has stated that the average water use in the region is greater than 500 gallons per day. In addition, the DEIR states that NID water will be supplied by the smallest pipe that NID offers, consisting of 5/8". Our current well provides twice that amount of water. Thus, NID's larger 3/4" pipe should be used. Our current well water has been thoroughly tested and is pristine. NID adds Aluminum Sulfate and Sodium Hydroxide to its water. We have a large pond and waterfall that serves fish and wildlife that don't tolerate Chlorine. Therefore, Rise Gold should pay for water filtration systems to remove Aluminum, Sodium, and Chlorine. This all needs to be adjusted in the EIR.

**Ind 362-7**

Well owners face significant impacts related to the mine reopening. The EIR should include creating a Water Review Team that include representatives from Rise Gold, the County, and well owners. The Siskon Gold Project included community involvement around well issues. By all accounts this arrangement of the applicant, local government, and a community liaison was very effective in quickly addressing and resolving well issues.

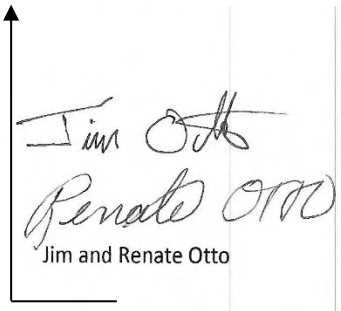
**Ind 362-8**

A final issue related to mine dewatering is the potential to increase the risk of fire. The average rainfall in Grass Valley has decreased significantly in recent years. This has resulted in historic fire damage in Northern California. The DEIR does not adequately address the impact that dewatering will have on vegetation in the area. Any significant loss of water to vegetation would add to increased fire risk at a time when the area has experienced several years of historically destructive fires. The EIR must address how soil moisture in the area will be monitored, before and after dewatering.

**Ind 362-9**

Another major concern with the DEIR is vibration resulting from underground blasting operations. Page 3-20 of the DEIR says that Rise plans to use 0.93 tons (1860 lbs.) of explosives and 257 detonators per day. This is approximately 40% of the explosive power of the 1995 Oklahoma City bombing. Page 2-97 discusses the Vibration Monitoring program. The monitoring will be conducted at the Brunswick site. The problem is that blasting may occur directly under homes along East Bennett Road and within 500' of the surface. Monitoring needs to be added to residential areas where blasting is occurring. Also, there is no mention of how homeowners may report unacceptable levels of blast vibration to Rise or the County. There needs to be a way to report these disturbances and a method for modifying the blasting plan down to an undetectable level.

**Ind 362-10**



We live 1/3 of a mile from the Brunswick surface site, so noise is a big concern. The Summary of Long-term Noise Monitoring (Table 4.10-1) is grossly inadequate. Of the 12 noise monitoring sites, the maximum "long-term" monitoring duration was 5 consecutive days. Worse, site #5 only had two days of monitoring, and site #12 only had one day. There are simply not enough data points. A minimum long-term study should be 90 days. This would reveal an honest noise pattern of the area. The DEIR does not address the process for reporting noise issues. Is it the County's job? If so, which department? What is the process for report a noise issue? This should be addressed in the EIR.

**Ind 362-11**

Finally, the DEIR does not adequately address damage to local roads caused by truck traffic. Page 4.7-37 states that there will be up to 100 truckloads of engineered fill per day. Each truckload will carry 20 tons of fill, and this could continue for 80 years. This will cause excessive road damage between the Brunswick and Centennial sites. The DEIR does not address the annual road maintenance costs from truck traffic. Since the applicant will cause significant road damage, they should help fund road repairs. Every winter cars slide off the top of the Brunswick grade. How will large trucks avoid doing the same? These should be added to the EIR.

**Ind 362-12**

Historic gold mining in Nevada County was an environmental disaster that we are still battling. Will reopening the Idaho-Maryland Mine add to that legacy? This project has several very significant environment impacts. Essentially, Rise Gold is proposing operating a gold mine in a residential area. This is unprecedented in California. It is critical that Nevada County thoroughly analyze the correct mix of mitigation measures to protect the environment and residents. But more importantly, the County needs to take a long, hard look at this project and decide if the benefits truly outweigh the risks.

Jim and Renate Otto

## INDIVIDUAL LETTER 362: JIM AND RENATE OTTO

### Response to Comment Ind 362-1
The commenters opposition to the project is noted for the decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 362-2
The commenter asserts that the well mitigation plan is inadequate but does not provide specifics in this comment. Please see the following responses to more detailed comments.

### Response to Comment Ind 362-3
The commenter asserts that the DEIR should identify wells within ½ mile of the mineral rights area; however, significant impacts to water supply are not anticipated this far from the project site. Please see Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Ind 362-4
General Plan Policy 17.12 and Mitigation Measure 4.8-2(b) already requires that the mine operator immediately replace water supply for wells where water supply or water quality issues occur due to the mine. Under General Plan Policy 17.12, the burden is on the mine operator to prove that the mine did not cause the water supply/quality issue, so this policy is protective of well owners. Please see Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Ind 362-5
The Well Mitigation Plan (Appendix K.9 of the DEIR) specifies that water meters will be installed at the property line and that the water meter would be connected to the house if requested and authorized by the property owner. Therefore, NID potable water would be available at any time unless a property owner refused authorization for this connection. The Well Mitigation plan has been revised to include the installation of Double Check Valves (see Appendix D to this Final EIR). If a property owner decides to retain and continue using their water well, the cost of the well's operation, including Double Check Valve monthly fees, would be the owner's responsibility and not the applicant's. All NID permitting, construction costs, and monthly fees would be funded by the applicant as described in the Well Mitigation Plan.

### Response to Comment Ind 362-6
Regarding annexation or sale of a property, please see Master Response 15 - Adequacy of Groundwater Monitoring Wells.

The single-family home unit demand factor of 0.36 acre-feet per year per connection is used by NID for projecting demands. (Page 18 of the NID 2020 Urban Water Management Plan). This is

equivalent to 321 gallons per day. The well mitigation plan proposes compensation of up to 400 gallons per day or approximately 25% more than NID's estimate of demand for a single-family home. The water supply assessment uses a higher water consumption figure as a conservative measure to ensure adequate water supply; but this is not the appropriate figure to use for the well mitigation plan. A 5/8" water meter is sufficient to provide this capacity of water and is used by over 75% of NID treated water accounts (see Table 1 of NID capacity charge update available at https://www.nidwater.com/files/0795f5c27/NIDCapacityChargeUpdate-2-12-14.pdf)

The commenter states that water quality of NID potable water is lower than the water quality from domestic water wells but provides no evidence to support this statement. Drinking water supplied to Nevada Irrigation District (NID) customers continues to meet and exceed state and federal public health standards, based on testing results that serve as the basis for the District's Water Quality Report. See NID water quality report at https://www.nidwater.com/files/1e68c2c9b/NID+WQR+2021.pdf.

## Response to Comment Ind 362-7

The comment does not address the adequacy of the DEIR. Nevada County Environmental Health will have review and oversight authority regarding prospective well impacts, as outlined in Mitigation Measure 4.8-2. The comment is noted and will be provided to County decisionmakers for their consideration.

## Response to Comment Ind 362-8

As stated on page 4.13-21 of the DEIR, it can be reasonably concluded that the dewatering of the mine would not affect the available moisture for vegetation in the project area because the depth to groundwater is already below the typical rooting depths in higher topographic areas, while adequate flows would occur in South Fork Wolf Creek and Wolf Creek to maintain groundwater levels in the lower topographic areas. The dewatering would not, therefore, increase fire risk due to reduced groundwater levels. Please see Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Ind 362-9

Mitigation Measure 4.10-4 requires ground vibration monitoring at nearby residences. The threshold of significance for blasting vibrations has been determined as 0.4 in/s. Please see Chapter 4.10 and Appendix M of the DEIR. The results of the ground monitoring vibration monitoring program shall be submitted to the Nevada County Planning Department for review, as required in Mitigation Measure 4.10-4. The Nevada County Code Compliance Division manages and investigates complaints, including complaints related to blasting. Please see Master Response 7 – Location of Future Mining Areas, and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 362-10

Please see Responses to Comments Ind 617-3 and Ind 617-4 regarding ambient noise measurements.

Mitigation Measure 4-10-3 requires a comprehensive noise monitoring program to be conducted for each facet of the operation to both verify the modelling assumptions of the project's noise analysis and to ensure that compliance with the applicable Nevada County noise standards is being achieved at nearby sensitive receptors. The permanent monitors shall be provided with a continual power source, and shall include internet connectivity technology, to enable electronic retrieval of noise monitoring data at any time by the County's third-party noise consultant.

The Nevada County Code Compliance Division manages and investigates complaints, including noise-related complaints. Please also see Master Response 3 - Operator Responsibility.

## Response to Comment Ind 362-11

Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between project driveway and Brunswick Road.

As stated on page 4.12-89 of the DEIR, TJKM's peer review also notes the presence of "ICY" signs on Brunswick Road, north of the Brunswick Industrial Site, which implies difficult traffic conditions during periods of inclement weather. As mentioned above, this portion of Brunswick Road is already regularly used by heavy-duty haul trucks. An approximate length of just over 900 feet exists from the crest of the hill on Brunswick Road to its down grade intersection with Loma Rica Drive. As is currently the case, it is incumbent upon individual truck drivers to drive with caution during periods of inclement weather. Mitigation Measure 4.12-6(f) requires that prior to commencement of operations, the Project Applicant shall obtain an encroachment permit from Nevada County and install: 1) W51 "Slow Trucks" road sign along Brunswick Road, about 500 feet north of the E. Bennett Road intersection; 2) A second sign shall be installed at the applicant's expense just south of the crest of the grade, warning truck drivers of the transition in grade and presence of the downgrade Loma Rica Drive intersection.

## Response to Comment Ind 362-12

The commenter's opposition to the project is noted for the decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

**Subject:** Idaho-Maryland Mine Impact, comments by Jim Wahler, former City Planner///Fwd: Updated Notice of Availability of a Draft Environmental Impact Report and Notice of Re-Scheduled Public Meeting to provide Comments on the Idaho-Maryland Mine Draft EIR
**Date:** Monday, February 7, 2022 4:07:55 PM
**Attachments:** image001.jpg
Idaho Maryland Mine NOA Comment Period Extension Final.pdf

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 363-1** Attention Matt Kelley,
I was a city planner for Lake County, Illinois from 1970-1973. During that time we were doing a lot of land use reports for that area.

**Ind 363-2** I can tell you that a project of this kind, the Idaho-Maryland Mine operation would never have been allowed, considering the air, water, and noise factors to the community.

**Ind 363-3** And looking at the track record of the developer, not being able to clean up the mess from other projects that he has done, that in itself would not even warranted his consideration to attempt it in an community as large as Grass Valley/Nevada City.

**Ind 363-4** **It would be a tragedy to this area, a hugh mistake, I would say catastrophic!!!**

I sincerely hope you can exercise your natural sense of planning ethics while making any decisions.

Sincerely,
Jim Wahler, Former City Planner

Subject: Updated Notice of Availability of a Draft Environmental Impact Report and Notice of Re-Scheduled Public Meeting to provide Comments on the Idaho-Maryland Mine Draft EIR

Good Afternoon:

Attached please find a copy of an updated Notice of Availability for a Draft Environmental Impact Report and a Notice of Re-Scheduled Special Public Meeting to provide comments on the Idaho-Maryland Mine Project EIR. This notice is to announce that the public comment period has been extended until Monday, April 4, 2022 at 5:00 p.m. to allow the public a total of 91 days to submit comments. This notice is to also announce that the Special Public Meeting before the Nevada County Planning Commission has been re-scheduled to March 24, 2022. The comment period has been extended due to the Winter Storm events in late December into January, which caused Nevada County residents to lose utility power and internet capabilities for an extended period of time

For more information, please see the attached revised Notice of Availability.

The Draft Environmental Impact Report and other project materials continue to be available for public review and comments on the Nevada County website at: https://www.mynevadacounty.com/3195/Idaho-Maryland-Mine---Rise-Grass-Valley

A printed copy of the Draft EIR is available for public review at the following locations during normal business hours. Due to the COVID-19 pandemic, the Planning Department highly recommends scheduling an appointment ahead of time to review the Draft EIR.

- Nevada County Planning Department, 950 Maidu Avenue, Suite 170, Nevada City, CA 95959 – (530) 265-1222, Option 2.

As a courtesy for public review, a printed copy of the Draft EIR with available Technical Appendices in

electronic format **may** be available for public review at the following library locations, **during normal**

**business hours and by appointment only. Please contact the individual library below for information on appointment availability.**

- Madelyn Helling Library, 980 Helling Way, Nevada City, CA 95959 – (530) 265-7078
- Grass Valley Library, Royce Branch, 207 Mill Street, Grass Valley, CA 95945 – (530) 470-2692
- Penn Valley Library, 11252 Pleasant Valley Road, Penn Valley, CA 95946 – (530) 388-8830
- Truckee Library, 10031 Levon Avenue, Truckee, CA 96161 – (530) 582-7819

A Special Public Meeting before the Nevada County Planning Commission will be held on March 24, 2022, beginning at 9:30 a.m. in the Board of Supervisors Chambers at the Eric Rood Administration Center, 950 Maidu Avenue, First Floor, Nevada City, CA 95959 to receive comments from public agencies and the public on the adequacy of the Draft EIR. Future notice of public hearings will be provided in accordance with Nevada County noticing requirements.

In adherence with Governor Gavin Newsom's Executive Order, and the Nevada County Public Health Officer's Order, pertaining to the convening of public meetings in response to the COVID-19 pandemic, please see the March 24, 2022, agenda after posting for the most updated information regarding the meeting format, as well as the various options being made available for public agencies and members of the general public to provide public comment. If there continues to be a high rate of COVID-19 spread within our community, the Planning Commission may attend the meeting and participate remotely to the same extent as if they were present.

**For information on how to participate in the Special Meeting, please see the Agenda, which will be available at least five (5) days before the meeting at:** https://www.mynevadacounty.com/AgendaCenter/Planning-Commission-10

Seven (7) days prior to the Special Public Meeting, all documents pertaining to the proposed actions, Staff Reports and other supporting documents will be available for public review and consideration at the Nevada County Planning Department, 950 Maidu Avenue, Suite 170, Nevada City, CA 95959 or can be found online at: https://www.mynevadacounty.com/517/Projects-Scheduled-for-Public-Meeting.

Thank you.

**Matt Kelley**

The Customer Service Counter for Nevada County CDA - Planning Department is open from 8:00am – 3:30pm for walk-ins and for appointments. To schedule an appointment with staff please contact the Planning Department at 530-265-1222 Option 2 or planning@co.nevada.ca.us. If you have any questions about our services, please contact us by email at planning@co.nevada.ca.us or by phone at 530-265-1222 Option 2.

## INDIVIDUAL LETTER 363: JIM WAHLER

### Response to Comment Ind 363-1
The comment is an introductory statement and does not address the adequacy of the DEIR.

### Response to Comment Ind 363-2
The commenter expresses general concerns regarding air, water, and noise but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 363-3
Please see Master Response 3.

### Response to Comment Ind 363-4
Please see Master Response 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 364**

**From:** Jim Wahler <jimawahler@comcast.net>
**Sent:** Saturday, April 2, 2022 12:04 PM
**To:** Idaho MMEIR; jim wahler
**Subject:** From Jim Wahler, former City Planner, of Lake County, Illinois.

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hello To County of Nevada,

My name is Jim Wahler. I was a City Planner for Lake County, Illinois, just north of Cook County in the Chicago area 50 years ago. The make up of Lake County was not unlike the density of Nevada County.

I was involved with developing a Land Use Plan for the county. It took 2 1/2 years to come up with our recommendations.

**Ind 364-1**

I assure you, if this kind of mine development were to be initiated in Lake County then or any other time since, it would never have made it to any type of stage 2 development.

**The 10 points outlined by the CEA foundation are completely true and accurate.**

Voting yes for this mine, would be a catastrophic decision for the future of Nevada County.

If you do any research on where other gold mines are, **say in the state of Nevada,** you will find that not only is the density of population far less, the actual mining takes place 50-100 miles away from even any small town population.

**Ind 364-2**

**Anyone who would vote yes on this mine, knowing the potential suicide it would bring to Nevada County air and water and energy usage, would be making a decision that would literally destroy this area for living safely for, not only the next 80 years, but probably FOREVER!!!**

1

I can't imagine who would vote yes on this mine and for what reason. **No amount of money could compensate** for the amount of irreversible damage that would occur for Nevada County and All its residents.

I could go on but **what really is necessary is for the decision makers to wake up to the truth** of the destructiveness of a gold mining operation in the back yard of a population that would be devastated for the rest of there lives and for generations to come.

**You can reach me at 530-274-2416.**

Sincerely,

Jim Wahler, resident of Grass Valley

**Ind 364-3**

**Individual Letter 365**

**RST Engineering**

13993 Downwind Court
Grass Valley CA 95945
530.272.2203 voice only
www.rstengineering.com

24 March 2022

The Honorable NevadaCounty Planning Commissioners
950 Maidu Ave
Nevada City CA 95959

RECEIVED
MAR 24 2022
NEVADA COUNTY
PLANNING DEPARTMENT

REF: DEIR, Dec 2021, Idaho Maryland Mine Project

Commissioners:

QUALIFICATIONS (in date order):

BA Semiconductor Physics, San Diego State University. Commercial Pilot, Flight Instructor, Airframe & Powerplant Mechanic with Inspection Authorization. Electronic Design Engineer, Surveyor & Apollo Moon projects, Viking Mars Soft Lander. Antenna & Instrumentation Designer on Voyager Earth Circumnavigation program, For the last 46 years the electronic and mechanical designer of FAA and FCC approved and installed electronic and mechanical apparatus for my own company at Nevada County Airport and distributed around the world. FCC approved type acceptance engineer.

**Ind 365-1**

Resident 46 years at the same location in Nevada County, roughly half a mile out Greenhorn from Brunswick and halfway between Brunswick and Loma Rica. Between half a mile and two miles from the current project surface sites.

43 years on the Sierra College faculty in the Electronic Technology/Computer Aided Design/ and Mechatronics programs at Rocklin, Grass Valley, and Truckee campuses. VP of the SC Faculty Association (2000-2014), Elected to the California Teachers Association State Council. Elected to the National Education Association Representative Assembly.

8 years on the Nevada County Board of Supervisors (District III) having dealt with dozens of these EIRs and projects including other gold mine proposals.

DISCUSSION #1.

In the call for preliminary comments (DEIR page 1-13), the concern was voiced (page 1-13) for the potential of sink holes. Sink holes are not uncommon where mining operations have taken place. No mining operation that I have ever studied could re-fill an underlying rock support system anywhere as good as Mother Nature did it several million years ago.

**Ind 365-2**

There has been zero response in the DEIR to this comment.

And what happens when a sink hold suddenly appears on a Nevada County Airport runway after the staff has gone home? Dark of night? As a flight instructor of several thousand hours, I can tell you that an aircraft landing light does little but find you the location of the runway and PERHAPS a deer or two on the runway. It certainly will NOT find you sink holes. I see no mitigation or even a nod to the possibility.

As the survivor of three aircraft forced landings, I can tell you that handling the emergency during the day is difficult. At night it is a gamble at best. The odds of an aircraft (and passengers) surviving a sink hole landing at night without injury is somewhere between zero and zip.

DISCUSSION #2

In the call for preliminary comments (DEIR page 1-14) the concern was voiced (page 1-14) for airborne particulate matter (smoke, dust, grindings, etc.) contamination of Nevada County aircraft engine air filters to become contaminated to the point of engine failure when passing over the proposed project.

There has been zero response in the DEiR to this comment.

**Ind 365-3**

This is my 55th year in aviation maintenance. When the engine stops breathing, the engine stops turning. When the engine stops turning the propeller stops turning. The propeller is only there to keep the pilot cool, because when it stops, (s)he starts sweating like you cannot believe.

You cannot accept in the final EIR that there will not be any airborne particulates, and yet the proponent has not shown any data on particulate matter and the distribution of it around the site.

Just as a side matter, when I get an airplane in the maintenance hangar to inspect, I can tell from the air filter contaminants where the airplane is based. Gray, black, yellow, or brown, they are all representative of the pollution in the area where they are from. I'd prefer not to have a Nevada County contaminant signature.

DISCUSSION #3

My apologies. I never considered blasting when I thought about aircraft. And, since the DEIR has concentrated its responses on domestic housing effects, I thought you should consider the effect of blasting on stationary aircraft at Nevada County Airport

**Ind 365-4**

As I stated above, I have been designing aircraft electronic devices for a very long time. And, the FAA has given us guidance on shock and how we had to design our devices to handle it. I see nothing in the DEIR about the hundred or so aircraft populating Nevada County Airport and how they or cannot resist the shock of blasting.

We in the aviation electronics ("avionics") industry have been guided for dozens of years by documents produced by RTCA for the tests our devices should undergo for blasting and vibration. I have absolutely no idea whether or not the DEIR considered these criteria.

Just for their information, I include reference to RTCA document DO-138 (as amended and superseded) as the basis for this discussion.

Thank you for your time

Jim Weir
RST VP Engineering
Nevada County Supervisor III (Retired)

## INDIVIDUAL LETTER 365: JIM WEIR

### Response to Comment Ind 365-1
The commenter provides a summary of their background. The comment is noted.

### Response to Comment Ind 365-2
The commenter is concerned that the project will cause a sinkhole at the Nevada County Airport and the commenter states the DEIR fails to address the possibility at the airport. The project will not cause sinkholes in the airport runway. Near surface workings and subsidence are analyzed in Chapter 4.6 (Geology, Soils, and Mineral Resources) of the DEIR. The commenter is referred to Master Response 7 - Location of Future Mining Areas, and Master Response 29 - Near Surface Workings.

### Response to Comment Ind 365-3
The commenter states that the DEIR fails to analyze air quality impacts, specifically particulate matter. The DEIR analyzed particulate emissions in Chapter 4.3 and found the impacts to be less than significant after mitigation. (DEIR, p. 4.3-66.) The commenter is also referred to Master Response 18 - Air Quality Thresholds. Further, as stated on page 4.3-81 of the DEIR:

> The project would be required to comply with NSAQMD Rule 207, Particulate Matter, and would implement APM-AQ-2, Surface Fugitive Dust Controls, which would limit the amount of dust generated during project implementation. By reducing the generation of fugitive dust through compliance with the foregoing NSAQMD rules and APM-AQ-2, emissions of $PM_{10}$ would be reduced to the maximum extent practicable and receptors would not be exposed to excess pollutant concentrations.

In addition, Mitigation Measure 4.3-2 states in part:

> *For all earthmoving activities, at least one of the following methods of dust control shall be implemented, pursuant to (e)(4)(E) of the ATCM:*
>
> *a. Pre-wetting the ground to the depth of anticipated cuts; and/or*
>
> *b. Suspending grading operations when visible dust emissions from any aspect of the grading (including tires, fans, and exhaust) cross the property line.*

Contrary to the commenter's speculation, there is no evidence that the mine's operation would generate substantial airborne particulate matter.

### Response to Comment Ind 365-4
The commenter states that the underground blasting will damage aviation electronics at the Nevada County Airport. The DEIR analyzed the impact of blasting vibrations on sensitive electronic equipment at Analog Devices, which is much closer to the proposed mining activities than the Nevada County Airport. Underground blasting associated with the project would result in a less than significant vibration-related impact to Analog Devices. (DEIR, p. 4.10-55.) The commenter is also referred to Master Response 7 - Location of Future Mining Areas.

I am a local resident who would be downwind from the Idaho-Maryland mine. Please don't approve this project. We cannot trust the government to do what's in our best interest. It's abhorrent that this is even being considered in the name of profit. I moved away from Oakland because of my asthma. I am so incredibly opposed to this project. Help us in keeping our air and water clean.

Thank you,
Jimena Saravia

Mining was Nevada County's past but it should not be our future! We all live in a beautiful rural community which has become a tourist destination enjoyed by visitors and citizens alike. We want to protect the precious resources we have so that our children and their children can thrive here.

The EIR is faulty; the company wanting to exploit the land is sketchy and putting out misinformation in glossy brochures; and worst of all, we are experiencing historic drought and accompanying fires. Our air pollution in this area is much too high and will only be exacerbated by the mining.

There has been so much information put out by knowledgeable people on the risks and uncertainties. I only hope those of you considering "what is best for the community" will not cave in to false promises and pipe dreams.

On Friday, March 18, 2022, 6:21 PM, Joan Reynolds Griffin <jreynoldsbotany@aol.com> wrote:

Dear Matt Kelley,

**Ind 368-1** I am a resident of Nevada City, a botanist, and I have worked for the gold mining industry in Nevada and California for over 30 years. Although my utmost concern about the proposed mining venture at the Idaho Maryland mine site is the amount of water that will be used for the mining venture, I also know from experience that the area will be impacted beyond repair regardless of what bonds or reclamation requirements are implemented.

**Ind 368-2** During my career as a field botanist for many mines throughout Nevada, I performed both pre-mining botanical surveys to search for botanical resources for environmental documentation, as well as reclamation monitoring for post mining rehabilitation. The amount of environmental damage that consistently occurs during the gold mining ventures never recovers the landscape to the level prior to the ventures to mine for gold. It is an environmental tragedy which typically enables a few to receive capital gain, most of which are from another country. The local economic gain is always short if at all, and the people who see the economic benefits do not contribute to the local economy. The resource demands and damage far out way the benefits to the local area, community and environment.

**Ind 368-3** The traffic, noise, air quality impacts are also huge concerns for the residents who reside near the proposed mine location, not to mention the potential for the water table to drop and impact wells throughout the area. Our people in our community need all the water we have, especially during these intense drought and climate change conditions.

Please stop the mining proposal in its tracks for the Idaho Maryland Mine.

Thank you.
Sincerely,
Joan Griffin

**Individual Letter 371**

**From:** Dovetail Services
**To:** Idaho MMEIR
**Subject:** Rise Gold Mine
**Date:** Friday, March 11, 2022 1:39:26 PM

Dear people making this decision,

**Ind 371-1** This mine is the worst idea ever. I don't need to outline the possible bad affects this will have on our community. A few jobs for a few years and some tax income is not worth the risk of destroying the paradise where we live. We are already still dealing with the effects of the last gold mining operations including on just from the 1990s. https://www.theunion.com/opinion/columns/jonathan-keehn-the-siskon-mine-well-disaster/.

**Ind 371-2** No matter what the impact report says, this company is not to be trusted. You only have to look at their Canadian record to see what folly it would be for us to have a mine here. https://www.minewatchnc.org/shouldnt-trust-rise-gold.

**Ind 371-3** Poisoned streams; drained wells; environmental havoc; noisy, heavy, stinky trucks tearing up the roads; traffic; noise! We don't need any of it! Please read the letters to the editor in *The Union*. The vast majority of residents in Grass Valley and Nevada City do NOT want this mine to open. https://www.theunion.com/search-results/?q=rise+gold&range=2021-12-11.

Please, we beg you—vote NO. Do you want to be held responsible for making a horrendous decision that could ruin our community and beautiful lands for decades or longer?

Best,

**Individual Letter 373**

**From:** Joanna Pedroncelli <mikolouise924@icloud.com>
**Sent:** Monday, April 4, 2022 12:49 PM
**To:** Matt Kelley
**Subject:** Idaho Mine Opposition Plea

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr. Kelley,

I am writing as a citizen of Grass Valley who is extremely concerned about the proposal to re-open the Idaho-Maryland Gold Mine. My husband and I moved to Grass Valley in 2018 to be closer to his family but the main attraction to this area was the magnificent wild beauty and small town friendly charm. We have been so happy here and though my husband has been battling cancer for 18 months, we feel strongly that living here has been a healing boost for its peaceful, scenic beauty and welcoming community.

**Ind 373-1**

History has proven that a gold mine cannot be operated without a tragic permanent devastation to the surrounding environment. Mining affects everything and everyone in proximity for many generations to come. I plead with you and your fellow Board to protect our town and its citizens. The short term financial gain, if any, will be overshadowed by the loss of our clean water and personal wells, natural wild life community, quiet neighborhood, lack of traffic and pollution and the decline of property values.

**Ind 373-2** Will the Canadian Rise Gold Company be financially responsible for the devastation they will cause by the simple fact of operating their business? I would like to see the DEIR

**Ind 373-3** Who is going to replace the millions of gallons of water our community will lose to toxic contamination when we already have a drought and water is precious as it is?

**Ind 373-4** How long will the soil be contaminated by the tailings? Who cleans that up and how?

**Ind 373-5** In an ever decreasing realm of wilderness, what will become of the wildlife that currently inhabit the many acres which will be affected by the mine? How many species of animals will be displaced or lose their life due to mining operations?

**Ind 373-6** Who wants to visit a town or live near a gold mine causing loud truck traffic and fumes from diesel engines running all day, not to mention increased traffic? What impact will this have on our town?

**Ind 373-7** What is the upside of reopening the mine, except for the Canadian company's financial gain? The economic losses due to lowered real estate values, less tourism, more pollution and a declining quality of life to the citizens of the area will be much greater.

Thank you for your time.

Sincerely,
Joanna Pedroncelli

## INDIVIDUAL LETTER 373: JOANNA PEDRONCELLI

### Response to Comment Ind 373-1
The commenter opposes the project on the basis that the economic benefits are outweighed by the environmental impacts. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

### Response to Comment Ind 373-2
This comment references the Project Applicant and does not concern the adequacy of the DEIR. The commenter is referred to Master Response 3 - Operator Responsibility.

### Response to Comment Ind 373-3
The commenter is concerned that the project will contaminate groundwater. However, the water in the Idaho-Maryland Mine does not supply private wells and the project would treat the water pumped from the Idaho-Maryland Mine to state standards (Central Valley Regional Water Quality Control Board) under state permitting, which would improve the water currently in South Fork Wolf Creek. DEIR Chapter 4.8 (Hydrology and Water Quality) found that impacts associated with the dewatering, treatment, and discharge process would be less than significant after mitigation. (DEIR, p. 4.8-41.) The commenter is referred to Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 16 - Drought and Climate Change, and Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Ind 373-4
The commenter asks how long the soil will be contaminated by the tailings and who will remediate the site, but it is unclear what site the commenter is referring to and which waste (e.g., existing waste at the Centennial Industrial Site or engineered fill). The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA, Master Response 8 - Mine Waste Characterization, and Master Response 9 – Historical Mine Waste at the Centennial Site.

### Response to Comment Ind 373-5
The commenter is concerned about the wildlife that inhabits the area of the project site. The DEIR states that impacts to special-status wildlife species would be less than significant. The commenter is referred to Master Response 37 – Birds and Raptors, and Master Response 38 – Foothill Yellow Legged Frog and California Red Legged Frog.

### Response to Comment Ind 373-6
The commenter is generally concerned about traffic and air quality impacts but does not provide any additional information on which to formulate a specific response. The DEIR found that all traffic-related impacts (with the exception of traffic at the SR 174/Brunswick Road and Brunswick Road/Sutton Way intersections) would be less than significant. (DEIR, p. 4.12-54, 67, and 69.) Regarding air quality impacts, the commenter is referred to Master Response 18 – Air Quality Thresholds, and Master Response 19 – NSAQMD Criterion Pollution Thresholds during Operations. As stated in the Health Risk Assessment (HRA) performed for the project (see Appendix B of Appendix E.1 to the DEIR), for diesel haul trucks, estimated maximum daily trips were multiplied by 365 days to estimate annual trips. For all other trucks, daily emissions were estimated based on the anticipated maximum daily truck trips, and annual emissions were estimated based on anticipated average trips per week multiplied by 52 weeks per year. Total truck trips assumptions for the HRA are shown in HRA Table 7. Based on the HRA, which includes all construction and

operational TAC sources of the project, the health risk to the maximally exposed individual resident (MEIR) would be less than significant after implementation of mitigation.

## Response to Comment Ind 373-7

The commenter opposes the project because of perceived adverse economic and social impacts. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

**Individual Letter 374**

**I support re-opening the Idaho-Maryland Mine** Impact of mining in other countries is horrible.

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Ind 374-1

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

our rocks make this certified GOLD.

**Individual Letter 375**

**From:** jevers888@gmail.com
**Sent:** Friday, April 1, 2022 12:50 PM
**To:** Idaho MMEIR
**Subject:** Rise Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Supervisors,

We have been residents of Nevada County since 2007. We have had issues with our well on and off from lack of water due to drought the entire time we have lived in Nevada County. Our well got so bad one year we were having red soil sediment flow into the house and were looking into having to drill a second well. I've heard of this same story, as you have, throughout Nevada County over the years.

**Ind 375-1**

With the proposed project of Rise Mine I am concerned about the 107,000 gallon a day project use of water. According to the DEIR and Raney Report/Assessment, most of which comes from Rise's own research, the Mine will be using NID water, ground water, and local municipal water. As you know the dewatering process of drilling below the water table will necessitate Rise Mine dumping large amounts of water into the south fork of the Yuba river, 10%of water use, so they estimate, or 10,700 gallons a day, 3,852,000 gallons per year.

**Ind 375-2**

Again, these reports were not supplied by independent sources. Rise even claims that they will even be making more water than they use! As you also know from the reports that Rise will not be responsible for flooding, damages, culverts or any other infrastructure improvements along the South Fork as it dumps its pumped water out into a location off of Brunswick and highway 49 on its way towards Grass Valley.

**Ind 375-3**

My concern is that the water will create flooding in Grass Valley especially in the winter months, as the mine plans to run 24/7, and most importantly, all that desperately needed water will simply flow down the hill to the valley by gravity. I worry that we will have less water for our homes, our wells, and our ever worsening wildfires in the summer and fall.

As stewards of our community I find it astonishing that you have all voted in favor of the DEIR for Rise and essentially this mine project.

With regret,
Joanne Evers

To: Board of Supervisors; A very interesting (non fiction) book I read and urge everyone on the board to take a look at it if not already is "Farsighted" how we make the decisions that matter the most by Steven Johnson.
Here is a page at the beginning of the book. Please don't let an opening of a mine (Rise) to happen in this County.

**Ind 376-2**

## THE FIVE-HUNDRED-YEAR MISTAKE

The story of Collect Pond is, in part, a story about a decision, or about two decisions, really. The decisions did not coincide directly in time, and neither was adjudicated by a single individual. But for the sake of shorthand we can compress them down into a simple binary: Should we preserve Collect Pond by turning it into a public park, or should we erase it? The consequences that trailed behind in the wake of that decision continue to affect the daily experiences of New Yorkers who live and work in the neighborhood today, more than two centuries later. Today, the land that was once occupied by the menacing crowds of Five Points now hosts a more wholesome, but not exactly lively, collection of government buildings and quotidian office towers. But imagine a Lower Manhattan that harbored a green oasis, perhaps the size of Boston Common, featuring a picturesque pond bordered by a rocky bluff that rivaled the heights of the man-made structures around it. We like to romanticize the Five Points era now, but the gangs of New York would have found somewhere else to assemble if the city hadn't filled the pond. The sudden drop in real estate prices that those subterranean microbes triggered certainly helped attract the immigrants who would make the city a truly cosmopolitan center, but there were other forces driving that population influx beyond the cheap housing in Five Points. City neighborhoods are still capable of great demographic and architectural change, reinventing themselves every few generations. But once you bury the pond, it never comes back.

If Delafont's plan had been put in place, it's entirely likely that Park would today stand as one of the great urban

**Ind 380-1**

Dear Board of Supervisors,

I've only lived in Nevada County 21 years, but have read extensively about both my county and mining operations in the United States. Put my and my family's name firmly in the column of "object to the proposed reopening of the Idaho-Maryland Mine". It's a NIMBY objection based upon research.

Sincerely,
John Deam
14844 Craig Lane, Grass Valley, CA 95945

Nevada County Planning Dept.
Attn: Matt Kelly
950 Maidu Ave, Suite 170
Nevada City , Ca 95959

Regards: Idaho Maryland Mine Project

**Ind 381-1**

Dear Mr. Kelly

I'm sad that I have to write this letter , I would think the powers that are in place would have all ready denied this project .

Please consider the of lack the water and the stress this will cause this community in lack of resources .

**Ind 381-2**

We have the joy of living in place where we can get our drinking water from our wells. Why make problems for people who lived here and have established wells . For the sake of few jobs and profit to people in another country !!!!!

I beg you vote NO NO NO on this project of destruction of our community. We don't need the noise and pollution of trucks rolling up and down our already well used highways ..

**Ind 381-3**

Best Reagrds

John Fischer

## INDIVIDUAL LETTER 381: JOHN FISCHER

### Response to Comment Ind 381-1

Please see Master Response 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 381-2

Please see Master Responses 2, 3, and 13 through 15.

### Response to Comment Ind 381-3

Please see Master Response 1. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

**Individual Letter 382**

# Comments on Draft EIR

CONCERNING IDAHO-MARYLAND MINE PROJECT

SUBMITTED TO NEVADA COUNTY PLANNING DEPARTMENT

JOHN F. HAVERTY
APRIL 3, 2022

# 1. Summary

## *1.1. Identity*

My name is John Haverty. I have lived in Nevada County since 2014, in the Forest Knolls region of lower Banner Mountain, and in California since 1990.

Ind 382-1

Although I am now retired, I spent most of my career working as a consultant in the computer field, for several different companies, both as a manager and individual contributor. I have undergraduate and graduate degrees in Electrical Engineering from MIT. I have several decades of personal experience in the business and technical aspects of consulting. Most recently I also consulted as an expert witness in a patent litigation, and prepared several reports as part of that work.

I also have personal experience with the impacts of Mining, from my family experience while growing up, in the area of central Pennsylvania where my ancestors settled. Although that area involved mining anthracite coal, much of the aspects of environmental impact may be similar to those of the "hard rock mining" that will be performed in the Project.

Additionally, I served 6 years in an elected position as a Board Member of a California Special District. Thus I have some understanding of the pressures, and constraints, under which public officials must operate.

I am not being compensated for creating this report, other than satisfaction in acting as a citizen of the area.

## *1.2. Position*

I have not yet formed a position on the Mine Project. It is a complex situation with long-lasting effects on our community, both pro and con. A decision to proceed or not, and selection of the most appropriate Alternative, demands gathering as much information as possible before making a decision with such long-lasting effects. The EIR is one important component of that information.

As requested, my Comments address only the Adequacy aspects of the Draft EIR. I have tried to present no opinions on the accuracy of the EIR or the data it presents.

## *1.3. Adequacy of Draft EIR*

The Draft EIR is quite detailed and lengthy, and contains much information in support of its conclusions. However, in my opinion, the information and analysis presented in this Draft is insufficient to warrant any conclusions or subsequent decisions. The Draft EIR is inadequate for those purposes, for the following reasons:

Ind 382-2

- **Time Scale**: An EIR is expected to detail the impact that a Project will have on the environment, i.e., compare the two scenarios of the future, one where the Project happens, and the other where it does not. This EIR seems to compare the Project scenario with the scenario of the local environment today, or in the very near term. The Project projected lifetime is 80 years. It should be evaluated in comparison to an 80-year projection of the Grass Valley area without the Project, but including all other changes that can be reasonably predicted over that timeframe.

**Ind 382-3**

- **Alternative Outcomes**: The EIR seems to consider only one scenario for the Project, where everything goes according to plan and the Project operates for many decades. There are many other possible, and perhaps more likely, scenarios which should be evaluated.

**Ind 382-4**

- **Local Conditions**: Although the EIR is comprehensive with its inclusions of many aspects of an environment, I find that it is quite generic in its structure. I know from experience that this is a common practice in Consulting, to make it easier to generate comprehensive reports by exploiting the commonality across many projects. However, this makes it easy to miss some of the situations specific to a particular Project, which can have significant environmental impacts. I have found several aspects of the Grass Valley environment which have apparently not been considered in the EIR analysis.

**Ind 382-5**

- **Incomplete Analysis**: The technical aspects of impacts on the environment are necessarily complex and interrelated. Using my personal experience, I have noticed some technical aspects that can affect the environment but which I haven't found to be addressed in the EIR.

The EIR document is sizable and addresses many different areas of possible concern, and I have not been able to exhaustively review and consider all of its information. However, the aspects that I have noted above, and provide a few detailed examples below, bring me to question the Conclusions of the report. Additionally, I have only used my personal experience to focus on issues that I have encountered where I have some background and expertise. There may be other similar inadequacies in other areas of the EIR's analyses that other reviewers may have reported in their comments.

**Ind 382-6**

In addition, my comments are based on a likely inadequate reading of the Draft EIR, with more than 1000 pages of information. If some inadequacy that I note has actually been addressed in the Draft EIR, and I simply have not yet found it, I apologize for my error.

### *1.4. Recommendation*

In my opinion, the Draft EIR is inadequate in providing an accurate comparison of the Grass Valley environment with and without the Project. I recommend that the Draft EIR be rejected as inadequate, and a revised EIR be prepared which addresses all of the reasons cited above, plus others which other reviewers may have identified. With such a report, an informed decision can be better made to identify which of the various Alternatives is best for everyone.

In the sections which follow, I provide some details for each of the reasons summarized above.

## 2. Time Scale

### *2.1. Known Projects*

The Draft EIR itself identifies changes to the local Environment, and notes that such changes are not yet even defined since they are still in the planning stage and need to be completed, receive government approval, and be implemented.

**Ind 382-7**

One example is the "DTSC Cleanup Project" mentioned in the Introduction section of the Draft EIR. A plan has been developed, based on tests done in the area to determine what cleanup procedures will be needed. The plan however has not yet been approved, and may change before it can even be initiated.

As with any construction project involving excavation, only when the actual digging is performed will the actual conditions under the surface be known. If unanticipated conditions are discovered as the cleanup proceeds, the plan may have to be modified to accommodate the actual site situation rather than the situation expected when the plan was developed.

The Draft EIR makes some assumptions that seem risky. One example is its assumption that the Cleanup plan as known today will be approved. It assumes also that the plan as known today will be executed with no significant changes needed when site conditions are exposed with digging.

Basically, the Draft EIR recognizes that the environment is going to change as tasks such as the Cleanup Project are actually performed, and it assumes that the new conditions after the Cleanup will be as expected from the current plan which is not yet either approved or begun. The Draft EIR assumes that the Cleanup will simply go as planned, and bases its analysis and conclusions on that questionable assumption.

### *2.2. Planned Projects*

The Draft EIR in some places recognizes that the environment of Grass Valley is changing, with numerous Projects in various stages of implementation. Driving around the area, one can observe several construction sites in progress. Other Projects are at various stages of the planning process, such as the Dorsey Marketplace. Others are still conceptual.

**Ind 382-8**

Such changes are happening as the area grows. We can't know which of the Projects will actually complete, especially those in planning or concept. But it seems reasonable to expect that some of these Projects will occur. Over the 80-year lifetime anticipated by the Draft EIR, it seems likely that many such Projects will be approved and implemented, bringing more people, jobs, and commercial activity to the area.

Other ongoing activities within the Grass Valley area can be expected to change the environment, even before the Project is initiated. For example, there has been much activity over the past few years to mitigate wildfire danger by removing trees and brush accumulated over many years. Federal, state, and local agencies are clearing public lands. Residents are clearing their properties. Significant time and expense is altering the landscape of the area around the Project site.

State and local laws and regulations have been enacted recently to mandate such activities. For example, there are regulations now for roadways that require a 10 foot clearance on the side of roadways, free of all flammable material.

Efforts to comply with such regulations can be seen all over the County. But there is still much work to be done, and it is easy to find locations that do not yet conform to the standards. But as the hundreds of loads of brush being collected recently indicate, people are working on it. As they do, they are changing the environment.

### *2.3. Effects*

**Ind 382-9**

Such changes have many effects on the area of Grass Valley, and will create a new Environment in which the Mine Project should be evaluated. I will highlight a few of the changes that should be considered in the EIR.

#### 2.3.1. Changes in Demographics

The Draft EIR, in mentioning some of the various ongoing projects in the community, notes that they will cause "significant changes", regardless of whether or not the Mine Project happens.

Yet the same report, in other sections, fails to recognize that those significant changes will happen. For example, the Transportation analysis of section 4.12 has extensive detail of "Existing Conditions", and then uses those Conditions to evaluate how the Mine Project will impact traffic flows.

**Ind 382-10**

By its own admission in other sections, today's Existing Conditions will undergo "significant changes" as Grass Valley evolves, even without the Mine Project happening. As more housing is built, the population will shift. As more services and destinations, such as a shopping area, appear, traffic patterns will change.

The Draft EIR performs an analysis by comparing an Environment which will not exist, i.e., today's Environment, with the same Environment but including the Mine Project, as indicators of the Environmental Impact over the next eighty years. Neither of those Environments is likely to match the reality of what will exist, even in the near future, as unrelated ongoing projects change the Grass Valley Environment. It similarly does not address the Environment which will exist as Grass Valley naturally evolves but includes the Mine Project.

Such an analysis of situations that will not actually occur seems of dubious value in making decisions.

#### 2.3.2. Changes in Physical Conditions

Community projects such as I've described have a common characteristic which is relevant to the EIR analysis. Such projects change the physical landscape. They often involve modifications to the land itself, such as grading and road construction.

**Ind 382-11**

In addition, such projects often involve removal of significant amounts of trees and brush. In doing so, they introduce new "view" scenarios, where people are now active in areas that were previously vacant. They also change the views of areas surrounding each such project, as people there can now see through areas which were previously covered by trees and brush.

Also, removal of trees and brush has a significant impact on the behavior of sound. Foliage acts as a barrier to sound, limiting its travels through the community. With the foliage removed, sounds can propagate farther and be louder than before.

From personal experience, I have seen such effects. Our local community has been quite active over the last few years in clearing trees and brush to address fire safety. As a result, our

neighbors can now see and hear each other, as well as hear the road and freeway noise, much better than just a few years ago. Such is the price of fire safety.

The Draft EIR similarly analyzes Sound and Vibration using Site Conditions today, rather than those that will exist in the Grass Valley area as it evolves, even over the next few years before the Mine Project could actually begin operation.

The analysis, e.g., of "Sound and Vibration" concludes that effects of the Mine Project will not be of significance. But such a conclusion is based on the Site Conditions today, not those that will exist even in the near future.

Such conclusions are also of dubious value for making decisions.

### *2.4. Inadequacy of Draft EIR*

The Draft EIR compares two scenarios: the Grass Valley area as it exists today, and the same situation as it would exist with the Mine Project. Neither situation is what may actually exist even in the next few years, and the Draft EIR shows no justification for the accuracy of the "today" scenario as representative of future conditions.

Because it analyzes situations which are not the actual ones that may exist, all of the evaluations and conclusions regarding the Significance of environmental impacts of the Mine Project on Grass Valley are of questionable value, and should not be used for guiding decisions.

## 3. Alternative Outcomes

### *3.1. Corporate and Government Responsibilities*

As a corporation, any Project management has a primary responsibility to its Owners and Investors, to deliver the promised financial returns as well as to follow federal, state, and local laws and regulations while doing so.

Corporations in general use many techniques to meet their Fiduciary Duty and protect their Owners and Investors regardless of how a Project progresses. Legal mechanisms are used to limit liability. Insurance is obtained to avoid unexpected expenses. Contracts, including Permits, are carefully negotiated to provide best conditions for the Owners and Investors, no matter what happens as the Project proceeds.

During the Project lifetime, the management has a fiduciary responsibility to its Owners and Investors, to make decisions and take actions that bring maximal benefit to them, reacting to any and all situations that may occur, whether predicted or unexpected.

**Ind 382-12**

Governments accept their own responsibilities as part of granting Permits. They must of course provide for all of the oversight, monitoring, and other such activities to assure that the Project is being performed as required by laws and agreements captured in the Permit. But in particular, they must also absorb the effects of any impacts of a Project beyond those absorbed by the Corporation. That includes not only impacts during a Project's lifetime, but also those that appear, or endure, after the Project ends and the Corporation is no longer involved. Government responsibilities are typically not covered by any kind of insurance, other than perhaps whatever is covered by bonds required of the Project itself. All other effects, financial and otherwise, are absorbed by the government, i.e., by the general population.

Governments have a similar responsibility to take necessary actions, and to find funds to perform those actions, but their responsibility is not limited to the Project lifetime. It is a continuous and perpetual responsibility as agents for the general population.

### *3.2. Alternative Timelines*

The Draft EIR summarizes the plan for the lifetime of the Project and beyond:

> *"The proposed project would reinitiate underground mining and gold mineralization processing for the Idaho-Maryland Mine over an 80 year permit period with gold mineralization processing and underground exploration and mining proposed to operate 24 hours a day, 7 days a week during full operations. Following completion of mining and processing activities, the project sites would be reclaimed to open space and land suitable for future development of industrial uses."*

**Ind 382-13**

This represents a "best case" scenario for the Project, where everything works as expected. This is the case that the Draft EIR analyzes.

However, especially over an 80 year timeframe, is it realistic to expect that everything will go as planned?

- Accidents can be expected to happen, possibly with consequences of liabilty and expenses that make the project no longer financially viable;
- Rules, regulations and laws may change, at local, state, or federal levels, which similarly affect the Project's viability;

- Previously unknown consequences of the Project activities may be discovered, that have not been addressed in mitigation measures;
- Standards for mitigation measures may become more burdensome in reaction to new information about how the environment is affected by the Project operation,
- Project management may make poor business decisions that render the Project financially unsustainable
- Previously unknown conditions in and around the Project site may be discovered, rendering the planned mitigation measures ineffective

Over an 80 year timeline, such surprises become more and more likely. Eighty years is a long time. Some of the surprises noted above might only be recognized after the 80 years is past and the Project has terminated. Some may never happen. But the longer the timeline, the more likely that some surprise will occur, and the likelihood of the "best case" scenario of the Draft EIR diminishes.

In response to any of those or other "surprises", Project management must still meet its primary responsibility to the Owners and Investors. The ultimate "mitigation" measure is to prematurely terminate the project and use the legal mechanisms of Bankruptcy to remove all future liabilities for the Owners and Investors.

Such mechanisms are of course unavailable to the government and the public, who must absorb the lingering effects of the Project's activities after it disappears.

In the scenario examined by the Draft EIR, such an event never happens over the 80-year timeline of the analysis. But eventually the Project will shut down. There are many scenarios in which that will occur well before 80 years have passed, as the Project managers react to events and make decisions to protect business interests.

A Shutdown could happen at any time. The Draft EIR doesn't appear to have analyzed any such scenario other than the full 80-year timeline.

### *3.3. Personal Experience*

Since I am now approaching my 80s, I have had time to experience some long-term Projects and their outcomes. One such project reminds me of what can happen in Mining operations.

**Ind 382-14**

In the 1950s, I recall as a child visiting relatives in the mining areas of central Pennsylvania. We frequently drove through a town called Centralia, PA. It was the quintessential small town in America – a main street with busy storefronts, children playing on the ball field at the edge of town, people tending their gardens in the houses on the side streets, and other such staples of small town life.

The vitality of the town came from the local mining operation. Mine tunnels perforated the ground under and around the town. Mining was a hard life but it supported the town. My grandfather told me many stories of his experiences as a supervisor in one of the mines. Overall, life was good.

In Spring 1962, the unexpected happened. There was an accidental fire, possibly started as part of a cleanup operation triggered by new government regulations. The fire progressed underground, likely through one of the many air shafts and tunnels in the area. The coal seam underground caught fire, fed by the coal as fuel and the air which could be drawn to the fire through the many fissures and cracks common underground. At least that's what some think happened; the true cause of the fire may never be known.

The mining company went out of business, unable to operate a burning mine. The local, state, and federal governments all attempted to put the fire out, at considerable public expense.

Sixty years later, the fire is still burning. The coal deposits run for hundreds of miles. Estimates are that it might burn for 250 years. Surely that wasn't in their Plan.

The town of Centralia, sitting on top of the fire, is now abandoned, unsafe for humans. It is a surreal experience for me to drive through the town now, remembering what it used to be, and seeing instead a scene appropriate for Dante's Inferno, with jets of steam coming out of the ground where the kids used to play.

Gold doesn't burn, so it's unlikely that a similar experience would occur in Grass Valley. But my experience has been that accidents do happen, and things don't always go according to plan.

I've only lived in Grass Valley for 8 years, but I can see evidence of unplanned events in past local mining activities. For example, we have a state park where Empire Mine used to operate. I've learned that it was shut down prematurely due to war constraints and has been idle for almost 70 years.

Yet there are still today areas of the Park where the soil is too toxic to permit visitors to even walk through the area safely. The mining companies are long gone, and the government now has the continuing responsibility to monitor the area while trying to find funds to perform mediation activties. Like the mine fire I experienced, such responsibility and expense is likely to go on for many years.

### *3.4. Inadequacy of Draft EIR*

The Draft EIR focuses on the "best case" scenario of a mining operation proceeding as planned for 80 years. It details numerous tasks that will be performed by both the Project staff and government overseers during the 80-year lifetime.

The Draft EIR does not appear to consider the possibility that the Project will not go as planned, and may terminate prematurely. It does not describe the environmental impact which will occur if the ongoing tasks of monitoring and mitigation are no longer being performed after the Project ceases – either after 80 years of possibly much sooner.

**Ind 382-15**

In my opinion, the 80-year lifetime scenario is unrealistically optimistic, and it is far more likely that something will occur much sooner that will affect the Project. Since the Draft EIR does not consider such a possibility, which seems more likely to be the actual experience that will occur, its analysis and conclusions do not reflect the reality of what Grass Valley is most likely to experience in the future, both near-term and long-term.

Reliance on any such Plan, especially one with such a long timeline, is extremely risky for the government and the people, who are not protected by the various legal structures to limit liability as the Corporate entities are.

For example, the plan describes activities such as dewatering, treatment of water before release into the environment, monitoring of wells and runoff from mine tailings, and other such measures to be taken continuously during the lifetime of the Project.

The Draft EIR fails to specify how such activities will occur if the Project terminates prematurely.

The Draft EIR is inadequate for purposes of evaluating the likely environmental impact of the Project, and should not be used as guidance for decisions until it is revised to address the most likely realities of the future, especially the time period after the Project is terminated, whether that happens in 80 years or just a few months.

## 4. Local Conditions

The Draft EIR has not considered Local Conditions that are specific to Grass Valley, and may be important to Environment Impact.

**4.1.1. Sound, in the Grass Valley "Auditorium"**

I am not an Acoustics Scientist or expert in that field. However, I worked for 13 years at a consulting company that was renowned for its Acoustics expertise, and had done numerous projects in that area. For example, the company was responsible for the analysis of the gaps in the Watergate Tapes, for the reconstruction of the Kennedy Assassination shooting recordings, for the design of many venues such as the auditorium of the United Nations, and numerous government contracts related to sonar, submarine detection and such acoustic technologies. By being surrounded by experts for years, I absorbed some knowledge about acoustics.

The Draft EIR references that it used a "SoundPlan model" but includes no details of what the model involves, how well regarded it is in the Acoustics field, or how well it applies to the Grass Valley area. Without some reassurance by independent experts about the validity of the Sound analyses discussed in the Draft EIR, I would be reluctant to accept its conclusions.

**Ind 382-16**

Specifically, one of the things I learned from my exposure to Acoustics experts was the complexity involved in analyzing sound behavior in venues such as auditoriums and arenas. Sound bounces off walls, and the angles formed in corners have a significant effect. Soft materials, such as curtains and seat upholstery, are used in designs to minimize the effects of such reflections, or even to augment them to make sound from a stage reach into all areas of the venue.

Grass Valley is, as its name implies, a Valley – i.e., a low area of land surrounded by hills and mountains. In effect, the entire Valley is a large "auditorium" where sound behaves as it always does, bouncing off the "walls" of mountains and buildings, and shaped by the "soft materials" in the venue – i.e., the trees, grass, and brush.

The Draft EIR, on page 4.10-23, explains the scientific fundamentals of Sound: "As a general rule, sound from a localized source spreads out as it travels away from the source, and the sound pressure levels drop off with distance according to fundamental relationships."

My non-expert understanding of the science concurs with that statement – but only in the case where the "localized source" is in the middle of a flat plain. As you have undoubtedly noticed, Grass Valley is not a flat plain. We're not in Kansas.

The sound analyses described in section 4.10 seem to base their analysis on measurements and projects in the immediate area of the Mine Project itself, e.g., "at Nearest Residences" and "at Nearest Receptors". Even if such measurements and predictions are correct, they fail to recognize the nature of Grass Valley as an "auditorium".

In auditoriums, sound can be focussed by the various walls and anything that reflects the sound, as well as by things that absorb it. This can have an amplifying effect. In some auditorium designs, words spoken on a stage will be louder in the audience than they are to other people on the stage, because the design of the walls and baffles purposely focusses the sound into the audience.

If the Mine Project is the "stage" from which sound is emitted, it may be quite a bit louder at some distance greater than the "nearest" listeners. The hills and mountains surrounding the Project

Site are the "walls" of our "auditorium", and will affect the propagation of sound in the Valley just as they do in a building.

Additionally, as I noted above, ongoing efforts in the community, many required now by law, will remove noticeable quantities of brush and trees. That will likely change the acoustic character of the Grass Valley "auditorium", making sound more easily propagated as such sound absorbing materials are removed. The sound analyses of the EIR should consider the future conditions of the area in order to get an accurate projection of how sounds will affect the Environment.

Because of these effects, I would expect a much more detailed and expansive acoustic analysis would be required before drawing conclusions such as are in Section 4.10 of the EIR.

**4.1.2. Non-vehicular Transportation**

Significant analysis is presented in the Draft EIR relating to Transportation, even including Bicycle and Pedestrian usage. However, the analysis seems to be limited to transportation along existing roadways. Similarly, analysis of the Environmental Impact of the Project on Views seems to focus on views experienced by the public as they travel through the area roadways.

While such analyses may be common, and appropriate, for Projects in Urban areas, the Grass Valley Area is not typical of such areas. People move to, live in, and visit Grass Valley in many cases for the wealth of outdoor activities which are available in the area.

**Ind 382-17**

Specifically, there are numerous hiking, equestrian, and mountain biking trails in the area, including in various Parks, NID and BLM lands, and other public areas.

The Draft EIR extensively analyzes uses of the roadways, and assesses the impact of the Project on the public using those facilities. But it seems to ignore the use of the many trails in the area for non-vehicular travel, and assess the impact of the Mine Project on the public use of those facilities, including both impacts on Views as well as effects of Sound.

Additionally, such public usage will also be affected by ongoing efforts such as brush and tree removal for fire safety. As noted earlier, such activities can be expected to change the nature of the Grass Valley, especially as Views and Sound are concerned.

Without an analyses of the Mine Project impact on the non-vehicular aspects of public use, focussed on the future rather than just the present, the EIR seems incomplete, and its conclusions about the impact of the Project are invalid.

**4.1.3. Tourism**

As noted earlier, part of the public usage in Grass Valley comes from Tourism. The Draft EIR does not seem to distinguish any different components of "the public" in drawing its conclusions about the significance of the Mine Project impact.

**Ind 382-18**

However, it seems reasonable to conclude that different people have different sensitivities to aspects such as Views and Sound. Residents might be here because of job opportunities or housing options. Tourists likely come for the experience of the Mountains and the natural environment.

In particular, Tourists may be less tolerant of situations where noise and views become more industrial, replacing the natural experience that attracted them with industrial noises, smells, and congestion.

The Draft EIR fails to distinguish any components of the public presence in Grass Valley, or differentiate the likely significance of the Project to each. For example, will Tourism fade away if Grass Valley becomes a less desirable place to visit?

Although I understand that the Draft EIR is not intended to analyze economic impacts, this aspect of the EIR failure to differentiate parts of the public should be corrected, so that suitable projections on Tourism behavior is available to the Economic Study.

