**Grp 9-18**

In reviewing the leach test results from Appendix K.2, Table 4-7: Tailings & Barren Rock Samples - Total Metals and DI-WET Results, the following observations are noted:

- Aluminum levels in the leachate are high. Even though the measurement was probably done as Total aluminum, these levels suggest that aluminum leaching could be an issue, and that Dissolved aluminum should be monitored.

- There is antimony present, and the water quality standard for antimony is low. Waste rock sample S-1 shows a level of antimony that is well above the water quality standard. Even though there is only a relatively small amount of S-1 rock in the waste, antimony should be monitored.

**Grp 9-19**

- Arsenic is measured at about 20% of the water quality standard, and is known to be an issue with the existing mine waste. Arsenic could become an issue if localized acidic conditions, or longer exposure time, drive the oxidation reactions.

**Grp 9-20**

Page #11

**Grp 9-21**
- Copper being detected at levels that could exceed water quality standards, but the measurement level for the sampling was too high, so we don't know enough about what is going on with copper.

**Grp 9-22**
- Iron and Manganese are both know to be present in existing mine water and the mine waste at levels that exceed water quality standards, but they are not showing elevated levels in the test data. This strongly suggests that the oxidation taking place in the mine itself, and in the mine waste on the surface, is more aggressive than that being simulated in the leach tests using distilled water.

**Grp 9-23**
- Nitrate, a residual from blasting, will almost certainly be present at levels significantly higher than projected in these tests.

**Grp 9-24**
- Similarly, sulfate will be higher than projected once the waste has time to oxidize.

**Grp 9-25**
- An important constituent, sulfide-sulfur, is not reported on a per-sample basis

**Grp 9-26**
In the summary of the report (Appendix K.2), EMKO notes that Potential Contaminants of Concern include ammonia, arsenic, hexavalent chromium, iron, manganese, pH, total suspended solids, TDS, and cis-1,2-DCE. To this list, I recommend adding antimony, copper, and nitrate.

**Grp 9-27**
Leach tests for the paste backfill also need to be completed. It is not appropriate to grant a mining permit that allows the use of this backfill without evaluating the potential long-term effects on water quality.

**6.3 Selection of Alternatives – Alternatives Considered in this EIR**

The mining project as proposed in this EIR has a fundamental lack of information on the economic viability of the mine, and potential environmental impacts related to geochemistry and water quality.

**Grp 9-28**
The data submitted in support of this EIR is only sufficient to support an application for dewatering the mine, and for underground exploration drilling. This would provide not only the information that will be required to perform a preliminary economic analysis of the orebody, but would also supply the samples needed for geotechnical and geochemical testing, and for water quality modeling.

The EIR should analyze an Alternative that provides for dewatering and underground exploration. That is the only Alternative that the information provided in this EIR will support.

Thank you for the opportunity to comment on this Draft EIR.

Sincerely;

David M. Chambers, Ph.D., P.Geop.

March 15, 2022

Matt Kelley, Sr. Planner
Nevada County Planning Department
950 Maidu Ave, Suite 170
Nevada City, California

Dear Mr. Kelley:

**Grp 10-1** In response to your outreach for public comments on the Draft EIR for the Idaho-Maryland Mine Project, the First Church of Christ Scientist, Grass Valley submits the following:

**Grp 10-2** Our primary concern with the project is the traffic and noise pollution that will occur from the project. Based on Figure 3-2 of the Draft EIR, our church is located approximately 800 feet from the Centennial Industrial Site, and also approximately 800 feet from the proposed haul route between the Brunswick Industrial Site, and the Centennial Industrial Site. According to your draft EIR, both of these sites will generate significant noise pollution. The EIR indicates the project will generate between 200 and 400 truck trips per day hauling industrial waste for compaction at the Centennial Industrial Site. If a heavy diesel truck hauling industrial waste generates about 110 decibels of noise at the haul point source, this would result in about 40-50 decibels of noise at our church which is about 800 feet away. If we keep our doors and windows shut, this would still create a noise disturbance at our church. We realize that a lot of inner city churches deal with a greater ambient noise level than this, but it will still significantly detract from the current peace and tranquility that we enjoy during our services.

**Grp 10-3** One easy mitigation would be if the trucks did not operate during our services, which is between 10 and 11 am on Sundays, and between 7:30 and 8:30 pm on Wednesdays.

**Grp 10-4** It is more difficult to determine the noise level created by the compaction activity on the Centennial Industry Site, as the EIR is negligent in assessing this issue. We would imagine the noise level would be similar to that of the truck hauling, so our concern would be the same.

**Grp 10-5** Respectfully submitted,
Executive Board, First Church of Christ Scientist, Grass Valley

## GROUP LETTER 10: FRED BELL, FIRST CHURCH OF CHRIST SCIENTIST, GRASS VALLEY

### Response to Comment Grp 10-1

This comment is introductory. No response is required. Please see the below response to specific comments.

### Response to Comment Grp 10-2

The comment states that commenter's primary concerns are traffic and noise. The scale on DEIR Figure 3-2 is incorrectly labeled. As a result, the distances cited in this comment which were based on that scale are similarly incorrect. The 1,600-foot reference on the scale should read 4,000 feet and is hereby corrected at the end of this letter. Using the correct scale, the actual distance from the Church of Christ Scientist, located at 375 Crown Circle in Grass Valley, was determined to be in excess of 3,000 feet to the Centennial Site and Brunswick Sites, and approximately 450 feet to the centerline of the nearest point of Whispering Pines Lane and Brunswick Road. Given the substantial distances from this receptor from the project noise sources, and the similarity of this receptor to Receptor #5, this location was not specifically evaluated in the noise study prepared for the DEIR. However, because the ambient noise exposure at this receptor is expected to be similar to that of Receptor #5 due to the similar distance to Brunswick Road, the baseline daytime, evening and nighttime average ambient noise environment at this receptor are approximately 50 dBA $L_{eq}$.

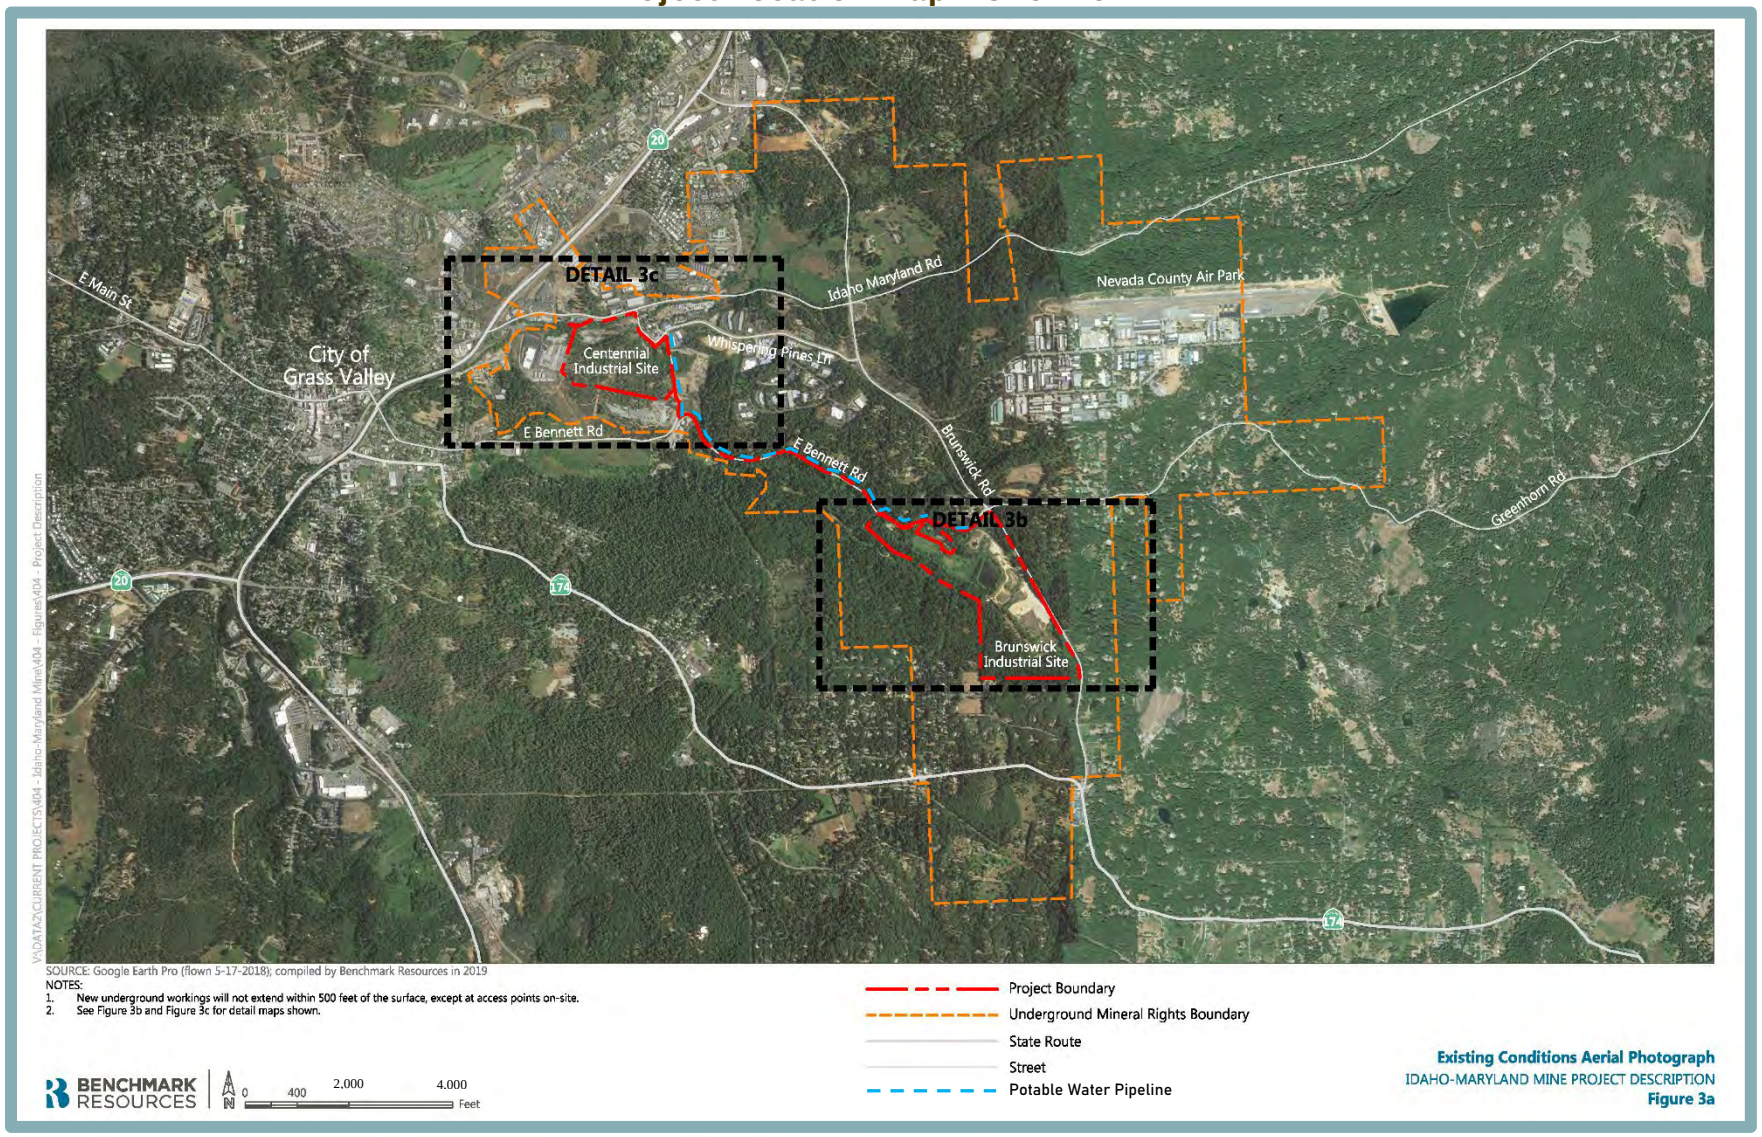
In response to this comment, the SoundPlan model was used to specifically model project noise exposure at this receptor. The results of that analysis indicate that average noise levels from the project, including all operations occurring on both the Brunswick and Centennial sites simultaneously, is predicted to be 19 dBA during daytime and evening hours, and 15 dBA during nighttime hours. The predicted noise level for receptor #5 is 29 dBA during daytime and 13 dBA during nighttime hours (see Tables 21 and 22 in Appendix L). These levels are well below both baseline ambient conditions and well below the noise standards applicable at the church use. As a result, the commenter's church would not be adversely affected by noise from the project.

DEIR Table 4.10-15 indicates that the project would result in a 2.6 dB increase in traffic noise levels on Whispering Pines Lane and a 0.3 dB increase in traffic noise levels on Brunswick Road. Neither of these increases exceed the project's standards of significance. In addition, because baseline ambient conditions at the church site are influenced more by traffic on Brunswick Road than by traffic on Whispering Pines Lane, the total change in traffic noise levels at the Church resulting from the project is predicted to be approximately 0.4 dB. As the project-related traffic noise level increase would be well below the criteria for a finding of a substantial traffic noise increase at the Church, no adverse noise impacts are identified for this receptor. The commenter's statement that heavy trucks generate 110 decibels of noise is unable to be verified without a distance being provided, but overall ambient traffic noise levels at this location are predicted to be approximately 58 dBA $L_{dn}$ at the exterior of the church. Because heavy trucks currently utilize Brunswick Road extensively, noise generated by the approximately 6 additional heavy truck trips generated by the project each hour would not be significant at this receptor, with combined baseline plus project noise at approximately 58.4 dBA $L_{dn}$. An exterior noise level of 58.4 dBA $L_{dn}$ would likely result in an interior noise level of 43.4 dBA $L_{dn}$ with windows open and 33.4 dBA $L_{dn}$ with windows closed. Interior noise levels of 45 dBA or less are typically considered acceptable for residential uses where sleep is critical. Therefore, these noise levels would not be expected to be destructive to typical worship activities.

Maximum noise levels generated during passbys of the project's heavy trucks would be similar to maximum noise generated currently by non-project heavy trucks which already operate daily on Brunswick Road. As a result, no increases in maximum noise levels would result from the project's heavy truck traffic at this receptor.

## Response to Comment Grp 10-3

CEQA requires potentially significant impacts be identified and mitigation applied in cases where the noise impacts of a project are predicted to be significant by exceeding identified thresholds of significance. After making corrections to the DEIR Figure 3-2 (see below), it can be seen that the project will not have any significant noise impacts at the church, and noise mitigation is therefore not required.



## Response to Comment Grp 10-4

Commenter is concerned with the noise level of compaction activity on the Centennial Site. The noise analysis prepared for the DEIR specifically evaluated the noise generation of heavy earth-moving equipment used for engineered fill operations at the Centennial Site (see DEIR Impact 4.10-2 on DEIR pages 4.10-31 and 4.10-32). The predicted noise level at the Church of Christ Scientist on Crown Circle associated with engineered fill operations at the Centennial Site is 15 dBA, which would be imperceptible at this receptor location.

## Response to Comment Grp 10-5

This comment is the signature line for the comment letter. No response is required.

Re: Comment Deadline Extension for Idaho-Maryland Mine Project DEIR

Dear Mr. Kelley

**Grp 11-1**

The Friends of Banner Mountain is currently reviewing the Idaho-Maryland Mine Project Draft Environmental Impact Report (DEIR) and will be submitting a comment letter on the document. Given the length and complexity of the DEIR we respectfully request an extension of at least 30 days beyond the March 4, 2022 comment deadline.

We appreciate the County's well-organized web page that provides the DEIR and all supporting technical appendices, and look forward to reviewing these documents and working with you as this project makes its way through the environmental review process.

Sincerely,

Edward Sylvester, President
Friends of Banner Mountain

## GROUP LETTER 11: EDWARD SYLVESTER, FRIENDS OF BANNER MOUNTAIN

### Response to Comment Grp 11-1

The commenter requests an extension of the DEIR public review period. CEQA requires a minimum 45-day public review period for DEIRs submitted to the State Clearinghouse (PRC 21091). The County elected to provide an extended DEIR review period of 91 days from January 4, 2022, to April 4, 2022.

Re: Idaho-Maryland Mine Project Draft Environmental Impact Report

Dear Mr. Kelley

The Friends of Banner Mountain (FBM) is a 501(c)(3) organization whose mission is to protect Banner Mountain and its natural and cultural resources for the benefit of residents, visitors, and future generations. We have reviewed the Idaho-Maryland Mine Project Draft Environmental Impact Report (DEIR) and provide our comments in the attached document.

For reasons described in the attached comments we believe that the DEIR does not provide an adequate assessment of the potential impacts of this project and does not provide sufficient evidence and analysis for the Nevada County Board of Supervisors to make an informed decision about the EIR and the proposed project.

FBM conducted a poll to assess support or opposition to the proposed project among our members; five respondents supported the project and 133 opposed it. Many of those respondents brought up the issues that we describe in the attached comments.

We believe that construction and operation of the mine will adversely affect the quality of life for residents of Banner Mountain for generations and we are hopeful that the Nevada County Board of Supervisors will not approve this project.

Thank you for this opportunity to share our concerns and comments about this project.

Sincerely,

Edward Sylvester, President
Friends of Banner Mountain

1

## GENERAL COMMENTS

### 1. Mitigation Monitoring and Reporting Program and Maintaining Public Access to Monitoring Reports and Permit Applications

Mitigation monitoring and reporting is a required element for many of the impacts described in the DEIR; the various management plans cited in the DEIR also describe numerous monitoring and reporting requirements. As discussed on DEIR Page 2-4 these monitoring and reporting requirements will be summarized in the Mitigation Monitoring and Reporting Program (MMRP). The reporting requirements among the many mitigation measures and management plans described in the DEIR are diverse and we are hopeful that there will be clarity in the MMRP as to where and when these monitoring reports will be submitted.

We appreciate the way that Nevada County has provided a well-organized website at www.mynevadacounty.com during the DEIR process so that the public has easy access to review the DEIR and supporting technical studies. We request that Nevada County continue to maintain a project website to provide transparency and document accessibility for the public for the duration of construction and the 80-year permit term. The content of the monitoring reports is very germane to determining whether the proposed mitigation is working; therefore, Friends of Banner Mountain (FBM) and many residents of Nevada County would like to have easy access to those monitoring reports and permit applications without having to resort to Public Record Act (PRA) requests.

**Grp 12-2**

FBM is also concerned that Nevada County may not have adequate staffing and resources to track, review and respond to the many monitoring reports and permit applications that will be submitted. Because the information in these monitoring reports may trigger remedial action, it is important that the County have sufficient funding to support dedicated staff who will promptly enforce and oversee implementation of those remedies. It is not sufficient to rely on review and oversight by agency staff who will be reviewing permit compliance (e.g., Regional Water Quality Control Board, California Department of Fish and Wildlife). Agency staff are busy and under no obligation to provide monitoring reports to private citizens without a PRA request. We believe it is the County's duty to provide the public with easy access to these reports during construction and for the life of the project.

To address the concerns described above we have the following requests:

a. Please develop a MMRP that includes information about:
   - The entity receiving the monitoring report or permit application (e.g., Nevada County Planning, Building or Environmental Health Department, or permitting agencies like Regional Water Quality Control Board)
   - The interval or triggering event for the submittal (e.g., quarterly, annually, or proposed mine activities such as preparing a Risk Assessment before storing explosives underground), and
   - Whether remedial action would be required if performance standards described in mitigation measures, management or monitoring plans are not met.

b. Please provide a discussion in the FEIR addressing:
   - The County's proposed plan for providing public access to monitoring reports, permit applications and any technical studies that are produced during construction and operation for the duration of the 80-year permit.
   - The County's proposed plan to provide sufficient funding to support the County's sustained oversight and monitoring during construction and 80 years of operation.

**Grp 12-3**

## 2. Security/Bonds

As described on DEIR Page 4.6-24, the Surface Mining and Reclamation Act requires preparation and implementation of a Reclamation Plan and security in the form of a surety bond, trust fund, irrevocable letter of credit from an accredited financial institution, or other method acceptable to the Count to fund implementation of that plan. That is the only security mentioned in the DEIR; there is no discussion of insurance or security to ensure that the many DEIR mitigation, closing, and reclamation commitments will be fulfilled in the event of the applicant's financial collapse.

A review of Rise Gold Corp's July 31, 2021 Form 10-K and 10Q annual and quarterly reports with the U.S. Security and Exchange Commission (https://www.risegoldcorp.com/financial-statements) is not reassuring and indicates that the proposed mining operation is economically marginal and the anticipated gold revenue is speculative. If the applicant files for bankruptcy after impacts have already occurred, but before the mitigation is implemented, there will be no funds to provide remedial action and mitigation.

**Grp 12-4**

We understand that the County has engaged the services of a consultant to provide an independent economic analysis of the economic impacts of the mine, which we appreciate. That analysis will likely show substantial declines in property values, which is one of many concerns expressed by FBM members. However, we understand the scope of work does not include addressing the impacts of the project if mitigation cannot be implemented in the event of the applicant's financial failure and bankruptcy. The conclusions of a "less than significant" impact on many resources is based on implementation of the DEIR mitigation measures, but if there is no funding available to implement monitoring and remediation measures those less than significant conclusions would not apply. To address our concern's regarding the financial solvency of the applicant and potential failure to implement monitoring and mitigation please:

a. Provide a discussion in the FEIR describing the proposed source of funding for implementing mitigation measures and remedial actions in the event of the applicant's financial failure and withdrawal from the project after impacts have already occurred. Ideally this would be in the form of security from the applicant, similar to what is described on DEIR Page 4.6-24, but also addressing the restoration and mitigation actions in addition to the required Reclamation Plan.

## 3. Project Schedule/Sequencing

Construction time estimates are an important element for assessing project impacts on traffic, air quality, noise, and other topics but the estimates are not consistent throughout the various technical section of the DEIR. The DEIR states in some places that the project is estimated to have a twelve-month construction phase, but also states that the construction of the water treatment facility alone would take eighteen months. Significant grading and underground development would be needed before initiating the eighteen-month construction of the water treatment facility, and that facility would need to be completed and fully operational before dewatering (a six-month process) of the mine could begin. After dewatering is complete, the new shaft for ventilation and emergency access would need be constructed to the 1000' depth by working upwards from below. Then, before beginning any actual new mining, the tunnels would need to be restored sufficiently to allow for construction of the underground rock crushing facility. All of these activities would need to happen sequentially rather than concurrently. The eighteen-month estimate of construction seems far too short a

**Grp 12-5**

period of time to accommodate the sequential construction process. The estimate of construction duration needs to be consistent and as accurate as possible throughout the EIR sections to provide an adequate assessment of impacts. In addition, the schedule needs to reflect the time required to secure the many required permits described in the DEIR. To address this issue, please provide the following in the FEIR:

a. A revised project description (that will carry through in all EIR sections) that offers an accurate and consistent representation of all project components, including expected duration and sequence of each component, and incorporating the time required to secure the many permits identified in the DEIR.

## SPECIFIC COMMENTS ON DEIR IMPACT ANALYSIS AND MITIGATION

### 4. Hydrology and Water Quality/Water Supply/Well Impacts

One of FBM's chief concerns about the project is that it could adversely affect local groundwater resources and wells for many of our members by dewatering the mine and lowering groundwater levels. The project area for the groundwater and well impact analysis should have encompassed the entire 2585-acre area under Banner Mountain where the applicant's mineral rights extend and where underground mining will occur rather than just the approximately thirty wells on East Bennett Drive.

**Grp 12-6** The groundwater model that predicted impacts of the proposed long-term and sustained dewatering effort was calibrated based on pumping rates from the historical Idaho Brunswick Mine and only one 1956 water level measurement was collected from the flooded and inactive Union Hill shaft. We believe that using only one water level measurement from 64 years ago to calibrate the analysis for a complex bedrock aquifer system over a large region introduces a significant amount of uncertainty to the model, thereby making the model results inaccurate.

**Grp 12-7** Data for the wells analysis came from private wells within a limited area and the data are old and cover just a few years. No usage data is provided, and critical data such as reduction in groundwater recharge from precipitation fails to include the 75 acres of low-permeable mine waste on the two sites. The groundwater model does not include the new access shaft, which would create a local area of groundwater drawdown and based on our review it looks like other existing mine features within a few hundred feet of the surface were also not evaluated in the ground water model. These mine features would contribute to the downward transmission of ground water from the near surface fractured rock areas. In addition, the groundwater model report assumes the geology in the area to be mined is homogeneous. Modeling that relies upon uniform rock, which is consistent from place to place, behaves in a more predictable fashion than rock that in bedrock systems having multiple faults and irregularities.

**Grp 12-8** The mine water drains from several locations along Wolf Creek near Centennial Drive, and the DEIR provides only rough approximations of the mine water outflow rates from these areas. Furthermore, these outflow data are contradicted by more reliable records from previous studies which indicate ten times more outflow. Mine water inflow analysis is based on sparse mine water level data from the New Brunswick shaft and only 12 water level measurements were taken between 2003-2007, and three measurements in 2018-19. Please note that these measurements could be incorrectly interpreted; the water level reaches a limit when it exceeds the level of the drains from which the mine water flows and doesn't reflect would could be substantial inflow. Without a measurement of the outflow, the amount of inflow cannot be determined by the water level in the New Brunswick shaft.

**Grp 12-9**

The DEIR inappropriately defers to the future the collection of additional data via a Groundwater Monitoring Plan. The DEIR acknowledges that more groundwater level data is needed to assess the potential impacts of the proposed project on groundwater levels. Mitigation Measure 4.8-2(a)(4) (DEIR Page 4.8-67) states that this needed water assessment be conducted "once dewatering of the underground mine workings commences." However, once dewatering begins, it will be impossible to measure baseline levels which makes this mitigation measures ineffective.

**Grp 12-10**

The DEIR relies on fifteen monitoring wells to estimate impacts on water supply wells but does not explain how it arrived at this number of wells or their location, nor is an explanation provided as to why fifteen monitoring wells would be sufficient to estimate the impacts on all water supply wells around the mine area. In complex fractured bedrock spread out over thousands of acres, monitoring water levels at fifteen locations could not provide the needed data to ensure that groundwater impacts to hundreds of existing water supply wells in the project vicinity are identified and mitigated. Groundwater monitoring networks should be established in advance of the project, and the resulting monitoring information should be included in the FEIR.

**Grp 12-11**

Our members are very concerned about water supply and competition for groundwater for future residential wells in light of the impacts of the project and also from the effects of climate change. According to DEIR Page 4.11-51, water demand within the Nevada Irrigation District's (NID's) service area is expected to exceed supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year period. The surface water supply to NID will be subject to reductions during single and multiple dry years. The DEIR concludes that any water supply deficit can be addressed through NID's Water Shortage Contingency Plan, but this NID mitigation may not be possible if NID must limit its own allocations due to drought and climate change.

**Grp 12-12**

Based on our review of the DEIR and supporting technical studies, we believe that the DEIR does not provide adequate information about existing and future conditions of groundwater, water supply, and wells, and does not accurately assess potential impacts of the project on these resources. To remedy these deficiencies please provide:

a. An updated and revised groundwater model to more accurately predict the extent of the well drawdown caused by the predicted 80 years of mine-dewatering and dewatered maintenance.
b. A more accurate and comprehensive analysis in the FEIR that addresses the issues discussed above. The revised analysis needs to better reflect current and future site conditions and incorporate impacts of climate change to determine the extent and the severity of potential impacts upon groundwater resources, water supply and wells within the larger 2585-acre area under Banner Mountain.
c. A revised and more comprehensive Well Monitoring Plan.

**Grp 12-13**

The DEIR does not adequately characterize the current mine water chemistry. The Hydrology Report (DEIR Appendix K.2, Table 4-10, page 120) uses discharge screening limits and data from the New Brunswick shaft to define water treatment criteria. However, a more accurate sampling of mine water would be from the drains located along Wolf Creek rather than from the New Brunswick shaft, as described in the analysis of mine water flow (see DEIR Figure 4.8-7). This figure shows water entering the New Brunswick shaft then flowing downward through the existing mineworks to exit the drains at Wolf Creek (e.g., Eureka drain, East Eureka drain). Only a few samples taken from the drains were reported, but these samples are much more representative of the mine water chemistry and indicate higher levels of iron, manganese, arsenic, aluminum, and zinc than the New Brunswick shaft samples (DEIR K.2 Tables 3-6). We believe that regular testing over time at the mine drains

would provide a more accurate assessment of the contaminants flowing out of the mine under varying conditions, regular testing must be conducted over time at the Mine drains. To address this concern, we request that:

d. Provide the results of water quality sampling at the drains located along Wolf Creek rather than the New Brunswick shaft to better define water treatment criteria and provide a revised assessment of potential impacts based on this new sampling data.

## 5. Hazards and Hazardous Materials

Chapter 4.7 (*Hazards and Hazardous Materials)* and Chapter 4.13 (*Wildfire)* concludes that the project would not impair implementation of emergency response plans, and that project impacts would be below the threshold of significance for Hazards and Hazardous Wastes (*"Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan"*). The paragraph below from DEIR Page 4.7-38 (with identical text on Page 4.13-17) is the only analysis in the DEIR about how 118 haul truck round trips between 6:00 a.m. to 10 p.m., seven days a week to State Route (SR) 20/49 via Brunswick Road, would affect emergency evacuation routes.

> *"In the event of an evacuation order in the vicinity of the proposed mine, such as an evacuation of residents off of Greenhorn Road, the incident command center would contact dispatch and direct them to contact the mine and request the mine operator to shut down the mine and cease all truck hauling operations.[20] While Brunswick Road is not a primary evacuation route, it would be the evacuation route used by residents of the Greenhorn Road area to evacuate to the primary evacuation route of SR 49/20. Ceasing haul truck operations during the emergency evacuation order would ensure that the proposed project would not have the potential to physically interfere with an emergency evacuation plan. Operation of the approximately 7.4 haul trucks per hour attributable to the proposed project could either be temporarily ceased and/or these trucks could pull off the road to enable residents to evacuate as quickly and expeditiously as possible. With the temporary cessation of mine operations, if directed by County dispatch, no further haul trucks would be entering Brunswick Road during an evacuation order. Accordingly, County OES has stated that the proposed project would not have a significant impact related to physically interfering with an adopted emergency evacuation plan."*

**Grp 12-14**

This conclusion is based on one conversation between Lieutenant Robert Jakobs, Emergency Operations Coordinator, Office of Emergency Services, Nevada County Sheriff's Office, and Nick Pappani, Vice President, Raney Planning & Management, Inc., on January 5, 2021. The DEIR provides nothing more that this brief narrative on the course of action to be taken in the event of an evacuation off of Greenhorn Road, and relies on the opinion of Mr. Jakobs at County OES. However, no details other than the date are provided about the conversation between Mr. Jackobs and Mr. Pappani, nor can the reader determine what information was provided to Mr. Jakobs when he came to that conclusion of no significant impact on an adopted emergency evacuation plan.

**Grp 12-15**

Wildfire safety and evacuation routes are the number one concern for residents of Banner Mountain during fire season, which is now more than half the year. Brunswick Road and subsequent entry onto SR 20/49 is already a major evacuation bottleneck not just for residents evacuating from Greenhorn Road but also from Banner Lava Cap and Idaho Maryland roads, and would be worse with the additional mine truck traffic.

Chapter 5.6 (*Significant and Unavoidable Impacts*) already identifies a significant, unmitigated traffic impact to the Brunswick Road/Idaho Maryland Road, Brunswick Road/SR 174, and Idaho Maryland Road/Centennial Drive intersections, but there is no assessment of how this significant impact affects evacuation scenarios for Banner Mountain residents.

The DEIR offers no analysis quantifying how much worse it would be during construction and operation of the project and whether the additional traffic might physically interfere with an emergency evacuation plan. Banner Mountain residents are not reassured by skimpy and vague language in the DEIR that the incident commander would contact dispatch to request the mine operator to shut down the mine and cease truck hauling operations.

**Grp 12-16**

a. Please revisit the conclusion of no significant impacts to implementation of evacuation plans with the following additional analysis and information:
   - A more detailed analysis of the effects of project traffic during construction and operation on evacuations in any residential areas that might use Brunswick/SR 20/49 and Brunswick Road/SR 174 access for evacuation egress.

**Grp 12-17**

   - Details on the process and timing of notification for mine shutdown and cessation of truck hauling operations. For example, what would be the trigger for notification that the mine needs to shut down and cease truck traffic? Would a voluntary evacuation order on Greenhorn Road carry the same weight as a mandatory evacuation order to trigger cessation of truck traffic? Would voluntary or mandatory evacuation orders in any area that might need to use Brunswick/S R 20/49 or Brunswick/SR174 for egress trigger a requirement to cease operations and truck hauling? The analysis needs to extend beyond those areas: "*In the vicinity of the proposed mine*" but rather include all areas where residents might need to use Brunswick Road/SR 20/49 or Brunswick/SR174 for evacuation. Please be aware that, depending on the location of the fire, thousands of residents on Banner Mountain and in Cascade Shores might need to use the Brunswick/SR 20/49 area for evacuation.

**Grp 12-18**

   - Details on specifically who (title/position) would be contacted at the mine and confirmation that this person has the authority and means to immediately cease mine operations and truck hauling. Please also provide an estimate as to how long this notification and shut-down process would take and the effect of delays in shutting down truck operations on evacuations.

**Grp 12-19**

   - Provide additional support for the conclusion that the project would not impair implementation of an emergency evacuation plan and that no mitigation is required. We believe that mitigation may be required and that a draft Wildfire Evacuation Plan should be prepared which provides the specific details we request above.

Our members are also concerned about the potential impacts of on-site temporary storage of mine waste material, which is not discussed in the DEIR. The DEIR does not provide sufficient information to demonstrate that mine waste disposal by off-site sales would be viable. The applicant proposes to sell waste rock on the open market if it is still being produced after the two proposed waste rock piles reach capacity. The market for aggregates varies significantly by season and during rainy seasons it might be necessary to stockpile the aggregate onsite. However, there are no provisions for onsite storage in the DEIR or an assessment of impacts related to such storage. Dispersing waste rock and other mine waste over large areas without containment often results in contamination but this potential impact is not assessed in the DEIR.

**Grp 12-20**

The Regional Water Quality Control Board (RWQCB) has jurisdiction over the disposal location requirements for mine waste rock to make sure discharges would not pose a threat to water quality, but there is no information

7

in the DEIR acknowledging this approval process is required. Although the DEIR does not discuss this, the concept of selling waste rock may not be feasible and alternative disposal methods should be considered. The absence of provisions for temporary waste rock storage (and the associated analysis of its impact) creates strict operational constraints and potential impacts on all phases of processing, but this impact has not been addressed in the DEIR. To address these concerns, please provide the following in the FEIR:

b. An analysis of the impacts of on-site storage of mine waste disposal and alternatives to off-site sales for mine waste disposal, and the impacts of those alternatives.