**4.1.4. Inadequacy of Draft EIR**

By failing to consider local conditions specific to Grass Valley, the Draft EIR paints an incomplete picture of the effects the Mine Project is likely to have on our specific area. Its conclusions are therefore likely inaccurate, and should not be used to guide decisions.

## 5. Incomplete Analysis

The Draft EIR fails to analyze issues completely, ignoring some aspects which could alter its conclusions.

### 5.1.1. Psychoacoustics

In my ~~exposure to~~ Acoustics experts, I learned of the existence of a scientific field called Psychoacoustics. This is the study of how sound affects people, which is of course one of the major "Environmental Impacts" that will occur.

The Draft EIR presents much data about expected sound and noise levels, and compares the expected sound levels against various limits determined to be maximum acceptable levels. It draws conclusions such as sound levels being far below "levels at which structural damage to buildings is possible."

**Ind 382-19**

However, maximum sound levels are not the only criteria for evaluating the effects of sound.

Anyone who has experienced sleeplessness in the middle of the night due to a faucet dripping will understand that even seemingly innocuous sounds can have a devastating psychological impact on people. Such techniques have even be adopted as interrogation tactics, such as the "chinese water torture". No physical damage is visible, yet the mental damage can be severe.

Sounds do not have to be loud and damaging to have a serious impact on the Environment in which people live, work, and play. An unrelentless minor sound, such as a dripping faucet, can have serious impacts on people.

Sounds associated with the Project, even if seemingly benign, might have a serious effect when they are repeated, incessantly, every day, for years, and echo throughout our Valley. Rumbles of random explosions, muted roar of trucks and machinery, and other such sounds and vibrations may not be strong enough to cause damages to property, and may meet government standards intended to avoid such damage.

But they may cause serious psychological damage, and people affected might not even be aware of what's happening. Grass Valley may become a less desirable place to call home, or a less desirable place to visit as a Tourist, and no one may even be aware of the cause.

An acoustic analysis of the Mine Project, by an expert in Psychoacoustics, seems prudent before accepting the conclusions of the EIR related to the Environmental Impact of sound and vibration, and making decisions about the future.

### 5.1.2. Effects of Dewatering

**Ind 382-20**

The Draft EIR presents detailed plans for the dewatering process necessary to the reactivation and operation of the Mine and notes that such pumping operations will continue for many decades. It also recognizes the concerns on the impact of such dewatering on wells in the immediate vicinity, and details mitigation measures that will be taken, at the expense of the Project itself.

The studies referenced in the Draft EIR focus on the site of the Project itself, and the dewatering of the mine shafts to be used for the Mining operation over the next 80 years.

However, even from my personal experience with mining as mentioned above, I would expect that a dewatering operation would not be limited to the Idaho-Maryland site and its own mineral rights areas.

As I noticed in the Centralia Fire above, mines are interconnected, if not by purposeful shafts then likely by fissures and cracks in the hard rock throughout our area. The Centralia Fire, even after its mine shafts and tunnels became involved, was expected to go out as the fuel was consumed. But that didn't happen. The fire spread to other mines, abandoned tunnels, and expanded.

I suspect water will do the same, although it may take years. As mining occurs and blasting is used to make new tunnels and drifts, the associated seismic shocks may open new cracks and fissures, enough to permit water to flow.

Such water flow seems, to me as a non-expert, somewhat unpredictable. Will water flow from an area outside of the Project site, bringing in whatever materials might now be imprisoned there? Will water from the Project site flow out through some new path, possibly escaping all of the provisions put in place to treat it before release into the Environment?

As water flows, it can cause other problems, such as erosion. Running water can reduce mountains to become canyons. Even in Grass Valley, we have recently seen the effects of erosion due to underground water flow. The large sinkhole near the McCourtney interchange developed, as I understand it, because of unexpected water flows underground. That was apparently not a result of any mining activity or artifact, but is indicative of what can happen, and has happened, in our area when water goes where it isn't expected to go.

Huge volumes of earth have been submerged by accumulated water for many decades. Water tends to protect some materials, such as wood that may have been used as timbers for supporting tunnels and other construction in the old mines. Such conditions likely exist in not only the Idaho-Maryland mine, but also others in the adjacent areas.

**Ind 382-21**

As the water is removed, such old construction will likely be exposed to air, which might cause further decay to begin again. It may take years for the effects to progress far enough for timbers to fail, potentially causing collapses in the underground areas, which may go unnoticed especially if they occur in areas not being actively worked by the Mine Project itself. The Draft EIR does not seem to consider this possibility, even within the Idaho-Maryland site itself where the report is focussed.

(n addition, as water flows and potentially dewaters other areas beyond the specific Project site and immediate neighborhood, wells might fail elsewhere as well, or become contaminated and unusable as water flows change. The Draft EIR seems to lack any explanation of how such occurrences, although not planned or included in the current regulations and agreements, will be mitigated. Will they become the responsibility of the Mine Project, assuming it still exists at that time? Will it be the responsibility of some part of the Government? Will it be the responsibility of the residents who happen to own the affected wells?

**5.1.3. Inadequacy of Draft EIR**

**Ind 382-22**

By failing to examine important aspects of the Mine Project, even to note that they will exist but have no significant impact, the EIR analyses are incomplete. Its conclusions, and the various mitigation, monitoring, or other such parts of the 80-year plan to manage such impacts, are also suspect, having been developed with incomplete information.

Above I have presented only a few areas in which I've noticed that the EIR is incomplete, namely in its treatment of Sound, where I have some acquired experience. There are many other elements of the Draft EIR which may have similar failings, but I am not skilled enough to notice

them. For example, the analyses related to Toxic Materials is especially worrisome to me because of its long reaching impact and serious effects, but I have no expertise in that area.

However, the incompleteness I have noticed in the issue of Sound makes me wary of the analyses and conclusions in other areas as well

## INDIVIDUAL LETTER 382: JOHN HAVERTY

### Response to Comment Ind 382-1
This is an introductory comment and does not provide a comment on an environmental issue associated with the project. Please see Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 382-2
The commenter states that the environmental baseline for the project incorrectly relies on existing conditions. However, as stated in CEQA Guidelines Section 15125(a)(1), the environmental analysis presented in the DEIR should typically compare the project to the physical environmental conditions as they exist at the time of the Notice of Preparation. Moreover, the DEIR analyzes fluctuations in conditions that may occur over time such as large storm events, multiple dry year scenarios, and effects from reasonably foreseeable future development. As such, the DEIR sets the proper environmental baseline as required under the CEQA Guidelines, but also considers fluctuations in the environment that may occur over the life of the project, when appropriate.

### Response to Comment Ind 382-3
Chapter 6 of the DEIR considered project alternatives. As summarized in DEIR section 6.2, and provided in CEQA Guidelines Section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternative analysis in section 6.2 of the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis given that they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail. (see DEIR section 6.3.)

### Response to Comment Ind 382-4
The comment states that the DEIR is generic in its analysis and presentation of the existing environment. However, the commenter does not identify any specific inadequacies in the DEIR's analysis. This comment is general in nature and does not provide a comment on a specific environmental issue associated with the project.

### Response to Comment Ind 382-5
The comment generally states that some technical aspects were not addressed in the DEIR. However, the commenter does not identify any specific inadequacies in the DEIR's analysis. This comment is general in nature and does not provide a comment on a specific environmental issue associated with the project.

### Response to Comment Ind 382-6
The commenter asserts that the DEIR is inadequate in comparing the Grass Valley environment with the project, but does not provide any specific references or examples. This comment is general in nature and does not provide a comment on a specific environmental issue associated with the project. Please see Master Response 1 - Non-EIR/ Administrative Issues regarding approval/denial of the project.

### Response to Comment Ind 382-7
Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA. The DEIR analyzes most impacts on the Centennial Site based on the reasonable environmental conditions that are expected when the site is cleaned up under a separate DTSC clean up project. If that separate project does not proceed, the Idaho-Maryland Mine Project would proceed, but would not place any material on the Centennial Site and would not impact the Centennial Site in any

way. Therefore, it would be misleading to analyze most project impacts based on the existing conditions on the Centennial Site, as the project could not impact the Centennial site under existing conditions.

## Response to Comment Ind 382-8

The commenter asserts that the DEIR should analyze the project's impact on the environment as the environment changes over time. Please see Response to Comment Ind 382-2 above.

CEQA Guidelines Section 15130 requires an EIR discuss cumulative impacts of a proposed project. Cumulative impacts are considered impacts created because of the combination of the proposed project with reasonably foreseeable future projects. DEIR section 5.3 summarizes the cumulative impacts analysis, and each resource analysis includes an analysis of cumulative impacts specific to that resource. The DEIR analyzes the project in the context of reasonably foreseeable projects, but the DEIR does not include analysis of future changes in the region that are unknown and/or speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

## Response to Comment Ind 382-9

The commenter asserts that the project should be evaluated in the context of the changing environment in Grass Valley. Please see Responses to Comments Ind 382-2 and Ind 382-8. Impacts to the City of Grass Valley were analyzed when appropriate based on the resource section. For example, traffic analysis included the analysis of intersections and road segments within the City. In addition, the aesthetics analysis included viewpoint locations within the City boundary.

## Response to Comment Ind 382-10

The commenter asserts that the project should be evaluated in the context of the changing environment and points to project impacts in the context of future traffic conditions. Please see Responses to Comments Ind 382-2 and Ind 382-8. The commenter is incorrect in its assertion that only existing conditions were analyzed for the purpose of assessing traffic impacts, as the DEIR analyzed future scenarios based on reasonably foreseeable traffic conditions.

DEIR Chapter 4.12, and the supporting traffic study (see Appendix O), analyzed twenty-four intersections and six roadway segments. As described and analyzed in DEIR section 4.12.4, based on consultation with Nevada County and the City of Grass Valley, seven different scenarios were analyzed including:

- Existing Condition: LOS based on current traffic counts, existing roadway geometry, and existing traffic control.
- Existing Plus Approved Projects (EPAP) Condition: LOS based on the Existing Condition plus traffic and improvements from projects that are approved or are reasonably foreseeable in the next five years.
- EPAP Plus Project Condition – Scenario #1: LOS based on the EPAP Condition plus traffic from the proposed project, considering transport of engineered fill to the Centennial Industrial Site.
- EPAP Plus Project Condition – Scenario #2: LOS based on the EPAP Condition plus traffic from the proposed project, considering transport of engineered fill to construction sites accessible via SR 49.

- Cumulative No Project Condition: LOS based on traffic volumes associated with cumulative buildout of the Nevada County region projected to occur by 2035 without traffic generated by the proposed project. The Cumulative No Project Condition includes reasonably certain projected changes to intersection geometry and roadway segments.
- Cumulative Plus Project Condition – Scenario #1: LOS based on the Cumulative No Project Condition plus traffic from the proposed project, considering transport of engineered fill to the Centennial Industrial Site.
- Cumulative Plus Project Condition – Scenario #2: LOS based on the Cumulative No Project Condition plus traffic from the proposed project, considering transport of engineered fill to construction sites accessible via SR 49.

This was a comprehensive analysis of potential project impacts to intersections and roadway segments consistent with the requirements of CEQA, and based on reasonably foreseeable traffic conditions in 2035.

## Response to Comment Ind 382-11

The commenter asserts that the project should be evaluated in the context of the changing environment with respect to aesthetics and noise impacts. Please see Responses to Comments Ind 382-2 and Ind 382-8.

DEIR Chapter 4.1 and Chapter 4.10 analyze proposed project impacts to aesthetics and noise and vibration, respectively. Each section includes an analysis of potential cumulative impacts. The aesthetics section (Chapter 4.1 of the DEIR) determined this impact was cumulatively considerable and significant and unavoidable given the anticipated cumulative build-out in the area changing the visual character of the region. The noise and vibration analysis determined the cumulative impacts were less than cumulatively considerable. (see Impact 4.10-6 of the DEIR.) Notwithstanding, the project-specific operational noise impact was conservatively determined to be less than significant after mitigation. Mitigation Measure 4.10-3 requires a comprehensive noise monitoring program to be conducted of each facet of the operation to verify the modelling assumptions of the project and to ensure that compliance with the applicable Nevada County noise standards is being achieved at nearby sensitive receptors. If results indicate that noise standards are being exceeded, operations shall cease until additional engineering controls can be implemented as needed.

The commenter's environmental scenario that "may" exist in the future is not known with any reasonable certainty such that it could be analyzed without engaging in speculation. It is not clear what factors the commenter wishes to have considered, beyond changes in traffic patterns, which is already accounted for in the DEIR (cf. Response to Comment Ind 382-10), and modification of vegetation due to future fuel treatment efforts, which are not clearly defined. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation about future unknown environmental changes in the region, no further response is necessary.

## Response to Comment Ind 382-12

Comment noted. This comment is general in nature and does not provide a comment on a specific environmental issue associated with the project. Please see Master Response 1, Non-EIR/Administrative Issues.

## Response to Comment Ind 382-13

The commenter asserts that the DEIR did not properly analyze unknown future conditions such as accidents, surprises and changed conditions. CEQA does not require that an EIR analyze impacts based on speculation. (CEQA Guidelines Section 15384.) However, the DEIR incorporates numerous mitigation measures and conditions of approval that provide the County with authority to enforce the requirements of those mitigation measures and conditions of approval to ensure that the project does not cause impacts beyond those analyzed in the DEIR. Moreover, some of the mitigation measures require that the applicant obtain other governmental approvals that will also allow state agencies to have oversight and enforcement authority over project operations to ensure that the project's operations are consistent with applicable law, and the impacts are consistent with the DEIR's analysis. The DEIR analyzes the environmental impacts of the project as proposed and does not attempt, nor is required to analyze under CEQA, the financial viability of a project or the likelihood it will encounter obstacles that may affect its viability. The commenter does not identify a specific impact created by the project or any inadequacy with the analysis presented in the DEIR.

## Response to Comment Ind 382-14

The commenter explains the facts surrounding a coal mine disaster in Pennsylvania and draws a comparison to the project. The project does not propose to mine coal, so the projects are distinguishable. Please see Response to Comment Ind 382-13.

## Response to Comment Ind 382-15

The commenter states that the DEIR is inadequate because it does not analyze what would happen if the mine closed prematurely. Please see Response to Comment Ind 382-13 above. In addition to governmental oversight provided by the mitigation measures, conditions of approval, and generally by local, state and federal law, the project is required to obtain approval of a reclamation plan and financial assurances. As such, financial assurance will be provided by the mine operator to the County prior to operating the mine, as required under the California Surface Mining and Reclamation Act. (see DEIR p. 3-47.) Financial assurances may also be required by other governmental agencies with oversight over the project such as the Regional Water Quality Control Board in connection with issuance of waste discharge requirements.

## Response to Comment Ind 382-16

Commenter alleges that the DEIR did not consider local conditions and is not aware of the SoundPlan Model or its accuracy, and that Grass Valley is an auditorium. The SoundPlan Model, which has been used worldwide for 30 years, is internationally recognized by the acoustical consulting profession as being a state-of-the-art noise prediction model. The latest guidelines and noise standards are constantly being incorporated into the software updates, and SoundPlan staff participate on advisory boards to acoustics standards committees. The sound prediction algorithms have been verified with field measurements numerous times.

The commenter is correct that sound reflections and propagation in auditoriums and arenas can differ from general outdoor sound propagation and that soft materials do absorb, rather than reflect, acoustic signals. However, the commenter is incorrect that the area surrounding the project site behaves like an auditorium, with sound focused in some areas. For sound focusing to occur, sound reflections are required. The area surrounding the project site consists of vegetated

ground cover with extensive pine tree cover. Such materials are acoustically absorptive rather than reflective. Furthermore, the noise contours contained in the DEIR clearly illustrate the extent by which the sound will "travel" from the project site. The SoundPlan model, which was used to generate the project noise contours, accounted for the fact that the project site will consist of harder surfaces with no tree cover, whereas the area immediately surrounding the project site will remain densely vegetated. (DEIR p. 4.10-24.) As a result, the predicted noise levels at both nearby and distant residences reflect the changes in ground cover which will result from the project, as well as the topography of the area surrounding the project area. The detailed and expansive acoustical analysis expected by the commenter for this project was, in fact, completed with the results of that analysis clearly presented in the project DEIR.

## Response to Comment Ind 382-17

The comment infers that use of parks, public lands, hiking, equestrian and mountain biking trails in the area may be impacted by noise, and users will see impacts on the views from these publicly available facilities. The commenter does not identify any trails, public facilities or lands or parks located in the vicinity of the project site, or any that may be impacted by the project. The nearest trail to the project area is the Loma Rica Trail, running north-south along Brunswick Road, from Loma Rica Drive north to Bubbling Wells Road; additionally, the edge of Empire Mine SHP is approximately 850 feet from the boundary of the Brunswick Site. (DEIR p. 4.11-8.) However, the distance from that nearest trail to the proposed project's noise-generating operations within the Brunswick Site is over 2,500 feet. The nearest trail within the Empire Mine SHP is nearly half a mile, or approximately 2,250 feet, from the nearest proposed noise-generating activities within the Centennial Site. The DEIR analyzed other sensitive receptors located much closer to the noise-generating aspects of the proposed project, which were determined to be less than significantly impacted by project noise generation, and more distant receptors, including the Empire Mine SHP trail network, or the Loma Rica Trail would similarly be less than significantly impacted by project noise generation. The Loma Rica Trial runs near the County airport and would be much more impacted by the noise from air traffic and the nearby industrial park than the project. DEIR Figures 4.10-7 and 4.10-8 show that both daytime and nighttime noise generation of operations at the Brunswick Site would be well below 40 dBA at the Empire Mine site. DEIR Table 4.10-4 (General Plan Noise Element Exterior Noise Limits) shows that the County's noise standard applicable to recreation use is 70 dBA Leq during the hours in which the park would be open to the public (i.e., 7 am - 7 pm). As such, the project noise level of less than 40 dBA at the park site from Brunswick operations would be more than 30 dBA ***below*** the County's noise standard applicable to recreation uses. At the portions of the Empire Mine SHP nearest to the Centennial Site, predicted daytime noise levels are 27 dBA at the grasslands and 22 dBA at the nearest trail within the park. (DEIR Figures 4.10-7 and 4.10-8.) The noise levels at both locations are well below the County's 70 dBA daytime noise level standard. As a result, the Empire Mine SHP and the Loma Rica Trail, which are the only public recreational facilities somewhat near the project site, would not be adversely impacted by noise from operations at the Centennial Site.

Regarding impacts on the viewshed, the commenter infers that undue attention was given to views of the project site from public roadways at the expense of parks, trails and public lands. The project site is surrounded by undeveloped forested land, industrial, rural residential development, and commercial uses. (DEIR p. 4.1-1; see also Table 3-2.) As part of the Aesthetics Technical Study, public viewer groups and vantage points from the surrounding area were considered to assess how the public would perceive changes in site conditions associated with the proposed project. The vantage points include public views considered to be the most visually sensitive locations. The commenter does not name any park, trail or public land that has a view of the project site, because none of the parks or trials in the general vicinity of the project have

line-of-sight to either the project site or any anticipated project operations, and the views from any of the listed facilities would not be impacted by the project. (DEIR p. 4.11-8)

## Response to Comment Ind 382-18

Please see Master Response 1 - Non-EIR/Administrative issues, and Master Response 2 - Social and Economic Impacts.

Regarding noise, DEIR Chapter 4.10 analyzed the proposed project's potential impact on noise impacts to existing sensitive receptors in the area of the project and haul route. The determination of a noise impact is not dependent on the type of person who may hear a sound (e.g., resident vs tourist) but rather if proposed project noise levels either exceed County standards or significantly increase the ambient noise condition. This proposed project's impact on noise was analyzed in DEIR Chapter 4.10, which found that temporary construction noise would be significant and unavoidable, but that other noise impacts form the project were less than significant after implementation of mitigation.

## Response to Comment Ind 382-19

The commenter believes the DEIR should include an analysis of psychological damage to the population who may be exposed to project sound even if noise thresholds are not exceeded. The standards of significance utilized for this DEIR were not arbitrarily selected so as to ignore the psychological effects of noise or to be favorable to the Project Applicant. Rather, the County's adopted noise standards, the CEQA Guidelines and Appendix G criteria, as well as the vibration criteria utilized in the project DEIR, were developed to specifically protect residents and other sensitive receptors from the harmful and annoying effects of noise and vibration, and they are consistent with standards recommended by the state of California for the development of community noise control ordinances. Although the noise evaluation did present information pertaining to the maximum noise generation of the project, as required by County policy, it also evaluated the effects of the project in terms of the County's average hourly noise level criteria and additionally evaluated potential impacts relative to baseline ambient noise conditions, per CEQA requirements. As noted in responses to other noise-related comments, the applicant will be required to conduct extensive noise monitoring following commencement of operations to ensure that the appropriate noise criteria are being satisfied during daytime, evening and nighttime hours. (DEIR p. 4.10-50.)

## Response to Comment Ind 382-20

The commenter asserts that water from areas outside of the mineral rights area may be drained of groundwater as a result of the project, that the water from other nearby mines may flow into the project mine works, and that the water may flow through some new path into the environment without proper treatment. The historical Empire mines and other mines are separated from the Idaho-Maryland mine by low permeability rock without any direct hydraulic connections and there is no direct flow from these historical mines to the future Idaho-Maryland mine workings. Please see Itasca Clarification Memo attached to the Final EIR as Appendix O.

In reference to rock fracturing, mining uses explosives to break rock into smaller pieces so it can be moved. The small amounts of explosives used in mining do not open cracks and fissures beyond the immediate vicinity of the blast itself and would not open cracks outward or toward other mines, allowing water to flow from outside areas into the mine. As discussed in Section 4.2 of Appendix M, the breaking of rock includes drilling a number of parallel holes in the mine face. Generally, one or more of these drillholes are located near the center of the drill pattern and used as void or "relief" holes (open holes not loaded with explosives). The holes drilled around that hole are then loaded with explosives and are set off. That first hole "relieves" the blast, and allows

the least amount of explosives possible to break the first rock out of the mine face. The remaining holes located around the first blast are then initiated using a series of delays to progressively enlarge the blasted area until the final dimensions and profile of the drift are created. Any fracturing of rock outside of the blasted excavation is limited to a very few inches beyond of the drill hole and therefore the process cannot create the extensive cracks or fissures envisioned by the commenter.

The DEIR analyzed potential groundwater drawdown in Chapter 4.8, and concluded that impacts to water supply would be less than significant after mitigation. Please see Master Response 14 - Adequacy of Groundwater Model.

## Response to Comment Ind 382-21

The commenter asserts that mine timbers in the existing underground mine may fail and collapse after the mine is dewatered and that erosion may result from the project. Additionally, the commenter asserts that water wells outside the expected impact area may fail causing uncertain liability for water replacement. Certain areas of the mine (primarily in the Idaho mine workings) used timber historically for ground support in tunnels. These workings may be already caved or may remain open. As the commenter notes, the flooded state of the mine, and resulting low oxygen, prevents the timber from rotting and the dewatering of the mine could cause these timbers to degrade and possibly lead to a certain tunnel collapsing. However, even if such an event occurred, the tunnels are too deep to cause subsidence at surface. Please see Master Response 29 – Near surface Workings.

Water flow, erosion, water quality, and well dewatering is extensively discussed in the DEIR and includes discussion on regulatory requirements and mitigation measures. Please see Chapter 4.8 of the DEIR.

The DEIR analyzed potential groundwater drawdown in Chapter 4.8, and concluded that impacts to water supply would be less than significant after mitigation. Please see Master Response 14 - Adequacy of Groundwater Model. The DEIR's conclusions regarding water supply and drawdown were peer-reviewed by the County's independent expert, West Yost, who concurred with the DEIR's conclusions. Mitigation Measure 4.8-2(a) requires a groundwater monitoring plan that includes installation and monitoring of numerous groundwater monitoring wells to detect drawdown impacts before they become significant enough to affect well owners. Additionally, Mitigation Measure 4.8-2(b) requires the applicant to be responsible for replacing water for any impacted wells beyond the expected drawdown impact area. Moreover, Mitigation Measure 4.8-2(c) requires the applicant to construct and pay for the connection of 30 parcels to potable water supply, including payment for water charges during the life of the project or until the parcel is sold or annexed into the City of Grass Valley. As such, the DEIR provided mitigation sufficient to mitigate the project's water supply impacts, even if the drawdown area is greater than expected.

## Response to Comment Ind 382-22

The commenter summarizes its comments as set forth in the comment letter. Please see Responses to Comments Ind 382-1 through Ind 382-21. The commenter's generally noted concern related to toxic materials is too general to warrant a specific response – Please see Master Response 1.

**Individual Letter 383**

John Hellwig
311 Park Avenue
Nevada City, CA 95959
530-205-6670

April 2, 2022

Matt Kelley, Senior Planner
County of Nevada
950 Maidu Avenue
Nevada City, CA 95959

Re: Draft EIR of Idaho-Maryland Mine Project

Dear Mr. Kelley:

I am a long-term resident of Nevada County. My family moved here in 1970 when I was a teen, and I have spent the majority of the intervening 52 years here in the Grass Valley / Nevada City area. Over the last 20 years, I raised my family here.

**Ind 383-1** Professionally, I have had a 40+ year career in technology research and development, having held senior technical and management positions in several technology companies. I have a Bachelor's degree in Mechanical Engineering from UC Davis and a Masters in Business Administration from UC Berkeley.

I am writing to you today to voice my deep concern about the highly inadequate Draft EIR that has been submitted in support of the proposed Idaho-Maryland Mine Project. The analysis is flawed in several ways, a few of which I briefly summarize below.

**Ind 383-2** Hazardous Materials -- the DEIR essentially ignores the disposition of existing waste rock and tailings at the Centennial site, known to be contaminated (through mining operations) with lead, arsenic, nickel and mercury at concentrations above California hazardous waste levels. The DEIR assumes these wastes to be magically cleaned up. Further, the analysis fails to describe how future waste rock and mine tailings will be managed to prevent toxic hazards to people and the environment.

It is widely understood that historical mining in the Sierra foothills left a devastating legacy of toxic waste in the environment – which is the reason that the Centennial site sits contaminated today. Do we really want to surface untold additional tons of toxic mine rock and tailings for the next 80 years?

**Ind 383-3**

Groundwater and Domestic Wells – The proposed project would lower groundwater levels in the mine by over 3000 feet, essentially acting as an enormous extraction well for the next 80 years. This will likely have a profound impact on hundreds of households and businesses relying exclusively on groundwater, and in turn, on their livelihoods and property values. Yet, the DEIR concludes, based on inadequate groundwater data, unreliable mathematical models of non-homogenous bedrock fractures, and insufficient monitoring wells, that impacts to wells will be insignificant, other than to a small number of wells in the East Bennett area. The DEIR does not adequately support this conclusion.

Many people in Nevada County are already having serious (and expensive) problems with diminishing production in wells associated with extended drought. Do we really want to drain the remaining groundwater in a large part of the Grass Valley area?

**Ind 383-4**

Air Quality – According to the DEIR, unmitigated emissions of NOx, reactive organic gases and respirable particulate matter would exceed certain air quality thresholds established by the Northern Sierra Air Quality Management District, during construction and the 80-year life of the project. This constitutes a potentially significant air quality impact that should be mitigated. However, there is no evidence in the DEIR that such impacts will be mitigated to a level less than significant. Additionally, the DEIR lacks substantial evidence to support its conclusions pertaining to health risks associated with toxic air contaminants such as asbestos, silica and heavy metals.

Our air quality here in western Nevada County is already very poor – and getting worse with the increasing numbers of fires due to climate change. Do we really want to add another generator of bad air in the immediate vicinity of Grass Valley for the next 80 years?

**Ind 383-5**

This mine proposal and its associated DEIR have very real deficiencies that portend material, negative impacts on thousands of local residents. The DEIR must be rejected in its current form.

Thank you for your consideration.

Sincerely,

John Hellwig

## INDIVIDUAL LETTER 383: JOHN HELLWIG

### Response to Comment Ind 383-1
This comment is introductory in nature and the commenter states generally that the DEIR is inadequate. Responses to specific comments are provided below.

### Response to Comment Ind 383-2
The commenter states that the DEIR fails to discuss the existing contaminated materials at the Centennial Industrial Site and how the site will be remediated. The commenter also states that the DEIR fails to mention how future waste rock (engineered fill) will be managed to prevent toxic hazards. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA, and Master Response 9 - Historical Mine Waste at Centennial Site.

### Response to Comment Ind 383-3
The commenter states that the DEIR understates the impacts associated with the dewatering of the mine but does not specify how the DEIR is inadequate. The commenter is referred to Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

### Response to Comment Ind 383-4
The commenter states that certain unmitigated emissions would exceed NSAQMD's criteria. However, according to the NSAQMD, the DEIR's implementation of Mitigation Measures 4.3-1(a) and (b) would reduce these impacts to less than significant. (DEIR, p. 4.3-73.) The commenter also states the DEIR lacks substantial evidence regarding health risks associated with toxic air contaminants but does not state why. Health risk impacts of the project have been analyzed in the DEIR and are less than significant after mitigation. Please see Chapter 4.3 of the DEIR and Master Response 18 - Air Quality Thresholds, Master Response 19 - NSAQMD Criteria Pollution Thresholds during Operations, Master Response 20 - Conservatism of Metals Assumptions, Master Response 21 - Conservatism of Silica Assumptions, and Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 383-5
The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 384**

To Matt Kelley, Senior Planner

# NO to the Idaho-Maryland Mine Project

**Public Comment from residents at 12223 Gayle Ln, Nevada City**
**02/11/2022**

## Reasons for our objection

**Ind 384-1**

I, John O'Shea, have a business in the Nevada County airport which is in close proximity to the proposed mine; my family also lives on lower Banner Mountain. I have noticed in the last couple of years that the traffic on Brunswick Rd has gotten hectic, especially in the morning and from 3pm and afterwards. I don't see how this mine is going to benefit the traffic in the area when there is going to be an additional 300+ vehicles/trucks in the area.

**Ind 384-2**

"Mining by it's nature consumes, diverts, and can seriously pollute water resources." In a state where water is already a scarce resource because of the endless drought that is seemingly only going to get worse, we can not afford to gamble on our already strained water resources just to line the pockets of a handful of people that don't even live in this county.

**Ind 384-3**

Have we not learned anything from history? The destruction is evident around the Sierra Nevada mountain range from the various types of mining that have been done over the years. Land scars where vegetation struggles to grow, heavy metal contamination and leaching continue to affect the health of local populations of people and animals. It is absolutely crazy that anyone is willing to disturb and destroy an immense amount of land to hope to find a tiny amount of gold.

**Ind 384-4**

The men and women who will be working in this proposed mine will be subject to intense health problems directly caused by the hazardous conditions and chemicals/materials that are a standard part of mining in general. Mining accidents and deaths in the last few years have been all over the news, in worldwide locations and seem to be more common than mine owners want the public to know about.

**Ind 384-5**

The environmental impact of re-opening this mine will be lasting on Nevada County long after the mining has stopped. The heavy machinery emissions alone should be cause for concern. Climate change and the wildfires have affected Nevada Counties air quality already, and having the mine reopen will make our air quality, water quality, and the overall quality of life for residents here impacted negatively for possibly the rest of our lives.

**Ind 384-6**

I want to reiterate the point that the proposed re-opening of this mine, and all of the disruption and processes that come with it, will only be serving to enrich a small amount of individuals; while sacrificing the quality of lives for tens-of thousands of Nevada County residents for years to come, something we have seen historically from other rural places where mining was prevalent, time and time again.

**Ind 384-7**

On top of this, if the mine is re-opened and they go down and find an insignificant amount of gold to keep operations going, it is my understanding that the county will ultimately have to clean up the mess that is left behind after the company has declared bankruptcy.

Please vote no on reopening the Idaho-Maryland Mine project.

## INDIVIDUAL LETTER 384: JOHN AND MELODY O'SHEA

### Response to Comment Ind 384-1
Traffic is analyzed in Impacts 4.12-1, 4.12-2, and 4.12-3, which start on pages 4.12-56, 4.12-67, 4.12-69, respectively, of the DEIR. The commenter expresses general concerns regarding traffic but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 384-2
Please see Master Responses 2 and 13 through 16. The commenter expresses general concerns regarding water supply but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 384-3
Please see Master Response 1. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 384-4
Please see Master Responses 18 through 23. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 384-5
Please see Master Responses 1, 6, and 16, as well as 18 through 23. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 384-6
Please see Master Responses 1 and 2.

### Response to Comment Ind 384-7

**Ind 385-1**

*Imagine you're on the Nevada County Board of Supervisors and you vote to allow Rise-Gold to reopen the Idaho-Maryland Mine. Years pass. You're an old man in a nursing home now. A pall of dust and smoke hangs over the area from the ongoing mining operation. The constant thumping of the rock crusher can be heard and felt twenty-four hours a day. Wolf Creek is essentially dead from the effects of millions of gallons of toxic mine water. Wells in the area have gone dry. Roads are pot-holed and congested from all the mine trucks and equipment. Brunswick Basin is a ghost town. Mill Street is deserted. Residents have either fled the area or are hunkered down to avoid the disaster the mine has wrought. Your granddaughter comes to visit you; she's in high school now. She says, "Grandpa, we learned about the reopening of the Idaho-Maryland Mine in history class today. We learned that you voted in favor. Grandpa, why were you so stupid?"*

Matt,
My particular interest is the issue of air quality and noise at the centennial site. The thought of 1000 tons/day of toxic dust laden tailings being hauled down winding bennett road and then dumped at centennial site is appalling. I am a recent survivor of a deadly form of sinus cancer. No doubt the cause was due to inhaling toxic dust decades ago. Luckily I had good health insurance to foot the $500k in medical expenses at stanford. The grading and compacting of this hill of tailings over a 5 year period will generate massive noise and toxic dust laden air in an increasingly dense residential area bordering grass valley city limits. Decades from now the legacy will be only sickness and death. It appears to me that the centennial site is an optional element of the project. If the mine tailings can be confined to the brunswick site it will have a less severe impact on neighborhood air quality and noise levels. Can you please be more explicit on this point in DEIR.

**Ind 386-1**

Sincerely,
John Purchase
10412 mercury drive
Grass Valley, Ca. 95945

1

## INDIVIDUAL LETTER 386: JOHN PURCHASE

### Response to Comment Ind 386-1

Please see Master Response 1 – Non-EIR/Administrative Issues and 18 through 23 regarding air quality, as well as the discussions and analyses in Chapter 4.10, Noise and Vibration, of the DEIR.

In addition, please see the analysis under Impact 4.3-2, which evaluates potential impacts related to exposure of sensitive receptors to substantial pollutant concentrations, starts on page 4.3-78 of the DEIR, and includes a health risk assessment, the results of which are summarized in Table 4.3-21 on page 4.3-80 of the DEIR. Because the potential impact is concluded to be significant without mitigation, the DEIR sets forth Mitigation Measure 4.3-2 to ensure project consistency with the CARB Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations by requiring preparation and implementation of an Asbestos Dust Mitigation Plan (ADMP).

Alternatives to the proposed project are addressed in Chapter 6, Alternatives Analysis of the DEIR. Alternative 2 eliminates the Centennial Industrial Site and expands the Brunswick Fill Site. Discussion of this Alternative begins on page 6-21 of the DEIR. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 387**

Dist 1

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Supervisors,

**Ind 387-1** I reside in Nevada County district 1, and I am a retired physician who practiced Pediatrics in town from 1980 through 2016. I am writing to express my strong opposition to the proposed mine project.

**Ind 387-2** In particular, living near the mine site and depending on a well, I worry about the unknowable negative impacts on local hydrology. But beyond that, the glaring negative impacts on traffic, noise, and local aesthetics would be completely unjustified by any imagined advantage to our neighborhood or the county at large.

**Ind 387-3** The environmental qualities and advantages that draw us to Nevada County should not be placed at risk without a clear and strong justification. I see no reason why any citizen or supervisor would consider this major mining project attractive enough to jeopardize those qualities and advantages. In short, the purpose of the mine seems to be solely corporate profit and greed.

Among all the things this county needs now, and the world at large needs now, more gold is certainly not high on the list of priorities.

John Reeder MD
12677 Jack Pine Rd
Grass Valley

**Individual Letter 388**

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: 02/28/2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno:

**Ind 388-1** My name is John Vaughan. I have been a resident of Nevada County since 1967 (55 years). My wife Gail and I live on Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. Our property is served by a well. We are District III voters.

We do not support the Rise Gold project due to the huge negative impacts on our people, water supplies and property values and urge you to vote NO on the project.

**Ind 388-2** I'd like to highlight one of my many areas of concern with the Draft Environmental Impact Report (DEIR), specifically the lack of inclusion and detailed review of the Nevada County Business and Industrial Center[1] (NCBIC) alternative, which with existing M1-SP zoning could include a 54,000 ft$^2$ Business Park, 242,000 ft$^2$ for Service Business/Light Manufacturing and 238,000 ft$^2$ for Industrial uses[2].

**Ind 388-3** I am currently retired but the last 20 years of my career were spent at PRIDE Industries in Roseville. The last 10 of those I was the Senior Vice President of Manufacturing and Logistics, including responsibility for a large distribution contract for Hewlett Packard. We operated a shipping/receiving/distribution warehouse shipping millions of printer parts/year all over the world. Our facility was just over 200,000 square feet with 12 loading docks about 10 minutes from Interstate 80. The in/out diesel truck traffic was 10-15 trucks/day between 6am-6pm. In short, I know a bit about distribution and logistics.

**Ind 388-4** The DEIR Chapter 6 "Alternatives Considered but Dismissed from Further Analysis"[3] is incorrect and incomplete. Specifically, in the "No Project" section, the analysis of the currently permitted NCBIC alternative[4] contains incomplete information and notes examples of negative impacts that are extremely unlikely to occur in the real world. The DEIR concludes an overall negative impact of these uses and rejects this alternative without adequate review.

**Ind 388-5** In the summary section for the NCBIC alternative[5], the DEIR rejects this option assuming noise, traffic, aesthetics and air quality would be the same or worse for the NBCIC alternative vs. the Rise Gold mine. In virtually all cases for the types of businesses, using existing zoning, that would actually locate there, the traffic and noise would be daytime, mostly weekdays, not 24x7, comprised largely of passenger cars and small trucks with large truck traffic substantially less than the 236 trips/day for the Rise Gold project[6] and almost none of the traffic hauling toxic waste.

**Ind 388-6** The DEIR identifies (among others) Distribution Facilities and Auto Dismantling Yards as examples of business that would "...cause substantial noise, traffic, aesthetic and air quality impacts..." While these business types are permitted under existing zoning, the likelihood of such ventures at this location is

[1] DEIR page 6-11, Nevada County Ordinance 1853, February 1994
[2] DEIR page 6-11/12
[3] DEIR page 6-8
[4] Beginning at the bottom of Page 6-11
[5] Bottom of Page 6-13, last 2 paragraphs before "Reduced Hours"
[6] 118 round trips, see Table 4.12-8, page 4.12-34

REC'D
MAR 02 2022
NEVADA COUNTY
PLANNING DEPARTMENT

extremely low. Both Distribution Facilities and Auto Dismantling Yards (and Saw Mills and Planing Mills) require easy access to major freeways like Interstate 80 and therefore are not realistic for this site. In the case of large 24x7 Distribution Facilities, anything further than 10-15 minutes from a major freeway is not feasible and 238,000 square feet (238K) is too small.[7] Even if you attracted a Distribution Facility tenant, 238K would not support enough loading docks to create the same large truck traffic as the Rise Gold Mine project. Additionally, for Distribution Facilities and other permitted businesses, at the scale available at this site, the semi-truck traffic would be limited to weekday or daytime use as small to mid-size facilities are unlikely to operate 24x7. The DEIR also notes that a Milling and Planing Facility "would potentially create noise similar or greater to the proposed project." Frankly, that's hard to believe as there was a saw mill and planing mill at that site for decades.[8]

**Ind 388-7** Re air quality: The impact on air quality would be greatly reduced with tenants that reflect what would happen in the real world at the NCBIC vs. the unrealistic scenarios in the DEIR.

**Ind 388-8** Re traffic: The DEIR suggests that car and truck traffic to/from the NCBIC would generate the same pollution as the projected traffic to/from the proposed mine, which includes 236 semi-truck trips/day. Each diesel semi-truck emits as much pollution as 150 cars[9]. Considering only the diesel semi-trucks, producing the same emissions as 236 trips/day requires 35,400 trips/day from cars and light trucks, an unlikely scenario for the mix of businesses that might actually occupy the NCBIC.

**Ind 388-9** Re aesthetics: Given the site is already zoned for the buildings and businesses noted, aesthetic issues could be easily mitigated and included in a proposal for development of all or part of the NCBIC.

**Ind 388-10** Virtually all of the businesses listed in "Examples of Permitted Uses"[10] already exist or have existed in Nevada County without hundreds of local residents protesting about potential traffic, noise, water consumption, water usage or pollution. It seems like a reasonable model to follow to do more of what we already know how to do without changing the nature of our community for the next 80 years. I believe many of the people who oppose this mine would likely support a "No Project" alternative with the NCBIC as the best outcome.

**Ind 388-11** Assigning a "not feasible" label to the NCBIC alternative using unrealistic assumptions makes it appear as if the DEIR authors have not done their homework. I'm not saying that the NCBIC should be built now (or ever), that's not my decision, but to reject this alternative without a more detailed review using real world scenarios and real world outcomes makes no sense.

**Ind 388-12** Rise Golds advertising "postcard" claims the "Science is Clear". That's debatable given that much of their science is based on assumptions and forecasts. The same postcard claims are there are "no significant impacts" while the DEIR clearly states there are "Significant and Unavoidable" impacts.

*What is clear* is this is the wrong project for Nevada County.

I urge you to vote NO on this project.

---

[7] While PRIDE's facility was considered too small we were awarded the HP contract, and kept it for years, because of HP's commitment to PRIDE's mission to create jobs for people with disabilities.

## INDIVIDUAL LETTER 388: JOHN VAUGHAN

### Response to Comment Ind 388-1
The commenter's opposition to the project is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 388-2
The alternative proposed by the commenter was discussed on pages 6-11 to 6-13 of the DEIR, but was dismissed from further consideration because the surface uses are reasonably anticipated to be more intense and cause more impacts than the proposed project. This would be contrary to CEQA's objectives for an alternative, which is to avoid or substantially lessen any of the significant effects of the project (Section 15126.6(f)). Therefore, this alternative is rejected from further consideration. Comment noted.

### Response to Comment Ind 388-3
The comment does not address the adequacy of the DEIR. Comment noted.

### Response to Comment Ind 388-4
The commenter asserts that the DEIR is incorrect in its assessment of impacts from uses that are permitted under the current M1-SP zoning, but does not provide specific examples. Please see Master Response 1.

### Response to Comment Ind 388-5
The commenter asserts that the traffic impacts and related traffic noise under existing zoning would be less than the project because the vehicles would be passenger cars, small trucks with less large trucks and less trips. The commenter appears to focus on only the less intense permitted uses, but does not acknowledge that the existing zoning allows heavy industrial uses such as large wholesaling and distribution facilities, lumber yards, auto dismantling yards, milling and planing facilities, and contractor equipment and storage yards, among other industrial uses. These types of uses (large wholesaling and distribution facilities, for example) involve far higher volume of heavy truck traffic than proposed by the project, and many of the permitted uses would involve greater noise impacts as the facilities (e.g., milling and planing facilities, auto dismantling) would be on the surface rather than underground as proposed for many aspects of the project.

### Response to Comment Ind 388-6
The commenter speculates that many of the more intense uses that are permitted under the current zoning (e.g., distribution facilities and auto dismantler) are not likely to be constructed and should be eliminated from the DEIR's consideration. However, the commenter does not provide evidence as to this opinion other than noting the distance from freeways. Accordingly, the elimination of numerous permitted use categories from consideration of potential impacts is speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary. The commenter states that a milling and planning facility would not be as loud as the project, but offers no evidence of that assertion besides pointing out that a saw mill and planing mill existed on the site for decades. Many of the project's noise-generating activities are underground or enclosed within buildings, which is not acknowledged by the commenter in its comparison. The commenter's opinion that a much lighter

mix of land uses would actually occupy the Brunswick site under existing zoning is speculation and is not substantial evidence under CEQA. Nevertheless, the comment has been forwarded to the decision makers for their consideration.

## Response to Comment Ind 388-7

Please see Response to Comment Ind 388-6.

## Response to Comment Ind 388-8

Please see Response to Comment 388-6.

## Response to Comment Ind 388-9

The commenter asserts that aesthetic impacts could be easily mitigated under an existing zoning alternative. Whether aesthetic impacts could be mitigated to less than significant would depend on the layout and height of the actual buildings and facilities proposed under the existing zoning, or in the case of an auto dismantling yard, the extent and type of screening around the facility. Given that the landscape could change to more intense uses and would be visible from public viewpoints, similar to the project, aesthetic impacts may be similar under the commenter's proposed alterative.

## Response to Comment Ind 388-10

The commenter's opposition to the project and preference for the No Project alternative is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 388-11

The commenter appears to believe that the existing-zoning alternative was rejected because it was infeasible. However, as discussed on page 6-13 of the DEIR, this alternative was rejected because it could result in more intense uses and environmental impacts as compared to the project, which would be contrary to CEQA's objectives for an alternative. Please see Response to Comment Ind 388-6.

## Response to Comment Ind 388-12

The commenter's opposition to the project is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 389**

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 02/28/2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock:

My name is John Vaughan. I have been a resident of Nevada County since 1967 (55 years). My wife Gail and I live on Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. Our property is served by a well. We are District III voters.

We do not support the Rise Gold project due to the huge negative impacts on our people, water supplies and property values and urge you to vote NO on the project.

I'd like to highlight one of my many areas of concern with the Draft Environmental Impact Report (DEIR), specifically the lack of inclusion and detailed review of the Nevada County Business and Industrial Center[1] (NCBIC) alternative, which with existing M1-SP zoning could include a 54,000 ft² Business Park, 242,000 ft² for Service Business/Light Manufacturing and 238,000 ft² for Industrial uses[2].

**Ind 389-1**

I am currently retired but the last 20 years of my career were spent at PRIDE Industries in Roseville. The last 10 of those I was the Senior Vice President of Manufacturing and Logistics, including responsibility for a large distribution contract for Hewlett Packard. We operated a shipping/receiving/distribution warehouse shipping millions of printer parts/year all over the world. Our facility was just over 200,000 square feet with 12 loading docks about 10 minutes from Interstate 80. The in/out diesel truck traffic was 10-15 trucks/day between 6am-6pm. In short, I know a bit about distribution and logistics.

The DEIR Chapter 6 "Alternatives Considered but Dismissed from Further Analysis"[3] is incorrect and incomplete. Specifically, in the "No Project" section, the analysis of the currently permitted NCBIC alternative[4] contains incomplete information and notes examples of negative impacts that are extremely unlikely to occur in the real world. The DEIR concludes an overall negative impact of these uses and rejects this alternative without adequate review.

In the summary section for the NCBIC alternative[5], the DEIR rejects this option assuming noise, traffic, aesthetics and air quality would be the same or worse for the NBCIC alternative vs. the Rise Gold mine. In virtually all cases for the types of businesses, using existing zoning, that would actually locate there, the traffic and noise would be daytime, mostly weekdays, not 24x7, comprised largely of passenger cars and small trucks with large truck traffic substantially less than the 236 trips/day for the Rise Gold project[6] and almost none of the traffic hauling toxic waste.

The DEIR identifies (among others) Distribution Facilities and Auto Dismantling Yards as examples of business that would "...cause substantial noise, traffic, aesthetic and air quality impacts..." While these business types are permitted under existing zoning, the likelihood of such ventures at this location is extremely low. Both Distribution Facilities and Auto Dismantling Yards (and Saw Mills and Planing Mills)

[1] DEIR page 6-11, Nevada County Ordinance 1853, February 1994
[2] DEIR page 6-11/12
[3] DEIR page 6-8
[4] Beginning at the bottom of Page 6-11
[5] Bottom of Page 6-13, last 2 paragraphs before "Reduced Hours"
[6] 118 round trips, see Table 4.12-8, page 4.12-34

require easy access to major freeways like Interstate 80 and therefore are not realistic for this site. In the case of large 24x7 Distribution Facilities, anything further than 10-15 minutes from a major freeway is not feasible and 238,000 square feet (238K) is too small.[7] Even if you attracted a Distribution Facility tenant, 238K would not support enough loading docks to create the same large truck traffic as the Rise Gold Mine project. Additionally, for Distribution Facilities and other permitted businesses, at the scale available at this site, the semi-truck traffic would be limited to weekday or daytime use as small to mid-size facilities are unlikely to operate 24x7. The DEIR also notes that a Milling and Planing Facility "would potentially create noise similar or greater to the proposed project." Frankly, that's hard to believe as there was a saw mill and planing mill at that site for decades.[8]

Re air quality: The impact on air quality would be greatly reduced with tenants that reflect what would happen in the real world at the NCBIC vs. the unrealistic scenarios in the DEIR.

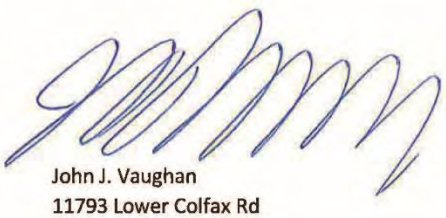
Re traffic: The DEIR suggests that car and truck traffic to/from the NCBIC would generate the same pollution as the projected traffic to/from the proposed mine, which includes 236 semi-truck trips/day. Each diesel semi-truck emits as much pollution as 150 cars[9]. Considering only the diesel semi-trucks, producing the same emissions as 236 trips/day requires 35,400 trips/day from cars and light trucks, an unlikely scenario for the mix of businesses that might actually occupy the NCBIC.

Re aesthetics: Given the site is already zoned for the buildings and businesses noted, aesthetic issues could be easily mitigated and included in a proposal for development of all or part of the NCBIC.

Virtually all of the businesses listed in "Examples of Permitted Uses"[10] already exist or have existed in Nevada County without hundreds of local residents protesting about potential traffic, noise, water consumption, water usage or pollution. It seems like a reasonable model to follow to do more of what we already know how to do without changing the nature of our community for the next 80 years. I believe many of the people who oppose this mine would likely support a "No Project" alternative with the NCBIC as the best outcome.

Assigning a "not feasible" label to the NCBIC alternative using unrealistic assumptions makes it appear as if the DEIR authors have not done their homework. I'm not saying that the NCBIC should be built now (or ever), that's not my decision, but to reject this alternative without a more detailed review using real world scenarios and real world outcomes makes no sense.

Rise Golds advertising "postcard" claims the "Science is Clear". That's debatable given that much of their science is based on assumptions and forecasts. The same postcard claims are there are "no significant impacts" while the DEIR clearly states there are "Significant and Unavoidable" impacts.



*What is clear* is this is the wrong project for Nevada County.

I urge you to vote NO on this project.

Thank you.

## INDIVIDUAL LETTER 389: JOHN VAUGHAN

### Response to Comment Ind 389-1

This letter is a duplicate copy of Individual Letter 388. Please see comments and responses in Individual Letter 388.

**Individual Letter 390**

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: 02/28/2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno:

My name is John Vaughan. I have been a resident of Nevada County since 1967 (55 years). My wife Gail and I live on Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. Our property is served by a well. We are District III voters.

We do not support the Rise Gold project due to the huge negative impacts on our people, water supplies and property values and urge you to vote NO on the project.

I'd like to highlight one of my many areas of concern with the Draft Environmental Impact Report (DEIR), specifically the lack of inclusion and detailed review of the Nevada County Business and Industrial Center[1] (NCBIC) alternative, which with existing M1-SP zoning could include a 54,000 ft$^2$ Business Park, 242,000 ft$^2$ for Service Business/Light Manufacturing and 238,000 ft$^2$ for Industrial uses[2].

**Ind 390-1**

I am currently retired but the last 20 years of my career were spent at PRIDE Industries in Roseville. The last 10 of those I was the Senior Vice President of Manufacturing and Logistics, including responsibility for a large distribution contract for Hewlett Packard. We operated a shipping/receiving/distribution warehouse shipping millions of printer parts/year all over the world. Our facility was just over 200,000 square feet with 12 loading docks about 10 minutes from Interstate 80. The in/out diesel truck traffic was 10-15 trucks/day between 6am-6pm. In short, I know a bit about distribution and logistics.

The DEIR Chapter 6 "Alternatives Considered but Dismissed from Further Analysis"[3] is incorrect and incomplete. Specifically, in the "No Project" section, the analysis of the currently permitted NCBIC alternative[4] contains incomplete information and notes examples of negative impacts that are extremely unlikely to occur in the real world. The DEIR concludes an overall negative impact of these uses and rejects this alternative without adequate review.

In the summary section for the NCBIC alternative[5], the DEIR rejects this option assuming noise, traffic, aesthetics and air quality would be the same or worse for the NBCIC alternative vs. the Rise Gold mine. In virtually all cases for the types of businesses, using existing zoning, that would actually locate there, the traffic and noise would be daytime, mostly weekdays, not 24x7, comprised largely of passenger cars and small trucks with large truck traffic substantially less than the 236 trips/day for the Rise Gold project[6] and almost none of the traffic hauling toxic waste.

The DEIR identifies (among others) Distribution Facilities and Auto Dismantling Yards as examples of business that would "...cause substantial noise, traffic, aesthetic and air quality impacts..." While these business types are permitted under existing zoning, the likelihood of such ventures at this location is

[1] DEIR page 6-11, Nevada County Ordinance 1853, February 1994
[2] DEIR page 6-11/12
[3] DEIR page 6-8
[4] Beginning at the bottom of Page 6-11
[5] Bottom of Page 6-13, last 2 paragraphs before "Reduced Hours"
[6] 118 round trips, see Table 4.12-8, page 4.12-34

extremely low. Both Distribution Facilities and Auto Dismantling Yards (and Saw Mills and Planing Mills) require easy access to major freeways like Interstate 80 and therefore are not realistic for this site. In the case of large 24x7 Distribution Facilities, anything further than 10-15 minutes from a major freeway is not feasible and 238,000 square feet (238K) is too small.[7] Even if you attracted a Distribution Facility tenant, 238K would not support enough loading docks to create the same large truck traffic as the Rise Gold Mine project. Additionally, for Distribution Facilities and other permitted businesses, at the scale available at this site, the semi-truck traffic would be limited to weekday or daytime use as small to mid-size facilities are unlikely to operate 24x7. The DEIR also notes that a Milling and Planing Facility "would potentially create noise similar or greater to the proposed project." Frankly, that's hard to believe as there was a saw mill and planing mill at that site for decades.[8]

Re air quality: The impact on air quality would be greatly reduced with tenants that reflect what would happen in the real world at the NCBIC vs. the unrealistic scenarios in the DEIR.

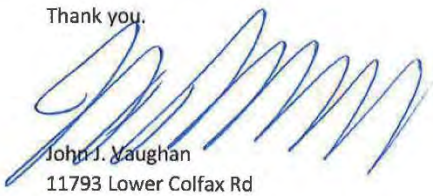
Re traffic: The DEIR suggests that car and truck traffic to/from the NCBIC would generate the same pollution as the projected traffic to/from the proposed mine, which includes 236 semi-truck trips/day. Each diesel semi-truck emits as much pollution as 150 cars[9]. Considering only the diesel semi-trucks, producing the same emissions as 236 trips/day requires 35,400 trips/day from cars and light trucks, an unlikely scenario for the mix of businesses that might actually occupy the NCBIC.

Re aesthetics: Given the site is already zoned for the buildings and businesses noted, aesthetic issues could be easily mitigated and included in a proposal for development of all or part of the NCBIC.

Virtually all of the businesses listed in "Examples of Permitted Uses"[10] already exist or have existed in Nevada County without hundreds of local residents protesting about potential traffic, noise, water consumption, water usage or pollution. It seems like a reasonable model to follow to do more of what we already know how to do without changing the nature of our community for the next 80 years. I believe many of the people who oppose this mine would likely support a "No Project" alternative with the NCBIC as the best outcome.

Assigning a "not feasible" label to the NCBIC alternative using unrealistic assumptions makes it appear as if the DEIR authors have not done their homework. I'm not saying that the NCBIC should be built now (or ever), that's not my decision, but to reject this alternative without a more detailed review using real world scenarios and real world outcomes makes no sense.

Rise Golds advertising "postcard" claims the "Science is Clear". That's debatable given that much of their science is based on assumptions and forecasts. The same postcard claims are there are "no significant impacts" while the DEIR clearly states there are "Significant and Unavoidable" impacts.



*What is clear* is this is the wrong project for Nevada County.

I urge you to vote NO on this project.

## INDIVIDUAL LETTER 392: JOHN VAUGHAN

### Response to Comment Ind 392-1

This letter is a duplicate copy of Individual Letter 388. Please see comments and responses in Individual Letter 388.

**Individual Letter 393**

Matt Kelley, Senior Planner 03/24/2022
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Subject: Idaho-Maryland Mine Project Draft Environmental Impact Report

Dear Mr. Kelley,

Please include my project-specific comments and questions in response to the Rise Gold Idaho-Maryland Mine Project Draft Environmental Impact Report (DEIR).

My name is John Vaughan. I have been a resident of Nevada County since 1967 (55 years). My wife Gail and I live on Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. Our property is served by a well. We are District III voters.

**Ind 393-1**

I have a number of issues, comments and questions about the adequacy of the DEIR, which is missing key information, underestimates significant negative impacts and proposes inadequate mitigation measures.

This document is organized in categories of "Issues" which are followed by factually supportive commentary, which are then followed by questions, based on the commentary, related to the issue I am concerned about regarding the inadequacy of the DEIR.

**Issue #1: Water Supply for well owners:**

I have serious concerns about how this proposal impacts wells in the area, including those properties not included in the DEIR, outside the studied area along East Bennett Rd.

This project will dewater to a depth of 3200 feet[1], including initial dewatering for approx. 6 months, removing over 815 million gallons, followed by maintenance dewatering, removing 450-750 million gallons/year. **That's over 1 BILLION gallons during the first year** (Enough to cover 43,560 square feet with column of water 3,685 feet deep[2]) **and over 40 billion gallons for the life of the project**. The DEIR acknowledges the significant and unavoidable negative impact of this dewatering but only in the small footprint of East Bennett Rd.

**Ind 393-2**

In a Fox40 news video from mid-March 2022[3], Ben Mossman, CEO of Rise Gold, talks about the maps used for modeling the tunnels are from the "World War II era". The reporter notes the maps reveal "nearly 100 miles of tunnel". It makes no sense that removing 40 billion gallons of water will have no negative impact on water availability in an area much broader than East Bennett Rd. The level of our aquifers are already at risk from years of drought behind and likely ahead of us.

The DEIR notes "the proposed project would result in substantial reduction in groundwater supplies"[4]. For well owners not serviced by NID, this is a "Significant and Unavoidable" issue. The DEIR does require mitigation where properties along East Bennett would be serviced by NID. But that does not solve the

[1] DEIR page 4.8-54
[2] 3,685 acre feet is the same as one acre covered in 3,685 feet of water. One acre = 43,560 square feet.
[3] www.youtube.com/watch?app=desktop&v=o6HbA2C55ds&t=310s
[4] DEIR Chapter 6, Alternatives Analysis page 6-6

groundwater issue for other properties which are negatively impacted by groundwater loss where NID is not an option. For these properties, including ours, the impact is "Significant and Unavoidable". The mitigations required in the 1996 Use Permit for Emperor Gold and the 2008 Emgold Mining DEIR are a reasonable starting place for minimal mitigations that are needed today and should be added to the DEIR. These options are not mentioned in the Rise Gold DEIR.

**Ind 393-3**

The 1993 final report for groundwater modeling and underground mining at the Siskon Mine on San Juan Ridge, which was approved by the County, and which, just like the Rise Gold proposal, was based on the currently available science at the time, stated: "Water levels in water supply wells surrounding the site are predicted to undergo very little or no impact from mine dewatering." The predictions were wrong. In 1995, there was a breach of an aquifer discharging millions of gallons of water and mine waste into Spring and Shady Creeks. The breach also drained community wells including those of Grizzly Hill School and North Columbia Schoolhouse Cultural Center. In 1997, the Siskon Mine was closed. As the security bond money ran out years ago, Grizzly Hill School continues to pay thousands of dollars/year to maintain a treatment system to provide drinking water for students and staff.[5]

In January 1997, a containment dam at the abandoned Lava Cap Mine (just 5 miles from the Idaho Maryland Mine) failed, releasing ~10,000 cubic yards of arsenic-rich tailings into its watershed including Little Clipper Creek and Lost Lake. Evidence of unsafe mine-related arsenic contamination was found in Little Clipper Creek, Lost Lake, surrounding property and local water wells. The properties around the Little Clipper Creek have been deemed an EPA Superfund site.[6] Since this area was declared an EPA Superfund site, the homeowners have had to test their wells several times/year. To date, all this work has been done at taxpayers' expense. 21 years later, in 2018, a $32 million judgement was obtained against Elder and Sterling CentreCorp related to cleanup costs. No cleanup has started.

**Ind 393-4**

This February (2/28/2022), the United Nations Intergovernmental Panel on Climate Change published a report[7] on climate change showing that:

- "...we have zero years left to avoid dangerous climate change, because it's here."
- "...as many as three billion people around the world will experience chronic water scarcity...".
- "...ecosystems and all sectors of human society and human well-being fundamentally depends on water..."
- "A water crisis is already brewing in the Western United States. Multiyear drought has drained reservoirs and triggered unprecedented water cuts for the region."

On 3/18/2022, The Union newspaper published an article titled "Hot spring forecast: Drought deepens in West, flooding ebbs".[8] A few selected quotes include:

- "There is no relief in sight for the West's record-shattering megadrought..."
- "The reason the West is warming is climate change, especially over the multiple decade timeframe."
- "California has 1.5 million acre feet less water available than it did this time last year."
- "The more than 20-year megadrought...is the worst in 1,200 years and is stoked by...climate change..."

[5] www.sjrtaxpayers.org/history
[6] en.wikipedia.org/wiki/Lava_Cap_Mine
[7] www.cnn.com/2022/02/28/world/un-ipcc-climate-report-adaptation-impacts/index.html
[8] The Union, 3/18/2022, Page 5. Source NOAA Meteorologists"

The Nevada County Energy Action Plan, accepted by the Board of Supervisors by vote of 5-0 on 2/12/2019 states the following:[9]

> "...Nevada County...faces challenges associated with regional climate change...climate change poses an immediate and escalating threat to the region's environment, economic strength, and public health. The region is affected by more intense dry periods...and more frequent periods of drought in California...The region is also impacted by a higher proportion of precipitation falling as rain instead of snow...and ***shortages in runoff and water supply, as well as substantial changes in runoff patterns and timing. This will affect groundwater recharge..."*** [emphasis added]

Goal 3 in the Nevada County Energy Action Plan states: "Encourage the Efficient and Safe Transportation and Use of Water Resources". While this section focuses mostly on in-home efficiencies, it notes "water losses" a number of times. Pumping 1 billion gallons of water into Wolf Creek in the first year followed by half a billion gallons per year for the following 79 years is a very substantial "water loss". Some of that water can be reclaimed by a downstream NID water treatment plant but much of it will be "lost" to Nevada County as it flows to the ocean. Please explain how this project is consistent with the water loss goals in the Nevada County Energy Action Plan.

The NID Board Meeting on 2/9/2022 included an agenda item to review the Idaho-Maryland Mine Water Supply Assessment, prepared by Raney Planning and Management (RPM). NID Director Karen Hull, posed a question regarding the impact of climate change on the water models to Mr. Houmau Liu, Ph.D., P.E. from Itasca International, a subcontractor to RPM. Dr. Liu's credentials are impeccable[10]. His response was a detail review of his analysis, including the statement "...but definitely ***we did not look into extensive [impact] of climate change*** [emphasis added] because those are not defined into the future."[11] The DEIR must be amended to include analysis of multiple scenarios that will arise due to climate change over the next 80 years.

*Please respond to the following questions regarding the adequacy of the DEIR:*

**Ind 393-5**

- With over 100 miles of tunnels that have not been mapped since World War II and have not been accessed in over 66 years (1956), the DEIR lacks inclusion of the larger area of risk to residential wells included in both the 1996 and 2008 Use Permit/DEIR applications. Please explain.

**Ind 393-6**

- How will well owners know that an effective pre-dewatering assessment of all wells within and immediately surrounding the Rise Gold mineral rights boundaries will be performed by independent consultants?

**Ind 393-7**

- For the next 80 years:
  - What systems are in place to remedy a well that is negatively impacted?
  - How will reduced well output (gallons/minute) be monitored?
  - How will well recharging rates be monitored?
  - How will well contamination be monitored?
  - Who determines root cause of degraded well function?
  - Who determines liability?
  - How and how quickly will temporary water provisions be in place when a well fails?

[9] Nevada County Energy Action Plan, Chapter 1, page 6
[10] www.itascainternational.com/about/staff-bios/houmao-liu
[11] NID Board Meeting, 2/9/2022, Dr. Houmau Liu, General Manager/Principal Hydrogeologist, Itasca International

- Why are the properties of well owners burdened with losing what little assurances are currently proposed if they sell their property?
- What financial systems are in place to provide mitigation funding when issues arise?
- What steps are planned to avoid a disaster like the one at the San Juan Ridge Mine in 1995?
- What steps are planned to avoid a disaster like the one at the Lava Cap Mine in 1997?

**Ind 393-8**
- What is the justification for why properties with proposed replacement NID water service along East Bennet Rd are required to assume the cost of NID services if the property is annexed into Grass Valley or sold?

**Ind 393-9**
- How will the DEIR address the real concerns from well owners outside the limited study area along East Bennet?

**Ind 393-10**
- Why are the mitigations required in 1996 and 2008 not the baseline for the current DEIR analysis?

**Ind 393-11**
- How has the failure, huge negative impacts, on-going costs and lessons learned from the Siskon Mine in North San Juan been factored into the analysis of the Rise Gold mine?
- How has the failure, huge negative impacts, on-going costs and lessons learned from the Lava Cap Mine been factored into the analysis of the Rise Gold mine?

**Ind 393-12**
- Will Nevada County provide inspectors and support systems to oversee well monitoring, potential contamination and reaction to a spill? If so, who pays these salaries?

**Ind 393-13**
- If "self-monitoring" and reporting is used, who audits the process used to develop the reports? If audits are performed, how often and who pays the salaries of the auditors?

**Ind 393-14**
- Why are water models for 80 years when the models are based on maps from the 1940's and "did not look into the extensive impact of climate change because those are not defined into the future"?[12]

**Ind 393-15**
- What steps are being taken to ensure the water models are correct, taking into consideration the "immediate and escalating threat of climate change amid the worst megadrought in 1,200 years?

**Ind 393-16**
- Have other hydrologists been consulted for peer review of the water models?

**Ind 393-17**
- Given that Nevada County knows in advance from the DEIR that "*the proposed project would result in substantial reduction in groundwater supplies*" and knows from the Nevada County Energy Plan that climate change will create "*shortages in runoff and water supply, as well as substantial changes in runoff patterns and timing. This will affect groundwater recharge*". How can the County justify removing 1 billion gallons of water in the first year followed by half a billion per year for the next 79 years?
- What specific steps is Nevada County taking to avoid liability for the above issue?
- What are the additional County liability insurance costs related to approval of this project?
- How are the costs for additional liability passed down to property owners in the county?

**Ind 393-18**
The FEIR needs to analyze all the wells potentially impacted by the project. The DEIR impact analysis on wells outside of Ease Bennett Rd is incomplete and proposes inadequate mitigation measures.

**Ind 393-19**
For the above reasons, re Issue #1: Water Supply for well owners, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24 and is as out of compliance with the Nevada County Energy Action Plan. Please provide a detailed explanation why this project should be allowed to proceed.

**Ind 393-20**
**Issue #2: Lack of inclusion and detailed review of the Nevada County Business and Industrial Center[13] (NCBIC) alternative:** The last 20 years of my career were spent at PRIDE Industries in Roseville. The final

[12] NID Board Meeting, 2/9/2022, Dr. Houmau Liu, General Manager/Principal Hydrogeologist, Itasca International
[13] DEIR page 6-11, Nevada County Ordinance 1853, February 1994

10 years I was the Senior Vice President of Manufacturing and Logistics, including responsibility for a large distribution contract for the world's largest printer manufacturer. We operated a shipping, receiving and distribution warehouse shipping millions of printer parts/year all over the world. Our facility was just over 200,000 square feet with 12 loading docks about 10 minutes from Interstate 80. The in/out diesel truck traffic was 10-15 trucks/day between 6am-6pm. In short, I know a bit about distribution and logistics.

The DEIR lacks inclusion and detailed review of the NCBIC alternative, which with existing M1-SP zoning could include a 54,000 ft$^2$ Business Park, 242,000 ft$^2$ for Service Business/Light Manufacturing and 238,000 ft$^2$ for Industrial uses[14].

The DEIR Chapter 6 "No Project" section discussing "Alternatives Considered but Dismissed from Further Analysis"[15] is incorrect and incomplete. The analysis of the currently permitted NCBIC alternative[16] contains incomplete information and notes examples of negative impacts that are extremely unlikely to occur in the real world. The DEIR concludes an overall negative impact of these uses and rejects this alternative without adequate review.

In the summary section for the NCBIC alternative[17], the DEIR concludes a negative impact and rejects this option assuming noise, traffic, aesthetics and air quality would be the same or worse for the NCBIC alternative vs. the Rise Gold mine. Those assumptions are wrong. Unlike the Rise Gold project, in virtually all cases for the types of businesses that would actually locate there (using existing zoning) the traffic and noise would be comprised largely of passenger and small trucks operating in daytime, mostly weekdays and not 24x7. Diesel truck traffic would be substantially less than the 236 trips/day for the Rise Gold project[18] and almost none of the traffic hauling toxic waste.

The DEIR identifies (among others) Distribution Facilities and Auto Dismantling Yards as examples of business that would "...cause substantial noise, traffic, aesthetic and air quality impacts..." While these business types are permitted under existing zoning, the likelihood of such ventures at this location is extremely low. Both Distribution Facilities and Auto Dismantling Yards (and Saw Mills and Planing Mills) require easy access to major freeways like Interstate 80 and therefore are not realistic for this site. In the case of large 24x7 Distribution Facilities, anything further than 10-15 minutes from a major freeway is not feasible and 238,000 square feet (238K) is too small[19]. Even if you attracted a Distribution Facility tenant, 238K would not support enough loading docks to create the same diesel truck traffic as the Rise Gold mine project. Additionally, for Distribution Facilities and other permitted businesses, at the scale available at this site, the semi-truck traffic would be limited to weekday or daytime use as small to mid-size facilities are unlikely to operate 24x7. The DEIR also notes that a Milling and Planing Facility "would potentially create noise similar or greater to the proposed project." Frankly, that's hard to believe as there was a saw mill and planing mill at that site for decades and there is already a custom milling operation at 11429 East Bennett Rd (Freds Custom Milling and Lumber).

---

[16] DEIR beginning at the bottom of Page 6-11
[17] DEIR bottom of Page 6-13, last 2 paragraphs before "Reduced Hours"
[18] 118 round trips = 236 trips, see DEIR Table 4.12-8, page 4.12-34
[19] While PRIDE's facility was considered too small we were awarded the HP contract, and kept it for years, because of HP's commitment to PRIDE's mission to create jobs for people with disabilities.

**Ind 393-21**

Re air quality and traffic: The impact on air quality would be greatly reduced with NCBIC tenants that reflect what would happen in the real world vs. the unrealistic scenarios in the DEIR. The DEIR suggests that car and truck traffic to/from the NCBIC would generate the same pollution as the projected traffic to/from the proposed mine, which includes 236 semi-truck trips/day. Each diesel semi-truck emits as much pollution as 150 cars[20]. Considering only the diesel semi-trucks, producing the same emissions as 236 trips/day requires 35,400 trips/day from cars and light trucks, an unlikely scenario for the mix of businesses that might actually occupy the NCBIC.

Re aesthetics: Given the site is already zoned for the buildings and businesses noted, aesthetic issues could be easily mitigated and included in a proposal for development of all or part of the NCBIC.

**Ind 393-22**

The DEIR discusses a "Project List"[21] noting 20 projects including "...those that would contribute to the impacts on the same environmental resources, infrastructure, or public services and facilities that would be impacted by the proposed project...". Table 5-1[22] summarizes the scale associated with these 20 projects showing 1,209 Dwelling Units, 23,300ft$^2$ Office, 119,676 ft$^2$ Commercial and 471,500 ft$^2$ Business Park/Industrial. Considering only the "Non-Residential" projects, a couple of items stand out:

1) There is business growth in Nevada County at a scale that could be easily accommodated at the NCBIC location. With the NCBIC option available, some of these or similar businesses would have likely considered locating there. None of them would have negative impacts that are "more intensive"[19] than the Rise Gold mine.
2) Generally speaking, people who live here understand business growth is good for the local economy. With the exception of the Dorsey Marketplace, which has a number of negative environmental impacts, I have not seen an "anti-growth" outcry from local residents and businesses regarding the projects noted in the "Project List".

The DEIR inaccurately states "As demonstrated below, development of the Brunswick Industrial Site[23] with industrial uses, consistent with the current M1-SP zoning, could reasonably be expected to result in above-ground uses that are more intensive in certain respects than the proposed project."[24] The DEIR also notes that the "Environmentally Superior Alternative"[25] would be "Alternative 2, Elimination of the Centennial Industrial Site".

It is clear from my experience, as I am confident one would find from other experts, that the DEIR *does not demonstrate* what it claims. It can be reasonably expected and that with detailed review (vs. exclusion without review) the NCBIC would be found to be the "Environmentally Superior Alternative".

Virtually all of the businesses listed in "Examples of Permitted Uses"[26] already exist or have existed in Nevada County without hundreds of local residents protesting about potential traffic, noise, water consumption, water usage or pollution. A reasonable model to follow would be to do more of what we already know how to do without changing the nature of our community for the next 80 years. I believe many of the people who oppose this mine would likely support a "No Project" alternative with the NCBIC as the best outcome.

[20] www.cleanairtrust.org/trucks.dirtytruth.html
[21] DEIR pages 5-4/7
[22] DEIR page 5-7
[23] Brunswick Industrial Site is synonymous with NCBIC
[24] DEIR page 6-11
[25] DEIR page 6-42
[26] DEIR pages 6-12/13

Assigning a "not feasible" label to the NCBIC alternative using unrealistic assumptions makes it appear as if the DEIR authors have not done their homework. To reject this alternative without a more detailed review using real world scenarios and real world outcomes makes no sense.

*Please respond to the following questions regarding the adequacy of the DEIR:*

**Ind 393-23**

- Will the DEIR be updated to include real world scenarios for the NCBIC?
- If not, please explain in detail.
- From a review of the "Project List" noted above, it can be reasonably concluded that the NCBIC would *not* be "more intensive" than the Rise Gold mine. Please explain why the EIR reviews for the "Project List" were not considered before claiming the NCBIC is "not feasible"?
- If the "Project List" projects were contrasted and compared to the Rise Gold mine, please explain the specific areas in the DEIR where those comparisons were made and justified.
- What are the specific measurements, using real world scenarios for noise, traffic, aesthetics and air quality that were done prior to rejecting this alternative?
- If no specific measurements were done, what assumptions, using real world scenarios, were used as the basis to conclude that noise, traffic and aesthetics "could reasonably be expected to result in above-ground uses that are more intensive in certain respects than the proposed project."[27]?
- Why does the DEIR claim "As demonstrated below...could reasonably be expected"[17] when no actual review of real world scenarios was conducted?
- Without detailed review of the NCBIC how can it be reasonably concluded that "Alternative 2, Elimination of the Centennial Industrial Site" is the "Environmentally Superior Alternative"?

For the above reasons, re Issue #2: Lack of inclusion and detailed review of the NCBIC alternative, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

**Issue #3: Negative Impacts:** Few, if any, of the 83 negative impacts are fully eliminated by the required mitigations, they are only reduced. Look at the long list of negative impacts, especially the "Significant and Unavoidable" impacts listed in the DEIR[28].

Chapter 5, section 5-5[29] "Significant Irreversible Environmental Changes" of the DEIR notes that:

**Ind 393-24**

"An irreversible environmental change would be considered significant if ***any*** [emphasis added] of the following would occur:

- The project would involve a large commitment of nonrenewable resources;
- The primary and secondary impacts of the project would generally *commit future generations* [emphasis added] to similar uses (e.g., a highway provides access to a previously remote area);
- The project involves uses in which *irreversible damage could result from any potential environmental accidents* [emphasis added] associated with the project; or
- The phasing of the proposed consumption of resources is not justified (e.g., the project involves a wasteful use of energy).

The proposed project would likely result in, or contribute to, the irreversible environmental

[27] DEIR page 6-13
[28] DEIR pages 6-7/8
[29] DEIR pages 5-8/9

changes...".

Among the "Significant and Unavoidable" issues, the DEIR concludes traffic at "SR174/Brunswick" and "Brunswick Road/Sutton Way" cannot be mitigated. Average injury accidents/year for the last 3 years in Nevada County was 405 (CHP Data), including 13 fatalities. With "Significant and Unavoidable" traffic issues, it is statistically likely that more accidents will occur at these intersections.

*Please respond to the following questions regarding the adequacy of the DEIR:*

**Ind 393-25**

- Is it acceptable if only a few traffic accidents, including injuries and possibly fatalities, occur because of the Significant and Unavoidable traffic impact?
- If yes, please provide justification for how this benefits Nevada County.
- Is it acceptable if water quality, water supply or property values go down for only a few residents?
- If yes, please provide justification for how this benefits Nevada County.
- Is it acceptable if only a few residents have medical issues from the additional air pollution?
- If yes, please provide justification for how this benefits Nevada County.
- Is it acceptable if we only have one toxic spill during the next 80 years?
- If yes, please provide justification for how this benefits Nevada County.
- Is it acceptable if only a few of the negative impacts have larger than planned repercussions?
- If yes, please provide justification for how this benefits Nevada County.

**Ind 393-26**

- Why are the significant irreversible environmental changes noted not considered "adverse environmental impacts" under CEQA?
- Please explain why this project should proceed, given there are "Significant Irreversible Environmental Changes" including "The project involves uses in which *irreversible damage could result from* ***any*** *potential environmental accidents* [emphasis added] associated with the project".

**Ind 393-27**

- Please explain why this project should proceed, given there are "Significant Irreversible Environmental Changes" and "The primary and secondary impacts of the project would generally commit future generations..."[30], including the grandchildren and great grandchildren of students currently enrolled in Nevada County, to the same use for *the next 80 years*.
- Why are projects even considered with negative Significant Irreversible Environmental Changes as well as Significant and Unavoidable issues?

Assuming even a few of these negative impacts and possible outcomes are *not acceptable*, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

**Ind 393-28**

**Issue #4: Air Pollution:**

Rise Gold proposes to purchase Carbon Offsets to mitigate greenhouse gas (GHG) emissions during construction[31] and notes "This shall include...for GHG reduction activities within the Nevada County region."[32].

- First, Carbon Offsets are an after the fact solution. Offsets purchased to mitigate GHG during construction "within the Nevada County region"[33] may be acceptable under CEQA, but may not

[30] DEIR pages 5-8/9. Also note this project spans 4 generations.
[31] DEIR Chapter 2, Table 2-1, item 4.3-7(b) Construction GHG Emissions Reductions, page 2-23
[32] DEIR Chapter 2, Table 2-1, item 4.3-7(b), page 2-24
[33] DEIR page 4.3-96

actually mitigate the negative impacts on the people in and around Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley in a reasonable time-frame.

- Second, there will be on-going emissions from daily operations, not just during construction. For the years following construction, GHG emissions range from 7,000-9,000 Metric Tons(MT)/year[34]. The DEIR uses a threshold of 10,000 MT/year, after construction, to conclude that no mitigation is required. The Air Quality Districts used in the DEIR[35] are not similar to Nevada County and should not be used to set Nevada County's air quality thresholds.

On 2/28/2022, the United Nations Intergovernmental Panel on Climate Change (UNIPCC) published a report[36] showing that:

- "Greenhouse gas emissions will push warming to 1.5ºC"
- "The world is already 1.1 degrees Celsius warmer than before industrialization...We are now rapidly barreling toward 1.5 degrees."
- "Only by making deep cuts to greenhouse gas emissions, while also removing carbon dioxide from the atmosphere, can we halt the precipitous trend."
- "Bottom line is that we have zero years left to avoid dangerous climate change, because it's here."
- The chart in the above UNIPCC report shows that at current trends GHG emissions will reach 1.5ºC between 2030 and 2050, well before end of the Rise Golds 80-year project.

**Ind 393-29**

The California Air Resources Board classifies diesel particulate matter (DPM) as a toxic air contaminant, and estimates that about 70% of the cancer risk the average Californian faces stems from DPM.[37] The American Lung Association gives our community an F grade for ozone levels, designating 105 days per year "unhealthy."[38] During the last two years, wildfires contributed to entire weeks when the Northern Sierra Air Quality Management District labeled Nevada County's air quality "very hazardous." Ongoing climate change, with warmer and drier conditions, intensifies wildfires. Nevada County's air quality is certain to get worse even without the additional pollution from the Rise Gold mine.

*Please respond to the following questions regarding the adequacy of the DEIR:*

**Ind 393-30**

- Besides Carbon Offsets, what is being done to monitor and mitigate the negative impacts of the Rise Gold project on increased GHG for the people in and around Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley during construction?

**Ind 393-31**

- Why isn't Nevada County requiring the necessary research to determine the appropriate GHG threshold specifically for the Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley areas, including the negative impact of 7,000-9,000 MT/year of new GHG emissions added during the dangerously unhealthy air quality in the much longer fire and smoke seasons vs. using assumptions from other dissimilar counties?

**Ind 393-32**

- Given the already serious impacts of climate change, what specific steps will Nevada County take to ensure a net zero impact from this project vs. adding 7,000-9,000 MT/year to the problem?

**Ind 393-33**

- Understanding the changing impact of climate change for the next 80 years:
  - What is being done to mitigate the negative impacts of increased GHG on the people in and around Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley?

[34] DEIR Chapter 4, Table 4.3-23, page 4.3-93
[35] DEIR pages 4.3-42/43
[36] www.cnn.com/2022/02/28/world/un-ipcc-climate-report-adaptation-impacts/index.html
[37] ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health
[38] www.lung.org/research/sota/city-rankings/states/california/nevada

- How will GHG emissions be monitored to ensure compliance?
- How will 7,000-9,000 MT/year of new GHG emissions added during fire season impact already poor air quality?
- What production mitigations, e.g. fewer diesel trucks/day, will occur at the Rise Gold mine when air quality as measured by the Northern Sierra Air Quality Management District for the Grass Valley, Nevada City, Alta Sierra, Lake Wildwood or Penn Valley areas is "very hazardous"?
- What mitigations will occur if parts of the proposed Rise Gold schedule changes (e.g., more trucks delivering Engineered Fill now vs. later), driving emissions over the thresholds noted in the DEIR?
- How will anyone outside of Rise Gold know about schedule changes that impact GHG emissions?
- Who will do the monitoring?
- How frequently will monitoring data be published?

**Ind 393-34** For the above reasons, re Issue #4: Air Pollution, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

**Ind 393-35** **Issue #5: Trips/Day**: There has been much talk about "100 trips/day" for large trucks which counts "round trips". It's actually 200 one-way trips/day for hauling mine waste plus 36 other large truck trips/day[39]. Each trip creates GHG emissions locally that won't be mitigated by Carbon Offsets from somewhere else in Nevada County. Diesel trucks generate up to 150 times the emissions of passenger vehicles.[40] Producing the same emissions as 236 large truck trips/day requires 35,400 trips/day from cars and light trucks. Following construction, Rise Gold is not required to provide any mitigation for GHG emissions comparable to as many as 35,400 passenger vehicles/day[41]. In addition, traffic issues at "SR174/Brunswick" and "Brunswick Road/Sutton Way" are "Significant and Unavoidable" and cannot be mitigated.[42]

The DEIR notes that the "Environmentally Superior Alternative"[18] would be "Alternative 2, Elimination of the Centennial Industrial Site" yet there are still "Significant and Unavoidable" issues for Transportation.[43]

*Please respond to the following questions regarding the adequacy of the DEIR:*

**Ind 393-36**
- Following construction, given the data for GHG "thresholds" is from counties dissimilar to Nevada County, why are no mitigations required for GHG emissions comparable to as many as 35,400 passenger vehicles/day?

**Ind 393-37**
- Given that the County knows in advance there will be injuries and possibly fatalities directly related to "Significant and Unavoidable" traffic issues, how does Nevada County justify the project at all?
- How will the County compensate victims of vehicle and pedestrian injury accidents and fatalities at intersections where the traffic impact from the Rise Gold project is "Significant and Unavoidable"?

**Ind 393-38**
- Given that the County knows in advance there will be injuries and possibly fatalities directly related to "Significant and Unavoidable" traffic issues, how does Nevada County avoid significant liability?
- What are the additional liability insurance costs related to approval of this project?

[39] DEIR Chapter 4, Table 4.12-7, page 4.12-33
[40] www.cleanairtrust.org/trucks.dirtytruth.html
[41] 236 truck trips/day x the equivalent 150 passenger vehicle trips, see www.cleanairtrust.org/trucks.dirtytruth.html
[42] DEIR, 4.12-8, 4.12-10, pages 5-11/12
[43] DEIR, Table 6-1, page 6-44

- How are the costs for additional liability passed down to property owners in the county?
- Why are projects even considered with negative Significant and Unavoidable issues?

**Ind 393-39**

For the above reasons, re Issue #5: Trips/Day, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

**Issue #6: Trust and Financial Stability**: Trust and Financial Stability may not sound like *environmental* issues, but in fact are an overlay on all environmental issues and planned mitigations. How can the County trust an organization led by a CEO who walked away from the Banks Island Mine in British Columbia after they were caught dumping toxic waste, claiming (in part) that they were allowed to "discharge waste into the *environment* [emphasis added]"?[44] Anyone who would make such a claim or believe it's okay to dump toxic waste into the environment should not be allowed to run a project in Nevada County.

Re Financial Stability: The most recent Rise Gold Corp. Form 10-Q, including its wholly-owned subsidiary Rise Grass Valley Inc., filed with the Securities and Exchange Commission for the quarter ending October 31, 2021 says the following on Page F-5:

**Ind 393-40**

"The Company has incurred a loss of $212,300 for the three-month period ended October 31, 2021 and has accumulated a deficit of $19,756,777. The ability of the Company to continue as a going concern is dependent on the Company's ability to maintain continued support from its shareholders and creditors and to raise additional capital and implement its business plan. There is no assurance that the Company will be able to obtain adequate financing in the future or that such financing will be on terms advantageous to the Company. However, the Company has been able to obtain such financings in the past. The consolidated financial statements do not include any adjustments that might be necessary if the Company is unable to continue as a going concern. At October 31, 2021, the Company had working capital of $474,447 (July 31, 2021 - $956,524). As such, ***these material uncertainties cast a substantial doubt regarding the Company's ability to continue as a going concern*** [emphasis added]."

Page F-20 of the 10-Q document states:

"The Company expects to operate at a loss for at least the next 12 months. It has no agreements for additional financing and cannot provide any assurance that additional funding will be available to finance its operations on acceptable terms in order to enable it to carry out its business plan. There are no assurances that the Company will be able to complete further sales of its common stock or any other form of additional financing. However, the Company has been able to obtain such financings in the past. If the Company is unable to achieve the financing necessary to continue its plan of operations, then it will not be able to carry out any exploration work on the Idaho-Maryland Property or the other properties in which it owns an interest and its business may fail. As such, ***these material uncertainties cast a substantial doubt regarding the Company's ability to continue as a going concern*** [emphasis added]."

*Please respond to the following questions regarding the adequacy of the DEIR:*

[44] www.thenorthernview.com/news/witnesses-testify-in-court-on-banks-island-mine-disaster

- Why does the DEIR not address how Rise Gold plans to manage this project without the excuse that they were allowed to "discharge waste into the environment"?
- What is the specific plan for when a toxic spill occurs?
- Who takes action?
- Who does the cleanup?
- Who bears the cost?
- Who reviews and modifies procedures to ensure the issue is solved and will not occur again?
- If the answer to the previous question is Rise Gold, who will review their work to ensure the issue is solved and will not occur again?
- How and when will the public have access to information during and after a toxic spill?
- Given the "...substantial doubt regarding the Company's ability to continue as a going concern" are funds set aside in escrow, before any construction or dewatering starts, to cover the cost of:
  - all required mitigations for the life of the 80 year project?
  - cleanup following a toxic spill?
  - additional NID connections when wells in the Rise Gold mineral rights area but beyond the planned pipeline on East Bennett are negatively impacted?
  - water well replacement for property owners who do not have access to NID?
  - Emergency water supplies for wells that dry up from mine dewatering?
- Given the history associated with Rise Gold's CEO, what steps are in place to mitigate the conflict of interest associated with self-monitoring and accurate reporting to the County?

For the above reasons, re Issue #6: Trust and Financial Stability, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

**Ind 393-41**

**Issue #7: 80-Year Plan**: The "80-year" plan is more than unrealistic. The grandchildren and great grandchildren of students currently enrolled at Nevada County schools will still be dealing with the fallout from this project. Rise Gold is owned by an investment group. All such groups have an "exit strategy" before they invest. That plan considers how to make a quick return on their investment. They will not be here for the long-term or to cover the cost of clean-up that will be required when something fails. That's why they declared **bankruptcy** in British Columbia but the "Management" bio for Ben Mossman at the Rise Gold website says "...he led...a **profitable** gold mine in British Columbia..."[45]. What that conflicting message means is they stayed long enough to make a profit for their investors and then bailed out.

*Please respond to the following questions regarding the adequacy of the DEIR:*

- When Rise Gold is sold to or merged with another mining company what plans are in place to ensure continued compliance and avoid concessions (e.g., the new company saying something like "we can't continue to operate if we have to continue various mitigations, so provide concessions or risk losing 300+ jobs")?
- What assurances do the people of Nevada County have that money is set aside now to cover the cost of clean-up and remediation when/if Rise Gold (again) declares bankruptcy?
- If money is set aside up front, what process is used to ensure it's enough for clean-up and remediation across the 80-year life of this project?

[45] www.risegoldcorp.com/management

- Please explain why this project should proceed given there are "Significant Irreversible Environmental Changes" and "The primary and secondary impacts of the project would generally commit future generations..."[46], including the grandchildren and great grandchildren of students currently enrolled at schools in Nevada County, to the same use for the next 80 years.

For the above reasons, re Issue #7: 80-Year Plan, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

**Issue #8: Incorporation by Reference**: The DEIR document "3.0 Introduction to the Environmental Analysis"[47] notes incorporation by reference of the "Nevada County General Plan Final Environmental Impact Report, dated March 1995 (State Clearinghouse Number 1995102136)" and possibly a DEIR for Dollar General Stores from December 2016 (Dollar General is noted in the footer on all pages). This section refers to technical information "in the above referenced EIR" (the Nevada County General Plan Final EIR).

Ind 393-42

*Please respond to the following questions regarding the adequacy of the DEIR:*

- What are the specific places where items that are incorporated by reference are used in the Idaho-Maryland Mine Project DEIR?
- In each case, why is the information incorporated by reference?
- Also note that the County website link provided in the DEIR for the referenced document ["Nevada County General Plan Final Environmental Impact Report, dated March 1995 (State Clearinghouse Number 1995102136)"] is incorrect and should be www.mynevadacounty.com/1065/General-Plan.[48]

Nevada County's General Plan, as approved by the Board of Supervisors, following thousands of hours of work and thousands of dollars in cost, has the following four Central Themes:

- Fostering a rural quality of life.
- Sustaining a quality environment.
- Development of a strong diversified, sustainable local economy.
- Planned land use patterns will determine the level of public services appropriate to the character, economy and environment of each region.

Ind 393-43

Please provide detailed reasoning why the Rise Gold Idaho-Maryland Mine Project should be approved when:

- The DEIR includes "Significant and Unavoidable" issues, which by definition cannot be addressed.
- The serious concerns noted in my questions and commentary, re Issues 1-7 above have not been adequately addressed in the DEIR.
- Lack of compliance with
  - at least 2 Central Themes of the Nevada County General Plan
  - Nevada County General Plan Policy 17.14
  - Nevada County General Plan Policy 17.24 including "All other related impacts **shall** [emphasis added] also be addressed."

Ind 393-44

  - The Nevada County Energy Action Plan

Ind 393-45

jvaughan1946@gmail.com

Planning Commission Public Comments, 03/24/2022

My name is John Vaughan. I have been a resident of Nevada County since 1967. My wife Gail and I live at 11793 Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. We are District III voters.

**Ind 393-46**

The last 10 years of my career I was the Senior Vice President of Manufacturing and Logistics at a non-profit in Roseville with responsibilities including a distribution contract for the world's largest printer manufacturer, shipping millions of printer parts per year all over the world.

I have many concerns with the Draft EIR and am submitting my written comments today.

One that stands out is the lack of inclusion and review of a previously approved use for the Idaho Maryland site, which is the Nevada County Business and Industrial Center.

As already approved and zoned, this alternative could include a 54,000ft$^2$ Business Park, 242,000ft$^2$ for Service Business/Light Manufacturing and 238,000ft$^2$ for Industrial uses.

**Ind 393-47**

The Draft EIR wrongly concludes a negative impact and rejects this alternative assuming the impact would be the same or worse than the Rise Gold mine. Unlike Rise Gold, in virtually all cases in the real world, for the types of businesses that would actually locate there, the traffic would be comprised largely of passenger cars and small trucks operating in the daytime, mostly weekdays and not 24x7. Diesel truck traffic would be substantially less than the 236 trips per day for the Rise Gold project. The scale and location of this site would not support large Distribution Facilities, Auto Dismantlers or Planing Mills as claimed in the Draft EIR.

My written comments include more specific details about why the Draft EIR conclusions regarding the Business and Industrial Center alternative are inadequate.

To reject this alternative without a more detailed review using real world scenarios and real world outcomes makes no sense. I believe that with adequate review the Business and Industrial Center will prove to be the environmental superior alternative.

This is the wrong project for Nevada County.

Thank you for the work you are doing and for your time today.

# Witnesses testify in court on Banks Island Mine disaster

## Former safety manager shares photos of waste from the mine site spilling into the environment

SHANNON LOUGH / Sep. 26, 2017 5:30 a.m. / LOCAL NEWS / NEWS

Two years after the Ministry of Environment ordered Banks Island Gold Mine to shut down its operations for environmental infractions, the province is now taking the company's ex-president, mine manager and aquatic biologist to court.

One of the first witnesses to take the stand was former safety manager of the site, Brent Edmunds. With 40 years in the mining industry, Edmunds was hired in April 2015 and once on site, he said he saw many labour issues and he was alerted about uncontained spillage. In May 2015, he toured the site and took photos of liquid discharge from the mine.

"All these tailings were all over the place," he said to the

*Northern View*, a day after his testimony.

He took photos of mill tailings, waste product from the mine, leaking into a creek at one site, and flowing into a swamp and lake area at another site.

Edmunds said he made an anonymous tip regarding concerns he had over the health and safety of many of the Indigenous employees.

"It's only because of God's grace that some one was not killed there while they were operating," he said, regarding one incident in particular where he witnessed people going into the mine without ventilation.

"I felt powerless to stop it."

He said he also sent photos and documents to the Inspector of Mines, and included the Ministry of Environment in the email. In June, he returned home for his two weeks off and never returned to the site.

"I was fired because I was trying to do my job," he said.

RELATED: BANKRUPT MINING COMPANY NOW FACES 35 CHARGES FOR BANKS ISLAND MESS

In response to Edmunds, defence attorney, Chilwin Cheng said in an email that "Banks Island chose not to engage Mr. Edmunds after his probationary period ended. He was not dismissed. His departure coincided with the temporary layoff of a number of employees of Banks Island Gold after the government issued its shutdown order in early July."

The Yellow Giant Gold Mine on Banks Island within the

Gitxaała Nation was shut down on July 15 by the Ministry of Energy and Mines.

Former CEO of now-bankrupt Banks Island Gold Mine Ltd., Benjamin Mossman, as well as mine manager, Dirk Meckert, and aquatic biologist Allegra Cairns are facing 35 charges under the federal Fisheries Act, provincial Environmental Management Act and Water Act.

Mossmann and Meckert's attorney, Cheng, is asking the Crown counsel to drop the charges.

The defence claims they received a permit from the ministry containing an error that led to them to believe they were allowed to "discharge waste into the enviornment."

The Gitxaała Environmental Monitoring (GEM) team based in Prince Rupert has been attending the court case to report back to the community.

"GEM on behalf of Kitkatla Nation are happy to see it going to trial and we're watching it intently. We're interested to see what the results of the trial will be," said James Herbert, regulatory affairs manager, GEM.

Last week, aquatic biologist Cairns took the stand as the Crown's first witness, more testimonies are expected to come from the mining inspectors. The next court date is set for Oct. 10.

The Yellow Giant mining site on Banks Island is still under remediation. The Ministry of Energy, Mines and Petroleum Resources stated in an email that it had removed all hazardous materials by May 2016. In June 2017, the ministry set up a site-wide water quality monitoring program to

determine areas needing remediation.

Remediation has cost the ministry approximately $250,000 out of the $420,000 confiscated from Banks Island Gold Ltd.'s reclamation security deposit.

The ministry said it has shared the final reclamation and closure plan with the Gitxaała First Nation and will continue to work with them until the program has been completed.

---

Mine sediments flow toward a lake from the Yellow Giant Gold Mine on Banks Island. This photo was taken in June 2015 by former mine safety manager Brent Edmunds. (Brent Edmunds photo)

## INDIVIDUAL LETTER 393: JOHN VAUGHAN

### Response to Comment Ind 393-1

The commenter states the DEIR is inadequate. Please see Master Response 1 and the responses to specific comments provided below.

### Response to Comment Ind 393-2

The commenter states that the DEIR acknowledges that dewatering will have a significant and unavoidable impact. This is incorrect, as the DEIR concludes that the project will have a less than significant impact with regard to dewatering and water supply after implementation of mitigation. The commenter asserts that the DEIR's mitigation does not address impacts to properties outside of the anticipated drawdown area. While the DEIR does not require installation of an NID pipeline beyond the 30 properties that are to be provided with the option of connecting to NID water supply, the DEIR does include a groundwater well monitoring plan designed to detect any unexpected drawdown impacts outside of the anticipated area of effect, and requires immediate replacement of water supply by the mine operator for any significant impacts to those wells pursuant to Mitigation Measure 4.8-2(b) and General Plan Policy 17.12. Please see Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and with regard to the commenter's reference to the Emgold and Emperor projects, see Master Response 13 - Historic Hydrogeologic Assessments.

As noted in Master Response 15, the applicant has also provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Ind 393-3

The commenter references two different mining projects that resulted in unexpected water supply and water quality impacts. Notably, the proposed project is in a different location with different geologic settings than the referenced projects, so the impacts from those projects are not directly comparable. Nonetheless, the County has seriously considered the potential impacts of the project to water supply and quality, prepared thorough analysis of those impacts in Chapter 4.8 of the DEIR, imposed mitigation measures to ensure that any impacts are mitigated, and hired an independent expert to peer review and provide input on the analysis. Please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells. With regard to the commenter's concern over potential breach of a tailings dam, the project does not propose a tailings dam. Please see Chapter 3 of the DEIR.

### Response to Comment Ind 393-4

The commenter provides information on climate change, drought and the Nevada County Energy Action Plan. Additionally, the commenter asserts that the DEIR did not adequately assess climate change, and cites a statement from Dr. Houmau Liu that Itasca did not look into climate change as part of the groundwater model. While the DEIR does consider variations in whether events such as multiple dry years and storm events, the impact of climate change in connection with the project is speculative; and therefore, not required to be analyzed under CEQA. Please see Master Response 16 - Drought and Climate Change, and Master Response 25 - Nevada County Energy Action Plan.

## Response to Comment Ind 393-5

The commenter asserts that the existing mine tunnels have not been mapped since the World War II era, and therefore the DEIR did not adequately assess groundwater impacts to the larger area. The location of the underground mine works is documented in historic materials from the prior mining operations and was used as part of the groundwater model. There is no evidence to suggest that there are significant underground mine works that are unmapped or that these would change the groundwater analysis. Please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 13 - Historic Hydrogeologic Assessments.

## Response to Comment Ind 393-6

The implementation of mitigation required in Chapter 4.8 of the DEIR to monitor groundwater levels and mitigate any impacts is under the authority of Nevada County, who has enforcement authority to ensure compliance. Please see Master Response 15 - Adequacy of Groundwater Monitoring Wells. As also noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 393-7

The commenter asks how the required monitoring and water replacement mitigation will be implemented. The implementation of mitigation required in Chapter 4.8 of the DEIR to monitor groundwater levels and mitigate any impacts is under the authority of Nevada County, who has enforcement authority to ensure compliance. Mitigation Measure 4.8-2(b) and General Plan Policy 17.12 require an immediate replacement of water supply at the expense of the Mine Operator. The threshold of significance for groundwater well impacts was determined in the DEIR to be a reduction of 10% of the well water column. See Chapter 4.8 and Appendix K.9 of the DEIR. The Well Mitigation Plan (Appendix K.9) has been modified to clarify actions that would be taken under the well mitigation plan outside of the E. Bennett Road area. Please see Appendix D to this Final EIR for a revised Well Mitigation Plan, and Master Response 15 - Adequacy of Groundwater Monitoring Wells regarding the applicant's commitment to conduct monitoring of domestic wells within the predicted 1-foot drawdown contour.

Please see Response to Comment Ind 393-3 regarding the San Juan Ridge Mine and Lava Cap Mine.

## Response to Comment Ind 393-8

The commenter asks why properties that are annexed into Grass Valley or sold would not receive payment for the cost of water supply. Please see Response to Comment Agcy 10-6.

## Response to Comment Ind 393-9

The commenter questions how impacts to wells outside the East Bennett area will be addressed. Please see Mitigation Measures 4.8-2(a) and 4.8-2(b) and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 393-10

The commenter asks why mitigation proposed for previous projects in 2008 and 1996 are different than the mitigation proposed for the project. Please see Master Response 13 - Historic

Hydrogeologic Assessments and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 393-11

Please see Response to Comment Ind 393-3 regarding the San Juan Ridge Mine and Lava Cap Mine.

## Response to Comment Ind 393-12

With regard to well monitoring, please see Mitigation Measure 4.8-2(a). Groundwater-level information shall be obtained from the project's groundwater monitoring wells and collected on a quarterly basis, and submitted in report form to the Nevada County Environmental Health Department. The County typically charges permit holders for inspections and other costs associated with enforcement and monitoring of permit conditions. The same would apply to Rise's project. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, regarding the applicant's commitment to monitor domestic wells within the predicted 1-foot drawdown contour.

Spills would be reported to the Central Valley Regional Water Quality Control board in compliance with regulations of the State of California. See Chapter 4.8 of the DEIR.

## Response to Comment Ind 393-13

The County has authority over enforcement of all required mitigation measures and conditions of approval through the Mitigation Monitoring and Reporting Program (Chapter 4 of this Final EIR). To the extent that certain conditions or mitigation measures include self-monitoring, the County has enforcement authority to ensure compliance. The County typically charges permit holders for inspections and other costs associated with enforcement and monitoring of permit conditions. The same would apply to Rise's project.

## Response to Comment Ind 393-14

Please see Master Response 13 – Historic Hydrogeologic Assessments, and Master Response 16 - Drought and Climate Change. The groundwater model incorporated historic data and current data to set the proper existing conditions baseline as required by CEQA.

## Response to Comment Ind 393-15

To ensure accuracy of the analysis, the County hired an independent expert to review and provide input on the groundwater model, impact analysis and mitigation measures. The independent expert's comments have been incorporated into the analysis and mitigation. Please see Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 393-16

As discussed in Response to Comment Ind 393-15, the County's independent expert, West Yost, peer-reviewed the hydrogeology studies as disclosed in Chapter 4.8 of the DEIR.

## Response to Comment Ind 393-17

The water that is being pumped from the underground mine workings is not being disposed of such that it is wasted. Rather, the water will be treated to State permit standards and discharged into South Fork Wolf Creek, where it can be used by NID for water customers in the County or used by other downstream water users. Liability and insurance costs are not within the scope of

CEQA analysis, but these comments have been forwarded to the decision makers for their consideration.

## Response to Comment Ind 393-18

Please see Responses to Comments Ind 393-7, Ind 393-7, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 393-19

The commenter asserts that the project is inconsistent with the General Plan and is inconsistent with the Nevada County Energy Action Plan. Please see Master Response 25 - Nevada County Energy Action Plan. General Plan Policy 17.14 requires existing development to be protected from impacts caused by mining. The DEIR provides extensive mitigation measures and conditions of approval to protect already existing development - commercial, residential, and community - as well as undeveloped private lands, from adverse environmental effects caused by mining. Accordingly, the DEIR found that the project is consistent with General Plan Policy 17.14.

General Plan Policy 17.24 requires subsurface mining to be conditionally approved only after environmental review under CEQA is completed to address surface land uses, water quantity and quality, noise and vibration, land subsidence, and traffic associated with surface access. The DEIR provides extensive analysis and mitigation measures regarding the listed impacts on the environment in compliance with CEQA. Accordingly, the DEIR found that the project is consistent with General Plan Policy 17.24.

## Response to Comment Ind 393-20

This comment is redundant with comments from Individual Comment Letter 388. See Responses to Comments Ind 388-3 through Ind 388-6.

## Response to Comment Ind 393-21

This comment is redundant with comments from Individual Letter 388. Please see Responses to Comments Ind 388-7 through Ind 388-9.

## Response to Comment Ind 393-22

This comment is similar to comments from Individual Letter 388. Please see Responses to Comments Ind 388-10 through Ind 388-12.

## Response to Comment Ind 393-23

This comment is redundant with comments from Individual Letter 388. Please see Responses to Comments Ind 388-1 through Ind 388-12.

## Response to Comment Ind 393-24

The commenter states that it is likely that more accidents will occur at the two intersections, where project traffic would result in a significant and unavoidable impact, but provides no evidence.

CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

It is also noted that the DEIR includes mitigation for the two impacted intersections. For example, while the DEIR concludes that the proposed project would have a significant and unavoidable impact to the SR 174/Brunswick Road intersection, Mitigation Measure 4.12-1(b) of the DEIR

requires the applicant to enter into a Traffic Mitigation Agreement with the County regarding the SR 174/Brunswick Road intersection. The Agreement shall require the applicant to pay the project's fair share contribution toward the improvements necessary to improve intersection operations to an acceptable level. The Agreement shall include the fair share calculations and total payment amount. Based on the Caltrans methodology to assess fair share, it is estimated that the fair share percentage is 14.9%. While the project is contributing toward addressing its contribution of traffic to the SR 174/Brunswick Road intersection, the remaining funding needed to improve the intersection (e.g., signalization) is not yet certain, nor secured. As a result, the DEIR conservatively concludes that the impact would remain significant and unavoidable.

Regarding the Brunswick Road/Sutton Way intersection, with project traffic, queues in the northbound left turn lanes of the intersection would exceed the threshold of significance. Re-timing of the Brunswick Road/Sutton Way intersection is required by Mitigation Measure 4.12-10 of the DEIR and would maintain LOS C conditions (29.5 seconds per vehicle) with queues declining for this movement. As such, implementation of MM 4.12-10 would reduce the potential impact to a less-than-significant level. However, because the intersection is within the jurisdiction of the City of Grass Valley, Nevada County does not have legal authority to impose this mitigation measure and ensure its eventual outcome. As a result, the impact is conservatively determined to be significant and unavoidable.

## Response to Comment Ind 393-25

Please see Response to Comment Ind 393-24 regarding traffic accidents.

Water quality and water supply are analyzed in Chapter 4.8 of the DEIR.

With regard to economic issues and property values, please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

With regard to air quality, please see Chapter 4.3 of the DEIR and Master Response 18 - Air Quality Thresholds.

With regard to "toxic spills" see Chapters 4.7 and 4.8 of the DEIR. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

While many of the project-related concerns noted by the commenter were not identified as significant and unavoidable in the DEIR, it is noted that under CEQA Guidelines Section 15043, the County maintains the authority to approve projects despite significant and unavoidable environmental effects under certain circumstances. Should the Nevada County Board of Supervisors seek to move forward with certifying this EIR and approving the project entitlements, due to the significant and unavoidable impacts that would occur with implementation of the project, the Board would be required to adopt a Statement of Overriding Considerations. The Statement of Overriding Considerations would publicly disclose the process by which the Board weighs the environmental impacts of the project against any other factors. As enumerated in Section 15093 of the CEQA Guidelines, factors to be balanced by the Board when considering projects that would result in a significant and unavoidable environmental impact include economic, legal, social, and technological benefits of projects as well as region-wide or statewide environmental benefits.

## Response to Comment Ind 393-26

Analysis of significant irreversible environmental changes is a distinct topic of analysis mandated by CEQA Guidelines, Section 15126.2, which is distinct from CEQA's requirement to assess potentially significant impacts in individual resource areas (e.g., noise, traffic, air quality).

## Response to Comment Ind 393-27

Any project that consumes non-renewable energy or mines non-renewable resources would be considered to cause significant irreversible environmental changes. The commenter's suggestion that any project with significant irreversible environmental changes is inconsistent with the General Plan is untenable and would result in the rejection of virtually every project. If the project is approved by the County, the reasons for approval will be outlined in the CEQA findings and the Statement of Overriding Considerations, as discussed in Response to Comment Ind 393-25.

## Response to Comment Ind 393-28

Please see Master Response 27 - Greenhouse Gas Thresholds, and Master Response 28 - Greenhouse Gas Credits.

## Response to Comment Ind 393-29

Please see Master Response 27 - Greenhouse Gas Thresholds, Master Response 18 - Air Quality Thresholds, and Master Response 166 – Drought and Climate Change.

## Response to Comment Ind 393-30

Climate change is a global issue and not only a project specific issue. The project's incremental contribution of GHG emissions would be less than cumulatively considerable (see page 4.3-95 of the DEIR).

## Response to Comment Ind 393-31

The County determined that 10,000 MT/year of $CO_2$ equivalent GHG emissions is the proper CEQA threshold to apply to the project. Please see Master Response 27 - Greenhouse Gas Thresholds. Greenhouse gas emissions are not included in health risk assessments, as they are not considered toxic air contaminants. Please see Chapter 4.3 of the DEIR.

## Response to Comment Ind 393-32

Please see Master Response 27 - Greenhouse Gas Thresholds. The project is not required to achieve net zero GHG emissions.

## Response to Comment Ind 393-33

Please see Chapter 4.3 of the DEIR, Master Response 18 - Air Quality Thresholds, and Master Response 27 - Greenhouse Gas Thresholds. The project is not required to monitor or publish emissions of GHG. GHG emissions during fire season would not cause a direct air quality impact as GHG emissions are not toxic air contaminants or criteria air pollutants. Climate change is a global impact and not specific to the individual communities listed by the commenter, thus individual analysis of those communities is not required by CEQA.

## Response to Comment Ind 393-34

Air quality impacts from the project are less than significant after mitigation. Please see Chapter 4.3 of the DEIR. If the project is approved by the County, the reasons for approval will be outlined in the CEQA findings and the Statement of Overriding Considerations.

## Response to Comment Ind 393-35

GHG emissions attributable to trucks has been analyzed in the DEIR. Please see Chapter 4.3 of the DEIR. Please also see Response to Comment 393-24 regarding significant traffic impacts.

The commenter notes that the DEIR identifies Alternative 2, Elimination of the Centennial Industrial Site, as the environmentally superior alternative, but said alternative still has significant and unavoidable issues for transportation. What the commenter does not mention is that Alternative 2 would eliminate one significant project-related noise impact (DEIR, p. 6-28). This is the impact related to potential use of Jake brakes along the haul route connecting the Brunswick and Centennial Industrial Sites. The EIR determined that the proposed project could result in a substantial increase in ambient noise levels in the vicinity of the project due to haul truck traffic should Jake brakes be used. As also noted on page 6-29, implementation of Alternative 2 would also eliminate the truck turning movements along Whispering Pines Lane into the Centennial Industrial Site driveway; thus, widening along the Centennial Industrial Site's frontage for purposes of facilitating adequate truck turn movements into and out of the Site would not be required for this Alternative. Alternative 2 would also eliminate certain project-related pavement impacts along the haul route from the Brunswick to Centennial Sites.

As discussed on page 6-2 of the DEIR, the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly (CEQA Guidelines Section 15126.6[b]). Alternative 2 would avoid some of the proposed project's impacts, and therefore, meets the CEQA requirement for an alternative.

## Response to Comment Ind 393-36

Please see Master Response 27 - Greenhouse Gas Thresholds.

## Response to Comment Ind 393-37

The commenter states that it is likely that more accidents will occur at intersections due to project traffic but provides no evidence for this argument.

CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." Please also see Response to Comment Ind 393-24.

Liability insurance is not an environmental issue requiring analysis under CEQA.

## Response to Comment Ind 393-38

Please see Response to Comment Ind 393-37.

## Response to Comment 161-39

Please see Responses to Comments Ind 393-19 and Ind 393-25.

## Response to Comment Ind 393-40

Please see Master Response 3 - Operator Responsibility. Please see Response to Comment Ind 393-19 regarding General Plan Policy consistency.

## Response to Comment Ind 393-41

Please see Master Response 3 - Operator Responsibility, and Master Response 1 - Non-EIR/Administrative Issues.

## Response to Comment Ind 393-42

Documents used directly in an EIR's impact analysis are typically included in the appendices (e.g., technical studies performed specifically for the project). However, outside documents that only indirectly relate to the project are sometimes incorporated by reference into an EIR to avoid inflating the length of the EIR and its appendices to an unmanageable size. Citations are provided for referenced documents, so that readers can locate those documents if desired.

## Response to Comment Ind 393-43

Please see Response to Comment Ind 393-19 regarding General Plan Policy consistency. General Plan consistency was analyzed in the DEIR, which concluded that the project is generally consistent with the General Plan. If the project is approved by the County, the reasons for approval will be outlined in the CEQA findings and the Statement of Overriding Considerations, as discussed in Response to Comment Ind 393-25.

## Response to Comment Ind 393-44

Please see Response to Comment Ind 393-43.

## Response to Comment Ind 393-45

Please see Master Response 25 - Nevada County Energy Action Plan.

## Response to Comment Ind 393-46

The comment does not address the adequacy of the DEIR. Comment noted.

## Response to Comment Ind 393-47

This comment is redundant with comments from Individual Letter 388. Please see Responses to Comments Ind 388-1 through Ind 388-12.

**Individual Letter 394**

RECEIVED

MAR 0 3 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

**Dist 3**

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 02/28/2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock:

My name is John Vaughan. I have been a resident of Nevada County since 1967 (55 years). My wife Gail and I live on Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. Our property is served by a well. We are District III voters.

We do not support the Rise Gold project due to the huge negative impacts on our people, water supplies and property values and urge you to vote NO on the project.

I'd like to highlight one of my many areas of concern with the Draft Environmental Impact Report (DEIR), specifically the lack of inclusion and detailed review of the Nevada County Business and Industrial Center[1] (NCBIC) alternative, which with existing M1-SP zoning could include a 54,000 ft$^2$ Business Park, 242,000 ft$^2$ for Service Business/Light Manufacturing and 238,000 ft$^2$ for Industrial uses[2].

**Ind 394-1**

I am currently retired but the last 20 years of my career were spent at PRIDE Industries in Roseville. The last 10 of those I was the Senior Vice President of Manufacturing and Logistics, including responsibility for a large distribution contract for Hewlett Packard. We operated a shipping/receiving/distribution warehouse shipping millions of printer parts/year all over the world. Our facility was just over 200,000 square feet with 12 loading docks about 10 minutes from Interstate 80. The in/out diesel truck traffic was 10-15 trucks/day between 6am-6pm. In short, I know a bit about distribution and logistics.

The DEIR Chapter 6 "Alternatives Considered but Dismissed from Further Analysis"[3] is incorrect and incomplete. Specifically, in the "No Project" section, the analysis of the currently permitted NCBIC alternative[4] contains incomplete information and notes examples of negative impacts that are extremely unlikely to occur in the real world. The DEIR concludes an overall negative impact of these uses and rejects this alternative without adequate review.

In the summary section for the NCBIC alternative[5], the DEIR rejects this option assuming noise, traffic, aesthetics and air quality would be the same or worse for the NBCIC alternative vs. the Rise Gold mine. In virtually all cases for the types of businesses, using existing zoning, that would actually locate there, the traffic and noise would be daytime, mostly weekdays, not 24x7, comprised largely of passenger cars and small trucks with large truck traffic substantially less than the 236 trips/day for the Rise Gold project[6] and almost none of the traffic hauling toxic waste.

The DEIR identifies (among others) Distribution Facilities and Auto Dismantling Yards as examples of business that would "...cause substantial noise, traffic, aesthetic and air quality impacts..." While these business types are permitted under existing zoning, the likelihood of such ventures at this location is extremely low. Both Distribution Facilities and Auto Dismantling Yards (and Saw Mills and Planing Mills)

[1] DEIR page 6-11, Nevada County Ordinance 1853, February 1994
[2] DEIR page 6-11/12
[3] DEIR page 6-8
[4] Beginning at the bottom of Page 6-11
[5] Bottom of Page 6-13, last 2 paragraphs before "Reduced Hours"
[6] 118 round trips, see Table 4.12-8, page 4.12-34

require easy access to major freeways like Interstate 80 and therefore are not realistic for this site. In the case of large 24x7 Distribution Facilities, anything further than 10-15 minutes from a major freeway is not feasible and 238,000 square feet (238K) is too small.[7] Even if you attracted a Distribution Facility tenant, 238K would not support enough loading docks to create the same large truck traffic as the Rise Gold Mine project. Additionally, for Distribution Facilities and other permitted businesses, at the scale available at this site, the semi-truck traffic would be limited to weekday or daytime use as small to mid-size facilities are unlikely to operate 24x7. The DEIR also notes that a Milling and Planing Facility "would potentially create noise similar or greater to the proposed project." Frankly, that's hard to believe as there was a saw mill and planing mill at that site for decades.[8]

Re air quality: The impact on air quality would be greatly reduced with tenants that reflect what would happen in the real world at the NCBIC vs. the unrealistic scenarios in the DEIR.

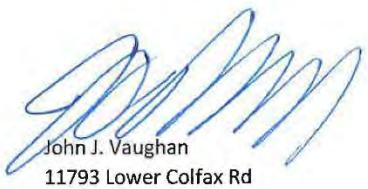
Re traffic: The DEIR suggests that car and truck traffic to/from the NCBIC would generate the same pollution as the projected traffic to/from the proposed mine, which includes 236 semi-truck trips/day. Each diesel semi-truck emits as much pollution as 150 cars[9]. Considering only the diesel semi-trucks, producing the same emissions as 236 trips/day requires 35,400 trips/day from cars and light trucks, an unlikely scenario for the mix of businesses that might actually occupy the NCBIC.

Re aesthetics: Given the site is already zoned for the buildings and businesses noted, aesthetic issues could be easily mitigated and included in a proposal for development of all or part of the NCBIC.