Grp 12-21

Management of asbestos-laden mined materials is not adequately addressed in the DEIR. Asbestos is likely to be released during underground blasting, crushing, and ore processing and during on-road transport, placement grading and compaction. The DEIR states that the Asbestos Management Plan would ensure that average mined material and engineered fill contains less than 0.01% asbestos. (DEIR Page 3-20). However, testing the asbestos content does not control the amount of asbestos in the actual material mined. To control the average amount of asbestos in output materials (and to avoid significant impacts related to asbestos exposure), but currently, the DEIR does not include any evidence that asbestos levels will not exceed this threshold. The testing process may require up to two weeks before the results are known, yet the project would continue daily mining activities during this time. This daily mined material would have to be stockpiled while awaiting the test results, which could expose workers to dangerous of asbestos. Furthermore, if the running average of asbestos in the daily mined material exceeds the required threshold, batches containing higher asbestos levels would have to be stockpiled in order to be later mixed with batches having lower asbestos levels. The DEIR does not disclose this fact nor does it analyze the associated impacts. The mineral processing described in the DEIR does not address the need for stockpiling materials or address the likely impacts of such efforts. To address this concern, please provide the following in the FEIR:

c. A revised Asbestos Management Plan that provides details on all of the steps necessary to safely manage this hazardous waste, including the location and organization of stockpiled materials, and safeguards to avoid fugitive dust emissions and potentially hazardous conditions.

## 6. Noise/Vibration

Grp 12-22

Many of our members choose to live on Banner Mountain because of the quiet and peaceful setting it offers, so potential noise and vibration impacts from the mine are a source of great concern. Some of the mine operations would generate noise levels of 85 dBA and begin early in the morning and extend into the evening, and some operations would occur 24 hours per day for 80 years. Tunneling and blasting would occur for 80 years, but DEIR does not identify the hours of these operations. The DEIR concludes that the project would not have significant noise impacts because they would comply with general County noise standards, but compliance with County standards is not the same as "less than significant" noise impacts.

Grp 12-23

In our quiet neighborhoods on Banner Mountain typically the only nighttime noises are the calls of Pacific chorus frogs in spring. But the DEIR states that because the project will comply with the County's nighttime noise level standards, an evaluation of sleep disturbance is not warranted. We disagree with this assertion because the project includes many operations that will occur during early morning or nighttime hours, including dewatering, indoor facility construction, truck loading/unloading and off-site hauling mineralization processing, and water treatment. The combination of morning and nighttime industrial activities and low background/ambient noise levels could definitely cause sleep disturbance for many of our members.

**Grp 12-24**

The DEIR identifies mine development (tunneling) and gold mineralization production (tunneling and production blasting) as part of the project, but it does not identify the hours of operation for these project components. The DEIR states that underground exploration and mining would occur 24 hours per day, 7 days per week, and assuming that underground exploration and mining include mine development and gold mineralization production, tunneling and blasting could occur at night. If this is the case, the project's noise and vibration impacts would be far more severe than the DEIR discloses.

Without explicit restrictions in the DEIR' s project description pertaining to the hours of tunneling and blasting, coupled with conditions of approval, the DEIR cannot simply assume that tunneling and blasting operations would not occur at night and would not adversely impact nearby receptors. The DEIR should have clearly identified the hours of mine development and gold mineralization production. The DEIR should have evaluated these impacts and identified and specified appropriate mitigation for nighttime noise.

**Grp 12-25**

The DEIR does not consider the absolute increase in noise levels compared to ambient background conditions. As described in the Salter Report (letter to Shute, Mihaly & Weinberger, from Salter Inc., dated March 9, 2022) certain operations could be 25-35 dB above background ambient noise levels. These noise levels would be perceived as more than four times as loud as the median ambient noise levels. The DIER assesses these impacts as less than significant because overall noise from these operations would not exceed the County's standards. The DEIR should have evaluated both the increase in noise level and the absolute noise level associated with the project.

**Grp 12-26**

Noise and vibration measurements were taken only at the Centennial and Brunswick sites and along the proposed pipeline location between the two sites. While processing would occur on these sites, tunneling and blasting would occur throughout the 2,585-acre mineral rights boundary under Banner Mountain. Tunneling and blasting could certainly result in excessive noise levels and vibration, but DEIR provides no evidence that noise and vibration impacts were measured throughout the entire mineral rights boundary. Many of our members live in areas immediately above or near the 2,585-acre mineral rights boundary, but the DEIR does not describe noise and vibration impacts to these residents. The DEIR should have disclosed the project's potential for noise and vibration impacts throughout the entire mineral rights boundary.

**Grp 12-27**

The DEIR does not adequately distinguish the project's construction-related noise sources from its operational noise sources. This distinction is very important because the DEIR asserts that the County's noise standards do not apply to construction-related activities. If the DEIR characterizes an operational activity as a construction project it may have incorrectly determined such impacts to be exempt from the County's noise standards and also determined the impact to be less-than-significant under CEQA. For example, the DEIR states that mine development (tunneling) would be constructed throughout the life of the mine which would require drilling and the use of explosives, and a new mine shaft would be
developed on the Brunswick Site. These massive project components appear to be characterized as construction activities, but would potentially extraordinarily noisy as they would require extensive drilling and rock excavation. If these are activities are considered construction rather than operation, it inappropriately assumes the noise from these sources would be exempt from the County's noise standards.

**Grp 12-28**

The DEIR relies on varying thresholds for the project's traffic and on-site noise sources. It uses a numerical increase in noise only to determine the significance of the project's traffic noise impacts, specifying +5.0 dB or more as constituting a significant traffic noise impact. For on-site noise sources, it relies on the noise limits included in the Nevada County General Plan Noise Element and the Nevada County Land Use and Development Code. The DEIR should have assessed project's noise levels relative to the noise levels that residents actually experience (ambient noise) rather than to the County's standards.

9

**Grp 12-29**

The DEIR asserts that vibration from the project's blasting operations would be barely perceptible to nearby receptors. The DEIR identifies a 0.4 in/sec peak particle velocity (PPV) vibration limit based primarily on a vibration study performed following an underground nuclear blast in Mississippi in 1964. As described in the Salter Report, human responses to a single blast does not reflect the impact on the community from ongoing, perceptible and potentially unpleasant vibration over the 80-year lifespan of this project. the DEIR ignores guidance by the U.S. Office of Surface Mining and Reclamation and Enforcement:
*All blasting must take place during daylight hours unless more restrictive times are specified. If night-time blasting is approved by the regulatory authority, it must be based on evidence from the operator that the public will be protected from adverse noise and other impacts.*

The DEIR provides no evidence that the public will be protected from adverse effects from the project's blasting operations and does not include restrictions on blasting vibration during evening and nighttime hours. According to the Salter Report, residents could experience "strongly perceptible" and borderline "unpleasant" vibration as a result of blasting. This impact would occur for 80 years. The DEIR does not disclose this significant impact.

**Grp 12-30**

To evaluate the project's blasting-related noise impacts, the DEIR relies on noise measurements conducted at the Sutter Gold underground mine in Amador County. The Sutter Gold study found blasting noise to be 75 dBA, on average, at a distance of 200 feet from the mine portal. However, to translate those findings to the Project's Brunswick Site, the DEIR assumes that noise at the project site would be reduced by 20 dB compared to the Sutter Gold mine. Other than mentioning the difference in orientation and size of the portal, this claim of 20 dB noise reduction is unsubstantiated. As described in the Salter Report twenty decibels of noise reduction is a substantial change in noise emission. Without the unsubstantiated 20 dB of reduction, the Salter Report notes that the blasting noise at the nearest sensitive receptors would be between 72 and 77 dBA. As stated in the DEIR, ambient median and "background" noise levels at many sensitive receptors is between 35 dBA and 50 dBA. Therefore, the blasting noise could be substantially above the ambient noise levels, by approximately 25 to 40 dB.

**Grp 12-31**

a. To address these concerns about noise and vibration impacts that would affect many of our members, please provide a revised analysis of noise and vibration that includes the following:

- Clearly identify the hours of mine development and gold mineralization production. If these operations occur at night or early in the morning, please evaluate the potential for noise and vibration to cause sleep disturbance and include appropriate mitigation for nighttime noise.
- Evaluate both the increase in noise level and the absolute noise level associated with the project.
- Assess the project's potential for noise and vibration impacts throughout the entire 2,585-acre mineral rights boundary where many of our members reside.
- Categorize each project component as either construction-related or operation-related and for each construction-related component provide details such as the construction-phasing plan, including the timing and duration of each and every project. This analysis should include each construction-project that is expected to occur over the project's 80-year timeframe.
- Evaluate the project noise levels relative to the noise levels that residents actually experience (ambient noise) rather than to the County's standards.

## 7. Biological Resources

**Grp 12-32**

The foothill yellow-legged frog, a species listed as Endangered by the California Department of Fish and Wildlife (CDFW), could occur in the South Fork of Wolf Creek at the Centennial and Brunswick sites and also downstream of those sites. [Please note that the foothill yellow-legged frog is listed as Endangered under the California Endangered Species Act, not a Candidate for Threatened as incorrectly stated in DEIR Table 4.4-6 and on DEIR Page 4.4-37.] DEIR Page 4.4-37 states: "*The main stem of Wolf Creek within the Centennial Industrial Site is considered suitable habitat for this species*" and notes that it has been documented within 3.9 miles of the site. Then in the same paragraph the DEIR inexplicably characterizes the potential for this species to occur at the Centennial as "very low" despite the fact that suitable habitat is present. No protocol level Visual Encounter Surveys were conducted for this species at the Centennial site.

**Grp 12-33**

The impact analysis and proposed mitigation for foothill yellow-legged frog and for other special-status aquatic species like western pond turtle is focused on construction impacts rather than the operational effects of discharging mine water to the South Fork of Wolf Creek for 80 years. Potential impacts of mine water discharges on the aquatic life in the South Fork of Wolf Creek are dismissed by stating that these discharges would need to comply with Central Valley Regional Water Quality Control Board National Pollutant Discharge Elimination System (NPDES) No. CAG995002 and that monitoring of NPDES regulated parameters (e.g., temperature, pH, turbidity, dissolved oxygen) would be conducted to ensure the project stays within safe threshold limits identified within the NPDES discharge requirements. However, we are concerned that mine water discharges would overheat the South Fork Wolf Creek. Mine water ranges between 14 and 15 degrees Celsius, and NPDES requirement specifies that the discharge temperature not exceed existing temperature in the South Fork of Wolf Creek by more than 5 degrees Fahrenheit (2.8C). The DEIR provides a range of values for creek flow and temperature but it is based on just a few samples collected in April and August of 2019 and Jan 2020. More than 15 years of monitoring by the Wolf Creek Community alliance provides data indicating that the temperature of the creek often falls substantially below 10 degrees C, and that these temperatures commonly occur during low flow times. As described above, we are also concerned about water quality impacts and the effects that the discharges will have on foothill yellow-legged frogs, western pond turtles and the benthic macroinvertebrates upon which these species and many others rely.

a. To address this concern, please provide the following information in the FEIR:

- A comprehensive assessment of impacts to foothill yellow legged frogs, western pond turtles and other aquatic life in the South Fork of Wolf Creek resulting from the discharge of mine water over an 80-year period. This assessment should be based on a detailed analysis of the water quality treatment processing and a comprehensive discussion of proposed water quality monitoring.
- Please also provide details on what immediate and long-term remedial actions would be taken if the NPDES water quality monitoring results indicate that NPDES thresholds are not being met. Please clarify whether mine operation and dewatering would cease until NPDES water quality thresholds are met, and if not, what the impact would be on continued water quality impacts on foothill yellow legged frogs, western pond turtles and other aquatic life in the South Fork of Wolf Creek.

**Grp 12-34**

A population of Pine Hill flannelbush, as species listed as federally Endangered and a California Rare Plant, was observed at the Centennial site. The DEIR states that 18 Pine Hill flannelbush plants would be directly impacted by proposed engineered fill placement at the Centennial Site. Mitigation for this impact refers to DEIR Appendix F.4, a Habitat Management Plan (HMP) for this species, and DEIR Mitigation Measure 4.4-1(a) indicates that only Steps 1-4 of the HMP would be required before issuance of a grading permit. HMP Steps 1-4 involve seed

collection and transplantation. Step 5 (DEIR Page 4.4-65-66) requires more seed collection and transplanting if the Steps 1 – 4 are not successful, and also calls for:

> *"Habitat Enhancement: Prior to issuance of grading permits, pursuant to the HMP, the applicant shall enhance Pine Hill flannelbush habitat outside the disturbance footprint, which could include removal of invasive plants and conducting a pilot study by collaborating with CAL FIRE or other research facility to conduct prescribed fire in areas to enhance natural germination and recruitment, as Pine Hill flannelbush need fire for successful germination, and root sprouts.*
>
> *Conservation Easement: Prior to issuance of grading permits, the applicant shall record a Conservation Easement for the on-site Pine Hill flannelbush avoidance area, or use a similar land protection mechanism that runs with the land in perpetuity, to protect the Pine Hill flannelbush plants within the avoidance area. The management guidelines for the Conservation Easement or similar mechanism shall require that the habitat be managed for the Pine Hill flannelbush and its associated habitat. The applicant shall also record a Conservation Easement or use a similar land protection mechanism for any offsite areas not owned by the applicant where the transplants are to be located."*

This mitigation measure is internally inconsistent; the Step 5 requirements for habitat enhancement and a conservation easement indicate that these measures should be implemented before issuance of the grading permit, but the language in the introductory paragraph of Mitigation Measure 4.4-1(a) indicates that it would be implemented only if Steps 1-4 are not successful.

We believe that all of the recommendations in the HMP should be implemented before issuance of the grading permit. Mitigation for impacts to this beautiful and rare plant should not be delayed and should not be mitigated solely by relying on transplants. Mitigation should focus on the more comprehensive and ecosystem-based approach described in the HMP to fully mitigate for project impacts rather than just relying on putting transplants in the ground.

Development of the habitat enhancement plan would be time consuming and will require extensive coordination with agencies such as CalFire, CDFW, and USFWS (and should also include the Redbud Chapter, our local California Native Plant Society) and therefore this collaborative effort should begin now. Waiting until after the monitoring results from the transplanting are available would delay development of the habitat enhancement plan and direct impacts to the Pine Hill flannelbush population at the Centennial site would go unmitigated for years. The HMP should be revised to provide more details on the proposed habitat enhancement plan, what activities that plan would include, and an assessment of how enhancement activities would fully mitigate for project impacts.

**Grp 12-35**

The HMP should be revised to provide more details on the proposed conservation easement, including identifying entities that could serve as easement holders, an estimate of stewardship costs for ongoing management of the easement lands in perpetuity, and a source of funding for those costs. Such costs are typically calculated with a Property Analysis Record or some other tool.

**Grp 12-36**

The HMP (page 6-1) indicates that flannelbush seed collection was conducted on August 21, 2019 with Mr. Brett Hall from the UC Santa Cruz Arboretum as a part of the UC Santa Cruz Native Plant Program. The HMP should provide an update on the status of those seedlings so the public can have some assurances that the transplantation proposed as mitigation is on a successful trajectory.

12

**Grp 12-37**

b. To address these concerns discussed above about mitigation for Pine Hill flannelbush, please provide the following:

- A revised Mitigation Measure 4.4-1(a) that calls for implementation of Steps 1 -5 from the Pine Hill Flannelbush HMP before issuance of grading permits.
- A revised Pine Hill Flannelbush HMP that includes the additional details on habitat enhancement and conservation easements discussed above, as well as updates on the status of the seeds collected in August 2019.

13

## GROUP LETTER 12: EDWARD SYLVESTER, FRIENDS OF BANNER MOUNTAIN

### Response to Comment Grp 12-1

This is an introductory comment. The commenter's opposition to the proposed project is noted for the decisionmakers. The commenter is referred to Master Response 1 - (Non-EIR/Administrative Issues). The comment also expresses general concern regarding the alleged inadequacy of the DEIR. The commenter provides specific concerns in the following portion of the letter, which are addressed below.

### Response to Comment Grp 12-2

The commenter requests that the County maintain a public website page about the project during construction and operation of the mine, so the public can have access to monitoring reports without submitting a public records act request. The commenter also makes specific requests about the contents of the mitigation monitoring and reporting program. This comment does not address the adequacy of the DEIR. Comment noted.

### Response to Comment Grp 12-3

The commenter requests that the FEIR include discussion of the County's plan to provide public access to monitoring reports, permit applications and any technical studies that are produced during mine construction or operation. Additionally, the commenter requests that in the FEIR, the County explain the source of funding for mine oversight and monitoring. This comment does not address the adequacy of the DEIR. Comment noted.

### Response to Comment Grp 12-4

The commenter asserts that the applicant may become insolvent and not be able to pay for mitigation required in the DEIR, and requests that the DEIR include a discussion on funding for restoration and mitigation activities in the case of mine operator insolvency or mine shutdown. Mitigation requirements in the DEIR are required to be implemented prior to the commencement of the project action that would cause the respective impact. As such, impacts would not be allowed to occur prior to implementation of mitigation beforehand. This comment does not address the adequacy of the DEIR. Comment noted.

### Response to Comment Grp 12-5

The commenter suggests that the construction timeline provided in the DEIR is unrealistically short and should be lengthened to reflect sequential construction tasks. Please see Master Response 24 – Project Construction Schedule.

### Response to Comment Grp 12-6

The commenter asserts that the groundwater analysis should have contemplated mining within the entire 2,585-acre mineral rights area and that insufficient data was used in the groundwater model. There are not valuable gold deposits within the entire 2,585-acre mineral rights area, thus, presuming that mining would occur in the entire mineral rights area would not be accurate. Moreover, the applicant has specific areas that will be targeted for gold extraction, and the groundwater model is based on that plan, along with reasonable assumptions about potential extension of mining into other areas. The groundwater model did look at potential drawdown within the entire mineral rights area, but only a small number of wells were shown to have a significant impact, prior to mitigation. Please see Master Response 7 - Location of Future Mining Areas, and Master Response 14 - Adequacy of Groundwater Model.

## Response to Comment Grp 12-7

Regarding age and amount of well data: See Response to Comment Grp 7-23.

Regarding the service shaft and near surface working in relations to the ground water model: please see Responses to Comments Grp 7-80 and Grp 7-81.

Regarding the recharge rate where the engineered fill will be placed: please see Response to Comment Grp 7-78.

The groundwater model does not assume that the rock is homogenous and includes changes in hydraulic conductivity with depth, geological units, and faults. Please see Chapter 4.8 and Appendices K.2 and K.3 of the DEIR and Master Response 14 - Adequacy of Groundwater Model.

## Response to Comment Grp 12-8

Regarding the drain outflow data from previous studies: please see Response to Comment Grp 7-68.

Measurements of current water flow from the drains is not based on the measurement of the water level in the Brunswick Shaft. The water flow from the mine drains was measured directly as is discussed in Chapter 4.8 of DEIR and Appendix K.2 of the DEIR. Please also see Responses to Comments Grp 7-69 through Grp 7-76.

## Response to Comment Grp 12-9

Please see Response to Comment Grp 21-110 and Master Response 15 - Adequacy of Groundwater Monitoring Wells. The commenter asserts that the requirement to collect groundwater data is inappropriate deferral of mitigation. However, Mitigation Measure 4.8-2 requires "Water-level monitoring data for a minimum of 12 months before commencement of dewatering of the mine." As such, the collection of data is not deferred and is required by the DEIR before dewatering commences.

## Response to Comment Grp 12-10

Please see Response to Comment Grp 21-119 and Master Response 15 - Adequacy of Groundwater Monitoring Wells. With regard to the commenter's request that groundwater monitoring networks be established before the project commences, see Response to Comment Grp 12-9 above.

## Response to Comment Grp 12-11

Please see Master Response 16 - Drought and Climate Change. In response to the commenter's questions on water supply, the Nevada Irrigation District (NID) approved a water supply assessment (WSA), which concluded that NID has sufficient water to supply the project and its existing customers.

With regard to NID's Water Shortage Contingency Plan, as described in NID's 2020 UWMP (Chapter 6 Drought Plan) and the WSA (Section 6.2 Additional Planned Future Potable Water Supplies), there are numerous management and operational efforts available to NID to address supply shortfalls during drought periods. Demand reductions, carryover storage strategies, system operational strategies, supplemental supplies, increased storage, and others are all options available to NID in the event of a water shortage condition. NID will evaluate each specific shortage condition and select the appropriate response action(s) for implementation. If supplies become extremely critical requiring implementation of Stage 6 of NID's Water Shortage Contingency Plan, drinking water supplies to NID's treated water and municipal water customers may be reduced to health and safety use of water only, but would not be cut off.

NID is in the early stages of a long-term visioning and planning effort to better understand potential future conditions and needs in response to climate change, and identify management and operational practices to meet those needs. The process, Plan for Water, will identify optional water management practices as triggering points if supply, demand, regulatory, legal, and other events are reached. These practices may include supply projects, demand management efforts, policy changes, and others. As the Plan for Water process is developing mitigation measures for drought resiliency, NID will continue to implement its current drought and water shortage contingency efforts as described in NID's 2020 UWMP.

## Response to Comment Grp 12-12

This comment summarizes the prior comments Grp 12-7 through Grp 12-11. Please see Responses to Comments Grp 12-7 through Grp 12-11, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 12-13

Please see Response to Comment Grp 7-12.

Water sampling data from the drains at Wolf Creek have already been provided in the DEIR. See Chapter 4.8 and Appendix K.2 of the DEIR.

## Response to Comment Grp 12-14

The commenter asserts that the project's truck traffic may impair emergency evacuations and asserts that further analysis is required. However, the project truck traffic accounts for only approximately 1% of typical traffic on Brunswick Road and would not affect an evacuation. Please see Master Response 5 – Evacuation Zones.

## Response to Comment Grp 12-15

Project traffic would not affect an evacuation for residents on Greenhorn, Banner Lava Cap, or Idaho-Maryland Roads. Please see Master Response 5 – Evacuation Zones. The commenter states that Chapter 5.6 identifies a significant, unmitigated traffic impact to the Brunswick Road/Idaho-Maryland Road intersection. This is incorrect. Page 5-11 of the DEIR states the following:

> The EIR requires implementation of Mitigation Measures 4.12-1(a-c), which would reduce the project's significant effect to the Brunswick Road/Idaho-Maryland Road intersection and the Idaho-Maryland/Centennial Drive intersection; however, the project's impact to the SR 174/Brunswick Road intersection would remain *significant and unavoidable*. The reason for this is that while Mitigation Measure 4.12-1(b) requires the applicant to enter into a traffic mitigation agreement with the County and provide the project's fair share toward needed improvements, the remaining funds for the intersection improvements are unknown, in terms of timing and contributing parties.

The text says the project's impact to the SR 174/Brunswick Road intersection would remain significant and unavoidable after mitigation, not the Brunswick Road/Idaho-Maryland Road intersection. To further demonstrate this, page 4.12-66 of the DEIR states the following:

> *Brunswick Road/Idaho-Maryland Road*
>
> Signalization would improve the Brunswick Road/Idaho-Maryland Road intersection to LOS D. This intersection is identified to be signalized in the City of Grass Valley GVTIF. Under EPAP Plus Project (Scenario #1), the project is expected to add 35 additional vehicles through the intersection during the 3:30-4:30 PM time period, and under EPAP Plus Project (Scenario #2), the project would add 47 additional vehicles. Mitigation Measure 4.12-1(a) requires the applicant to pay the GVTIF to the City of Grass Valley,

> given that the needed intersection improvement is included in the City's TIF. Thus, payment of the GVTIF would reduce the impact to a *less-than-significant* level.

The commenter has a similar misunderstanding of the Idaho-Maryland/Centennial Drive intersection. The text on page 5-11 of the DEIR says the project's impact to the SR 174/Brunswick Road intersection would remain significant and unavoidable after mitigation, not the Idaho-Maryland Road/Centennial Drive intersection. To further demonstrate this, page 4.12-66 of the DEIR states the following:

> *Idaho-Maryland/Centennial Drive*
>
> Signalization will improve the Idaho-Maryland/Centennial Drive intersection to LOS D. This intersection is identified to be signalized in the City of Grass Valley GVTIF. Under EPAP Plus Project (Scenario #1), the project is expected to add 18 additional vehicles through the intersection during the 3:30 to 4:30 PM time period, and under EPAP Plus Project (Scenario #2), the project would add 15 additional vehicles. Mitigation Measure 4.12-1(b) requires the applicant to pay the GVTIF to the City of Grass Valley, given that the needed intersection improvement is included in the City's TIF. Thus, payment of the GVTIF would reduce the impact to a *less-than-significant* level.

While the DEIR concludes that the proposed project would have a significant and unavoidable impact to the SR 174/Brunswick Road intersection, there are a few important factors to consider. First, this intersection would not serve as a key evacuation route for the area in question, and residents in the intersection area have multiple routes to evacuate the area (e.g., Lower Colfax Road, Rattlesnake Road, SR 174 EB). Second, Mitigation Measure 4.12-1(b) of the DEIR requires the applicant to enter into a Traffic Mitigation Agreement with the County regarding the SR 174/Brunswick Road intersection. The Agreement shall require the applicant to pay the project's fair share contribution toward the improvements necessary to improve intersection operations to an acceptable level. The Agreement shall include the fair share calculations and total payment amount. Based on the Caltrans methodology to assess fair share, it is estimated that the fair share percentage is 14.9%. While the project is contributing toward addressing its contribution of traffic to the SR 174/Brunswick Road intersection, the remaining funding needed to improve the intersection (e.g., signalization) is not yet certain, nor secured. As a result, the DEIR conservatively concludes that the impact would remain significant and unavoidable.

## Response to Comment Grp 12-16

Please see Response to Comment Grp 12-15 and Master Response 5 – Evacuation Zones.

## Response to Comment Grp 12-17

If regular traffic were interfering with an evacuation, local authorities would implement traffic control and the project traffic, which is relatively minor in comparison to existing traffic, would also be redirected to minimize interference. Please see Master Response 5 – Evacuation Zones.

## Response to Comment Grp 12-18

Please see Responses to Comments Grp 12-14 and Grp 12-17. Please also see Master Response 5 – Evacuation Zones. The project would have a manager present onsite at all times, who would be available should Nevada County Regional Dispatch Center contact the operation to request the mine to shut down trucking.

## Response to Comment Grp 12-19

Please see Master Response 5 – Evacuation Zones.

## Response to Comment Grp 12-20

Please see Master Response 11 – Engineered Fill Utilized in Local and Regional Construction Markets.

Please also see Chapter 4.8 of the DEIR and Master Response 8 - Mine Waste Characterization.

## Response to Comment Grp 12-21

The project does not propose temporary stockpiles of mine waste, and would hold that material in silos until it is picked up by trucks for engineered fill use or for sale as construction aggregate. Please see Master Response 11 – Engineered Fill Utilized in Local and Regional Construction Markets.

In regard to asbestos: Please see Responses to Comments Grp 7-6 and Grp 7-7, and Master Response 22 - Conservatism of Asbestos Assumptions.

## Response to Comment Grp 12-22

The commenter disagrees with the DEIR's conclusion that noise impacts would be less than significant, states that an evaluation of sleep disturbance is warranted, and states that the DEIR does not disclose the hours in which blasting would occur. Hours for noise generating activities are described in Chapter 4.10 and Appendix L of the DEIR. In regard to hours of blasting, see Responses to Comments Grp 21-143 and Grp 21-144. With regard to sleep disturbance analysis, please see Response to Comment Grp 21-130.

County noise standards are not the only standard of significance used for the noise analysis, as the DEIR also considered a substantial increase in ambient noise levels to be a significant increase, even if the noise does not exceed the County noise standard. Please see Section 4.10.3, and Table 4.10-5 of the DEIR.

## Response to Comment Grp 12-23

Please see Response to Comment Grp 21-130.

Please see Responses to Comments Grp 21-130, Grp 21-143 and Grp 21-144.

## Response to Comment Grp 12-25

See Response to Comment Grp 21-133.

## Response to Comment Grp 12-26

The project's potential for noise and vibration throughout the entire mineral rights boundary has already been considered in the EIR. The DEIR's analysis of blasting vibrations is based on an assumption that blasting would take place a minimum of 500 feet below surface. Any noise from blasting would only be at the opening to surface at the two shafts on Brunswick site which has already been analyzed in Chapter 4.10 of the DEIR. As such, the location of noise sources of the project would not change based on the area of mining underground. Please also see Master Response 7 - Location of Future Mining Areas.

## Response to Comment Grp 12-27

The commenter asserts that construction noise was not differentiated from operation noise in the DEIR. However, the DEIR specifically analyzed the separate noise impacts of construction and of operations. As stated on page 4.10-16 of the DEIR, the Nevada County Land Use and Development Code exempts construction noise from the County noise standards. Nonetheless,

an evaluation of construction noise is provided in the DEIR for purposes of CEQA analysis. See Chapter 4.10 of the DEIR.

## Response to Comment Grp 12-28

The commenter states that for on-site noise sources, the DEIR relies on noise limits included in the Nevada County General Plan and Nevada County Land Use and development Code and should have assessed project noise levels relative to the noise levels that residents actually experience (ambient noise) rather than to the County's standards. Because the County's noise standards are adjusted upwards or downwards based on ambient conditions, the DEIR analysis effectively did evaluate impacts relative to ambient conditions by applying the appropriate offsets to the County's standards to account for the baseline ambient conditions. Specifically, application of standards 5 dB above the ambient are required where baseline ambient conditions currently exceed the County standards and, where baseline ambient levels are more than 5 dB below the County standards, the standards have been set at the baseline ambient level plus 5 dB. Finally, where ambient conditions are less than 5 dB below the County standards, no adjustment for ambient conditions is applied in the analysis. Table 6 of Appendix L (Table 4.10-6 of the DEIR) shows the baseline ambient conditions at each representative receptor extrapolated from the ambient noise survey results and the corresponding maximum and average, daytime, evening, and nighttime noise level standards applicable at each representative receptor location after the appropriate adjustments to the County standards have been applied to account for the baseline ambient conditions. Please see pages 18-28 of Appendix L of the DEIR for a detailed discussion of applicable noise standards by receptor. Nonetheless, in response to this comment, the following two additional tables were prepared to provide the increase in ambient noise levels for each receptor location during daytime and nighttime periods, respectively. As indicated in Tables A & B, the project-related increases in ambient noise levels from all on-site noise sources are below the 5 dBA threshold for a finding of a significant noise increase.

## Response to Comment Grp 12-34

Mitigation Measure 4.4-1(a) includes three different and independent requirements to mitigate project impacts to the Pine Hill flannelbush. The first measure requires the preparation of a habitat management plan, a draft of which was included in Appendix F.4. The habitat management plan (i) is to mitigate the direct loss of 18 Pine Hill flannelbush as a result engineered fill placement and the potential indirect loss of 4 Pine Hill flannelbush within 30 feet of the edge of the engineered fill. The second measure (ii) requires the Project Proponent to enhance the Pine Hill flannelbush habitat that would not be impacted by engineered fill placement. The third measure (iii) requires a conservation easement be placed on the onsite Pine Hill flannelbush avoidance area and any offsite transplant areas. All measures are required to be completed prior to the issuance of a grading permit. This is hereby clarified in the revised mitigation measure text in the EIR (page 4.4-69), as shown below.

*4.4-1(a)* *i.* *Prior to issuance of grading permits for the Centennial Industrial Site, the Project Applicant shall obtain an Incidental Take Permit (ITP) from CDFW for Project-related impacts to the Pine Hill Flannelbush. During the consultation process with CDFW, the Centennial Pine Hill Flannelbush Habitat Management Plan (Matuzak 2021) (HMP) shall be revised if required by CDFW, and must be approved by CDFW prior to implementation. This HMP shall include habitat enhancement and conservation easement requirements. If the USFWS determines that the plants within the Study Area are the federally endangered Pine Hill flannelbush prior to project implementation, then a USFWS Biological Opinion must also be secured, and the USFWS would also need to approve the HMP prior to implementation. Note that the measures outlined below are minimum measures, and additional measures may be required by CDFW to be included in the HMP during consultation.*

*Prior to issuance of grading permits for the Centennial Industrial Site, implement project-specific mitigation measures 1-3 outlined below consistent with the County and CDFW approved HMP, as well as the Habitat Enhancement and Conservation Easement. Project-specific mitigation measures generally include protective measures for the Pine Hill flannelbush within the on-site avoidance area. For project actions that will directly impact the Pine Hill flannelbush, measure 4 (monitoring) shall occur on an ongoing basis, and measure 5 depends upon the results of monitoring, and thus, measures 4 and 5 are not required prior to issuance of grading permits).~~implement project-specific mitigation measures 1-3 within the Centennial Pine Hill Flannelbush Habitat Management Plan (Matuzak 2021) (HMP), to the satisfaction of the County, USFWS and CDFW. Project-specific mitigation measures generally include protective measures for the Pine Hill flannelbush within the on-site avoidance area. For project actions that will directly impact the Pine Hill flannelbush, measure 4 (monitoring) shall occur on an ongoing basis, and measure 5 depends upon the results of monitoring, and thus, measures 4 and 5 are not required prior to issuance of grading permits):~~*

1. *Seed Collection;*

   *Collect seed for seedbanking and for future replacement and recovery efforts pursuant to the requirements of Section 6.2 of the HMP.*

2. *Develop Transplantation Plan and Monitoring Plan;*

   *The Transplantation and Monitoring Plan shall be developed in consultation with USFWS and CDFW, and shall, at a minimum, address location(s) for dormant season relocation, site selection for transplanting, and metrics of successful establishment (i.e., Section 6 of the HMP).*

3. *Transplanting;*

   *Transplant the individuals of Pine Hill flannelbush that fall within the disturbance footprint to another site with similar soil, hydrologic, vegetation type and aspect. The transplantation site(s) selected shall extend the known population spatially, in other words, planting beyond the known perimeters of the existing population is preferable, to maintain population coverage. Transplanting shall occur in the season deemed to have the greatest potential for success, generally the fall, after rains have commenced.*

4. *Transplant Monitoring; and*

   *Transplants shall be monitored every month for the first six months, then subsequently, every two months for the first two years. After monitoring identifies successful establishment and flowering for the second season for each of the transplants, transplanting will have been deemed successful.*

5. *Alternative Measures to Transplantation and Seed Collection (if required pursuant to the criteria in the HMP)*

   *If Steps 1-4 of the HMP are not successful in maintaining the Pine Hill flannelbush population numbers, then the following measures shall be taken:*

   - *Individuals shall be grown from seed and transplanted out in a 100:1 ratio for those taken.*
   - *Transplants of individuals grown from seed shall be planted with similar soil, hydrologic, vegetation type and aspect.*
   - *Transplanting shall occur in the season deemed to have the greatest potential for success, generally the fall, after rains have commenced.*
   - *Transplants shall be monitored every month for the first six months, then subsequently, every two months for the first two years.*

*ii.* *Habitat Enhancement:* *Prior to issuance of grading permits, pursuant to the HMP, the applicant shall enhance Pine Hill flannelbush habitat outside the disturbance footprint, which could include removal of invasive plants and conducting a pilot study by collaborating with CAL FIRE or other research facility to conduct prescribed fire in areas to*

*enhance natural germination and recruitment, as Pine Hill flannelbush need fire for successful germination, and root sprouts.*

*iii. Conservation Easement: Prior to issuance of grading permits, the applicant shall record a Conservation Easement for the on-site Pine Hill flannelbush avoidance area, or use a similar land protection mechanism that runs with the land in perpetuity, to protect the Pine Hill flannelbush plants within the avoidance area. The management guidelines for the Conservation Easement or similar mechanism shall require that the habitat be managed for the Pine Hill flannelbush and its associated habitat. The applicant shall also record a Conservation Easement or use a similar land protection mechanism for any offsite areas not owned by the applicant where the transplants are to be located.*

The above revisions are for clarification purposes and do not alter the conclusions of the DEIR.