Virtually all of the businesses listed in "Examples of Permitted Uses"[10] already exist or have existed in Nevada County without hundreds of local residents protesting about potential traffic, noise, water consumption, water usage or pollution. It seems like a reasonable model to follow to do more of what we already know how to do without changing the nature of our community for the next 80 years. I believe many of the people who oppose this mine would likely support a "No Project" alternative with the NCBIC as the best outcome.

Assigning a "not feasible" label to the NCBIC alternative using unrealistic assumptions makes it appear as if the DEIR authors have not done their homework. I'm not saying that the NCBIC should be built now (or ever), that's not my decision, but to reject this alternative without a more detailed review using real world scenarios and real world outcomes makes no sense.

Rise Golds advertising "postcard" claims the "Science is Clear". That's debatable given that much of their science is based on assumptions and forecasts. The same postcard claims are there are "no significant impacts" while the DEIR clearly states there are "Significant and Unavoidable" impacts.



*What is clear* is this is the wrong project for Nevada County.

I urge you to vote NO on this project.

Thank you.

---

[7] While PRIDE's facility was considered too small we were awarded the HP contract, and kept it for years, because of HP's commitment to PRIDE's mission to create jobs for people with disabilities.

MAR 21 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 03/09/2022

Dear Supervisors Sue Hoek, Heidi Hall, Ed Scofield, Dan Miller, and Hardy Bullock:

**Ind 395-1** Volz Brothers is a family owned company that has been in business in Nevada County since 1982. We are located less than ½ mile from the Centennial Site where much of the post excavation fill dirt will be deposited. Our business, including our customers and employees will be negatively impacted by the more than 200 diesel truck trips between the mine and the Centennial Site.

I am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corp. I urge you to vote NO on the project.

Rise Gold fails to adequately mitigate many significant negative impacts of this large industrial project on our community and business.

**Ind 395-2** My business and personal opposition to this project is based on published Rise Gold plans, reports and the DEIR (Draft Environmental Impact Report). Reports from experts show there will be significant increases in air pollution, traffic in key areas (including on Idaho Maryland Rd, very near the Volz Brothers location), noise from both above and below ground operations, wildfire evacuation blockages, reduction of our community's water resources and more. They also report that any economic gains do not justify the costs to the County. Adding 312 jobs, approximately 220 from local hiring, to the County workforce of approximately 44,000 is trivial no matter what the wages, and the higher paying jobs are unlikely to go to County residents.

**Ind 395-3** Sincerely,

John Volz

NEVADA COUNTY
BOARD OF SUPERVISORS

Dear Nevada County Supervisors;

**Ind 397-1**

Businesses, homeowners, and conservationists in Nevada County are joining together to protect our neighborhoods, our local economy, and our quality of life from the Rise Gold proposal to re-open the Idaho-Maryland Mine. We, urge the Board of Supervisors to reject this destructive proposal and instead protect our community.

We face new environmental challenges and this project seems to be a step in the wrong direction. Our duty is to protect our land and natural resources and not exploit them to their limit. As a father I urge you to think about what world we want for out next generations and encourage you to look at our past and at the past of this Rise Gold. This is not what we want for our community.

In gratitude for your service,

Jon Benner

**Subject:** DEIR Comment Submission - Concerned About Dewatering Impact on Water Quality

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Board of Supervisors,

Thank you for considering my comment. I am a 36 year old home owner in Grass Valley, and intend to raise my family in the area. My property is on the South Fork of Wolf Creek, and I am very concerned about the water quality impacts of the proposed mine. Our property is adjacent to a historic lumber damn, that is now largely sedimented and has created extensive marshland behind it. The wildlife I've observed from our home in Wolf Creek includes top of the food chain species like otter, beaver, heron, osprey, as well as many other species of waterfowl, fish, and amphibians. I'm VERY concerned that the dewatering that is necessary for mine re-opening will adversely affect this complex ecosystem, especially in a time that ecosystems in California are already under incredible duress due to climate change. Furthermore, my house's water supply comes from a shallow well that is on the banks of the South Fork of Wolf Creek, and I am concerned that the mine dewatering will have an impact on my household's water quality. The lack of sufficient analysis in the DEIR of impact on the water quality of South Fork Wolf Creek has me very concerned that the well for my house will no longer be suitable for domestic use.

**Ind 398-1**

The DEIR fails to adequately address biological and aquatic resources and hydrological impacts to those resources. The DEIR's biological surveys exclude an entire reach of South Fork Wolf Creek (SFWC) which is where my home is located. Species of special concern are inadequately considered and qualitative data for benthic macro- invertebrates (BMI) is missing. (Wolf Creek Community Alliance (WCCA), Benthic Macroinvertebrate Analysis, 2007) Aquatic resources are excluded through an inaccurate hydrological assessment of the full length of SFWC ignoring the connectivity of the creek upstream and downstream of the culvert on the Mine property thus failing to consider the movement of trout and other aquatic species.

**Ind 398-2**

1

**Ind 398-3**

Hydrological impacts due to mine dewatering into SFWC are inadequately studied mischaracterized or not considered. The initial dewatering rate of 2500 gallons per minute (gpm) would be followed by 80 years of subsequent operational dewatering at 850 gpm and as much as 2500 gpm. The DEIR fails to adequately consider this long-term higher rate of discharge. Nor does the DEIR consider the seasonality of stream flow loss of streambed or streambank habitat changes in temperature differences in Specific Conductance (EC) and habitat for BMI. Drawdown of the water table due to dewatering is also underestimated and its impacts to meadow wetland and forest habitats are not considered. Further the DEIR fails to consider chronic and cumulative impacts to BMI trout and other aquatic species including special concern amphibians. (WCCA) Overall because the DEIR does not adequately address biological and aquatic resources or sufficiently analyze hydrological impacts this document must be revised.

**Ind 398-4**

Again, thank you for your consideration of my comment. I've focused my comment submission on this particular aspect of the DEIR, but there are many other aspects of the mine proposal that have me very concerned. Please diligently consider all the other comments received from our community as to whether or not this mine will truly be beneficial for our town and bio-region.

Kindly,
Jonas

## INDIVIDUAL LETTER 398: JONAS KETTERLE

### Response to Comment Ind 398-1

The commenter resides near South Fork Wolf Creek and is concerned with impacts from the discharge of treated water to South Fork Wolf Creek and any adverse impacts to the private well that serves the property. The DEIR discusses the impacts to South Fork Wolf Creek in Chapter 4.8 and found that impacts would be less than significant after mitigation, both with regard to water quality standards (DEIR, p. 4.8-41) and groundwater supplies (DEIR, p. 4.8-54.) For other impacts related to South Fork Wolf Creek, the commenter is referred to Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependent Vegetation, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 36 - Flows in South Fork Wolf Creek, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 16 - Drought and Climate Change, Master Response 30 - Biological Study Technical Adequacy, Master Response 34 - Resident Fish, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

### Response to Comment Ind 398-2

The commenter states that the DEIR is inadequate because it does not include a biological survey of the entire reach of South Fork Wolf Creek and does not discuss biological, aquatic, or hydrological impacts to South Fork Wolf Creek. The offsite stream reach referenced by the commenter is outside the project site and will not be subject to project-related surface disturbance. However, potential downstream effects of the project were evaluated in the DEIR. Please see Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 34 - Resident Fish, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependant Vegetation, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog. The commenter is also referred to Response to Comment Grp 31-12 regarding BMI.

### Response to Comment Ind 398-3

The commenter reiterates concerns with hydrological and biological impacts to South Fork Wolf Creek. The commenter also states that the DEIR inadequately discusses the variable rate of flow from the dewatering of the Idaho-Maryland Mine. The commenter is referred to Response to Comment Ind 398-1. Regarding the rate of flow, the analysis of project impacts considers the higher rate of flow of 2,500 gallons per minute. The commenter is referred to Chapter 4.8, Appendices K.1, K.2, and K.3 of the DEIR. Regarding the Specific Conductance and BMI, the commenter is referred to Response to Comment Grp 31-12.

### Response to Comment Ind 398-4

The commenter is concerned about various other aspects of the DEIR but provides no specific comments on the adequacy of the DEIR. The comment is noted and has been forwarded to the decisionmakers.

MAR 24 2022
NEVADA COUNTY
PLANNING DEPARTMENT

JBK Comment to Planning Commission 3/24/2022

Good morning Commissioners; thank you for this opportunity.

My name is Jonathan Keehn. My wife and I live in District 3, just outside the GV city limits, and also own two other properties in GV proper. I also own a house in District 4, near North Columbia. Our place there is on property adjacent to the now-defunct Siskon Gold Mine. (more?)

I've lived and worked in Nevada County since 1970. I am licensed General Contractor, and owner of Keehn Construction, in business for close to 50 years. In 2003 I was one of the founders of the Wolf Creek Community Alliance, and currently serve as President. The mission of our organization includes "to preserve, protect, and restore Wolf Creek and its watershed."

In getting ready to address you this morning, I looked at the Staff Report you have before you. On page 2, about ⅔ of the way down, a sentence jumped out at me. "A new above ground pipe would convey treated water from the water treatment plant along an existing dirt road to the planned discharge point at South Fork Wolf Creek." This is an important pipe for the proposed project, as I'm sure you are aware. But it is not the pipe I want to bring to your attention - it's the wording : "existing dirt road". It is not a road, it's a path.

**Ind 399-1**

I know this area pretty well - our organization has monitoring sites just upstream and downstream. For years before RISE bought the property and put up No Trespassing signs, lots of neighbors and creek lovers enjoyed walking and bird-watching on the informal trails. There are a ton of native California plants: trillium, equisetum, and surprising orchid called rattlesnake plantain. Maps in the DEIR show a dotted line for the proposed pipeline, but there is no "existing dirt road" there. It is a meandering path; it may have been used for logging 50 years ago, but not a road. One has to step over fallen trees, dodge poison oak, and jump over streams in the rainy season.

At least that's the way it was last time I was there 3 or 4 years ago. I don't know if the applicant has recently built a road there - I'd have to check with the planning department to see if permits exist.

So why does the DEIR (and your staff report) call it an "existing dirt road"? Whoever wrote those words apparently wanted it to sound like "no big deal, this area is already degraded, just fine for a pipeline". It may be a small detail, but it is indicative of many passages in the DEIR that minimize or ignore the existing habitats, to say, "we're only going to make it a little bit worse".

My comment this morning: "the DEIR must be revised to accurately describe the proposed pipeline route as it really is; not "an existing dirt road", but a lovely path along the creek."

Thank you for your time.

## INDIVIDUAL LETTER 399: JONATHAN KEEHN

### Response to Comment Ind 399-1

The commenter questions whether the pathway for the new above ground pipe that would convey treated water from the treatment plant to its discharge point at South Fork Wolf Creek is accurately characterized as "an existing dirt road." The commenter incorrectly states this is a "path along the creek" and it should be noted this is private property and not a public path or trail. Irrespective of the terminology used to characterize this area of the site, the DEIR analyzed potential impacts associated with disturbance related to installation of the treated water pipeline along this pathway. DEIR section 4.4.4 analyzed potential biological impacts associated with project-related surface disturbance, including installation of the aboveground pipe. Mitigation measures require preconstruction surveys prior to surface disturbance to limit potential impacts to rare plants, special status wildlife species, and protected birds and raptors (see Mitigation Measures 4.4-1(b) and 4.4-2(a-g.)

**Individual Letter 400**

3/24/2022

Nevada County Planning Department
950 Maidu Avenue, Nevada City,
CA 95959

225 south auburn street
Grass Valley, CA
95945

Dear Matt Kelley,

**Ind 400-1**

We should not reopen the Idaho Maryland mine and here is why. Did you know the metal mining industry reported 2.8 billion pounds of toxins admitted to our air, water, and wildlife, now let that sink in?" In 2012, 340 migrating geese were found dead in the abandoned Berkeley pit copper mine in Butte Montana. "Fish in a 15 mile stretch of the Alamosa river were found dead in Colorado and were killed by a spillage in Summitville mine, near Leadville." Did you know Some of the most acidic water ever recorded in the Richmond Mine in California? The water was more acidic than battery acid and was known to catch on fire. I believe we should not reopen the Idaho Maryland mine because it is bad for our air, water, and wildlife. (WMAN)

**Ind 400-2**

Imagine how bad our air quality is during the fire season with all of the smoke, now imagine how much worse it would be with the mine, people would not be able to live here. "Hundreds of tons of rock are unearthed, moved, and crushed in mining operations significantly increasing the amount of dust and particulates in the air." In addition, mine tailings, which may contain finely ground and even toxic waste, can become airborne." This air pollution can directly affect human health. Tailing from uranium mines on Navajo Reservations lands in Arizona has contributed to health problems experienced by local residents. "In a 1998 case study, EPA documented dozens of toxic releases from mines and processing facilities in Arizona, New Mexico, and Nevada. Eight out of 12 major mines in Montana have major water quality problems that were not predicted by federal agencies at the time of permitting."

**Ind 400-3**

You need water to survive right? So how would you feel if one of the things you needed to survive was contaminated, well I know that I wouldn't like that? More than 40% of stream reaches in western watersheds are contaminated by acid mine drainage and heavy metals now that is a lot. In Nevada, the driest state in the U.S, the Humboldt River is being drained to benefit gold mining operations along with the Carlin Trend, all of this just for gold. Mines in the northeastern Nevada desert have pumped out more than 580 billion gallons of water since 1986—enough to feed New York City's taps for over a year. Hundreds of migratory birds have been poisoned after landing at mine pit lakes in California and Nevada, according to the WMAN Eviremental impactite of mines. Acid mine drainage can be 20 to 300 times more acidic than acid rain and can burn human skin and kill fish and aquatic organisms. An EPA inspection

between 1990 and 1995 of some U.S. mines and processing facilities found that about 20 percent were polluting air or water in violation of federal environmental laws, according to the WMAN Eviremental impactite of mines.

The death rate from the serious disease has been very high in the Clark Fork Basin near Butte, Montana, and areas of intensive mining and smelting for over a hundred years. "The Clark Fork Basin contains the most extensive area of Superfund sites in the United States." National cancer statistics also have shown elevated death rates from cancer—particularly lung, bronchial, and trachea cancer—in areas of the Clark Fork Basin where mining has occurred. And losing many people do to cancer I don't want more people to lose people do to it. "Cancer mortality rates in these areas have been much higher than in other areas in Montana and neighboring states where mining activity has not occurred. Spills and drainage for the defunct Richmond Mine have killed fish and plants along miles of the Sacramento River, which provides drinking water for 80,000 residents of Redding, California. We need these things to survive so why are we just getting rid of them. Mining also can cause erosion and sedimentation, burying gravel beds important for salmon spawning and damaging habitat for trout and other species that depend on clear, cold, oxygen-rich water for example that is like taking away all of are clear water and replacing it with dirty water, oh wait that exactly what they are doing."

**Ind 400-4**

Sincerely,
Jonathan Nolan
Jonathan Nolan

### Response to Comment Ind 400-1

Please see Master Response 1. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 400-2

Please see Master Responses 18 through 23 regarding air quality. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 400-3

Please see Master Responses 30, and 33 through 35 regarding water quality. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 400-4

Please see Master Responses 34 and 35, as well as Response to Comment Ind 400-3. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

**Individual Letter 401**

February 18, 2022

Dear Nevada County Board of Supervisors:

I OPPOSE the Idaho-Maryland Gold Mine being reopened by Rise Mining Company.

**Ind 401-1** As a registered voter in Nevada County and a homeowner in Cedar Ridge, I am deeply concerned about the proposed possibility of reopening the Idaho-Maryland Mine in my backyard and underneath my feet.

I have downloaded and reviewed the EIR report.

Here are the reasons why I oppose reopening the Idaho-Maryland Mine:

**Ind 401-2** MINE WASTE and WATER POLLUTION
Gold mining produces huge amounts of mining waste, some of which contain heavy metals and other toxic substances. Both waste rock and tailings threaten to pollute groundwater and surface water. Our community is still dealing with arsenic and the leaching of heavy metals from the Gold-Era days. And now, Rise, a Canadian company comes along and wants to produce even more mine waste for 80 years: 182,500 tons per year! More tailings that polluting big rig trucks will need to haul away with the potential for leaching more arsenic into our waterways for generations to come.

**Ind 401-3** INCREASE GREENHOUSE GAS EMISSIONS
Haul trucks, up to 100 round trips PER DAY will be needed to transport this mine waste, significantly increasing the amount of air pollution and greenhouse gas emissions into our community's air.

**Ind 401-4** TRAFFIC AND SAFETY
The increase of vehicles, specifically 20 ton haul trucks, up to 100 round trips per day on Brunswick Road and the Cedar Ridge Y (Brunswick Road and Highway 174) intersection will be significant and unavoidable! This is according to the EIR report. Are the supervisors aware that the Union Hill School District, with over 800 students and staff, are within the boundaries of these dangerous roads and intersections? The same intersection and roads that school buses and parents use to transport students to school five days a week, twice a day. The same roadways that the EIR report states will be significant and unavoidable even after implementation of feasible measures. Reopening the Mine will threaten the safety of our children, their parents, and the over 100 school staff members from the nearby Union Hill School.

Is the pursuit of gold really worth so much environmental destruction AND the real potential for significant and unavoidable auto accidents between 20 ton trucks and children in cars/buses?
I think not. Vote NO to Rise MIning Company.

**Ind 401-5** Sincerely,

Jorge Velasquez,
mailing address: P.O. Box 1812, Cedar Ridge, CA 95924
physical address: 11073 Cedar Ridge Dr., Grass Valley, CA 95945

RECEIVED
FEB 25 2022
NEVADA COUNTY
PLANNING DEPARTMENT

## INDIVIDUAL LETTER 401: JORGE VELASQUEZ

### Response to Comment Ind 401-1
Please see Master Response 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 401-2
Please see Master Responses 8 through 12 regarding mine waste and Master Response 35 regarding water quality in South Fork Wolf Creek. In addition, the DEIR evaluates the proposed project's potential to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, including as part of construction and mine dewatering, under Impact 4.8-1, starting on page 4.8-41. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 401-3
Please see Master Responses 18 through 23 regarding air quality and Master Responses 25 through 28 on greenhouse gases and climate change, as well as the discussions and analyses in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 401-4
The commenter reiterates the significant and unavoidable conclusion in the DEIR. Because significant and unavoidable impacts have been identified in the DEIR, for which feasible mitigation measures cannot reduce the potential impact to a less-than-significant level, the County, should it decide to approve the proposed project, would be required to adopt a Statement of Overriding Considerations.

### Response to Comment Ind 401-5
Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 402**

February 15, 2022

Dear Nevada County Board of Supervisors,

I OPPOSE the Idaho-Maryland Gold Mine being reopened by Rise Mining Company

**Ind 402-1** As a registered voter in Nevada County and a homeowner in Cedar Ridge, I am deeply concerned aboul the proposed possibility of reopening the Idaho-Maryland Mine in my backyard and underneath my feet.

I have downloaded and reviewed the EIR report.

Here are the reasons why I oppose reopening the Idaho-Maryland Mine:

**Ind 402-2** MINE WASTE and WATER POLLUTION
Gold mining produces huge amounts of mining waste, some of which contain heavy metals and other toxic substances. Both waste rock and tailings threaten to pollute groundwater and surface water. Our community is still dealing with arsenic and the leaching of heavy metals from the Gold-Era days. And now, Rise, a Canadian company comes along and wants to produce even more mine waste for 80 years: 182,500 tons per year! More tailings that polluting big rig trucks will need to haul away with the potential for leaching more arsenic into our waterways for generations to come.

**Ind 402-3** INCREASE GREENHOUSE GAS EMISSIONS
Haul trucks, up to 100 round trips PER DAY will be needed to transport this mine waste, significantly increasing the amount of air pollution and greenhouse gas emissions into our community's air.

**Ind 402-4** TRAFFIC AND SAFETY
The increase of vehicles, specifically 20 ton haul trucks, up to 100 round trips per day on Brunswick Road and the Cedar Ridge Y (Brunswick Road and Highway 174) intersection will be significant and unavoidable! This is according to the EIR report. Are the supervisors aware that the Union Hill School District, with over 800 students and staff, are within the boundaries of these dangerous roads and intersections? The same intersection and roads that school buses and parents use to transport students to school five days a week, twice a day. The same roadways that the EIR report states will be significant and unavoidable even after implementation of feasible measures. Reopening the Mine will threaten the safety of our children, their parents, and the over 100 school staff members from the nearby Union Hill School.

**Ind 402-5** Is the pursuit of gold really worth so much environmental destruction AND the real potential for significant and unavoidable auto accidents between 20 ton trucks and children in cars/buses?
I think not. Vote NO to Rise MIning Company.

Sincerely,

Jorge Velasquez

February 14, 2022

Attention: Matt Kelley
Senior Planner, Nevada County Planning Department
950 Maidu Avenue Suite 170
Nevada City, CA 95959-7902

**Ind 403-1** Thank you for this opportunity to review and comment on the, *Idaho-MaryLand Mine Project SCH # 2020070378 Draft Environmental Impact Report December 2021 Prepared By: Raney Planning & Management, INC. for the proposed Idaho-Maryland Mine.*

Having reviewed the proposed project's Draft EIR I agree with, Alternative 1: No Project (No Build) Alternative (Section 2.4 Summary of Project Alternatives).

My main concern for such a project is potential adverse effects to groundwater within the Wolf Creek watershed. I own property within the Greenhorn Creek watershed and rely on a groundwater well. Having lived most of my life using well water, I understand the need for conserving your groundwater, especially in years of drought.

**Ind 403-2** I have other concerns, though my agreement is with Alternative 1.

Hello Matt,

I wanted to voice my concerns about the possibility of the mine reopening.

I am a newer resident of Nevada City, my girlfriend and I moved up here from Los Angeles in September, mainly to be surrounded by the nature, cleaner air & water and just a slower pace of life. We love to so far!

**Ind 404-1**

I am not going to pretend to be an expert on mines because I am not. I am political junky and know a good deal about history and with that comes the some knowledge of mines and the harm they can bring to their surrounding environments. With that said, I like to read and I have looked into a lot of the consultant letters and reports and I think this mine project has the ability to harm many of the reasons we intended to move up here in the first place — This is coming from a new resident. We have some neighbors who have been here for generations and they concerns carry more weight.

Some of the issues I have are

**Ind 404-2**

- Mine waste — a lot of the experts say Asbestos will be. Huge problem and there would need to be a way larger effort than described in the report. There is no denying there will be Asbestos, so in my opinion, why even mess with something so toxic.

**Ind 404-3**

- I'm worried about all the toxins that can get into our drinking water

**Ind 404-4**

- Noise, traffic, air quality — All the reasons I moved to a place like Nevada City and all the things this projects would bring.

These are just a few of the many concerns I have and have been raised by the community. I hope you take it all into consideration. I know there is a lot of money behind the project, but the people of this community don't want this project moving forward!

**Ind 404-5**

### Response to Comment Ind 404-1

The comment alludes to concerns expressed in subsequent comments. Please see Master Response 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 404-2

Please see Master Responses 8 through 10 regarding mine waste and Master Responses 22 and 23 regarding asbestos. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 404-3

Please see Master Response 35. In addition, the DEIR evaluates the proposed project's potential to violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality, including as part of construction and mine dewatering, under Impact 4.8-1, starting on page 4.8-41. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 404-4

Please see Master Response 1. The commenter expresses general concerns regarding noise, traffic, and air quality but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 404-5

Please see Master Response 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 405**

**Dist 1**

**Ind 405-1**

**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Matt Kelly
Senior Planner
Nevada County

Comments on the Rise Gold DEIR

I am concentrating on water concerns although there are many other of the at least 83 "issues that cannot be mitigated" that concern me.

Concerns about water fall into several categories:

**Ind 406-1** Water follows the path of least resistance. The miles of mine shafts holding incalculable volumes of water has a (DEIR) reported static level at 260 feet below the surface. This volume of water is significant as an underground reservoir. Pumping this water out creates an open space that serves as a path of least resistance. Rise Gold is proposing that the mine would continue to be pumped out for 80 years. Even if we had no concerns about drought, knowing that water was being pumped out of Nevada County at 2500 gallons per minute per the DEIR flies in the face of residents already being periodically asked to reduce water use.

**Ind 406-2** Related to the above is the water security of neighboring home owners. The DEIR admits the relationship between emptying the mine of water and the failure of local wells. The area the DEIR suggests that NID provide a water supply to is minimal (30 homes along East Bennett St). Well failure could be much more widespread (some suggesting 595 or more wells) When Emgold took us through this process (hasn't our community gone through this same process enough times???), residents as far away as Banner Mountain expressed concern about the viability of their wells. The precautionary principle would put the **onus on Rise Gold** to prove that the evacuation of water from the mine did not cause these failures.

**Ind 406-3** The DEIR claims that the water in the mine is clean and qualifies for a "Limited Threat permit". High levels of iron and manganese are the only issues noted. The description of a 40 acre foot settling pond and water treatment plant are very sketchy and lack details. The minimal information provided leaves more questions than answers. This shows that very little effort and thought has been put into this important issue. All we read about the water treatment plant is that there will be one. Nothing about the design or how it would function is specified. Design and specifications for a water treatment plant must be part of the DEIR. At 2500 gallons per minute, 11.05 acre feet of water would be pumped out per day. A 40 acre foot settling pond would reach capacity in less than 4 days. That volume of water negates its use as a settling pond.

**Ind 406-4** The DEIR includes a section on Stormwater detention ponds. There is no plan mentioned for treating the water in these detention ponds despite the volumes of tailings that will be produced and stored on the surface. What about the quality of water being pumped out of the mine after tailings are used underground for "backfill? In addition to water security, our local geology of fractured rock makes the path of water largely a guessing game, how about probable contamination of wells due to mining activity?

**Ind 406-5** The DEIR indicates that an on site septic field system would contain waste water from toilets, sinks, showers, etc. Again, water follows the path of least resistance. How will this water be

kept out of the mine? Specifications on proposed septic systems need to be included in the DEIR.

**Ind 406-6**

NID is being asked to provide 5700 gallons per day of potable water, and an undetermined amount of water for myriad other uses such as dust control. One number offered is 42,000 gallons per day from NID. The DEIR admits squandering a current water supply (de watering) and then also sucking up a significant amount of already limited local water.

**Ind 406-7**

Our community's water security is of utmost importance and cannot be compromised by dirty extractive industrial operations. History has proven that the wealth of communities has been taken and a mess left behind. The term coined is "toxic mining legacy" here in Nevada County. **We can't afford one day of mine reopening** let alone 80 years and the DEIR suggests further industrial uses after that. Reclamation according to the DEIR is seeding the surface tailings. There is no requirement that the seeds be able to grow. The mine closed in the 1950's and the site is still contaminated. Those who do not learn from history end up repeating it. Haven't neighbor complaints since Rise Gold has been doing "exploration" been proof enough of the devastation that would be wrought by full mining operations?? Please don't open the door to this destructive exploitation of our beautiful community. How easily the incredible arts and culture so cultivated and prized here, and the lovely foothills environment we love could be wrecked..,

Joy Waite
Grass Valley

## INDIVIDUAL LETTER 406: JOY WAITE

### Response to Comment Ind 406-1

The DEIR estimates that there is approximately 1,183 acre-feet of water in the underground mine workings. (DEIR, p. 4.8-12.) The DEIR concludes that the dewatering of the mine would result in less than significant impacts after mitigation to groundwater supplies. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, Master Response 15 – Adequacy of Groundwater Monitoring Wells, and Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 406-2

The commenter states that the DEIR underestimates the number of private wells potentially impacted by the project, but does not explain how the DEIR is inadequate in this regard. The DEIR concludes that the dewatering of the mine would result in a less than significant impact after mitigation to groundwater supplies. (DEIR, p. 4.8-54.) The commenter is also referred to Master Response 7 - Location of Future Mining Areas, Master Response 13 - Historic Hydrogeologic Assessments, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Ind 406-3

The commenter states that the DEIR lacks adequate detail with regard to the settling pond and on-site water treatment plant and that the mine contains contaminants. A sufficient description of the proposed water treatment plant is included in Chapter 4.8, Hydrology and Water Quality, of the DEIR (DEIR, pg. 4.8-43). A detailed description of the water treatment plant is provided in Appendix K.4 of the DEIR (Water Treatment Plant Design Report). The mine water discharge is required to meet water quality goals including total suspended solids. The commenter is also referred to Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 406-4

One of the commenter's primary concerns appears to be with the potential for stormwater quality to be impacted by above-ground tailings. The applicant will need to obtain several approvals from the Central Valley Regional Water Quality Control Board (RWQCB), which will require further testing of the rock at the project site. As described in the April 4, 2022 comment letter from the RWQCB (Agency Letter 5 of this Final EIR), additional laboratory studies will be required to characterize the waste materials as part of a Report of Waste Discharge. The RWQCB cannot issue permits for the placement of engineered fill unless the testing that is part of the Report of Waste Discharge clearly demonstrates that use of the barren rock for engineered fill will not violate water quality standards or conflict with the Water Quality Control Plan. The barren rock testing that was conducted in support of the project application and used in the DEIR provides evidence of the potential water quality effects that might occur due to the use barren rock as engineered fill, while the RWQCB permits, which are a requirement of the project because mining cannot occur until such permits are issued, ensure that water quality standards will be met. Please see Master Response 8 – Mine Waste Characterization.

Another primary concern of the commenter appears to be the potential for backfill placed in the mine to contaminate groundwater being pumped from the mine. Regarding cement paste backfill, the DEIR imposes mitigation measures that require the applicant to submit a Report of Waste Discharge (RoWD) and receive an approved Waste Discharge Requirement (WDR) from the Central Valley Regional Water Quality Control Board (CVRQCB) prior to the placement of cemented paste backfill (Mitigation Measure 4.8-1(d). The CVRWQCB requires additional waste characterization as part of approving WDRs and also requires ongoing water quality monitoring during the implementation of WDRs to ensure that no water quality impacts will occur.

In regard to fractured rock, the commenter is referred to Master Response 14 - Adequacy of Groundwater Model.

## Response to Comment Ind 406-5

The commenter asks how water from the on-site septic system would be contained and states that the DEIR lacks this information. Water from the leach field proposed for the project does not drain into the underground mine. Appendix H.8 of the DEIR provides a septic system analysis. As stated on page 4.11-34 of the DEIR, a relatively large, acceptably permeable soil area has been identified within the proposed leach field area, just south of the proposed engineered fill footprint, and set back 100 feet from the property line. The evaluation concludes that the project site is suited for a Pressure Dose sewage disposal system with a minimum of 1,935 lineal feet of leach line. A minimum 10,000-gallon septic pump tank with watertight risers over each lid and an outlet effluent filter would be required. The pump tank would be oversized in order to accommodate for potential power loss, backups, and surge flows in the future.

## Response to Comment Ind 406-6

The commenter states that the dewatering of the mine is wasteful but does not state how the DEIR is inadequate. By increasing flows to South Fork Wolf Creek, the project would produce a surplus of water. The commenter is referred to Chapter 4.8 and Appendix N of the DEIR and Master Response 16 - Drought and Climate Change.

## Response to Comment Ind 406-7

The commenter summarizes their opposition due to a variety of perceived impacts. The commenter's opposition to the project is noted for decisionmakers. Please see Master Response 1 - Non-EIR/Administrative Issues.

April 1, 2022

To Matt Kelley, Nevada County Planner

This letter is to bring up another concern I have over the potential Rise Mine project. I am against the mine for all the reasons that have already been mentioned in the paper and at the meetings. But another concern is over wildfires. Last year, we had a terrible scare when part of their property was on fire. It was very close to town and many businesses as well as neighborhoods were on alert.

**Ind 407-1**

My question is, why hasn't the county or the city of Grass Valley asked the owners of Rise's properties to clear out dry, damaged, or congested vegetation and create a fire break between their property and the surrounding properties?

Please include this issue and address it in response to the community's objections to the Rise endeavor.

Thank you.

Joyce Hoffman, Ph.D.
266 North Auburn Street
Grass Valley, CA 95945

## INDIVIDUAL LETTER 407: JOYCE HOFFMAN

### Response to Comment Ind 407-1

Please see Master Response 6 – Wildfire Impacts. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

**Individual Letter 408**

April 4, 2022

Matt Kelly, Senior Planner
Nevada County Planning Department
Idaho.MMEIR@co.nevada.ca.us

Dear Mr. Kelly,

Thank you and the Planning Department for your dedication to hearing from the general public about the potential of bringing industrial mining back to Nevada County. I am among those in strong opposition to the plan proposed by Ben Mossman and the company he represents, Rise Gold.

**Ind 408-1**

The EIR Noise Report does not address the real impact of living next to an Industrial Mining Operation. Last summer when Rise Gold was doing test drilling the vibrations from the drilling could be felt coming up through our floor boards. The EIR downplays the noise coming from blasting and drilling underground as nonexistent when we in fact know from experience this is not the case. . Running a crushing machine 24/7 inside a building is going to emit a great deal of noise. Again the EIR downplays this as modern mining techniques. The trucks running from 8am to 10 pm will greatly impact our quiet country lifestyle. The EIR says this will be no more than regular traffic noise. WE know in fact that every dump truck backing up emits a warning siren that will carry up through our forest and greatly impact our lives.

We are asking for a more in depth study on the noise potential for the mine. Sleep is an important factor in the health and welfare of our community. Our property is within a quarter mile of the mine site.

Sincerely,

Jude Bischoff
Residence Address:
11010 Brunswick Dr.
Grass Valley, CA 95945

Mailing Address:
PO Box 1202
Cedar Ridge, CA 95924

## INDIVIDUAL LETTER 408: JUDE BISCHOFF

### Response to Comment Ind 408-1

Please see Master Responses 1 and 2.

The analysis of potential noise and vibration impacts can be found in Chapter 4.10, Noise and Vibration, of the DEIR. Mitigation Measures 4.10-1 through 4.10-4 have been incorporated into the project to reduce the severity level of potential impacts that would otherwise be significant. In the case of Impact 4.10-1, the DEIR discloses that even with incorporation of Mitigation Measure 4.10-1, the impact would remain significant and unavoidable. Thus, the analysis within the DEIR does not downplay the severity of potential impacts that could occur through implementation of the proposed project. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve or deny the project. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Subject:** Rise Gold & Reopening of Idaho Maryland Mine

**CAUTION**: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Planning Commission,

**Ind 410-1** I've lived in Nevada County for 41 years after 10 years in San Francisco. What a pleasure it's been to live here with so much natural beauty, much less traffic/congestion, noise & pollution.
I'm horrified that you are considering allowing the reopening of the Idaho Maryland Mine. To do so will increase traffic, noise, air pollution, water pollution, impact local wells, threaten wildlife & change the aesthetics of our beautiful community.

**Ind 410-2** How much water would the mine use when we're already in severe drought conditions? Last year, NID expected homeowners, like myself, to cut back their water usage by 20%. I've done this & continue to do this. I do not wish to cut back further to accommodate a gold mining project.

**Ind 410-3** And for what? Jobs? Mining is the lowest job creator in US industry.
Please, please, please do not approve the mine reopening. You live here, too. Let's enjoy & appreciate our community as it is today.
All good wishes,
Judith Cooper
105 Woodcrest Way
Grass Valley, CA 95945

## INDIVIDUAL LETTER 410: JUDITH COOPER

### Response to Comment Ind 410-1

Please see Master Response 1. The commenter expresses general concerns regarding the impacts of the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 410-2

As detailed on page 3-39 of the DEIR, the Idaho-Maryland Mine would have a surplus of water from the natural groundwater flow into the underground workings. Once dewatering is completed, approximately 1.9 cubic feet per second (cfs), or 850 gallons per minute (gpm) (approximately 1,224,000 gallons per day [gpd]), are estimated to be pumped to the surface and settling pond. Such water would support all project-related water demand (i.e., mining and processing activities), except for water purchased from NID. The process plant would run on a closed circuit. Please also see Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 410-3

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 413**

March 26, 2022

Matt Kelly, Senior Planner
Nevada County Planning Department
950 Maidu Ave., Suite 170
Nevada City, CA 95959

RE: Mine Comments / Opposition

Dear Mr. Kelly:

I am a home owner off Greenhorn in Grass Valley. I was a Chiropractor in the Bay Area for 30 years and had a ten year plan to retire and move to the Grass Valley area.

I absolutely love our home, neighborhood and community. I have never in my life felt so much a part of where I live. I thought I would live my golden years here, enjoying the quiet serene mountain life.

Ind 413-1 If the mine gets approved, all my dreams will be shattered. In fact, I will most likely be forced to move, which breaks my heart.

My biggest opposition to the reopening of the Idaho-Maryland Mine as pertaining to the DEIR as follows:

1. The impact analysis on the wells in the DEIR underestimates potential impacts and has highly inadequate mitigation measures. No impact report can accurately assess the flow of underground water in the midst of a 22 year drought, especially stretched out over 80 years. There needs to be a written solution to remedy any well affected by the mine (contamination or reduced water flow), which could be hundreds.

Ind 413-2
2. Air Quality impact is inadequate in the DEIR. The air quality in Nevada County is already poorer than I am comfortable with. ANY additional toxic particles reaching our lungs in unacceptable in Grass Valley.

Ind 413-3
3. Noise and Visual impacts which cannot be mitigated. The natural character of our mountain community should not be subject to buildings of 8-16

stories high! This ignores existing building height limits of 45 feet. I will be forced to look at this unsightly mess every time I drive out.

4. Increased traffic by trucks running morning until night as outlined by the DEIR, cannot be mitigated. The emissions put out by these vehicles is again affecting our air quality and runs counter to our efforts as a community to reduce greenhouse gas emissions.

Ind 413-4

**Please Choose No Project, No Build Option**

We in Grass Valley and Nevada City do not define ourselves by having an active mine in 2022. It will hurt tourism, home values and most importantly our quality of life.

Vote No on the re-opening of the Idaho-Maryland Mine.

Thank you,

Judy McGrain

## INDIVIDUAL LETTER 413: JUDY MCGRAIN

### Response to Comment Ind 413-1

Please see Master Responses 14 through 16 regarding groundwater and impacts to wells. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 413-2

Please see Master Responses 18 through 22 regarding air quality. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 413-3

Noise and vibration impacts are addressed in Chapter 4.10, Noise and Vibration, of the DEIR sets forth Mitigation Measures 4.10-1 through 4.10-4 to reduce the severity level of potential impacts that would otherwise be significant. In the case of Impact 4.10-1, the DEIR discloses that even with incorporation of Mitigation Measure 4.10-1, the impact would remain significant and unavoidable. Additionally, please see the discussions and analyses in Chapter 4.1, Aesthetics, of the DEIR which in Impact 4.1-2 finds the project would result in a significant and unavoidable impact to visual character and quality of the area. Because significant and unavoidable impacts have been identified in the DEIR, for which feasible mitigation measures cannot reduce the potential impact to a less-than-significant level, the County, should it decide to approve the proposed project, would be required to adopt a Statement of Overriding Considerations.

### Response to Comment Ind 413-4

Please see Master Response 1 and Response to Comments Ind 413-2 and Ind 413-3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 414**

**From:** Judy Miner <jaminer3@gmail.com>
**Sent:** Saturday, April 2, 2022 2:34 PM
**To:** Idaho MMEIR
**Subject:** DEIR for reopening Idaho Maryland Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Matt Kelley and Nevada County Planning Department,

**Ind 414-1** My husband and I (Brian and Judy Miner) strongly object to the opening of the Idaho Maryland Mine and the Canadian company proposing this endeavor. Rise Gold's past projects produced failures that compromised the surrounding land and nature while providing zero resources for recouping the damages they created. More importantly, we believe that opening the mine would be detrimental to our community, environment, water supply, wildlife, real estate values, and most importantly our quality of life in this beautiful community we've called home for the last 6 years.

**In 414-2** Reasons for objecting to the opening the Idaho-Maryland Mine are as follows:

- **Ind 414-3** Rise Gold's plans to dewater the mine puts wells, creeks, and aquifers at risk.
- **Ind 414-4** Our air quality is already poor in our community. This will make a bad situation truly terrible with Fugitive dust from rock crushing, transporting, and diesel exhaust from constant truck traffic.
- **Ind 414-5** Gold mining is a power-hungry business, which will require significant use of fossil fuels. The mine's estimated power usage will be 12% of what the whole of Nevada County uses in a year, raising questions about further straining our power grid and effectively erasing the gains our County was planning to make in reducing power consumption to curb climate change.
- **Ind 414-6** Increased truck traffic, higher noise levels, and vibration from blasting will ruin our neighborhood quality of life. Our natural settings will be compromised and get buried beneath mountains of mine waste and a paved industrial area.
- **Ind 414-7** The enormous unimaginable environmental risks far out way the few jobs gained, (false claims of bringing jobs to the community are misleading and statistically and feasibly false), which includes tourism, high tech businesses, private wells, and 10's of millions lost in property values, all of which were NOT included in the current environmental review process. Analysis and study of these economic impacts must be included in an economic analysis in the Draft Environmental Impact Report (DEIR).
- Rise Gold is untrustworthy given their 14 year old company history, have never opened a mine and never made a profit. Their current financials are weak. And most importantly, their CEO's prior venture polluted tribal waters, went bankrupt, and left Canadians with a bill to pay for cleanup.

**Ind 414-8** It is no longer the 1940s when this area was a small little mountain town. It is a sprawling beautiful community. The impact of this reopening would be devastating to our community and adversely affect all those that call it home, including our Cedar Ridge home, which would be directly affected due to its proximity to the mine.

The cost to the community and the surrounding areas is too great and MUST NOT HAPPEN! For the reasons outlined, coupled with Rise Golds dubious and untrustworthy record, we vehemently object to the reopening of The Idaho-Maryland Mine.

1

Thank you for your time. We hope you will do the right thing for our community and it's citizens and object to the opening and VOTE NO.

Sincerely,

Brian and Judy Miner

**Individual Letter 415**

DO NOT!

**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

**Ind 415-1**

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

**Individual Letter 416**

TO: **Matt Kelley, Senior Planner – Nevada County Planning Department**

RE: **Comments on Rise Gold's Draft Environmental Impact Report**

My area of concern regarding Rise Gold's DEIR is the handling of the Centennial Industrial Site. In the Executive Summary (Chapter 2), there is a summary of project alternatives (2.4), and Alternative 2 calls for the Elimination of the Centennial site—an alternative that the DEIR promotes as the best choice for the environment.

However, this alternative definitely does not meet CEQA guidelines. The Centennial site is a noteworthy part of the whole mine proposal, not an isolated piece of property, and CEQA guidelines specifically define a project as "the whole of the action" that may result either directly or indirectly in physical changes to the environment.

By omitting the Centennial site from the environmental review process, Rise Gold is sidestepping its obligation to clean up the site—a site where toxic mine waste was deposited several decades ago. Last year, Rise Gold submitted a Remedial Action Plan to the Department of Toxic Substances Control that called for the destruction of healthy wetlands and riparian areas that cover close to 70 percent of the whole site.

**Ind 416-1**

According to the RAP, Rise Gold wanted to dig up existing wetlands to use as clean fill to cap the contaminated portion of the site. But the wetlands on the property are *uncontaminated*, and they play an active role in the ecosystem. Among other functions, they filter water, reduce erosion and sequester greenhouse gases. They are a precious natural resource and they need to be protected, not used as a "cap" and destined to be buried under tons of rubble trucked from the mine site in the future.

From what I understand, there was so much hue and cry from the public regarding the RAP that the DTSC has yet to formally endorse the proposed clean-up plan. And yet, in Chapter 4 of the DEIR, there is an aerial photograph that shows a big white patch in the middle. Under the photo, the caption reads: Figure C – "IMM Project Baseline after DTSC Cleanup."

This means Rise Gold is attempting to use an adjusted environmental baseline—a future baseline that ignores the present conditions and assumes that the DTSC clean-up has already taken place, which again, does not comply with CEQA guidelines, which state: "An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published." Therefore this section of the DEIR is flawed and deficient and needs to be rewritten.

I appreciate having you include my comments in the record.

Julie Becker 13345 Evergreen Drive Nevada City - Submitted April 2, 2022

## INDIVIDUAL LETTER 416: JULIE BECKER

### Response to Comment Ind 416-1

Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 417**

March 30, 2022

Matt Kelley, Senior Planner
Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Dear Mr. Keeley,
I am writing in response to the DEIR and the proposal to re-open the Idaho-Maryland Mine by Rise Gold. I'm deeply opposed to it. A mine that would operate 24 hours a day, 7 days a week, up to 80 years is shocking, which should be enough to stop the mine right now. Mitigations in the DEIR that deal with the following concerns are inadequate:

**Ind 417-1** The airborne toxic mining dust, i.e. asbestos and other toxins, would worsen our air quality. Our air quality is already a problem that will be aggravated by the Climate Crisis. Our children in Nevada County already have high levels of asthma, because of poor air in Nevada County. Claims that a few hundred local jobs will be created (if even true) do not justify the serious threat that this mine will be to our children and adults over 80 years. We don't have the right to allow this mine to damage present or future generations. We need to clean up our air, not allow it to be made worse.

**Ind 417-2** Blasting 7 days a week in tunnels under 2,585 acres across Grass Valley and a large factory on Brunswick Road in the middle of hundreds of family homes in a residential community can't be mitigated. Trucks

**Ind 417-3** hauling 1,000 tons of waste rock every day, all day long along Brunswick Road and piling the rock higher than a 6 story building at the Centennial site is shocking!!!

Removing 1 to 3 million gallons of contaminated water per day for the next 80 years and dumping it into Wolf Creek and contaminating the Creek is horrific. The de-watering of homeowners' wells is also a

**Ind 417-4** very serious risk to take, which people and the school up on the Ridge have had to struggle with. This, along with all the other issues should be enough to stop all future mining in Nevada County.

We have also been living for 66 years with the toxic waters of the Empire Mine, with the State of California still trying to it clean up. Taxpayers are paying to clean up the water, because the mine owners walked away without being held responsible for the damage.

These are a just a few of the serious problems that the mitigations can't deal with. I have lived in Nevada County for 33 years and love our community. We live in a beautiful County that deserves to live in peace

**Ind 417-5** and quiet and not be damaged by a company only interested in the money filling the owners' pockets.

Please share this letter with the rest of the Planning Commission. Please stand up to stop this mine by recommending that the Supervisors deny this mine permit.

Sincerely,
Julie Carville

## INDIVIDUAL LETTER 417: JULIE CARVILLE

### Response to Comment Ind 417-1

Please see Master Response 1, 16, and 18 through 24. The commenter expresses general concerns regarding the project's impacts to air quality but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 417-2

The DEIR evaluates the potential for the proposed project to generate a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of applicable standards under Impact 4.10-3, which starts on page 4.10-37. As detailed therein under the Blasting subheading, based on project site characteristics and a long-term blasting noise level survey conducted for the proposed project over the course of 30 days at the Sutter Gold Mine in Amador County, the worst-case maximum noise levels at the nearest noise-sensitive receptors to the project site would range from 52 to 57 dBA $L_{max}$. The range of predicted worst-case blasting noise levels of 52 to 57 dBA $L_{max}$ is below the daytime, evening, and nighttime dBA $L_{max}$ criteria at the nearest receptors (refer to Table 4.10-6 on page 4.10-18 of the DEIR for daytime, evening, and nighttime noise criteria for each receptor).

### Response to Comment Ind 417-3

RECEIVED

MAR 0 3 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Ave. #200
Nevada City, CA 95959

Dear Heidi Hall, Ed Scofield, Dan Miller, Sue Hoek and Hardy Bullock,

I have been a resident of Nevada County for 25 years and have lived on Greenhorn Road for the past 7 years.

**Ind 418-1** I am writing to express my deep opposition to the reopening of the Idaho-Maryland Mine. I have read the summary DEIR and listened to many informed opinions. The significant number of potential, and even probable, negative impacts to our area are alarming. Noise, traffic, vibrations from underground blasting, air and water pollution, loss of well water for local residents. All of these, and more, should give us pause before gambling away our quality of life.

**Ind 418-2** Given what is at stake, and to evaluate the potential risks, it is essential to understand the background of the Rise Gold company. I hope you have all read the 2/22/22 column in The Union written by Randal Snodgrass. He points to the company's last project, where Rise Gold filed for bankruptcy and left the public and government with hundreds of thousands of dollars in costs. Rise Gold was charged with 35 counts of failing to comply with environmental and safety standards.

We can see clearly who Rise Gold really is. We can choose to avoid the losses suffered by the people of British Columbia.

**Ind 418-3** The remaining issue will be how to provide more jobs in Nevada County. Universal broadband, filling out infrastructure in existing industrial areas are potential starts. True leadership will take us in new directions, not repeating the errors of the past.

Thank you,
Julie Enzor-Wilson

Julie Enzor-Wilson

**Individual Letter 419**

Matt Kelley
Nevada County Planning Commission
950 Maidu. Ave. Suite. 170
Nevada City, CA. 95959

Dear Mr. Kelley,

**Ind 419-1** I have been a resident of Nevada County for 25 years and have been living on Greenhorn Road for the past 7 years.

I am writing to express my deep opposition to the reopening of the Idaho-Maryland Mine. I have read the DEIR Summary and listened to many informed opinions. The potentially harmful impacts to our community are many and alarming.

**Ind 419-2** First, the aesthetic degradation of our area from noise, traffic, vibrations from underground blasting, in addition to a six story industrial building, have no place in a tourist focused area. Though these issues were addressed in the DEIR it is absolutely true that these problems will still exist. It will be a great loss to those of us who chose to live here for the peace of a rural community.

**Ind 419-3** An even more alarming impact will be on our water, both the quantity and the quality. It has been documented that California is experiencing the worst drought in 1200 years. Absolutely no one is suggesting that we will return to pre drought conditions any time soon. In these circumstances it would be negligent and potentially disastrous to allocate such enormous amounts of water to a foreign entity - one which is currently charged with water pollution in their last project. The DEIR does not address climate change and is inadequate to meet the moment. To suggest that adding 30 wells to NID will solve the problem is an insult to all of us

**Ind 419-4** These and the many other potential harms of reopening the mine far outweigh the benefits. Please reject this project.

Sincerely,
Julie Enzor-Wilson

Please see Master Response 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 419-2
As affirmed by the commenter, pursuant to the requirements set forth by CEQA Guidelines Section 15121, the DEIR assesses all potential project impacts that could occur to all environmental issue areas required for analysis under CEQA. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project. Please see Master Responses 1 and 2.

### Response to Comment Ind 419-3
Please see Master Responses 13 through 16 regarding groundwater. The commenter expresses general concerns regarding water quality and quantity impacts associated with the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 419-4
Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 420**

**From:** Juliette Phyllis Kunin
**To:** Idaho MMEIR
**Subject:** Proposed mine reopening
**Date:** Monday, March 14, 2022 3:40:55 PM

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To whom this may concern,

I do not understand why this proposed mine has even a chance of being approved.

**Ind 420-1**

From the stories questioning the integrity of the company itself, the obvious air, water, sound pollution, why in the world would we be approving a Canadian firm to come in to our beautiful area and risk ruining our way of life????

We still have mercury in the waters from mining done decades ago. This company does not even have a game plan for how not to pollute our waters again! A mine that will be operating constantly will be very noisy as well as having a terrible impact on our air.

**Ind 420-2**

Our property values will go down, our wells may be impacted and our wonderful water polluted.

How could this tragedy even have a chance of happening?????

Someone please explain to me.

Thanks for the opportunity to give my input and I pray that this will not happen.

Thank you, Phyllis Kunin

June A. Oberdorfer, March 27, 2022

Comments on Groundwater Modeling, Idaho-Maryland Mine

**Documents reviewed:**

1) Itasca Denver, Inc., March 2020a, *Predictions of Groundwater Inflows to the Underground Mine Workings at the Idaho-Maryland Mine.*
2) EMKO Environmental, Inc., March 2020a, *Groundwater Hydrology and Water Quality Analysis for the Idaho-Maryland Mine Project, Nevada County, California.*
3) EMKO Environmental, Inc., March 2020b, *Appendices, Groundwater Hydrology and Water Quality Analysis for the Idaho-Maryland Mine Project, Nevada County, California.*
4) Itasca Denver, Inc., December 2020b, *Groundwater Monitoring Plan, Idaho-Maryland Mine Project.*

**Concerns:**

Simulations by Itasca (2020a) of the effects of mine-dewatering produced a map of predicted drawdowns after 25 years of dewatering (Figure 5-7). The contours of equal groundwater drawdown in this figure show a maximum drawdown of approximately ten feet and the extent of drawdown over one foot approximate the limits of Rise Gold's mineral rights. This figure was reproduced by EMKO (2020a) and served as the basis for determining which private wells would experience excessive drawdown and thus need to be mitigated with a supplemental water supply from the Nevada Irrigation District.

**Ind 421-1**

An incorrect assumption was made in the running of these future predictions of mining impacts which led to a significant underestimation of groundwater drawdown, both in magnitude and areal extent. This assumption needs to be corrected to get both a more accurate prediction of the extent of the well drawdown caused by the predicted 25 years of mine-dewatering and a more accurate determination of the number of wells needing to be mitigated with supplemental water supply.

The computer model was calibrated to match historic dewatering rates (700 gallons per minute [gpm] toward the end of historic mining in 1956) and one groundwater measurement taken from near the end of the historic mining period at the Union Hill Mine shaft (a small mine that had been inactive for many decades). These calibrations are reflected in Figure 4-7 (Itasca, 2020a). The lower part of this figure shows a hydrograph (water elevation versus time) for simulated water levels within the New Brunswick Mine for the 700-gpm dewatering rate. Simulated water levels in the mine were around 1,150 feet above mean sea level (ft amsl) at the end of historic mining and recovered rapidly to about 2,500 ft amsl after the cessation of mine-dewatering.

The top portion of Figure 4-7 (Itasca, 2020a) shows a hydrograph of the calibration to the historic water level measurement in the Union Hill Mine shaft at the end of mine-dewatering when the water level was approximately 20 feet lower than at present. In order to calibrate to this

one historic water level, Itasca had to insert a very low permeability barrier next to the Union Hill Mine into the model to create sufficient hydraulic isolation of the Union Hill Mine from the much lower water levels in the adjacent area. The hydraulic isolation of this Union Hill Mine area is supported by the fact that the current water levels in its shaft are about 165 feet higher than water levels in the New Brunswick Mine.

What is not known, other than at this one point in the Union Hill Mine, are the shallow groundwater levels in 1956. Itasca (2020a) does not present a map of groundwater drawdown for 1956 (as they do for the predictive modeling of 25 years into the future). Those simulated water levels in 1956 would provide important insights into what future water levels during mine dewatering would be and should be presented.

The water level in the Union Hill Mine shaft is shallow, and it is quite likely that the drawdown in 1956 in the shallow groundwater to the west (in the vicinity of the New Brunswick Mine) was significantly greater than the 20 feet observed at the Union Hill Mine, probably on the order of or greater than the 165-foot water level difference observed at present. Water levels to the west could have been on the order of 185 feet or more lower than present (20 feet plus 165 feet). It is a major shortcoming of Itasca's modeling report that they do not provide a drawdown map or hydrographs of the effects of historic mine-dewatering on the shallow aquifer.

The incorrect assumption that was made in the predictive modeling of future 25 years of mine-dewatering was in the initial condition (starting water levels) for that predictive simulation. Rather than taking present day water levels as the starting point for predicting the effects of mining for 25 years starting in 2019, they chose to use the water levels at the end of mining in 1956 (Sec. 5.1). Those water levels don't reflect the fact that there's no current dewatering, but rather reflect dewatering at a rate of 700 gpm. The incremental drawdown from increasing dewatering from 700 gpm to the future rate of 900 gpm is what is reflected in the map of impact (Figure 5-7, Itasca, 2020a) used to determine the area requiring mitigation by Rise Gold. Examining the predicted drawdown in Figure 5-7 in the vicinity of the Union Hill Mine, it would be expected to be greater than the historic drawdown measured of 20 feet if dewatering has increased over the historic rate. With drawdown being proportional to pumping rate, the drawdown would be expected to be on the order of 25 feet in the vicinity of the Union Hill Mine. Instead, drawdown in this area is on the order of a few feet (Fig. 5-7). Drawdowns further to the west in the vicinity of the New Brunswick Mine should be considerably greater than 20 feet, which they are not. This reduced drawdown compared to what was observed historically is the result of the incorrect assumption for the initial condition for predictive modeling.

This incorrect assumption minimizes both the magnitude of drawdown shown on the Figure 5-7 and the extent of the area affected. In addition to underestimating the number of domestic water supply wells impacted and requiring mitigation, this assumption also underestimates the extent of the area requiring groundwater monitoring (Itasca, 2020b). That area needs to be expanded. If the effects on dewatering on the discharge to nearby streams were calculated similarly to the effects on groundwater drawdown, then the amount of decrease in groundwater discharge to adjacent streams could be underestimated as well.

Itasca should clarify the results of their simulations by producing:

1) Both a groundwater drawdown contour map and a groundwater elevation contour map for the shallow aquifer immediately before the cessation of dewatering in 1956.
2) Hydrographs for simulated heads in the shallow aquifer for the historic period 1920 to 2020 plus continuation for the 25 years of predictive modeling for future mining. The hydrographs should be for groundwater elevation in ft amsl versus time for the 125 years and represent the heads in the shallow aquifer near wells labeled WS95, WS216, WS201, WS80, WS 91, and WS85 on Itasca Figure 2-6.
3) Model water budget (all volumetric water inputs and outputs) for the general area of the mineral rights boundary over the 125 years simulated, preferably in plot rather than tabular format, using the one-month time increment used in the modeling.
4) The model should be run using the 2019 water levels as the initial conditions for the predictive simulations. Contour maps, hydrographs, and water budgets should be provided for these revised predictive runs.

## INDIVIDUAL LETTER 421: JUNE OBERDORFER

### Response to Comment Ind 421-1

This letter is a duplicate copy of content in Group Letter 8. Please see Comments and Responses to Comments Grp 8-127 through Grp 8-133.

**Individual Letter 422**

Justine Jacus
District 1
Grass Valley

Nevada County Planning Department

To Whom It May Concern,

**Ind 422-1** I have several points of view regarding the mining situation. Number one, is the amount of noise and traffic on the roads that will be generated from the mine, it is completely unacceptable.

**Ind 422-2** Number two, is taking that much water from underground, and to do so during a drought and dredging up all the toxins that will come with it, is completely wrong. This will not only affect the environment; the streams, rivers, agriculture, air quality, and wildlife, but it will also directly affect citizens of Nevada County's personal underground wells. In my opinion, it will irrevocably change our way of life and change the serenity of this beautiful area we call home. As far as this company, Rise Gold, their past history alone should be enough to deem them unworthy to even work on this ill fated project. It should not be about one company's greed, it should be about preserving the quality of life that we have all come to love. I personally think their promise of boosting our economy is a sham, it will not bring jobs to our county, but will likely outsource jobs from elsewhere. The end effect being, lining the pockets within the company while negatively

**Ind 422-3** affecting our community. And who is to say that they will not just shut down the mine leaving behind a huge toxic dump with no plan to clean it up. I want to see my children and grandchildren to be able to grow up in a beautiful community and area that has so much to offer, without reopening a mine that has the potential to destroy everything we love about this area.

Sincerely,
Local Citizen and Business Owner Since 1979

## INDIVIDUAL LETTER 422: JUSTINE JACUS

### Response to Comment Ind 422-1

Please see Master Response 1. Noise is addressed in the DEIR in Chapter 4.10, Noise and Vibration. Traffic is addressed in Chapter 4.12, Transportation. The commenter expresses general concerns regarding the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 422-2

Please see Master Responses 1 and 2, 14 through 16, 18 and 19, 30, and 35. The commenter expresses general concerns regarding the impacts of the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 422-3

Please see Master Responses 1 through 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 423**

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

March 23, 2022

Dear Commissions Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno

STATEMENT TO NEVADA COUNTY PLANNING BOARD

My name is Robert Foster. Live in Grass Valley at 122 Ironhorse Place, just off of Bennett Street. During my youth, I spent many dayts in adventure along the banks of the West Fork of Rock Creek, near Red Lodge, Montana. Those days were among the most formative, most important days of my youth. The West Fork of Rock Creek is very , very similar to Wolf Creek. That might be one reason I live in Grass Velley. During that time I grew close to the creatures that lived in that stream.

So, that is why I am here today. The creatures in Wolf Creek need a spokesman--. The Mayflies, the Caddis flies, the Stone flies and the Rainbow trout that live in Wolf Creek

RECEIVED
MAR 24 2022
NEVADA COUNTY
PLANNING DEPARTMENT

**Ind 423-1**

I have read the entire DEIR. I have focused my attention on the section related to Hydrology, Chapter 4.8 of the DEIR. I find that section to be speculative and potentially dangerous—particularly dangerous to Wolf Creek. The Hydrology section contains opinions and statements that are shocking in their naiveté. Some of these opinions relate particularly to the maintenance and operation of the Settling Pond. Make no mistake about it, the Settling Pond is a key feature to the entire potential operation of the mine. Without the Settling Pond, the application would violate CEQUA, and have no possibility. And, from my perspective, the Settling Pond is one of the most dangerous features of the application. The Settling Pond takes water that contains Iron and Manganese amounts that far exceed limits, and Arsenic and Cyanide that exceed limits, and produces water for delivery into the South Fork, and on into Wolf Creek proper. When you read over the section on water treatment, there no doubt that treatment to remove the offensive materials is complicated, and requires constant attention, constant monitoring and constant money. All of the offensive materials are deposited on the floor of the Settling Pond. Thus, the

sledge at the bottom of the Settling Pond is intended to be a concentrated soup of materials that are potentially harmful and in some cases, known carcinogens. Antimony and Chromium are known carcinogens. The DEIR assumes, without any supporting facts, that the applicant will have the money and the will to spend what is necessary to keep the water within safe limits. That assumption is a totally false assumption. Everyone, including the applicant, knows that eventually the mine would become unprofitable. That happens to all mines, and will happen to this mine. When the mine becomes unprofitable, there will simply be no money for the proper treatment of water. The water released will then be toxic and likely contain known carcinogens. The answer to this hazard in the DEIR is that responsibility for safe operation of the mine becomes the responsibility of the State Water Resources Regional Board. Seriously?? This body would never assume responsibility for such a complicated and expensive operation. That entity, to my understanding, has three employees who are responsible for the entirely of Nevada, Placer, and Sierra Counties. From a practical point of view, the water, and potentially the sludge as well, would simply Flow into the Wolf Creek watershed. Goodbye Mayflies, goodbye Rainbow trout. Similarly, the DEIR assumes honest and faithful maintenance and operation of water treatment facilities. That assumption is false. This applicant has a demonstrated history of willful noncompliance with environmental rules. For the writers of the DEIR to assume faithful compliance is a serious assumption that is unwarranted by the history of this applicant.

The plan for removal of the toxic sludge is borderline comical. Again, the sludge will contain concentrated amounts of Manganese, Antimony, Chromium, Arsenic and Cyanide. The plan is to remove that material "off of site." I guess the idea is that you shut down mining operations, which is not going to happen, get some dump trucks into the Settling Pond somehow, and haul thousands of tons of material and dump that material "off of site." I guess the idea is that you pay somebody in Placer County or in Sierra County, to give you the right to dump this sludge on their property. What I find borderline funny is that these experts somehow believe that such a release of highly toxic material complies

with CEQUA. Seriously?? We have a new exception to the requirements of CEQUA, the "off of site" exception.

The fundamental assumption of the entire DEIR, is that everything is going to proceed according to their approved plans. The assumption is that compliance will be faithful and continuous, for a period of 80 years. From my point of view that assumption doesn't begin to pass the smell test. No gunna happen. What will happen, is some event, some series of events, which will cause a lapse in compliance. With a certainty, non-compliance will occur when the mine runs out of money. When that happens, it is more likely than not, that toxic water and toxic sludge will be released into Wolf Creek. There is then, the distinct possibility that Wolf Creek and maybe even The Bear River will be superfund site. That possibility is horrendous.

What I ask you to do is to return the DEIR to Sacramento, and ask the following questions:

**Ind 423-2**

1. Regarding water treatment: What it the plan for paying for water treatment after the Applicant is no longer able to pay for treatment?

**Ind 423-3**

2. Regarding periodic removal of toxic sludge from the Settling Pond:
   a. Will mining operations be shut down for removal of sludge?
   b. How long will removal take and how will it be accomplished?
   c. Who will pay for removal of sludge when the Applicant can't?
   d. How will disposal of the sludge be accomplished?
   e. Is there in place a definite plan for disposal of sludge that meets with CEQUA requirements?

**Ind 423-4**

Thank you. My goal here is to ensure that there is a healthy Wolf Creek for future Generations to appreciate and love.

Sincerely,

K. Robert Foster

## INDIVIDUAL LETTER 423: K. FOSTER

### Response to Comment Ind 423-1

The commenter states that the settling pond is one of the most dangerous features of the project and water treatment is complicated and requires constant monitoring. The commenter states that the DEIR wrongly assumes the water treatment and settling pond component of the project will go according to plan without any accidents. However, the commenters does not explain how the DEIR is inadequate or how the settling pond will fail and discharge untreated water to South Fork Wolf Creek. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary. For information regarding the water treatment process, the commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek. As explained in the DEIR and Master Response 35, the primary method of on-site treatment is not the settling pond, but the water treatment plant, which will be permitted by the Central Valley Regional Water Quality Control Board.

The commenter also states that the DEIR fails to identify the management of the settled solids from the treated mine water. Section 5.4 of Appendix K.4 of the DEIR provides a detailed description of the management of settled solids in the water treatment pond. As described, the removal of these solids would not require the mine to shut down mining operations. The dewatered solids would be dewatered and hauled to an appropriate and approved offsite landfill.

Regarding the commenter's assertions that the Project Applicant will not implement the mitigation measures described in the DEIR, a mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement. The commenter is also referred to Master Response 3 - Operator Responsibility.

### Response to Comment Ind 423-2

The commenter asks who will fund the water treatment process in the event the Project Applicant is unable to pay. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary.

### Response to Comment Ind 423-3

The commenter asks a series of questions pertaining to the removal of settled solids from the settling pond. Section 5.4 of Appendix K.4 of the DEIR provides a detailed description of the management of settled solids in the water treatment pond. As described, the removal of these solids would not require the mine to shut down mining operations. The dewatered solids would be dewatered and hauled to an appropriate and approved offsite landfill.

### Response to Comment Ind 423-4

The commenter states that their goal is to ensure a healthy Wolf Creek for future generations. The comment is noted.

**Subject:** Mine Comment

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr. Kelley,

I have been living in Nevada County for 11 years and my husband and I recently welcomed our daughter Mabel. We hope that she can grow up safely here, but this proposed mine is of high concern to us.

I am very concerned about arsenic, ammonia, and other contaminants from treated mine waste water polluting downstream irrigation water and prohibiting farmers from using the water.

**Ind 424-1**

A 2021 study by Sandil et al titled, "Effect of arsenic-contaminated irrigation water on the growth and elemental composition of tomato and cabbage cultivated in three different soils, and related health risk assessment," found that cabbage and tomato plants absorb the arsenic into their roots, leaves, and the edible portion of the crop. The study cites the arsenic threshold for drinking water is 10 µg/L (WHO, 2001), and for irrigation water is 100µg/L (FAO, 1994).

In chapter 4.81-1 of the DEIR, related to water it states, "The treatment process would also reduce the concentrations of arsenic and ammonia, both of which have been detected in low concentrations in surface seeps near the mine."

What does reduce mean? Please provide specific information on what levels of arsenic will be allowed to be in the treated mine waste water discharge. At a minimum the arsenic levels allowed in the treated mine water discharge should be aligned with the FAO's 100µg/L, if not more strict.

**Ind 424-2**

Additionally, the mine discharge water should not be tested once a quarter, but everyday, to have as close to real time tracking on the water (and any contamination it might be spreading) being discharged from the mine.

Thank you,
Kali Feiereisel

1

## INDIVIDUAL LETTER 424: KALI FEIEREISEL

### Response to Comment Ind 424-1

The commenter is concerned about arsenic, ammonia, and other contaminants being discharged to South Fork Wolf Creek. The commenter points to a study highlighting the harmful effects of these contaminants on soil and produce. The commenter states that the DEIR requires more specific information regarding these contaminants in the mine water. As indicated by Table 4.8-2 in the DEIR, the requirement for the treated mine water discharge is less than 10 micrograms per liter for arsenic and less than 25 micrograms per liter for ammonia. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Ind 424-2

The commenter states that the water discharged to South Fork Wolf Creek should be monitored daily. Monitoring of water discharge will be done in accordance with requirements of the approved Notice of Intent and the Central Valley Regional Water Quality Control Board. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

**Subject:** Mine DEIR

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 425-1** In my opinion, the county should not accept the current EIR. The first and most important point to me is the effects on local water sources. Much of the data used was based on normal or average rain years. After 3 years of extreme drought normal and average water calculations do not hold up.

**Ind 425-2** One of the other issues that concern me is air quality. First of all when you look at data based in Blue Canyon how much is applicable to Nevada City and Grass Valley. Locally we have been dealing with increased pollution from Sacramento Valley, let alone the effects to our air from local wildfires.

**Ind 425-3** Please look carefully at the basis of lack of current local information and understanding local needs turn down this report and application for reopening this mine.
Karen Farlee
Nevada City

Sent from my iPad

## INDIVIDUAL LETTER 425: KAREN FARLEE

### Response to Comment Ind 425-1

This commenter is concerned with the impacts of the project on local water sources and is concerned that the DEIR uses average rainfall data in light of the drought that California is currently experiencing. However, the water supply assessment prepared for the project's water consumption includes analysis of single and multiple dry-year scenarios. Additionally, please see Master Response 16 - Drought and Climate Change.

### Response to Comment Ind 425-2

This comment expresses concern regarding the project's impacts to air quality and questions the extent to which data based in Blue Canyon is applicable to Nevada City and Grass Valley.

The dispersion model in the Health Risk Assessment used the most appropriate data for the HRA. Please see Master Response 17 - Meteorological Data Used in HRA. In regard to existing baseline air quality, please see Master Response 18 - Air Quality Thresholds.

### Response to Comment Ind 425-3

The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

Re: DEIR Rise Gold

Commissioners:

I appreciate this chance to respond to the Idaho-Maryland Project draft EIR. The difficulty I have found in this document is tracking the ***dirt.*** **DIRT** - engineered, bare rock, wet, mixed, impermeable, clay, loamy - is what is left behind in a mining project whether it comes to an end as unprofitable, delayed, abandoned or bankrupt.

What it needs is a ***dirt*** budget similar to a water budget when analyzing a closed system. In order to visualize what is proposed, one has to coordinate shift schedules, vehicle schedules, vehicle capacity, mine development, projected fill site quotas, tonnage for vehicles, predicted trip numbers, cubic-feet, on and on it goes.

**Ind 426-1**

We are told that at planned capacity once the project is rolling the tons of material produced annually is 557,000 tons. At mining year 7, the two fill projects will have used 3,800,000 tons. An eighty-year permit less estimated 1.5 years for construction and the high of five years for closure, the applicant could mine for 72.5 years. To get a concept of how much ***dirt*** could accumulate at Brunswick in 72.5 years – ignoring gold concentrate and fill customers as a worst case – 35,620,000 tons of the stuff would accumulate.

In mining year 12, there is enough ***dirt*** to accomplish Alternative 3 – storing an additional 2.3M tons at Centennial. In mining year 15, another 1.7M could be stored at Brunswick. Ta-dah - Alternative 2! - a potential Alternative 5, a 20-year permit with 5 years for closure. 4,000,000 tons of the stuff tucked away. (Did you notice? The DEIR has two estimates for fill - 3.8M tons in the project description and 4M tons in the Alternatives. Tsk, tsk, an unexplained internal inconsistency of data.)

Missing for these scenarios:

Market study for **clean** fill needs within 60 miles (DEIR haul radius)

Qualified Engineer analysis of fill product

**Ind 426-2**

No closure plan for intermittent, inevitable or permanent shut down of project in re ***dirt***

OHV crowd will come from miles away – must include bond for 24/7 security

The phrase "engineered fill" is used (473 times in 1070 pages), replace with ***dirt*** and the picture of this project changes dramatically.

**Ind 426-3**

I was interested to find if the DEIR would tackle the subject of interconnected tunnels. It does admit Union Hill has "a poor hydraulic connection between these two mines" which is included in the water model. Apparently, there is no hydraulic connection to the behemoth to the West – the Empire - 367 miles of workings, 11,007 feet deep. There is no information on how closely those works are to this project possibly requiring an evaluation.

> Page 4.8-14 Union Hill Mine workings are within 95 to 180 feet of workings of the Brunswick at three or four different levels.

The water modeling did not run a scenario for the Union Hill abruptly flooding the Brunswick. No study of the strength of this material under years of vibration, blasting or dewatering has been included.

**Ind 426-4**

The DEIR looks at sink holes and dewatering only within the Project surface property (Geotechnical Assessment of Near Surface Mine Surfaces). No assessment is included of the impact on surrounding properties, not even the East Bennett impacted residences. The original information is NV5. Geotechnical Engineering Report, Idaho-Maryland Mine Project – **Brunswick Industrial Site** [pg. 11].November 18, 2019. Definitely a limited study.

> (I did learn a new historical term that's fun: shaft shifting where timber beams finally give way and there goes the back yard.)

**Ind 426-5**

Appendix K.9_Idaho-Maryland Well Mitigation Plan is included in the DEIR. It is an in-house document citing various authorities on the details of the proposed mitigation of 30 (26) wells on East Bennett. RISE will:

> Reimburse cost of NID annually
>
> Reimbursement will cease when the property is sold or the property is annexed to the City of Grass Valley

Neither Grass Valley, the current property owners nor future owners should pay for water so long as the company dewaters the wells. There is no guarantee the wells will recover – in volume or quality – once dewatering ceases. No mention is made for the inevitable temporary closures or abandonment of the project altogether. Is the County by issuing the permit the ultimate responsible party? An adequate bonding arrangement is required.

**Ind 426-6**

The monster in the closet is cleaning up the Centennial toxic dump. Since the 1960's when the property had reverted to private owners, yet nothing has been accomplished. IMM walked away; the City of Grass Valley walked away and RISE itself has delayed a real commitment. The Voluntary Cleanup Agreement may be "unilaterally terminated with 30-day notice." Unilaterally means for no reason, no consequence for failure to complete. The DEIR in deciding the environmentally superior plan is Alternative 2 (no Centennial use) .. ha, ha .. except for page 1-8, EIR PROCESS states

> While it may be suggested that the Centennial Clean-Up Project, were it to be successfully completed, could benefit the Idaho-Maryland Mine Project in a **limited way (i.e., serving only as a waste rock stockpile location)**, similar to the court's ruling in *Banning Ranch*, the Idaho-Maryland Mine Project would not be a "consequence" of the Centennial Clean-Up Project, as the Idaho-Maryland Mine Project can proceed without completion of the Clean-Up project.

There's that ***dirt*** again! The DEIR fiddles around on Alternative 2 ... doesn't mean it will, doesn't mean it won't..

**Clean-Up of the Centennial (limited as it will be to capping) should be a condition of the permit before they create another.**

**Ind 426-7**

Where's the market study for Nevada County's *critical need* for industrial acreage

Where's the Qualified Engineer analysis for Brunswick and Centennial sites – not landscape elevations

Where is the temporary closure plan for the inevitable over 80 years ...

open/close cycle for gold price fluctuation

for funding, for abandonment, for bankruptcy

that clay-lined pond requires maintenance every 10 years for one thing!

**Ind 426-8**

Eagerly awaiting release of the economic analysis - - library fund and all ...

Karen Melquist

## INDIVIDUAL LETTER 426: KAREN MELQUIST

### Response to Comment Ind 426-1

The majority of the comment expresses a general opinion that the commenter had trouble tracking "the dirt" in the DEIR, but does not provide specific examples that would allow for a detailed response. The Project Description chapter of the DEIR provides a detailed description of the proposed engineered fill piles, including exhibits showing cross-sections.

The commenter points out that the additive tonnage of engineered fill at the Brunswick and Centennial Industrial Sites under the proposed project scenario, would total 3.8 million tons, whereas the total tonnage of engineered fill for Alternatives 2 and 3 appears to equal 4 million tons. This is a correct observation; however, it does not present an inconsistency for the following reasons. The conceptual design for the alternatives is not meant to be such that the sum of engineered fill from Alternative 2 and Alternative 3 equates to the total fill under the project scenario. For example, under Alternative 3 (Expansion of Centennial Fill Pile and Elimination of Brunswick Fill Pile), the additional tonnage to be accommodated at Centennial is 2.3 million tons, whereas the Brunswick Industrial Site would accommodate 2.2 million tons. Rather than design Alternative 3 to accommodate 2.2 million tons of additional engineered fill, it was determined that the dimensions of the Centennial Industrial Site could reasonably accommodate up to 2.3 million additional tons. Seen in this way, there is no inconsistency in the DEIR.

### Response to Comment Ind 426-2

Please see Master Response 11 – Engineered Fill Utilized in Local and Regional Construction Markets. The commenter's suggestions that OHV crowd will come from miles away is speculative; further, both the engineered fill piles at the Brunswick and Centennial Industrial Sites will be fenced. This portion of the comment is speculative, and CEQA does not require that an EIR analyze speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

The commenter states there is no closure plan. However, the project requires an approved Reclamation plan. To ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The Project Applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably determines are adequate to perform reclamation in accordance with the surface mining operation's approved Plan. The commenter is referred to page 4.6-24 and Appendix C of the DEIR.

The commenter asks that the DEIR refer to engineered fill as "dirt". Referring to rock and sand tailings (engineered fill) as "dirt" would not affect the analysis of project impacts.

### Response to Comment Ind 426-3

The commenter suggests that the Union Hill Mine may have hydraulic connection to the Idaho-Maryland Mine and flooding may result. The Union Hill mine is discussed in Section 3.3.3.4 of Appendix K.2 of the DEIR. The Union Hill mine is a smaller mine than the others in the project area. It was closed in 1918 and has been flooded with water since that time. The Union Hill mine

is not connected to any of the other underground mine workings in the area but is in close proximity to the workings of the Brunswick Mine. On April 17, 2019, the water level in the Union Hill shaft was 165 feet higher than the water level in the New Brunswick shaft. The Union Hill mine workings are within 95 feet to 180 feet of workings of the Brunswick Mine at three to four different levels. The Brunswick mine tunnels in proximity of Union Hill were constructed around 1950. During the post WWII period, the combined Idaho-Maryland Mine workings were completely dewatered. In 1956, the water level at the Union Hill Mine was reported to be within 20 feet of the top of the shaft, suggesting that the complete dewatering of the adjacent mine workings resulted in no more than 10 to 20 feet of water level decline in the Union Hill Mine. A "conduit" has not formed between the mines in the previous 70 years, which included active mine operations, as evidenced by the different observed water levels.

## Response to Comment Ind 426-4

The DEIR, in accordance with CEQA Guidelines Appendix G, evaluates the proposed project's potential impacts associated with being located on a geological unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse, or be located on expansive soil under Impact 4.6-3, which starts on page 4.6-41. As discussed therein within the discussion of potential impacts related to collapse, the potential for collapse of existing near-surface mine features as a result of the proposed project is not the same as "sink holes" that occur within limestone environments where a gaping hole forms that may be tens or even hundreds of feet across. As such, the DEIR addresses the commenter's concerns related to sink holes. Please also see Master Response 29 – Near Surface Workings.

Please also see Master Response 7 – Location of Future Mining Areas. As stated therein, to address public concerns regarding the scope of future mining within the mineral rights area, the applicant has agreed to an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area (shown on maps A101, A201 and A202 in Appendix A to this Final EIR).

## Response to Comment Ind 426-5

Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. In addition, a revised Well Mitigation Plan has been prepared and is attached to this Final EIR as Appendix D.

## Response to Comment Ind 426-6

Please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Ind 426-7

The commenter raises concerns regarding the market demand for industrial acreage. Market analysis is not required for an EIR. In addition, future industrial use of the sites would only occur after reclamation and future planning and environmental review. The demand for industrial acreage in 80 years is speculative.

The commenter's concern regarding funding is noted, but these are considerations outside the scope of CEQA. Please see Master Responses 1, 2, and 4. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

The commenter states the DEIR is missing a "Qualified Engineer analysis for Brunswick and Centennial cites." Numerous reports and analysis, including geotechnical and other areas, have been conducted for the Brunswick and Centennial Industrial Sites. The commenter is referred to Chapter 4 of the DEIR.

## Response to Comment Ind 426-8

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 427**

**Dist 3**

RECEIVED

MAR 18 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 3-15-2022

Dear Supervisors Sue Hoek, Heidi Hall, Ed Scofield, Dan Miller, and Hardy Bullock:

**Ind 427-1** I work/~~own~~ a business in Nevada County and I am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corp. I expect that you will be voting on the project based on the Environmental Impact Report and community input.

I have listened to both sides of the argument and find the Rise Gold Corp. (RYES) reports and advertising to be inaccurate. They fail to adequately mitigate many significant negative impacts of this large industrial project on my community and business. It is in my business and personal interest that you do not approve this project.

**Ind 427-2** My business's opposition to this project is based on RYES plans, reports and the DEIR (Draft Environmental Impact Report). Experts have reported to me that there will be significant increases in air pollution, traffic in key areas, noise from both above and below ground operations, wildfire evacuation blockages, reduction of our community's water resources, etc. They also report that any economic gains do not justify the costs to the County. Adding 312 jobs to the County workforce of approximately 44,000 is trivial no matter what the wages, and well-paying jobs will not go to County residents.

Businesses depend upon a quality living experience for residents and visitors alike. I am especially concerned about tourism, likely the largest single public industry in the County. Huge diesel trucks and machines spewing exhaust and using key access roads to Grass Valley are not going to improve our vital image as a tourist destination.

Many tourists come here for the outdoors, art, food and wine, and live performances. Please do not permit the County's attractive environment to be damaged by air and noise pollution, a large factory, waste dumps, and industrial traffic.

Sincerely,

Business Name: Eastridge Apartments

Individual Name: Karin Davenport

Address: 85 Rockwood Dr.

Phone number: 530-272-1888

~~Email~~: P.S. I manage an 80 unit Senior complex with Disabled and Frail Seniors. Which is a sizable responsibility. So I am speaking for a lot of people. Please don't open this Pandora's!

## INDIVIDUAL LETTER 427: KARIN DAVENPORT

### Response to Comment Ind 427-1

Please see Master Responses 1 and 2. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project.

### Response to Comment Ind 427-2

Please see Master Responses 1 and 2. The commenter expresses general concerns regarding the impacts of the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

**Individual Letter 428**

**From:** karolynrenee
**To:** bdofsupervisors
**Subject:** Stop the mine project
**Date:** Monday, January 17, 2022 7:19:12 AM

**Ind 428-1**

Protect our community, do not allow this mine to open!

Sincerely,
Karri Knowles

## INDIVIDUAL LETTER 428: KARRI KNOWLES

### Response to Comment Ind 428-1

Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 429**

3/8/22

Dear Mr. Kelley and Board of Supervisors,

**Ind 429-1**

I am strongly opposed to the proposed re-opening of the Idaho-Maryland Mine by Rise Gold. The community clearly does not embrace this project for numerous reasons, environmental as well as financial.

Please listen to us and do not approve this disasterous project.

Thank you,

Kate Frame

**Individual Letter 430**

Nevada County Board of Supervisors
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Mar 21, 2022

**Subject: Comments on the Idaho Maryland Mine Project and DEIR**

Dear Nevada County Board of Supervisors,

**Ind 430-1**

My name is Kate Gazzo. I am a resident of District 1 and live in Nevada City and work in Grass Valley for a nonprofit conservation organization. I have worked in environmental consulting, water quality, and natural resource mitigation for the past ten years since arriving in California. I have a M.S. degree in Environmental Management from the University of San Francisco.

**Ind 430-2**

In reviewing the DEIR, I found three major errors which need revision.
1. The Less Than Significant impacts conclusion on protected species and sensitive natural communities is unfounded and needs to be re-examined which I discuss further below.

**Ind 430-3**

2. The Hydrology study and Wolf Creek Technical Memo fail to present surface water quality data. Without baseline surface water quality data taken from South Fork Wolf Creek prior to the mine opening, there will be no data to compare changes in water quality once the mine begins operations. These data should be collected and disclosed to the public.

**Ind 430-4**

3. The DEIR lacks an economic evaluation of physical impacts posed by the Project from mining waste/spoils, noise, traffic, visual resources, water, and air pollution. The economic impacts of a project are only subject to CEQA if those impacts cause physical impacts, which the Project will.

**Ind 430-5**

My first comment is in response to the unfounded "Less than Significant" Impacts conclusion on sensitive natural communities and protected species. Increased flows and changes in the hydrology and hydroperiod of South Fork Wolf Creek will affect terrestrial, riparian and aquatic communities downstream. How much or how little water in a system impacts the vegetation communities that are present along the creek and therefore, what wildlife uses or does not use those areas. There are protected State and Federally-listed species with known occurrences just downstream of the Brunswick mine site, such as the Endangered Willow flycatcher bird, which relies on the riparian cover, primarily willows, along South Fork Wolf Creek. The willow

1

flycatcher and at least two other CESA-listed species have been documented two miles downstream of the Brunswick mine. The riparian band of vegetation along South Fork Wolf Creek will change in response to increased flows from mine dewatering. These impacts have not been analyzed or included in the DEIR. The geographic scope of the biological evaluations for vegetation and wildlife is too narrow and needs to be expanded to the creek corridor of South Fork Wolf Creek and its aquatic and biological communities which will be impacted by increased flows and changes in water chemistry from mine dewatering. Changes in water chemistry including specific conductivity, pH, turbidity and heavy mental contaminants will also affect biota directly downstream of the mine from benthic macroinvertebrates–the base of the food chain in South Fork Wolf Creek, to larger species such as brown trout which are present in the creek. These impacts are not evaluated and need to be included.

**Ind 430-6**

Regarding impacts on hydrology and water quality in South Fork Wolf Creek, there is no baseline surface water quality monitoring data presented in the DEIR, to make the determination that the Project will have Less than Significant Impacts.. Without baseline surface water quality data, we will not be able to track changes in constituents of concern such as turbidity or heavy metals over time to know if they are mine-related or were always present. Similarly, there is not an assessment on how the water levels and hydroperiod will change in South Fork Wolf Creek and how that will impact downstream habitats and wildlife. These need analysis.

**Ind 430-7**

My third comment about the DEIR is that the report lacks an economic evaluation. The economic impacts of a project are only subject to CEQA if those impacts cause physical impacts, which the Project will. There will be visual, noise, traffic, mining spoils/waste, and air and water quality impacts on the environment surrounding and downstream of the mine which will impact current residents, and future residents thinking about living in our community in addition to visitors considering coming to Grass Valley for recreation. The appearance of an operating mine as seen from the roadway, poor air quality, noise, traffic, and potential water contamination would likely deter numerous people from choosing to buy a home in the Grass Valley Area. The same argument can be said for visitors. Many would choose somewhere else to vacation that is not encumbered by pollution.This would impact business owners, realtors, and residents (home prices). Additionally, there is no evaluation of cleanup costs from surface mining spoils/waste, water, or air that citizens may be encumbered with. These economic impacts need analysis and inclusion in the DEIR.

2

Ind 430-8

Below I put together a simple table with some of the costs of opening the IMM mine paired with the benefits. This is a crude analysis and actual monetary values (an economic study) are needed in the DEIR which is something that is lacking.

| Cost | Likelihood | Benefit | Likelihood |
|---|---|---|---|
| Fewer visitors and a less desirable place to live (home prices) stemming from air, traffic, noise, and water pollution impacts | Certain | Creation of local jobs (many may be outsourced) | Uncertain |
| Mining spoils cleanup and site reclamation. This could be taxpayers responsible for this if you consider the Track Record of Rise Gold Corp | Likely | No additional benefits | |
| Increased noise for local residents leading to residents leaving the area, and property prices decreasing | Certain | Economic stimulation from more workforce in the community | Certain |
| Local air quality impacts leading to acute and chronic health impacts for residents from dust and greenhouse gas particulate matter released during operations and trucking | Certain | No additional benefits | |
| Traffic flows and congestion | Certain | No additional benefits | |
| Water storage and security impacts to local groundwater table and nearby resident's wells | Certain | No additional benefits | |
| Surface water quality impacts (turbidity, iron, manganese, others) and impacts on aquatic life | Certain | No additional benefits | |
| Downstream hydrology impacts on habitats and wildlife along South Fork Wolf Creek | Likely | No additional benefits | |

3

The Project garners very minimal benefit other than a few local jobs. Most people in our area do not have the technical expertise to dewater and operate a mine, therefore, very few local residents will likely obtain jobs from the IMM and most will be from other states. The few millions of dollars stemming from local job creation and local business spending severely underweighs the likely more than a billion dollars of losses in tourism, home prices, human health and environmental costs associated with opening this mine. Many of these impacts are irreversible impacts and ones that we can't simply "cleanup" such as the perception of our cities or contaminated water and sediment. There are so many other great business opportunities and needs of the Grass Valley community than a mine where all profits are going into the pockets of a corporation and only a small fraction back into the community.

**Ind 420-9**

I request that the Board of Supervisors thoroughly consider all the costs associated with this Project compared with the benefits which includes an economic evaluation to weigh the costs and benefits of the Project. I also recommend that the hydrology and water quality evaluation be revised to include background surface water quality samples from South Fork Wolf Creek. I request that the protected species and natural communities determination of "Less than Significant" be re-evaluated to encompass sensitive natural communities such as the Bennett Street Grasslands and CESA-protected species that occur in South Fork Wolf Creek directly downstream from the Project.

Sincerely,

Kate Gazzo, M.S.

4

## INDIVIDUAL LETTER 430: KATE GAZZO

### Response to Comment Ind 430-1

This comment is introductory in nature and does not address the adequacy of the DEIR. The comment is noted.

### Response to Comment Ind 430-2

The commenter states the DEIR's conclusions needs to be reexamined. Responses to specific comments are provided below.

### Response to Comment Ind 430-3

The commenter states that the Hydrology study and Wolf Creek Technical Memo fail to present surface water quality data. Contrary to the assertions in this comment, the DEIR contains voluminous baseline surface water quality data. The baseline surface water quality data are described in Section 3.4.1.2 and presented in Tables 3.5 through 3.10 of Appendix K.2 of the DEIR. The baseline data include results from samples collected from the underground workings, from drains that discharge water from the underground workings, from Wolf Creek, and from South Fork Wolf Creek. The results include field parameters, general water chemistry parameters, and metals. In particular, Table 3-8 of Appendix K.2 contains pH, temperature, dissolved oxygen (DO), electrical conductivity, and oxidation-reduction potential (ORP) measurements from three locations along South Fork Wolf Creek and two locations on the former SPI site that discharge to South Fork Wolf Creek. Table 3-8 of Appendix K.2 presents laboratory analytical results for 18 general water chemistry parameters and 19 different metals from two samples collected along South Fork Wolf Creek at locations that will be upstream and downstream of the proposed treated water discharge location.

Table 3-10 of Appendix K.2 provides field measurements of flow, temperature, specific conductance, pH, and turbidity for two locations (upstream and downstream) along South Fork Wolf Creek measured during five different storm flow conditions, including summer baseflow, early-season post-storm (comparable to first-flush) flows, winter baseflow, rising flows during a "qualifying rain event of 1.25 inches, and peak flows during the same "qualifying rain event". Additional details regarding flow conditions and baseline water quality conditions in South Fork Wolf Creek are also provided in Appendix K.1 of the DEIR.

Further, analysis of the baseline water quality data is provided in Section 3.4.2 of Appendix K.2 of the DEIR. In particular, data from South Fork Wolf Creek are presented on Figures 3-12 and 3-19, while the baseline data from the underground workings, drains, and Wolf Creek are presented on Figures 3-12 through 3-18.

Compliance with water quality standards, including parameters such as temperature, turbidity, pH, and dissolved oxygen, and also general chemistry and metals, will be based on comparison of the results from the upstream and downstream sample locations while treated water discharge to South Fork Wolf Creek is actually taking place, and not on current baseline conditions. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek and NPDES CAG99500 (provided below). While the baseline sampling that has been conducted for the project informs the analysis of potential impacts in the DEIR, it would not be relevant for future compliance once dewatering, water treatment, and discharge begin. The compliance sampling requirements would be defined in the Monitoring and Reporting Program for the NPDES permit to be issued by the Regional Water Quality Control Board.

https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2022-0006_npdes.pdf

## Response to Comment Ind 430-4

The commenter states that the DEIR must include an economic evaluation because the economic impacts of the project will lead to adverse physical changes but provides no evidence to substantiate this claim. CEQA provides that the economic and social impacts of a project are not to be treated as significant effects on the environment. (*Save Our Schools v. Barstow Unified School District Board of Education* (2015) 240 Cal. App. 4th 128, 146.) An economic or social change is to be considered only to the extent it will lead directly or indirectly to an adverse physical change. (*Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal. App. 4th 1184.)

In *Bakersfield Citizens for Local Control v. City of Bakersfield*, the court described the phenomenon [urban decay] as "a chain reaction of store closures and long-term vacancies, ultimately destroying existing neighborhoods and leaving decaying shells in their wake." The court also discussed prior case law that addressed the potential for large retail projects to cause "physical deterioration of [a] downtown area" or "a general deterioration of [a] downtown area." (Id. at pp. 1206, 1207). When looking at the phenomenon of urban decay, it is also helpful to note economic impacts that do not constitute urban decay. For example, a vacant building is not urban decay, even if the building were to be vacant over a relatively long time. Similarly, in the context of retail development, even a number of empty storefronts would not constitute urban decay.

The commenter provides no evidence as to how the economic changes of the project will directly or indirectly lead to adverse physical changes akin to urban decay. The commenter is also referred to Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 430-5

The commenter states that the DEIR is inadequate because increased flows to South Fork Wolf Creek will impact species downstream. The commenter also states that the geographic scope of the biological impacts along South Fork Wolf Creek must be expanded. The commenter is referred to Master Response 30 - Biological Study Technical Adequacy, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependent Vegetation, Master Response 34 - Resident Fish, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 36 - Flows in South Fork Wolf Creek, and Master Response 37 – Birds and Raptors. Please also see Response to Comment Grp 2-5, which demonstrates that the project would not affect vegetation adjacent to the creek or interrelated habitat.

## Response to Comment Ind 430-6

The commenter reiterates the erroneous assertion that the DEIR contains no baseline date to evaluate the hydrology and water quality of South Fork Wolf Creek. The commenter is referred to Responses to Comments Ind 430-3 and 430-5.

## Response to Comment Ind 430-7

The commenter reiterates the assertion that the project's economic impacts will cause adverse physical changes and thus must be considered by the DEIR. The commenter states that the project's physical impacts (e.g., aesthetics, traffic, noise) will adversely impact recreation or tourism and would deter would-be future residents from purchasing a home in the community. The commenter is describing potential economic impacts that may result from the project's

physical impacts. The commenter does not identify any physical impacts that would result from project's economic impacts. The commenter is referred to Response to Comment Ind 430-4, Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 430-8

The commenter states that the project's economic benefits to the community are outweighed by the project's environmental impacts. The commenter is referred Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Ind 430-9

The commenter summarizes the concerns previously listed in the Letter. The commenter is referred to the Responses to Comments above.

**Individual Letter 431**

**Ind 431-1**

**Ind 431-1**

RISE GRASS VALLEY
THE SCIENCE IS CLEAR:
NO MINE!
Rise Grass Valley's Plan to Re-Open the Idaho-Maryland Mine is Safe and Responsible
No!

# Rise Grass Valley strikes deal with Ophir Hill and Nevada County to bolster local fire protection.

In a major boost to local fire protection, Rise Grass Valley has committed to purchase a new, top-of-line fire engine to serve the Ophir Hill Fire Protection District and to fund three new full-time firefighter positions. Plus, Rise Grass Valley will pay for installation of a new water supply line along East Bennett that will provide fire hydrant access for the OHFPD. Rise's mine rescue team, with 24 members and five emergency technicians, will be available to OHFPD if needed. The Brunswick site may be used as a base for marshalling of fire resources – with 21 acres of unused area, a changing/shower facility and a backup power system – in the event of a local or regional fire emergency.

**Over 600 new local jobs created. $50 million of new local annual spending in Nevada County.**

I call BS

The mine would create an estimated 612 new local jobs comprised of 312 mine employees and 300 jobs induced by new local annual spending of ~$50 million per year.

Rise estimates workers will earn an average of $122,000 per year including benefits, that's more than double the county average. Local hiring and training programs are designed to **achieve the goal that 2/3 of our workers will be recruited from current residents in the area.** That's why we're investing so heavily in the Nevada County community – Nevada County residents will be the backbone of our team.

The project provides safe and satisfying careers with exceptional opportunity for skills and knowledge development.

**Ind 431-2**

## INDIVIDUAL LETTER 431: KATE KANE

### Response to Comment Ind 431-1

Please see Master Response 1 – Non-EIR/Administrative Issues. The comment does not address the adequacy of the DEIR.

### Response to Comment Ind 431-2

Please see Master Responses 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 432**

**From:** Katharine Popenuk <popenuk@gmail.com>
**Sent:** Monday, April 4, 2022 4:30 PM
**To:** Idaho MMEIR
**Subject:** DEIR shortcomings-against mine reopening

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

My name is Katharine Popenuk and I reside in Grandview Terrace.

I wish to address whether a specific business, the gold mining business, as opposed to any other business, is in the best interest of the citizens of Nevada County.

**Ind 432-1**

We are talking about the real and potential environmental impact of a heavy industrial hard rock mining operation. And we're talking about 80 years. 80 years of 24/7 mine operation, of listening to rumbling below our homes, the thunder of trucks carrying waste rock down our streets. 80 years of breathing microscopic asbestos dust, listening to the non stop crushing mill, driveing on destroyed roads, watching habitats disappear and our natural beauty fade.

**Ind 432-2**

Where in the DEIR do they say how this microscopic asbestos will be filtered out when even a N95 mask is ineffective? Where in the DEIR do they talk about repairs to public roadways ruined by non-stop truck traffic of tons of rock? Where does it address damage to our local highways when the dump sites are filled to capacity or when they find a buyer for the rock fill they will be creating?

**Ind 432-3**

These deeply buried rocks will be stored in a gigantic 37 acre pile, up to 70' high. They also contain naturally occurring sulfide.
When sulfide combines with rain sulfuric acid is created. Contaminating our groundwater. Where in the DEIR do they mention how they will stop this from happening?
Sulfuric acid will taint our most important water source.

**Ind 432-4**

What will be left of South Wolf Creek and Bennett Meadow after it is blasted every day for the first six months with 15 1/2 Grass Valley municipal swimming pools worth of water? Where in the DEIR do they discuss the potential flooding of Bennett meadow and the resultant killing of the native grasses, and habitat destruction to the many birds and other animals that live there?

**Ind 432-5**

Can we really expect our water table to NOT deplete when 1.6 million gallons of water are being pumped out each and every day? Do they have any better plans than those described in the DEIR than to pipe in water for only 7-30 potential wells gone dry?

**Ind 432-6**

Who will take responsibility when Mr. Mossman or whoever runs "Rise Gold" next, have long since left or declared bankruptcy?

**We, the people, assume all the risk while others, with no interest in our quality of life, leave with all the gold.**

1

No one can do whatever they want on their own land. All private property rights are subject to laws and codes. Our Board of Supervisors is responsible for ensuring those objectives are met and the community is protected.

I encourage each board member to consider your allegiance to the citizens you have been elected to protect.

Most Sincerely,
Katharine Popenuk
10728 Footwall Drive
Grass Valley, CA.

## INDIVIDUAL LETTER 432: KATHARINE POPENUK

### Response to Comment Ind 432-1

The commenter is generally opposed to the project and cites a number of potential impacts including noise, traffic, air quality, damage to roads, and adverse impacts to habitat. The DEIR states that noise-related impacts will be less than significant after mitigation, with one exception – temporary construction noise. Specifically, the installation of a potable water pipeline along East Bennett Road will cause a temporary noise impact that is significant and unavoidable. (DEIR, p. 4.10-27, 31.) As noted on page 4.10-44 of the DEIR, using average blasting noise levels from a comparable underground gold mine, the worst-case maximum noise levels at the nearest noise-sensitive receptors would range from 52 to 57 dBA $L_{max}$. The range of predicted worst-case blasting noise levels of 52 to 57 dBA $L_{max}$ is below the daytime, evening, and nighttime dBA $L_{max}$ criteria at the nearest receptors. For clarification, there is no crushing mill, as envisioned by the commenter. Rather, the fully enclosed process plant building would include grinding equipment for mineralized rock. The noise study for the project evaluated the potential noise impacts from this grinding equipment (DEIR, p. 4.10-38). Based on the data, the mineral processing operations would generate noise levels below the applicable nighttime standards of significance at each of the nearest sensitive receptor locations. As such, noise-related impacts from mineral processing would be less than significant (DEIR, p. 4.10-38).

The DEIR states that air quality impacts would be less than significant after mitigation. (DEIR, p. 4.3-66.) The commenter is also referred to Master Response 18 – Air Quality Thresholds, and Master Response 19 – NSAQMD Criterion Pollution Thresholds during Operations. The DEIR states that any impacts to habitat would be less than significant after mitigation. (DEIR, p. 4.4-80.) Lastly, the Project Applicant would be required to enter into agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between the project driveway and Brunswick Road. (DEIR, Mitigation Measure 4.12-6(c).)

### Response to Comment Ind 432-2

The commenter asks how asbestos will be filtered during project operations. Please see Response to Comment Grp 7-6.

Regarding the potential damage to pavement from project traffic, Mitigation Measure 4.12-6(b) requires that prior to commencement of engineered fill hauling, the Project Applicant shall enter into separate road maintenance agreements with Nevada County and the City of Grass Valley to provide the project's fair share of funding for maintenance of roadways commensurate with the project's impact to pavement conditions on both Nevada County and Grass Valley roadways, including Brunswick Road between E. Bennett Road and SR 49, and E. Bennett Road between project driveway and Brunswick Road.

### Response to Comment Ind 432-3

The commenter states that the engineered fill contains sulfide, which will produce sulfuric acid during a weather event and pollute groundwater. Please see Master Response 8 – Mine Waste Characterization. Based on the geology of the rock encountered in the core drilling at the project site, and testing of those samples, acid rock drainage is not expected. (DEIR p. 4.8-50.) Nonetheless, the DEIR has concluded that the project may have a potentially significant impact on water quality and has identified Mitigation Measures 4.8-1(d) and 4.8-1(e) to address these

potential impacts and reduce the impact to less than significant. The purpose of the Waste Discharge Requirement (WDR) from the Central Valley Regional Water Control Board is to ensure the effluent from mine waste does not impact water quality. Further testing will be required as part of the RoWD and WDR process as required by Mitigation Measures 4.8-1(d) and 4.8-1(e) such that any impacts will be mitigated. WDRs for the project will require monitoring and reporting to ensure compliance.

## Response to Comment Ind 432-4

The commenter is concerned with the potential flooding of Bennett Meadow and biological impacts to species and habitat. The DEIR states that the project would not result in flooding on- or off-site and impacts would be less than significant after mitigation. (DEIR, p.4.8-69.) The commenter is also referred to Master Response 36 - Flows in South Fork Wolf Creek. The DEIR's drainage analysis concludes that the project would not significantly alter the drainage patterns of the sites in a manner which would result in substantial erosion or siltation on- or off-site, nor substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site, nor create or contribute to runoff water which would exceed the capacity of existing stormwater drainage systems, nor impede or redirect flood flows. (DEIR, p. 4.8-75.) West Yost's independent peer review concurs with this conclusion. Regarding the impacts to habitat and species, the DEIR states that any impacts to habitat would be less than significant after mitigation. (DEIR, p. 4.4-80.) The commenter is also referred to Master Response 37 – Birds and Raptors, Master Response 38 – Foothill Yellow Legged Frog and California Red Legged Frog, and Response to Comment Grp 2-5.

## Response to Comment Ind 432-5

The commenter is concerned about the project's impact on groundwater supplies. The commenter is referred to Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 432-6

This comment concerns the Project Applicant. The commenter is referred to Master Response 3 - Operator Responsibility. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Individual Letter 433**

**From:** Katherine Plocharczyk <katherineplocharczyk@gmail.com>
**Sent:** Monday, April 4, 2022 12:19 PM
**To:** Idaho MMEIR
**Subject:** Comment on the Draft Environmental Impact Report

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

County Planning Commissioners,

I am writing to let you know that I object to the proposed re-opening of the Idaho Maryland mine. I am a Nevada County resident, and I have been for seven years. I urge you to protect not only the natural beauty in Nevada County, but the quality of life for its residents.

**Ind 433-1**

There is little evidence that re-opening the mine will bring financial benefit to the community. Rise Gold, the company intending to re-open the mine, has never opened a mine and never made a profit. Their CEO, Benjamin Mossman's, last project went bankrupt, and resulted in a toxic spill that polluted tribal waters in British Columbia. The mine left a huge mess for Canadians to clean up.

**Ind 433-2**

The chances are unlikely that Rise Gold's new venture in Nevada County will be lucrative, and even so, such potential profits will be going directly to Rise Gold shareholders instead of the local community. There is the promise of creating jobs, but these appear few and far between. What we do know is that despite these few job gains, the mine will threaten both tourism and property values by diminishing the quality of life in Nevada Coutny.

**Ind 433-3**

While there is little evidence that the mine will benefit the local economy, there is an abundance of evidence that supports the claim that the mine will ultimately diminish quality of life in Nevada County. I have organized a few reasons below. The Idaho-Maryland mine will:

1. Produce Toxic Waste:
Hardrock mining is the number one source of toxic waste in the U.S. Nevada county should be very wary of introducing industrial mining into our community, without a clear plan for disposing of toxic waste. Rise Gold is already responsible for the Centennial Mine Site in Grass Valley, which they have failed to clean up, and with Benjamin Mossman's last venture as precedent, it seems unlikely that the waste produced by the Idaho-Maryland mine will see any other fate.

**Ind 433-4**

2. Diminish Air quality:
Continuous rock crushing, loading, hauling, unloading, spreading, and compacting also produces an abundance of dust, when the air quality in Nevada County is already worse than we would like. Nevada County already sees chronic lung disease deaths at twice the state average, and we can't afford to increase these numbers.

**Ind 433-5**

3. Drain our energy:
The mine requires massive energy usage, approximately 12% of what all Nevada County uses annually, which will strain our power grid. The county has already planned to cut residential power consumption in an effort to curb our carbon footprint, but the proposal of the mine renders such efforts futile.

**Ind 433-6**

4. Drain our water:

1

Not only will the mine drain our energy but it will swallow up our supply of precious water. The mine calls for 3.6 million gallons every day for 6 months and another 1.2 for up to 80 years - flooding creeks, destroying habitat, and putting private 300+ private wells at risk. In a drought, we cannot endanger our water supply in this manner. Water supply for private residences will be at risk, when they have already been threatened by the state drought.

Thank you for your time and for reading my comments.

All the best,
Katherine Plocharczyk
Nevada County Resident

## INDIVIDUAL LETTER 433: KATHERIN PLOCHARCZYK

### Response to Comment Ind 433-1
Please see Master Responses 1 through 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 433-2
Please see Master Response 2.

### Response to Comment Ind 433-3
Please see Master Responses 3 and 4, as well as Master Responses 8 through 12 and the discussions and analyses in Chapter 4.7, Hazards and Hazardous Materials, of the DEIR. The commenter expresses general concerns regarding the impacts of the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 433-4
Please see Master Responses 18 through 23 regarding air quality.

### Response to Comment Ind 433-5
Please see the analysis under Impact 4.3-4, which evaluates the proposed project's potential to result in inefficient or wasteful use of energy and starts on page 4.3-86 of the DEIR. Based on the incorporation of various measures, including the applicant's proposed APM-AQ-1 (Exhaust Emission Control) and Tier 4 engines as required by Mitigation Measure 4.3-1(b), the DEIR concludes that the proposed project would not result in an inefficient, wasteful, and unnecessary consumption of energy, and a less-than-significant impact would occur.

### Response to Comment Ind 433-6
Please see Master Responses 13 through 16 regarding groundwater. The commenter expresses general concerns regarding the impacts of the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

**Individual Letter 434**

March 28, 2022

Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Subject: Comments on Draft Environmental Impact Report, Idaho-Maryland Mine

Dear Mr. Kelley and the Board of Supervisors:

**Ind 434-1**

My name is Katherine Thompson and I am part of a 5-generation Nevada County family. I reside within a mile of the Idaho-Maryland mine mineral rights area. Also, I was with the U.S. Environmental Protection Agency Office of Inspector General for over a decade.

**Concerns as a resident:** As a resident, I am concerned about the significant impacts of this mining project not only to me, but also to my children and grandchildren, and my grandchildren's children. This is proposed as an 80-year project with significant impacts for generations.

**Ind 434-2**

Our house is near Gold Hill Drive and we can hear and see the school bus barn traffic on East Bennett Road, where Rise Gold proposes to have dozens and dozens of truckloads of waste trucked daily. We are about 3 blocks from the Grass Valley city limits; we have also heard and felt mine blasts. The trucking and blasting noise and resulting air pollution will adversely and directly impact the quality of life in my neighborhood.

My concerns are:

**Ind 434-3**

- Excessive traffic, noise, and air pollution from trucks hauling waste, supplies, and hazardous substances to and from the mine and from underground blasting.

**Ind 434-4**

- Dewatering the underground water supply, impacting not only wells but also the environment dependent upon the groundwater supply.

**Ind 434-5**

- High flows down South Wolf Creek and Wolf Creek, which passes by Hennessy School.

**Ind 434-6**

- Inadequately identified risks including seismic, climate change, and use of hazardous and toxic materials and practices.

1

**Ind 434-7**

- Insufficient hydrogeology investigations throughout the project area that could result in dewatering large portions of our underground water supply and adversely impact a large ecosystem.

**Ind 434-8**

- Vague identification of operations and risks in the entire project area, including the 2,585-acre mineral rights boundary that includes the Brunswick Basin.

The County public meeting on Thursday, March 24, 2022, identified many significant environmental impacts that were not identified, fully identified or mitigated.

**Ind 434-9**

Rise Gold's reputation and history as a non-compliant operator is a serious concern to me. As we know, it's the actions not the words that count. It doesn't take much research to see Rise Gold has a poor track record.

Given this history and the large population impacted, it is even more critical that the County have the authority, expertise, plans, and resources to effectively monitor this operation. Does the Nevada County have sufficient funds to monitor all significant aspects of this permit and operation? Will we, the taxpayers, be paying for additional staff or contractors for oversight and compliance? If the operator is not in compliance with its permit, how will Nevada County respond?

**Ind 434-10**

Minimally, permit compliance would involve discharge water sampling, mine waste discharge monitoring, air monitoring, noise monitoring, and safety inspections. What actions will be taken for violations? Will the mine be allowed to continue to operate with repeated violations? Under what conditions can the permit be revoked? Are we accepting Rise Gold's monitoring suggestions? Are they adequate to protect the community and the environment? The Rise Gold track record should clearly cause pause.

**Ind 434-11**

**Concerns as a professional.** As mentioned in my introduction, I was with the U.S. EPA Office of Inspector General for over a decade and spent many years evaluating the Superfund program, in addition to wastewater discharge permits. This included evaluations encompassing mine cleanups. A Superfund designation means that the owner has created a serious toxic or hazardous waste that endangers human health or the environment.

Based on my experience and knowledge:

- Mines are significant toxic polluters.

**Ind 434-12**

- Fully identifying mining site hydrogeology is very difficult but critical to understanding how mining operations impact groundwater, associated wells and drinking water, and the scope of the impact. There are multiples cases where unknowns in hydrogeology resulted in dewatering wells (e.g. San Juan Ridge Mine, https://yubariver.org/issues/the-san-juan-ridge-mine/) and extensive contamination of ground water and or surface water (e.g. Sacramento water supplies, Aerojet Superfund site, https://www.epa.gov/enforcement/case-summary-epa-issues-order-aerojet-general-corporation-superfund-site).

**Ind 434-13**

- Environmental impact reports often fail to consider the cumulative impacts of planned development, are too vague, and propose inadequate mitigation measures.

**Ind 434-14**

- Cleaning up significant pollution from mines is extremely expensive and some cleanups must continue in perpetuity at taxpayer expense.

**Ind 434-15**

- Companies declare bankruptcy to avoid paying for cleanups.

**Ind 434-16**

Mines are significant toxic polluters. According to Columbia Climate School, (December 2016), "**The EPA's Toxic Release Inventory indicates that that the metal mining industry is the nation's most significant toxic polluter, accounting for 40 percent of toxic releases in 2011 with chemicals such as arsenic, lead and mercury**. In 2013, the EPA's superfund budget was only about $775 million, but the agency had identified 156 mining sites with potential cleanup costs of up to $24 billion. As of Oct. 3, 2016, the EPA has identified over 1,000 sites as belonging to the National Priorities List, a collection of polluted sites warranting further investigation." No Federal funding means Nevada County taxpayers would likely be on the hook.

**Ind 434-17**

Congress passed the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA or Superfund) in 1980 because of the need to cleanup tremendous toxic and hazardous dumps that had been left behind. Initially there was a Superfund trust fund to cleanup these sites.

In 1995, the Trust funding was eliminated and EPA went to a 'polluter pays' approach that typically includes enforcement orders, negotiation, lawyers and litigation. (https://www.epa.gov/superfund/superfund-history).

According to the Sierra Club, the Centennial Industrial site, purchased by Rise Gold for the project, ranked as the top priority California abandoned

mine by the EPA, because proximity to communities and known contamination and physical hazards. "This site is 56 acres with two-thirds of the site covered with tailings from the Idaho-Maryland Mine, which operated until 1956. Though it was much quieter during the war and afterwards, in fact it then closed in the mid 50's. There is an estimated two hundred and seventy thousand cubic yards of legacy tailings which are toxic, which have to be removed in order to use the site for new dumping or placing new mine waste." (Barbara Rivenes, Sierra Club, October 2020. https://www.minewatchnc.org/post/centennial-site-needs-cleanup). It should be noted that this site has not been cleaned up or listed on the Superfund National Priorities List although full operations ceased in the mid-1950s.

Rise Gold plans to dump an additional 1 million cubic yards of mining waste as this site. (Rivenes, Sierra Club, October 2020). This area has a "severe" erosion hazard potential (DEIR page 4.6-35) and is subject to a cleanup plan.

Hard rock mining sites are frequently Superfund sites or candidates for Superfund. A 2004 report by the U.S. Environmental Protection Agency (EPA) Office of Inspector General (EPA 2004b) identified 63 hard rock mining sites (which do not include coal mining) listed on the National Priorities List (NPL), another 82 that were on Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) but had not yet been listed on the NPL, and 11 potential CERCLIS/NPL sites. (Source: National Academies of Sciences, Engineering, and Medicine. 2005. Superfund and Mining Megasites: Lessons from the Coeur d'Alene River Basin. Washington, DC: The National Academies Press. https://doi.org/10.17226/11359.)

In an article entitled, "Why Are Mines Still Polluting, the Money's Not There," the Columbia Climate School explained, "companies declaring bankruptcy or restructuring their corporate relationships have exploited the current assurance mechanisms to avoid cleanup costs."
(https://news.climate.columbia.edu/2016/12/20/why-are-mines-still-polluting-the-moneys-not-there/)

In 2019, the United States Court of Appeals for the District of Columbia Circuit upheld an Environmental Protection Agency decision not to instate its proposed rule that would have protected taxpayers from having to foot the bill for costly clean-ups of mining pollution. (Pacific Standard news report, July 2019.)

The Pacific Standard (7/22/19) noted that John Robison, the public lands director with the Idaho Conservation League said this decision highlights the

4

need for states and communities to take it upon themselves to ask tougher questions about mining and mine designs. "Communities can't rely on the EPA in protecting public health, safety, and taxpayers," Robison says.

In 2020, the University of British Columbia published research on the adequacy of environment assessments, such as EIRs, including those performed in California. It found these environmental impact reviews identified few to no environment impacts important enough to be "significant" for regulators. Of the various mining projects reviewed, only one in British Columbia adequately included a realistic timescale for the ongoing effects of acid mine drainage, which pollutes streams from mining activities.

**Ind 434-18**

According to the research, many of the reviews failed to consider the cumulative impacts that the development would add to other ongoing problems. "Building a mine in an area, for example, may present new challenges for wildlife already struggling in that area due other threats." (Wildlife Society, April 2020, https://wildlife.org/are-environmental-impact-assessments-short-on-science/).

The same research also found that many of the reviews failed to show an understanding of potential negative impacts. "Many [environmental] assessments are far too vague," the researcher said, adding that almost none of them included specifics about what wildlife population might be affected by a particular project or whether the effects on nearby wildlife may affect the larger population of a species.

The Idaho-Maryland DEIR is no exception. For example, the DEIR states it will operate in a 2,500-acre underground mineral rights area (DEIR page 2-1). But impacts of accessing these mineral rights (blasting and dewatering) in this area are missing or vague. To illustrate, in evaluating noise and vibration impacts (DEIR 4.10), tshe DEIR focuses around the area around the Brunswick and Centennial sites and one area in between (DEIR 4.10-4).

**Ind 434-19**

There is no discussion in 4-10 of blasting and dewatering throughout the mineral rights boundary area, to include the Brunswick Basin. What will be the extent, depth, and frequency of the blasting and dewatering? Also missing is the fact that hundreds of buildings (homes, apartment buildings, businesses) have been constructed above the mineral rights area since the 1950s, when mining last occurred.

5

**Ind 434-20**

**Conclusion**. Mines are high-risk toxic operations that cause serious damage, leaving toxic waste, dry wells, and both soil and water contamination. One cause is unknowns in complex hydrogeology. These unknowns have resulted in significant impacts like the loss of drinking water supplies and widespread contamination.

Moreover, recent research shows deficiencies in EIRs are common and this EIR is no exception. Unaddressed deficiencies and unidentified risks and operations in this EIR add to the likelihood the project will not operate as described. Nevada County is responsible for mine oversight, which if sufficient, would significantly add to County budget and burden taxpayers.

Nevada County has grown substantially in the last 70 years (since the last hard rock mining) and hundreds of structures and people now reside above the Idaho-Maryland mineral rights area where blasting and dewatering can and will likely occur. Are these structures and the people in them at risk? The DEIR does not inform us about this.

**Ind 434-21**

The stakes of this project are high. I believe Nevada County must reject the project based on significant risks to our quality of life (including air, water, and environment). If not, it must ask the really tough questions about this operation, get them answered, apply the necessary limits, enact mitigation, and fund stringent oversight of this operation.

This project has to potential to change the trajectory for Nevada County. Will it continue be a beautiful area that attracts and invites visitors, artists, events, outdoor recreation, entrepreneurs, and tech companies? Or will it become an industrial, noisy, polluted mining town with a poor quality of life? I vote for the first option.