## Response to Comment Grp 12-35

Comment noted. The requested level of detail is not required for a mitigation measure.

## Response to Comment Grp 12-36

Comment noted. This additional information requested by the commenter is not necessary to analyze and conduct an impact analysis resulting from potential project impacts.

## Response to Comment Grp 12-37

**Group Letter 13**

**Gold Country Avian Studies**
14401 Pierite Road Nevada City, CA 95959 (510)541-9078

To: Nevada County Planning Commission
Attn: Matt Kelley, Senior Planner
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

Dear Mr. Kelley and the Nevada County Planning Commission,

**Grp 13-1**

I am a biologist and the director of Gold Country Avian Studies (GCAS), an organization focusing on avian research and education in the Sierra Foothills. We have found that the DEIR for the proposed Idaho Maryland Mine (IMM) project is deficient in numerous areas that would directly affect the environment and wildlife of the Centennial and Brunswick sites, as well as the surrounding area, especially South Fork Wolf Creek and the portion of Empire Mine State Historic Park that the creek transects, a meadow known as the Bennett Street Grasslands. Since December 2016 I have run a year-round bird monitoring program in the Grasslands, performed with a permit from the Park and in conjunction with Bear Yuba Land Trust. The land trust holds a conservation easement on 7+ acres within the grasslands along South Fork Wolf Creek. At the grasslands we perform detection surveys and run a monitoring station where we operate 10 mistnets to passively capture wild birds, then band and release them. The grasslands are a rich, biodiverse ecotone that connects a conifer covered hillside, a riparian creek corridor, and a very wet meadow which drains from the hill where the Centennial site is located. At the Brunswick site, the project proposes to put its untreated wastewater into a vibrant pond, rich with birdlife. After treatment, the water will be discharged into the creek, which flows downstream though the grasslands where we run the monitoring program. The DEIR is inadequate in that is does not call out the Significant and Unavoidable Impacts that the proposed project would have to the birds and other wildlife that use South Fork Wolf Creek and its riparian habitat for breeding, foraging, and cover. Nor does it address the direct environmental or economic impacts that the mine activities would have on the monitoring program that GCAS runs.

1

Brunswick site pond

**4.4 Biological Resources**

Grp 13-2

The Idaho-Maryland Mine Project DEIR is deficient in that it does not it does not acknowledge nor address Significant and Unavoidable impacts to the 98 native bird species that my organization has captured or detected in the Grasslands, all of which are protected by the Migratory Bird Treaty Act. This list includes 4 rare, special status species including the critically endangered willow flycatcher. These species and their relevant statuses are listed below and can be found at this link from the State of California Natural Resources Agency Department of Fish and Wildlife:

***Empidonax traillii* willow flycatcher**
State rank: S1/S2: critically imperiled/imperiled in the state at subspecies level (State listing of the full species includes all subspecies.)
CESA (California Endangered Species Act): Endangered
USFS:Sensitive
USFWS: Bird of Conservation Concern

2

***Contopus cooperi* olive-sided flycatcher**
State rank: S3 vulnerable
CDFW:Species of Special Concern
IUCN:Near Threatened
NABCI:Yellow Watch List
USFWS:Bird of Conservation Concern

***Icteria virens* yellow-breasted chat**
State rank: S3 = Vulnerable
CDFW: Species of Special Concern

***Setophaga petechia* yellow warbler**
State rank: S3/S4 Vulnerable
CDFW:Species of Special Concern
USFWS:Bird of Conservation Concern

Grp 13-3

First, GCAS takes issue with the following statements from the DEIR:

Page 471 of the DEIR states "California black rail is the only special-status bird that was identified as potentially occurring on the Sites, though it is considered to have only a very low potential to occur. Common avian species having no special status are not at risk of populations declining below self-sustaining levels." In Appendix F.10, the Updated Technical Memorandum for the Idaho-Maryland Mine Project – South Fork Wolf Creek Discharge Biological Resources Assessment states "The habitat (aquatic and upland riparian zone) associated with the South Fork Wolf Creek does not provide suitable habitat for other CESA listed species such as the California black rail (*Laterallus jamaicensis coturiculus*)".

We disagree with these statements and believe that the pond area and adjacent meadow on the Brunswick property *could* in fact provide proper habitat for the California black rail. Moreover, the statement that "California black rail is the only special-status bird that was identified as potentially occurring" is absolutely incorrect--on at least 15 separate occasions GCAS has captured or detected one or more individuals of the above-mentioned special status species (yellow-breasted chat, yellow warbler, olive-sided flycatcher, and the critically endangered willow flycatcher). During four out of the past five years **we have captured more than 7 willow flycatchers** in the creek vegetation. In 2003 this

3

species was estimated to have only 400 remaining breeding pairs! We can only imagine that this species is in greater jeopardy today, and for the DEIR to ignore its presence in this region is completely negligent.

Moreover, **the DEIR is deficient because it did not consider significant relevant facts known to the county:** in my NOP comment letter addressed to Matt Kelley, dated August 17, 2020, I listed 3 special status species we had encountered in the Bennett Street grasslands, including willow flycatcher, and on March 10, 2021, I also submitted to the county planning department a folder of all our CDFW California Natural Diversity Database (CNDDB) special status species submissions. On March 24, 2022 at the DEIR Public Hearing, an updated list of all CNDDB submissions and photographs of all 4 Special Status species was provided to the Commissioners and are included in this letter as well (see below).

**Grp 13-4**

The DEIR's biological surveys of the South Fork Wolf Creek riparian area were severely lacking, My understanding from Appendix F.10 is that the only biological survey that occurred in the South Fork Wolf Creek riparian area was a Visual Encounter Survey (VES) during which two people walked the creek on August 29, 2019. Not only is it likely that many amphibians were missed during this late, hot, dry time of year in a warming climate, but also, there is no evidence that any bird survey was attempted. If so, bird vocalizations are almost non-existent at that time of year and locally breeding migrants would have already departed.

In addition, a second meadow, located on the Brunswick property, also rich with birdlife, lies directly to the east of a vibrant pond where the project will pump its untreated wastewater. Using this pond as a wastewater dump is a tragic waste of a vibrant wetland, which is a rare asset in a very dry region in the midst of a multi-year drought. Studies must be required to determine if diverting water from this pond into a treatment facility could dry this meadow, and/or determine if contaminants in the wastewater can leach to this meadow. Also, a precise plan would need to be developed to protect wildlife from contaminated pond water. **It must also be stated that this meadow on the Brunswick property is dense with excellent willow habitat, and it is quite likely that the protected CESA willow flycatchers that we have caught in late summer may in fact breed at this location, and may be dispersing downstream towards the Bennett Street**

**Grp 13-5**

4

**Grp 13-5**

**Grasslands, using South Fork Wolf Creek as a migration corridor.** Multi-year studies of these aspects of the project must be studied, addressed, and mitigated, but none of this is adequately addressed in the DEIR. It is of utmost importance that the county ensures that this willow habitat be viewed as a vital, protected wetland and should not be disturbed in any way by the project owner without adequate permitting. The "rebuilding" of the southwest pond berm suggested in the DEIR could have Significant and Unavoidable Impacts on birds and wildlife including the CESA willow flycatcher, the adjacent meadow, and rich, willow habitat of South Fork Wolf Creek. Two breeding wood duck pairs were recently (March 26, 2022) observed on the pond, as a testament to the importance of the habitat that this area provides.

5

Meadow and extensive willow habitat available on Brunswick property

**Grp 13-6**

We find the statement "Common avian species having no special status are not at risk of populations declining below self-sustaining levels" (DEIR p 471) extremely disturbing. The landmark Rosenberg et al. 2019 peer-reviewed study published in the journal Science demonstrates a "cumulative loss of billions of breeding individuals across a wide range of species and habitats… and that declines are not restricted to rare and threatened species—those once considered common and wide-spread are also diminished." The study's results demonstrate that in my 50 year lifetime, we have lost 1/3 of the birds (in sheer volume) that existed in North America when I was born in 1971; a horrible tragedy. According to the 2019 State of the Birds Report produced by the North American Bird Conservation Initiative (NABCI), a consortium of governmental organizations and NGOs, "just 15 species of "common birds" (species that were once abundant, such as meadowlarks, juncos, blackbirds, and swallows) account for more than two-thirds of the total loss in native bird populations. Our common birds are now suffering population losses in the tens of millions— similar to the decline of the Passenger Pigeon." Even the dark-eyed junco, a 'common' backyard feeder bird, has had one of the steepest declines in North America. **So, the DEIR's**

6

**statement indicating that "common...species are not at risk of populations declining" is simply absurd, and the authors should be ashamed for even making this suggestion.**

Grp 13-7

**Section 4.4-4** The DEIR indicates in this section that no mitigation is required for a 'Less than Significant' Impact of "**Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites."** However, GCAS's data indicates that the SF Wolf Creek may be used regularly during migration season by the endangered Willow Flycatcher, Yellow-breasted Chats, and Yellow Warblers. Also, we have documented evidence that black bears use the Bennett Street Grasslands as a wildlife corridor and den nearby. We also have concerns that increased traffic between the meadow and the Centennial site, and between the grasslands and the Brunswick site could negatively impact bird and other wildlife moving between these areas.

Given that the Bennett Street Grasslands are located between the Centennial site and the Brunswick site, and across the street from a proposed housing development (see below), extensive additional studies need to be performed regarding the Significant and Unavoidable Impacts that the project will have on the grasslands and the riparian corridor. These should include but are not limited to general bird surveys; surveys of special status species; willow flycatcher surveys during breeding and migration periods; research on impacts of temperature change and flooding that the creek may have on invertebrates; and studies on the effects of flooding on ground nesting birds, of which there are numerous resident and migrant examples at the site. Additionally, we have documentation of birds, bobcats, bear, coyote, mountain lions and other wildlife moving freely between the grasslands and the area of the proposed housing development and the Centennial site, and additional studies must be performed to identify the Significant and Unavoidable Impacts that the additional traffic and noise created by the proposed housing development and the mine project would have on wildlife, their migration corridors, and the aesthetics of the grasslands of Empire Mine State Historic Park.

7

Grp 13-8

**4.4-2(a) Foothill yellow-legged frog** According to https://animaldiversity.org/accounts/Rana_boylii/ "at lower elevations, foothill yellow-legged frogs breed from late March to early May, after the high-water stages of streams subside. At higher elevations, breeding usually takes place from June to August, after the ice and snow has melted from the high-mountain lakes..... Depending on the water temperature, the eggs may hatch within 5 to 37 days." This development is probably accelerated in warmer temperatures, and slowed in colder ones. Given our warming climate, it is likely that even at higher elevations the breeding period would have occurred earlier rather than later in the summer. In this case, even assuming the latest possible breeding date, which is unlikely given the drought of the past few years, warmer temperatures would have caused a short hatching period and egg masses could have easily been missed during the one survey performed August 29, 2019, and that this species is present nearby, so additional studies should be performed.

Grp 13-9

**4.4-2(b) Western pond turtle** On p 90 of the DIER states re: the western pond turtle *"If a nest is documented during pre-construction surveys, a non-disturbance buffer shall be established, as determined by a qualified biologist, based on the location of the nest until all eggs have hatched and the juveniles have dispersed out of the proposed impact area."* It is not clear to GCAS how any reasonable biologist could expect that juvenile turtles would or could disperse out of this area to the nearest pond, which is approximately 1,969.81 ft (600.40 m) away and across the busy Brunswick Road. This impact is Significant and Unavoidable.

Grp 13-10

**4.4-2(f)** More specifics should be provided regarding how and when roosting bats should be surveyed. Given the extensive period of disuse of the shaft tower, it is likely that the tower is used as a roosting or maternal roost site by a variety of bat species. Simply shutting the bats out of the tower when they depart to forage is UNETHICAL and should not be considered as a viable mitigation.

Grp 13-11

**4-8 Hydrology and Water Quality**

Ignoring the Significant and Unavoidable Impacts to South Fork Wolf Creek by alteration of temperature, water levels, and clarity, and the addition of toxins to South Fork Wolf Creek could **Result in Loss, Disturbance, or Degradation of**

8

**Jurisdictional Waters of the United States, and Waters of the State, Including Wetlands,** which would not be acceptable under CEQA.

An extensive study of the hydrology of waters potentially entering the pond/wetland located immediately east of the Centennial site (south of the Ferguson Plumbing Supply buildings) should performed as this wetland is important to birds, frogs, and other wildlife. The DEIR provides no mention of any mitigation for impacts to surface or ground waters flowing into this wetland. Terrain maps would imply that this is the lowest elevation location in the area, so greater attention should be given to impacts to this pond/wetland.

Grp 13-12

**4.4-3(c)** The DEIR states: "To the extent feasible, as determined by the qualified biologist in coordination with the Corps, the project shall be designed to avoid and minimize adverse effects to waters of the U.S. or jurisdictional waters of the State of California within the project area. This is woefully inadequate. The language "to the extent feasible" allows too much leeway for the project sponsor to do the minimum necessary rather than actually care for the waterways and adjacent resources, vital resources .

The DEIR also must clarify a plan for placement of rock and rip rap along Wolf Creek and clarify how construction byproducts will be prevented from discharging into South Fork Wolf Creek, and specify how "dissipation" riprap will work at the point of entry into the creek.

Grp 13-13

The DIER indicates that a clay liner covered with geomembrane will line the pond, and that filtration through mined manganese dioxide, treated with sodium hypochlorite or potassium permanganate, and that sodium hydroxide will be used to treat NH3 in higher concentrations due to explosives. The presence of these chemicals could ultimately end up in the drinking water of the residents and water sources available to wildlife in untenable, whether allowed or unintentional. This Impact is Significant and Unavoidable and must not be allowed.

Grp 13-14

**Aesthetics 4.1**

**4.1-1** The project inaccurately describes Impact 4.1-1 as Low Significance (LS) and requests a zoning variance to increase 4 separate buildings to a height of up to

9

165, well above the currently zoned 45 foot limit. This would be a negative impact to the character of the region and a Significant and Unavoidable Impact to the trails of the adjacent state park, from which one can view the property.

Grp 13-15

**4.1-3** We disagree that new sources of light are of Low Significance and could have Significant and Unavoidable Impacts to wildlife and the surrounding communities, potentially reducing home values and making the properties less desirable for those who wish to buy homes in the area.

**4.10 Noise and Vibration**

Grp 13-16

**4.10-6** The DEIR indicates that no mitigation is required for a "Less Than Cumulatively Considerable" Impact of "Generation of a substantial permanent increase in ambient noise and/or vibration levels associated with the cumulative noise and vibration from all sources of the proposed project." However, GCAS disagrees with this, and is concerned that noise impacts could affect the fecundity (breeding success) of nesting birds. Knowledge of this impact can be found in many peer-reviewed scientific publications, too numerous to catalog here.

**Rezoning**

Grp 13-17

Due to the Significant Impacts proposed by the project, GCAS does not support the rezoning from **M1-SP to M1-ME of the Brunswick site.** "The proposed project includes the requested rezone of the parcels located at the Brunswick Industrial Site from M1-SP to Light Industrial with Mineral Extraction Combining District (M1-ME)" (see DEIR Figure 4.9-3).

We also do not support the transfer of 46.27 acres at the Centennial site (p 54) to reconfigure property lines to resolve issue of proposed buildings crossing property boundaries.

Grp 13-18

**Additional Considerations**

The DEIR is also deficient in that it does not address the simultaneous impacts of a 300+ unit housing development currently under review by the city of

10

Grass Valley, which is proposed on Bennett Road between the Centennial site and the grasslands at APNs: 009-560-005, 010, 031 – 039, by owner Timothy Snow and Millennium Engineering.

Also, in apparent violation of CEQA legislation, the IMM DEIR decouples the Centennial development from that of the Brunswick area and is written as if the Centennial developments are a "done deal." The Centennial site has numerous contaminants present and the site's development is sure to have Significant and Unavoidable Impacts on human and environmental health, and the Centennial and Brunswick site proposals must be considered in conjunction, as ONE project, and all negative Impacts considered simultaneously.

**Grp 13-19**

Numerous aspects of the IMM project require substantial environmental monitoring, such as long-term effects on Air and Water Quality and impacts to wells and the aquifer. The DEIR does not give sufficient consideration to who will be responsible for the extensive monitoring necessary for the 80-year life of the mine, and beyond. The monitoring of these impacts should not be left to the responsibility of the project sponsor, (for whom financial gain is the primary goal), nor to Nevada County, the City of Grass Valley, and its taxpayers. So, who will perform a sufficient level of monitoring that will keep our citizens and the environment healthy and who will pay for this Herculean task?

**Grp 13-20**

Gold Country Avian Studies agrees with the arguments put forth in comment letters submitted to the County by Empire Mine State Historic Park and CEA in opposition to aspects of the DEIR and supports the efforts and intentions of those organizations.

In summary, the Bennett Street grasslands are a biodiverse gem providing ideal habitat for resident and migratory birds. It is plentiful in food sources, as well as perennial water from South Fork Wolf Creek, which supports the invertebrates that birds feed to their young and consume during migration stopovers. Moreover, the grasslands are known to be the last remnant of the grassy valley after which Grass Valley acquired its name -- this site truly encompasses our community's heritage and serves as a rich environmental reservoir.

**Grp 13-21**

The true gold of our county are its stunning landscapes, its beautiful forests, its sparkling life-filled waters, and the diverse wildlife that populate these

habitats. It will be a sad day when this is sacrificed for the short-sighted gain of pulling ore from the ground.

Sincerely,

Allison Nelson, MS
Director, Gold Country Avian Studies

# GROUP LETTER 13: ALLISON NELSON, GOLD COUNTRY AVIAN STUDIES

## Response to Comment Grp 13-1

This is an introductory comment expressing general concerns regarding the project and its associated DEIR. Please see responses to the following comments addressing the commenter's specific concerns.

## Response to Comment Grp 13-2

The commenter generally states that the DEIR is deficient, and the project would directly affect the environment and associated wildlife. DEIR Chapter 4.4 analyzed potential impacts to special--status bird species, special-status bats, and non-special status birds protected by other laws (see Impact 4.4-2). Impacts were identified as potentially significant and required mitigation (e.g., preconstruction surveys) reducing these impacts to less than significant level. Please see Master Response 30 - Technical Study Adequacy and Master Response 37 - Birds and Raptors. Master Response 37 includes minor changes to Mitigation Measure 4.4-2(g) (e.g., pre-construction nesting bird surveys) to identify, by name, the riparian bird species identified by the commenter. In addition, Table 4.4-6 of Chapter 4.4, Biological Resources of the DEIR, is hereby revised as shown at the end of this letter to add descriptions of the bird species and evidence of their low potential for occurrence on the Centennial and Brunswick Industrial Sites. Similarly, page 4.4-39 of Chapter 4.4 is hereby revised as follows:

> Riparian Bird Species
>
> Several species of birds are known to forage and nest within riparian habitat along stream corridors, including the willow flycatcher (*Empidonax traillii*), yellow warbler (*Setophaga petechia*), yellow-breasted chat (*Icteria virens*), and olive-sided flycatcher (*Contopus cooperi*). Yellow-breasted chat has been mapped within the CNDDB approximately 1.0 mile downstream of the Brunswick Area within the riparian habitat along South Fork Willow Creek. The willow flycatcher, yellow warbler, and olive-sided flycatcher have not been mapped within the CNDDB within 5 miles of the Brunswick Area or Centennial Area, but unprocessed data regarding their potential occurrence within the same vicinity as the yellow-breasted chat along the South Fork Wolf Creek downstream of the Brunswick Area is included in the Grass Valley Quad CNDDB search (CDFW 2022).
>
> However, compared to the riparian habitat downstream of the Brunswick Area where the yellow-breasted chat has been mapped in the CNDDB (CDFW 2022), the riparian habitat within the Centennial and Brunswick Industrial Sites provide minimal suitable habitat for any of these species given the level of disturbance historically within those areas as well as the recent disturbance within both areas in 2021 related to a fire that burned a large area within the Centennial Area and a large storm in late December 2021 that heavily impacted the riparian habitat along the South Fork Wolf Creek within the Brunswick Area. The previous mapped location of the yellow-breasted chat, as well as the locations of the other three riparian bird species included as unprocessed data within the CNDDB (CDFW 2022), are within the Empire Mine State Historic Park and have been identified in an area of substantially higher stream and riparian habitat quality than the more highly disturbed riparian habitat located along the South Fork Wolf Creek within Brunswick Area. Accordingly, these species have a low probability of occurrence onsite, and no potential impact is expected.

The aforementioned revisions to Chapter 4.4. of the DEIR are provided for clarification purposes in response to public comment and do not affect the adequacy of the DEIR analysis, which already identified that the proposed project would result in a potentially significant impact to nesting

raptors and other migratory birds. As a result, the DEIR includes mitigation (MM 4.4-2(g)) requiring pre-construction nesting bird surveys, and if nesting birds are detected, implementation of avoidance measures.

## Response to Comment Grp 13-3

Please see Response to Comment Grp 13-2.

## Response to Comment Grp 13-4

Please see Response to Comment Grp 13-2, as well as Master Response 38 – Foothill Yellow Legged Frog and California Red Legged Frog.

## Response to Comment Grp 13-5

As noted in DEIR Chapter 4.4, and various biological appendices (Appendix F) the "pond" is a man-made clay-lined pond that was constructed to support previous industrial land uses and surrounded by wet meadow, montane hardwood-conifer, and developed vegetation types. These technical studies analyzed the species that would utilize these habitats and the DEIR included an impact analysis and mitigation measures if an impact was identified. Therefore, potential impacts to the man-made pond, onsite vegetation habitats, and potential special status species were thoroughly analyzed.

As stated on page 4.8-30 of the DEIR, the clay-lined pond, constructed in the 1980s, for the former Bohemia Lumbermill, was permitted by the RWQCB through WDRs as a Class II Designated Waste Management Unit, under former Title 23 of the CCR, Subchapter 15, Section 2532. According to the WDRs (Order No. 88-185 for Bohemia Incorporated Grass Valley Mill), the pond was to be lined with a two-foot-thick clay layer having a permeability not to exceed 1x 10-6 cm/s. Vector Engineering found that the “clay liner system was constructed in substantial accordance with the SWRCB Title 23, Subchapter 15, Section 2532 regarding construction of the natural liner system for Class II Designated Waste Management Units.” Mitigation Measure 4.8-1(a) requires the applicant to submit a RoWD and obtain a WDR for the use of the surface impoundment (i.e. Brunswick clay-lined pond. At a minimum, the liner of the clay-lined surface impoundment shall be upgraded to include a synthetic liner meeting the specifications in Title 27, Section 22490(f), of the California Code of Regulations. Due to the very low permeability of the existing and proposed liner, water contained in the pond does not infiltrate into the adjacent wetland meadow and therefore diverting water from the pond to the water treatment plant would not dry out the adjacent meadow and water in the pond cannot leach out into the adjacent meadow. As stated on page 4.4-85 of the DEIR, the project includes excavation and reconstruction of a segment of the berm of the existing clay-lined pond to remove pockets of sawdust not removed during prior construction. No disturbance to the wetland meadow is proposed and Mitigation Measure 4.4-3(b) requires the appliance to implement the Watercourse/Wetlands/Riparian Areas Management Plans prepared for the Centennial Industrial Site and Brunswick Area, as approved in their final form by Nevada County. Specifically, the applicant shall implement the mitigation measures and conditions identified in the Management Plans, which include measures designed to protect aquatic resources and the biological resources they support. Regarding, the Willow Flycatcher, please see Master Response 37 - Birds and Raptors.

As discussed in Master Response 30 - Biological Study Technical Adequacy, the project site (including the pond within the Brunswick Industrial Site) has been subject to extensive biological surveys, peer review, and analysis in the DEIR.

## Response to Comment Grp 13-6

CEQA requires the analysis of impacts, directly or due to habitat modifications, to special-status species protected by CDFW or USFWS. In addition, CEQA requires an analysis of impacts to non-special status birds if they are protected by other laws and regulations (e.g., Migratory Bird Treaty Act). DEIR, Impact 4.4-2, conducted this analysis consistent with CEQA.

## Response to Comment Grp 13-7

Please see Master Response 37 - Birds and Raptors, regarding potential impacts to the California black rail, willow flycatcher, olive-sided flycatcher, yellow-breasted chat, and yellow warbler.

The CEQA guidelines require analysis of substantial interference to "the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites." Migration is defined as the seasonal movement of animals from one habitat to another. Various animal, bird, and fish species are not automatically considered migratory just because they move from one location to another. Migration serves a purpose for the species such as winter/summer habitat for foraging or breeding. It is acknowledged, and analyzed in the DEIR impact analysis (see Section 4.4.4), that species exist within the project site that are common to the area. Potential impacts to these species were analyzed and mitigation measures have been provided where it was determined impacts to species could occur as a result of project activities including preconstruction surveys and agency permitting. The only migratory species acknowledged by the County General Plan is deer migration corridors. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded it would be less than significant. The commenter does not raise any specific impact that would be caused by the project, but speculates that impacts could result. CEQA does not require analysis of speculative impacts. (CEQA Guidelines Section 15384.)

The commenter is concerned that increased traffic between the Bennett Street Grassland Meadow and the Centennial site and Brunswick site could negatively impact bird and other wildlife moving between these areas. Truck traffic from the proposed project is not on E. Bennett Road (see Figure 3.-13 of the DEIR) and traffic from operations along E. Bennett Road is limited to a portion of employees (approximately 12%) who may use that route to come to and from work at the Brunswick site (See figures 4.12-5 and 4.12-6 of the DEIR). As stated on page 4.4.74 of the DEIR, studies of the effects of noise on wildlife populations have shown that while some species can be negatively affected by traffic noise and wildlife densities are generally inversely proportional to distance from roadways, many species of wildlife are unaffected by roadway noise. In general, wildlife species have been shown to acclimate to the noise environment in which the species resides, or to select habitat based on a range of factors including the level of disturbance.

The project would not result in flooding and therefore would not have any impact to invertebrates or nests from flooding. Please see Chapter 4.8 of the DEIR and Master Response 36 - Flows in South Fork Wolf Creek. The project water discharge would be required to meet state water quality goals regarding temperature of discharged water. Please also see Master Response 32 – Temperature of Mine Water Discharge.

The commenter states that the DEIR must analyze how the project would affect the aesthetics of the grasslands of the Empire Mine State Historic Park. The project proposes no activities in the park that would have an aesthetic impact and no analysis is required.

## Response to Comment Grp 13-8

Please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

## Response to Comment Grp 13-9

As noted in Mitigation Measure 4.4-2(b), in addition to allowing an identified western pond turtle to move out of the way on its own, an option is also provided that a qualified wildlife biologist with a CDFW handling permit may move an individual out of the disturbance area. As a result, if a western pond turtle is identified during a preconstruction survey, they can safely exit the disturbance area either through their own movement or by a qualified biologist. As the adjacent South Fork Wolf Creek is habitat for western pond turtle, individuals of this species encountered around the pond could disperse from the pond to the creek.

## Response to Comment Grp 13-10

Mitigation Measure 4.4-2(f) provides extensive detail regarding the survey of bats, specifically that surveys shall occur no more than seven days prior to surface disturbance, reporting requirements if bats are not found, passive removal if bats are identified, and avoidance until breeding roosts have dispersed. This mitigation measure allows for potential bats to be identified, prevented from returning to disturbance areas, and/or avoided to limit the potential for impact. As detailed in the revised mitigation measure, exclusion would not occur until all bats have vacated the roost (see Response to Comment AGCY 3-29). Most bats use different locations as day roosts every day, and passive exclusion is common practice, as it has little to no impact on bats, especially where there are numerous alternative roosts in the surrounding avoided forests.

## Response to Comment Grp 13-11

Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

The hydrology of waters entering the pond/wetland located east of the Centennial site has already been analyzed in the DEIR (See Chapter 4.8, Figure 4.8.3 and Appendix K.5 of the DEIR). Water currently flows from this offsite pond onto the Centennial site through a box culvert (see page 2 and page 7 of Appendix H.4) and would continue to flow through this offsite pond and onto the Centennial site (See figure H-2 of Appendix K.5). The project would not impact the pond/wetland located offsite to the east of the Centennial site and therefore further analysis is not required in the DEIR.

## Response to Comment Grp 13-12

Mitigation Measure 4.4-3 requires additional state and federal permitting prior to the fill or any jurisdictional water. Negotiation with these agencies will determine avoidance, minimization, and compensatory mitigation requirements for project related disturbance. As stated in Mitigation Measure 4.4-3 “Compensatory mitigation can include but is not limited to the following: onsite and/or offsite wetland creation and/or restoration, purchase or placement of conservation easements, payment of an in-lieu fee, and/or purchase of mitigation credits at an approved Corps wetland mitigation or conservation bank.”

The commenter asks that the DEIR clarify a plan for placement of rip rap along Wolf Creek and specify how dissipation rip rap will work at the point of entry into the creek. Additionally, the commenter asks how construction byproducts will be prevented from discharging into South Fork Wolf Creek. The placement of rip rap is discussed in Mitigation Measure 4.4-3(b). Regarding the prevention of construction byproducts from entering the creek, Mitigation Measure 4.6-2 requires that the mine operator obtain coverage under the Construction General Permit, and to prepare and implement a Storm Water Pollution Prevention Plan.

## Response to Comment Grp 13-13

Groundwater will be pumped from underground workings to the existing 40-acre-foot, clay-lined settling pond. The existing pond does not have a discharge point and therefore untreated water would not flow to surface waters. As noted by the commenter, the existing pond is clay lined. As described in the DEIR project description (Chapter 3) and Impact 4.8-1, the existing pond's claying lining was constructed with a 2-foot clay layer, consistent with RWQCB regulations. In addition to this clay lining, the applicant is proposing to install a synthetic liner that will be required to meet RWQCB regulation (required by Mitigation Measure 4.8-1(a)). The existing clay liner, combined with the synthetic liner, will prevent leaching of untreated water into the groundwater.

Please see Master Response 35 - Discharge to South Wolf Creek, for a detailed description of the water treatment system and eventual discharge of treated water into South Fork Wolf Creek.

## Response to Comment Grp 13-14

As stated in Impact 4.-1, the County General Plan does not identify any scenic vistas in the vicinity of the project site. Impact 4.1-2, analyzing visual impacts from surrounding vantage points, concluded this impact was significant and unavoidable due to a change in views from these public vantage points.

## Response to Comment Grp 13-15

The commenter states that they disagree with the significance conclusion regarding new sources of light. This impact was addressed in Impact 4.1-3 of the DEIR and found to be less than significant. As stated therein (page 4.1-24),

> The Brunswick Industrial Site is anticipated to include approximately 41 pole-mounted LED lights throughout the operational area, including the parking lot, building complex, and internal roads (see Figure 3-13 of Chapter 3, Project Description, which depicts the proposed exterior lighting plan for the Brunswick Industrial Site). The mounting height for the LED lights would be 20 feet. The 41 pole-mounted lights would be Gardco (by Signify) LED lights, which are "dark sky approved" by the International Dark Sky Association (IDA).[4] IDA's Fixture Seal of Approval Program certifies outdoor lighting fixtures as being Dark Sky Friendly, meaning that they minimize glare while reducing light trespass and skyglow. All products approved in the program are required to be fully shielded and to minimize the amount of blue light in the nighttime environment.

The above statement, in addition to the more extensive analysis contained in Impact 4.1-3, provides substantial evidence that the project's lighting effects would be less than significant.

Please see Master Response 1 - Non-EIR/ Administrative Issues, and Master Response 2 - Social and Economic Issues regarding impacts to property values. Comment noted.

## Response to Comment Grp 13-16

Noise impacts to wildlife and bird species was analyzed in Impact 4.4-2 of Chapter 4.4, Biological Resources, and determined to be less than significant.

## Response to Comment Grp 13-17

Comment noted. Please see Master Response 1.

[4] International Dark Sky Association: Dark Sky Approved Lighting. Available at: https://www.darksky.org/our-work/lighting/lighting-for-industry/fsa/fsa-products/#!/EcoForm-LED-site-and-area-G2-small-ECF-S/p/133073023/ category=34046011. Accessed August 20, 2021.

## Response to Comment Grp 13-18

The commenter asserts that the DEIR is not adequate because it does not address the simultaneous impacts of a 300+ unit housing development under review by Grass Valley. A conceptual review of the mixed-use housing project located at 10662 East Bennett Road by the City of Grass Valley on October 12, 2021, was conducted after the Notice of Preparation for the Idaho-Maryland Mine project.

https://nevco.granicus.com/DocumentViewer.php?file=nevco_30c8ac8bef88b0269a248327f380cbfe.pdf&view=1

However, based on the City's online application tracking platform, no formal application has been submitted for the referenced conceptual project, so analysis of associated impacts would be mere speculation. CEQA does not require analysis of speculative impacts. (CEQA Guidelines Section 15384.)[5]

## Response to Comment Grp 13-19

Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

## Response to Comment Grp 13-20

As a required pursuant to CEQA, a mitigation monitoring and reporting program has been prepared and is included as Chapter 4 of this Final EIR. The mitigation measures and conditions of approval will be enforced by the County.

## Response to Comment Grp 13-21

Comment noted. Please see Responses to Comments to Agency Letter AGCY 1 and Group Letters Grp 7 and Grp 8.

## Response to Comment Grp 13-22

Comment noted.

**Group Letter 14**

Nevada City Rancheria Tribal Council P.O. Box 2624 Nevada City, Ca. 95959
530-265-6563 (Chairman) 530-570-0846 (Secretary)

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: March 28, 2022

RE: Formal Request for Tribal Consultation Pursuant to the California Environmental Quality Act (CEQA), Public Resources Code section 21080.3.1, subds. (b), (d) and (e) for Idaho-Maryland Mine by Rise Gold Corporation, Grass Valley, Nevada County, California

Dear Commissioners Milman, Duncan, Ingram, Mastrodonato, and Greeno:

This letter constitutes a formal request for tribal consultation under California law, including the provisions of the California Environmental Quality Act ("CEQA") (Cal. Public Resources Code section 21080.3.1 subdivisions (b), (d) and (e)) for the mitigation of potential project impacts to tribal cultural resource for the above referenced project. The Nevada City Rancheria Nisenan Tribe ("Tribe") hereby requests notice and information for the above referenced project, which is within the Tribe's territory, which includes the Nevada County Planning Commission's geographical jurisdiction. The Nevada City Rancheria Nisenan Tribe is a California Native American Tribe as defined by Cal. Public Resources Code section 21073, whose ancestral territory includes, specifically, the lands affected by the proposed project.

**Grp 14-1**

The Tribe has significant interests in the proposed Project including, without limitation Tribal Cultural Resources as defined by California Public Resources Code § 21074 ("Tribal cultural resources"), traditional ecological knowledge, and the current badges and intendants of the genocide of our people caused by gold mining in this area. Therefore, the Tribe requests consultation on topics that are to be included in consultation if requested pursuant to Cal. Public Resources Code section 21080.3.2, subd. (a), including without limitation alternatives to the project, recommended mitigation measures, significant effects of the project.

The Tribe also requests consultation regarding the discretionary topics pursuant to Cal. Public Resources Code section 21080.3.2, subd. (a), including without limitation the type of environmental review necessary, significance of tribal cultural resources, including any regulations, policies or standards used by your agency to determine significance of tribal cultural resources, significance of the project's impacts on tribal cultural resources, project alternatives

Chairman: Richard Johnson Vice Chair: Virginia Covert Secretary: Shelly Covert
Treasurer: Lorena Davis Alt: Sarah Thomas Mal: Saxon Thomas

and/or appropriate measures for preservation or mitigation that we may recommend, including, but not limited to:

(1) Avoidance and preservation of the resources in place, pursuant to Public Resources Code section 21084.3, including, but not limited to, planning and construction to avoid the resources and protect the cultural and natural context, or planning greenspace, parks or other open space, to incorporate the resources with culturally appropriate protection and management criteria;
(2) Treating the resources with culturally appropriate dignity considering the tribal cultural values and meaning of the resources, including but not limited to the following: (a) protecting the cultural character and integrity of the resource; (b) protection the traditional use of the resource; and (c) protecting the confidentiality of the resource;
(3) Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places; and
(4) Protecting the resource.

**Grp 14-2**

The Tribe also notes that the Draft EIR states that the Tribe did not respond within 30 days of notification of an offer to consult. See DEIR p. 4.5-21. Please be advised that the Tribe received notice on March 21, 2022, that the California Native American Heritage Commission finally determined that the Tribe "has provided sufficient documentation to the NAHC to be added to the NAHC's Contact/Tribal Consultation list." This notice comes approximately seven years after the Tribe first requested that the NAHC include the Tribe on its consultation list. Thus, it is only this week that the Tribe understood that it finally has achieved the protections of California law, including Tribal consultation mandates and consideration of Tribal cultural resources in the CEQA review process.

**Grp 14-3**

Moreover, given the history of genocide to our people caused by gold mining in this area, and because of the illegal termination of the Tribe's federal recognition, the Tribe's capacity to respond to such offers is necessarily limited to those matters that appear of genuine concern. Given the ongoing harm that gold mining caused to the Tribe and its members, the Tribe never thought the proposed project could possibly proceed to the point of seriously being considered by the Commission and the County. This is particularly true considering the County's Resolution No. 20-533 "recognizing the Nevada City Rancheria Nisenan Tribe's historical, cultural and continued significance to Nevada County and California …." Id. Thus, the Tribe requests consultation under this County law as well. See https://www.counties.org/general-information/county-structure-0 ("As the legislative body of the county, the Board of Supervisors may act by resolution ..."). The County recognizes that the discovery of gold here led to "the displacement of the Tribe and its members." Id. The County also acknowledges the "Tribe's continuous existence as an indigenous tribe in Nevada County, and further recognizes the Tribe's historical, cultural and continued significance to Nevada County and California." The County also "supports future collaboration and agreement between the County and the Tribe that strengthen each of their governments, for their mutual benefit and to ensure that local land use impacts on tribal and county governments, including their citizenry, services,

lands, and infrastructure, are maintained and mitigated for the benefit of all." Id. The Tribe therefore respectfully requests that the Commission, as a County agency, honor the County's Resolution by consulting with the Tribe regarding the proposed project as a matter of County law and policy, in addition to and distinct from CEQA and other applicable law.

The Tribe therefore requests consultation within 30 days of your receipt of this letter. Please contact me to arrange a convenient date and time to initiate the consultation process.

Sincerely,

Shelly Covert, Tribal Secretary
Nevada City Rancheria Nisenan Tribe
Shelly@NevadaCityRancheria.org

Debbie Pilas-Treadway, Chief Deputy Executive Secretary, NAHC
Alison Lehman, Executive Officer, Nevada County
Jeff Thorsby, Senior Management Analyst, Nevada County
Frank Lawrence, Esq.

## GROUP LETTER 14: SHELLY COVERT, NEVADA CITY RANCHERIA NISENAN TRIBE

### Response to Comment Grp 14-1

The commenter notes that the letter constitutes a formal request for tribal consultation under California law, including the provisions of CEQA Section 21080.3.1. Please see Response to Comment Grp 14-2.

### Response to Comment Grp 14-2

California Public Resources Code Section 21080.3.1(d), requires formal notice to California Native American Tribes, as stated below:

> *Within 14 days of determining that an application for a project is complete or a decision by a public agency to undertake a project, the lead agency shall provide formal notification to the designated contact of, or a tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, which shall be accomplished by means of at least one written notification that includes a brief description of the proposed project and its location, the lead agency contact information, and a notification that the California Native American tribe has 30 days to request consultation pursuant to this section.*

The County complied with the above requirement, despite the fact that the Nevada City Rancheria Nisenan Tribe was not added to the Native American Heritage Commission Contact/Tribal Consultation list until March 21, 2022.

As stated in the Cultural Resources Section of the EIR, "On November 25, 2019, Nevada County sent project notification letters with offers to consult pursuant to AB 52 to the Tsi Akim Maidu Tribal Council, Shingle Springs Band of Miwok Indians, **Nevada City Rancheria Nisenan Tribe**, and UAIC. The Tsi Akim Maidu Tribal Council, Shingle Springs Band of Miwok Indians, and **Nevada City Rancheria Nisenan Tribe did not respond within the 30-day consultation period**." (DEIR p. 4.5-21, emphasis added.) Additionally, the Project Proponent's cultural resource consultant, InContext, attempted to contact the Tribe on December 1, 2020 by letter, phone and email, and on December 16, 2022 by phone and email, with no response. The correspondence was addressed and sent directly to Shelly Covert, the author of Letter 14.

As such, the County considers the March 28, 2022 letter as a CEQA comment letter, but does not have legal authority to start a late consultation process under California Public Resources Code Section 21080.3.1 because the request for consultation was not received within 30 days of the notice.

### Response to Comment Grp 14-3

The commenter cites to County Resolution No. 20-533, recognizing the Tribe's history, culture and significance to Nevada County and California, and again requests late consultation under the County Resolution.

The County agrees that consultation is required if a request is received within 30 days of receipt of formal notice; however, the Public Resources Code does not otherwise allow a lead agency to engage in formal consultation under CEQA if notice is not received within that 30-day timeframe. See the relevant language from California Public Resources Code Section 21080.3.1(b) below:

> *Prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report for a project, the lead agency shall begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project if: (1) the California Native American tribe requested to the lead agency, in writing, to be informed by the lead agency through formal notification of proposed projects in the geographic area that is traditionally and culturally affiliated with the tribe,* ***and*** *(2)* ***the California Native American tribe responds, in writing, within 30 days of receipt of the formal notification, and requests the consultation****.*

Importantly, the California Public Resources Code does not grant the County, as lead agency, authority for formal consultation based on requests received outside of the 30-day window. (See California Public Resources Code Section 21080.3.1 - 21080.3.2.) The commenter appears to argue that either the California Native American Heritage Commission's recent position change that the Tribe is eligible to receive notices, or that County Resolution No. 20-533 somehow allow a late consultation request to be made; however, California law does not provide any mechanism for official consultation based on untimely requests from newly notice-eligible tribes; and as stated above, the Nisenan Tribe actually did receive repeated notice from both the County and the Project Proponent's consultant, and did not contact the County. As such, the County cannot lawfully initiate a late formal AB52 consultation process based on the March 28, 2022 letter.

In addition, as noted on page 4.5-32 of Chapter 4.5 of the DEIR,

> The UAIC responded on December 18, 2019, and requested consultation and copies of the Cultural Impact Report, technical reports, requests for and results of records searches, and GIS SHP files. The County provided such information. In addition, the UAIC noted that they are not aware of any Native American archaeological sites in or near the project site.

Nevertheless, the County concluded that project impacts to tribal cultural resources could be potentially significant, but reduced to less than significant through imposition of mitigation measures (cf. MM 4.5-2 and 4.5-3).

**Group Letter 15**

NEVADA COUNTY ASSOCIATION OF REALTORS®
REALTOR®
*"Committed to a Higher Standard"*

April 4, 2022

County Planning Commission
County of Nevada
950 Maidu
Nevada City, CA 95959

RE: Comments on Draft Environmental Impact Report (EIR19-0001), prepared by the Idaho-Maryland Mine Project.

Nevada County Planning Commission
Danny Milman, District 1
Laura Duncan, District II
Robert Ingram, District III
Mike Mastrodonato, District IV
William Greeno, District V

**Grp 15-1** Thank you for allowing us to speak before you on March 24th during Public Comments to address public comments on the Draft Environmental Impact Report. As stated, we reviewed the document and have the following concerns and questions:

- **Water –**
  - **Grp 15-2** The EIR does not sufficiently clarify remediation for homes in Brunswick/Bennett region that are on wells yet not included in the limited number of residences that will receive new access to treated water hook-ups
  - The report does not adequately address the drilling's impact on the water table and requirement for well modifications as well as fiscal impact to reach the new water table depths over the eighty (80) year mining period with 3.6 million gallons of water per day during de-watering and 1.2 million gallons per day during remaining mining over eighty-year period.
  - **Grp 15-3** The study does not sufficiently address the impact on the water table and potential for resulting ground movement.
  - **Grp 15-4** Report states that the mine will be a net water producer yet does not clarify the recipients. Will Nevada County have potential to recapture those waters?
  - **Grp 15-5** Minimal study of required erosion and subsidence remediation due to extensive increase of waterflow down Wolfe Creek.
  - **Grp 15-6** Question of whether a bond will be posted for the additional hook-ups to replace wells that may need to be addressed following re-opening.

■ 336 Crown Point Circle, Grass Valley, CA 95945 ■ Phone 530 272-2627 ■ Fax: 530 272-2646 ■ Email nevadacountyaor.com ■

**Grp 15-7**

- **Traffic**
  - Insufficient study on the impact of traffic along Brunswick and adjacent roadways with 300 employees commuting into and out of the workplace and one hundred (100) truck load transported each day during a twelve-hour (7am-7pm day).
  - Requesting clarification on traffic regulation at Brunswick/Whispering Pines (Absence of light signal) posing a safety issue with semi-truck crossing traffic every eight (8) minutes. Further, no requirement for signal at Idaho Maryland/Centennial which commuters may use as an alternate egress from business park due to traffic on Whispering Pines/Brunswick intersection.
  - With current traffic congestion posing access issues, how will this project affect emergency access to the public and emergency services?

**Grp 15-8**

- **Habitat and Contaminants**
  - The Centennial site requires remediation of contaminants. Report does not address removal and extent of rock refining and levels of contaminants in the tailings being disposed at the Centennial site, rain runoff on the adjacent waterway and resulting impact on lakes and communities downstream.

**Grp 15-9**

- What determined the amount set for the restoration bond and is it adequate to accommodate future site restoration to a natural, healthy state? The report does not address specific restoration levels required.

**Grp 15-10**

- **Noise**
  - Insufficient study of noise levels created with project – 24- hour operation
    - Noise from trucks and machinery loading and unloading tailings
    - Truck noise on Brunswick and adjacent roadways
    - Insufficient data as study reflects noise decibel levels lower than results of ambient noise from Brunswick in adjacent neighborhoods prior to the Idaho Maryland Mine re-opening.

**Grp 15-11**

- **Electricity/alternate Power**
  - The County is calling for a decrease in electricity usage. The report does not address electricity consumption and ability to work within the reduced guidelines or impact of alternative energy on noise levels.

**Grp 15-12**

Housing and workforce supply are not topics addressed in the Environmental Impact Report, yet the Association of REALTORS encourages the County to ensure that they are included under further study in the Economic Impact Report. We thank you for hearing our request for further information.

Sincerely,

Kathleen Hinman

Kathleen Hinman, RCE
The Nevada County Association of REALTORS

## GROUP LETTER 15: KATHLEEN HINMAN, NEVADA COUNTY ASSOCIATION OF REALTORS

### Response to Comment Grp 15-1
The comment is introductory and does not address the adequacy of the DEIR. Please see the below responses to comments.

### Response to Comment Grp 15-2
Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Grp 15-3
The commenter's reference to ground movement is somewhat unclear but appears to concern subsidence due to groundwater pumping. Please refer to Master Response 29 – Near Surface Workings and Subsidence.

### Response to Comment Grp 15-4
As stated on page 2 of the Water Supply Assessment for the project (Appendix N), the projected potable and non-potable water demand for building of the proposed project totals approximately 121 acre-feet per year. The project is expected to be a net producer of water through its discharge of approximately 1,371 acre-feet per year of treated mine water to the South Fork of Wolf Creek. The Nevada Irrigation District (NID) could adjust its flows upstream to use the extra water available downstream if it desired to. Customers of such water would be within the purview of NID.

### Response to Comment Grp 15-5
Please see Master Response 35 – Discharge to South Fork Wolf Creek.

### Response to Comment Grp 15-6
Please see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

### Response to Comment Grp 15-7
The commenter asserts that the DEIR inadequately studies traffic effects along Brunswick Road with 300 employees and 100 trucks. This is incorrect. As can be seen in Table 4.12-8 of the DEIR, Project Trip Generation, the project traffic analysis considered the traffic effects of employee and haul truck trips on the surrounding roadways, including Brunswick Road (i.e., Brunswick is study roadway segment). Other study roadways include E. Bennett Road and SR 174.

As indicated in Tables 4.12-10 and 4.12-11 of Chapter 4.12, the Brunswick Road/Whispering Pines Lane intersection would operate acceptable with the addition of project traffic.

Regarding the Idaho-Maryland/Centennial Drive intersection, page 4.12-66 of the DEIR states the following:

> Signalization will improve the Idaho-Maryland/Centennial Drive intersection to LOS D. This intersection is identified to be signalized in the City of Grass Valley

> GVTIF. Under EPAP Plus Project (Scenario #1), the project is expected to add 18 additional vehicles through the intersection during the 3:30 to 4:30 PM time period, and under EPAP Plus Project (Scenario #2), the project would add 15 additional vehicles. Mitigation Measure 4.12-1(b) requires the applicant to pay the GVTIF to the City of Grass Valley, given that the needed intersection improvement is included in the City's TIF. Thus, payment of the GVTIF would reduce the impact to a *less-than-significant* level.

Potential project effects on emergency access is addressed in Chapter 4.13, Wildfire. Please also see Master Responses 4 and 5.

## Response to Comment Grp 15-8

Regarding cleanup of the Centennial Industrial Site, please see Master Response 4 – Cleanup Project is a Separate Project Under CEQA. Regarding water quality effects of engineered fill placement at the Centennial Industrial Site, please see Master Response 8 – Mine Waste Characterization.

## Response to Comment Grp 15-9

The comment is somewhat unclear but the following response is offered. A final assurance cost estimate will be required annually pursuant to SMARA and the County Code that will estimate the cost of reclamation based on existing surface disturbance. Once concurrence with this estimate is received from the County and Department of Conservation, Division of Mine Reclamation, the application will be required to post a financial assurance mechanism (FAM) in the estimated amount.

## Response to Comment Grp 15-10

Regarding the commenter's noise concerns, please see Response to Comment Grp 21-129 through 21-131.

## Response to Comment Grp 15-11

Energy is addressed in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy. The reference to "reduced guidelines" is unclear. Nevertheless, in an attempt to provide information that may be helpful, please see Master Response 25 – Nevada County Energy Action Plan.

## Response to Comment Grp 15-12

The commenter's concerns related to housing and workforce supply are outside the scope of CEQA, but noted for the record. Please see Master Response 1.

**Group Letter 16**

Nevada County Planning Department
Mr. Matt Kelley, Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902
(530) 265-1423

Dear Mr. Kelley,

On behalf of the volunteer members of the Nevada County Chapter of Citizens' Climate Lobby/Education (CCL), please accept our comments to the Draft Environmental Impact Report (DEIR) for the Rise Gold Mine Project.

**Grp 16-1**

Our volunteer membership seeks to inform community members about ways to address climate change. Given the enormous amount of Greenhouse Gas emissions that could be produced by the Rise Gold Mine Project, the members authorized our submission of comments to the DEIR. You will find our comments in the separate 11-page document enclosed.

Thank you for your assistance to the Board of Supervisors and the Planning Commission of Nevada County. Your public service is an invaluable asset to the citizens of Nevada County.

Best Regards,

David J. Whitehead, PE

**Draft DEIR Comments submitted by David J. Whitehead, PE, 100 Bawden Ave, Grass Valley CA 95045**

**Table 2.1 Page 2-23**

**Grp 16-2**

The Summary of Impacts and Mitigation Measures, Item 4.3-7(b) states " Rise shall retire carbon offsets equaling 2,664 MT CO2e, which was calculated by subtracting 1,100 MT CO2e (threshold) from the construction emissions generated by the project." However, in Table 4.3-23, the Total Annual Emissions (GHGs) generated during construction is calculated to be 3,444.55 MT CO2e. Subtracting the proposed threshold of 1100 MT CO2e from that figure would result in 2,344.55 MT CO2e, not 2664 MT CO2e. The value in Table 2.1 is approximately 320 MT CO2e greater than the value shown Table 4.3-23. It is not clear what accounts for this discrepancy, but it is noteworthy that the estimated values in the tables are presented as having a high degree of precision that is probably not justified by the underlying quality of the data.

**Grp 16-3**

In the section titled "Method of Analysis" (page 4.3-44), it is stated that using a construction start date of January 2021 "provides a conservative approach to the emissions analysis…because the existing regulations will ensure that emissions from construction equipment and vehicles during future years will be less intense than identical activities undertaken at the present time. Likewise, …if the same construction activities were to be spread over a longer period (i.e., a period in excess of 12 months), the amount of overlap of equipment usage would be reduced, which would result in reduced max daily and annual emissions." This statement reveals a misunderstanding of the cumulative nature of GHG emissions that underlies the discussion of GHGs. In an effort to portray their GHG emissions as less than significant in relation to the local air management district's significance criterion of 1,100 tons per year, Rise has presented their emissions estimates as though the date the project begins, or the schedule of construction and operation, make any difference. In fact, GHG emissions are unlike other pollutant emissions where concentration or intensity over time may have meaning. GHG emissions do not depend on a dose:effect relationship.

The effects of GHG emissions from the project will not be felt locally; they will impact the entire world. All of the sources of emissions around the world contribute to global warming and to other serious threats to life on Earth. Any GHG emissions above zero are potentially significant because carbon dioxide accumulates for many years in the atmosphere, incrementally contributing to global warming. If GHG emissions only warmed the atmosphere of Nevada County, then the approach taken in the DEIR would make sense. But that is not how GHG emissions affect the environment. Just as Nevada County will experience rising temperatures, weather extremes, threats to forest health, increased threats from wildfires, and changes in plant and animal populations in coming years because of the cumulative effects of GHG emissions from the multitude of sources that have been contributing to global warming over many decades, so the GHG emissions from the proposed project will contribute to the continuing threat of global warming for the life of the project. It does not matter that these emissions occur in January or

June, or that they occur over one year or two years, or that they are due to construction or operation, or even that they occur in Nevada County instead of Los Angeles County. What matters is the total amount of additional emissions that will occur and the amount of time that the carbon dioxide remains in the atmosphere.

**Grp 16-4**

The residence time of CO2 in the atmosphere, by the way, is between 300 and 1,000 years, much longer than the 80 year estimated life of the project. Carbon dioxide is removed from the atmosphere relatively slowly, by plant respiration, solution in sea water, by interaction with certain minerals, and by dissipation into space. Absorption of CO2 by seawater presents an additional existential threat to life on Earth because it results in acidification of sea water, and interferes with removal of CO2 by algae, and the growth of organisms that rely on calcium carbonate. Global warming is not the only global threat posed by continued increases in GHG emissions. Ocean acidification may be an even greater concern than global warming, but both are caused by the continued burning of fossil fuels. That is why Californians have decided to work so hard at finding ways to reduce their emissions of GHGs. It is not that California alone will benefit from these reductions. It is because Californians have decided to chip in and do their share to lead the nation in reducing their emissions, to find new ways to remove carbon dioxide from the atmosphere, and to help persuade the rest of the world to follow our lead. The DEIR alludes to the fact that vehicle emissions standards are expected to become more stringent in future years. Unfortunately, the preparers of the DEIR see this as a reason why they should not be concerned about their own emissions, instead of seeing it as a clear indication that their emissions will be an increasing concern.

In failing to recognize and treat GHG emissions seriously, the discussion of GHG emissions in the DEIR fails its most basic purpose, which is to correctly identify the environmental impacts of the project and to identify and evaluate appropriate mitigation measures to address these impacts. Whether or not the emissions from the project may be considered justified given the possible benefits of the project, the DEIR is inadequate for not properly identifying the impacts of GHG emissions that will result from the project, and for not presenting a full range of feasible measures to mitigate those impacts.

**Grp 16-5**

Needless to say, the preparers of the DEIR should review their calculations of GHG emissions and correct any additional errors. Further, the DEIR should present estimated values with an appropriate level of precision (a value of 2,344.55 MT CO2e may look accurate, but in reality, it may only be accurate to one or two significant figures). Such estimates would be more honestly presented along with some discussion of the sources and magnitudes of uncertainty in the estimates. The estimates should not focus on precise estimates of the fuel efficiency of the trucks to be used in the project, but on the uncertainty in the number of miles, number of vehicles, origination locations of the trucks, effects of weather conditions on the estimates, and perhaps most important, whether some items that have carbon footprints have been ignored in the analysis.

**Grp 16-6**

This project relies on materials that themselves have carbon footprints that will potentially impact the total GHG emissions of the project. These include, but are not limited to building materials, including concrete, steel, and paving materials. While the DEIR quibbles over the technicality of whether they will exceed an Air Management District significance threshold, presenting their estimates as accurate to six significant figures, they have entirely forgotten the cost in GHG emissions of producing the building materials needed for the project.

**Chapter 4.3 Page 4.3-43**

After a brief discussion of established GHG emission thresholds in adjacent Air Quality Management Districts, and noting that Nevada County has not established any thresholds for such emissions, the DEIR makes the following statement:

"For a conservative evaluation, the SMAQMD 1,100 MT CO2e per year construction GHG threshold has been applied to project construction. For operations, because the project is an industrial project that includes stationary sources (i.e., diesel generators used for emergency power), the project's GHG emissions were compared to the 10,000 MT CO2e per year quantitative threshold, which, as described above, is used by SMAQMD, PCAPCD, BAAQMD, and SCAQMD for industrial and/or stationary source emissions of GHGs. The substantial evidence for this GHG emissions threshold is based on the expert opinion of various California air districts, which have applied the 10,000 MT CO2e per year threshold in numerous CEQA documents where those air districts are the lead agency."

**Grp 16-7**

The DEIR claims that the consultant has made a "conservative evaluation", and yet has omitted GHG estimates for the production of concrete, paving asphalt, steel, and other building materials to be used in the construction period. These omissions result in an incomplete and unscientific calculation of GHG production, and indicate that the consultant has set a goal for its analysis to stay below the identified thresholds, rather than take a truly scientific and conservative approach to estimating GHG production of the project, letting "the chips fall as they may." The result is an incomplete description of the project to the public. The consultant should recalculate GHG production for the entire project scope, with the purpose of including all sources of GHG production for the project, both direct and indirect.

The proposal to utilize thresholds of other air districts in California does not necessarily mean that, should Nevada County decide to accept this approach, Nevada County will satisfy its duty to the public to thoroughly evaluate harmful environmental impacts and determine their significance. In fact, as Lead Agency, Nevada County may, and should, require that the DEIR make a more thorough analysis of GHG emission impacts. We recommend that Nevada County take an approach that recognizes the ever-increasing threats of climate change and GHG emission contributions to climate change, in view of the State of California's goals to address climate change impacts.

**Grp 16-8**

Among these goals is that California should achieve carbon neutrality by 2045 (Executive Order B-55-18). The DEIR correctly mentions that EO B-55-18 calls for CARB to work with relevant state agencies to ensure that future Scoping Plans identify and recommend measures to achieve the carbon neutrality goal, but fails to mention that the next (five year) update of the Scoping Plan is due to be completed in 2022. The general direction of State policy in California has been to set more ambitious climate targets, and to achieve them earlier. Hence, for example, EO N-79-20 sets a goal to end sales of internal combustion passenger vehicles by 2035, as part of the goal to achieve carbon neutrality by 2045. In fact, the FAQ accompanying EO N-79-20 states that "separate rulemaking process and incentives will be needed to address other targets in the Executive Order. This includes more stringent standards for medium- and heavy-duty trucks, and reduced emissions from fossil fuel and electricity production." (https://ww2.arb.ca.gov/resources/fact-sheets/governor-newsoms-zero-emission-2035-executive-order-n-79-20). The DEIR should discuss this direction and, if possible, any foreseeable changes in State policy that may impact the project. While the DEIR mentions that passenger vehicle emission standards will

become more stringent, one of the implications of this change is that stationary and mobile GHG source emissions will need to be reduced. After all, the purpose of making vehicle emissions standards more stringent is not simply to reduce emissions from each source, but to reduce total emissions.

Furthermore, the DEIR proposes to mitigate only the GHG emissions that surpass the thresholds. This approach is not "conservative" at all. If the calculations reveal that the project will surpass the thresholds, then the project is a significant source and all GHG emissions should be mitigated.

**Chapter 4.3 Page 4.3-92**

The Rise Grass Valley Inc. proposal to mitigate project generated GHG emissions addresses construction emissions only. The proposal does not mitigate operational GHG emissions, nor indirectly caused GHG emissions generated by second-tier activities (i.e. purchase of concrete, paving asphalt, etc.) Furthermore, the DEIR does not estimate total CO2e emitted by the proposed project over its lifetime, which as discussed above, represents the actual cumulative impact of the emissions from the project since CO2 emissions from the project are expected to remain in the atmosphere for more than 300 years. Below is the calculation of total emissions over the course of the project based on information on annual emissions provided in the DEIR:

**Grp 16-9**

**Total Proposed CO2e MT Produced**

| Time Period | Annual Amount | Number of Years | Total CO2e (MT) |
|---|---|---|---|
| 2021 | 3,444.55 | 1 year | 3,444.55 |
| 2022-2026 | 7,221.64 | 5 years | 36,108.20 |
| 2027-2032 | 6,999.63 | 6 years | 41,997.78 |
| 2033-2102 | 9,041.23 | 69 years | 623,844.87 |
| 2103 | 46.09 | 1 year | 46.09 |
| **Total** | | **81 years** | **705,441.49** |

The project is estimated to generate more than 700,000 MT CO2e over its 81 year lifetime, which is equivalent to an average annual rate of emissions from the project of over 8,700 MT CO2e per year. The table above, showing total CO2 emissions illustrates the relatively minor impact that emissions during construction will have on global warming, compared to operational emissions. Given these vast differences in impact, and armed with the knowledge that CO2 resides in the atmosphere for hundreds of years, the DEIR's emphasis on the purchase just 2,444.55 carbon offset credits to mitigate the GHG emissions from the project might appear to the reader of the DEIR to be absurd, since this represents just 0.35 percent of the total GHG impact of the project.

**Grp 16-10**

Presumably, the rate at which the project produces GHG emissions will depend on a number of variables affecting mining operations, including the price of gold, subsurface conditions, and other factors that are difficult to accurately predict. The price of gold is likely to fluctuate over time, and activity at the project site will likely fluctuate as well. As a result, it seems reasonable to expect that the rate of GHG emissions may vary also. On page 4.3-50, the DEIR states that "the principal variation in operational activities over the lifetime of the project is the fate of non-gold bearing mined material that could be used as fill material." Is this an accurate statement? Or do external economic factors, such as the price of gold, have a bigger potential to impact operations? It should be noted that in the period between 1975 and 2022 the price of gold ranged from about $150/ounce to over $2,000/ounce. But during this time, there were a number of large fluctuations in price. The DEIR does not discuss the dependence of operational intensity on such factors, and gives the impression that the activities will occur at the same dependable steady rate for the life of the project. If this is not a reasonable expectation, the DEIR should discuss the potential for fluctuations in activity, including the relationship between operational activity and gold price, since among other things, these fluctuations may impact the rate of GHG emissions.

**Grp 16-11**

**Page 4.3 -96-99 Carbon Offsets - Construction Emissions**

The Nevada County Chapter of CCL supports carbon pricing as a means of reducing demand for fossil fuels and increasing demand for alternative sources of energy, because the cost of producing energy from fossil fuels does not adequately reflect the hidden environmental costs of GHG emissions. Although Carbon Offsets are not designed to reduce GHG emissions, we recognize that Carbon Offsets can be an effective interim measure to prevent new sources of GHG emissions from increasing the amount of CO2e in the atmosphere. Unfortunately, the project as currently proposed would only offset a tiny percentage of the emissions it produces. According to the California Climate Investment 2021 Annual Report, the cost of carbon offsets in 2020 was $125/MT CO2e, and the market price of Carbon Offsets is expected to continue to increase over time. This price is one measure of the true cost of emitting one ton of CO2, because it represents the cost of removing one ton of CO2 from the atmosphere by other means. Of course, not emitting the CO2 in the first place, by using an alternative source of energy or by increasing energy efficiency, would be preferable, but is not always feasible at the present time. The State's goal of achieving carbon neutrality (also known as Net Zero) by 2045 means that by 2045 the State would contribute, including offsets, the equivalent of no GHG emissions. Of course, any GHGs emitted before reaching Net Zero would continue to contribute to global warming. If Rise Gold does not mitigate the approximately 700,000 MT CO2e that the project would emit, then in order to achieve Net Zero, the people of the State will need to offset Rise Gold's GHG emissions through other means, such as developing alternative energy sources, reducing energy use, increasing energy efficiency, and developing carbon removal technologies. In effect, the people of California will need to subsidize the project to the tune of $125/MT CO2e at the current price of offsets. The cost to the public today of this subsidy to Rise Gold would be approximately $88 million, or roughly the value of 44,000 ounces of gold at current prices. This cost is likely to increase as the project proceeds. The question that should be asked is whether this is a good use of public money, and whether the project itself should bear this cost.

**4.3-7(b) Carbon Offsets – Construction Emissions.**

The discussion of "Carbon Offset Standards – Eligible Registries, Acceptable Protocols and Defined Terms" does not mention the State of California Cap and Trade program. By proposing to set standards for carbon offsets, the DEIR apparently would allow carbon offsets of any kind from any place in the world, as long as the carbon offsets could be evaluated to meet the proposed standards. The DEIR states that "Qualifying carbon offsets presented for compliance with this mitigation measure may be used provided that the evidence required by the "Reporting and Enforcement Standards" below is submitted to the County."

This proposal ignores the suite of projects that make up the California Cap and Trade program. Because the carbon emissions generated by the project occur in California, and impact California's citizens, the carbon offsets purchased by Rise Gold should be California Cap and Trade program offsets, not cheaper and less effective offsets from some other state or foreign country.

**Grp 16-12**

Such a mitigation measure risks harming Nevada County by undermining our ability to reduce or to eliminate GHG emissions. It also undermines the ability of Nevada County to participate in GHG emissions reductions plans of the State of California and the USA. If many jurisdictions in California approve projects that create new GHG emissions, and take the approach of the DEIR, California will not be able to reduce GHG emissions sufficiently to actually be effective in combating climate change.

Therefore, the proposed mitigation measure should be strengthened. The proposed mitigation measure should require Rise Gold to purchase California Cap and Trade program carbon offsets exclusively.

Also, the mitigation measure should include a requirement for Rise Gold to submit plans outlining how they will achieve Net Zero GHG emissions by 2045, the State of California goal, or sooner. The 80 year life of the proposed project permit extends far beyond the timeline for global Net Zero goals, and so is inconsistent with strategies established by the State of California.

The proposed Carbon Offset mitigation measure cannot reduce the cumulative impacts of this proposed project with regard to its GHG creation, both direct and indirect, construction and operational, for an 80 year permit. The significance level will not be reduced from CC to LCC. Therefore, the mitigation measure is inadequate.

**Page 4.3-101 Cumulative Analysis**

No cumulative analysis of GHG emissions for the Rise Gold project in the context of the atmosphere of the State of California is presented in the DEIR. All that the DEIR provides the public is a general discussion regarding twenty projects within Nevada County and the following statement:

**Grp 16-13**

"Based on the above considerations, the proposed project would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Consequently, the project's impact is less than cumulatively considerable."

However, the proposed project conflicts with AB32 and the State of California Climate Scoping Plan because the project is estimated to produce over 700,000 MT CO2e which will cumulatively impact the global and California climates in combination with other known or reasonably foreseeable projects.

**Page 5.2 Section 5.2 Cumulative Impacts**

No identification of cumulative impacts of GHG emissions is presented in the DEIR.

In California Supreme Court case S217763 Center for Biological Diversity v. California Department of Fish and Wildlife; Newhall Land and Farming, the question was asked: "Does the Environmental Impact Report validly determine the development would not significantly impact the environment by its discharge of greenhouse gases?" Although the court found that the Lead Agency may rely upon numerical thresholds of significance for greenhouse gas emissions, "use of such thresholds is not required." The Court went on to advise that "Thresholds only define the level at which an environmental effect 'normally' is considered significant; they do not relieve the Lead Agency from its duty to determine the significance of the impact independently."

**Grp 16-14**

Nevada County, as Lead Agency, has a duty to the public to independently determine the impact of the Rise Gold project in generating over 700,000 MT CO2e over 81 years of construction, operations, and reclamation. That duty includes recognition of Nevada County's responsibility to reduce GHG emissions within the context of the State of California's goals under AB32, the updated Climate Scoping Plan, and EO B-55-18, among other goals and policies. The DEIR fails to address the cumulative impacts of generating over 700,000 MT CO2e in terms of the additive contribution to worsening the impacts of climate change on the State of California.

The DEIR should be revised to include a thorough cumulative impact analysis. This analysis should describe to the public how the Rise Gold project would impact the State of California as it attempts to reduce GHG production over the next 80 years.

**Page 5.7 Table 5-2 Cumulative Geographic Scope by CEQA Topic**

For Air Quality/Greenhouse Gas Emissions, the DEIR states that "the geographical context for global climate change is limited to the State of California." The DEIR also states that "at this time, neither the NSAQMD nor the County has adopted numerical thresholds of significance for GHG emissions that would apply to the project."

**Grp 16-15**

Despite the lack of applicable numerical thresholds of significance, the DEIR then identifies significance thresholds that have been developed by several air quality management agencies, including the Sacramento Metropolitan Air Quality Management District (SMAQMD), the Placer County Air Pollution Control District (PCAPCD), the Bay Area Air Quality Management District (BAAQMD), and the South Coast Air Quality Management District (SCAQMD). Although these agencies have adopted similar significance thresholds, each jurisdiction's limits and rationales differ somewhat. Since none of these significance thresholds is applicable to the project, they provide no more than guidance to the Rise Gold project EIR and Nevada County is free to set significance thresholds of its own, based on other, possibly more appropriate criteria.

Examination of the supporting documents for the various Air Management Districts' significance thresholds reveals plenty of leeway for Nevada County to adopt a more appropriate significance threshold than the ones presented in the DEIR, such as a zero net GHG emission threshold, or a single 1,100 MT CO2e per year threshold, consistent with the screening threshold used by the SMAQMD following the California Supreme Court decision in Center for Biological Diversity v. California Department of Fish and Wildlife; Newhall Land and Farming in 2016.