Sincerely yours,

Katherine Thompson

## INDIVIDUAL LETTER 434: KATHERINE THOMPSON

### Response to Comment Ind 434-1
This comment is introductory in nature. The comment is noted.

### Response to Comment Ind 434-2
The commenter is concerned about project trucks travelling on East Bennett Road, noise and vibration impacts from mine blasts, and air pollution from trucks but does not state why the DEIR is inadequate regarding these impacts. The project does not propose any trucking on East Bennett Road. (DEIR, Figure 3-30.) No mine blasting has taken place at the project since the mines were closed in the 1950s. Noise and vibration impacts from the project are analyzed in Chapter 4.10 (Noise and Vibration) of the DEIR and air quality impacts are analyzed in Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) of the DEIR.

### Response to Comment Ind 434-3
The commenter is concerned about traffic, noise, air pollution from trucks, transport of hazardous substances, and underground blasting but does not state why the DEIR is inadequate regarding these impacts. Noise from trucks and underground blasting has been analyzed in DEIR Chapter 4.10 (Noise and Vibration) and was found to be less than significant after mitigation. Air emissions from trucks and other equipment was analyzed in DEIR Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy) and is less than significant after mitigation. Hazardous substances are analyzed in DEIR Chapter 4.7 (Hazards and Hazardous Materials). The commenter does not identify which “hazardous substances” they are referring to; thus, a specific response cannot be offered.

### Response to Comment Ind 434-4
The commenter is concerned about the project’s impact to groundwater wells but does not state how the DEIR is inadequate in this regard. DEIR Chapter 4.8 (Hydrology and Water Quality) analyzed impacts to domestic wells and groundwater supply, which were determined to be less than significant after mitigation. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Ind 434-5
The commenter is concerned about discharges to South Fork Wolf Creek. DEIR Chapter 4.8 (Hydrology and Water Quality) analyzed impacts related to flow in South Fork Wolf Creek and determined those impacts to be less than significant after mitigation. The commenter is also referred to Master Response 36 –Flows in South Fork Wolf Creek.

### Response to Comment Ind 434-6
The commenter states that risks including seismic, climate change, and use of hazardous and toxic materials and practices are inadequately identified in the DEIR, but provides no further information or evidence. The commenter is referred to Chapters 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy), 4.6 (Geology, Soils, and Mineral Resources), 4.7 (Hazards and Hazardous Materials), and 4.8 (Hydrology and Water Quality) of the DEIR. Regarding climate change, please also refer to Master Response 16 – Drought and Climate Change.

### Response to Comment Ind 434-7
The commenter states that hydrology investigations in the DEIR are insufficient but provides no further information or evidence. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14

- Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 434-8

The commenter states that operations and risks for the project area is only vaguely identified in the DEIR but provides no further information or evidence. The commenter is referred to Chapter 4 of the DEIR and Master Response 7 - Location of Future Mining Areas.

## Response to Comment Ind 434-9

The commenter references the reputation of the Project Applicant. The commenter is referred to Master Response 3 - Operator Responsibility.

## Response to Comment Ind 434-10

The commenter references the reputation of the Project Applicant. The commenter is referred to Master Response 3 - Operator Responsibility.

## Response to Comment Ind 434-11

The commenter is concerned about the project potentially creating toxic mining waste. The commenter is referred to Master Response 9 - Historical Mine Waste at Centennial Site.

## Response to Comment Ind 434-12

The commenter states that fully understanding mining site hydrogeology is very difficult but does not comment on the project or the adequacy of the DEIR. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Ind 434-13

The commenter states that EIRs often fail to consider cumulative impacts but does not comment on the project nor the adequacy of the DEIR. Cumulative impacts have been analyzed at the end of each technical chapter of the DEIR. The commenter is referred to Chapter 4 and Section 5.3 of the DEIR.

## Response to Comment Ind 434-14

The commenter states that cleaning up mining sites can be expensive and can continue into perpetuity. This comment does not concern the project nor the adequacy of the DEIR. The commenter is referred to Chapter 4.8 (Hydrology and Water Quality) and Appendix C of the DEIR. The commenter is also referred Master Response 8 - Mine Waste Characterization.

## Response to Comment Ind 434-15

The commenter states that mining companies declare bankruptcy to avoid paying for cleanups. This comment does not concern the project nor the adequacy of the DEIR. The commenter is referred to Appendix C (Reclamation Plan) of the DEIR and Master Response 3 - Operator Responsibility.

## Response to Comment Ind 434-16

The commenter states that the metal mining industry is a significant toxic polluter. This comment does not concern the project nor the adequacy of the DEIR. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA, and Master Response 9 - Historical Mine Waste at Centennial Site.

## Response to Comment Ind 434-17

The commenter references the Centennial Industrial Site. The commenter is referred to Master Response 4 - Cleanup Project is a Separate Project Under CEQA, and Master Response 9 – Historical Mine Waste at Centennial Site.

## Response to Comment Ind 434-18

The commenter states that the DEIR fails to consider cumulative impacts but provides no additional information. Cumulative impacts have been analyzed in DEIR Chapters 4 and 5.3. The commenter also states that the DEIR understates the project's impacts because the project areas analyzed are the Brunswick and Centennial Industrial Sites, but the mineral rights area consists of 2,500 acres. The commenter is referred to Master Response 7 - Location of Future Mining Areas. The commenter also states that environmental review, such as this DEIR, frequently understates the impacts of the mining waste. The commenter is referred to Master Response 8 - Mine Waste Characterization.

## Response to Comment Ind 434-19

The commenter states that there is no discussion of blasting or dewatering throughout the mineral rights boundary area. The commenter is referred to Chapter 4.10 (Noise and Vibration) and Appendix M of the DEIR and Master Response 7 - Location of Future Mining Areas. Regarding the groundwater impacts from dewatering, the commenter is referred to Chapter 4.8 (Hydrology and Water Quality) of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

The commenter also states, in relation to blasting, that numerous structures have been built on the surface since the Idaho-Maryland Mine was last active. Impacts to structures and residents from blasting vibrations has been analyzed in the DEIR. Impacts from blasting vibrations are less than significant after mitigation. The commenter is referred to Chapter 4.10 (Noise and Vibration) and Appendix M of the DEIR and Master Response 7 - Location of Future Mining Areas.

## Response to Comment Ind 434-20

The commenter summarizes their previous concerns. Please see the above responses.

## Response to Comment Ind 434-21

The commenter urges the County to not approve the project. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, Master Response 2 - Social and Economic Impacts, and Master Response 3 - Operator Responsibility.

NEVADA COUNTY
BOARD OF SUPERVISORS

# THE IDAHO-MARYLAND MINE: A PROUD HISTORY

The Idaho-Maryland Mine was one of the most productive and best-known gold mines in the United States, producing approximately 2.4 million ounces between 1866 and 1955. The mine closed in 1956 as the fixed price of gold at $35 per oz made the mining of American gold unprofitable.

Rise Grass Valley will reinitiate mining and will do so with a focus on green-friendly practices and minimizing the impacts to neighbors. The project will use modern, clean, state-of-the-art mining equipment and proven techniques to produce "green gold." The result is a project that has no significant impacts to water, air quality, and the natural environment or from noise or vibrations during operations.

When in full operation, Rise Grass Valley's Idaho-Maryland Mine project will create hundreds of good-paying jobs and realize broad economic benefits for Nevada County.

**Please fill out and send back to us your support for the Idaho-Maryland Mine**

## I support re-opening the Idaho-Maryland Mine

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

This opinion piece was in the Union today. Unfortunately, they did not print the most up to date version, which is below.

Science is clear but Rise Gold's most recent mailing is anything but. Rather, it is an intentionally misleading attempt to skew the facts regarding the mine reopening.

**Ind 437-1**

Has the mine reopening been approved?

No, Nevada County has NOT just completed anything regarding approval of the mine reopening. The county Board of Supervisors has yet to conduct its first meeting to discuss the contents of the draft environmental study. They have not yet fully considered nor approved the contents of the study. No final determination has been made as to the accuracy of the scientific analysis, anticipated impacts, or adequacy of the proposed regulation of a reopened mine.

**Ind 437-2**

The DEIR (DRAFT Environmental Impact Report) has not laid to rest anything. Rather, the report enumerates 83 impacts, 32 of which are considered significant enough that they will require some measure of intervention so as to make them not as bad as they actually are anticipated to be. Some impacts are so severe, there is nothing that can be done, we will just have to live with them. We are being asked to accept a lower quality of life in Grass Valley.

**Ind 437-3**

None of these concerns have been "put to rest". There remains grave concerns about drained wells, spoiled aquifers, polluted water ways, destroyed habitats, dust, exhaust, noise, and airborne chemicals associated with the transportation of waste and by gold extraction. There is no confirmation that there will not be spills, seepage, accidents, oversight, or callous disregard of regulations or safety practices.

**Ind 437-4**

What is the DEIR?

The DEIR's only purpose is to lay out the ways in which the reopened mine will impact our

environment and the possible ways some of these impacts could be dealt with. This report was compiled for and paid for by Rise Gold. It is important to note that this report was limited by and relied exclusively on information provided to the consulting firm by Rise Gold, and many of the conclusions reached in the report are based on assumptions and best case scenarios. The report does not guarantee in any way what will be the actual outcome. The fact remains, the mining industry is the single largest source of toxic waste and one of the most destructive industries in the country. Today's industrial mining involves the blasting, deep excavating, and crushing of acres of land and the use of huge quantities of toxic chemicals such as cyanide and sulfuric acid.

But what about the new jobs?

**Ind 437-5**

Rise Gold states we can expect 612 new jobs, 312 of which are directly related to the mine operation. The other 300 are presumed to be increases in our current employment base, in response to the estimated 50 million new dollars being poured into our community. Two thirds of the 312 mine employees are to be current local residents. The remaining 104 employees, would be the top paid technical and managerial positions. Are any of these highly trained specialized employees already a part of our local community? Or will these positions more likely be outsourced? Will adding 104 new Grass Valley residents really induce a new local spending increase of $50M each year?

Do mine workers really earn $122,000 a year?

**Ind 437-6**

When Rise Gold says "average", they are including all salaries, including the top 1/3 salaried positions in the calculation of that average. This includes the CEO's anticipated very generous salary. Furthermore, Rise Gold's estimated worker earnings includes company-paid benefit costs that the employee never sees in their paycheck. The reality is an entry-level Miner can expect to earn an average total compensation (includes bonus and overtime pay) of $18.55/hour, based on a survey of typical existing salaries. An early career Miner earns $20.26, and an experienced Miner with 10-19 years of experience earns $27.56. (source: payscale.com). Truck drivers, janitors, front load operators, security staff, etc. will all be making the current going rate, with or without a mine.

**Ind 437-7**

Do we get to keep the gold? No, we don't. All of the gold and all of the profits will be leaving Grass Valley. The city of Grass Valley and Nevada County will not be receiving a piece of the gold pie. Any profits will go to the owners and shareholders of Rise Gold.

So what's in it for us?

**Ind 437-8**

That is a very good question. Grass Valley assumes all of the risks, and for what? It's a case of trading the family cow for a handful of magic beans. We would be risking so much for so very little; throwing away our beautiful quiet community, our neighbors, our scenery, our streams and rivers, our air quality, our water quality and habitat, our well paved traffic free streets, our peace and quiet, and our tax dollars for mitigation and reparation—24/7 for the next 80 years; for what?

## INDIVIDUAL LETTER 437: KATHLEEN MADEIRA

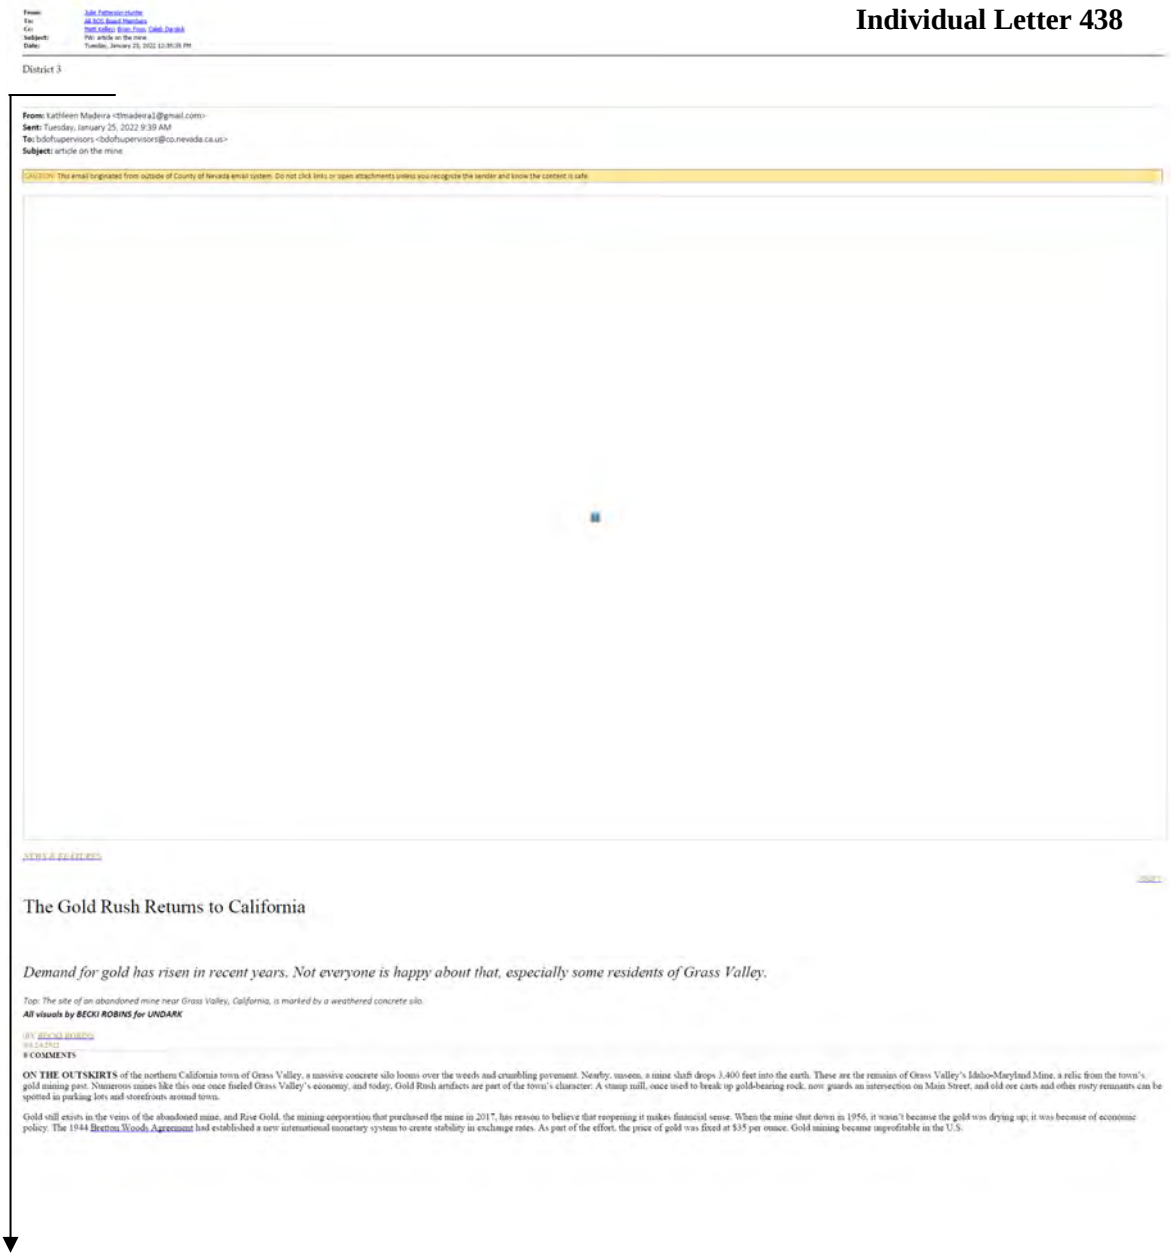
### Response to Comment Ind 437-1
The comment does not address the adequacy of the DEIR. Please see Master Response 1. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 437-2
The commenter generally summarizes the number of impacts analyzed in the DEIR, but does not address the adequacy. See Master Responses 1 and 2.

### Response to Comment Ind 437-3
The commenter expresses general concerns regarding the impacts of the project but does not specially address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 437-4
The DEIR has been prepared by a consultant hired and directed by the County. All technical reports used in the DEIR that were prepared by the Project Applicant have been independently peer reviewed by third party consultants hired by the County.

### Response to Comment Ind 437-5
Please see Master Response 2.



### Response to Comment Ind 437-6
Please see Master Response 2.

### Response to Comment Ind 437-7
Please see Master Responses 1 and 2.

### Response to Comment Ind 437-8
Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

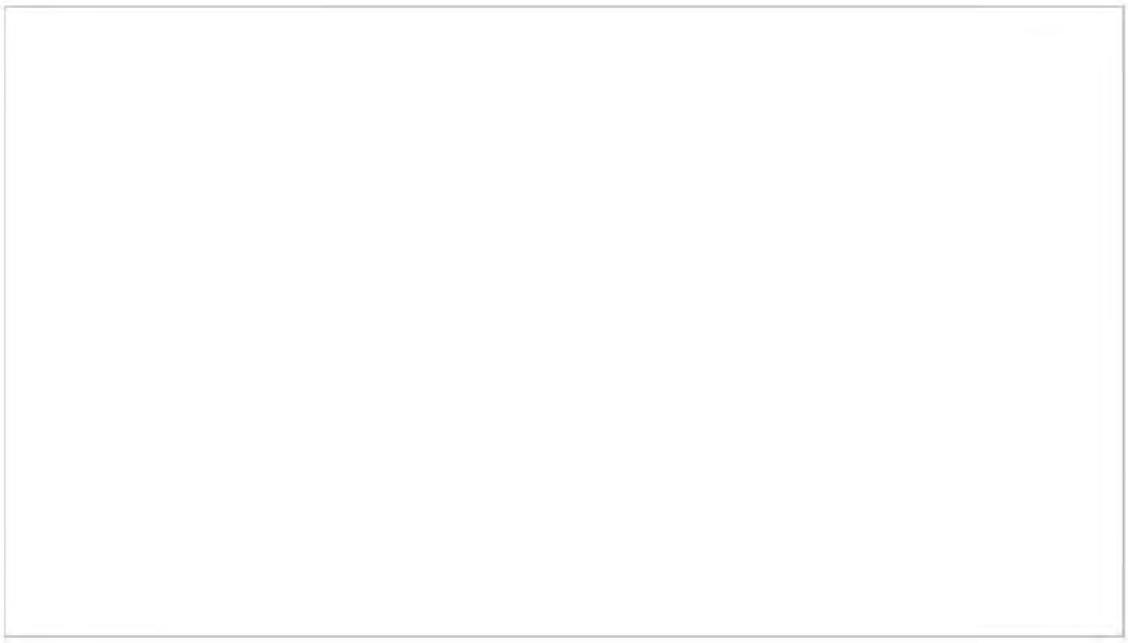
NEWS & FEATURES

The Gold Rush Returns to California



*Demand for gold has risen in recent years. Not everyone is happy about that, especially some residents of Grass Valley.*

*Top: The site of an abandoned mine near Grass Valley, California, is marked by a weathered concrete silo.*
***All visuals by BECKI ROBINS for UNDARK***

BY BECKI ROBINS
09.24.2021
**8 COMMENTS**

**ON THE OUTSKIRTS** of the northern California town of Grass Valley, a massive concrete silo looms over the weeds and crumbling pavement. Nearby, unseen, a mine shaft drops 3,400 feet into the earth. These are the remains of Grass Valley's Idaho-Maryland Mine, a relic from the town's gold mining past. Numerous mines like this one once fueled Grass Valley's economy, and today, Gold Rush artifacts are part of the town's character. A stamp mill, once used to break up gold-bearing rock, now guards an intersection on Main Street, and old ore carts and other rusty remnants can be spotted in parking lots and storefronts around town.

Gold still exists in the veins of the abandoned mine, and Rise Gold, the mining corporation that purchased the mine in 2017, has reason to believe that reopening it makes financial sense. When the mine shut down in 1956, it wasn't because the gold was drying up; it was because of economic policy. The 1944 Bretton Woods Agreement had established a new international monetary system to create stability in exchange rates. As part of the effort, the price of gold was fixed at $35 per ounce. Gold mining became unprofitable in the U.S.

RELATED

The Chinchillas and the Gold Mine

Today, the price of gold is no longer fixed, and prices have risen in response to the economic uncertainty wrought by Covid-19. At the start of the pandemic, the Federal Reserve lowered interest rates in an effort to stimulate

the U.S. economy and encourage borrowing money. But those record-low rates decreased the returns on bonds and savings accounts, making gold a relatively more attractive business investment.

Now, with inflation rising and renewed economic uncertainty over the omicron variant of the coronavirus, demand for gold remains high, even despite some recent [illegible]. In 2020, roughly 43 percent of gold consumed globally went towards exchange-traded funds and central banks. As prices have risen and mining technology has become more sophisticated, mines are opening and reopening in places where mining was once thought economically unfeasible.

Still, mining isn't as simple as it used to be. The U.S. Geological Survey estimates that of the world's known gold, roughly 63,000 tons are still in the ground, compared with roughly 206,000 tons that have already been mined. And the world's unmined gold is generally only unmined because it's deeper underground and thus less accessible. To obtain it, companies have to figure out what to do with huge amounts of mining waste, some of which contains heavy metals and other toxic substances.

Rise Gold has pledged to mitigate the environmental impact of its new mining operation in part by employing a technique called paste backfilling, which involves injecting a mixture of water, mine waste, and a binder (often cement) into mining tunnels. The practice helps provide structural support and reduce the amount of aboveground mine waste. There is some science to support the benefits of this approach, but it's only a partial solution, and there are lingering uncertainties about its long-term impact. While Rise Gold reports that there is strong support for the project throughout Nevada County, where Grass Valley is located, some local residents remain skeptical. Among other things, they are concerned that the new mining operation will not be able to adequately contain its waste.

Given these challenges, some economists are asking whether it makes sense to mine gold when the precious mineral is merely destined for a bank vault. "The cost of mining is high," says financial economist Dirk Baur. Much of the value of gold is tied up in the cost of just digging it out of the ground, he says. "There's some profit for the mining company, but a big, big chunk is just an expense."

**OVER THE PAST** couple of decades, proposals to develop or expand gold mining facilities have popped up across Europe and North America. In Northern Ireland, Dalradian Gold plans to open a mine in the Sperrin Mountains. In Newfoundland, Macathon Gold is slated to open an open-pit mine that the company says will be the largest gold mining operation in Atlantic Canada. In the United States, which, as of 2020, had the fourth-largest gold mine reserves in the world, mining operations have expanded in northwestern Arizona in recent years, and there are plans to reopen a mine in central Idaho. Many companies seeking to find new riches in old places face community pushback similar to what is happening in Grass Valley.

Gold mine opponents have good reason to be wary. Mining creates a lot of waste, including the rock that doesn't contain enough gold to extract (called "waste rock") and also the slurry left over after gold has been extracted from ore (called "tailings"). Both waste rock and tailings can contain toxic substances that threaten to pollute groundwater and surface waters if not properly mitigated.

Grass Valley has been dealing with the fallout of Gold Rush-era mining for decades. Arsenic, which occurs naturally in the gold deposits of the Sierra Nevada foothills, remains an ongoing problem in the area. Old tailings can still leach heavy metals decades after mining operations have ceased. In Grass Valley, the Central Valley Regional Water Quality Control Board documented high concentrations of arsenic in a pile of tailings nicknamed "the Red Dirt Pile." In 2020, high concentrations of lead, mercury, and arsenic were found in samples taken from a former mine waste disposal area that now supports approximately 4.5 acres of wetland habitat. That disposal area, known as the Centennial site, is owned by a subsidiary of Rise Gold called Rise Grass Valley.

The Centennial site was polluted enough to warrant consideration for listing as a federal Superfund site, but Rise Gold avoided federal regulation by agreeing to undertake its own cleanup. Ralph Silberstein, president of the Community Environmental Advocates Foundation, a local environmental organization, says his group welcomes Rise Gold's plans to address the hazardous substances that currently mar the area. But, he says, the group is troubled by what might come next. According to Rise Grass Valley's Remedial Action Plan, the company may take the freshly cleaned-up site and use it for dumping waste from "future mining operations," though they'll first have to get permission from the state.

Equipment labeled "Rise Gold Corp" sits at the Centennial site. The area now supports 4.5 acres of wetland habitat and was considered for listing as a federal Superfund site.

Rise Gold's plans to minimize the mine's impact are outlined in a draft environmental report, which Nevada County released this month, and which the company describes as "favorable." In an interview with Undark, Rise Gold's CEO, Ben Mossman, defended his company's plan to use the Centennial site for some of the waste produced in conjunction with the reopening of Grass Valley's Idaho-Maryland Mine. This particular mine is unique, said Mossman, because the company found "very little metal content" in the areas where it plans to dig. Because the waste will largely consist of non-toxic materials such as sand and rock, he says, "there's no geochemical concerns to the environment or human health" — a claim that activists question.

Even when rock has little or no heavy metals, disposing of it can be a significant challenge. According to Rise Gold's website, the Idaho-Maryland mining operation historically had to remove a ton of rock for every half ounce of gold it recovered. "These mining companies come along and they want us to not notice that they're going to have a huge amount of mine waste rock," says Elizabeth Martin, who recently retired as CEO of the Sierra Fund, a local conservation group based in nearby Nevada City. Rise Gold's draft environmental impact report says the plan will result in approximately 182,500 tons of material produced per year that will need to be transported then used as engineered fill. By comparison, a large dump truck can carry about 14 tons. Multiply that by more than 10,000, and the visual is "beyond most people's imagination," says Martin.

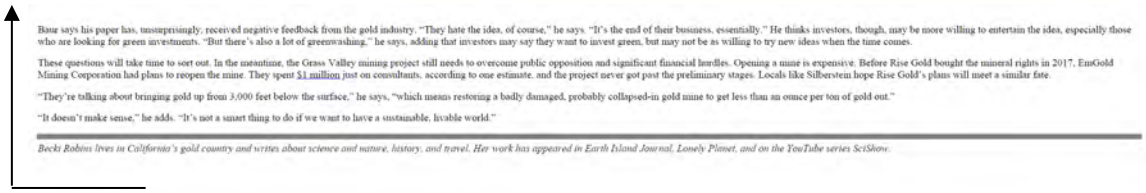
**RISE GOLD PLANS** to reduce its aboveground footprint at the Grass Valley mine with cemented paste backfill, which was first used in the 1970s as a way to recycle mine materials and help stabilize the underground workings. In essence, the mine becomes safer and the waste goes back to where it came from.

Paste backfilling is widely regarded as a more environmentally friendly way to dispose of mine waste. There is evidence that locking tailings up in cement decreases their permeability and stabilizes any heavy metals within them. There are still questions, though, about whether or not arsenic and heavy metals will stay put in the paste backfill material over the long term. The leaching behavior of arsenic depends on a lot of different factors, including the binder used in the backfill and the chemical content of the tailings. The biggest unknown is what happens in the future, when the mine closes and the pumps shut down, which will let groundwater flow into the backfilled tunnels. Some studies have noted that even low levels of leaching could continue for years, potentially contaminating drinking water or nearby rivers and streams.

> *"These mining companies come along and they want us to not notice that they're going to have a huge amount of mine waste rock," says Martin.*

Heavy metal leaching is high on the list of concerns in Grass Valley. Rise Gold promises their operations will be clean, but even so, the company's hydrology report does note arsenic leaching from some test samples. The leaching tests, meant to simulate what might happen to a waste rock pile when it rains, found that arsenic leached at concentrations 17 times greater than the water quality standards from samples of the mineral type serpentinite. Rise says that's not a concern since there will be very little serpentinite in the waste rock. Its report also notes that tests on tailings indicated arsenic leaching, but only at concentrations that would not exceed regulatory limits.

Underground mining operations also intersect with the water table, which means the existing tunnels have to be dewatered, and the water that's pumped out of the tunnels has to be treated before it's released aboveground. "The water coming from these mines that they're dewatering is full of arsenic, manganese, iron, and other heavy metals," says biologist Josie Crawford, executive director of the Wolf Creek Community Alliance, another local group that opposes the mine. "It will be treated, but it needs to be treated forever."



The water also has to go somewhere after it's been treated. Rise Gold plans to flush it down nearby South Fork Wolf Creek, a move that Crawford fears could cause damage to the riparian habitat. "It's a trout stream, so it's sensitive," she says. "If the dewatering starts scouring the creek, they could lose a lot of those invertebrates and ruin the trout habitat."

**CONSERVATIONISTS AND** community opposition groups often see gold mining as a battle between nature and greed, and question whether the pursuit of gold is really worth so much environmental destruction. So does Baur, the financial economist, who says it makes sense from both an environmental and economic perspective to just not mine for gold at all. Much of the gold that already exists above ground, he says, is held by banks and investment companies. Investors can buy shares of gold they've never even seen. Baur says they might as well just buy shares of gold that companies promise to leave in the ground. "You buy something that doesn't disrupt the land as much," he says, "and you don't have all the negative effects of the actual gold mining."

Baur recently explored this idea with a couple of his colleagues at the University of Western Australia Business School. In a 2021 paper, they proposed leaving unmined gold in the ground and letting "nature act as a natural vault and custodian legally protected by gold firms and the government." In this scenario, investors could buy stock in gold exploration companies that have identified underground gold but have no plans to mine it. This would give investors an alternative to purchasing shares of the aboveground gold that currently sits in bank vaults around the globe.

Would the unmined gold, which the paper calls "green gold," actually earn money for its investors? Baur and his coauthors considered the costs of gold exploration and gold mining, and the uncertainty of the quality and amount of gold that might exist in any given underground location. They then ran an empirical analysis, and concluded that unmined gold can still be a valuable investment.

A sign in the East Bennett neighborhood of Grass Valley reads "NO MINE." Several community groups in the area, concerned about heavy metal pollution and the vast amount of waste rock, are opposed to the mining project.

Baur says his paper has, unsurprisingly, received negative feedback from the gold industry. "They hate the idea, of course," he says. "It's the end of their business, essentially." He thinks investors, though, may be more willing to entertain the idea, especially those who are looking for green investments. "But there's also a lot of greenwashing," he says, adding that investors may say they want to invest green, but may not be as willing to try new ideas when the time comes.

These questions will take time to sort out. In the meantime, the Grass Valley mining project still needs to overcome public opposition and significant financial hurdles. Opening a mine is expensive. Before Rise Gold bought the mineral rights in 2017, EmGold Mining Corporation had plans to reopen the mine. They spent $1 million just on consultants, according to one estimate, and the project never got past the preliminary stages. Locals like Silberstein hope Rise Gold's plans will meet a similar fate.

"They're talking about bringing gold up from 3,000 feet below the surface," he says, "which means restoring a badly damaged, probably collapsed-in gold mine to get less than an ounce per ton of gold out."

"It doesn't make sense," he adds. "It's not a smart thing to do if we want to have a sustainable, livable world."

**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying career with an average expected annual earnings of more than $122,000 including benefi The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County worke and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other officials to jump start our local economy by strongly supporting the re-opening Idaho-Maryland Mine.

Nevada City, CA 95959

Re: Idaho-Maryland Mine Environmental Impact Report Study Comments

Dear Mr. Kelly:

**Ind 440-1** This correspondence is in reference to the letter sent allowing the public to provide comments on the Idaho-Maryland Mine Project EIR. I strongly disagree in allowing anyone to reopen the Idaho-Maryland Mine, or any other mine in or near Nevada County. There is no guarantee the problems that can occur due to the opening of the mine will not happen, regardless of the speculative content of the Environmental Impact report. What I see is a lot of rhetoric stating the pollution will not occur for various reasons. I do not see any proof of these words. Where is the example of a clean slate of pollutants after reopening a similar mine? What happened to the water wells in the San Juan Ridge area of Nevada County when mine activity occurred in the past?

**Ind 440-2** What I don't understand is why Nevada County continues to entertain the idea of reopening mines in the county? There are far too many people in Grass Valley to consider that any mine activity would not grossly interfere with human health, air quality, water quality, noise abatement restrictions, traffic problems, environmental disruptions and road quality problems, etc. Mining within a city is not conducive to a healthy living environment, particularly when Grass Valley has changed considerably since mining originated. This is no longer a city that is developing because a gold mine is in existence. It is a resort-like town that attracts people because of it's history and it has remained somewhat quaint due to restoring the old buildings and touting the days of yesteryear. The emphasis has been on cleaning up the environment and finding ways to keep pollution and big box stores at bay. It has taken years for all the previous mine work damage to subside. We have enough problems keeping things green and environmentally safe due to climate change and fossil fuel problems. Why would we want to take the chance the previously known environmental problems discussed in the EIR may come to the forefront? This city also has a large number of retired people. These are senior citizens who came here to live out their older years by taking advantage of the clean mountain air, beautiful landscapes and solitude. Many of these people, including my husband who has C.O.P.D./emphysema, have medical issues that would be greatly impaired with any chance of air or environmental quality issues due to reopening the Idaho-Maryland Mine. What a sad state of affairs to create problems for the very people who have helped keep this city alive.

**Ind 440-3** Even if the anti-pollution efforts in the EIR were found to be correct and not a problem, there is still the issue of a constant stream of dump trucks creating traffic, fumes, noise road destruction and the possible sparking of a fire due to our drought conditions. Water is so scarce in California, it is a poor idea to take the slightest chance that chemicals or

**Ind 440-4**

Page 2

any particulates not natural to everyday life be introduced to our rivers and streams. We don't want to worry about becoming a victim of anything similar to Flint, Michigan. Air quality is already a problem world wide The particulates are so microscopic it may take years to realize the damage to humans, plants and animals is occurring until it is too late to reverse the problem.

**Ind 440-5**

Do we really want to take the risk that all the problems the mine reopening could create will actually occur? Is it worth lining the pockets of people from a foreign country, by polluting our small town? I find it unlikely we will solve any employment problems from the reopening of the mine. Many of the jobs require highly qualified personnel. We can't refill the basic jobs from the pre-pandemic times, do you think the labor intensive jobs will be highly sought after? The unskilled jobs will continue to be filled from the poor, less educated, or undocumented people from other cities, states and countries. I predict a very small percentage of local people will gain employment from the reopening of the mine. Once the unskilled workers realize the work is unsavory, the workers will find other ways to make a living. Current residents are not looking for menial, hard labor positions, at least not as a long term job. The pandemic has proven the jobs people prefer are remote, computer oriented jobs.

**Ind 440-6**

There are no redeeming qualities in opening the Idaho-Maryland Mine or any other mine. If tax revenue is the advantage, it is a poor trade off for making sweeping changes to the city of Grass Valley, creating problems for the current residents of the area. Is the dollar so important that the very people who live in this area may suffer poor health and a polluted environment?

**Ind 440-7**

My only hope is that the Nevada County Board of Supervisors will think long and hard on voting in favor of the reopening of the Idaho-Maryland Mine. It is hard for me to believe the people who live in this county and have followed the news stories about the mine truly understand the problems that could and will arise due to reopening of this or any mine in our community. If we need revenue let's find a less disruptive method. I'm certain we could do some fund raisers or other ways of gaining funds.

**Ind 440-8**

Thank you for the opportunity to voice my opinion. I do hope you will consider what I have voiced as pertinent and valid. This is truly a life changing situation for me and for many people in Grass Valley. I would definitely need to make a major change in my retirement location if this mine were to be reopened. It would be extremely difficult and of great consternation.

Sincerely,

Kathleen Woodson

### Response to Comment Ind 440-1
Please see Master Responses 1 and 2.

Pursuant to the requirements set forth by CEQA Guidelines Section 15121, the DEIR assesses all potential project impacts that could occur to all environmental issue areas required for analysis under CEQA. As part of such assessment, the DEIR evaluates the proposed project's consistency with applicable policies, regulations, and standards established at the federal, State, and local levels and incorporates analyses from the County's expert consultants, which includes independent peer review. Where potential impacts are identified, the DEIR sets forth mitigation measures to reduce the severity level of the identified impacts to the extent feasible and discloses the level of impact that would occur subsequent to incorporation of mitigation. As such, the analysis within the DEIR is not speculative. The analysis in the DEIR is adequate and meets the requirements set forth by the CEQA Guidelines. In its role as the lead agency, the County of Nevada will consider the information in the DEIR along with other information that may be presented to the agency in deciding whether to approve the project.

**Individual Letter 441**

April 2, 2022

To: Matt Kelley, Senior Planner

Nevada County Planning Department
950 Maidu Ave, Suite 170
Nevada City, CA
530-265-1423
Matt.Kelley@co.nevada.ca.us
Idaho.MMEIR@co.nevada.ca.us

Attn: Matt Kelley

Please include these comments to the Idaho-Maryland Mine DEIR:

Sierra Streams Institute, a regional watershed science organization located in Nevada City, initiated a project in 2014 entitled, "Community Health Impacts from Mining Exposure, or CHIME." This project was a response to concerned Nevada County residents who asked Sierra Streams to investigate if there was any connection between Nevada County's high breast cancer rate and heavy metals from historical mining still present in the environment. The project was guided by a group of local community members called the community advisory board of whom I was member. *(https://sierrastreamsinstitute.org/research/)*

**Ind 441-1**

The CHIME study was funded by state tobacco taxes through the California Breast Cancer Research Program. It investigated the concentrations of heavy metals, like cadmium and arsenic, in a group of approximately 100 Nevada County women. It not only found interesting links between body burden (the total amount of a particular chemical present in a human's body) and the amount of time living in the area, but was also able to educate the community about the health hazards of heavy metal exposure. The second phase of the study focused on the amount of cadmium and arsenic in the bodies of women with and without breast cancer residing in historical Gold Country.

These two metals are of interest because they are found at high levels throughout the Gold Country, are known carcinogens and may play a role in developing breast cancer. The three most populous counties in the Gold Country, including Nevada County, have breast cancer rates that rank in the top ten counties in California. *(http://cancer-rates.info/ca/)*

According to the DEIR:

"Blasting and crushing would also result in emissions of dust with trace heavy metals TACs including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium and vanadium. Concentrations of each heavy metal within the barren rock and mineralized rock was taken from Table 4-7 of the *Groundwater Hydrology and Water Quality Analysis Report for the Idaho-Maryland Mine Project* (EMKO Environmentoal, Inc. 2020)"

The DEIR fails to respond adequately to how it would mitigate the issue of contaminated soil and dust. This is of great concern given that the CHIME study has already shown that there is an increase in the risk of cancer in our community due to this exposure. We are currently dealing with one of the highest rates of breast cancer in California.

**Ind 441-2**

Why would we want to add to the toxic burden that our county is already experiencing?

Thank you,

Kathryn Eldredge

## INDIVIDUAL LETTER 441: KATHRYN ELDREDGE

### Response to Comment Ind 441-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 441-2

Please see Master Responses 12 and 18 through 23. In addition, please see the analysis under Impact 4.3-2, which evaluates potential impacts related to exposure of sensitive receptors to substantial pollutant concentrations, starts on page 4.3-78 of the DEIR, and includes a health risk assessment, the results of which are summarized in Table 4.3-21 on page 4.3-80 of the DEIR. As part of the analysis, the DEIR assesses potential dust impacts. Because the potential impact is concluded to be significant without mitigation, the DEIR sets forth Mitigation Measure 4.3-2 to ensure project consistency with the CARB Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying and Surface Mining Operations by requiring preparation and implementation of an Asbestos Dust Mitigation Plan (ADMP). With implementation of Mitigation Measure 4.3-2, the DEIR concludes a less-than-significant impact would occur.

**Ind 442-1**

I Katrina, reside in Nevada County and am opposed to the Mine. This project would cause major depletion of groundwater reserves with plans to pump millions of gallons a day, contaminate local wells which we are still dealing with the repercussions from. The Nisenan people have not been consulted, there will be nice pollution from trucks right in the middle of quiet neighborhoods. The people who live here do not want to contaminate this precious land and water systems to create a few jobs and have a mess to clean up later. Water is a precious commodity and also this will likely crush tourism which brings money into our town. This wouldn't just effect our town, but surrounding communities as well. Listen to the people who live here and not money hungry corporations. Put efforts into clean energy deals.

## INDIVIDUAL LETTER 442: KATRINA CHRISTENSON

### Response to Comment Ind 442-1

Please see Master Responses 14 and 15 regarding groundwater. In addition, as detailed in Chapter 4.5, Cultural and Tribal Cultural Resources, of the DEIR on page 4.5-21, InContext contacted Native American tribes with the potential to have knowledge of cultural resources in the project area, which included the Nevada City Rancheria Nisenan Tribe. Reponses were not received from any of the tribes. Furthermore, on November 25, 2019, Nevada County sent project notification letters with offers to consult pursuant to AB 52 to Native American tribes who had previously requested to be notified by the County. The tribes contacted by the County pursuant to AB 52 included the Nevada City Rancheria Nisenan Tribe. The Nevada City Rancheria Nisenan Tribe did not respond within the 30-day consultation period. Finally, please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

RECEIVED
MAR 24 2022
NEVADA COUNTY
PLANNING DEPARTMENT

**Ind 443-1**

I moved to Grass Valley four years ago and I love the town and the people and the many local environmental groups that energize this community to create a strong bond with the natural beauty in this county.

But, that's not to say that living here is without it's challenges including a perrenial fire season, power outaages and home insurance at astronomical rates.

**Ind 443-2**

All of this is to say that in spite of the friends I've made and my connections to this community my roots here do not yet run deep.

Please vote this mine down. Don't tip the ~~sca~~ scale any more in favor of moving out of this area. Don't put in peril what people live in this area for. I lived in Oroville ~~during~~ during the Spillway repair. The amount of traffic caused by the trucks impacted our quality of life but at least it was for the greater good, not the potential profit of a foreign company!

**Ind 443-3**

Please vote no. Kmaston

Dear Members of the Nevada County Planning Commission, Nevada County Board of Supervisors, and Nevada County Planning Department Staff,

**Ind 444-1**

I am writing to voice my opposition to the proposed plan to reopen the Idaho-Maryland Mine. The DEIR report clearly outlines several threats to our environment and our community's well-being. I am particularly concerned about the use of water (draining of our local groundwater/wells) as well as the proposed waste water dumping. At a time when our water resources are already severely threatened, this plan would exacerbate the deteriorating environmental conditions in our county. Although the DEIR report claims to have made ample plans to mitigate environmental impact, the report outlines several changes that would in full certainty negatively affect our environment notwithstanding the ever present danger of a repeat disaster like the Siskon Mine Well. Our community is centered around our beautiful natural environment, as is our tourism industry, and locals will continue to prioritize our future over a cheap deal with a dirty mine.

Thank you,
Kayla Koontz

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Hi there,

**Ind 445-1** I hope that this note finds you and yours safe and healthy. I am writing in regard to the proposal surrounding reopening the Idaho Maryland mine in Grass Valley, CA.

I am not in favor of the re-opening based on multiple reasons.

**Ind 445-2** One, it will cause massive depletion of groundwater reserves to the plants based on the millions of gallons of water per day needed to power the mining initiatives. Next, I am extremely concerned about the local wells that will be contaminated. Also, we have seen the damage that previous mining has done to this community. I am in favor of

**Ind 445-3** learning from past missteps. The Nisenan people whose land this mine would be on have not been consulted or given

**Ind 445-4** their blessing to move forward. The noise pollution based on close-quartered neighborhoods is another concern of this

**Ind 445-5** operation taking place. Finally, looking at the CEO's last venture, it ended up polluting tribal waters, followed by bankruptcy, and a mess for locals to clean up.

**Ind 445-6** Thank you for taking the time to review my concerns. I was raised in Nevada County. It's such a beautiful and special place. I urge you to please consider what would be lost if this project were to move forward. Please let me know if you have any questions.

With kind regards,

Kayla Pearson

**Individual Letter 446**

April 4, 2022

To: Matt Kelley, Senior Planner
or to whom it may concern

Re: Proposed opening of the Idaho-Maryland Mine

Dear Sir, My name is Keith A. Brown and I reside at 13936 Downwind Ct. My home will be negatively affected if this project is approved. I am heartily against this project. I understand that this mine closed in 1954 and with that Nevada County made the conscious decision to allow 68 years of urbanization up to the mine property. And now 68 years later they want to reverse this decision. This is unconscionable to consider approving this project to the detriment of the many property owners who will now suffer loss as to their property values and especially their water wells. I don't understand this thinking. Nevada County needs to stand by their decision that they made many years ago and protect their citizens.

**Ind 446-1**

Just a couple of observations: First, to dewater the mine will cause many wells to go dry. In my case NID put a water main down our road (Downwind Ct.) several years ago to connect their main up by the airport to their main at Brunswick Rd. In doing this we who live on Downwind Ct. specifically asked NID if while they were doing the construction could they add a lateral to the main so that we could obtain water in case the mine went thru. They told us no because the water main was so large that they would have to put in a pressure reducing station due to the pressure off the main and that was cost prohibitive for only a few connections. Therefore, NID water is not available if my well goes dry. By the way your letter states a water line will go along East Bennett which doers not help us here. What recourse will us well owners have if our wells go dry? Who will pay for new wells? What mechanism is in place for claims? How long would it take to get compensation? Also to dewater the mine means pumping out millions of gallons of tainted water (arsenic and mercury) and where will that go? And doing this during a drought. This makes no sense.

**Ind 446-2**

Next, the traffic on Brunswick, with their trucks running 24/7, will be chaos. There is the new housing subdivision (200 units) on Brunswick and Idaho-Maryland. Now you add the trucks and this will be a mess as well as the pounding the roads will take.

**Ind 446-3**

There will noise and vibration from underground blasting. All of this will seriously affect property values. Who will monetarily reimburse us for the lost value on our homes?

**Ind 446-4**

This will be an environmental disaster with no real benefit to Nevada County except a few jobs. Terrible trade off.

**Ind 446-5**

I have lived here since 1984. This will totally disrupt my life. This is not fair and this companies track record is horrible, with regard to maintenance and clean up. This has

**Ind 446-6**

been going on since the mid-nineties with Emperor Gold trying to open the mine. I am strongly opposed to this project. I pray that Nevada County will do the right and sane thing and not approve this project and protect their citizens. Thank you.

Regards, Keith A. Brown

## INDIVIDUAL LETTER 446: KEITH BROWN

### Response to Comment Ind 446-1
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2.

### Response to Comment Ind 446-2
Please see Master Responses13 through 16 regarding groundwater.

### Response to Comment Ind 446-3
Traffic is addressed in Chapter 4.12, Transportation of the DEIR. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 446-4
Noise and vibration are addressed in Chapter 4.10, Noise and Vibration of the DEIR. Please see Master Responses 1 and 2. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 446-5
Please see Master Response 2.

### Response to Comment Ind 446-6
Please see Master Responses 1 through 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 447**

**From:** Keith Thomassen <kthomassen@mac.com>
**Sent:** Wednesday, March 30, 2022 3:01 PM

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

**Ind 447-1**

You don't need to be an expert in any of the technical areas of the envrironmental report on the mine to make a sensible judgement on whether this mine should operate in Grass Valley. It simply doesn't pass the smell test. We all know the devastation that mining has created locally and elsewhere, with long lasting effects that has required expensive cleanup. And we know that the last project of the managers of this proposed mine ended badly for the environment; not a comforting thought as to whether they would do any better here. Finally, in my view, entrusting our environment to any company, let alone this one, to be conscientious stewards of this project for 80 years is unthinkable. The activity associated with this project is totally inconsistent with the kind of city we have become; one sought by people wanting a more quiet life from that in bigger cities, in a charming town with a variety of arts and entertainment, good restaurants, and outdoor activities in a scenic setting. If the project is approved I predict an exodus from the area of people and possibly businesses. I have personally heard, as have a number of my friends, of people coming to the area looking for housing only to walk away when they hear of the mine project.

Keith Thomassen
Grass Valley resident

**From:** Kelly Holland <kholland2920@gmail.com>
**Sent:** Monday, April 4, 2022 3:25 PM
**To:** Idaho MMEIR
**Cc:** DEIRcomments@cea-nc.org
**Subject:** Concerns for Opening Idaho Maryland Mine by Rise Gold

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Matt Kelly and Nevada County Board of Supervisors,

**Ind 448-1** I am writing this email as a concerned citizen of Nevada County living here for over 22 years. I have had the opportunity to work and raise a family in this county. I am currently living near Memorial Park off Highway 174, one of the areas that will be affected by the 24/7 truck traffic. I was excited with all the renovations being done at Memorial Park, then learned if the Idaho Maryland mine opens, it will impact the peace and quiet of that area, because the truck traffic will be along highway 174. The truck traffic will be detrimental with the noise and air pollution caused by the non-stop truck trips. Below are some of my concerns with the mine opening. There are many, but I will focus on just a few that are quite concerning.

**Ind 448-2** 1. Truck traffic - up to 100 one way trips a day, 7 days a week, 16 hours a day!
**Ind 448-3** 2. Grading and rock compacting noise - 5 days a week for 11 years!
**Ind 448-4** 3. Noise - from compacting, excavating and grading engineered fill piles up to seven stories tall. The excavating and grading could affect spare the air days and our already high ozone area with rock particles floating in the airways.
**Ind 448-5** 4. Noise and vibration from the underground blasting and drilling.
**Ind 448-6** 5. Rezoning will raise the current limits to include more noise and traffic.
**Ind 448-7** 6. Concerned that home values will drop (have heard $50,000 - $100,000) that are within a seven mile radius of the mine.
**Ind 448-8** 7. Dewatering all the tunnels. Grass Valley and Nevada City are built with tunnels under them. If the water is drained, what impact will that have on the ground structure? Could it contribute to sinkholes in and around the mine area? What about the contamination of the existing wells that could run dry? What about the arsenic and other chemicals that could leach into the water systems? It has been over 60 years since Empire Mine closed and there are still contaminants found in the waters.

**Ind 448-9** These are just a few of my main concerns and questions. There are many other concerns I have with Rise Gold opening the Idaho Maryland mine that I have not mentioned. My husband and I love this area, but have considered selling if the mine gets approved. Our grown children have even come back to live in this area, and it saddens me to think what will happen to this county if this mine gets approved.

Thank you,

Kelly and Jim Holland
Grass Valley, CA

**Ind 449-1**

There is literally no good reason other than the greed of a few people, for this mine to go ahead.

This community will be heavily impacted negatively for potentially centuries to come.

The water will be poisoned, the habitat & local animals & fish will be negatively effected

The reasons behind this movement do not justify the impact.

**Subject:** Comment on EIR and proposed reopening of the mine
**Date:** Friday, February 4, 2022 9:07:32 AM

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Attention: Matt Kelly

**Ind 450-1** As a resident of Nevada City, I am opposed to reactivating the Idaho Maryland Mine. During my 48-year career, I spent many years preparing and/or reviewing Environmental Impact Reports. This EIR, in my experienced opinion, skews the data to downplay environmental impacts from truck traffic in particular and operations in general and exaggerate the jobs and other economic benefits of the mine. Their proposed use of our water would seem to be reason enough to deny acceptance of the EIR.

**Ind 450-2** I hope the Planning Commission and Board of Supervisors do not allow the lure of tax dollars to blind their understanding of the harm mine operations will cause to our quality of life. Grass Valley and Nevada City are rare gems among California's livable cities. While many other areas in our state may be acceptable for this kind of heavy industry and related pollution, we must protect our fragile forests, air quality, and precious few water resources. Please do not make the mistake of thinking this EIR adequately describes the mine's immediate or long-term affects on our unique, treasured way of life here in Nevada City/Grass Valley.

Sincerely,
Kendal Smeeth

Dear County of Nevada

**Ind 451-1** I am writing to ask you on bended knees NOT to allow the mine to go through. I'm not quite sure why this is even a question, as you must've known from the start the PEOPLE of this county do not want it in our beautiful home. I can only think that your motivation is to bring tax dollars into our county, but you must know that is not enough. Those dollars will end up cleaning up the mess left by the mine and all the people this mine has affected. Please represent your people and understand that the almighty dollar is not that important. We must maintain our beautiful quality of life.

**Ind 451-2** Remember also, that no matter what they say, there will be problems with this endeavor. Wells will go dry and become contaminated. Who will fix that? Not the mine. Not the county. Are you going to leave us stranded?

**Ind 451-3** Our property values will go down, as who wants to live by a noisy, dirty mine and worry about our wells. Are you going to leave us stranded?

**Ind 451-4** Who will protect us from pollution, increased traffic and cave ins? Are you going to leave us stranded?

No matter what the studies say, we will have problems and all of them will fall on the people you represent. Is that right?

Let's do what is right and not what looks to be a money maker. Please protect the people and the environment you represent

Thank you

Kerry and Sue Anderson

**I support re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new well-paying jobs that can provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 600 new employees in safe and satisfying careers with an average expected annual earnings of more than $92,000 including benefits. The mine will also spur an additional 300 jobs through related new businesses in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

NO! We do NOT support re-opening the mine.

**RE: Idaho-Maryland Mine**

Dear Supervisor Hall,

**Ind 454-1** I have been a Nevada County resident for over 20 years. I am very concerned about the harmful impacts of the Idaho-Maryland Mine, regarding noise pollution and quality of life.

For two years I lived on Dorsey Drive in Grass Valley, which became a commonly used road for large trucks after the onramps and offramps were installed. The constant noise from random large vehicles was unbearable and I moved. I sure wouldn't want to live near a dedicated mining operation.

There are many questionable claims made by Rise Gold, which seems to be a troubled and untrustworthy company, which is reason enough to be skeptical of their intentions.

**Ind 454-2** Please do not approve the Idaho-Maryland mine project.

Do the right thing and protect our community.

Thank you,

Kim James

## INDIVIDUAL LETTER 454: KIM JAMES

### Response to Comment Ind 454-1

Noise is addressed in Chapter 4.10, Noise and Vibration of the DEIR. Please see Master Responses 1 and 2. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 454-2

Please see Master Responses 1 through 3. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 455**

January 30, 2022

Matt Kelley
Senior Planner
Nevada County Planning Department
Idaho.MMEIR@co.nevada.ca.us

Mr. Kelley

I am submitting comments on technical evaluations presented in the Idaho-Maryland Mine Project DEIR.

**Ind 455-1**

1. **Carbon offset plans for GHG mitigation**: The county should require that these carbon offsets be purchased from Nevada County/ surrounding county sources and there should be a bond in place that guarantees performance of these offsets for at least 10 years before the project applicants' responsibility is complete. There are several reasons for this. First, carbon offsets are extremely difficult to measure and guarantee. Having the offsets be local would allow oversight of performance. Second, Nevada County needs to move towards climate change resiliency and a lower carbon future. Keeping the benefits of the GHG carbon offsets in the same place as the environmental costs of the mine is consistent with sustainable practice.

**Ind 455-2**

2. **Groundwater monitoring wells**: Previous hydrologic studies in Nevada County have concluded that the fractured bedrock aquifer supplies water to do not work the same way alluvial aquifers do. Water levels at one site may have completely different response times than water levels at a nearby site because the fracture networks supplying those wells may not be connected. As a result, using area-wide potentiometric contour maps as a means of evaluating dewatering impacts is not appropriate. Additionally, local precipitation is highly variable, meaning that groundwater levels in individual wells will probably vary with the frequency of major storm events.

   A scientifically defensible water level monitoring network requires measuring water levels at a frequency greater than anticipated changes in order to clearly ascertain the difference between natural recharge, current hyper-local water uses, and the impact of the project's dewatering. In addition, the network of water monitoring sites must extend outside the subsurface footprint of the mine tunnels (the underground minerals rights area) and include wells in riparian zones to track where groundwater depletion may begin affecting surface water flows.

   The current plan is technically insufficient because it does not require the spatial extent and frequency needed to provide an early-warning for irreversible dewatering impacts. It also allows for improper seasonal averaging of data and for improper averaging of water level measurements across the site when impacts could be severe and unmitigated in a portion of the site.

**Ind 455-3**

3. **Groundwater depletion mitigation**: The current plan for mitigation of groundwater depletion impacts (4.8-2(b)) says the "project shall be responsible for providing a comparable supply of water to such homes and businesses whose wells are significantly impacted." This plan presumes that water is available for purchase to provide that supply, and that NID or deeper wells will be able to provide the water in question.

This graph shows the overall decline in the county's groundwater levels since 1970s due to the increased number of domestic wells and population.

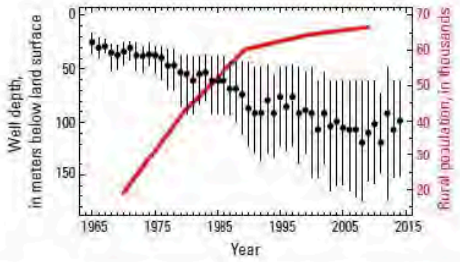

**Figure 2.** Well-completion depths in the study area binned by year: points represent the median of annual data and whiskers span the interquartile range. Rural population (red line) represents census population data for the unincorporated area of Nevada County from 1970 to 2010.

During droughts, many of the existing wells in the County are already running dry, so having the project proponent deepen an affected well may not end up providing a reliable source of water over the long-term. The plan also relies on NID being able and willing to extend service. The project should not move forward unless and until NID provides documentation about how much backfill water supply the agency can actually provide beyond the estimated 30 homes. The determination that there is a less than significant impact on public services 4.11-10 is inaccurate and based on incomplete analyses.

For scale, the initial dewatering volume is estimated to be 2500AF over the first six months of operation and 1376 AF/ year on an ongoing basis (p. 177 and p. 3-18) . NID currently supplied 8657AF to all public water supply customers in 2020 (NID Urban water management plan). In other words, the project is planning to send about **one third of the volume of NID's total annual treated water supply downstream in the first six months of pumping; continuous dewatering estimates are for a volume equal to about 16% of total treated water supply to be sent downstream.** These are, of course, estimates. The actual amount could be vastly different. The County needs to have plans in place that would require cessation of dewatering if the actual performance of the project ends up with different water volumes/ dewatering impacts than projected.

SB 552 was enacted on September 23,2021 and requires the County to plan for and facilitate water shortage preparedness planning. The potential impact of dewatering and exporting per year volume of water from the County should be evaluated in the context of future drought resiliency before this project is approved. The legal distinction that groundwater in Nevada County is not part of a groundwater basin is a technical justification for avoiding this issue. It is not sound policy or science, and the County has a duty to consider long-term sustainability regardless.

Respectfully,
Kim Taylor, 10231 Mills Rd Grass Valley 95945

## INDIVIDUAL LETTER 455: KIM TAYLOR

### Response to Comment Ind 455-1

The commenter asserts that the carbon credits that are to be purchased as mitigation for the project's GHG emissions should involve a bond to ensure performance and should also be purchased locally. The requirements for carbon credits are detailed in Mitigation Measure 4.3-7(b) of the DEIR. Also, please see Master Response 28 – Greenhouse Gas Credits.

As specified in Mitigation Measure 4.3-7(b), the carbon offset must be retired prior to the issuance of the project's first grading permit and therefore a bond is not required. The mitigation measure requires an instrument, credit or other certification issued by the specified registries for GHG reduction activities within the Nevada County region. Global climate change is by definition a global impact; therefore, purchase of credits from offsets produced locally would not reduce the impact or change the effectiveness of the mitigation.

### Response to Comment Ind 455-2

The commenter states that previous studies in Nevada County have determined that fractured bedrock aquifers do not work the same way as alluvial aquifers and that use of area-wide contour maps is not appropriate. The commenter does not provide the name or details of previous hydraulic studies in Nevada County which conclude that the fractured bedrock aquifer does not work the same way as alluvial aquifers. However, Section 3.4.4 of Appendix K.2 and Section 4.8.2 of the DEIR (at page 4.8-18) discuss the flow of groundwater within fractured bedrock in the project area. The groundwater model used an appropriate methodology to predict groundwater drawdown from mine dewatering in bedrock, and is not assuming that water in bedrock is exactly the same as in an alluvial aquifer. Please see Master Response 14 – Adequacy of Groundwater Model.