The SCAQMD's Draft Guidance Document – Interim CEQA Greenhouse Gas (GHG Significance Threshold, (October 2008), provides a detailed explanation of the origins and rationales for the SCAQMD's significance thresholds. The Draft Guidance Document cites a White Paper on Global Climate Change prepared by the Association of Environmental Professionals in 2007 that identified eight approaches it suggested that a Lead Agency may select in a CEQA document to address potential impacts of global climate change and a project's cumulative contribution to GHG. The only one that included a significance threshold was Approach 6, which would use zero net carbon dioxide equivalent increase as the threshold (http://www.aqmd.gov/docs/default-source/ceqa/handbook/greenhouse-gases-(ghg)-ceqa-significance-thresholds/ghgattachmente.pdf ).

Shortly after, the California Air Pollution Control Officers Association (CAPCOA) prepared a White Paper: CEQA and Climate Change, in which three basic approaches were identified: including a zero GHG emissions threshold; and two non-zero threshold variations. The SCAQMD opted to adopt one of the non-zero threshold approaches rather than a net zero approach, but the basis for this choice was that the threshold was consistent with the goal of EO S-3-05 to reduce GHG emissions to a level 80 percent below 1990 levels or 90 percent below current (2008) levels by 2050. We now have not only a better understanding of the threats posed by global warming, but the State of California has decided to embark on a more ambitious path to addressing these threats by setting a goal of achieving net zero by 2045. Perhaps it is time to set significance thresholds lower as well.

In June 2020, the SMAQMD prepared "Greenhouse Gas Thresholds for Sacramento County" which discusses the development and rationales for its own GHG significance thresholds. In this document, SMAQMD explains that to assist lead agencies in determining significance, in October 2014 it adopted the current GHG thresholds of significance which include a construction threshold of 1,100 MT GHG/year, a land use operational threshold of 1,100 MT GHG/year, and a stationary source operational threshold of 10,000 MT GHG/year: (https://www.airquality.org/LandUseTransportation/Documents/SMAQMDGHGThresholds2020-03-04v2.pdf ).

The document further explains that following the California Supreme Court decision in Center for Biological Diversity v. California Department of Fish and Wildlife and Newhall Land and Farming in January 2016, SMAQMD recommended suspending the thresholds for operational emissions, leaving only a 1,100 MT GHG/year screening threshold and the need to demonstrate all feasible mitigation for projects exceeding this threshold. SMAQMD then encouraged local agencies (in Sacramento County) to develop a Climate Action Plan (CAP) or GHG reduction plan "that could be used by the local agency to reduce GHG emissions and streamline CEQA review for development projects which can provide

adequate mitigation for GHG impacts by demonstrating consistency with the reduction measures adopted in the CAP." Thus, even within Sacramento County, SMAQMD recognizes that individual local agencies should be able to set their own significance thresholds for evaluation of CEQA projects.

To illustrate the increasing concerns about the State's ability to meet the goals of Executive Order B-55-18 (Carbon Neutrality), SMAQMD notes that "in January 2019, CARB held a workshop regarding carbon neutrality in California, during which CARB staff explained that the definitional parameters and meaning of the term – carbon neutrality – are still being explored. CARB intends to hold additional workshops to explore specific topics related to the pursuit of carbon neutrality, engage with other experts in the field and stakeholders, and conduct research to ensure than any path to carbon neutrality balances scientific, economic and social justice principles."

In 2018 the California Natural Resources Agency (CNRA) finalized its updated "CEQA Guidelines Amendments" document. The guidelines include the following (underlines added for emphasis):

1. Lead agencies must analyze the GHG emissions of proposed projects.
2. The focus of the lead agency's analysis should be on the project's incremental contribution to climate change, rather than simply focusing on the quantity of emissions and how that quantity of emissions compares to statewide or global emissions.
3. The impacts analysis of GHG emissions is global in nature and thus should be considered in a broader context. A project's incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national, or global emissions.
4. Lead agencies should consider a timeframe for the analysis that is appropriate for the project.
5. A lead agency's analysis must reasonably reflect evolving scientific knowledge and state regulatory schemes.
6. Lead agencies may rely on plans prepared pursuant to section 15183.5 (Plans for the Reduction of Greenhouse Gases) in evaluating a project's GHG emissions.
7. In determining the significance of a project's impacts, the lead agency may consider a project's consistency with the State's long-term climate goals or strategies, provided that substantial evidence supports the agency's analysis of how those goals or strategies address the project's incremental contribution to climate change and its conclusion that the project's incremental contribution is consistent with those plans, goals, or strategies.
8. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change.

Given the increasing risk that California, the US, and the world, may fail to achieve the reductions in GHG emissions necessary to forestall catastrophic global warming, it seems incumbent upon agencies to recognize the need to mitigate as many GHG emissions as feasible. Ignoring the incremental effects of the GHG emissions from the Rise Gold project simply because "operational" GHG emissions are treated differently from emissions from other types of sources conflicts with several of CNRA's guidelines listed above, and especially with the fifth item: "A lead agency's analysis must reasonably reflect evolving scientific knowledge and state regulatory schemes."

**Grp 16-16**

For the reasons discussed above, the appropriate significance threshold for GHG emissions from the Rise Gold project is a Zero Threshold. In effect, this was the threshold ultimately adopted in the Settlement following the State Supreme Court's decision in California Supreme Court case S217763 Center for Biological Diversity v. California Department of Fish and Wildlife; Newhall Land and Farming.

Even if a significance threshold of 10,000 MT CO2e per year for "operational" GHG emissions is adopted by Nevada County in the DEIR, and the estimates provided in the DEIR are accepted as reasonable, given the uncertainties associated with the assumptions of the analysis, the uncounted GHG contributions associated with the production of the building materials that will be used in the project, and the chance that unforeseen conditions that may be encountered during the project will increase the actual GHG emissions, nominal annual operational emissions of 9,000 MT CO2e per year should probably be considered close enough to 10,000 MT CO2e per year to warrant full mitigation. Nevada County has a responsibility to help California achieve its goal of net carbon neutrality by 2045, to the extent feasible, by not adding the additional burden of this project on the backs of the citizens of California.

## GROUP LETTER 16: DAVID WHITEHEAD, NEVADA COUNTY CHAPTER OF CITIZENS' CLIMATE LOBBY/EDUCATION (CCL)

### Response to Comment Grp 16-1

The County acknowledges the comment as an introduction to comments that follow. This comment is included in the Final EIR for review and consideration by the decision-makers prior to a final decision on the project. Comment noted.

### Response to Comment Grp 16-2

The commenter has identified a transcription error in the summary Table 2-1 of the DEIR. This error is a typo and does not affect the impact analysis. Table 2-1, Mitigation Measure 4.3-7(b), page 2-23 of the DEIR, is hereby revised as follows:

> *4.3-7(b)* ***Carbon Offsets – Construction Emissions.***
>
> *Rise Grass Valley Inc. (Rise) shall retire carbon offsets in a quantity sufficient to offset the project's construction greenhouse gas (GHG) emissions to below the 1,100 metric ton carbon dioxide equivalent (MT $CO_2e$) per year construction threshold, consistent with the performance standards and requirements set forth below. Specifically, prior to Nevada County's (County) issuance of the project's first grading permit, Rise shall retire carbon offsets equaling ~~2,664~~ 2,345 MT $CO_2e$, which was calculated by subtracting 1,100 MT $CO_2e$ (threshold) from the construction emissions generated by the project.*

The 2,345 MT $CO_2e$ carbon offset value is already correctly calculated at 2,345 metric tons on page 85 of Appendix E.1 and for Mitigation Measure 4.3-7(b), as presented in Chapter 4.3 of the DEIR. This has been corrected in the Final EIR, as shown above. Contrary to the commenter's assertion, an editorial error does not cast aspersion on the underlying quality of the data.

### Response to Comment Grp 16-3

The commenter asserts that the DEIR presents a misunderstanding regarding the cumulative nature of GHGs and intimates that any GHGs above zero should be considered potentially significant. Firstly, the statement quoted by the commenter is not in reference to the global nature of GHGs, but rather the regulatory required improvements in engines and associated reduction in emissions in future years. Regarding the cumulative nature of GHGs, the DEIR already acknowledges the potential impacts on a global, statewide, and Sierra Nevada regional scale from GHGs (see "Potential Effects of Climate Change" starting on page 4.3-15 of the DEIR). Global climate change is a cumulative impact; a project participates in this potential impact through its incremental contribution combined with the cumulative increase of all other sources of GHGs. However, regarding the commenter's assertion that any project that results in GHGs above net zero should be considered significant is inconsistent with the statewide guidance. As described in the DEIR on page 4.3-29:

> The 2017 Scoping Plan further provides that "the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA."

The lead agency has determined that the threshold of significance for the project is 1,100 MT $CO_2e$ per year for construction and 10,000 MT $CO_2e$ per year for operations, based on substantial evidence provided in the DEIR (please see Master Response 27 – GHG Thresholds). These thresholds are the metric used to determine if the project results in a substantial contribution to the cumulative GHG impact. Given that the project would result in GHG emissions below the

applied construction threshold (after mitigation) and below the applied operational threshold (no mitigation required), and because the project would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, the project would not result in a cumulatively considerable GHG impact.

## Response to Comment Grp 16-4

The commenter asserts that the DEIR is inadequate for not properly identifying the impacts of GHG emissions that will result from the project, and for not presenting a full range of feasible measures to mitigate those impacts. Notably, the GHG emissions presented in the DEIR are conservative, given that California regulations will reduce GHG emissions over time. For instance, Senate Bill 100 requires that zero carbon energy resources supply 100% of electric retail sales to customers by 2045. Neither this requirement, nor the progressive steps to achieve it (i.e., 44% of electricity by 2024, 52% by 2027, and 60% by 2030 be procured from renewable energy sources) were accounted for in the GHG analysis. Further, the lead agency has determined that the threshold of significance for the project is 1,100 MT $CO_2$e per year for construction and 10,000 MT $CO_2$e per year for operations, based on substantial evidence provided in the DEIR (please see Master Response 27 – GHG Thresholds). These thresholds are based on annual GHG emissions, rather than life cycle emissions of a project, which the commenter suggests the project's impacts should have been evaluated on. However, life cycle emissions are not required to be assessed under CEQA (please see Master Response 26 – Life Cycle GHG Emissions). Given that the project would result in GHG emissions during construction that would exceed the applied threshold of 1,100 MT $CO_2$e per year, mitigation has been applied to reduce emissions to a less than significant level. For operations, the GHG emissions do not exceed the applied threshold during any of the years of activity and therefore, no mitigation was required.

## Response to Comment Grp 16-5

The commenter expresses concerns regarding the implied precision in the GHG emissions estimates presented in the DEIR. CEQA requires a good faith effort to estimate emissions from the project during construction and operation. It is common that granular details, such as exact distances that each truck travels for a project are unknown during the drafting of documents in support of CEQA. As such, estimation of emissions during the construction and operation of the project are based on the best project-specific information and industry-standard emission factors that were available at the time of analysis, as thoroughly described in the "Method of Analysis" of Chapter 4.3 of the DEIR, beginning on page 4.3-44. Changing the number of digits in the presentation of emissions estimates for the report would not change the analysis or conclusions in the DEIR. As stated by California Courts, "The need for thorough discussion and analysis is not to be construed unreasonably… to serve as an easy way of defeating projects. Absolute perfection is not required." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d at p. 406.) As such, the County acknowledges the comment and notes it expresses the opinions of the commenter and does not raise an issue related to the adequacy of any specific section or analysis of the DEIR. The comment has been provided to the decision-makers for their consideration prior to a final decision on the project.

## Response to Comment Grp 16-6

This comment pertains to a "lifecycle" analysis for GHG emissions, which is not required under CEQA. Please see Master Response 26 - Life Cycle GHG emissions.

## Response to Comment Grp 16-7

This comment pertains to a "lifecycle" analysis for GHG emissions, which is not required under CEQA. Please see Master Response 26 - Life Cycle GHG emissions.

## Response to Comment Grp 16-8

The commenter suggests that the County should apply different thresholds than what were used in the analysis and summarizes the ongoing evolution of statewide GHG regulations. In regard to the GHG thresholds applied to the project, please see Master Response 27 - GHG Thresholds. Regarding GHG regulations, the commenter states that the "DEIR should discuss this [regulatory] direction and, if possible, any foreseeable changes in State policy that may impact the project". Statewide GHG regulations are thoroughly discussed in the DEIR beginning on pages 4.3-25 through 4.3-34. The project would not preclude the State from implementing these regulations that would reduce statewide GHG emissions. Rather, the "foreseeable changes in State policy" cited by the commenter, such as California requiring utility providers to supply electricity from 100% renewable sources by 2045, would result in a reduced estimated GHG emissions inventory associated with the project in future years, had they been accounted for in the project analysis. Finally, CEQA does not have a requirement for a project to mitigate beyond the threshold.

## Response to Comment Grp 16-9

This comment pertains to a "lifecycle" analysis for GHG emissions, which is not required under CEQA. Please see also Response to Comment Grp 16-4 above. The commenter also implies that the project should be required to mitigate for operational GHG emissions, even though these emissions were found to be below the applicable CEQA threshold of 10,000 tons per year and were therefore deemed less than significant. CEQA does not require mitigation for impacts that are less than significant. Please see Master Response 27 - Greenhouse Gas Thresholds.

## Response to Comment Grp 16-10

The commenter suggests that economic uncertainty and price of gold will affect the rate of mining. The project's emissions are estimated at the maximum production rate of the project (1,000 tons per day mineralized rock and 500 tons per day of barren rock). Higher production levels, which could result in higher GHG emissions are not proposed by the project and would not be allowed by the conditional use permit. As such, the analysis included in the DEIR presents the maximum reasonably foreseeable GHG emissions scenario. Variability in the price of gold, therefore, cannot result in an increase of GHG impacts from the project.

## Response to Comment Grp 16-11

The commenter suggests that the project should purchase offsets such that the lifetime emissions would be net zero. Notably, the lead agency has determined that the threshold of significance for the project is 1,100 MT $CO_2e$ per year for construction and 10,000 MT $CO_2e$ per year for operations, based on substantial evidence provided in the DEIR (please see Master Response 27 – GHG Thresholds). These thresholds are based on annual GHG emissions, rather than life cycle emissions of a project, which the commenter suggests the project's impacts should have been evaluated on. However, life cycle emissions are not required to be assessed under CEQA (please see Master Response 26 – Life Cycle GHG Emissions). Given that the project would result in GHG emissions during construction that would exceed the applied threshold of 1,100 MT $CO_2e$ per year, mitigation has been applied to reduce emissions to a less than significant level. For operations, the GHG emissions do not exceed the applied threshold during any of the years of activity and therefore, no mitigation was required. CEQA does not have a requirement for a project to mitigate beyond the threshold or to mitigate impacts deemed less than significant.

In addition, the project GHG inventory in the DEIR makes conservative assumptions for GHG emissions over the life of the project. As shown in Table 22 of Appendix E.1, for the Year 2033 to 2102 Scenario, PG&E supplied electricity makes up the majority (51%) of GHG emissions from the project at 4,636 metric tons. GHG emissions from electricity are calculated based on an

intensity factor of 204 pounds per MWh. These values will decrease over time due to the Renewable Portfolio Standard but were used for all scenarios as a conservative estimate (see page 347 of Appendix E.1). "On-road vehicles – Off-Site" makes up a large part (35%) of GHG emissions from the project at 3,123 metric tons. These emissions are primarily generated by haul trucks which are assumed to deliver engineered fill at an average distance of 60 miles (see page 246 of Appendix E.1). As heavy trucks and passenger vehicles are eventually transitioned to battery-electric vehicles, these emissions will likely be less than assumed in future years.

## Response to Comment Grp 16-12

The commenter states that the project should exclusively use Cap-and-Trade compliance offsets. However, the project would not be a covered entity under the State's Cap-and-Trade program, as described in the California Air Resources Board's *Cap-and-Trade Instructional Guidance* (2012):

> Starting in 2012, major GHG-emitting sources, such as electricity generation (including imports), and large stationary sources (e.g., refineries, cement production facilities, oil and gas production facilities, glass manufacturing facilities, and food processing plants) that emit more than 25,000 MT $CO_2e$ per year will have to comply with the Cap-and-Trade Program. The program expands in 2015 to include fuel distributors (natural gas and propane fuel providers and transportation fuel providers) to address emissions from transportation fuels, and from combustion of other fossil fuels not directly covered at large sources in the program's initial phase.

(https://ww2.arb.ca.gov/sites/default/files/cap-and-trade/guidance/chapter1.pdf.) In addition, per the California Air Resources Board's *Draft 2022 Scoping Plan, Appendix D – Local Actions*:

> Over the years, agencies and courts have provided direction and guidance regarding GHG mitigation. Nevertheless, given the variety of potential projects and mitigation scenarios, some uncertainty and misconceptions persist. For example, when lead agencies consider offsite GHG mitigation (including offsets), they may sometimes conflate the requirements for compliance-grade offsets in California's Cap-and-Trade regulation with the requirements for GHG mitigation measures under CEQA. The Cap-and-Trade regulation requires that compliance offsets meet certain regulatory criteria, which specify that compliance offsets must be real, additional, quantifiable, permanent, verifiable, and enforceable. In general, the State's Cap-and-Trade Program restricts compliance offsets from being used for any purpose other than Cap-and-Trade compliance, including being used as mitigation under CEQA [emphasis added].

The project does not emit 10,000 MT of $CO_2e$ per year and is not subject to the Mandatory Reporting Regulation since it does not result in more than 25,000 MT MT $CO_2e$ per year. See CARB regulations for the mandatory reporting of GHG emissions on page 4.3-29 of the DEIR. The project is not a covered entity under Cap-and-Trade, and therefore Cap-and-Trade offsets cannot be used as mitigation for the project.

In addition, Mitigation Measure 4.3-7(b) specifies the requirements for carbon credits be real, additional, quantifiable, permanent, verifiable, and enforceable and does not allow "carbon offsets of any kind from any place in the world", as suggested by the commenter. Please see also Response to Comment Grp 16-11 above, which pertains to the commenter's assertion that the project should purchase offsets such that the lifetime emissions would be net zero. In addition, please see Master Response 28 - Greenhouse Gas Credits regarding the validity of mitigation requirements for carbon offsets.

## Response to Comment Grp 16-13

The commenter asserts that the DEIR does not discuss cumulative GHG impacts. However, as GHGs are definitionally only a cumulative impact, the assessment included in the DEIR is a cumulative analysis. This topic is addressed above in Response to Comment Grp 16-3.

## Response to Comment Grp 16-14

The commenter asserts that the DEIR does not discuss cumulative GHG impacts. This topic is addressed above in Responses to Comments Grp 16-3 and Grp 16-13.

## Response to Comment Grp 16-15

The lead agency has determined that the appropriate threshold of significance for the project is 1,100 MT CO2e per year construction and 10,000 MT CO2e per year for operations. Please see Master Response 27 - GHG Thresholds.

The CEQA Guidelines do not prescribe specific methodologies for performing an assessment, do not establish specific quantitative thresholds of significance, and do not mandate specific mitigation measures. Rather, the CEQA Guidelines emphasize the lead agency's discretion to determine the appropriate methodologies and thresholds of significance consistent with the manner in which other impact areas are handled in CEQA (CNRA 2009). In summary, the County has discretion on how to evaluate the significance of GHG emissions under CEQA and could rely on other adopted thresholds if substantial evidence is provided, as explained in Section 3.4, Significance Criteria and Methodology, in the Air Quality and GHG Emissions Technical Report.

The commenter emphasizes the importance of conducting analyses that reflect evolving scientific knowledge and regulatory schemes. Notably, the commenter does not specify how the analysis does not reflect evolving scientific knowledge or regulatory schemes. However, for additional substantiation of the GHG approach to analysis in the DEIR, the CARB 2022 Draft Scoping Plan, which was released in May 2022 after the publication of the DEIR, as well as the project's NOP, is briefly discussed herein.

First, the Draft 2022 Scoping Plan provides the blueprint for how California can achieve carbon neutrality by 2045 or earlier. Even with ambitious and aggressive strategies to reduce anthropogenic sources of GHG emissions, achieving carbon neutrality is not accomplished in the state by reducing all sources of GHG emissions to zero. Instead, some sources, such as the industrial, agriculture/recycling/waste and electricity generation sectors, are anticipated to continue to generate GHG emissions to support California's growing economy and provide services, such as energy production and transmission, to the state (See Figures 2-1 and 2-5)[6]. As the state's GHG emissions inventory is anticipated to be greater than zero, addressing the residual GHG emissions (i.e., the gap in GHG emissions between non-zero and zero) are anticipated to be achieved through carbon capture and storage through natural and working lands and mechanical technologies. In summary, while ambitious strategies must be implemented to achieve carbon neutrality, not all development can or is expected to operate at a net carbon neutral level to support the state in meeting their carbon neutrality goals.

Second, the Draft 2022 Scoping Plan, Appendix D, Local Actions, provides some guidance on evaluating project-level alignment with state climate goals.[7] The first approach that the State recommends for proposed land use developments to demonstrate that they are aligned with State climate goals is based on the attributes of land use development that reduce operational GHG emissions while simultaneously advancing fair housing; however, this approach is not applicable

[6] https://ww2.arb.ca.gov/sites/default/files/2022-05/2022-draft-sp.pdf
[7] https://ww2.arb.ca.gov/sites/default/files/2022-05/2022-draft-sp-appendix-d-local-actions_0.pdf

to the project as it only applies to residential and mixed-use development projects. The second approach CARB outlined is net zero GHG emissions, which they noted may be an appropriate overall objective for new residential development, but this approach may not be feasible or appropriate for every project. The two examples of land use development projects in Appendix D (Newhall Ranch and Centennial) that committed to net zero are very large primarily residential developments and are not representative of typical development under CEQA, including the proposed project. The third approach to demonstrating project-level alignment with State climate goals is to align with GHG thresholds of significance, which many local air quality management (AQMDs) and air pollution control districts (APCDs) have developed or adopted. Use of a numeric threshold adopted by AQMDs/APCDs, as expert agencies, was applied in the DEIR GHG emissions analysis. As such, the DEIR GHG emissions analysis does not conflict with evolving science and regulation as provided in the CARB 2022 Draft Scoping Plan, albeit being released following public review of the project's DEIR.

## Response to Comment Grp 16-16

This is a summary of the commenter's previous statements. Please see Responses to Comments Grp 16-1 through Grp 16-15. The County acknowledges the comment and notes it provides concluding remarks that do not raise new or additional environmental issues concerning the adequacy of the DEIR.

Re: Idaho-Maryland Mine Project Draft Environmental Impact Report
To Matt Kelly

Comments submitted by Don Rivenes
On Behalf of Nevada County Climate Action Now

Our organization also has signed on to group comments submitted by Community Environmental Advocates Foundation

Re: Section 4.3 Air Quality, Greenhouse Gas Emissions, And Energy

The DEIR report reaches the following conclusion:
Page 4.3-92 - 4.3-7 "Generation of GHG emissions that may have a significant impact on the environment. Based on the analysis below and with implementation of mitigation, the project's incremental contribution to global GHG emissions and climate change is *less than cumulatively considerable*.
Table 4.3-23 Estimated Annual Greenhouse Gas Emissions (Metric Tons) shows the analysis.
Page 4.3-94 - "As shown in Table 4.3-23, the project would not exceed the applied threshold of 10,000 MT CO2*e* per year during operations and reclamation. However, the project would exceed the 1,100 MT CO2*e* per year threshold during construction.

Grp 17-1

**Dispute of the DEIR conclusions**

**Emergency Generators**
The statement on page 4.3.94 - "The diesel emergency generators were assumed to operate up to a maximum of 100 hours per year for routine testing and maintenance, per the CARB ATCM for Stationary Compression Ignition Engines" fails to consider the operational hours of the generators under PG&E PSPS conditions and other power shutoffs due to local weather. One four- day outage would equal the hours indicated.

**Off-road equipment**
Page 4.3-51 Table 6. Operational Off-Road Equipment Assumptions
The only changes noted between the February 2020 Dudek report and the December 2021 DEIR are that the following equipment went from diesel to electric:

Grp 17-2

| | | Qty | Usage per day | Days per week |
|---|---|---|---|---|
| Jumbo drill carrier | Diesel | 3 | 4 | 7 |
| LHD units | Diesel | 6 | 20 | 7 |
| Personnel all-terrain vehicles | Diesel | 10 | 12 | 7 |

All other equipment remained the same.
And yet the Co2e emissions for 2022-2032 went from 2130 metric tons in Table 17 on page 73 of the February 2020 report to 755 metric tons in Table 4.3-23. The total hours for this electric equipment in 2022-2032 are just a small part of the off-road equipment and shouldn't account for the difference going from 2130 metric tons in the February 2020 report to 755 metric tons in the DEIR. The DEIR must account for this difference.

**On-road equipment – off and on site**

**Grp 17-3**

The Co2e emissions for 2022-2026 went from 1528 metric tons in Table 17 on page 73 of the February 2020 report to 923 metric tons (off-site) and 75 (on-site) in Table 4.3-23. The On-road vehicles exact difference is explained due to a change to the figure for cement vehicles. February 2020 report shows 649.4 for CO2e emissions while December 2020 report shows 64.94. Based on the factor used it appears the decimal correction is justified. However, it doesn't give us confidence for any other figures where a decimal can be misplaced, in this case bringing down the total but perhaps in other case the number could go up. The DEIR must show the factors used when converting miles driven to CO2 emissions for each of the vehicles.

We also ask what factors were used to relate miles travelled with emissions generated. This must be provided.

**Cement Vehicles**

**Grp 17-4**

Page 4.3-53 Table 4.3-11 Operations Off-Site On-Road Vehicle Trip Assumptions in a explanatory point states: "Freight, cement, and explosives trucks were assumed to have an average 60-mile distance assuming that these materials would come from distribution facilities in Sacramento California."

The CalPortland website states: "CalPortland in Stockton California manufactures Portland cement in three cement plants located in Mojave, CA; Oro Grande, CA; and Rillito, AZ. Their state of the art distribution system features the operation of a deep water international import terminal located in Stockton, CA with an additional transfer terminal in Stockton, CA."

Table 4.3-11 figures do not include the CO2 emissions from transporting the cement from production point to Sacramento (for example from Oro Grande in the desert to Stockton and from Stockton to a pickup point for the truck).
We assume that the cement is not manufactured in Sacramento. The DEIR must state where the Portland cement is manufactured and include the transportation miles to get the cement to Sacramento.

**Emission standards**

Appendix E Table 22 page 83 shows for the years 2033-2102, the DEIR shows 9,041 metric tons of Annual Greenhouse Gas Emissions and declares them under the threshold of significance.

The DEIR seeks to justify its chosen significance threshold of 10,000 MT $CO_2e$ for operational GHG emissions by looking to other air district standards. This standard from other air districts was based on old California requirements and is not consistent with the S.B. 32's statewide GHG reductions goals for 2030 and beyond.

**Grp 17-5**

The DEIR must use a significance threshold that will achieve California's new statewide GHG reductions goals over the proposed 80-year lifetime of the Project. Considering state goals and the severity of climate change, ***any*** operational GHG emissions over existing conditions are significant.

The California Air Resources Board 2017 Climate Change Scoping Plan stated: "Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development.". Given these facts, the DEIR must establish a net zero threshold for new GHG emissions from the Project and declare the project has significant and unavoidable impacts.

**Cement emissions from production**

We feel that the embedded emissions in cement production are a legitimate concern for the county. If they were included in the total emissions, the indefensible standard of 10,000 MT CO2e would be exceeded.

In a paper entitled Production, Consumption and Lifecycle Greenhouse Gas Inventories: Association of Environmental Professionals, California Chapter, Climate Change Committee August 2017" it was stated:

**Grp 17-6**

*"There have been a few CEQA analyses for projects that have included estimates of emissions associated with certain construction materials, such as concrete. While it is feasible to estimate upstream emissions associated with cement manufacturing (provided reasonable and non-speculative assumptions can be made about cement source, and production emissions data is available), the emissions associated with cement manufacturing by non-project entities are accounted for in project inventories for the cement plant, and by the jurisdiction containing the cement plant.*
*Thus, inclusion of such emissions would result in double-counting of emissions. Furthermore, in the case of cement, manufacturing is directly regulated by the state, both as a point source and under the California cap and trade regulation, and thus such emissions can be presumed to be controlled sufficiently through state regulation to meet the state's legislated GHG reduction goals. While one could include cement manufacturing emissions associated with project concrete use, the addition of such emissions would not add any information necessary to make conclusions about the significance of project emissions compared to statewide reduction goals."*

We are interested in these emissions because the County has created an Energy Action Plan whose goal is the reduction of GHG emissions. They may already have been counted at the plant level and for state goals, but we are including them for this project as avoidable emissions in that the emissions would not have occurred if this project were not done.

Therefore, to calculate the GHG impact from the Idaho-Maryland mine, one must include the embedded impact from the manufacture of the Portland cement. Embedded cost, in the context of energy costing, refers to the full amount required for a certain amount of energy to be provided.

To calculate the amount of cement used by the mine, Page 4.3-53 Table 4.3-11 Operations Off-Site On-Road Vehicle Trip Assumptions Table shows 936 cement truck trips each year over the 80 year lifetime. Each employee and truck are assumed to generate two one-way trips or 468 actual round trips per year with cement.

A cement truck on the average carries 8 cubic yards of cement weighing 2,538 pounds per cubic yard (Portland Cement Conversion Amount: 1 cubic foot of volume equals: 94.00 pounds (lb) in mass (source Traditionaloven) or about 20,300 pounds of cement or 9.2 metric tons.

We ask that the DEIR provide the projected yearly amount of cement. For these comments, we will use the more conservative number based on tonnage carried in a cement truck.

**Grp 17-7**

Carbon dioxide intensity is measured in metric tons of CO2 emitted per metric ton of cement produced. Manufacturing a ton of cement releases 0.73–0.99 tons of CO2 [6] *[6] WBCSD, Getting the numbers right: cement industry energy and CO2 performance, World Bus. Counc. Sustain. Dev. (2011) 42. [7] CEMBUREAU - the European Cement Association*

The performance in the Annex 1 regions is largely a result of the fairly high CO2 intensity of the cement industry in North America, at 760 kg net and 790 kg gross CO2 emissions per tonne of cementitious product, significantly higher than any other region. *A decision support tool for cement industry to select energy efficiency measures Alireza Mokhtar a,*, Mohsen Nasooti b*

The national weighted average carbon intensity for cement production is estimated at 0.97 metric ton CO2/ton cement. Thus, each cement truck would contain cement that released about 8.3 metric tons of CO2 when it was produced. Operationally, 468 truck trips would mean 3,884 metric tons of CO2 were released in a year of cement production for the mine.

The revised DEIR should provide adequate information to quantify these GHG emissions and include the quantities in their emission totals for significant impacts.

**Grp 17-8**

**Mitigation suggested for construction phase**

Page 4.3-96 4.3-7(b) ***Carbon Offsets – Construction Emissions.***
"Rise Grass Valley Inc. (Rise) shall retire carbon offsets in a quantity sufficient to offset the project's construction greenhouse gas (GHG) emissions to below the 1,100 metric ton carbon dioxide equivalent (MT CO2e) per year construction threshold, consistent with the performance standards and requirements set forth below."

The DEIR proposes to mitigate only 68 percent of the Project's construction-related GHG emissions and the entirety of that mitigation will rely on offsets.

The proposed GHG offset mitigation measure is impermissibly deferred without adequate performance standards, in violation of CEQA. The EIR fails to evaluate the foreseeable environmental impacts of offset projects. The DEIR fails to analyze additional feasible on-site mitigation for GHG emissions.

**Grp 17-9**

**Mitigation of operation phase**

The DEIR's GHG offset mitigation measure is unenforceable, delegates verification and enforcement to private third parties, and lacks specific performance standards essential to ensure the effectiveness of the mitigation. We are not in favor of the County allowing for ongoing emissions for this project over the next 80 years. It will be difficult enough to reach the California goal of net-zero carbon by 2045 without adding more unnecessary carbon in the atmosphere.

These operational emissions are a significant and unavoidable impact that calls for rejection of the Plan.

**Grp 17-10**

**Nevada County Energy Action Plan**

In 2018 Nevada County adopted an Energy Action Plan to assist the County in implementing the energy goals and policies in the County's General Plan and inform the community of best practices that will help them save energy and money.

The Plan calls for a 51% reduction in greenhouse gas emissions for electricity use by 2035, which is in close alignment with state goals. The Plan forecasts residential energy reduction savings from building efficiency of 42 million kilowatt hours per year.

The DEIR states the amount of electricity required to operate the mine would be approximately 49 million kilowatt hours per year, which would erase any residential electricity savings attained by the Plan.

It is even more stunning when you know that the total non-residential electricity use of the county in 2017 was 53 million kWh/Yr. So, this one mining project would almost

match all other non-residential electricity use in the County and wipe out the projected 9 million kWhYr non-residential efficiency savings.

Asking residents and business owners to cut down their use of electricity while allowing the electricity use of the mine would be highly counter-productive. The DEIR must explain how the project intends to comply with the goals of the Nevada County Climate Action Plan. These goals approximately match SB32 goals

Thank you for consideration of my comments.

## GROUP LETTER 17: DONALD RIVENES, NEVADA COUNTY CLIMATE ACTION NOW

### Response to Comment Grp 17-1

The commenter acknowledges that their organization has signed on to comments provided by Community Environmental Advocates. Please see responses to Group Letters 7 and 8.

The commenter suggests that emergency generator usage for Power Safety Power Shutoffs (PSPS) and other local weather condition should have been accounted for. Given that it is unknown if/ when a PSPS would occur, it is considered a speculative event, and per the CEQA Guidelines, if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145). California courts have consistently held that "an EIR is not required to engage in speculation in order to analyze a worst-case scenario." (See Napa Citizens for Honest Government v. Napa County Bd. of Supervisors (2001) 91 Cal.App.4th 342, 373.). The use of emergency generators is speculative and beyond the reasonable control of the applicant. However, criteria air pollutant emissions associated with 24-hour operation of the emergency generators is provided in Table 4.3-25 of the DEIR on page 4.3-104 for informational disclosure purposes only.

### Response to Comment Grp 17-2

The commenter identifies differences between the analysis in the DEIR and a draft version of the Air Quality and GHG Report. Notably, the DEIR is based on the most recent Air Quality and GHG Report (dated November 2021) included as Appendix E.1 of the DEIR. Numerous revisions were made to the Air Quality Report during the preparation of the DEIR. The report presented in Appendix E.1 of the DEIR is the final version of this report. The analysis presented in the DEIR uses the final version of the report and reconciliation to draft versions of this report is not relevant to the analysis of the DEIR.

### Response to Comment Grp 17-3

The commenter identifies differences between the analysis in the DEIR and a draft version of the Air Quality and GHG Report. Please see response to comment Grp 17-2 regarding draft versions of the air quality report. Emission factors for conversion of miles driven to carbon dioxide ($CO_2$) and other emissions are already included in Appendix E.1 of the DEIR.

### Response to Comment Grp 17-4

The commentator suggests that GHGs associated with the transport of cement by third parties should have been included in the DEIR. This comment pertains to a "lifecycle" analysis, which is not required under CEQA. Please see Master Response 26 – Life Cycle GHG emissions.