The commenter states that local precipitation is highly variable and groundwater levels in individual weeks will probably vary with the frequency of major storm events. Due to variations in topography, for example between downtown Grass Valley and on Banner Mountain, local variation in precipitation may be appreciable. However, as discussed in Section 3.2 and shown on Figure 3-4 of Appendix K.2 of the DEIR, rainfall variation between wet and dry climatic cycles can vary by more than a factor of three. Despite this magnitude of variation, the available data shows that seasonal cycles in groundwater levels in local domestic supply wells remain relatively consistent from year to year and do not show any notable fluctuations in response to very wet years or very dry years, as shown on the hydrographs in Appendix B of Appendix K.2 of the DEIR and discussed in Section 4.8.2 of the DEIR (at pages 4.8-11 to 4.8-12). Thus, potential variations to recharge and the effects on groundwater levels has been considered in the DEIR, based on both local rainfall data and actual monitoring data from local groundwater wells. No groundwater level measurements have been completed since 2007, which creates some uncertainty to the predicted impact to percentage of water column in domestic wells. Uncertainty in predicted impacts is addressed through the various sensitivity scenarios discussed in Appendix K.3, the application of a 100% factor of safety (see page 4.8-58 of the DEIR), and the proposed connection of 30 properties, including properties where no significant impact is predicted, in the E. Bennett area to NID potable water (see page 4.8-66 of the DEIR). Nevertheless, the analysis in Chapter 4.8 of DEIR has determined that the project could result in a significant impact to groundwater supplies without implementation of a groundwater monitoring program and well mitigation plan. Mitigation Measure 4.8-2(a) requires that a minimum of 12 months of water-level monitoring data is collected before commencement of dewatering. Impacts to domestic water wells will be measured against those current baseline measurements and not historic water levels. Mitigation

Measure 4.8-2(b) requires well mitigation if, based the groundwater monitoring plan, a 10 percent reduction in the water column of a well is determined. Therefore, the determination of impact would be based on current water level data and any impacts to domestic wells would be mitigated through the proposed mitigation measures.

The commenter states that water level monitoring requires monitoring of water levels at a frequency greater than expected changes in order to ascertain the difference between natural recharge and the impact of the project's dewatering. The well monitoring plan incorporates the collection of water level data for 12 months prior to the commencement of dewatering. This baseline information allows the effects of natural recharge, and seasonal variability, to be accounted for in the measurement of the effect on water levels from mine dewatering. Monitoring wells are also located outside of the impact area of mine dewatering to measure regional changes in water levels in order to differentiate groundwater drawdown from mining versus background conditions. As stated on page 13 of Appendix K.8, each monitoring well will be equipped with a downhole submersible data logger that will record water levels over time. The data logger will be programmed to collect water-level information on a periodic basis, such as once every 1 to 4 hours. Therefore, water level monitoring will be collected at a frequency greater than expected changes and can be collected at appropriate intervals to measure the response to mine dewatering. Seasonal averaging of data or water level measurements would occur as claimed by the commenter. The network of water monitoring wells is planned to extend outside of the subsurface footprint of the mine tunnels (see Appendix K.8). The location of underground mineral rights boundaries is irrelevant as the location of existing and proposed underground mine workings will determine the impact to groundwater levels.

Monitoring wells in riparian zones are not required. Mine dewatering will not impact riparian zone or groundwater dependant vegetation. Please see Master Response 33 – Groundwater Dependent Vegetation. The project will not significantly affect surface water flows, see page 4.8-65 of the DEIR.

Please also see Master Response 7 – Location of Future Mining Areas. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, for an updated description of the proposed monitoring approach, which now also includes a proposal by the applicant to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Ind 455-3

The commenter provides a graph of well depths in Nevada County from the period of 1970 through 2010 but does not provide the source of this material to allow for an evaluation or a technical response. As disclosed in Section 3.3.2.2 of Appendix K.2 of the DEIR, the water levels in the private domestic wells have seasonal fluctuations that may range from 10 feet to 50 feet between wet and dry times of the year, but remain relatively consistent from year to year within each individual well. During the monitoring period, several years with below normal rainfall occurred (2001, 2004, and 2007), multiple years with above normal rainfall occurred (1995-1998 and 2006), and several years of near-normal rainfall occurred (1999, 2000, 2002, 2003, 2005). Despite large variations in annual rainfall from year to year, the seasonal water level cycles in individual wells remained consistent over time and the overall water levels shown on the hydrographs for each well do not fluctuate based on wet or dry climatic cycles. The analysis in the DEIR relied upon local data from wells in the project vicinity. Without a source citation or the actual data upon which this comment is based, the County does not have a basis upon which to compare it with the data

relied upon for the EIR. No groundwater level measurements have been completed since 2007, which creates some uncertainty to the predicted impact to percentage of water column in domestic wells. Uncertainty in predicted impacts is addressed through the various sensitivity scenarios discussed in Appendix K.3, the application of a 100% factor of safety (see page 4.8-58 of the DEIR), and the proposed connection of 30 properties, including properties where no significant impact is predicted, in the E. Bennett area to NID potable water (see page 4.8-66 of the DEIR). Nevertheless, the analysis in Chapter 4.8 of DEIR has determined that the project could result in a significant impact to groundwater supplies without implementation of a groundwater monitoring program and well mitigation plan. Mitigation Measure 4.8-2(a) requires that a minimum of 12 months of water-level monitoring data is collected before commencement of dewatering. Impacts to domestic water wells will be measured against those current baseline measurements and not historic water levels. Mitigation Measure 4.8-2(b) requires well mitigation if, based the groundwater monitoring plan, a 10 percent reduction in the water column of a well is determined. Therefore, the determination of impact would be based on current water level data and any impacts to domestic wells would be mitigated through the proposed mitigation measures.

As discussed in the Well Mitigation Plan, if a dewatering impact to an area outside of the E. Bennett area were projected during operations, pre-emptive action would be taken as necessary to ensure immediate water supply and compensation. The comment is incorrect in stating (with underline added for emphasis) that the mitigation plan presumes that water is available to purchase, since one of the options under the plan is to deepen an affected well. Well deepening does not require purchase of any water. In addition, if reduction of the water column in a well was great enough to reduce the well's yield, adjustment of the pumping system may only be required; for example, by pumping at a lesser rate over a longer duration and installing or increasing the size of a pressure or holding tank. In the unlikely case where these measures were not sufficient, appropriate mitigation could be the deepening of a single well, drilling of a new well, or the provision of potable water service.

Comparison of the volume of water that would be pumped from the mine with NID's treated water supply is not relevant. The treated water supply is provided by NID's "upper division" surface water system that relies on annual snowmelt and available reservoir capacity. The water pumped from the mine will consist of seepage of groundwater into the underground workings from depths that are considerably deeper than local groundwater supply wells. Mitigation measures in the DEIR and parts of the County Code define the actions that the operator would need to take if any wells are impacted by the project. If those measures are not or cannot be successfully implemented, then the County would have the ability to issue a Notice of Violation of the permit and could require cessation of dewatering if the violation is not corrected. Thus, such plans are already in place.

Senate Bill 552 of 2021 applies to small water suppliers with fewer than 1,000 connections and to schools that maintain their own water system. Other existing regulations related to water shortage planning already apply to NID, which has approximately 25,000 connections (see https://www.nidwater.com/our-story) and the County. Both NID and the County are in compliance with applicable drought resiliency requirements.

**To:** Idaho MMEIR
**Subject:** DEIR deficiencies

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Mr. Matt Kelley,

My name is Kimberly Cappa, I am in District 3, I retired to this beautiful community 5 years ago.

**Ind 456-1** I spent my career at an oil refinery in the bay area. As much as you like to think that safety is #1...there is ALWAYS going to be mechanical failure or human failure for that matter. This is why I am against the re-opening of the Idaho-Maryland mine.

**Ind 456-2** After looking over the DEIR, I believe there are some impacts that ARE NOT going to be mitigated. The greenhouse gas emissions are unavoidable. I know from working at the refinery 23 years that California keeps working to get those emissions numbers down. Our legislators have passed a climate policy to reduce GHG. What Rise Gold acknowledges now, MIGHT be within the limit, but in 2030 it will be OVER the limit. And years into the future even worse, it just isn't feasible. And if they think they can purchase carbon offsets they are wrong and California will say NO DEAL.

**Ind 456-3** There are other impacts I don't think they can mitigate such as the noise levels, fire and explosion evacuations, groundwater issues, explosives in transit/storage and loss of habitat for local birds and animals.

**Ind 456-4** Another important thing I'd like to comment on is the fact that the DEIR did not even mention that this will bring property values down. We don't want spoiled air, land or water in our backyard.

Thank you for taking the time to hear my concerns,
Kimberly Cappa

## INDIVIDUAL LETTER 456: KIMBERLY CAPPA

### Response to Comment Ind 456-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1 Non-EIR/Administrative Issues.

### Response to Comment Ind 456-2

Please see Master Responses 25 through 28. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 456-3

Noise is addressed in Chapter 4.10, Noise and Vibration of the DEIR. Evacuations are addressed in Master Response 5 – Evacuation Zones. Please see Master Responses 13 through 16 regarding groundwater. Hazards are addressed in Chapter 4.7, Hazards and Hazardous Materials of the DEIR, and impacts to wildlife is addressed in Chapter 4.4 Biological Resources of the DEIR. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 456-4

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 457**

March 28, 2022

Matt Kelley, Senior Planner

(Sent electronically to Idaho.MMEIR@co.nevada.ca.us)

Nevada County Planning Department

950 Maidu Avenue, Suite 170

Nevada City, CA 95959-8617

Subject: Idaho-Maryland Mine Project Draft EIR (SCH # 2020070378)

Dear Mr. Kelley,

Thank you for the opportunity to review and comment on the Draft Environmental Impact Report (Draft EIR) for the proposed Idaho-Maryland Mine Project (proposed project). The proposed project would reinitiate underground mining and gold mineralization processing for the Idaho-Maryland Mine over an 80-year permit period with gold mineralization processing and underground exploration and mining proposed to operate 24 hours a day, 7 days a week during full operations. The operations of the proposed would allow for unmitigable impacts on our community for 80 years resulting in significant and unavoidable environmental impacts as well as the damage the character and vitality of the community.

**Ind 457-1**

**Significant and Unavoidable Impacts**

The Draft EIR has determined that the following project impacts would remain significant and unavoidable, even after implementation of the feasible mitigation measures:

• Aesthetics

The Draft EIR determined that the proposed project would result in a significant impact related to substantially degrading the visual character or quality of the site and its surroundings. Even after mitigation, the impact would remain significant and unavoidable. The Draft EIR also determined that the project's incremental contribution to the significant cumulative impact related to substantial degradation of visual character or quality would be cumulatively considerable and significant and unavoidable.

**Ind 457-2**

• Noise.

The Draft EIR determined that during construction activities, the project could result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity (i.e., residents along East Bennett Road during construction of the potable water line). Even with implementation of mitigation, the impact would remain significant and unavoidable.

• Transportation and Circulation

The draft EIR determined that the proposed project would result in a significant impact at three study intersections under the EPAP Plus Project scenarios, one of which would be significant and unavoidable

Ind 457-3

even after mitigation (Brunswick Road/SR 174). The Draft EIR also determined that the proposed project would have a cumulatively considerable incremental contribution to two intersections under both Cumulative Plus Project scenarios, one of which would be significant and unavoidable Draft EIR Idaho-Maryland Mine Project December 2021 Chapter 6 – Alternatives Analysis Page 6-8 even after mitigation (Brunswick Road/SR 174). In addition, the project's incremental traffic would cause a significant impact at one intersection queue during both Cumulative Plus Project scenarios (Brunswick Road/Sutton Way). Mitigation measures are identified and required for the aforementioned cumulative impacts, but it cannot be guaranteed that the measures would reduce the incremental impacts to a less than cumulatively considerable level.

**Preference of the No-Build Alternative**

Preference of the Environmentally Superior Alternative, which is Alternative 1: No Project (No-Build) Alternative. The No-Build ensure that the project area and the public would not result in project related impacts in the following CEQA Appendix G sections:

- Aesthetics
  - The proposed project would result in a significant impact related to substantially degrading the visual character or quality of the site and its surroundings. Even after mitigation, the impact would remain significant and unavoidable. The proposed project would result in tailings, the reduction of vegetative cover, the erection of industrial use buildings, mining equipment, engineered fill, and frequent trucks to transport materials. The No-Build would not impact the visual character or quality of the site and its surroundings.
- Air Quality
  - The proposed project would result in more truck traffic to the project area resulting in more air quality emissions, which may affect the health of the community even with the implementation of mitigation measures. The No-Build would not disturb naturally occurring asbestos as could possibly occur during underground mining.
- Biological Resources
  - The No-Build would not have the potential to impact special-status plants, foothill yellow-legged frog, western pond turtle, California red-legged frog, California black rail, coast horned lizard, special-status bats, and non-special status raptors and migratory birds. In addition, the Alternative would not result in any substantial adverse effects on riparian habitat and/or other sensitive natural communities and/or have a substantial adverse effect on federal or State protected aquatic resources.
- Cultural Resources
  - The No-Build would not have a substantial adverse effect to the underground mine workings, which were determined to be historically significant pursuant to the National Register of Historic Places (NRHP) and California Register of Historic Resources (CRHR). The No-Build would not impact any unknown cultural and tribal cultural resources should they be encountered during construction.
- Energy
  - The No-Build would not result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project

construction or operation. The No-Build would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

- Geology/Soils
  - The No-Build would not include underground mining and generation of engineered fill, grading or other ground-disturbing activities, substantial soil erosion would not occur. In addition, the near-surface geotechnical features identified for closure due to dewatering of the mine would not be adversely impacted, though they may currently pose some level of risk that would continue under the Alternative. Other geotechnical issues that could pose a significant effect under the proposed project, but would not pose an adverse effect under the Alternative, include potential seismic hazards at the Brunswick Industrial Site and slope stability associated with temporary steep cut slopes at the new service shaft collar. However, the proposed project would fix a few existing geotechnical issues that would remain under this Alternative, including the safety concern related to the presence of the South Idaho Shaft on the Centennial Industrial Site, and an unstable portion of the clay-lined pond dam on the Brunswick Industrial Site.
- Greenhouse Gas Emissions
  - The No-Build would not generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment or conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases.
- Hazards & Hazardous Materials
  - The proposed project could result in a significant impact related to creating a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials, specifically, the transport and underground storage and use of explosives at the Brunswick Industrial Site. Compliance with applicable federal (MSHA, OSHA), State (CCR), and local regulations, and the additional mitigation measures in the Draft EIR, would reduce the significant hazard related to transport, underground storage and use of explosives to a less-than-significant level. Because the use of explosives would be eliminated under the No-Build, the significant impact would also be eliminated. The Draft EIR determined that the proposed project could result in a significant impact related to creating a significant hazard through reasonably foreseeable upset and accident conditions involving the likely release of hazardous materials into the environment related to the Brunswick Industrial Site, given the presence of elevated arsenic in the southeastern paved area, potential residual petroleum contamination in a few locations, and presence of groundwater monitoring wells of unknown status. The No-Build would result in fewer
  - impacts related to hazards and hazardous materials.
- Hydrology/Water Quality
  - The No-Build would not result in on-site construction disturbance or above-ground operations such that the following project-related significant impacts to water quality would not occur: Centennial Industrial Site: engineered fill pad construction; Brunswick Industrial Site: operations within industrial area, underground placement of Cement Paste Backfill, use of clay-lined pond for water treatment process purposes, engineered fill pad construction, and treated water discharge in South Fork Wolf Creek. In addition, the No-Build would not necessitate dewatering of the mine; thus, there would not be a substantial reduction in groundwater supplies resulting in effects to nearby wells, though the proposed project

includes mitigation to offset impacts to wells (i.e., provision of potable water service). Further, due to the lack of on-site operations, the No-Build would not result in the substantial alteration of drainage patterns, and for the Centennial Industrial Site, risk release of pollutants in a flood hazard area.

- Noise
  - The No-Build would not result in a substantial temporary or periodic increase in ambient noise levels in the project vicinity, nor a substantial permanent increase in ambient noise levels in the vicinity of the project due to haul truck traffic. In addition, the Draft EIR concludes that the combined operational noise sources at the Brunswick Industrial Site could result in a significant noise impact. With respect to vibration, the Draft EIR determined that while blasting is not projected to exceed applicable thresholds, a ground vibration monitoring program should be implemented to determine the actual levels of ground vibration at commencement of mining. These operational noise and vibration impacts would not occur under the No-Build.
- Tribal Cultural Resources
  - The No-Build would not impact any unknown cultural and tribal cultural resources should they be encountered during construction.
- Transportation
  - The No-Build would not generate construction traffic or operational vehicle traffic on local roadways and, thus, unlike the proposed project, the Alternative would not result in a significant construction traffic impact, nor would General Plan LOS policy conflicts occur under the EPAP Plus Project conditions to the intersections of Brunswick Road/Idaho Maryland Road, Brunswick Road/SR 174, and Idaho Maryland Road/Centennial Drive; and under the Cumulative Plus Project scenarios to the intersections of Brunswick Road/SR 174 and Sutton Way/Dorsey Drive. The proposed project would also result in a significant effect to the intersection queue during the Cumulative Plus Project scenarios (Brunswick Road/Sutton Way), which would not occur under this Alternative. Further, the Draft EIR determined that proposed project (Brunswick Industrial Site operations) would have an impact related to truck turn movements at the Millsite Road/E. Bennett Road project egress at the Brunswick Industrial Site; this effect would not occur under this Alternative. The Draft EIR determined that some of the above-noted impacts would be considered significant and unavoidable due to the uncertainty concerning certain mitigation measures. The subject impacts are the EPAP Plus Project and Cumulative Plus Project intersection impacts to Brunswick Road/SR 174 and the Cumulative Plus Project intersection queue at Brunswick Road/Sutton Way. These significant and unavoidable impacts would be eliminated under this Alternative.
- Wildfire
  - The No-Build would not result in a significant impact related to exacerbating wildfire hazards, as compared to the proposed project. For example, above-ground machinery would not be operated at both project sites. Therefore, potential vegetation fires associated with on-site equipment operations would be substantially reduced under the No-Build.

**Ind 457-4**

**Beyond the Scope of CEQA**

CEQA can be narrow in scope and does not address various issues such as social or economic issues.

**Ind 457-5**

The Draft EIR notes relevant caselaw on how impacts on private views are not studied under CEQA. Although this is true and accurate under CEQA, the property owners for those that would be impacted by the next 80 years of constant operation and construction would surely face a reduction in property value. Overall, the operations of the mine may act as a deterrent for the community and reduce the overall appeal of tourism as well as the demand for property within the area. Certainly, community members have voiced their concerns in significant numbers. It is clear that our community takes great pride in the environment in which we live and want to protect it. Any activity that undermines our attraction of tourism and to the draw of people who so recently are moving to this community to work remotely is a negative for the members of this beautiful, historic community. It is true that adding jobs to our local economy could be a valuable boost. But there are other jobs that could be encouraged. A good portion of the jobs that Rise Gold is promising are trucking jobs. Will those truly be given to local people? Furthermore, those of us that live here are taking steps to conserve water and are alarmed for our neighbors that have wells. Many variables could impact ground level and our residents consider any deep underground disturbances to be an unnecessary risk during this time of severe drought. So many of us have friends who already have well issues. This is evidence that our environment is fragile

**Ind 457-6**

**Ind 457-7**

Thank you for the opportunity to review and comment on the Draft EIR. If you have any questions or would like clarification, please contact me at shureen@pacbell.net

Sincerely,

Kimberly Shureen

Nevada County Board of Supervisors
950 Maidu Avenue
Nevada City, CA 95959-8617
bdofsupervisors@co.nevada.ca.us

RE: Businesses OPPOSE Rise Gold's proposal to re-open the Idaho-Maryland Mine

Dear Supervisors:

The undersigned businesses respectfully request that you oppose Rise Gold's proposal to re-open the Idaho-Maryland Mine.

**Ind 459-1**

Mining is our past, not our future. During the past 50 years, Nevada County has worked diligently to attract people and investments that contribute to and renew its economic vitality through promising and sustainable enterprises which align with the aspirations of its residents. That is what continues to make this County an attractive place to live, to make a living, and to start new business ventures.

**Ind 459-2**

Reopening the mine risks a transformation from a community that is a scenic and cultural destination to an industrial town that tolerates excess noise, dust, and truck traffic. It would entail supporting a business that puts precious water resources at risk, generates significant greenhouse gases, and consumes so much energy that it would completely erase the county's plan to reduce the effects of climate change. The mine could become a deterrent for many seeking to build new business opportunities in Western Nevada County, resulting in reduced community investment and property values. We welcome the County's call for an independent economic study of the impacts of the proposed mine and expect that it will include a non-mine alternative.

**Ind 459-3**

**Ind 459-4**

Rise Gold's promises to inject money into the local economy may sound attractive, but Nevada County can do better by continuing to invest in existing industries as well as new enterprises that address current priorities in the Sierra like watershed and forest management. The Economic Policy Institute Brief cited by Rise Gold actually shows that other industries can produce far better job numbers than mining, including eight industries Nevada County already has today. An economic study commissioned by the City of Grass Valley during Emgold's attempt to reopen the Idaho-Maryland Mine in 2008 concluded that Nevada County would be better off economically if it pursued other opportunities than mining.

An industrial gold mine would not be a constructive addition to our community. The social and economic benefits are far from clear. The environmental impacts are sobering.

We urge you to protect our health, economy, and quality of life. Please deny Rise Gold's application to reopen the Idaho-Maryland Mine.

**Ind 459-5**

Thank you for your time and consideration.

Sincerely,

Kristen Hensley

**Individual Letter 460**

Dist 3 RECEIVED

MAR 0 1 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

February 22, 2022

Dear Nevada County Board of Supervisors,

My Name is Kristen Krauel-Privett. I live near the Empire Mine State Park in District 3 with my husband and our 13 month old daughter. I am a Licensed Clinical Social Worker (LCSW) for the Sierra Foothills Veterans Clinic in Auburn and my husband is a longshoreman out of the Port of Oakland. I am hoping that you will deeply consider my comments in regard to determining whether to approve the opening of the Idaho-Maryland Mine in Grass Valley.

**Ind 460-1**

Like a lot of families, our family chose to move to Grass Valley to be closer to nature and a natural way of life. My husband and I both grew up in remote Modoc County. We lost touch after high school but serendipitously reconnected after moving to San Francisco within weeks of each other for our jobs. After bringing our baby girl into the world, we knew we wanted to raise her in a community in which she would have the opportunity to cultivate a strong relationship with the outdoors and Mother Earth. Things we both feel benefited us tremendously growing up. An area in which she could safely walk or ride her bike about the neighborhood, raise animals, and enjoy the natural beauty of her surroundings while still maintaining access to a variety of medical care and shopping.

**Ind 460-2**

Unfortunately, we didn't learn of the potential opening of the Idaho-Maryland Mine until after we moved here. Had we known, we may not have taken the risk. We have dire concerns that the opening of the mine will result in higher noise levels, including vibration from blasting, and harm to the surrounding wildlife and natural settings. Our prior living in San Francisco made us all too aware of the negative impact high noise levels can have on one's quality of life. As a longshoreman, my husband experiences a detrimental level of noise and machinery related vibration on the job. This is yet another reason why we chose to move to Grass Valley, as working AND living in noise infested environments is not a healthy combination for my husband (nor anyone for that matter). His work, however, influenced him to immerse himself in learning about the negative impact of industrial vibrations on physical and mental health as well as various sound healing modalities.

**Ind 460-3**

In addition to noise related dismays, we worry the mine will seriously compromise the quality of our air and water. I understand the water quality board will have to rely on Rise Gold, a mining company with a history of environmental violations, for environmental assurances reports. Our daughter's pediatrician educated us about the risk the mine poses to her health (not to mention our health and the health of our community). I am tearing up as I think about our smiley daughter being subjected to increased toxins through the water she drinks and air she breathes. After being diagnosed with endometriosis and battling related fertility challenges to have our miracle baby, I learned a great deal (more than I would've liked) about the link between environmental toxins, fertility, and health. I would hate for our daughter and community to fall victim. Surely the few jobs gained from the mine will be seriously offset by the risk of losing health conscious San Franciscans (I'm sure you know Grass Valley has become a popular destination for this population) and their businesses, tourism, millions in property values, and the list goes on. The mine will destroy the majority of the reasons people are drawn to Grass Valley. More pavement, mine waste, loud noises, poorer air and water quality. This is definitely not the sort of environment we envisioned raising our sweet daughter in and I know many, many parents who feel the same way.

I am urging you NOT to approve Rise Gold's application to open the mine.

Sincerely,

Kristen Krauel-Privett

## INDIVIDUAL LETTER 460: KRISTEN KRAUEL-PRIVETT

### Response to Comment Ind 460-1

The comment does not address the adequacy of the DEIR. Please see Master Response 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 460-2

Noise and vibration are addressed in Chapter 4.10, Noise and Vibration of the DEIR. Please see Master Responses 1 and 2. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 460-3

Please see Master Responses 1 through 3. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

Dear Nevada County Board of Supervisors,

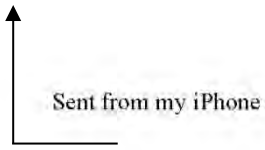
My Name is Kristen Krauel-Privett. I live near the Empire Mine State Park in District 3 with my husband and our 13 month old daughter. I am a Licensed Clinical Social Worker (LCSW) for the Sierra Foothills Veterans Clinic in Auburn and my husband is a longshoreman out of the Port of Oakland. I am hoping that you will deeply consider my comments in regard to determining whether to approve the opening of the Idaho-Maryland Mine in Grass Valley.

**Ind 461-1**

Like a lot of families, our family chose to move to Grass Valley to be closer to nature and a natural way of life. My husband and I both grew up in remote Modoc County. We lost touch after high school but serendipitously reconnected after moving to San Francisco within weeks of each other for our jobs. After bringing our baby girl into the world, we knew we wanted to raise her in a community in which she would have the opportunity to cultivate a strong relationship with the outdoors and Mother Earth. Things we both feel benefited us tremendously growing up. An area in which she could safely walk or ride her bike about the neighborhood, raise animals, and enjoy the natural beauty of her surroundings while still maintaining access to a variety of medical care and shopping.

**Ind 461-2**

Unfortunately, we didn't learn of the potential opening of the Idaho-Maryland Mine until after we moved here. Had we known, we may not have taken the risk. We have dire concerns that the opening of the mine will result in higher noise levels, including vibration from blasting, and harm to the surrounding wildlife and natural settings. Our prior living in San Francisco made us all too aware of the negative impact high noise levels can have on one's quality of life. As a longshoreman, my husband experiences a detrimental level of noise and machinery related vibration on the job. This is yet another reason why we chose to move to Grass Valley, as working AND living in noise infested environments is not a healthy combination for my husband (nor anyone for that matter). His work, however, influenced him to immerse himself in learning about the negative impact of industrial vibrations on physical and mental health as well as various sound healing modalities.



**Ind 461-3**

In addition to noise related dismays, we worry the mine will seriously compromise the quality of our air and water. I understand the water quality board will have to rely on Rise Gold, a mining company with a history of environmental violations, for environmental assurances reports. Our daughter's pediatrician educated us about the risk the mine poses to her health (not to mention our health and the health of our community). I am tearing up as I think about our smiley daughter being subjected to increased toxins through the water she drinks and air she breathes. After being diagnosed with endometriosis and battling related fertility challenges to have our miracle baby, I learned a great deal (more than I would've liked) about the link between environmental toxins, fertility, and health. I would hate for our daughter and community to fall victim. Surely the few jobs gained from the mine will be seriously offset by the risk of losing health conscious San Franciscans (I'm sure you know Grass Valley has become a popular destination for this population) and their businesses, tourism, millions in property values, and the list goes on. The mine will destroy the majority of the reasons people are drawn to Grass Valley. More pavement, mine waste, loud noises, poorer air and water quality. This is definitely not the sort of environment we envisioned raising our sweet daughter in and I know many, many parents who feel the same way.

I am urging you NOT to approve Rise Gold's application to open the mine.

Sincerely,

Kristen Krauel-Privett

To: Matt Kelly, Senior Planner for the Nevada City Planning Commission

**Ind 462-1** I was a helper at a deep rock mine years ago and there is no telling what type of horrible toxins are buried underground as I found out to my detriment and which I am still recovering from.

So, obviously, I have been very alarmed that the Nevada City Planning Commission is considering opening the Idaho Maryland Mine. I was in a chemical accident that could have been avoided if others had taken action prior to being exposed to toxic chemicals.

**Ind 462-2** And it seems to me completely cruel to expose the Nevada County populace with what this mining firm has in mind. Not only the by the additional traffic on Brunswick road with large trucks, especially considering a large housing development is also going to impact Brunswick Road, but as well as dumping toxic waters into a stream.

**Ind 462-3** So I ask you, from someone who has been almost killed by underground mine waters being dumped near me, to NOT ALLOW THEM TO POLLUTE OUR WATER, AIR OR OUR ROADWAYS. If you do so it will allow this firm to destroy out peaceful harmony and low pollution that we have here, just for the sake of money and a few jobs.

Dear Mr. Kelley and Planning Commission members,

My husband and I are homeowners on Anchor Lane in District 3, about 1/2 mile from the Brunswick mine site and within the mineral rights boundary of the project. We would like to register our concerns about the Draft EIR.

1) Wells Mitigation Plan
Appendix K.9, p.1 of the DEIR says that " All potentially impacted wells are located in the E. Bennett Road area. Domestic water wells outside this area will not be impacted." It is concerning, therefore, that in chapter 4.8, p.55 it states that the "Base Case" analysis conducted is only relevant within a 25-year period. However, the proposed project is requesting a permit to cover 80 years of mining activity, during which time the tunnels and impacts would presumably expand to additional sites within the mineral rights boundary.

**Ind 464-1**

Nowhere in chapter 4.8 does the DEIR discuss how the mining company would monitor for impacts on domestic wells outside of the very limited E. Bennett Rd study area should an unexpected or "worst case scenario" occur, despite the uncertainties inherent in mining in fractured bedrock. In fact, Appendix K.7 specifically calls out the inadequacy of the DEIR analysis, stating:
"it is possible that mining activities, including blasting, backfilling with CPB, and sealing of drains or areas of the underground workings, could activate leaching and groundwater flow in new subsurface areas, potentially resulting in impacts to neighboring wells (p.8);" and

"A major assumption is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth. However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. (p.12)"

We are concerned that our well, and those of our neighbors, could suffer dewatering as a result of mining activities. The DEIR does not adequately address uncertainties in the hydrology models over the 80-year period of the project nor does it provide a plan for establishing a baseline, monitoring, and mitigating impacts on all domestic wells within the mineral rights boundary.

2) Traffic and road safety
We drive our children to and from school along E. Bennett Rd and Brunswick Rd. every day. We would directly suffer the "significant and unavoidable" consequences of the 428 additional daily truck and vehicle trips generated by this project (Chapter 4.12, p. 34). In addition, our key fire evacuation routes include the Brunswick/Sutton Rd. intersection and the Brunswick/Hwy 174 intersection, both of which are foreseen to suffer significant increases in congestion, queues and wait time.

**Ind 464-2**

We believe that the DEIR chapter 4.12 fails to appropriately analyze and provide mitigations for the impact of additional truck and vehicle traffic on the safety of residents in the (very likely) scenario of a wildfire or other other emergency evacuation along the identified road segments and intersections. On page 92, it discusses emergency vehicle access to the mining site on Brunswick Rd, but does not discuss how increased traffic along impacted roads will slow down firetrucks and other emergency vehicles access to homes in a wildfire situation.

1

**Ind 464-3**

For these reasons, we urge the members of the Planning Commission to require that the DEIR be revised to include
1) a more thorough and accurate assessment of the potential impacts on groundwater and domestic wells within the entire mineral rights boundary over the 80-year project lifespan, and
2) a traffic analysis that includes the safety of traffic flows in an emergency scenario such as a wildfire evacuation.

Thank you for your consideration,
Laina and Matt Levy
Anchor Ln
Grass Valley, CA

## INDIVIDUAL LETTER 464: LAINA LEVY

### Response to Comment Ind 464-1

The commenter is concerned that its well could be impacted by the mining project and asserts that the DEIR does not adequately address uncertainties in the groundwater models. The groundwater model was based on the expected mining plan during year one to year 25, and then Sensitivity Scenario 6 considered the significant expansion of mining in areas with potential for mineralization as shown in Figure 5.10 of Appendix K.3 of the DEIR for an additional 40 years of mining. As shown in Figure 5-12, and discussed on page 29 of the report, the 5-ft drawdown contour extent of Scenario 6 at the end of potential additional mining (to Year 65) relative to the 2019 water level expands less than 500 ft from that of the Base-Case Scenario. The drawdown contour of the Base-Case Scenario is at the end of the original planned future mining (Year 25) relative to the 2019 water level. The comparison of drawdown contours between Scenario 6 and the Base-Case Scenario suggests that the added potential mining (beyond the 65 years modeled) will not lead to large incremental drawdowns as the mining progresses because the mining activities occur in deep, low-K rocks. Please also see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

Appendix K.7 contains the West Yost peer review of the applicant's draft technical reports. West Yost comments in the peer review were satisfactorily addressed during the preparation of the DEIR.

As stated on page 4.8-48 of the DEIR, blasting or backfilling with CPB would be conducted exclusively within the underground mine workings. Thus, any water that contacts those components would be present only within the mine workings and would be pumped out of the mine workings by the dewatering system. As a result, that water would not have the potential to flow into the fractured bedrock and flow toward any domestic supply wells. The dewatering causes a low pressure area around the underground workings such that groundwater inflow is toward the mine, not from the mine toward the domestic wells. The primary residual components of the ammonium nitrate-fuel oil (ANFO) used for blasting, ammonia and nitrate, are very soluble and mobile in water. This means that any blasting residuals would be continually removed from the mine over time through the dewatering system. The proposed WTP is designed to treat ammonia and other blasting residuals that might occur due to incomplete detonation. Thus, when the mine is allowed to flood again following the completion of mining, there is no reasonable potential that residuals from former blasting activities would cause a violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality. In addition, the proposed new mining activities would all occur at depths that are comparable to or much deeper than the historic mine workings. Most of the proposed additional mining, and potential exploration and expansion into new areas, would occur below depths of 1,000 feet (1,600 feet msl), a depth below the levels of the existing domestic supply wells (see Table 2-2, Itasca, 2020). The substantial reduction in hydraulic conductivity at those depths, compared to the depths of the domestic supply wells, is further evidence that the proposed project would not adversely affect water quality in domestic wells. As stated on page 4.8-51 of the DEIR, the proposed mining areas would primarily be at equivalent or deeper depths than the existing underground mine workings, while the potential future expansion areas all involve mining at

greater depths, typically more than 1,000 feet below the surface and deeper. At those greater depths, the hydraulic conductivity is several orders of magnitude lower than it is at the depths of the domestic supply wells, due primarily to the lack of open fractures as a result of the large pressures exerted by the overlying rock mass (i.e., the lithostatic pressure). Given that the new mining activity would occur at equivalent or greater depths than the proposed mining, there is little or no potential for the proposed mining and mining in the future expansion areas to affect the quality of the groundwater in the domestic supply wells that are completed at much shallower depths.

The comment on page 12 of Appendix K.7 referenced by the commentor is in regard to Section 4.2.2 of the EMKO Report (Appendix K.2 of the DEIR), which describes a three-step procedure used to assess potential drawdown effects in perimeter areas. The results of this three-step procedure are not used for the prediction of groundwater drawdown and impact analysis. Rather the groundwater model prepared by Itasca (see Appendix K.3 of the DEIR) is used for this prediction and analysis. Discussion of this uncertainty and the overall uncertainty of the model predictions with respect to groundwater level impacts on individual wells was provided in the final version of Appendices K.2 and K.3, as requested in the West Yost peer review (page 12 of Appendix K.7).

## Response to Comment Ind 464-2

Please see Master Response 5 - Evacuation Zones. While the DEIR concludes that the proposed project would have a significant and unavoidable impact to the SR 174/Brunswick Road intersection, there are a few important factors to consider. First, the commenter would have other available evacuation routes, such as Idaho-Maryland Road. Second, Mitigation Measure 4.12-1(b) of the DEIR requires the applicant to enter into a Traffic Mitigation Agreement with the County regarding the SR 174/Brunswick Road intersection. The Agreement shall require the applicant to pay the project's fair share contribution toward the improvements necessary to improve intersection operations to an acceptable level. The Agreement shall include the fair share calculations and total payment amount. Based on the Caltrans methodology to assess fair share, it is estimated that the fair share percentage is 14.9%. While the project is contributing toward addressing its contribution of traffic to the SR 174/Brunswick Road intersection, the remaining funding needed to improve the intersection (e.g., signalization) is not yet certain, nor secured. As a result, the DEIR conservatively concludes that the impact would remain significant and unavoidable.

The project's cumulatively considerable incremental contribution to the queue impact at Brunswick Road/Sutton Way intersection could be addressed simply by retiming the intersection, as required by Mitigation Measure 4.12-10 of the DEIR. However, because this intersection is located within the City of Grass Valley, Nevada County cannot require the City to retime the intersection. As a result, the DEIR conservatively concludes that the impact would be significant and unavoidable. However, if the City of Grass Valley agrees to retime the Brunswick Road/Sutton Way intersection, the project's incremental contribution to the cumulative queue impact would be eliminated.

## Response to Comment Ind 464-3

Please see Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 5 - Evacuation Zones.

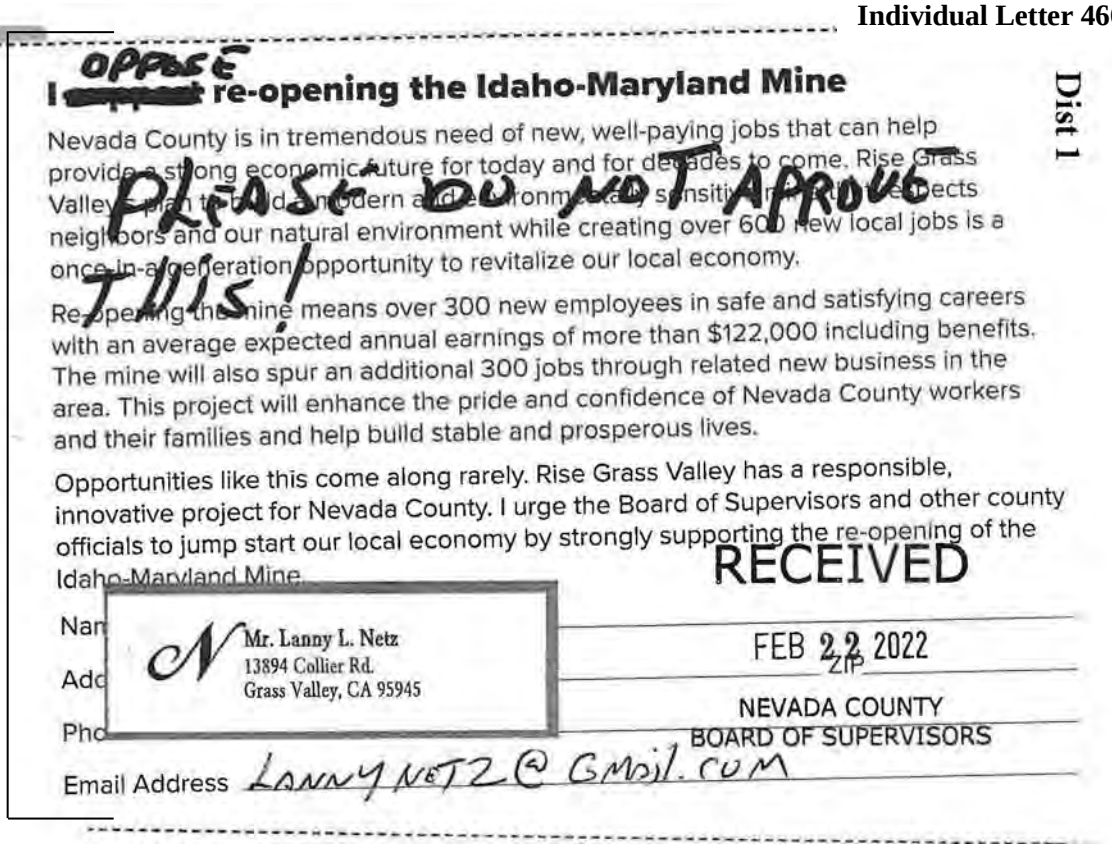
**Ind 465-1**



I am opposed to the Idaho Maryland Mine reopening. Our future lies in tourism, recreation and maintaining the rural quality of life for which so many of us have moved.
Promises by developers are rarely kept in full. The history of this developer is spotty and claims are not to be believed. If there is some environmental damage or disaster, what is to keep them from abandoning the project and keeping the prosecution and fining in the courts for years and years?
Do not approve this project. It is not in keeping with our community's best interests.
LaMont Reynolds

**Individual Letter 466**

I OPPOSE re-opening the Idaho-Maryland Mine

Dist 1

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine protects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

PLEASE DO NOT APPROVE THIS!

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

**Idaho.MMEIR@co.nevada.ca.us**

**Ind 467-1**

The E.I.R. has many flaws as pointed out by many professionals in many feilds at the meeting on March 24th and what has been written in the Union. The biggest omission in the E.I.R. is the people of this community which are the most important part of the environment here!
If the majority of the community Feels that this proposed project has a negative effect on their quality of life then there is nothing more to do other than to tell Rise Gold to GO AWAY!!! The planning dept. and our representatives have the obligation to do what the community **wants** !!! NUFF Said!!!

Larik Butyrin

## INDIVIDUAL LETTER 467: LARIK BUTYRIN

### Response to Comment Ind 467-1

Please see Master Responses 1 and 2. The commenter expresses general concerns regarding the impacts of the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

Dear Nevada County Supervisors:

**Ind 468-1** Our home is located within the possible affected area, if the Idaho Maryland Mine is allowed to reopen. We have lived on this property for 35 years. We are extremely concerned about the proposal to reopen the mine because we depend solely on water provided by our well. We have seen studies showing that the mine operations propose to drain the groundwater for miles/acres including under our property located close to the Nevada County Airport.

Please take note of the devastating effects that could be put upon our residential and business community. We strongly oppose the proposal to reopen the mine.

**Ind 468-2** Attached is a copy of the recently received postcard that came with misleading propaganda from Rise Gold.

Thank you for your consideration,

Larry & Patsy Rieger
13026 Madrona Lf Ct
Grass Valley CA 95945
(530) 273-1473

## INDIVIDUAL LETTER 468: LARRY AND PATSY RIEGER

### Response to Comment Ind 468-1

Please see Master Responses 13 through 15 regarding groundwater. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 468-2

Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 469**

Nevada County Supervisors March 31, 2022

950 Maidu Avenue

Nevada City, CA 95959

**To**: Nevada County Board of Supervisors

**From**: Laura Wagner Balch and Gary Balch

Citizens of Nevada County, District 5

18286 Nubian Way

Nevada City CA 95959

To Whom it May concern:

As long-term residents of Nevada County, we are writing about our concerns about the reopening of the Idaho Maryland Mine, outside Grass Valley, Ca.

**Ind 469-1** Mining helped make our community what it is today, but the mining days are over. Today, Nevada County is a home and destination for people who like the Northern California lifestyle. Today, Nevada County is a home and destination for its beautiful scenery, mostly amiable community, and its many cultural amenities.

Reopening this mine would cause considerable environmental, financial, and life-style disruptions which we cannot afford. The recent Draft Environmental Report (DEIR) raises many of these concerns and neglects others.

**Ind 469-2** First, we could not find any alternative proposals for the use of this land, other than mining. We think the Board of Supervisors should consider our communities' needs for affordable housing, light industry, and parks to make this space accessible and useful to all residents.

**Ind 469-3** Second, the DEIR fails in our view to adequately address the ground and waste water issues which this mine would create. California is already experiencing a drought and the mine would not only use water needed for other activities, but would negatively impact ground water in Wolf Creek, which flows beside numerous homes in Grass Valley and below. It is not clear in the report how mine waste is to be realistically dealt with, particularly with asbestos and heavy metals to be disposed of.

**Ind 469-4** Third, the mine would significantly impact travel in Grass Valley and on Highway 174, where traffic is already congested. Heavy trucks with diesel emissions will impact the air and the noise will be disruptive to the quality of life for people who live in Grass Valley and the surrounds. Although a site has been identified for dumping mine waste, this will severely impact the neighborhood and it is not clear how that waste will be cleaned up and disposed of in an environmentally sensitive manner.

**Ind 469-5** Fourth, the Mine Watch coalition has identified some issues in the draft DEIR which mitigate against pursuing Rise Gold's plans. Some of these include: the aesthetic impacts, air quality impacts from a moisture cloud plume, evening blasting impacts and the threat of airborne pollutants, all of which mitigate against opening this mine.

**Ind 469-6**

We are grateful to the County Board of Supervisors for their careful study of the prospects for reopening the Idaho Maryland mine and humbly suggest that mining of this type should occur only be considered in isolated areas where there is little impact on the quality of life of nearby residents. Instead, the Nevada County Supervisors should consider an alternative use of this site, more suitable to the needs of Nevada county in the 21st century.

Thank you for your time.

Sincerely,

Gary S. Balch at garyb@eccnc.com

Laura A. Wagner-Balch at laura.wagner.balch@outlook.com

18286 Nubian Way

Nevada City, CA 95959

## INDIVIDUAL LETTER 469: LAURA BALCH

### Response to Comment Ind 469-1
Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 469-2
Alternatives are addressed in Chapter 6, Alternatives, of the DEIR. The CEQA Guidelines provide the following guidance for discussing alternatives to a proposed project:

- An EIR shall describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives (CEQA Guidelines Section 15126.6[a]).

An alternative to the proposed mining use would not achieve any of the basic objectives of the project. Project objectives are identified starting on page 3-11 and repeated on starting on page 6-2 of the DEIR. Therefore, an alternative to the proposed mine is not required to be analyzed.

The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 469-3
Please see Master Response 16 – Drought and Climate Change. Please see Master Responses 8, 10, and 12 regarding mine waste and Master Response 35 – Discharge to South Fork Wolf Creek. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 469-4
Traffic is addressed in Chapter 4.12, Transportation, of the DEIR. Air quality and noise are addressed in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, and Chapter 4.10, Noise, of the DEIR. Please see Master Responses 8 through 12 regarding mine waste. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 469-5
Please see Response to Comment 7-95. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 469-6
Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 470**

To: Matt Kelley, Senior Planner Nevada County Planning Department
Idaho.MMEIR@co.nevada.ca.us
Cc DEIRcomments@cea-nc.org

**Ind 470-1**

I am Laura Gagliasso, at 14035 Diamond Ct.,Grass Valley 95945. I am one of "the 30" well owners in District 3 who are listed as impacted by the proposed Idaho-Maryland Mine project.I have been at this property 8 years with a lifetime in the area. My husband and I are retired and on a fixed income.

**Ind 470-2**

These are my comments on what I consider the inadequacies of the DEIR as it pertains to my property and well.

Allowing Rise Gold to self monitor is inadequate.
There are 2 wells on the mine property. Those 2 wells plus the 30 wells should be monitored, with water quality testing, by an independent entity for 12 months BEFORE any dewatering begins in order to determine average depths and flow. A new and recent model needs to be established. What provision is there for beyond the 30…there are 300+ wells within the mining rights. Rise Gold used a 1996 model to make their predictions and, clearly, after extended drought seasons a model that is over 16 years old is inadequate.

The provision to provide water to "the 30" current property owners is inadequate. That provision should go with the property, not just the current owner or it will impact property values.

There is no true enough predictability of weather or groundwater levels and according to The Nature Conservancy, March 14, 2022, "ground water supplies nearly half the world's drinking water and supports farms that feed us." 38% of the drinking water in the USA comes from groundwater.

**Ind 470-3**

On February 10, 2022, at an NID meeting there was a map showing the truck route down E. Bennett Rd. to the back side of the Centennial site. I have seen no traffic study showing that usage on narrow and curvy E. Bennett Rd. Also, it showed a road cut into the Centennial site right at the very dangerous curve on E. Bennett Rd. across from the old mill. Where is the traffic study for large semi trucks using that route everyday? This is an inadequacy in the DEIR.

**Ind 470-4**

What if: They run a water line to my home but right now the well is fine? What if, rght now I choose not to hook up to NID and later my well fails? Why should I have to hook up beforehand? What if the well never would have failed? Predicting the future using inadequate models is inadequate. I do not want my well capped.

**Ind 470-5**

Finally, I would like to ask…Has anyone bothered to walk or drive UP Diamond Ct. from E. Bennett Rd…and UP is the operative word? This is a single lane private road. One owner has the land on both sides all the way UP. There are 3 properties at the top. Has anyone bothered to come UP my driveway to my home on the back corner to the property where the well is

located on the back side of the home? Again, UP is the operative word and there is no egress on either side of the driveway. It is not a simple thing to say that NID will swoop in and hook my property up to their water supply. It is inadequate of the DEIR to say so.

Thank you for your consideration of these comments concerning a project of this scope that will impact this entire community, not just 30 well owners.

Laura Gagliasso
Donald Gagliasso
14035 Diamond Ct. Grass Valley 95945
lmgagliasso@comcast.net

## INDIVIDUAL LETTER 470: LAURA AND DONALD GAGLIASSO

### Response to Comment Ind 470-1
The comment does not address the adequacy of the DEIR but is noted for the record.

### Response to Comment Ind 470-2
Domestic water wells in the E. Bennett area are proposed to be mitigated by the installation of NID potable water. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, for an updated description of the proposed monitoring approach, which now also includes a proposal by the applicant to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring. The commenter asserts that self-monitoring is not acceptable but does not explain why. The County will have oversight and enforcement authority over all mitigation measures and conditions of approval.

The DEIR did not use a 1996 model to make predictions of groundwater drawdown. Please see Chapter 4.8 of the DEIR. With regard to adequacy of groundwater modeling, mitigation, and payment of water charges after sale of a property please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

Regarding property values, please see Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 470-3
No trucking is proposed on E. Bennett Road. Please see Figure 3-13 of the DEIR. No new roads are proposed to be constructed off of E. Bennett Road.

### Response to Comment Ind 470-4
As described in the Well Mitigation Plan (Appendix K.9 of the DEIR), the applicant will close property owners' wells, using certified well drillers and under Nevada County regulations, if requested by the landowner at the time of NID connection and service to their properties. It is unlikely that the reduction in water column of wells in the E. Bennett area will make these wells unusable. Therefore, property owners may decide to retain and continue using their water wells. The applicant will not close domestic water wells in the future if property owners decline this closure at the time of NID potable water connection. A water meter will be installed at property lines and connected to homes if requested and authorized by property owner. A property owner could therefore choose to use NID potable water at any time, even if they decide to continue using their domestic water well. The Well Mitigation plan has been revised to include the installation of Double Check Valves, which will allow the use of both wells and NID potable water service (Please see Appendix D to this Final EIR). If a property owner decides to retain and continue using their water well, the cost of the well's operation, including Double Check Valve monthly fees, would be the owner's responsible and not the applicant.

### Response to Comment Ind 470-5
Mitigation Measure 4-8(c) requires the engineering and permitting of the NID potable water extension prior to dewatering. Engineering details of several lateral piping to individual properties will be determined during engineering. Engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.) A 20-foot public utility

easement is present on three side of the commenter's property, as shown on maps submitted with the Use Permit application and available at the links below.

Matt Kelly, Senior Planner
Nevada County Planning Department
Idaho.MMEIR@co.nevada.ca.us

Dear Mr. Kelly,

Thank you and the Planning Department for your dedication to hearing from the general public about the potential of bringing industrial mining back to Nevada County. I am among those in strong opposition to the plan proposed by Ben Mossman and the company he represents, Rise Gold.

**Ind 471-1**

I own a home in one of the areas that will be most impacted by the reopening of the Idaho Maryland Mine. I have seen the DEIR and have been in on many intelligent conversations put forth by the MineWatch group regarding the inadequacies of the document. I support their requests for further study and review of the DEIR conclusions, and I am confident representatives of CEA and MineWatch have presented those far more eloquently than I could.

What I would like to add, given the history of Ben Mossman and the mining industry he represents, is that I have little faith in their commitment to fully implement the very long list of mitigations suggested in the DEIR to address the significant short and long range impacts the mine operation will impose on our community. This leaves us as citizens and tax payers to, at the very least, foot a large bill for oversight. I would like to see the final EIR estimate the costs of county oversight included as a factor. This, especially, given the already over-burdened public services in our county working on many other vital matters to keep us all safe.

**Ind 471-2**

Sincerely,

Laura Gerhart

Dear Planning Committee,

**Ind 472-1** My husband and I are members of District Three and are both extremely concerned about the social and environmental impacts the reopening of the Idaho-Maryland mine might have upon our community. Hard rock mining is the leading source of toxic waste in America—and it has no place in a peaceful residential community whose residents would suffer from relentless noise pollution and potential exposure to toxic elements.

**Ind 472-2** In my profession as a business and technology writer/editor, I spend much of my time looking into the workings of organizations, particularly as it pertains to their commitment to corporate ESG (environmental, social, governance) impacts. I am sad to report that Rise Gold is the poster child for corporate malfeasance—from reckless pollution to the overpromising of job outcomes and underreporting of environmental impacts. To let them into our community would be a grave mistake, one that could negatively affect our area for generations to come.

**Ind 472-3** Thank you for taking your time to read and respond to the citizens of Nevada County. I hope you know that the vast majority of residents want nothing to do with Rise Gold—surely there are other, less potentially damaging visions for the future of our county and our kids.

Sincerely,

Laura LeBleu

The reopening of the mine will negatively impact the community in the following areas:

**Ind 474-1** 1. Location - The proposed re-opening, with its buildings that require multiple variances, is proposed in an established residential area. Not to mention it is very close to a school that is for children kindergarten through 8th grade. The mine wants to operate 24 hours a day. They will be blasting, dumping and hauling tons of rock from 6a - 10p. Residents will be unable to open their windows or enjoy the great outdoors due to the noise. The noise will make it difficult for the school to conduct classes. In addition they are not sure which way the wind will carry the dust and particles. Would you want your child inhaling this during recess?

**Ind 474-2** 2. Health and wellness. As noted, the proposed mine will be dumping and hauling tons of fill rock contains asbestos and silica each day. Once asbestos particles become airborne you have the danger of them being inhaled and causing Mesothelioma - a fatal asbestos lung cancer. We have no idea which way the wind will take these particles. While you may think this is just another "ambulance chaser" legal action - having watched a relative die from this disease and gasp for their last breath due to asbestos exposure at work - I can assure you this disease is no joke. This company will be exposing all our residents to this toxin. The company has also said the rocks and dirt hauled out can be used for local constructions projects. Really - what construction project is going to accept contaminated fill?

**Ind 474-3** 3. Water - We are in a substantial drought situation. They propose to pump out over one million gallons of ground water per day. When ground water from aquifers was depleted in Santa Clara county, they saw the ground sink as much as 13 feet in some area making the area unstable and causing damage to structures, roads and even dams. In addition depletion of ground water can impact peoples wells and make it harder for them to reach water as the water table will be lower. Many here are dependent on wells as their primary source of water. This depletion can also cause residents increased costs for treatment as the depletion of surface water can impact the quality of the remaining water. How will the depletion of water impact the health of our forests? We are already in a high risk fire area and have difficulty getting fire insurance. Any depletion of water will only make this worse.

**Ind 474-4** The "treated" water will be pumped into Deer Creek. How will that affect that ecosystem? We have all see the holding ponds at the Empire Mine trying to make the water useable again and the disaster that is Lost Lake. Can we afford another Super-Fund site?

**Ind 474-5** In closing, this is a foreign company who has had issues with not living up to their commitments. Who will be left holding the bag when for some reason they decide this project is not longer viable? Or, when the residents start getting sick from tainted ground water and polluted air? The damage will be done and they will be long gone. They are not the first who have tried this. Short term gains do not offset long term costs.

1

Sincerely,

Lauran and Cy Rinck
Grass Valley

## INDIVIDUAL LETTER 474: LAURAN AND CY RINCK

### Response to Comment Ind 474-1

The commenter is concerned about the vicinity of a school to the project and the noise- and air quality-related impacts on children. The DEIR identifies the closest school to the project, which is the Montessori House of Children on The Burma Road located approximately 2,500 feet south of the Brunswick Industrial Site boundary. (DEIR, p. 4.3-62.) Sensitive receptors, including schools, are considered in the health risk assessment and impacts are less than significant after mitigation. (DEIR, p. 4.3-78.) The DEIR also found that noise-related impacts would be less than significant after mitigation, with the exception of the installation of a potable water line along East Bennett Road. (DEIR, 4.10-27, 31.)

### Response to Comment Ind 474-2

The commenter is concerned that the waste rock produced by the project will release asbestos and other toxic air contaminants. The DEIR and Health Risk Assessment (Appendix E.1) evaluates asbestos and silica emissions and determined the impacts to be less than significant after mitigation. (DEIR, p. 4.3-78.) The commenter is referred to Master Response 17 - Meteorological Data Used in HRA, Master Response 18 - Air Quality Thresholds, Master Response 21 - Conservatism of Silica Assumptions, and Master Response 22 - Conservatism of Asbestos Assumptions.

### Response to Comment Ind 474-3

The commenter is concerned that the project will impact both quantity and quality of the groundwater supplies, especially in the context of the drought. The commenter is also concerned about the impact of the project on the soil moisture which could affect vegetation. The DEIR found that the project would not significantly impact groundwater supplies and would not violate any water quality standard after mitigation. (DEIR, p. 4.8-41, 54.) The commenter is also referred to Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 16 - Drought and Climate Change, Master Response 33 - Groundwater Dependent Vegetation, and Master Response 29 - Near Surface Workings.

Regarding the impact to vegetation, it can be reasonably concluded that the dewatering of the mine would not affect the available moisture for vegetation in the project area because the depth to groundwater is already below the typical rooting depths in higher topographic areas while adequate flows would occur in South Fork Wolf Creek and Wolf Creek to maintain groundwater levels in the lower topographic areas. (DEIR, p. 4.13-21.) The dewatering of mine would not, therefore, increase fire risk due to reduced groundwater levels.

### Response to Comment Ind 474-4

The commenter states that treated water would be pumped into Deer Creek but is likely referencing the discharge of treated water to South Fork Wolf Creek. The DEIR found that the project would not violate any applicable water quality standard after mitigation. (DEIR, 4.8-41.) The commenter is also referred to Master Response 35 - Discharge to South Fork Wolf Creek, and Master Response 36 - Flows in South Fork Wolf Creek

### Response to Comment Ind 474-5

The commenter references the Project Applicant and is concerned about reclamation following the project. Regarding the Project Applicant, the commenter is referred to Master Response 3 - Operator Responsibility.

The project requires an approved Reclamation Plan. To ensure that reclamation will proceed in accordance with the approved Reclamation Plan, the County shall require as a condition of approval Security that will be released upon satisfactory performance. The applicant may pose Security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the County and the State Mining and Geology Board as specified in State regulations, and which the County reasonably determines are adequate to perform reclamation in accordance with the surface mining operation's approved Plan. (DEIR, p. 4.6-24.) The commenter is also referred to Appendix C (Reclamation Plan) of the DEIR.

A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

**LAUREN ANDERSON / DESIGN**

**RE: Rise Gold**

**Matt Kelley**
Planning Commission

**Ind 475-1** I wish to express my complete opposition to the proposed mine opening ! There are so many negative impacts for our area and community with almost nothing positive. I question their job numbers. Rise doesn't have anything adequate in the EIR to mitigate the negative impacts or solutions ...and self monitoring.....with their negative past record..... Really ?