### Response to Comment Grp 17-5

The commenter asserts that the project's DEIR should have evaluated emissions against a net zero GHG threshold based on the 2017 Scoping Plan and statewide GHG reduction goals. The commenter's opinion that any project that results in GHGs above net zero should be considered significant is inconsistent with the statewide guidance, as described in the DEIR on page 4.3-29:

> The 2017 Scoping Plan further provides that "the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA."

The lead agency has determined that the threshold of significance for the project is 1,100 MT $CO_2e$ per year for construction and 10,000 MT $CO_2e$ per year for operations, based on substantial

evidence provided in the DEIR (please see Master Response 27 – GHG Thresholds). These thresholds are the metric used to determine if the project results in a substantial contribution to the cumulative GHG impact. Given that the project would result in GHG emissions below the applied construction threshold (after mitigation) and below the applied operational threshold (no mitigation required), and because the project would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs, the project would not result in a cumulatively considerable GHG impact.

## Response to Comment Grp 17-6

The commenter suggests that GHGs associated with the manufacture of cement should have been included in the DEIR. This comment pertains to a "lifecycle" analysis, which is not required under CEQA. Please see Master Response 26 - Life Cycle GHG emissions. In addition, as stated on page 4.3-89 of the DEIR, the referenced Energy Action Plan (EAP) is not a Qualified GHG Emissions Reduction Plan under CEQA pursuant to the requirements outlined in the CEQA Guidelines, Section 15183.5(D); therefore, no CEQA document can tier from the County EAP. Nevertheless, the compliance of the project with EAP strategies has been analyzed and found to be consistent with the EAP. Please see Master Response 25 - Nevada County Energy Action Plan.

## Response to Comment Grp 17-7

The commenter suggests that GHGs associated with the manufacture and transport of cement by third parties should have been included in the DEIR. This comment pertains to a "lifecycle" analysis, which is not required under CEQA. Please see Master Response 26 - Life Cycle GHG emissions. Regarding quantity of cement required for the project, Portland cement use of 25 tons per day (5% cement content in cemented paste fill) is assumed, as disclosed on page 295 of Appendix E.1.

## Response to Comment Grp 17-8

With regard to the validity of Mitigation Measure 4.3-7(b), which requires carbon offsets to reduce the project's construction emissions of GHG below the applicable threshold, please see Master Response 28 - Greenhouse Gas Credits.

The commenter does not provide explanation of how the GHG offset mitigation measure is impermissibly deferred without adequate performance standards. In fact, the GHG offset mitigation measure includes a section on "Reporting and Enforcement Standards" to ensure that the mitigation is feasibly enforced. Nonetheless, as shown in Master Response 28 - Mitigation Measure 4.3-7(b) has been revised in the Final EIR to further aid the County in enforcement of the mitigation measure, as currently set forth in the DEIR. The changes do not alter the conclusions of the DEIR.

Of note, CEQA Guidelines section 15097(a) allows lead agencies to delegate mitigation monitoring: "A public agency may delegate reporting or monitoring responsibilities to another public agency or to a private entity which accepts the delegation; however, until mitigation measures have been completed the lead agency remains responsible for ensuring that implementation of the mitigation measures occurs in accordance with the program." A GHG credit registry serves as the delegated entity. GHG offset credits recognized by a registry represent GHG emission reductions that *have already occurred in the past*; therefore, by purchasing an offset credit, the reduction in GHG emissions has been completed, and the impact has been mitigated.

GHG offset projects avoid, destruct, or sequester $CO_2e$ emissions. GHG offsets projects may be subject to environmental review such as CEQA or NEPA; however, most GHG offset projects do not require environmental analysis as they do not result in adverse environmental impacts. For example, landfill gas destruction and beneficial use carbon offsets collect and combust landfill gas at an existing landfill and do not generate adverse environmental impacts. The commenter fails to provide any evidence that GHG offset projects result in foreseeable environmental impacts. Accordingly, no further response can be provided.

The commenter states that the DEIR fails to analyze additional feasible on-site mitigation for GHG emissions, but neglects to provide any recommendations for feasible mitigation. At this time, feasible construction GHG emissions mitigation is very limited given the state of technology and available GHG reduction strategies for offroad equipment and heavy-duty trucks. As the commenter does not provide onsite mitigation to be evaluated, no further response can be provided.

## Response to Comment Grp 17-9

With regard to the validity of the Mitigation Measure 4.3-7(b), which requires carbon offsets to reduce the project's construction emissions of GHG below the applicable threshold, please see Master Response 28 - Greenhouse Gas Credits.

The commenter states that the operational GHG emissions are a significant and unavoidable impact and the associated GHG offset mitigation has various issues. However, as demonstrated in the DEIR, estimated operational GHG emissions are below the applied numeric threshold of 10,000 MT $CO_2e$ per year. The DEIR determined that project-generated construction GHG emissions would exceed the applied GHG threshold of 1,100 MT CO2e per year, as addressed above. As such, the commenter incorrectly summarizes the draft GHG emissions analysis findings; instead, the project's operational GHG emissions are below the applied threshold of significance and is not the source of GHG emissions that was the basis of the less than significant with mitigation finding for threshold GHG-1.

## Response to Comment Grp 17-10

The commenter states that the project would consume a substantial amount of electricity and would be inconsistent with the County EAP. Of note, projects that consume electricity do not necessarily conflict with the County energy reduction goals. Additionally, although the EAP is not a Qualified GHG Emissions Reduction Plan under CEQA pursuant to the requirements outlined in the CEQA Guidelines, Section 15183.5(D), the project was nevertheless determined to be consistent with the EAP (see Table 4.3-22 of the DEIR). Please see also Master Response 25 - Nevada County Energy Action Plan.

The commenter also asserts that "the DEIR must explain how the project intents to comply with the goals of the Nevada County Climate Action Plan". However, Nevada County has not adopted a Climate Action Plan.

**Group Letter 18**

NEVADA COUNTY DEMOCRATS

March 22, 2022

Dear Nevada County Planning Commissioners'

**Grp 18-1** The Nevada County Democratic Central Committee passed a resolution opposing the reopening of the Idaho Maryland Mine. The local Democratic party has not been one to spend much time writing resolutions, but this proposal is too risky for the environment and public health to keep silent on it. Even if you accept the findings of the DEIR released on January 4th, Rise Gold Grass Valley's track record shows they cannot be trusted to implement the mitigation measures. They have a history of leaving waste to be cleaned up, had 35 charges filed against them in various courts, and a local bankruptcy judge, in evaluating the economic reports published by the company, thinks bankruptcy is likely."

**Grp 18-2** Proponents of the mine often cite the possible 300 new jobs that could come with it. This job gain would likely be offset by the big risks for the tourism industry, high tech, and medical industry that won't be able to work in a situation where they are vibrations from underground blasting, the possible loss of hundreds of wells, and lowering of property values. However, right now Nevada County has more jobs available than workers, and very low housing stock.

**Grp 18-3** The loading and dumping of rock would add tremendous pollution to the "F' Nevada County already earns from the American Lung Associations grading system due to the ozone in our air at times during the heat of the summer.

**Grp 18-4** We could go on but we included the text of the resolution.

Sincerely,

Eric Robins
Chair, Nevada County Democrats
Office
1721 E Main Street, Ste.6
Grass Valley, CA 95945
ericwrobins@gmail.com
530-305-9223

**Nevada County Democratic Central Committee**

**Resolution**

**Opposing Rise Gold's proposal to re-open the Idaho Maryland Mine**

**Grp 18-5** **Whereas,** the proposal by Rise Grass Valley, a subsidiary of Rise Gold Corp., for an 80 year, 7 day a week, 24 hour operation of mining machinery and trucking of mine materials will create negative impacts to the air quality, water quality, ambient light and noise levels far beyond the scope of what we believe the citizens of Nevada County can or should tolerate; and

**Grp 18-6** **Whereas,** the proposal to open the mine has severely undercounted the number of private wells that will be impacted and potentially contaminated. Local well professionals estimate the number of affected parcels will be in the hundreds, not the handful identified by Rise Gold; and

**Grp 18-7** **Whereas,** the potential economic losses to homeowners within the mineral rights area have been estimated to exceed $5 million in reduced market value, even rendering many homes unsellable; and

**Grp 18-8** **Whereas,** the jobs Rise Gold purports to be creating to stimulate the local economy will need to be filled by outside labor, as Nevada County no longer has a pool of trained underground miners; and

**Grp 18-9** **Whereas,** Nevada County and California suffer from a severe housing shortage both in rental and sale properties, leaving imported workers unhoused locally; and

**Grp 18-10** **Whereas**, the proposed energy use of the mine would be in direct and fatal conflict with our county's existing Energy Action Plan (EAP), which was unanimously approved by the Nevada County Board of Supervisors in 2019, and which directs an urgent countywide decrease in energy use, Rise Gold's proposal actually doubles the county's annual non-residential energy consumption; and

**Grp 18-11** **Whereas,** Rise Gold's promises to inject money into the local economy may sound attractive, but the Economic Policy Institute Brief cited by Rise Gold actually shows that other industries can produce far better job numbers than mining, including eight industries we already have in Nevada County today; and

**Grp 18-12** **Whereas**, the CEO of Rise Gold, Ben Mossman, is currently awaiting a retrial on Canadian Environmental Rights Act and Fisheries Act violations allegedly committed by his former company, Banks Island Gold Ltd., at the Yellow Giant gold mine site in British Columbia. Banks Island Gold faces 35 provincial and federal charges after enforcement officers found evidence that they were dumping waste from the Yellow Giant gold mine into the surrounding woods and wetland in 2015, and Mr. Mossman, the responsible party as CEO, did not report any spills; and

**Grp 18-13**

**Whereas,** California Judge Randall J. Newsome has said, "My experience as a U.S bankruptcy judge for 28 years leads me to believe that this company, now Rise Grass Valley (a wholly owned subsidiary of Rise Gold) is destined for financial failure."

**Now, Therefore, be it Resolved,** that the above recitals are true and correct to the best of our knowledge and shall serve as findings of the Nevada County Democratic Central Committee.

**Grp 18-14**

**Be it Further Resolved**, that the Nevada County Democratic Central Committee calls upon the Nevada County Board of Supervisors to deny any and all permits for opening and operating the Brunswick/Idaho Maryland Mine, thereby protecting the citizens of Nevada County and our environment from the potential damages, losses and hardships this proposal will cause.

**Be it Further Resolved,** that the Nevada County Democratic Central Committee opposes the proposal to allow Rise Gold to open the Brunswick/Idaho Maryland Mine and further opposes Rise Gold to operate in Nevada County.

**PASSED AND ADOPTED** by the membership of the Nevada County Democratic Central Committee at its meeting held on the 18th Day of November, 2021.

## GROUP LETTER 18: ERIC ROBINS, NEVADA COUNTY DEMOCRATIC CENTRAL COMMITTEE

### Response to Comment Grp 18-1

The commenter states that its organization passed a resolution opposing the project. The commenter also states that even if the conclusions of the DEIR are accepted, the Project Applicant's CEO "cannot be trusted." The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues. Even though the Project Applicant's prior business dealings are not relevant to the adequacy of the DEIR, these types of comments are addressed in Master Response 3 – Operator Responsibility.

### Response to Comment Grp 18-2

The commenter states that any economic gain to the community will be offset by environmental impacts, but does not offer any specifics as to why the DEIR is inadequate. The commenter is referred to Master Response 1 – Non-EIR/Administrative Issues, and Master Response 2 – Social and Economic Impacts.

### Response to Comment Grp 18-3

The commenter asserts that the placement, grading, and compaction of engineered fill would further degrade the community's poor air quality but does not assert any deficiency in the DEIR. The DEIR evaluates the project's potential air quality impacts in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, and finds that impacts to air quality after mitigation would be less than significant.

### Response to Comment Grp 18-4

The comment does not address the adequacy of the DEIR. Comment noted.

### Response to Comment Grp 18-5

The commenter generally states that the project would create negative impacts to air quality, water quality, ambient light, and noise levels beyond the scope of what the community would tolerate. Please see Master Response 1. The DEIR identifies and evaluates each of the project's potential environmental impacts in accordance with CEQA. The commenter is referred to DEIR Chapter 4.1 (Aesthetics), Chapter 4.3 (Air Quality, Greenhouse Gas Emission, and Energy), Chapter 4.8 (Hydrology and Water Quality), and Chapter 4.10 (Noise and Vibration).

### Response to Comment Grp 18-6

The commenter states that the DEIR underestimates the number of private wells that the project would impact and potentially contaminate. The commenter references "[l]ocal well professionals" but does not identify these individuals or the basis for their findings that the DEIR underestimates the number of wells impacted. The DEIR discusses the project's potential impacts on groundwater levels and recharge in Impact 4.8-2. (DEIR, p. 4.8-54–68.) The Impact 4.8-2 analysis is based on the groundwater modeling report prepared by Itasca Denver Inc. and peer reviewed by the County's independent expert West Yost Engineering (DEIR Appendix K.3). The DEIR describes the methodology used in the modeling. (DEIR, p. 4.8-36–37.) The commenter is also referred to Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 18-7

The commenter states that the project would result in the cumulative loss of $5 million to nearby residential home values, but provides no basis for this finding. The commenter is referred to Master Response 2 – Social and Economic Issues.

## Response to Comment Grp 18-8

The commenter states that the project will create demand for outside labor only because Nevada County does not have a pool of trained underground miners. While impacts to jobs are not an impact under CEQA, the DEIR establishes recruitment targets for local candidates with no previous mining experience, and will provide training for jobs at the project site. (DEIR, p. 4.9-26.) The DEIR estimates the project will create approximately 162 positions for local candidates with no previous mining experience and approximately 51 additional positions for candidates with some previous mining experience or other applicable trade experience. The commenter is also referred to Master Response 2 – Social and Economic Issues.

## Response to Comment Grp 18-9

The commenter states that Nevada County and California suffers from a severe housing shortage which would leave any out-of-County workers unhoused. The DEIR evaluates the project's potential effects related to population growth and housing, which is provided in Chapter 4.9 (Land Use and Population and Housing). The DEIR specifically finds that the project would lead to indirect population growth by bringing approximately 312 persons to the area. (DEIR, p. 4.9-25.) Nevada County has 53,745 total housing units with a vacancy rate of 22.5 percent (12,098 vacant housing units.) (*Id*.) It is reasonably anticipated that the addition of 312 persons, as a result of the project, can be absorbed by the existing housing stock in Nevada County. (*Id.*)

## Response to Comment Grp 18-10

The commenter states that project's proposed energy use would conflict with Nevada County's Energy Action Plan (EAP.) The commenter is referred to Master Response 25 – Nevada County Energy Action Plan.

## Response to Comment Grp 18-11

The commenter states that there are alternative projects that will yield better economic benefits to the region. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts. The comment is noted for the decisionmakers.

## Response to Comment Grp 18-12

The commenter discusses the CEO of the Project Applicant and his prior project in Canada. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 3 - Operator Responsibility. The comment is noted for the decisionmakers.

## Response to Comment Grp 18-13

The commenter discusses the opinion of the Honorable Judge Randall J. Newsome (Ret.) regarding the economic viability of the Project Applicant. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues, and Master Response 3 - Operator Responsibility. The comment is noted for the decisionmakers.

## Response to Comment Grp 18-14

The commenter opposes the project and calls on the Nevada County Board of Supervisors to deny the Project Applicant any permits or approvals needed to reopen the Idaho-Maryland Mine. The commenter's opposition to the project is noted for the decisionmakers. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

**Group Letter 19**

Matt Kelley, Senior Planner

Nevada County Planning Department

950 Maidu Avenue, Suite 170 Nevada City, CA 95959-7902

Phone: 530-265-1423

Email: Idaho.MMEIR@co.nevada.ca.us

April 4, 2022

Dear Matt Kelly, Nevada County Planning Commission and Board of Supervisors,

**Grp 19-1**

The Nevada County Food Policy Council (NCFPC) is a collaboration of 55+ agencies, organizations, businesses, farmers, ranchers and individuals with a mission to cultivate and promote a local, Whole-sum Food system (local and community-based, fair, ecologically sound and humane) that readily provides health and vitality to every member of our community; that protects, stewards, and regenerates our land and our natural resources; that serves and honors our local interests and creates wealth and prosperity for every link in the food chain; and more meaningfully connects us as humans with one another, with the land, its occupants and its cycles, and the bounty, creativity, and sacredness of life.

Community Alliance with Family Farmers (CAFF) is a statewide non-profit that has been providing technical assistance to family farmers across the state since 1978. CAFF's mission is to build sustainable food and farming systems through policy advocacy and on-the-ground programs to create more resilient family farms, communities, and ecosystems. We often partner with local organizations throughout the state, including Sierra Harvest and the NCFPC. CAFF has dozens of farmer members located within Nevada County. While we are a statewide organization, we strongly support the NCFPC and the comments in this document.

**Grp 19-2**

Our council and CAFF are deeply concerned that the impacts of this proposed mine would have detrimental effects on Nevada County agriculture and food production and that the issues listed in the DEIR haven't addressed our concerns listed below regarding water quality and water supply.

**Grp 19-3**

The NCFPC recently published a comprehensive assessment on current food system challenges and strengths. A food system encompasses all the stages of keeping us fed: growing, harvesting, packing, processing, transforming, marketing, consuming and composting or disposing of food.

It is estimated that Nevada County residents buy over $340 million in food annually. The value of food produced in the county is roughly $16 million, less than 5 percent of our annual purchases.

Local food production contributes to keeping our food dollars recirculating in our local economy, as well as creating tax revenues, increases food resilience, and meaningful jobs for our farmers and ranchers. From a health standpoint, local food purchases will likely equate to fresher, more nutritious, less processed foods. In addition, local food is transported from farms a shorter distance thus reducing fuel and refrigerant use, causing less pollution, packaging, and waste.

The study conducted in Central Oregon [Rahe 2017] found that $0.76 of every dollar spent on a local food product stays in the community compared to $0.28 of every dollar spent on food from outside the region. That means for every dollar you spend buying from your local farmer or rancher, an additional $0.48 is circulated through your local economy not only fueling jobs, but helping to make your community more resilient to external economic forces. Additionally, for every 5 farm jobs, an additional 2 off-farm jobs are created within the community.

Our locally produced food is a tiny part of our food market, leaving us vulnerable to a national food system that is fraying at the edges. Food can become unavailable, overpriced, and quality-compromised at any point. But our county has the water, land, and expertise to become more self-reliant.

Based on the 2020 Nevada County Agriculture Report https://www.mynevadacounty.com/ArchiveCenter/ViewFile/Item/1318,

**Grp 19-4**

"The 2020 COVID-19 pandemic highlighted the importance of our local food production as evident by empty produce shelves at national chain supermarkets during the beginning of this pandemic. Farmers that sold directly to restaurants were forced to quickly pivot and find other customers and many residents began growing their own vegetable garden. Throughout these uncertain times, our farmers fulfilled their role as essential workers and fed our community. The total value in 2020 of fruit and vegetable crops increased almost 7%, or $175,900. The total gross value of all agricultural commodities produced in 2020 was $19,725,200. Nevada County has in production 365 Farms with 3,313 acres of harvested cropland, 133,393 acres of grazing land and 7,760 acres of farmland," stated Chris de Njis, Nevada County Agricultural Commissioner.

**Grp 19-5**

**The situation our agricultural system is facing due to drought is dire.** New research shows California and the West are in a megadrought, the worst drought in 1,200 years. (CA Food and Farming Network, 2022). Our local farms and ranches rely on water to produce the food we consume.

It is imperative that we need to protect the water and land necessary to preserve our farm and ranchland that produce our local food and strengthen our local economy.

**Specifically, we are concerned about the following 2 areas:**

- **Downstream water quality**: How do you ensure that the downstream farms and ranches that have the South Fork of Wolf Creek running through their land continue to have excellent water quality? Their land may be certified Organic and cannot have high levels of chemicals or metals leaching into their soil affecting their crops or land used for grazing purposes of their livestock.

**Grp 19-6**

- **Adequate water supply with a mega drought forecasted.**

**Downstream Water Quality Issue**

In chapter 4.8.4, the DEIRstates that "only full treated water meeting the State's discharge requirements will be routed to the South Fork of Wolf Creek and will submit quarterly monitoring reports to the Regional Water Quality Control Board (RWQCB). "

**Grp 19-7**

- We recommend that there needs to be real time monitoring due to the high variability of water levels seasonally in the South Fork of Wolf Creek and not quarterly.
- We also recommend a local independent agent as oversight for the monitoring reports. Self-reporting holds a conflict of interest that does not align with the health of the watershed. Nonprofits such as the Sierra Fund, Sierra Streams, or Wolf Creek Community Alliance have the expertise to either perform the monitoring or ensure that the monitoring is done appropriately.

**Grp 19-8**

In chapter 4.8-1, "The treatment process would also reduce the concentrations of arsenic and ammonia, both of which have been detected in low concentrations in surface seeps near the mine."

**Grp 19-9**

- Is the water treatment process adequate to ensure that the arsenic levels never go above an unsafe level? If the water is being tested only quarterly, this issue might not be detected. According to a study completed in 2021 on the effect of arsenic-contaminated irrigation water on growth and elemental composition of tomato and cabbage cultivated in three different soils, and related health risks, "The Arsenic (As) threshold for drinking water is 10 µg/L (WHO, 2001), and for irrigation water is 100µg/L (FAO, 1994), but there is currently no recommended As limit value for vegetables." Again, we recommend that there needs to be real time, DAILY, water quality monitoring to ensure the downstream land holders of the South Fork of Wolf Creek have excellent water quality running through their land at all times, not just 4 times a year. Additionally, these reports need to be accessible to the public in real time so that any downstream users can monitor the situation themselves and be alert of an issue immediately and take necessary

**Grp 19-10**

actions to ensure their food production or grazing animals are safe and that their organic certifications are not in jeopardy.

**Grp 19-11**

- Is there a mitigation plan, in case the metals or other contaminant levels are detected above the allotted amount determined by the RWQCB? What is the mitigation plan?

**Grp 19-12**

- Is there a plan if the holding ponds have a break in the liner or berm and there is a flood allowing toxins to flow into the creek?

**Grp 19-13**

There also seems to be inadequate baseline mine water testing. The testing completed from the Brunswick shaft is inadequate in that it doesn't give enough data about the diversity of water quality within the vast underground sections containing old shafts and projected to have new exploration. Four current seeps emptying into Wolf Creek itself off Idaho-Maryland Road are probably more indicative. They contain high concentrations and greater numbers of heavy metals.

- Therefore, the DEIR needs additional study to create a better baseline for predicting the level of contamination in the mine groundwater. The results of that study need to be explicitly incorporated into water treatment design.

**Grp 19-14**

**Adequate water supply**

In Chapter 4.11 the DEIR states that "Water demand within Nevada Irrigation District's (NID) service area is expected to exceed the District's supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year period. However, this mining project is not expected to exacerbate NID's water supply shortages during dry years and the project will supply water into South Fork Wolf Creek, and into the NID water conveyance system, at volumes exceeding the project water demand for potable water from NID that there is sufficient water supply available to serve the project during normal, dry and multiple dry years."

NID is in the early stages of a long-term visioning and planning effort to better understand potential future conditions and needs and identify management and operational practices to meet those needs. **In 2021, NID was barely able to meet the needs of the existing ag customers and at one point discussed cutting off all agricultural users in August.** This Plan for Water process will take a minimum of 2 years to complete. https://www.nidwater.com/plan-for-water. From the 2020 Agricultural Water Management Plan NID also states that they have roughly 5,600 agricultural customers. "***About ninety percent of all the water delivered by NID is for agricultural use giving life to approximately 32,000 acres of irrigated land in Nevada and Placer Counties.*** Most agricultural water customers purchase water seasonally, from mid-

April through mid-October. NID's raw water is conveyed to customers through a unique network of over 500 miles of canal. The ag water is used to grow multiple crops including wine grapes, nursery stock, apples, rice, plums, citrus, grass, alfalfa hay, as well as to irrigate pasture." https://www.nidwater.com/ag-urban-water-management-plans

**Grp 19-15**

- The data compiled in the DEIR thus far about water supply is extremely inadequate based on information about drought conditions in CA and the fact that NID has not completed its Plan for Water to determine its needs for its present customers for the next 50 years. Therefore, we recommend that more specific water analysis be completed AFTER the Plan for Water is completed by NID to ensure that there truly is enough water for the existing Nevada County agricultural users now and into the future.

**Grp 19-16**

- IF there truly is excess water supplied by the mining project into the South Fork of Wolf Creek, that water still does not assist any upstream users that may be without enough water during a drought year. Statements about water supply need to be stated as conditional and uncertain until the full Plan for Water by NID is completed. The DEIR should emphasize the uncertainty and unresolved nature of water supply and NOT state that there is enough water for the project.

**Grp 19-17**

- The following statement contradicts itself by implying that there is plenty of water available from NID, yet, you state that there isn't enough for 15 years for its own customers – if NID does not have enough for its customers, how can they have enough for this project? Please explain this in clearer terms. "Water demand within Nevada Irrigation District's (NID) service area is expected to exceed the District's supplies by more than 45 percent from 2025 to 2040 in Single Dry Years and by less than 10 percent from 2025 to 2040 during the first and second years of a Multiple Dry Year period. However, this mining project is not expected to exacerbate NID's water supply shortages during dry years."

**Grp 19-18**

In Chapter 4.11, the DEIR states that "it is anticipated to receive potable water from Nevada Irrigation District (NID) for dust control, sanitary uses and reliable water supply to some nearby residences whose wells may be impacted by the mining operations." And Chapter 4.8 suggests that mine dewatering will impact only a few wells. Yet it only includes tests for a few wells and suggests that possibly up to 30 wells could be impacted. Previous studies suggested a larger area of impact.

- The DEIR states that NID would have more than adequate water to supply the 30 wells, but what if it's 100 wells? Therefore, we recommend a larger

and more comprehensive well study to be completed as well as new analysis of underground hydrology.

**Grp 19-19**

Based on what is not included in the DEIR regarding water supply, water quality and flooding possibilities, the impacts could be much more serious than suggested. Please carefully address these concerns and include the new areas of study or analysis needed to adequately assess the impacts of this project. Without these changes, the DEIR is severely flawed and inadequate.

Healthy food is critical to our lives. However, the future of our food supply is in jeopardy, threatened by erratic weather events, environmental degradation, drought and now a global pandemic. The COVID-19 pandemic pushed our fragile food system to the limit and supply for many products was disrupted. We must ensure that Nevada County has a thriving food supply system to weather future challenges. Please consider these issues when weighing the impacts of the proposed mine on the health and well-being of our Nevada County residents for the next 80 years and beyond!

*Thank you for your consideration of our concerns.*

## GROUP LETTER 19: MIRIAM LIMOV, NEVADA COUNTY FOOD POLICY COUNCIL COMMUNITY ALLIANCE WITH FAMILY FARMERS

### Response to Comment Grp 19-1
This comment is introductory in nature. The comment is noted.

### Response to Comment Grp 19-2
The commenter generally states that the DEIR does not address their concerns regarding water quality and water supply. Please see Master Response 1 - Non-EIR/Administrative Issues. Responses to specific comments are provided below.

### Response to Comment Grp 19-3
The commenter provides a general discussion of the agricultural industry and its importance in Nevada County. The comment is noted. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Grp 19-4
The commenter highlights the importance of producing food locally, especially in light of the COVID-19 public health emergency. The comment is noted. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Grp 19-5
The commenter states that the local agricultural system is strained by the current drought and that water resources must be protected. The comment is noted. The commenter is referred to Master Response 1 - Non-EIR/Administrative Issues.

### Response to Comment Grp 19-6
The commenter is concerned about downstream users the water quality of South Fork Wolf Creek and an adequate water supply in light of the drought. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek and Master Response 16 - Drought and Climate Change.

### Response to Comment Grp 19-7
The commenter requests that water quality monitoring of South Fork Wolf Creek be conducted in real time. Monitoring will be done in accordance with the approved Notice of Intent and requirements and oversight of the Central Valley Regional Water Quality Control Board. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Grp 19-8
Monitoring would be done in accordance with the approved Notice of Intent and requirements and oversight of the Central Valley Regional Water Quality Control Board. Please see Master Response 35 - Discharge to South Fork Wolf Creek.

### Response to Comment Grp 19-9
The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek. Effluent limitations in the treated water that will be discharged into South Fork Wolf Creek are set by the Central Valley Regional Water Quality Control Board through its permitting, with which the project

will be required to comply, as verified and monitored by said state agency. Please refer to Chapter 4.8 of the DEIR for additional detail (cf. Table 4.8-2).

## Response to Comment Grp 19-10

The commenter reiterates its request for daily water quality monitoring of South Fork Wolf Creek and requests the monitoring data be publicly available. Monitoring will be done in accordance with the approved Notice of Intent and requirements and oversight of the Central Valley Regional Water Quality Control Board. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment Grp 19-11

The commenter asks if there is a mitigation plan in place to address any contaminants that exceed RWQCB thresholds. A mitigation monitoring and reporting program has been prepared and is included as Chapter 4 to this Final EIR. The mitigation measures and conditions of approval will be enforced by the County. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

## Response to Comment Grp 19-12

The commenter is concerned that the wastewater treatment pond may fail and asks if there is a contingency plan in the event of such failure. The geotechnical stability of the treatment pond is analyzed in Chapter 4.6 of the DEIR and required mitigations would reduce the impact to a less than significant level. (DEIR, p. 4.6-41.) The commenter is also referred to Appendix H.1 of the DEIR. Failure of the water treatment plant is speculative and is not required to be analyzed under CEQA.

## Response to Comment Grp 19-13

The commenter states that the DEIR's analysis of the water in the mine is inadequate. The commenter is referred to Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment 19-14

The commenter is concerned about drought and NID's ability to meet future water demands. The commenter is referred to Master Response 16 - Drought and Climate Change, and the following responses to more specific comments.

## Response to Comment Grp 19-15

The commenter states that the DEIR's analysis of water supply is inadequate. The commenter is referred to Master Response 16 - Drought and Climate Change and Appendix N (Water Supply Assessment) of the DEIR.

## Response to Comment Grp 19-16

The commenter states that the added water supply to South Fork Wolf Creek does not benefit any upstream users. As stated on page 4.11-37 of the DEIR, the possibility exists for NID to utilize the excess treated mine water discharged to South Fork Wolf Creek. If desired, NID could adjust its flows upstream to use the extra water available downstream.

## Response to Comment Grp 19-17

The commenter states that the language from Appendix N (Water Supply Assessment) is inconsistent in that it states water demand would exceed NID supplies in dry years but that the project would not exacerbate NID's water supply shortage during dry years. This statement is

made in part based on the fact that, as discussed in the WSA (page 2), the potable water demands for buildout of the proposed project are already included in the District's projected 2040 water demands. In addition, as stated on page 4.11-37 of the DEIR, notwithstanding the potable demand of 26.4 acre-feet per year associated with the project, the project would be a net contributor of water to the NID water system as a result of the project's ongoing discharge of treated mine dewatering water to South Fork Wolf Creek (850 gpm or about 1,371 ac-ft/yr). The possibility exists for NID to utilize the excess treated mine water discharged to South Fork Wolf Creek. If desired, NID could adjust its flows upstream to use the extra water available downstream. The commenter is also referred to Master Response 16 - Drought and Climate Change.

## Response to Comment Grp 19-18

The commenter states that the DEIR underestimates the number of potentially impacted private wells. The commenter is referred to Master Response 13 - Historic Hydrogeologic Assessments, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 19-19

The commenter summarizes its primary concerns with project stated throughout the letter. Responses to specific concerns with the project are provide above. The commenter's opposition to the project is noted for the decisionmakers (please see Master Response 1).

Re: Idaho-Maryland Mine DEIR Comment Letter

Dear Mr. Kelley:

I appreciate the opportunity to share my grave concerns regarding the Draft Environmental Impact Report ("DEIR") for the Idaho-Maryland Mine Project ("Project") from the perspective both as a land use and natural resources attorney for over two decades and a resident of Grass Valley. Based on an extensive review of the DEIR, it is clear that the DEIR must be revised and recirculated to comply with the requirements of the California Environmental Quality Act ("CEQA"), Public Resources Code section 21000 et seq., for the reasons outlined below.

**Grp 20-1**

An EIR is required to correctly inform the public and trustee and responsible agencies of all potential environmental impacts of a proposed action, to list ways in which the significant effects of such a project might be minimized, and to indicate alternatives to address impacts that cannot be mitigated. (CA Pub. Res. Code § 21061.) Unfortunately, the DEIR fails on all three requirements. First and foremost, the DEIR fails to accurately describe the Project and all potentially significant impacts. In particular, it fails to identify potentially significant and unavoidable biological, hazards, air quality, and hydrological impacts that may not be mitigated. Second, the DEIR fails to identify feasible and achievable mitigation measures to minimize such impacts to less than significant levels. And finally, this DEIR fails to identify alternatives to address the potentially significant impacts identified in the report. The DEIR deprives the public of a meaningful opportunity to comment upon substantial environmental impacts of the project and fails to identify feasible mitigation measures for such effect, and accordingly, requires recirculation a revised DEIR. (CEQA Guidelines § 15088.5(a)(4).)

**1. The Project Description is Inadequate Under CEQA**

**Grp 20-2**

The Project Description in the DEIR is inadequate under CEQA because it fails to include the cleanup of the Centennial Site, which is an integral component of the Project. In doing so, the DEIR fails to provide the public with an accurate accounting of all Project impacts, including potentially significant and unavoidable biological, hydrological, hazards, air quality and cumulative impacts.

California courts make it clear that ""The scope of the environmental review conducted for the initial study must include the entire project." (*Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007) 155 Cal.App.4th 1214, 1222) *Nelson v. County of Kern*, 190 Cal.App.4th 252, 267 (Cal. Ct. App. 2010) A project is defined under CEQA to include "*the whole of an action*, including everything that has a potential to result in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment and which is undertaken, supported or approved by a public agency. (CEQA Guidelines, § 15378(a), italics added.)

CEQA Guidelines further clarifies that the term "project" refers to "the activity which is being approved and which *may be subject to several discretionary approvals by governmental agencies*. The term 'project' does not mean each separate governmental approval." (CEQA Guidelines, § 15378 (c), italics added.) This definition "ensure[s] that a project proponent does not file separate environmental reports for the same project to different agencies thereby preventing 'consideration of the cumulative impact on the environment. . . .' [Citation.]" (*Azusa Land Reclamation Co. v. Main San Gabriel Basin Watermaster* (1997) 52 Cal.App.4th 1165, 1190, fn. 5, quoting *City of Santee v. County of San Diego* (1989) 214 Cal.App.3d 1438, 1452; *Nelson*, 190 Cal.App.4th at 271.)

CEQA's conception of a project is applied broadly "to maximize protection of the environment" to "prevent a proponent or a public agency from avoiding CEQA requirements by dividing a project into smaller components which, when considered separately, may not have a significant environmental effect." *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 730, *Nelson*, 190 Cal.App.4th at 271. Unfortunately, the DEIR does exactly this by segmenting out the Centennial cleanup from this Project rationalizing that such remediation efforts are being reviewed and approved by another agency, the Department of Toxic and Substance Control ("DTSC").

**Grp 20-3**

The Notice of Preparation ("NOP") for the Project originally identified the Centennial cleanup an essential "part of the proposed project." (NOP, p.7) and confirmed for the public that the cleanup would be reviewed as part of this CEQA document. The NOP is required to provide "sufficient information describing the project and the potential environmental effects to enable the responsible agencies to make a meaningful response." (CEQA Guidelines, 14 CCR § 15082(a)(1).) The resulting Project description in the DEIR should never be smaller than the scope identified in the NOP. To the extent that the County wanted to reduce the scope of the Project so significantly as to remove an extensive cleanup effort at the Centennial Site, the County should have issued a revised NOP and received feedback from both the public and responsible agencies on this revised approach. It did not.

**Grp 20-4**

Moreover, Centennial cleanup is an essential part of the stated Project Objectives in the DEIR. Two of the ten project objectives are directly tied to the cleanup of Centennial. (DEIR, p. 3-11-3-12.)

- Increase the usable land area at the Centennial Industrial Site to allow its future use as industrial land.
- Minimize impacts to wetlands, vernal pools, and other special-status species habitat located on the Brunswick and Centennial Industrial sites, and, to the extent feasible, mitigate any such impacts identified.

California courts make it clear that if a component is dependent upon and closely related to an objective of the project, it must be included. See *Tuolumne County Citizens* at pp. 1225-1231 [where the success of the overall objective depends on the inclusion of certain action, the distinct actions are viewed as parts of a larger whole — the same project].)" *Nelson v. County*

*of Kern*, 190 Cal.App.4th 252, 272. Here, the success of these two objectives depend on the remediation of the Centennial Site, and accordingly, it must be included as part of the same Project.

The County acknowledges throughout the DEIR that actual impacts are dependent on the design of the Centennial cleanup (DEIR, p. 1-6, 4.0-2, 4.1-2, 4.2-1, 4.4-2, etc.) and that such designs have not yet been approved (DEIR, p. 3-10), but then fails to include such work as part of the Project. The Project will result in impacts to over 44 acres of the Centennial Site, which may or may not be on top of an engineered cap post cleanup or pristine wetlands, depending upon the outcome of the DTSC process. To suggest that these two projects have independent utility and do not impact one another, defies logic and results in an analysis that does not comply with CEQA requirements.

The Water Board agreed with this analysis and requested that the Centennial cleanup be analyzed with the Idaho-Maryland Mine as part of its comment letter to DTSC on the IS/MND for the Centennial cleanup. The Water Board stated that

> the cumulative impacts to water quality incurred by the project described in the RAP and potential future discharge of mine waste generated by the proposed Idaho-Maryland Mine-Rise Grass Valley project **should be considered in a single environmental document**. This seems particularly relevant considering the potential use of the Centennial Property for management and reuse of mine waste generated by the proposed Idaho-Maryland Mine-Rise Grass Valley project.

**Grp 20-5**

(*Water Board Comment Letter to DTSC on the Centennial IS/MND*, September 24, 2021, p. 5, included as Attachment A hereto.) The Water Board concluded that because the two projects have been separated "staff are unable to assess the cumulative impacts to water quality or whether the existing environmental document prepared for the RAP is adequate to support future WDRs for Waters of the State (see Permitting Requirement 2)." (Id.) In other words, as a result of separating out the two projects, the Water Board is currently unable to rely on the IS/MND to issue permits for the Centennial cleanup.

The Centennial cleanup is an integral part of the Project, as referenced in the NOP and the Project objectives, and must be analyzed in this DEIR to provide the public with an accurate picture of all potential impacts associated with the Project. The Centennial cleanup must be added to the analysis and the DEIR must be recirculated.

**2. CEQA Does Not Allow Use of a Future Baseline That May or May Not Happen**

The inconsistent treatment of the Centennial cleanup not only leads to an inaccurate Project description, but violates the CEQA Guidelines related to the environmental baseline and analysis of impacts. CEQA Guidelines require the DEIR to describe physical environmental conditions as they exist at the time the notice of preparation ("NOP") is published in order "to give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." (CEQA Guidelines § 15125(a).) The existing conditions at the time of the NOP (July 17, 2020), reflect a Centennial Site contaminated enough to be considered a superfund site in need of remediation of existing mine waste including contaminants that cause a significant risk to human health like arsenic, lead, thallium, mercury, and other metals (DEIR, p. 4.7-3). According to the Water Board, these metals and contaminants "present a potential human health risk resulting from routine, long-term exposures including ingestion, inhalation of dust or vapors, and dermal contact. In

**Grp 20-6**

addition, contaminated mine waste presents potential risks to ecological health and water quality." (*Water Board Comment Letter*, p. 1, Attachment A.) As indicated in the DEIR, such cleanup must be addressed to protect the health of the community and to allow any future uses on the site, including the placement of mine waste. (DEIR p. 3-10.)

Unfortunately, the DEIR does not identify the existing contaminated site as part of the environmental baseline for purposes calculating impacts. Instead, the DEIR assumes that the Centennial remediation has been fully completed by the start of the Project and applies anticipated conceptual future conditions to complete the analysis of aesthetic impacts, agriculture, biological resources, hazards and hazardous materials, and wildfire risk. (DEIR, pp. 1-6 to 1-7.) Not only is this approach inconsistent with CEQA, but it is not supported by substantial evidence in the record.

The Centennial cleanup *may* happen as the result of a Voluntary Agreement that involves Rise Gold working with DTSC to prepare a draft and then a future final Remedial Action Plan ("RAP") describing the methods for remediating the Centennial Site. Each remediation approach results in varying levels of ground disturbance, depending upon how much contaminated soil is removed from the site and how much is placed onsite on existing wetlands and sensitive resources. The RAP describes the various remedial alternatives and then ultimately, DTSC will select one that reduces the risks associated with environmental conditions identified at the Site. The RAP also outlines procedures for excavation, on-site treatment, and consolidation of mining waste as engineered fill in an area that will be subject to land use controls at the Site. The remedial alternative will be selected based on its effectiveness, feasibility, and cost as part of a Final RAP, which has not yet been developed.

The draft RAP along with an Initial Study/Mitigated Negative Declaration ("IS/MND") for the cleanup work are currently out for public review. DTSC has <u>not yet selected a preferred remedial alternative</u> which means that the exact level of ground disturbance associated with the Centennial cleanup is not yet known. The latest communication with the DTSC project manager for the Centennial cleanup highlights just how far off the decision is at this point. In response to a request for a status update regarding the Final RAP, Dean Wright, the Project Manager at DTSC in charge of the Centennial cleanup said "I've almost given up anticipating a decision on the Centennial M-1 RAP. Typically, the RAP review and especially CEQA reviews are where project schedules can go off the rails and that has certainly happened in this case." (Email communication from Dean Wright, March 21, 2022, italics added.) While DTSC anticipates finalizing a remedial alternative soon, there is no clarity on which remedial alternative will be selected and when work would actually begin.

After the Final RAP is provided for public review, the applicant is then required to produce a more detailed Remedial Design Implementation Plan ("RDIP") with additional design details, which also could affect the footprint of ground disturbance at the Centennial site.

The DEIR cannot rely on the draft RAP that is still under review by DTSC as substantial evidence of likely future conditions because such decisions have yet to be made. DTSC may ultimately not approve the RAP as proposed and require an entirely different design based on public input. Accordingly, speculating on the specific levels of disturbance associated with the cleanup in the DEIR would be inaccurate, misleading, and not supported by substantial evidence because they are still under review and may change significantly.

As just one example, the draft RAP proposes to potentially impact almost five acres of existing wetlands on the Centennial site, but several commenters have asked DTSC to revise the approach to reduce the level of impacts on wetlands, which would significantly change the ground conditions post remediation and significantly alter the resulting impacts from placement of mine waste from the Idaho-Maryland Mine.

Moreover, as acknowledged in the DEIR, it's possible that the remediation may never occur (DEIR, p. 3-26). Accordingly, the use of conceptual future baseline conditions that have not been approved and may never take place is wholly inappropriate for calculating environmental impacts associated with this Project.

CEQA Guidelines only grant authority to change the environmental baseline from existing physical conditions in very limited circumstances. Where absolutely necessary to provide the *most accurate picture practically possible of the project's impacts*, a lead agency may define existing conditions by referencing historic conditions, or conditions expected *when the project becomes operational*, or both, that are supported with substantial evidence. (CEQA Guidelines § 15125(a)(1).) Here, there is insufficient evidence to confirm that the cleanup will be remediated, much less by the time the Project becomes operational. Indeed, the County is so unsure of the potential future conditions of the Centennial cleanup, and the timing thereof, that the DEIR includes an alternative (Alternative #2) design that could become necessary if the Centennial cleanup is never completed. This approach completely undermines the DEIR assertion that there is substantial evidence supporting the assumption that Centennial cleanup will be completed when the Project becomes operational. The County cannot have it both ways. Either the Centennial cleanup *is certain* enough to be expected to be in place when the Project becomes operational *OR uncertain* enough as to require a separate alternative excluding use of the site. It cannot be both. Given the questionable timeline of DTSC's approval process, the responsible and appropriate approach would be to describe the existing environmental baseline at the time of the NOP, without any remediation of the Centennial Site, to get an accurate picture of all Project impacts.

The brief discussion in the DEIR ostensibly supporting the wholly unique baseline approach (pp. 1-3-1-7) suggests that the DEIR is not using a projected future baseline, which is false. The DEIR acknowledges that Centennial cleanup may not occur until after Project operations have begun (DEIR p. 3-26), which means the DEIR must meet the strict legal standard for using a future baseline, which it does not. The CEQA Guidelines limit use of such a future speculative baseline to those instances in which the DEIR "demonstrates with substantial evidence that use of existing conditions would be either misleading or without informative value to decision-makers and the public. Use of projected future conditions as the only baseline must be supported by reliable projections based on substantial evidence in the record." (CEQA Guidelines § 15125(a)(2).)

The DEIR does not provide any evidence to suggest that assumption of the Centennial site is necessary to avoid misleading the decision-makers or the public. On the contrary, the use of the future conceptual baseline that may or may not happen prior to Project operations results in a very misleading analysis of impacts that fails to identify all potential and likely impacts of the Project at the Centennial location. As described above, such projections are not supported by substantial evidence. On the contrary, the substantial evidence in the record in the DEIR, the Water Board's Comment Letter, and the DTSC Draft RAP, suggest that the Centennial remedial design has not yet been selected and could change significantly. It is far from a reliable projection. Accordingly, the DEIR must be revised and recirculated to identify the existing physical conditions of the Centennial Site and to provide a comprehensive analysis of impacts to give both the public and decision-makers an accurate picture of all potential impacts.

CEQA prohibits such assumptions of Project approval before DTSC has completed its review and requires the DEIR to identify existing environmental conditions, not a future baseline based on speculation. CEQA strictly prohibits the use of a future baseline, particularly when projections are unreliable and not supported by substantial evidence in the record.

The DEIR selectively uses a future baseline for certain resource areas that result in an underestimation of potential impacts, which is prohibited under CEQA. The last thing the County should be doing for a Project that could cause 80-years of community impacts is underestimating potential issues to expedite approval. While the DEIR sites all of the aspects of the Centennial Site, never does it provide clear substantial evidence to support the assumption that Centennial will be cleaned up in a certain way, and certainly should not make such assumptions before DTSC has completed its CEQA and approval process.

To protect the County from legal challenge, the DEIR must be revised to address existing conditions on the unremediated Centennial Site and be recirculated to provide the public and decision makers with an accurate picture of all potential impacts.

**3. Inconsistent Approach Leads to Undercounting of Impacts Violating CEQA**

**Grp 20-7**

The DEIR must be revised and recirculated to address the various flaws in the analysis that result from assuming the Centennial cleanup as part of the baseline. In particular, the failure to adequately address the Centennial cleanup leads to flaws in the biological, hazards, geology, aesthetics, and cumulative impact analysis among other resource areas.

**a. Undercounting of Biological Impacts In Connection with Centennial**

The DEIR arbitrarily assumes the level of biological impacts associated with the Project will be less than significant because it assumes that the Centennial cleanup, which has not yet been approved (and has been challenged by the public) will be completed before Project construction. As described above, this assumption is not supported by substantial evidence, and even if it were, the DEIR cannot rely on a remedial design that has not yet been selected or approved by DTSC. The DEIR acknowledges that potential biological impacts would vary significantly depending on the remedial design chosen for the Centennial cleanup. (DEIR, p. 2-2.) The DEIR also describes the Centennial cleanup inconsistently stated that the remediation may impact some amount up to 28 acres chapter two, but then assuming that all 28 acres will be disturbed in certain sections (DEIR, p. 4.4-2.) The DEIR is riddled with these kinds of inconsistencies that must be addressed in a revised DEIR.

**Grp 20-8**

In the biology chapter, the DEIR acknowledges that the exact number of impacts from Centennial "cannot be precisely established for the baseline condition" because DTSC has not approved the Final RAP (DEIR, p. 4.4-3), but then includes a map identifying a massive whole in the center concluding that this entire area will be impacted by the Centennial cleanup. (Figure 4.4-1, p. 4.4-4.) This map is not supported by substantial evidence and provides the public with a misleading impression that this entire area will be wiped clean of all environmental resources prior to Project implementation, including four acres of existing wetlands and other sensitive habitat, when this design has not been approved by DTSC. Using such an approach, conveniently cuts out over four acres of potential impacts to wetlands and leads the DEIR to conclude that biological impacts will be less than significant.

As shown in the DTSC IS/MND, most of the 'blank' area on Figure 4.4-1 is currently home to a variety of sensitive resources including wetlands, and a large number of commenters have asked DTSC to revise the RAP to avoid these resources, which would significantly alter the footprint of this 'disturbed area' and thereby significantly change the number of impacts that the mine waste would cause. As a result of the DEIR's assumption, the estimated impacts go from 5 acres of permanent impacts to wetlands down to 0.03 acres. This is a gross underestimate of existing conditions and likely biological impacts at Centennial from the Project. The result is a significant undercounting of wetland impacts resulting in an inappropriate conclusion of less than significant impacts. When impacts are speculative or

unknown, the DEIR must conservatively assume the most impacting result, which here, would involve placement of mine waste on the existing 4-5 acres of wetlands. This should be identified as a significant impact that requires at the very least, a one to one mitigation ratio for wetlands.

Given the speculative nature of the analysis and the likelihood that the Centennial cleanup design will change, biological impacts should be assumed to be significant and unavoidable. The goal of CEQA is to conservatively identify, in an accurate, transparent, and user-friendly way, ALL of the potentially significant impacts associated with the Project, which very easily could include several additional biological and hazardous materials impacts if DTSC chooses a different alternative for the Centennial clean up.

Accordingly, the DEIR must incorporate the Centennial cleanup to provide a clear and accurate picture of impacts and identify this impact as potentially significant.

**b. Geology Analysis is Flawed Based on the Centennial Approach**

Moreover, the vegetated communities post remediation are not handled consistently throughout the document leading to an undercounting of geological impacts. For example, the DEIR assumes that approximately half of the Centennial Site will have been disturbed by the remediation, leading to a much smaller footprint of impacts associated with the subsequent engineered fill and placement of mine waste. But the opposite is anticipated in the geology chapter. In the geology analysis, the DEIR assumes that the erosion concerns associated with future mine waste will be avoided because the area will be revegetated after remediation in accordance with DTSC oversight pursuant to the Final RAP. (DEIR, p. 4.6-35.) The DEIR assumes in the biology analysis the vegetated areas will be gone – thereby avoiding significant impacts to special status species habitat, but for geology, the area will be revegetated to avoid erosion. The DEIR cannot have it both ways. The remediated Centennial Site will either be revegetated and address erosion, thereby resulting in additional biological impacts from the placement of new mine waste OR the area will remain disturbed and therefore must be identified as a geological impact. This is just one example of the flawed analysis that results from the inconsistent use of the Centennial cleanup as part of the baseline and highlights why the cleanup must be part of the Project, incorporated into all impact areas, and the DEIR must be recirculated. The current draft simply does not provide the public or decision-makers with an accurate picture of impacts.

Grp 20-9

**c. Hazard Impacts Are Undercounted As a Result of Centennial**

Similar to biology, the DEIR assumes that all contamination at the Centennial Site will be magically cleaned up by the start of Project impacts and thereby concludes that potential contaminants "do not exist under the adjusted baseline condition." (DEIR, p.4.7-3.) The approach avoids any analysis of the various remedial designs being considered in the draft RAP and undercounts any potential remaining contamination that could be impacted by the placement of additional mine waste and construction efforts. As described above, the ultimate remedial action does not guarantee that all contaminants will be removed as the design will be chosen based on feasibility, implementability, and cost, and may not address all contaminants. The DEIR must conservatively assume that some contaminants may remain at Centennial that could be impacted by the placement of additional mine waste. Once again, the DEIR has used the creative future baseline to magically erase potentially significant impacts associated with hazards that could pose a significant risk to health and human life.

Grp 20-10

The Centennial Site is a superfund site that only avoided formal designations as a result of the Voluntary Cleanup Agreement agreed to by Rise Gold; however, the site remains significantly contaminated. These existing conditions cannot be glossed over in the DEIR, and the hazards

section must conservatively analyze potential additional impacts of placing mine waste on an area that has not been fully remediated. Indeed, all substantial evidence suggests that the RAP has not been completed, has not been shared with the public, and may not address all potential and future contaminants that could exist at the site post cleanup.

**d. Cumulative Impacts Are Underestimated As a Result of Centennial**

Grp 20-11

Perhaps the most egregious issue with the Centennial baseline approach is the resulting Cumulative Impact analysis, which inconceivably fails to include Centennial cleanup one of the projects that must be viewed cumulatively with other Projects to conservatively identify all cumulative impacts. CEQA defines "Cumulative impacts" as "two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts." (CEQA Guidelines §15355.) The cumulative impact from several projects is the change in the environment which results from the incremental impact of the Project when added to other closely related *past, present, and reasonably foreseeable probable future projects*. If not included as part of the Project, the Centennial cleanup should at the very least be included in the cumulatives analysis to give the public an accurate picture of all potential impacts occurring at the Centennial Site, including air quality and traffic impacts from truck hauling, hazard impacts from contaminant exposure, etc. Yet, incredulously, the cumulative projects list does not include the Centennial cleanup, which is – depending upon how you look at it- either a past, present, or future project that will cause cumulative impacts when considered with this Project. In removing the Centennial cleanup from this critical part of the analysis, the DEIR avoids identifying potentially significant and unavoidable cumulative biological, air quality impacts, hazards, geological, aesthetics, among others. This section must be revised to include the Centennial Site and to identify potentially significant cumulative impacts.

By excluding the Centennial cleanup work from the Project and from the analysis, the DEIR woefully undercounts cumulative impacts and fails to provide the public with an accurate accounting of likely Project impacts. This section must be revised and the DEIR must be recirculated.

**4. Biological Analysis is Flawed**

In addition to the above, the biological analysis must be revised to address the following flaws in the analysis:

Grp 20-12

**a. Pinehill Flatbush**

The DEIR identifies potentially significant impacts to the Pinehill Flatbush on the Centennial site, but cannot possibly know the exact level of potential impacts without first confirming the design of the Centennial clean up. (DEIR, p. 2-37). The County makes an assumption that the clean-up will impact 28 acres, but also admits that such numbers may be different if DTSC chooses a different clean up alternative. (DEIR, p. 2-2) Again, highlighting the failures of the analysis. There are significant populations of this plant species that must be adequately analyzed and protected by incorporating the Centennial cleanup.

**b. Foothill Yellow-Legged Frog (FYLF)**

Grp 20-13

The FYLF frog is state listed under the California Endangered Species Act ("CESA") and was proposed to be listed as endangered under the Federal Endangered Species Act ("FESA") on December 28, 2021 (86 FR 73914, December 28, 2021). The DEIR identifies potentially significant impacts to this species, which impacts are, as described above, not correctly quantified as a result of the Centennial baseline issue, and may be far more significant than currently

described. Any impacts to a CESA listed species will require Section 2081 Permit from the California Department of Fish and Wildlife ("CDFW") prior to construction, and may require an Incidental Take Permit under the FESA from the US Fish and Wildlife Service ("USFWS") if the proposed rule becomes final. Rather than require that the applicant consult with the CDFW and USFWS now to ensure protection of this endangered species, the DEIR fails to mitigate this risk and requires agency consultation only after construction starts. (See DEIR, Mitigation Measure 4.4-2(a).) At this point, the Project would be underway, and it may be too late for Rise Gold to obtain either a Section 2081 Permit from CDFW or an ITP from the USFWS. Indeed, there is no guarantee that such permits would be granted by either CDFW or the USFWS.

Section 2081 Permits regularly take 1-3 years to obtain. Mitigation Measure 4.4-2(a) must be revised to require Rise to consult with both CDFW and USFWS prior to the start of construction to obtain any necessary take permits for the FYLF. In the alternative, the mitigation measure must require Rise to halt all construction if and when the species is found until Rise has obtained an ITP or 2081 Permit for the species. The DEIR cannot assume that CDFW would issue such a permit as such authorizations are completely discretionary and regularly denied. Accordingly, such impacts must be mitigated up front to reach a less than significant conclusion or identified as potentially significant and unavoidable.

The failure of the DEIR to include such protective measures, which are regularly required by CDFW as a responsible and trustee agency under CEQA, raises the issue of whether CDFW was appropriately consulted in the preparation of this DEIR as required under CEQA to ensure that the proposed mitigation measures are viable. (*See SCVWater District v SFRWQCB* 59 Cal.App.5th 199 2020.) Any mitigation measure that requires input and approval from CDFW, should involve direct consultation between CDFW and the County before finalizing the CEQA document.

Accordingly, we respectfully ask for clarification in the response to comments document clarifying the consultation with CDFW in the preparation of this DEIR.

**c. California Red-Legged Frog (CRLF)**

**Grp 20-14**

The CRLF is a federally listed endangered species that may be significantly impacted by this Project, but the DEIR offers only deferred mitigation to ensure its protection. (DEIR, MM 4.4-2(c), p.2-41.) Similar to the YLF, the DEIR cannot cross its fingers and hope that the species is not there, only then require consultation with the USFWS after the fact. The DEIR must identify any potential impacts to federally listed species as potentially significant, must require the applicant to consult with USFWS, identify impacts, and complete Section 7 or Section 10 consultation to ensure that impacts to RLF are mitigated to less than significant levels. Without such assurances, the DEIR should identify these impacts as significant and unavoidable.

**d. California Black Rail (CBR)**

**Grp 20-15**

The California Black Rail is not only state-listed as threatened, but is also a fully protected species under the California Department of Fish and Game Code. Fully protected species cannot, under any circumstances, be taken or impacted without violating state law. No permits can be given by CDFW to impact fully protected species. The DEIR incorrectly suggests that if a CBR is identified, Rise can obtain a take permit from CDFW for this species. (See DEIR, MM 4.4-2(d).) CDFW cannot grant any take permits for fully protected species. Accordingly, MM 4.4-2(d) is not feasible and must be revised. Had the County consulted with CDFW prior to issuing the DEIR, CDFW would have clarified such issues and ensured feasible mitigation. The Project must be designed to to avoid all impacts to fully protected species such as the CBR. Not only should CDFW weigh in on potential impacts as both a trustee and responsible agency under CEQA, but the County must revise the determination to call out this impact as potentially significant and unavoidable.

Moreover, the impacts to the CBR and other bird species must be revised to analyze the potential long-lasting impacts to sensitive species habitats from long-term vibration and noise from the 80-year operation of the mine, including mine blasting, truck trips, hauling mine waste, etc. Such noise impacts have been known to cause long-term harassment of bird species.

**e. Biological Impacts Should be Identified as Significant and Potentially Unavoidable.**

**Grp 20-16**

Given the unknown impacts associated with the Centennial cleanup, the potential for take of state and federally listed species, and the potential for impacts to fully protected species that cannot be authorized by permit, such impacts should be identified as significant and potentially unavoidable.

**5. Air Quality Analysis is Flawed**

Many others in the community have provided detailed comments on the air quality analysis that we support, including the Baseline Environmental Consulting Report, February 15, 2022, included with comments from Shute, Mihaly, and Weinberger, March 30, 2022, which we will not restate here, but fully support.

**Grp 20-17**

The air quality analysis fails to include the significant impacts associated with the Centennial cleanup, and must be revised for that reason alone. In addition, the air quality, greenhouse gas and energy use analysis must be revised to address a more accurate project timeline. The Project description suggests a construction timeline of 18 months. (DEIR at 3-37.) But, the DEIR's air quality analysis assumes that Project construction would last for only 12 months, and bases its impact evaluation on that assumption. (DEIR, pps. 4.3-44 to 4.3-46, 4.3-66 to 4.3-67, 4.3-74. Moreover, the DEIR fails to address significant air quality emissions from operation of the mine for the next 80 years, including emissions of criteria air pollutants that must be mitigated. The DEIR currently relies on mitigation offsets that lack performance standards and therefore cannot be relied upon to mitigate significant impacts to less than significant levels. Moreover, the DEIR relies on mitigation measure 4.3-1(b) which requires Tier 4 engines to reduce significant emissions when 'commercially reasonable' which is defined vaguely to mean 'available taking into consideration factors such as critical path timing of construction and geographic proximity of the equipment location to the project sites.' With language this vague, the applicant can claim that tier 4 engines are not 'commercially available', leaving this impact unmitigated. Tier 3 engines will not be sufficient to mitigate this impact to less than significant levels, as a result this impact should be identified as potentially significant and unavoidable.

**6. Hydrology Analysis is Flawed**

Many experts in the community have highlighted significant concerns with the hydrological analysis (see Baseline Report referenced above), which comments we fully support. In addition, we highlight the following major concerns with the hydrology analysis.

**Grp 20-18**

**a. Analysis of 31 wells is a gross underestimate.**

The DEIR concludes that the significant discharges, hydromorphology, and dewatering (of at least 300 wells) associated with this Project can be mitigated to less than significant levels, mostly by relying on general permits issued by the Water Board and using insufficient modeling data (DEIR, p. 2-78.) In 1996, the County approved a much smaller project at the mine for only 5 years that was estimated to impact 101 wells. The DEIR and the Water Supply Assessment ("WSA") for the

Project conclude, with no evidence to contradict the County's previous studies, that the much larger mine Project – which will continually pump 2,500 gallons per minute for the first 6 months, 850 gallons per minute over the next 80 years – will impact only 7 wells, at most 31. Experts in the community have reviewed the hydrology report that supports the WSA, and have identified extensive errors, including issues with the groundwater modeling and underlying assumptions. (See Baseline Report for additional details.)

**Grp 20-19**

During its public meeting to review the WSA on February 9, 2022, the Nevada Irrigation District ("NID") the agency responsible for providing additional hookups to residents that lose their well water supply highlighted their concern about the veracity of these conclusions and subsequently asked the Planning Commission on March 24, 2022, to revise the DEIR to require Rise to provide a security bond of up to approximately $14 million to support likely future hookups that likely will be required as a result of this Project's impacts to groundwater wells. This requested mitigation measure from the expert agency on water supply should be incorporated, and this should be identified as a potentially significant and unavoidable impact that requires recirculation of the DEIR.

**b. Mitigation Measures Are Insufficient to Reduce Well Impacts to Less than Significant Levels**

**Grp 20-20**

CEQA requires mitigation measure to be fully enforceable through permit conditions, agreements or other legally-binding instruments (CEQA Guideline 15126.4). Mitigation Measure 4.8-2 requires Rise to provide 31 new water connections by constructing a water line along Bennet Road, but NID has not committed to granting such new connections. These connections will be subject to discretionary approvals that may not be granted. Accordingly, this mitigation measure cannot be deemed fully enforceable or achievable and the DEIR must identify potential impacts to groundwater wells as significant and unavoidable, which triggers a recirculation of the DEIR. Even if such a measure were enforceable by the County, which it is not, the mitigation measure does not mitigate the impact to less than significant levels. People could potentially lose access to water supplies forever, rendering their property essentially worthless. This potentially significant and unavoidable impact needs to be identified in the DEIR.

**7. Permitting Overview is Flawed and Leads to Insufficient Mitigation**

**a. Water Board Permitting is Flawed and Leads to Deferred Mitigation With the Incorrect Performance Standard**

**Grp 20-21**

The DEIR repeatedly and falsely claims that this Project, which will involve the pumping of 2,500 Gallons per minute for initial dewatering (815 Million gallons over 6-month period) and 850 gpm over the life of the 80-year project will fall under the State Water Board's General Permit for Limited Threat Discharge Permit (General Order R5-2016-0076; NPDES No. CAG995002) ("Limited Threat General Order"). The DEIR explicitly relies on the use of this General Order to ensure that hydrology impacts from discharges will be less than significant. (DEIR, pp.2-78, 3-15 to 3-18, 4.8-28) The extensive discharges this Project would cause for the next 80 years do not pose a 'low threat', but rather pose a significant threat to groundwater resources and the hydromorphology of Wolf Creek and the surrounding sensitive resources, and will not qualify under the Limited Threat General Order for many reasons, including but not limited to the fact that the proposed discharges:

i. Will exceed discharge limitations;

ii. Will not meet the required effluent limitations in the Limited Threat General Order based on the levels of ammonium, manganese, and likely other metals in the discharged effluent;
iii. Likely will violate the Basin Plan by impacting beneficial uses of receiving waters;
iv. May contain acid mine drainage;
v. May exceed TMDLs at the point of discharge;
vi. Will alter temperature > 5 degrees;
vii. May cause acute or chronic toxicity in receiving water; and
viii. May a nuisance under 13050 of the Water Code.

**Grp 20-22**

For all of these reasons, it would be highly inappropriate for the Water Board to allow this applicant to use the Limited Threat General Order to permit these extensive discharges, which will last 80+ years. Similarly, it also inappropriate for the DEIR to rely on the use of such a General Order to conclude that the Project will result in less than significant impacts under CEQA. (DEIR, pp.2-78, 3-15 to 3-18, 4.8-28; Mitigation Measure 4.8-1(a).). The DEIR should be revised to clarify that the Project will require an individual NPDES permit for proposed water discharges. Moreover, Mitigation Measure 4.8-1(a) should be revised to require an individual NPDES Permit under Section 402 of the Clean Water Act and an individual Waste Discharge Requirement ("WDR") under the California Porter-Cologne Act for such extensive discharges to ensure that discharges proposed for this Project will be mitigated to less than significant levels. The current mitigation measure relies on the use of an inapplicable permit to the Project, and accordingly, does not currently reduce the significant impacts from discharges to less than significant levels. The measure must be revised and the DEIR must be recirculated.

**Grp 20-23**

Based on this underestimate of permitting requirements, it is not clear whether the Water Board was consulted in the preparation of this DEIR as a responsible agency under CEQA as required under the CEQA Guidelines. Similar to the request regarding CDFW, we respectfully request that the County include in the response to comments document a description of its consultation with responsible and trustee agencies in the preparation of this DEIR.

**Grp 20-24**

**8. Conclusion**

For all of the reasons stated above, the DEIR is not adequate under CEQA and cannot be certified. It is imperative that the County revise and recirculate this DEIR to provide the public and decision makers with an accurate picture of all impacts that will be caused by this Project. To protect itself from legal liability and to protect this beautiful community, the DEIR must be revised and recirculated.

Thank you for your careful attention to this Project of critical concern to the residents of Nevada County.

Sincerely,

Jillian B. Blanchard
Managing Partner
Rudder Law Group, LLP

## Central Valley Regional Water Quality Control Board

24 September 2021

Dean Wright, Project Manager
Site Evaluation and Remediation Unit
Department of Toxic Substances Control
8800 Cal Center Drive
Sacramento, CA 95826

***REVIEW OF DRAFT FINAL REMEDIAL ACTION PLAN CENTENNIAL M-1 PROPERTY, NEVADA COUNTY***

Central Valley Regional Water Quality Control Board (Central Valley Water Board) staff has reviewed the 25 January 2021 *Draft Final Remedial Action Plan* (RAP) for the Centennial M-1 Property (the Site) located at 10344 Centennial Drive in Grass Valley, Nevada County. The RAP was prepared pursuant to a Voluntary Cleanup Agreement (VCA; Docket No. HSA-FY18/19-014) between Rise Grass Valley Inc. (the Proponent) and the California Department of Toxic Substances Control (DTSC). NV5, an engineering services company, prepared the RAP on behalf of Rise Grass Valley Inc. Pursuant to the VCA, DTSC is the State lead agency for oversight of site characterization, remedy selection, and implementation of the cleanup activities. The Central Valley Water Board is a support agency for the project.

**SITE INFORMATION AND DTSC RAP APPROACH:**

The Site is historically associated with the Idaho Maryland Mine, a former underground hardrock (lode) gold mining operation. Historical mining and milling structures associated with the former mine were generally located to the east of the Site, and the Site was used primarily for disposal of mine waste (tailings and waste rock) to land. The historical tailings ponds comprise approximately two-thirds of the Site (37.1 acres of 56.4-acres).

Site investigation has identified mill tailings, waste rock, and impacted soil that contain lead, arsenic, mercury, and other metals at concentrations exceeding background soil metals concentrations and regulatory benchmark concentrations. Elevated metals concentrations present a potential human health risk resulting from routine, long-term exposures including ingestion, inhalation of dust or vapors, and dermal contact. In addition, contaminated mine waste presents potential risks to ecological health and water quality.

The Site is zoned for industrial development (M1). A specific development plan has not been prepared. Prior to Site development for industrial/commercial use, the contaminated mine tailings are to be remediated under DTSC oversight. The RAP was prepared to outline the proposed remedial action based on the results of the risk assessment presented in the Preliminary Environmental Assessment (NV5, 2020). The purpose of the RAP is to evaluate

remedial alternatives and to select a remedial alternative that reduces, to the extent feasible, the risks associated with environmental conditions identified at the Site. The evaluation of remedial alternatives considers the effectiveness, implementability and cost associated with each alternative. The RAP also outlines procedures for excavation, on-site treatment, and consolidation of mining waste as engineered fill in an area that will be subject to land use controls at the Site.

A Remedial Design Implementation Plan (RDIP) will follow with more specific design documents and supporting details.

**CENTRAL VALLEY WATER BOARD REQUIREMENTS**

The following Water Board requirements apply to the work outlined in the RAP:

Water Code 13304, subdivision (a) provides in part that:

> *A person … who has caused or permitted, causes or permits, or threatens to cause or permit any waste to be discharged or deposited where it is, or probably will be, discharged into the waters of the state and creates, or threatens to create, a condition of pollution…, shall, upon order of the regional board, clean up the waste or abate the effects of the waste, or, in the case of threatened pollution…, take other necessary remedial action, including, but not limited to, overseeing cleanup and abatement efforts.*

Water Code, section 13050, subdivision (q)(1) defines mining waste as follows:

> *"Mining waste" means all solid, semisolid, and liquid waste materials from the extraction, beneficiation, and processing of ores and minerals. Mining waste includes, but is not limited to, soil, waste rock, and overburden, as defined in Section 2732 of the Public Resources Code, and tailings, slag, and other processed waste materials, including cementitious materials that are managed at the cement manufacturing facility where the materials were generated.*

Title 27 California Code of Regulations (Title 27) Mining Waste Management Regulations (Cal. Code Regs., tit. 27, § 22470 et seq.) apply to all discharges of mining wastes and to owners/operators of a waste management unit for the treatment, storage, or disposal of mining waste.[1] The Mining Waste Management Regulations further define "mining waste" as:

> *waste from the mining and processing of ores and mineral commodities. Mining waste includes: (1) overburden; (2) natural geologic materials which have been removed or relocated but have not been processed (waste rock); and (3) the solid residues, sludges, and liquids from the processing of ores and mineral commodities.* (Cal. Code Regs., tit. 27, § 22480, sub.(a)).