**Ind 475-2** I live on he south boundary of the proposed mine off Brunswick and our Home Owners Association was told by the Engineer for "Peters Well Drilling" at the last go around with "M Gold" we would definitely lose our water"....and it would take NID about two years to get us that water with the engineering, permitting and construction work to get water to us. Can NID guarantee us water ?

**Ind 475-3** I have not been able to increase the height limit by three feet for my projects... Why allow them a 165 foot exemption with a completely out of place look ! ... not to mention, allowing the change in zoning. We didn't buy our property 30 years ago here for this. Don't let this happen !

**Ind 475-4** The noise is something else I must mention... We were here with the lumber mill and the sound from the trucks and the beeping of the backing up all day was horrible. I can't imagine what the loading of the trucks and truck traffic will sound like.. ( up to 100 trucks from 6am to 10pm ) ! and for 80 years.

This is a beautiful residential area ... Look at the "Facts" and vote no.... !

Thank You

Lauren Anderson

## INDIVIDUAL LETTER 476: LAUREN DRUTZ

### Response to Comment Ind 476-1

The comment does not address the adequacy of the DEIR.

**Individual Letter 477**

**From:** Lauren Drutz <lau@zebradesignworks.com>
**Sent:** Monday, April 4, 2022 4:13 PM
**To:** Matt Kelley; Idaho MMEIR
**Cc:** deircomments@cea-nc.org
**Subject:** Idaho Maryland Mine Project Draft EIR comments

**CAUTION:** This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

Dear Mr Kelley,

I am writing to express my thoughts on the Idaho-Maryland Mine Project Draft EIR Project.

**Ind 477-1**

The DEIR states that "Rise Grass Valley Inc. entered into a Voluntary Cleanup Agreement (VCA; Docket No. HSA-FY18/19-014) with the Department of Toxic Substances Control (DTSC) for the voluntary cleanup of soil contamination on the Centennial Industrial Site" for problems from previous mining activities. These old problems have not been mitigated yet and the solutions to fixing these old problems have been linked to this DEIR. This seems quite backwards to me. The proposed Rise Gold plan to re-open the Idaho-Maryland Mine has many new environmental and health problems. Beginning a new project without first addressing and mitigating the existing problems is asking for trouble. The DEIR assumes that Rise will fix these issues sometime, and then takes an incredible leap of faith by saying that the environmental baseline for Aesthetics, Ag and Forestry Resources, Biological Resources, Hazards and Hazardous Materials and Wildfire "has been adjusted to reflect the reasonably anticipated conditions of the site following the remediation activities (CEQA Guidelines Section 15125(a))." This dangerous assumption allows prevents Rise from being held accountable for completing the VCA or doing so adequately.

**Ind 477-2**

Thirteen major concerns are minimized and rationalized by Rise in this DEIR.

I have commented on seven of these concerns. Following are excerpts in quotes from the DEIR, with my comments following or without quotation marks.

Aesthetics: "…the project would substantially degrade the existing visual character or quality of public views of the project sites or the site surroundings, or conflict with applicable zoning and other regulations governing scenic quality. Based on the above, a ***significant*** impact would occur." "…given the proposed heights of the structures and the permanent alteration of the views, the impact would remain ***significant and unavoidable.***" Apparently, the DEIR is giving Rise a pass regarding degradation of aesthetics.

**Ind 477-3**

With respect to light pollution, section 4.1-3, the claim "All work at the Centennial Industrial Site would be done between 6:00 AM and 10:00 PM." appears to be in conflict with Table 3-7. From my perspective, loaders, trucks and building lights would add sources of light to a site where currently none exist. These two references from the DEIR appear to be contradictory. But then the DEIR rationalizes the increase in visual degradation by saying "...the proposed project would substantially degrade the character of the Centennial and Brunswick Industrial Sites, though they are zoned for industrial development and there are surrounding industrial land uses in the vicinity of the project sites. Therefore, the project's incremental contribution to the significant cumulative impact would be ***cumulatively considerable and significant and unavoidable***." I have to disagree. This is not an unavoidable impact. The cumulative impact is occurring because

1

successive projects are being approved using the same backwards logic. The DEIR could instead conclude that adding more light pollution and aesthetic degradation is not appropriate at the Rise site because it would contribute to the cumulative impact.

**Ind 477-4** Figure 4.1-11 Viewpoint 6: Corner of Brunswick Rd and East Bennett Road. It appears that the Simulated Condition picture forgot that almost all of the existing and native trees are to be removed and replaced with species that a landscaper will decide as appropriate. See landscape diagram 3-17 as compared to Figure 4.1-11

**Ind 477-5** Agriculture & Forestry Resources: The DEIR states "The potential loss of up to 25 acres of forest/timberland associated with the proposed project would equate to an approximately 0.0001 percent decrease in statewide timberland resources. This very small relative amount of forest/timberland loss that would result from the project is not substantial in terms of the overall resources in the state and is therefore considered less than significant for the purposes of this analysis. Once again, the DEIR reasons that such a small amount of lost forestland is not significant. Once again, I feel that I need to point out that little things, incremental acreages, small voices, all add up and make a difference, positive or negative, in the big picture.

**Ind 477-6** Air Quality & Greenhouse Gas Emissions: The DEIR maintains that air quality and greenhouse gas emissions would be "less than cumulatively considerable". "The proposed project is anticipated to result in increased electricity consumption of 16,513 MWh during the year of construction and 49,613 MWh annually during operations. Reclamation activity is not anticipated to create a substantial demand for electrical power. Although the project would increase electricity demand, the increased demand is not anticipated to conflict with PG&E's ability to meet the RPS requirements." And "As mentioned above, global climate change is, by nature, a cumulative impact." The DEIR also states "There is already a trend in Nevada County regarding increased energy efficiency. According to the Nevada County EAP, since 2010, Nevada County residents and businesses have saved 13,034,571 kWh of electricity and 163,282 therms of natural gas annually from PG&E energy efficiency programs including Nevada City and Grass Valley customers.[47] Increased efficiency will be ensured in the future as cumulative development occurs due to compliance with the State's robust energy efficiency requirements. For example, the 2019 CBSC has begun phasing in Zero Net Energy requirements by requiring residential projects to meet 100% of their electricity needs through rooftop solar. Cumulative residential development would include rooftop solar to meet 100% of each project's electricity demand. In addition, pursuant to 2019 CBSC, new non-residential buildings associated with cumulative development are also required to be solar ready."

"Based on the above, implementation of the project in combination with other cumulative development would not result in the wasteful or inefficient use of energy. Because the project would not conflict with a local plan to increase energy efficiency and reduce energy consumption, a ***less-than-significant*** impact would occur."

**Ind 477-7** The DEIR points to positive "cumulative development" benefits of adopting energy efficient electricity sources within Nevada County, yet Rise has no part in contributing towards this goal! Instead, the DEIR points out that Rise will add to electricity demand.

**Ind 477-8** The DEIR contradicts itself, stating "...global climate change is, by nature, a cumulative impact" and "....the project would increase electricity demand...." Then the DEIR calls them "less-than-significant" and provides a path for these negative impacts to be ignored.

**Ind 477-9** Hydrology and Water Quality: "The Idaho-Maryland Mine would have a surplus of water from the natural groundwater flow into the underground workings." The DEIR ignores mega-drought and climate change in California. Water is scarce and not reliable. DEIR claims about water availability are not reality based. The claim that Rise will be buying water from NID is merely a hope and if there is any water to buy from NID or pump from aquifers, Rise Gold will be competing with existing local communities and businesses who are scaling back now due to drought and climate change.

**Ind 477-10** Noise and Vibration: Please see Table 3-7 "Hours of Operation" on page 3-37.

It is disingenuous to claim that noise and/or vibration from the mine and its transport vehicles can be mitigated when mine operations are running 24/7 and trucks are hauling 7 days a week from 6AM to 10PM for 80 years, initial

2

dewatering is occurring 24/7 for 6 months (what about post-initial dewatering?), underground exploration/mining is happening 24/7 for 7 days a week for 80 years and outside truck loading is going on 7AM-7PM 7 days a week for 80 years.

**Ind 477-11**

Transportation: "The average transport of engineered fill would be 1,000 tons per day or 365,000 tons per year. A maximum transport rate of up to 2,000 tons of engineered fill per day is required to make up for periodic weather or operational delays. Truck payloads would be approximately 20 tons per truck and, therefore, would require up to 100 trips per day and an average of 50 trips per day."

Negative impacts to our county include wear and tear on roads, exhaust pollution, increased traffic and broken windshields from haul trucks, dangerous conditions for local drivers as haul trucks enter and leave Rise sites throughout the day, extra chaos for emergency vehicles especially during fire season.

**Ind 477-12**

Wildfire: "In the event of an evacuation order in the vicinity of the proposed mine, such as an evacuation of residents off of Greenhorn Road, the incident command center would contact dispatch and direct them to contact the mine and request the mine operator to shut down the mine and cease all truck hauling operations.[6] While Brunswick Road is not a primary evacuation route, it would be the evacuation route used by residents of the Greenhorn Road area to evacuate to the primary evacuation route of SR 49/20." Again, the DEIR has minimized the impact of Rise's operations on local residents during or in anticipation of an emergency evacuation.

**Ind 477-13**

"Overall, it can be reasonably concluded that the dewatering of the mine would not affect the available moisture for vegetation in the project area because the depth to groundwater is already below the typical rooting depths in higher topographic areas while adequate flows would occur in South Fork Wolf Creek and Wolf Creek to maintain groundwater levels in the lower topographic areas.[10] The dewatering would not, therefore, increase fire risk due to reduced groundwater levels." The forgoing statement is not taking into account drought and climate change. The DEIR is assuming adequate river and stream flows. However, this is not a given. The DEIR needs to include comprehensive and current data on groundwater, climate change and drought and refrain from discounting quality of life and safety issues for Nevada County residents.

**Ind 477-14**

"With limited exception, none of the infrastructure improvements would be expected to exacerbate wildfire risk. One exception is the extension of the overhead power line along Brunswick Road that would be extended onto the Brunswick Industrial Site, which would have the potential to exacerbate wildfire risk if the line comes in contact with tree limbs or other overhanging vegetation." Our community and California in general have experienced many fires resulting from power line ignitions. If Rise is serious about fire safety, they would put new power lines underground.

**Ind 477-15**

No consideration has been given to the proximity of Nevada County's air attack base on Loma Rica Drive to the Rise Gold Brunswick site. It is less than 1.5 miles away (as a plane flies). I think that this issue has been ignored with respect to first Standards of Significance 4.13.4. "Consistent with Appendix G of the CEQA Guidelines, Section XX. Wildfire, determination of significant impacts related to wildfire is based on whether the proposed project would result in the following, if located in or near state responsibility areas or lands classified as very high FHSZs:

- Substantially impair an adopted emergency response plan or emergency evacuation plan."

**Ind 477-16**

Two lengthy paragraphs describing the fire-fighting resources at the Grass Valley Air Attack base are included by the DEIR but no remarks about how a conflagration at a Rise site could negatively impact fire-fighting aircraft due to smoke or from issues with stored or in-use explosives at the Rise facilities. The air attack base is an incredible resource for our community and Northern California. It needs to be accounted for by the DEIR.

3

To write this letter, I have read through hundreds of pages of DEIR documents. It is obvious to me that most of the DEIR is weighted heavily on hopeful scenarios and assumptions so that Rise can push their project through the Planning Department.

**Ind 477-17** The term "cumulative impact" has been misused throughout this DEIR. Apparently, only positive cumulative impacts are applicable to Rise, while negative cumulative impacts are allowed to be ignored or trivialized. Logic of this type discredits the DEIR document.

Thank you for your consideration.

Lauren Drutz

## INDIVIDUAL LETTER 477: LAUREN DRUTZ

### Response to Comment Ind 477-1
The commenter states that the DEIR establishes an incorrect baseline by assuming the Centennial Industrial Site cleanup project will be completed. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Ind 477-2
The commenter states that the DEIR is "giving a pass" to the Project Applicant regarding aesthetic impacts, which were determined to be significant and unavoidable. A "significant and unavoidable impact" simply means that the DEIR has determined that a particular impact cannot be mitigated (or mitigation measures were infeasible) to a less than significant level. (DEIR, p. 5-9.) CEQA requires that the DEIR identifies significant and unavoidable impacts so that a lead agency is informed and can decide whether or not to approve a project, despite the significant and unavoidable impacts. (CEQA Guidelines § 15093.) The DEIR compiles all of the project's significant and unavoidable impacts in Section 5.6.

### Response to Comment Ind 477-3
The commenter states that the DEIR contradicts itself with regard to light pollution. As shown in Table 3-7 of the DEIR, off-site hauling of engineered fill would be from the hours of 6:00 AM to 10:00 PM and placement, grading, and compaction of engineered fill would take place from the hours of 7:00 AM to 3:30 PM. Therefore, there is no conflict with Section 4.1-3 of the DEIR. As discussed in this section of the DEIR, the significance threshold is the creation of a new source of substantial light of glare which would adversely affect day or nighttime views. The proposed project would not create a new source of substantial light or glare which would adversely affect day or nighttime views in the area, and a less-than-significant impact would occur.

As discussed in Section 4.1-4 of the DEIR, the project would create long-term changes in visual character associated with the proposed project in combination with cumulative development. The project's incremental contribution to this significant cumulative impact is cumulatively considerable and significant and unavoidable. As discussed in Section 4.1-5 of the DEIR, creation of new sources of light or glare associated with the proposed project in combination with cumulative development is less than cumulatively considerable.

### Response to Comment Ind 477-4
The commenter states that one of the DEIR's simulated vantage points (DEIR, p. 4.1-38, Viewpoint 6) fails to mention that all existing vegetation would be removed and replaced. Existing trees and vegetation in the northeast corner of the Brunswick site are not proposed to be removed by the project. The commenter is referred to Figure 4.4-10 of the DEIR.

### Response to Comment Ind 477-5
The commenter states that the DEIR understates the impact of from loss of acreage. The commenter is referred to Section 4.2-4 of the DEIR which explains how the significance of the project's impact to cumulative loss of forest land or conversion of forest land to non-forest use was determined.

### Response to Comment Ind 477-6
The commenter provides excepts from Chapter 4.3 of the DEIR. The comment is noted.

## Response to Comment Ind 477-7

The commenter states that the project would not contribute to energy efficiency goals within the County. The commenter is referred Master Response 25 - Nevada County Energy Action Plan.

## Response to Comment Ind 477-8

The commenter is referred to Master Response 27 - Greenhouse Gas Thresholds.

## Response to Comment Ind 477-9

The commenter states that the DEIR ignores the current drought conditions. The commenter is referred to Master Response 16 - Drought and Climate Change.

## Response to Comment Ind 477-10

The commenter states that the noise and vibration impacts cannot be mitigated to less than significant but provides no additional detail. The DEIR discusses noise and vibration impacts from the project in Chapter 4.10. Noise impact determination pursuant to CEQA is based on measurable thresholds established by the jurisdiction. The project noise analysis contained in Chapter 4.10 of the DEIR appropriately determined impact significance by comparing the project's estimated noise levels against the County's numerical noise thresholds. While this approach may not satisfy the commenter, it is the legally required approach under CEQA. As stated in CEQA Guidelines Section 15064.7:

> (a) A threshold of significance is an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.

Specifically, for the topic of noise, Appendix G of the CEQA Guidelines identifies the following thresholds:

> a) Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
>
> b) Generation of excessive groundborne vibration or groundborne noise levels?
>
> c) For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Furthermore, while the DEIR determined, based on best available data, that the project's operations would not result in noise levels that would exceed the above-listed thresholds, the DEIR conservatively concludes that the proposed project could result in a substantial permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, and the project's noise impacts could be significant. As a result, the DEIR includes Mitigation Measure

4.10-3, which requires implementation of a robust, ongoing noise monitoring program. The noise monitoring program shall evaluate noise levels at a minimum of five receptor locations surrounding the Brunswick Industrial Site. The noise monitoring system shall consist of the installation of permanent noise monitors at three to five locations on the Brunswick Industrial Site, and one site at the Centennial Industrial Site, to be determined by a third-party noise consultant under contract with the County, in coordination with the applicant. The permanent monitors shall be provided with a continual power source, and shall include internet connectivity technology, to enable electronic retrieval of noise monitoring data at any time by the County's third-party noise consultant. The County's third-party noise consultant is required to retrieve and evaluate mine-related operational noise levels within 30 days of commencement of mining, quarterly thereafter for the first five years, and then once per year thereafter for the life of the project. If noise levels are found to exceed the County's standards, then operation of the mine shall cease, until additional engineering controls can be implemented as needed.

## Response to Comment Ind 477-11

The commenter states that traffic-related impacts will damage roadways and increase emissions, but does not state how the DEIR is inadequate in assessing these impacts. The DEIR discusses the traffic impacts of trucks, including impacts to pavement, in Chapter 4.12. Truck emissions are discussed in Chapter 4.8. The commenter also states that the project would impede an evacuation during an emergency. The commenter is referred to Master Response 5 - Evacuation Zones.

## Response to Comment Ind 477-12

The commenter quotes from the DEIR and states that it minimizes the project's impacts on local residents during an emergency evaluation. However, the commenter does not provide any additional information regarding the adequacy of the DEIR on which to formulate a specific response. The commenter is referred to Master Response 5 - Evacuation Zones.

## Response to Comment Ind 477-13

The commenter states that the DEIR does not consider climate change in connection to the project's impacts to private groundwater wells. The commenter is referred to Master Response 16 - Drought and Climate Change.

## Response to Comment Ind 477-14

The commenter states that the DEIR should consider undergrounding a power line to abate fire risk. Mitigation Measure 4.13-2 requires a Vegetation Management Plan, including trimming of vegetation within specified horizontal distances from roadways and overhead power line(s), the latter of which may be implemented by PG&E as the service provider, consistent with clearance requirements in Public Resources Code Sections 4292 and 4293. Undergrounding the power line is not necessary because Mitigation Measure 4.13-2 reduces the impact to less than significant.

## Response to Comment Ind 477-15

The commenter states that the project would impair the Nevada County air attack base. However, the commenter does not state how the project would impact the air attack base. The commenter is referred to Response to Comment Ind 477-16.

## Response to Comment Ind 477-16

The commenter states that a fire at the project site would produce smoke that could interfere with operations at the Grass Valley air attack base. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or

economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence."

## Response to Comment Ind 477-17

The commenter states that cumulative impacts are ignored or trivialized in the DEIR. Responses to specific comments have been provided above.

**Individual Letter 478**

March 22, 2022

We are writing to express our objection to the reopening of the Idaho- Maryland mine. We ask that you reject the proposal from Rise corporation. Nothing is to be gained for our community from their project.

**Ind 478-1** We moved to Nevada County in 1988 and love this community. We were certainly aware of the area's mining history and enjoy the quaint celebrations of that fact.... people in period costumes, the tossing of the pasties and the connections to Cornwall etc. Nevada County's mining legacy is something which is charming only because it remains in the past and is thankfully no longer a current reality. We have learned more and more about mining's toxic legacy and destruction. The re-opening of any mine, even with modern technology, is full of risk and is no benefit to our community.

**Ind 478-2** Hundreds of truck trips per day will increasingly pollute our air and, as you know, we can not afford to add more air pollution to our already poor air quality throughout much of the summer. Noise pollution will increase with mine activity and trucking. Water issues will be greatly impacted by mining needs. The Rise Corporation has a history of leaving toxic mess and not fulfilling obligations to clean up. There are too many unknown health impacts from this project.

**Ind 478-3** We recognize that you are attracted by business and promise of job creation. However, we reject the notion that this is the way to achieve those goals. You only have to look at Truckee to see how tourism and recreational businesses will improve our economy and way of life. Support the creation of bike trails, attract more eco- businesses, develop a nature center or a museum. Continue to attract alternative energy companies and high tech businesses. That's how to increase jobs and tax revenue and also improve our communities. Mining will be a deterrent to any tourist, retiree, or remote worker.

**Ind 478-4** Property values will plummet. Who wants to visit or reside in an area full of noise and air pollution? Who wants to move to a community that may have depleted or polluted water and possible contaminated soil?

**Ind 478-5** We urge you to reject this project.

Thank you for your attention,

Laurie and Philip DesJardins

PO Box 2102 Nevada City CA 95959

## INDIVIDUAL LETTER 478: LAURIE DESJARDINS

### Response to Comment Ind 478-1
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

### Response to Comment Ind 478-2
Air quality is addressed in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR as well as in Master Responses 17 through 24. Noise is addressed in Chapter 4.10, Noise and Vibration, of the DEIR. Please see Master Responses 13 through 15 regarding groundwater. Please also see Master Responses 1 and 3. The commenter expresses general concerns regarding impacts of the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

### Response to Comment Ind 478-3
The comment does not address the adequacy of the DEIR. Please see Master Response 2.

### Response to Comment Ind 478-4
The comment does not address the adequacy of the DEIR. Please see Master Response 2.

### Response to Comment Ind 478-5
The comment does not address the adequacy of the DEIR. Please see Master Responses 1 – Non-EIR/Administrative Issues. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 479**

Laurie Dahm Segal
14226 Gochine Dr.
Nevada City, CA 95959
(650) 533-8744
ldahmsegal@acsrdl.

March 27, 2022

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902 (530) 265-1423

Dear Mr. Kelley,

I am a resident of Nevada City that was forced to evacuate my home during the Jones Fire. I have reviewed the DEIR for re-opening the Idaho-Maryland Mine and am very concerned about the GHG emissions that will be generated during the life of the project. Regarding Chapter 4.3 Air, Quality, Greenhouse Gas Emissions, and Energy I submit the following comment.

The DEIR proposes the use of Carbon Offsets in offsetting the project's construction GHG emissions.

**Ind 479-1**

4.3-7(b) Carbon Offsets – Construction Emissions. Rise Grass Valley Inc. (Rise) shall retire carbon offsets in a quantity sufficient to offset the project's construction greenhouse gas (GHG) emissions to below the 1,100 metric ton carbon dioxide equivalent (MT CO2e) per year construction threshold, consistent with the performance standards and requirements set forth below. Specifically, prior to Nevada County's (County) issuance of the project's first grading permit, Rise shall retire carbon offsets equaling 2,345 MT CO2e, which was calculated by subtracting 1,100 MT CO2e (threshold) from the construction emissions generated by the project.

I have the following comment to the proposed mitigation technique:

The California cap-and-trade policy is under review. Therefore, the proposed mitigation is in a state of flux. A second net-zero mitigation plan is warranted.

"*In January (2021), the program (cap-and-trade) entered a new phase that adds new requirements through 2030. These include doubling the rate at which the emissions cap drops and adding a price ceiling for credits to prevent costs for industries from increasing past a certain point.*" *(2)*

*"California climate policy is already failing to reduce planet-warming emissions fast enough to meet the state's 2030 targets".(1) The cap-and-trade program "might be too weak to achieve California's ambitious climate goals". Therefore, hearings are taking place to determine "the extent to which the state's climate strategy should rely on the cap-and-trade program reductions relative to other approaches." (2)*

*"The cap-and-trade system in California was a pioneering initiative when it was established in 2013. But its goals look relatively modest next to the net-zero climate commitments being adopted by a growing number of states and businesses." (3)*

Laurie Dahm Segal

## INDIVIDUAL LETTER 479: LAURIE SEGAL

### Response to Comment Ind 479-1

The project would not be a covered entity under the State's Cap-and-Trade program, as described in the California Air Resources Board's *Cap-and-Trade Instructional Guidance*[3] (2012):

> Starting in 2012, major GHG-emitting sources, such as electricity generation (including imports), and large stationary sources (e.g., refineries, cement production facilities, oil and gas production facilities, glass manufacturing facilities, and food processing plants) that emit more than 25,000 MT $CO_2e$ per year will have to comply with the Cap-and-Trade Program. The program expands in 2015 to include fuel distributors (natural gas and propane fuel providers and transportation fuel providers) to address emissions from transportation fuels, and from combustion of other fossil fuels not directly covered at large sources in the program's initial phase.

In addition, per the California Air Resources Board's *Draft 2022 Scoping Plan, Appendix D – Local Actions*:

> Over the years, agencies and courts have provided direction and guidance regarding GHG mitigation. Nevertheless, given the variety of potential projects and mitigation scenarios, some uncertainty and misconceptions persist. For example, when lead agencies consider offsite GHG mitigation (including offsets), they may sometimes conflate the requirements for compliance-grade offsets in California's Cap-and-Trade regulation with the requirements for GHG mitigation measures under CEQA. The Cap-and-Trade regulation requires that compliance offsets meet certain regulatory criteria, which specify that compliance offsets must be real, additional, quantifiable, permanent, verifiable, and enforceable. In general, the State's Cap-and-Trade Program restricts compliance offsets from being used for any purpose other than Cap-and-Trade compliance, including being used as mitigation under CEQA [emphasis added].

The project does not emit 10,000 MT of $CO_2e$ per year and is not subject to the Mandatory Reporting Regulation since it does not result in more than 25,000 MT $CO_2e$ per year. See CARB regulations for the mandatory reporting of GHG emissions on page 4.3-29 of the DEIR. The project is not a covered entity under Cap-and-Trade, and therefore Cap-and-Trade offsets cannot be used as mitigation for the project.

The commenter suggests that the project should purchase offsets such that the lifetime emissions would be net zero. However, there is no requirement that a project reduce greenhouse gas emissions to net zero. Notably, the lead agency has determined that the threshold of significance for the project is 1,100 MT $CO_2e$ per year for construction and 10,000 MT $CO_2e$ per year for operations, based on substantial evidence provided in the DEIR (please see Master Response 27, GHG Thresholds). These thresholds are based on annual GHG emissions, rather than life cycle emissions of a project, which the commenter suggests the project's impacts should have been evaluated on. However, life cycle emissions are not required to be assessed under CEQA (please see Master Response 26, Life Cycle GHG Emissions). Since the project would result in GHG emissions during construction that would exceed the applied threshold of 1,100 MT $CO_2e$ per year, mitigation has been applied to reduce emissions to a less than significant level. For operations, the GHG emissions do not exceed the applied threshold during any of the years of activity and therefore, no mitigation was required. CEQA does not have a requirement for a project to mitigate beyond the threshold.

[3] https://ww2.arb.ca.gov/sites/default/files/cap-and-trade/guidance/chapter1.pdf

In addition, the project's GHG inventory in the DEIR makes conservative assumptions for GHG emissions over the life of the project. As shown in Table 22 of Appendix E.1, for the Year 2033 to 2102 Scenario, PG&E supplied electricity makes up the majority (51%) of GHG emissions from the project at 4,636 metric tons. GHG emissions from electricity are calculated based on an intensity factor of 204 pounds per MWh. These values will decrease over time due to the Renewable Portfolio Standard but were used for all scenarios as a conservative estimate (see page 347 of Appendix E.2). On-road vehicles – Off-Site makes up a large part (35%) of GHG emissions from the project at 3,123 metric tons. These emissions are primarily generated by haul trucks which are assumed to deliver engineered fill at an average distance of 60 miles (see page 246 of Appendix E.2). As heavy trucks and passenger vehicles are eventually transitioned to battery-electric vehicles under State policy, these emissions will likely be less than assumed in future years.

**Individual Letter 480**

Laurie Dahm Segal

Nevada City, CA 95959
(650) 533-8744
ldahmsegal@acsrdl.

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902 (530) 265-1423

March 27, 2022

Dear Mr. Kelley,

I am a resident of Nevada City that was forced to evacuate my home during the Jones Fire. I have reviewed the DEIR for re-opening the Idaho-Maryland Mine and am very concerned about the GHG emissions that will be generated during the life of the project. Regarding Chapter 4.3 Air, Quality, Greenhouse Gas Emissions, and Energy I submit the following comment.

DEIR ***Table 4.3-23 Estimated Annual Greenhouse Gas Emissions (Metric Tons) Year 2033 to 2102 – Mining, Brunswick Industrial Site Operations, Fill Placement at Off-Site Location*** provides an entry of **9,041.23** of **Total Annual Emissions (Metric Tons)**. *The GHG Threshold used is* ***10,000****. Additionally, a* ***No*** *is provided in assessing Significance (Yes/No)?*

My comment is two-fold

**Ind 480-1**

1) 10,000 MT CO2e per year is the quantitative threshold used by SMAQMD, PCAPCD, BAAQMD and SCAQMD as sited in the four bullets on *DEIR Page 4.3-42/43*. The 10,000 MT CO2e per year threshold is based on the CEQA Guide December 2009, Revised November 2014, May 2015, April 2020[1],

   CEQA revisions coincide with updates from the CARBs' Climate Change Scoping Plan. *The 2017 Scoping Plan serves as the framework for reaching targets established by SB 32 – that emissions be 40 percent below 1990 levels by 2030. This is needed to keep California on a trajectory toward meeting or exceeding the long-term goal of reducing GHG emissions to 80 percent below 1990 levels by 2050 as set forth in EO S-3-05 (DEIR Page 4.3-28).*

   Targets have not been set for beyond 2050, therefore a conclusion that the Significance is **No** for years 2051 – 2102 should not be assumed. In fact, *"California climate policy is already failing to reduce planet-warming emissions fast enough to meet the state's 2030 targets".*[2] Workshops are currently being

held as CARB prepares its' 2022 Scoping plan for achieving carbon neutrality by 2045.[3]

*https://www.airquality.org/LandUseTransportation/Documents/CH2ThresholdsTable4-2020.pdf*[1]

*https://calmatters.org/commentary/my-turn/2021/03/cap-and-trade-offsets-at-a-crossroads-in-californias-climate-policy/*[2]

*https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan*[3]

**Ind 480-2**

2) **Sixty-seven** years of being >90% of GHG target emissions for a project should be considered **Significant**. Nevada County, located in the MCAB, is already experiencing extreme effects of climate change as documented in the three bullet points on *DEIR Page 4.3.16.*

The IPCC Sixth Assessment Report (28 February 2022)[3] implores that urgent action is required to deal with increasing risks. *Hoesung Lee states that "It (the report) emphasizes the **urgency of immediate and more ambitious action** to address climate risks. Half measures are no longer an option."* Approving a project that increases GHG emissions for the next 67 years in Nevada County will only accelerate the affects of climate change already being experienced - higher temperatures, less water, more fires, etc.

*https://www.ipcc.ch/report/ar6/wg2/resources/press/press-release/*[3]

Sincerely,

Laurie Dahm Segal

## INDIVIDUAL LETTER 480: LAURIE SEGAL

### Response to Comment Ind 480-1

The commenter states that the DEIR should not assume a less than significant impact for project years beyond 2050 because GHG emission reduction targets have not been set beyond year 2050, and that California policies are failing to meet GHG emission reduction targets for 2030. As GHG emission reduction targets for years subsequent to 2050 have not yet been established in California, the DEIR cannot compare the project to those targets and any analysis based on hypothetical targets would be mere speculation. CEQA does not require an EIR to analyze speculative impacts. (see CEQA Guidelines Section 15384.)

Notably, the lead agency has determined that the threshold of significance for the project is 1,100 MT $CO_2$e per year for construction and 10,000 MT $CO_2$e per year for operations, based on substantial evidence provided in the DEIR (please see Master Response 27, Greenhouse Gas Thresholds). Since the project would result in GHG emissions during construction that would exceed the applied threshold of 1,100 MT $CO_2$e per year, mitigation has been applied to reduce emissions to a less than significant level. For operations, the GHG emissions do not exceed the applied threshold during any of the years of activity and therefore, no mitigation was required. CEQA does not have a requirement for a project to mitigate beyond the threshold.

In addition, the project's GHG inventory in the DEIR makes conservative assumptions for GHG emissions over the life of the project. As shown in Table 22 of Appendix E.1, for the Year 2033 to 2102 Scenario, PG&E supplied electricity makes up the majority (51%) of GHG emissions from the project at 4,636 metric tons. GHG emissions from electricity are calculated based on an intensity factor of 204 pounds per MWh. These values will decrease over time due to the Renewable Portfolio Standard but were used for all scenarios as a conservative estimate (see page 347 of Appendix E.2). On-road vehicles – Off-Site makes up a large part (35%) of GHG emissions from the project at 3,123 metric tons. These emissions are primarily generated by haul trucks which are assumed to deliver engineered fill at an average distance of 60 miles (see page 246 of Appendix E.2). As heavy trucks and passenger vehicles are eventually transitioned to battery-electric vehicles, these emissions will likely be less than assumed in future years. Likewise, any changes in California law or regulation that are subsequently approved to meet new targets developed for post-2050 emission reduction targets would be applied to the project where applicable; however, those changes are speculative and cannot be accurately analyzed in the DEIR.

### Response to Comment Ind 480-2

The commenter asserts that the project's operational GHG emissions should be considered significant because they are over 90% of the applicable threshold. Impacts are considered significant when they exceed the applicable threshold, and the project's operational GHG emissions do not exceed the threshold selected by the County, based on substantial evidence. As such, the project's operational GHG emissions are considered less than significant. Please see Master Response 27 - Greenhouse Gas Thresholds, and see Response to Comment Ind 480-1.

10591 Salcido Lane

Grass Valley

916.432.0409 (Call/Text)

Dear Mr. Kelly

Idaho-Maryland Mine Project SCH# 2020070378 Draft Environmental Impact Report

I am writing as a co-owner, with my three sisters, the property at 10591 Salcido Lane to express my concern on aspects of this project.

**Ind 481-1** I am particularly concerned at the content of tables 4.4-5 and 4.4-6 which omit flora, fauna and avian species identified at the recent hearing and also, where identified substantially understate the potential.

The "on foot" surveys were conducted during the winter and summer seasons but no surveys were taken in the spring and autumn seasons therefore omitting two very significant seasons for the observation of seasonal flora, fauna and migratory avian species. This omission requires that "on-foot" surveys for the omitted seasons be undertaken and included in a revised issue or the report.

Yours faithfully,

Lea K. Wheatley

1

## INDIVIDUAL LETTER 481: LEA WHEATLEY

### Response to Comment Ind 481-1

The commenter identifies concerns with flora, fauna, and migratory birds not identified in the DEIR, but does not specifically state which species. In addition, the commenter questions the timing of surveys. Please see Master Response 31 - Rare Plants and Master Response 37 - Birds and Raptors.

**Individual Letter 482**

We oppose.

**~~I support~~ re-opening the Idaho-Maryland Mine**

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a ~~modern and environmentally sensitive~~ mine ~~that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.~~ is a potential disaster

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Not likely to happen

OAR current residents.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials ~~to jump start our local economy by strongly supporting~~ the re-opening of the Idaho-Maryland Mine.

### Response to Comment Ind 482-1

The comment does not address the adequacy of the DEIR. Please see Master Responses 1 and 2. The comment has been noted for the record and will be forwarded to the decisionmakers as part of their consideration of the proposed project.

**Individual Letter 483**

March 25, 2022

Matt Kelley, Senior Planner

950 Maidu Ave. Suite 170

Nevada City, CA 95959

Dear Matt,

**Ind 483-1** We have been following the proposal to reopen the Idaho Maryland Mine on Brunswick Road in Grass Valley, including attending the public Supervisor's meeting on March 24th. When my husband and I moved to Nevada County, we were alarmed by all the disclosures that we were required to acknowledge before purchasing our home on Lee Lane. The area had obviously been riddled with toxic practices stemming from the mid 1800's forward. We felt grateful that the land, trees and water were in the process of being restored to a healthy environment. Then we learned of the proposed reopening of mines in the area that threaten to continue polluting this beautiful land for the same reason it was so devastatingly destroyed more than a century ago, and continuing to be allowed into the late 20th century.

**Ind 483-2** Hearing the various issues that were addressed on March 24th in reference to the DIER we were alarmed that if the Rise Corporation were allowed to open the Idaho Maryland mine, that there would be blasting of underground tunnels, threatening the homeowners that rely on private wells by potentially striking water bearing fractures and dewatering or contaminating local wells, air quality issues of which we are struggling with already, sound pollution, and many more issues that could change our community for the unforeseeable future.

**Ind 483-3** There have been many lessons learned about the devastating effects from mining that need to be remembered in order to protect our entire area. Simply walking in Empire Mine State Historic Park and seeing how many areas are still too toxic to be open to the public is a huge red flag as to how devastating this practice is, whether the operations are above ground or below.

**Ind 483-4** Property values will be impacted tremendously if the pollution of truck traffic, the safety of our roads with the hauling of rock and mining debris, the noise of blasting, the inevitable public health issues of toxic metals being released into the aquifers are allowed, sacrificing the beauty of our natural environment for a proposed 80 years only for a few additional jobs and tax revenue. It's too great of a risk to take. Instead, we need to heal the devastating effects of the past mining operations, creating a healthy environment for those of us that have been born here or have migrated here for a better and healthier life.

Thank you for rejecting the proposed mine opening, promoting and sustaining the health of this beautiful land and its residents both now and in the future.

Sincerely,

Letitia and Robert Jacobs

**Individual Letter 484**

Nevada County Planning Commission Date: 950 Maidu Avenue, Suite 170
Nevada City, CA, 95959 1/29/20

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

January 23, 2022

**Ind 484-1** I have lived in Nevada County now for over 50 years. I raised my family here and retired from high school teaching in 2006 to run NCTV for 6 years. I helped broadcast your government meetings and have working with most of the non-profits in the community and served on many of their boards and well as working with County staff. In other words, I have seen many changes here and respect the work of many contributors. I have a long-standing interest in our community and oppose the approval of Rise Gold's proposed mine for the various reasons;

**Ind 484-2** 1. Follow the history of extractive industries both here and elsewhere. They leave a dismal legacy.

**Ind 484-3** 2. Nevada County has left its industry of mining and has moved on to recreation, tourism and now lumber/forest/water management.

**Ind 484-4** 3. The jobs that Rise Gold promises are not needed as we already have a shortage of workers and timber/forest management will provide a lifetime of opportunities for employment along with service and construction industries. For example, due to the recent storm, I have large, downed trees. The tree services here are backed up and say it will be 3 months before they can remove them.

**Ind 484-5** 4. The storm also left me without power for 12 days. PG&E will have its hands full providing both summer and winter support, providing jobs.

**Ind 484-6** 5. The power and water footprint of the proposed mine will make huge demands when our environment cannot absorb these impacts, as well as accompanying health issues due to air pollution.

**Ind 484-7** 6. Just the amount of trucking going through town will create a huge impact on air, noise and traffic congestion.

**Ind 484-8** Finally, when we stand back and look at our county and its future, we need to ask ourselves the question, what are our priorities? Do we want to return to a heavy industrial base and give up the quality of life that brings people here both to live and recreate?

You can approve the proposal and anticipate years of litigation of disapprove the proposal and be done with it, so we can get on with our lives.

Thank you for your patience. I wish you wisdom in your decision.

Re: adequacy of DEIR Idaho-Maryland Mine Project

Dear Matt Kelley,

After reviewing the **Hydrology** and Water Quality chapter of the DEIR for the Idaho-Maryland Mine Project, I'm astonished by the sparsity of data on which the DEIR bases its conclusions. Below I address just one of those.

The DEIR has used a groundwater hydrology model that assumes that the geology over the 2,585 acre project site is homogeneous.

**Ind 486-1**

I was one of the leaders of the cooperative effort from 1992 to 1997 between the San Juan Ridge Taxpayers Association (SJRTA) and Siskon Gold Corporation to craft a mining project that would have the least possible impact on surrounding communities. Over objections from our association, the EIR for that project based its hydrology analysis on the conclusion that:

> "Numerous studies have been conducted on the surface and ground water hydrology at the project site, and the data are voluminous … (that) Two separate groundwater systems occur under the project site." And that "The bedrock is a *confined* groundwater system." (my italics)

Thus, according to that EIR analysis, there was no connection between the project area and wells surrounding that area.

Yet 17 months after project commencement, tunnel excavations intercepted a large groundwater fracture that dewatered some 12 wells, some of them several miles from the tunnel itself.

This example, from the *initial stages* of the project, that is, before the proposed 3-mile-tunnel was less than a mile long, provides an object lesson and warning that a geological model that assume homogeneity cannot adequately address the complex geology of 2,585 subsurface acres.

**Noise:** I've read the Salter Report Acoustical Review of the DEIR Noise and Vibration section of the DEIR, and am alarmed by its finding that the DEIR underestimates certain noise levels by 10 to 18 dB.

A 10 decibel increase is perceived as a doubling of sound, and a 20 decibel increase is perceived as a quadrupling. So the Salter Report is extremely concerning. And these discrepancies must be addressed.

**Ind 486-2**

The neighborhood in the vicinity of the Idaho-Maryland project area is blessed with low ambient noise levels, especially nighttime noise levels, as was the area surrounding the Siskon Mine.

Our experience with the Siskon Mine was that nighttime operations just within the mouth of the tunnel and outside the mouth were far higher than the EIR had predicted. And although they only occasionally exceeded county nighttime standards, residents of households situated on a hillside as far as two miles from the tunnel mouth reported project noise from equipment, generators and fans that greatly increased their normal nighttime noise environmental, with a concomitant decrease in their quality of life.

I'd like to conclude by saying that I've read CEA's report on the DEIR, and am in agreement with all of the areas of inadequacy that the report details.

Thank you for your attention to my concerns.

Sincerely,
Liese Greensfelder

**Individual Letter 487**

March 31, 2022

16910 Cooper Road
Nevada City, California 95959

Matt Kelley
Nevada City Planning Department
950 Maidu Avenue Suite 170
Nevada City, California 95959

Dear Mr. Kelley:

**Ind 487-1** I oppose the application for the opening of a gold mile proposed by the Idaho-Marilyn Mine Project. Many objections have been submitted by citizens of this county that pointed out the flaws in the environmental impact report prepared by the Rise Gold applicants. I agree that the impact report is highly distorted.

I strongly oppose any proposal which would impact water supply and quality, noise and air quality.

Sincerely,

Lilly Grenz

**Nevada City, CA 95959**

**From: Lily Marie Mora**

**11683 Alta Vista Ave.**

**Grass Valley, CA 95945**

**Re: Rise Grass Valley, Inc.—EIR –I am opposed to the mine for many good reasons.**

**Dear County Staff, Planning Commission Members and Supervisorial Board Members:**

**Ind 488-1**

I have been working to review the EIR findings and have come to the conclusion that Rise Grass Valley, Inc.'s time to be in business in Nevada County has come and gone. The regulatory (government) intervention that will be needed to make this company operate within environmental, health and safety standards in this populated area will be astronomical.

1

Who will pay for all these watch dogs to make sure this company operates legally, as it already has a terrible track-record of bankruptcy, unfinished environmental clean-up in Canada and unpaid employees from its last mining fiasco?

I have lived in Nevada County all my life, 66years. I have had family members involved in all aspects of mining, up until the Siskon Mine, another Canadian company, that opened on the North San Juan ridge in the early 1990's. It all sounded great in the beginning, but soon became a huge environment catastrophe. A lot of the private property wells went dry and/or became contaminated, and the school still buys bottled water. Our county government sold out our kids, and their future for the promise of big money and a few jobs.

**The areas of the EIR that I am the most concerned about are the Size of the Mine, Clean Drinking Water availability, Maintaining Healthy Air Quality Standards, the Mitigation Measures and the possible bias of an EIR that was paid for by Rise Grass Valley, Inc.**

**I will list some of my many concerns:**

**1.) The location and size of the site and underground footprint of the mineral rights—**

**(Aprox. 2,585 acres)**

Ind 488-2

- Most people in the county have been getting their information about this project through articles in the Union newspaper.

  It has only been from reading this EIR that I understood the true size, scope and area of the mineral rights footprint, which poses a great risk to many landowners, businesses and our local Airport *(now used for year around fire suppression)*.

  It seems that a more direct comprehensive notification plan to educate these stakeholders would be necessary to evaluate the real support for and viability of this project.

  Rise Grass Valley, Inc.'s flashy mailers don't come close to explaining the possible risks involved with the proposed mining operation. The flyers appear to be more divisive than informative.

  Will there be an Emergency Fund put up by Rise Grass Valley, Inc., and held by the County of Nevada to handle any and all of the possible problems that will come up in the next 80yrs.?

**2.) Water Issues and Mitigation Measures:**

Ind 488-3

- The Sysckon mine project let us all know that the wells in the area are at risk,

- Pg. 4.3-49, 2nd Paragraph of the EIR, I learned about Surface Fugitive Dust Control.

  *"The modeling assumes that, during construction, NID-supplied water would be required for dust suppression. The NID-supplied water would result in associated indirect GHG emissions. For the assessment, it was assumed that about 11 million gallons total would be required for construction dust suppression."*

It seems that the people compiling this EIR are not educated about water use rules and regulations that are put in place during drought conditions.

On Feb. 9, 2022 and on April 28, 2021--NID-Nevada Irrigation District Board of Directors passed resolutions to implement Stage 1 of the Water Storage Contingency Plan.

Visit: www.nid.com/water-shortage-stages See: Table Stage 1-- 10%Supply Shortages for summary.

1. Treated Water and Municipal Customers are 1st on that list

2. Agriculture Customers are 2nd

(Being part of a ranching family, we have already been dealing directly with these restrictions during the drought.)

3. District Actions- is 3rd on the list

- Declare no new or increased surplus availability.

The State of CA Water Resources Board and NID have obviously realized the need to prioritize water usage to have enough clean water to drink and to grow healthy food to eat; dust control has not even been mentioned on the list.

**Ind 488-4**

This 11million gallons of NID water will be greatly needed for fire suppression, which has become a year around job during the drought.

This is a great error in the calculation of mitigation measures in this EIR.

**3.) Air Quality, Greenhouse Gas Emissions and Energy Issues and Mitigation Measures:**

- See various Tables:

**Ind 488-5**

Construction Off Road Equipment and On Road On Site Vehicle Trip Assumptions.

Diesel is the fuel mentioned to be used the most in all phases of the development process. Equipment will be running 1hr. to 24hrs per day depending on the equipment needed for the task. Even when electricity is mentioned as the fuel type, it does not mention how the electricity will be generated. Much of our electricity comes from hydroelectric power plants, which require a lot of rain and snow. What happens during a drought? If the public is in competition for the same electrical supply, won't our utility bills increase?

3

**Ind 488-6** Also, I didn't find how the Mitigation Measures would address the air quality during "Year Around Fire Season." You don't need to be an environmental scientist to know that the Air Quality meets fair to very unhealthy standards during these times.

**Ind 488-7** I didn't see addressed how Rise Grass Valley, Inc would handle their 24 hr./7day a week operations during a PG& E "black out" due to hazardous fire conditions. It would seem that they would need to use their back-up generators to supply the needed electricity, which are diesel powered, adding even more pollution to our unhealthy air.

**Ind 488-8** The air quality testing in this area seemed extremely lacking, as one of the test sites used was in Yuba City, CA located many miles away from the mine site.

So, that makes the mitigation measures at best misleading and the amount of mitigation measures needed to manage everything from the "Health Risks of Mining to the Reduction of Emissions" are daunting.

**Ind 488-9** **4.) Wildfire Issues and Mitigation Measures –**

- Figure 4.13-1, both the Centennial and Brunswick Industrial Sites are located on lands classified as being within a "Very High Fire Hazard Severity Zone."

**Ind 488-10**

- The EIR section on Prevailing Winds and Fire History are indicating that the southwesterly wind patterns can cause fire to burn through the mine site. In August 2021, the Bennett Fire did burn 59 acres of the Centennial Industrial site.

**Ind 488-11**

- Earlier in the EIR, it was mentioned that there would be 2-12,000 gallon diesel fuel tanks locate at the mine site. What safety measures will be taken to keep these tanks from burning or exploding in a fire and/or leaking, if they are installed underground?

**Ind 488-12**

- Public Safety Shutoffs—Will the mine shut down during these emergencies or will their power use take precedence over other users?

**Ind 488-13**

- How will evacuation routes, like Bennett St. and Idaho Marilyn Rd. be use during a forest fire, if they are clogged with mine truck traffic?

**Ind 488-14**

- These concerns highlight the difficulties of having a mining operation in a developed community.

When peoples' lives are on the line that is "significant" and that cannot be mitigated to "less significant."

**Ind 488-15** There are a couple of old sayings that come to mind, "The man who does not learn the lessons of history is domed to repeat them" and "All that glitters is not gold" is another.

So, as we all move forward to assess the real risks and benefits of this project, let us move into the mindset of "Ourstory." Will we court businesses that are fraught with problems from the beginning or will we choose businesses that benefit our entire community and our future generations.

In conclusion, I found the Mitigation Measures to be simplistic and short sited. I know you need to look at the merits of this project as described in the EIR, but as you deliberate to voter to approve or deny this project, think what if it was located near your home / well or local business? Put yourself and your family in the shoes of the individuals and families that will be directly affected by this mine. You represent all of us and our families, not big corporate interests from another country.

Many thanks to all of you for your time, consideration and hard work to evaluate this most complicated issue.

Sincerely,

Lily Marie Mora

## INDIVIDUAL LETTER 488: LILY MARIE

### Response to Comment Ind 488-1
This comment is introductory in nature. The commenter opposes the project and references the Project Applicant's reputation. The commenter's opposition to the project is noted for the decisionmakers. The commenter is also referred to Master Response 3 - Operator Responsibility.

### Response to Comment Ind 488-2
The commenter is concerned about a number of resource areas impacted by the mine, but is primarily concerned with the scope of the mineral rights boundary and implies that the Project Applicant will conduct underground mining to the extent of that boundary. The commenter is referred to Master Response 7 - Location of Future Mining Areas. Regarding the various resource areas mentioned by the commenter, the DEIR provides analysis of the project's impacts and proposes numerous mitigation measures. The commenter is referred to Chapter 4 of the DEIR. Regarding the media associated with the project, the commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Ind 488-3
The commenter states that project's water consumption for dust suppression would violate NID drought plans for water shortages. The commenter does not specifically identify what NID rules and regulations the project would violate or how the DEIR is inadequate. The DEIR found that impacts to water supply during normal, dry, and multiple dry years would be less than significant. (DEIR, 4.11-35.) The commenter is also referred to the project's Water Supply Assessment, Appendix N of the DEIR.

### Response to Comment Ind 488-4
The commenter reiterates concerns regarding the project's water consumption. The commenter is referred to Appendix N of the DEIR, and Master Response 16 - Drought and Climate Change.

### Response to Comment Ind 488-5
The commenter states that the project's energy consumption is inappropriate in light of the drought and it would raise the utility bills of others in the community. As stated on page 4.11-35 of the DEIR, PG&E provided a will serve letter for the project, PG&E has confirmed that there are electric facilities available to serve the proposed project in accordance with all applicable design standards, rules, and tariffs on file with the State of California Public Utilities Commission. Regarding utility bills, the commenter is referred to Master Response 2 - Social and Economic Impacts.

### Response to Comment Ind 488-6
The commenter states that the DEIR does not account for air quality impacts due to wildfire but does not state how the DEIR is inadequate. The commenter is referred to Master Response 18 - Air Quality Thresholds.

### Response to Comment Ind 488-7
The commenter states that the DEIR fails to discuss how the project would operate during a power outage. As stated on page 58 of Appendix E.1, the Stationary Engine ATCM allows owners and operators of emergency standby engines to use those engines to provide electrical power when a facility experiences the loss of normal electrical service that is beyond the reasonable control of the facility. Electrical service loss resulting from Public Safety Power Shutoff events is beyond the reasonable control of back-up engine owners and operators, and therefore, appropriately-

permitted emergency standby engines may be operated to provide electrical power during such an event pursuant to the Stationary Engine ATCM.

Air emissions from use of emergency generators are provided on pages 3.3-103 to 4.3-104 of the DEIR. Although maximum daily emissions have been estimated, the ultimate number of days per year the generators would operate cannot be known with certainty. Because the use of emergency generators is speculative and beyond the reasonable control of Rise Grass Valley, Inc., the emissions presented in the DEIR are for informational purposes only. Finally, it is important to note that while the use of emergency generators during power-outages such as PSPSs is outside of the scope of CEQA, the regular use of generators for routine maintenance and testing has been considered throughout the entirety of the analysis of the chapter, as such use is not speculative.

## Response to Comment Ind 488-8

The commenter questions the selection of ambient air quality monitoring stations summarized in the "Local Air Quality Monitoring" section of the DEIR, Chapter 4.3 (Air Quality, Greenhouse Gas Emissions, and Energy). The ambient criteria air pollutant data are presented for context and are used to determine the NSAQMD's compliance with the AAQS and to set applicable thresholds of significance. Therefore, they are not directly relevant to the analysis of the impacts from the project to criteria air pollutants. Significance determinations in the DEIR are based on comparison to the NSAQMD thresholds, which were developed based on compliance with AAQS. Further, the NSAQMD reviewed all versions of the Air Quality and Greenhouse Gas Technical Report (included as Appendix E.1 in the DEIR) and did not identify issues regarding the ambient air monitoring stations selected.

## Response to Comment Ind 488-9

The commenter references Figure 4.13-1, which identifies the project sites as being located in Very High Fire Hazard Severity Zones. The comment is noted.

## Response to Comment Ind 488-10

The commenter references the "Prevailing Winds" paragraph on DEIR page 4.13-3. The commenter is noted.

## Response to Comment Ind 488-11

The commenter asks what safety measures will be taken for the fuel tanks installed at the Brunswick site and whether they will be stored underground. Fuel tanks are not proposed to be installed underground. As stated on page 4.13-24 of the DEIR, the project would install two, 12,000-gallon above-ground diesel fuel storage tanks on the Brunswick Industrial Site. The tanks would be located in the industrial building complex area, away from existing and proposed vegetation. Diesel fuel is considered a Class II liquid, and as such, the tanks would be regulated in accordance with Chapter 23 of the California Fire Code (CFC). Chapter 23 of the CFC includes robust design requirements for above-ground fuel storage tanks to minimize fire hazard to the maximum extent feasible, including but not limited to requirements for overfill protection, spill containment, and dispenser emergency shutoff valve. Compliance with CFC requirements, as determined by the Fire Marshall's Office, at time of improvement plan review, would reduce fire hazards related to on-site fuel storage tanks.

## Response to Comment Ind 488-12

The commenter asks if the project would consume electricity during a Public Safety Power Shutoff when electricity is turned off. The Project Applicant does not control Public Safety Power Shutoffs. In such an event the project may use its onsite backup power generators.

## Response to Comment Ind 488-13

The commenter asks how the project would impact an evacuation during an emergency. The commenter is referred to Master Response 5 - Evacuation Zones.

## Response to Comment Ind 488-14

This comment does pertain to the adequacy of the DEIR. Responses to specific comments are provided above.

## Response to Comment Ind 488-15

The commenter opposes the project. Responses to specific comments are provided above. The commenter's opposition to the project is noted for decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

Dear Supervisors,

Do you all really think this is a good idea for our community??
What's in it for you personally?
Do any of you live in the impacted area? Bet you don't.

Please seriously give this fiasco some thought, and choose wisely for us all..
Blessings,
Linda

Mr. Matt Kelley
Senior Planner
Nevada County Planning Dept.
950 Maidu Ave, Suite 170
Nevada City, CA 95959

Dear Mr Kelley,

**Ind 490-1** I am writing you to protest the reopening of the Idaho-Maryland Mine.
My name is Linda Carlson and I moved up to Grass Valley from Sunnyvale after I retired 5 years ago.
I had lived in the Bay Area for over 50 years. However during that time the area
became more crowded and that caused more pollution. So I moved up here and I live in an apartment a mile way from the mine.

**Ind 490-2** I am concerned about air and water pollution along with traffic congestion in our area.
And I don't believe the hype. I don't believe the miners are going to be paid $95,000 a year and that the company would protect their workers or stop pollution the mining would create.
It's my understanding that Rise Gold Corp is headquartered in Canada. That's along way from Grass Valley and their people would not be living here and would not experience any adverse reaction resulting from working the mine.

**Ind 490-3** Plus CEO Ben Mossman lost his last company through bankruptcy and I understand he is still facing criminal charges.
Also, why are there not any California companies interested in reopening the mine?
I know you are very busy and I trust you will have the safety of the people currently living here foremost in your mind.

Sincerely,
Linda Carlson

**Ind 491-1**

Dear Supervisors,
Please do not allow this operation to come in to our Western Nevada County cherished sphere of residence, community and Commerce.

Please explore many other ways to approach suitable jobs and so forth for us.

I believe this operation will not enhance our community but will rather degrade it. Mitigations often fall apart down the road after there bowed after their promised.

I am a resident and property owner in Nevada City for 20 years. And a California resident for much more.

Thank you,
Linda Cohen
14520 Alderwood Way
Nevada City, Ca

CAUTION: This email originated from outside of County of Nevada email system. Do not click links or open attachments unless you recognize the sender and know the content is safe.

**Ind 492-1**

We are against New Rise coming into our county. They blew it in Canada, who's to say they won't make the same mistakes here. Not to mention the added traffic, damaged roads from all the heavy loads, the NOISE, property values declining, WATER POLLUTION, peace and quiet for that residential neighborhood, need I go on. And when they go bankrupt and skip town, which they will, we will be stuck cleaning up their mess. This man is a fraud, send him back to where he came from, we don't need that kind of business any longer. PLEASE VOTE NO. Thank you, Linda Ennis

## INDIVIDUAL LETTER 492: LINDA ENNIS

### Response to Comment Ind 492-1

Please see Master Responses 1 through 3. The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required.

To Whom It May Concern:

Please read and take seriously the comments by the CEA Foundation (Community Environmental Advocates Foundation) as regards the Draft Environmental Impact Report for the proposed reopening of the Idaho-Maryland Mine.

https://yubanet.com/regional/cea-foundation-significant-flaws-in-the-deir-for-the-proposed-reopening-of-idaho-maryland-mine/

**Ind 493-1**

Like most others in Western Nevada County I am against the mine's reopening because of the extensive damage it will do to the town of Grass Valley and hence to Nevada County. The damage costs will far exceed any profits realized by the mine.

Thank you for your consideration.

Linda Fillion
757 Uren Street
Nevada City,

## INDIVIDUAL LETTER 493: LINDA FILLION

### Response to Comment Ind 493-1

The comment cites concurrence with CEA Foundation's comments on the adequacy of the DEIR. CEA Foundation's comment letters are addressed in responses to Group Letter 6, 7, and 8. Please also see Master Responses 1 and 2.

**Individual Letter 494**

**From:** Sunny Lyons <sunnylyons@yahoo.com>
**Sent:** Saturday, March 19, 2022 12:29 PM
**To:** Idaho MMEIR
**Subject:** RISE Mine

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

**Do not click links or open attachments** unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

To Whom it May Concern:

**Ind 494-1** I am writing to express my extreme concerns about the Rise gold project reopening of the mine. Not only do they have a very poor track record, but they are also being disingenuous about the impact reopening the mine would thrust upon our community.

**Ind 494-2** Please vote NO on the mine to protect our already frail and essential water supply. Your NO vote will also protect the community from other mining pollution, noise and traffic.

**Ind 494-3** Please vote in favor of supporting our community, not a greedy and sketchy company coming in to reap profits at our expense.

Thank you,
Linda Howe

**Individual Letter 495**

March 21, 2022

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue
Nevada City, CA 95959-8617

Re: Preliminary Environmental Impact Report
Rise Gold Idaho Maryland Mine reopening study
Grass Valley, California

Dear Mr. Kelley:

**Ind 495-1** In the following, we set forth our concerns for sufficient study that will result in identified mitigation measures that can be incorporated in an approval of the reopening of the Idaho Maryland Mine proposal:

As proposed for operation, there will be significant detrimental impact on nearby and surrounding properties as a direct result of projected increased traffic impacts (truck traffic), audible noise from operations and trucks, degradation of air quality, potential loss of water wells from proposed mine dewatering, hazardous waste disposal and remediation, just to identify just a few.