Under Title 27, the Site constitutes an "inactive mining waste management unit," which is defined as:

> *any area containing mining wastes which is located at a present or former mining or milling site, and where all mining operations and discharges of mining waste ended*

[1] Authority cited: Water Code § 13172; Cal. Code Regs., tit. 27, § 20080(h).

*and have not been resumed for 5 years, or more.* (Cal. Code Regs., tit. 27, § 20164.)

Further, under Title 27 (see Cal. Code Regs., tit. 27, § 22470, subd. (a)), the Site's inactive mining waste management units are subject to reporting requirements and siting/construction standards determined to be feasible with regard to in situ containment of waste (see Section 20090, subd. (d)). Applicable and feasible requirements under Title 27 include (without limitation) those provisions pertaining to the containment, closure, and post-closure maintenance of inactive mining waste management units. (See Cal. Code Regs., tit. 27, §§22470-22510.)

The Central Valley Water Board reserves the right to designate additional Title 27 provisions to the inactive mining waste management units.

**CENTRAL VALLEY WATER BOARD PERMITTING REQUIREMENTS**

The following permitting requirements may apply to the project.

1. If a U.S. Army Corps of Engineers Clean Water Act Section 404 permit is required for the project, a corresponding Clean Water Act Section 401 Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. For more information on the Water Quality Certification, visit the Central Valley Water Board website at:
https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

2. If the U.S. Army Corps of Engineers determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project will require a Waste Discharge Requirement (WDR) permit to be issued by the Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands are subject to State regulation.

   The State Board's "Procedures for Discharges of Dredged or Fill Material to Waters of the State" state that "Unless excluded by section IV.D, applicants must file an application with the Water Boards for any 111 activity that could result in the discharge of dredged or fill material to waters of the state in accordance with California Code of Regulations, title 23, section 3855." (p. 4)

   For more information on the Water Quality Certification and WDR processes, visit the Central Valley Water Board website at:.
   https://www.waterboards.ca.gov/centralvalley/help/permit/#wqcapp

3. Dischargers whose projects disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ, as amended by 2010-0014-DWQ, and 2012-0006-DWQ, NPDES No. CAS000002. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground (such as stockpiling or excavation) but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit

requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/construction_general_permits/

4. Storm water discharges associated with industrial sites must comply with the regulations contained in the Industrial Storm Water General Permit No. 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/index.shtml.

5. If the proposed project includes dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are covered under the *General Waste Discharge Requirements/NPDES Permit for Limited Threat Discharges to Surface Waters* Order R5-2016-0076-01/NPDES Permit No. CAG995002 (Limited Threat General Order). A complete application must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/

6. If post remediation use of the Site includes placement of soil/waste rock (i.e. mining waste) from the proposed Idaho-Maryland Mine-Rise Grass Valley project, site activities will require Title 27 waste discharge requirements. See Specific Comment #1 for further discussion.

**CENTRAL VALLEY WATER BOARD COMMENTS**

**General Comments:**

1. Information provided in the RAP is comparable with information which would be submitted to a Regional Board in a Report of Waste Discharge (Water Code §13260) for Title 27 waste discharge requirements for discharges of mining waste and contains similar information required by the Title 27 Mining Waste Management Regulations. As required by Title 27, sections 22480 through 22510, the RAP has:
    a. characterized and classified the mining waste,
    b. identified the potential risk of water quality degradation for both surface water and groundwater,
    c. identified treatment and containment strategies, and
    d. specified mining unit siting and construction standards, monitoring requirements, and closure and post closure maintenance requirements, including financial assurances.

2. The term "engineered fill" discussed throughout the RAP is considered a "mining unit" as defined in Title 27, section 22470 because the engineered fill material is derived from material classified under Title 27 as mining waste. As such, Title 27 regulations pertaining to mining units are applicable.

3. The terms "chemical stabilization", "cement stabilization", and "stabilization" are viewed as referring to "treatment" as identified in Title 27, section 22480, subdivision (d).

4. To the extent feasible, the cumulative impacts to water quality incurred by the project described in the RAP and potential future discharge of mine waste generated by the proposed Idaho-Maryland Mine-Rise Grass Valley project should be considered in a single environmental document. This seems particularly relevant considering the potential use of the Centennial Property for management and reuse of mine waste generated by the proposed Idaho-Maryland Mine-Rise Grass Valley project. Given the information currently available to us, staff are unable to assess the cumulative impacts to water quality or whether the existing environmental document prepared for the RAP is adequate to support future WDRs for Waters of the State (see Permitting Requirement 2).

**Specific Comments:**

1. **Section 1.4.1 DTSC Comments on Draft RAP**
   4. *DTSC has been made aware that post remediation use of the property may include additional soil/waste rock being brought on the Site from the nearby mine if/when it reopens. If such a post remedial use of the property is envisioned, DTSC believes its potential impacts on the remedy or maintenance of the remedy should be briefly discussed in the RAP in the interest of full disclosure to the public.*

   **Comment:** If post remediation use of the Site includes placement of soil/waste rock (i.e. mining waste) from the proposed Idaho-Maryland Mine-Rise Grass Valley project, the Central Valley Water Board would exercise its Water Code section 13172 authority and Title 27, section 20080, subdivision (h) to regulate the discharges of mining waste. Additionally, the discharge of mining waste at the remediated Site will require submittal of a Report of Waste Discharge and issuance of Waste Discharge Requirements from the Central Valley Water Board (Water Code §13260).

2. **Section 2.6.3 Intended Use of the Property**
   *The remedy described in this RAP includes the consolidation of mine waste as engineered fill, and placement of clean engineered fill as a cap over the consolidated mine waste.*

   **Comment:** The use of clean engineered fill as a cap over the consolidated mining waste may be appropriate for Group C mining waste (see Cal. Code Regs., tit. 27, §22490, subd. (c) and Table 1.3). However, the following details are needed, either in the final RAP or RDIP:
   a. run-on/run-off controls (Cal. Code Regs., tit. 27, §22490, subd. (h)(3) and §20365, subd. (e)),
   b. the source or origin, soil properties, and stability of the clean engineered fill,
   c. whether the cap will be vegetated or stabilized to prevent erosion as required by California Code of Regulations, title 27, section 22510, subdivision (m), and
   d. specific plans to keep the mining unit "high and dry".

3. **Section 3.4.4 Summary of Water Quality Evaluation**
   *Laboratory results indicate that the potential for acid generation is low and the potential for discharge or leaching of heavy metals at concentrations that would significantly impact surface water or groundwater quality is low. Based on these results the mine waste excluding the TP19 hot spot, when considered as a whole, can be managed as Group C mine waste as defined in CCR Title 27 Section 2248(b).*

**Comment:** Central Valley Water Board staff concurs with the characterization and classification methodology for the mining waste and the proposed treatment of the TP19 Hot Spot material (see General Comment 2 above). We also concur with the RAP's assessment, that when considered as a whole, the waste can be managed as Group C mining waste in accordance with Title 27 Mining Waste Management Regulations.

4. **Section 7.7.5 Characterization for On-Site Placement**
*Characterization of affected mine waste and soil was performed as part of the site investigation. Mine waste and affected soil that is* (sic) *to be placed on-site will not require further characterization.*

**Comment:** The RAP does not propose any confirmation sampling to demonstrate removal of mining waste. Typically, these types of projects include confirmation sampling (e.g., field characterization such as X-ray fluorescence with a subset of laboratory samples) to demonstrate achievement of cleanup goals. Why is this not needed for this project and what method(s) will be used as the basis for evaluating that contaminated soil (mining waste) has been removed?

5. **Section 7.8.1 Deed Restriction**

**Comment:** Is it reasonably anticipated that soil/waste rock (i.e. mining waste) from the proposed Idaho-Maryland Mine-Rise Grass Valley project could in the future encroach upon or cover the deed restricted engineered fill? If so, is this a cause for concern?

**CLOSING**

The draft Final RAP should be revised to address Central Valley Water Board staff's comments. Staff understands that a RDIP will follow with more specific design documents and supporting details. We request the opportunity to review and offer further comments on the Final RAP and RDIP.

Please contact Jeff Huggins at (916) 464-4639 or Jeff.Huggins@waterboards.ca.gov with any questions regarding the contents of this letter. We are available to meet with you if you would like to discuss the applicable Water Board requirements or potentially applicable permits.

## GROUP LETTER 20: JILLIAN BLANCHARD, RUDDER LAW GROUP, LLP

### Response to Comment Grp 20-1

The commenter generally asserts that the DEIR is inadequate and should be revised and recirculated. The commenter states that reason for recirculation is the DEIR's failure to describe the project, identify significant impacts, identify feasible mitigation measures to minimize impacts and failure to identify alternatives that would avoid impacts. This comment is general in nature and does not specifically identify any defect in the DEIR. Accordingly, no further response is required. Responses to the commenter's specific concerns are provided below.

### Response to Comment Grp 20-2

The commenter asserts that the DEIR is deficient because it does not include the Centennial site cleanup project. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Grp 20-3

The commenter asserts that the Notice of Preparation (NOP) states that the Centennial Cleanup Project was "part of the proposed project" and that now the project description has been changed to remove the cleanup work from the scope of the project, requiring a new NOP to be released. However, the commenter mischaracterizes the text of the NOP, which clearly states that, "The Project Applicant is working with the California Department of Toxic Substances Control (DTSC) to develop a plan to consolidate and cap the contaminated soils in a manner consistent with current federal and State regulations, separate from the proposed project." (NOP, p. 5.) The language cited by the commenter is provided out of context, as the referenced sentence states that the engineered fill will be placed on the Centennial site as part of the project *after* the DTSC cleanup is completed as follows: "The environmental cleanup work at the Centennial Industrial Site will be completed under the DTSC voluntary cleanup program. After such environmental cleanup work is completed, as part of the proposed project, engineered fill from the Brunswick Industrial Site would be placed, graded, and compacted on the Centennial Industrial Site." (NOP, p. 7.) As such, the Project Description in the DEIR is consistent with the NOP. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Grp 20-4

Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Grp 20-5

Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Grp 20-6

As discussed in Section 1.3 of the DEIR, the baseline for the Centennial Site was adjusted because the proposed project could not possibly impact that site until and unless the DTSC cleanup project has already been completed. As such, presenting the project's impacts to the Centennial Site based on the pre-DTSC Project conditions would be misleading to the public and decision-makers and would not represent the actual project impacts. This adjusted baseline is appropriate under CEQA Guidelines Section 15125(a)(1), and is supported by substantial evidence in the record. Please see Section 1.3 of the DEIR and Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

The commenter incorrectly asserts that the Centennial Site is a "Superfund" site. The Centennial Site has never been on the National Priorities List[8] (A "Superfund site"). The Centennial Site has never been proposed to be placed on the National Priorities List (NPL). The USEPA has prepared a Site Inspection Report in 2019 for the Centennial site but did not score the site using the Hazard Ranking System (HRS). The HRS is the primary method used to place sites on the NPL[9].

## Response to Comment Grp 20-7

The commenter asserts that the DEIR must be revised to include the DTSC project in the Project Description. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 20-8

The commenter asserts that the project should assume that the DTSC project will not impact the wetlands on the Centennial Site and that all wetlands should be assumed to be impacted by the project, as the impact is speculative. As such, the commenter asserts that the DEIR must conclude that the impact to wetlands is significant and unavoidable, and at the very least, wetlands mitigation at a 1 to 1 ratio should be provided. The remaining wetlands that could be onsite after the DTSC cleanup project is complete are calculated in the EIR based on the expected impact under DTSC's existing remedial action plan, not on mere speculation. As shown in Figure 4.4-9 of the DEIR, most of the existing wetlands that will be removed in the cleanup project are directly on top of the historic mine tailings and therefore must be removed in order to excavate the historic tailings as part of the cleanup project. Rather, the commenter's assertion that public comments on DTSC's IS/MND, asking DTSC to revise the RAP to avoid more wetlands, could significantly alter the footprint of the disturbed area on the Centennial Site, is speculative. The DEIR's reliance on the RAP and the IS/MND for the DTSC cleanup project is substantial evidence, while reliance on the commenter's arguments would be speculation. Further, Mitigation Measure 4.4-3(c) already requires coordination with the Corps and mitigation of wetlands in accordance with the Corps' no-net-loss policy, which therefore already requires at least a 1 to 1 mitigation ratio. As such, the impact analysis is based on substantial evidence and the mitigation would fully address additional wetlands impacts, even in the case where there were more wetlands existing onsite after the DTSC cleanup project than anticipated in the DEIR. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 20-9

The commenter suggests that the portions of the Centennial Site that are revegetated after Centennial cleanup will contain biological resources. The commenter does not provide evidence that biological resources protected pursuant to federal, state, or local laws will be supported by revegetation efforts with erosion control seed mixes. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 20-10

The commenter asserts that the Centennial site is a superfund site; however, this is not correct. The Centennial site is the subject of a separate DTSC cleanup project, not a superfund cleanup. After the DTSC cleanup project is complete, the Centennial Site would be subject to restrictions imposed by DTSC such as restrictions on penetration of the protective cap placed on any capped contaminated soils, with which the project would need to comply to avoid release of those capped contaminated soils. As stated in Section 7.11 of the Remedial Action Plan, an Operation and Maintenance Plan is required to establish procedures for long-term operation, inspection, maintenance, monitoring, and regulatory reporting that are required to preserve the engineering

[8] https://www.epa.gov/superfund/superfund-national-priorities-list-npl
[9] https://www.epa.gov/superfund/about-superfund-cleanup-process#pasi

controls associated with the mine waste consolidation area. As such, the placement of engineered fill on the Centennial Site would not result in disturbance of the capped soils and would not result in hazard impacts related to release of that soil. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 20-11

The separate DTSC cleanup project on the Centennial site is a temporary construction project that would not result in permanent development of land, construction of structures, or permanent contribution to traffic, noise, or air quality that would combine with the proposed project's related effects. The commenter also mentions cumulative biological resource impacts. The DEIR, Impact 4.4-6, already identifies that the project, in combination with other cumulative development, could have a significant cumulative impact, and there is no evidence to suggest that the incremental effect of the loss of wetlands on the Centennial Site, attributable to remediation, would render this impact significant and unavoidable. The DTSC project would be required to mitigate its impacts through compliance with regulatory permit requirements for those resources. All projects within the County are required to mitigate for their impacts to biological resources, and in the case of wetlands, compliance with the USACE's no-net-loss policy. Accordingly, addition of the Centennial Site DTSC cleanup project would not result in a different cumulative impact conclusion for any resource area.

As stated in the DEIR (page 4.4-97), the proposed project's incremental contribution to the significant cumulative biological effect could be reduced with implementation of the mitigation measures required in this EIR.

Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 20-12

The commenter asserts that the DEIR is inadequate because there may be more Pine Hill Flannelbush onsite after the DTSC Project is complete than expected by the DEIR. However, Mitigation Measure 4.4-1(a) of the DEIR would apply to the Flannelbush found onsite, even if there were more than originally anticipated, involving implementation of a Habitat Management Plan for Flannelbush, seed collection, transplantation and monitoring to ensure success of transplants. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 20-13

Please see Master Response 4 - Clean-Up Project is a Separate Project under CEQA, regarding the Centennial Industrial Site baseline conditions for DEIR impact analysis.

As explained in Impact 4.4-2, Visual Encounter Surveys were conducted for Foothill Yellow Legged Frog and none were identified onsite. The DEIR conservatively considered this a potentially significant impact and required mitigation. Mitigation Measure 4.4-2(a) requires preconstruction surveys "no more than fourteen (14) days prior to disturbance." If the species is identified, the mitigation measure then requires that the mine operator immediately contact CDFW and then requires the appropriate state and federal permitting prior to the start of construction. Contrary to the commenter's assertion, state and federal permits should not be required unless there is a potential impact to the species, which based on surveys to date, will not occur. Please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

In addition, contrary to the commenter's assertion, both federal and state resource agencies (including CDFW) have been consulted throughout the environmental review including reviewing notices for both the Notice of Preparation and Notice of Availability.

The commenter also states that Foothill Yellow Legged Frog is proposed to be listed as endangered under the Federal Endangered Species Act. The project area is located within the Northern Sierra Unit, which is not proposed for listing.

## Response to Comment Grp 20-14

Please see Response to Comment 13 above and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

## Response to Comment Grp 20-15

As identified in DEIR Chapter 4.4, California Black Rail was considered to have a "very low" likelihood of being found onsite in the DEIR. Note that the DEIR reflected that California Black Rail is California Threatened, but it is also considered California Fully Protected. The DEIR has been amended to reflect the Fully Protected status for this species. Additionally, Mitigation Measure 4.4-2(d) requiring preconstruction surveys for California Black Rail, has been amended to remove reference to an ITP being obtained for take of California Black Rail if identified onsite during these preconstruction surveys. This species is considered to have a very low potential to be found onsite; nonetheless, surveys will be conducted prior to site disturbance, and consultation with CDFW and avoidance shall be required in the case of species presence, prior to commencement of on-site disturbance. For these reasons, the DEIR considered this impact less than significant after mitigation.

Noise impacts to wildlife and bird species were analyzed in Impact 4.4-2 and determined to be less than significant.

## Response to Comment Grp 20-16

The commenter asserts that biological impacts should be considered significant and potentially unavoidable due to the uncertainty of impacts, the potential for take of protected species and the potential for impacts to fully protected species. However, the mitigation measures required for the project require pre-construction surveys for special-status species, consultation with state and federal resource agencies if species are present, and require take permits of special-status species if take is possible. The project would not be allowed to obtain a take permit for any Fully-protected species found onsite, so avoidance of those species would be required. For these reasons, the County reasonably concluded that the required mitigation would reduce the biological impacts to less than significant after mitigation.

## Response to Comment Grp 20-17

Please see Responses to Comments Grp 21-122 to Grp 21-127 for responses to Baseline Environmental Consulting Group's air-related comments.

Regarding air emissions from the separate Centennial clean-up project, please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

Regarding construction timeline, please see Master Response 24 - Project Construction Schedule.

Regarding proposed use of Tier 4 engines during operations and criteria pollutant emissions, please see Master Response 19 - NSAQMD Criteria Pollution Thresholds during Operations.

## Response to Comment Grp 20-18

Please see Chapter 4.8 of the DEIR, Master Response 13 - Historic Hydrogeologic Assessments, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

For responses to Baseline Environmental Group's hydrology-related comments, see Responses to Comments Grp 21-110 to Grp 21-121.

## Response to Comment Grp 20-19

Please see responses to NID comments in Agcy Letter 10 of the Final EIR.

## Response to Comment Grp 20-20

The Water Supply Assessment relating to water supply for the project, including the connection of parcels along East Bennett Road, was approved by the Nevada Irrigation District in February of 2022. Accordingly, NID has already determined that sufficient water supply exists for these connections and has committed to providing water for the project and those connections.

## Response to Comment Grp 20-21

The commenter asserts that the project's discharge of treated water from the underground mine works would not qualify for coverage under the Limited Threat General Order. However, the commenter provides no evidence that the water could not be treated to meet the standards required for the Limited Threat General Order. In fact, the nearby Empire Mine and Northstar Mine both discharge treated mine water under the Limited Threat General Order, providing evidence that treatment methods are available to meet the Limited Threat General Order standards. Additionally, the DEIR requires installation of a water treatment plant specifically designed to meet the applicable standards. (See Mitigation Measure 4.8-1(a).) The County's independent expert reviewed the water treatment plant designs and confirmed that the treatment plant could meet the applicable standards. As stated on page 4.8-41 of the DEIR, "West Yost's technical peer review of Linkan's Water Treatment Plant Design Report confirmed that the proposed method of treatment would be adequate to successfully treat the mine water to comply with RWQCB effluent limitations, and identified items for Linkan Engineering to consider during the detailed design phase."

Regarding water temperatures, please see Master Response 32 – Temperature of Mine Water Discharge.

## Response to Comment Grp 20-22

Please see Response to Comment Grp 20-21 above.

## Response to Comment Grp 20-23

The regional water quality control board (RWQCB) was provided notice of the project's DEIR, and provided comments on the DEIR. Notably, the RWQCB did not state that the Limited Threat General Order was inapplicable, and rather confirmed that the RWQCB would review the notice of applicability when that is submitted, as is done for any project proposing to discharge under the Limited Threat General Order.

## Response to Comment Grp 20-24

The commenter asserts that the DEIR should be revised and recirculated. The County has determined that recirculation of the DEIR is not required, as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met.

Re: Idaho-Maryland Mine Project Draft Environmental Impact Report

Dear Mr. Kelley:

**Grp 21-1**

On behalf of Community Environmental Advocates Foundation (CEA), we respectfully submit these comments in connection with the Draft Environmental Impact Report (DEIR) for the Idaho-Maryland Mine Project (Project). CEA seeks to ensure any development and operations at the Project site protects the site's unique environmental resources and addresses the community's needs and concerns. To that end, the DEIR plays a critical role in informing the public and decisionmakers about the environmental impacts of the Project and how best to avoid these impacts through mitigation and alternatives to the Project. After carefully reviewing the DEIR, we have concluded that it fails to comply with the requirements of the California Environmental Quality Act (CEQA), Public Resources Code section 2100 et seq.

The EIR is "the heart of CEQA." *Laurel Heights Improvement Assn. v. Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 392 ("*Laurel Heights I*"; citations omitted). It is "intended to demonstrate to an apprehensive citizenry that the agency has, in fact, analyzed and considered the ecological implications of its action. Because the EIR must be certified or rejected by public officials, it is a document of accountability." *Id.* (internal quotations and citations omitted).

**Grp 21-2**

This DEIR's flaws prevent it from achieving its required informational purpose. An overarching defect is the DEIR's failure to accurately describe the Project. The DEIR's project description is legally inadequate because, among other things, it improperly excludes the required cleanup of existing contamination on part of the Project site (the Centennial Site) from the scope of the Project. In addition, the DEIR improperly uses post-cleanup conditions on the Centennial Site as the baseline for impact analysis instead of the existing conditions on the site.

**Grp 21-3**

The DEIR further violates CEQA because it fails to properly analyze or mitigate the Project's numerous significant environmental impacts. The Applicant is requesting a conditional

use permit (CUP) to operate the mine for 80 years. Yet, according to geophysicist and mineral exploration expert David M. Chambers, Ph.D., the design details of the Project, including its "engineered fill" have yet to be determined, so it is not possible to determine if the proposed design of the Project is geotechnically sound.[1] *See* Report from David Chambers, Ph.D., submitted under separate cover. Nor does the DEIR provide the necessary information on the geochemistry of the waste rock and tailings to evaluate the environmental impacts of the proposed mine's operations. *Id.*

**Grp 21-4**

In addition, the DEIR fails to adequately evaluate how the Project would affect hydrology and groundwater levels in the Project vicinity. The need for an accurate analysis cannot be overstated since even a slight drawdown in groundwater levels could severely affect those in the community that rely exclusively on well water. Among its many shortcomings, the DEIR fails to accurately describe the existing hydrologic conditions in the area, lacks thresholds of significance for evaluating the Project's impacts on groundwater supplies, relies on a flawed groundwater model, lacks *any* modeling of the Project's water quality impacts, and fails to identify effective mitigation capable of mitigating the few groundwater impacts the DEIR does disclose.

**Grp 21-5**

The DEIR fares no better in its analysis of noise and vibration impacts from on-going mining operations because it substantially underestimates the severity and extent of these impacts. The document largely relies on compliance with County standards to conclude that the Project's noise impacts would be less than significant, downplaying entirely that noise from the Project's operations could increase substantially in this quiet rural residential community. It fails to disclose the geographic extent of where noise and vibration impacts could occur and omits any analysis of noise impacts resulting from remediation of the Centennial Site. It also fails to provide an adequate analysis of noise and vibration impacts from the Project's ongoing blasting operations and disregards entirely the potential for these operations to cause sleep disturbance.

**Grp 21-6**

The DEIR's analysis of hazards and hazardous materials is equally deficient. Although there is no evidence that clean-up of the Centennial Site will occur prior to implementation of the Project, the DEIR simply assumes that such clean-up will occur. The document also fails to analyze or mitigate hazardous impacts relating to waste rock and mine tailings, opting instead to take a "trust us" approach when it promises to comply with environmental regulations. And

[1] The DEIR repeatedly refers to "engineered fill" but it never defines this term. The document appears to be trying to "rebrand" the prior mine's waste rock and mine tailings as "engineered fill," apparently in the hopes that the waste material can be transported off-site for use at various unspecified construction sites throughout the region as fill material, which would almost certainly result in numerous new contaminated waste sites that pose a threat to the public and the environment. Exhibit A (Baseline Environmental Report) at 3, 4.

despite the fact that the Project could cause a super-saturated plume cloud that could affect operations at the Nevada County Air Park, the DEIR fails to provide any analysis of this impact.

**Grp 21-7** The DEIR's analysis of air quality, greenhouse gas (GHG) emissions, and energy use also contains numerous flaws. First, the DEIR fails to analyze the effect that the cleanup of the Centennial Site would have on air quality, GHG emissions, or energy use, or the air quality impacts, GHG impacts, or energy impacts that may result from the proposed Project if the Centennial cleanup does not occur. Second, the DEIR's analysis of air quality impacts, GHGs, and energy use from Project construction assumes a construction timeline that contradicts the DEIR's description of the Project. Third, the DEIR improperly relies on assumed mitigation measures for air quality impacts, GHGs, and energy use, failing to acknowledge those measures as mitigation. Fourth, the DEIR fails to mitigate significant air quality impacts from operational emissions of criteria air pollutants. Fifth, the DEIR's Health Risk Assessment fails to disclose essential information and lacks substantial evidence to support its conclusions. Sixth, the DEIR's significance threshold for operational GHG emissions is unsupported. Finally, the DEIR relies on third-party GHG mitigation offsets which lack adequate performance standards and are improperly deferred.

**Grp 21-8** The DEIR also fails to meet CEQA's clear mandates because it does not provide a reasonable range of alternatives. The DEIR identifies the Project's significant and unavoidable impacts as those on aesthetics, noise, and transportation. Yet, except for the "no project" alternative, which would not meet any of the Project objectives, none of the examined alternatives would reduce the Project's impacts on aesthetics, noise, and transportation to a less than significant level. Moreover, given the Project's significant impacts in a range of areas, including GHG emissions, air quality, water supply and water quality, the DEIR must be revised to include alternatives that would reduce these impacts.

**Grp 21-9** Where, as here, the environmental review document fails to fully and accurately inform decisionmakers and the public of the environmental consequences of proposed actions, it does not satisfy the basic goals of CEQA. See Pub. Res. Code § 21061. As a result of the DEIR's numerous and serious inadequacies, there can be no meaningful public review of the Project. The magnitude of the revisions required to create a legally adequate EIR will require recirculation of a revised DEIR, not just publication of a Final EIR, to give decision-makers and the public an accurate understanding of the environmental issues at stake. *See* CEQA Guidelines[2] § 15088.5(a)(4).

**Grp 21-10** This letter, along with the February 15, 2022 report prepared by Baseline Environmental Consulting addressing air quality, GHG emissions, energy, hydrology, water quality, and hazards (attached as Exhibit A), and the March 9, 2022 prepared by Salter addressing noise and vibration (attached as Exhibit B) constitute our comments on the DEIR. Please refer to these reports for

[2] The "CEQA Guidelines" are found at Cal. Code Regs., tit. 14, § 15000 et seq.

further detail and discussion of the DEIR's inadequacies. We request that the County respond to both the comments in this letter and to each of the comments in the attached reports.

In addition, CEA will be submitting its own letter on the DEIR. We have reviewed this letter and concur with its findings. The CEA letter is hereby incorporated by reference into this letter.

## I. The DEIR's Flawed Project Description and Inaccurate Baseline Do Not Permit Meaningful Public Review of the Project.

Grp 21-11

The DEIR's project description is flawed for several reasons. First, it improperly excludes the cleanup of the Centennial Site from the scope of the Project. Second, the DEIR lacks a legally adequate baseline because it improperly uses post-cleanup conditions on the Centennial Site as the baseline for impact analysis instead of the existing conditions on the site. Third, the Project description is incomplete and unstable because it fails to adequately describe the duration of required permits and does not consistently describe the duration of Project construction or the phasing of mining and exploration activities over the entire permit period.

### A. Project Background

Grp 21-12

The proposed Project would reopen the abandoned Idaho-Maryland Mine in unincorporated western Nevada County near the City of Grass Valley. DEIR at 3-1, 3-12. The Project would involve underground gold mining within a 2,585-acre mineral rights boundary owned by the Applicant, Rise Grass Valley. *Id.* at 3-1. The Project's surface components would be spread across 175.64 acres, consisting of two sites, the 119-acre Brunswick Industrial Site and the 56.41-acre Centennial Industrial Site, as well as a potable water pipeline easement connecting the sites. *Id.* at 3-1, 3-12.

The Centennial Site is located immediately adjacent to the city limits of the City of Grass Valley, and is surrounded by light industrial and commercial uses. *Id.* at 3-11. The Brunswick Site is surrounded by rural residential neighborhoods of single-family homes and undeveloped open space. *Id.* Both sites are zoned for light industrial use. *Id.* at 3-1. The South Fork of Wolf Creek runs through the Brunswick Site, and the main stem of Wolf Creek runs through the Centennial site. *Id.* at 3-13, 3-16. Wetlands and riparian habitat are located along the main stem and South Fork of Wolf Creek. *Id.* at 3-10, 3-33, 4.4-2.

Both the Brunswick and Centennial sites were part of previous mining operations prior to the closure of the Idaho-Maryland Mine in 1956. *Id.* at 3-9. The Brunswick Site contains mine shafts which provided access to the mine, while the Centennial Site was historically used for dumping mine waste. *Id.* at 3-9 to 3-10. The Centennial Site contains mine waste contaminated with arsenic, lead, thallium, mercury, and nickel. *Id.* at 4.7-3. Because of this existing pollution and unstable soil conditions, the Centennial Site cannot be redeveloped until the contamination is

remediated. *Id.* at 3-10, 3-33. The Applicant has entered into a Voluntary Cleanup Agreement with the California Department of Toxic Substances Control (DTSC) for the voluntary cleanup of soil contamination on the Centennial Site. *Id.* at 3-10. DTSC is reviewing a proposed Remedial Action Plan (RAP) under which the Applicant would excavate contaminated soils, and consolidate and stabilize contaminated materials within a 5.6-acre area where they would be mixed with cement and capped with four feet of soil. *Id.*; *see* RAP, attached as Exhibit C.

The Project would require pumping approximately 2,500 acre-feet of groundwater ("dewatering") out of the abandoned underground mine over a six-month period before mining operations could begin. *Id.* at 3-11 to 3-12, 3-15. Gold mining and mineralization would then occur over an 80-year permit period, with a planned production of 1,000 tons of gold mineralization per day (365,000 tons per year). *Id.* at 3-19. Mining would occur 24 hours per day, 7 days per week. *Id.* at 3-18. Mining would require the daily underground detonation of ammonia nitrate fuel oil and packaged or bulk emulsion explosives. *Id.* at 3-19. The mine would generate approximately 500 tons of waste rock per day, which would be transported to the surface. *Id.* In addition, approximately 850 gallons of groundwater per minute would be pumped out of the mine on a continuous basis during operations. *Id.* at 3-18. Pumped groundwater would be discharged into the South Fork of Wolf Creek after treatment. *Id.* at 3-29.

The Project proposes to construct new aboveground processing facilities for gold and mine waste as well as water treatment facilities and a wastewater pond at the Brunswick Site. *Id.* at 3-11 to 3-12. Waste rock or tailings excavated from the mine would be dumped on the Centennial and Brunswick sites, where they would be graded into "engineered fill" pads intended to support future industrial development on both sites. *Id.* The fill pad at the Centennial Site would cover an area of 44 acres and contain 1.6 million tons of mine waste, while the fill pad at the Brunswick Site would cover 31 acres and contain 2.2 million tons of mine waste. *Id.* at 3-32 to 3-33. However, remediation of the Centennial Site under a DTSC-approved RAP would need to be completed before that site could be used for dumping waste from the mine. *Id.* at 3-10.

Once dumping begins, the DEIR estimates that the Centennial Site would be completely filled with mine waste in five years, and the Brunswick Site would be filled in six years. *Id.* at 3-26, 3-28. After the dumping areas at the Centennial and Brunswick sites have reached their maximum capacity, mine waste from the Project would be trucked offsite and disposed of elsewhere for the remainder of the 80-year proposed lease term. *Id.* Mine waste would be trucked offsite along Brunswick Road to SR 20/49. *Id.* at 3-29. Following completion of mining and processing activities, the Project proposes to restore the Centennial and Brunswick sites for future industrial use as outlined in a Reclamation Plan. *Id.* at 3-12.

**Grp 21-13**

**B. The DEIR Does Not Use the Correct Baseline of Existing Conditions at the Centennial Site.**

CEQA requires that an EIR include an accurate description of a project's environmental setting, which provides "the baseline physical conditions by which a lead agency determines whether an impact is significant." CEQA Guidelines § 15125(a). This baseline "should describe physical environmental conditions as they exist at the time the notice of preparation is published." *Id.* The purpose of this requirement is "to give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." *Id.* "Without a determination and description of the existing physical conditions on the property at the start of the environmental review process, the EIR cannot provide a meaningful assessment of the environmental impacts of the proposed project." *Save Our Peninsula Com. v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 119.

Here, the DEIR lacks a legally adequate baseline because it improperly uses hypothetical future post-cleanup conditions on the Centennial Site as the baseline for impact analysis instead of the existing conditions on the site. *See* Exhibit A (Baseline Report) at 2. As the DEIR acknowledges, the Centennial Site is currently contaminated with toxic mine waste, and cannot be used for the Project until the contamination has been remediated in a DTSC-approved cleanup. DEIR at 3-10, 3-33. The correct baseline for the site therefore must reflect the current contaminated state of the property. However, the DEIR does not use these existing conditions at the Centennial Site as the baseline for impact analysis. Instead, the DEIR simply assumes that cleanup of the site will be completed, and uses expected future post-remediation conditions at the site as the baseline. *Id.* at 1-4, 1-6, 3-10. The DEIR uses this assumed post-remediation baseline for the Centennial Site in its analysis of aesthetic impacts, agriculture and forestry resources, biological resources, hazards and hazardous materials, and wildfire risk. *Id.* at 1-6 to 1-7.

Elsewhere, however, the DEIR acknowledges the possibility that the cleanup of the Centennial Site might never be approved by DTSC and might never be completed during the 80-year term of the Project permit. *Id.* at 1-3, 3-26. The DEIR asserts that in that case, the mine waste that would otherwise be dumped on the Centennial Site would be trucked offsite and disposed of elsewhere in "local and regional construction markets" after the fill area at the Brunswick Site is full. *Id.* at 1-3, 3-26.

DTSC has not yet approved the Centennial Site cleanup, which is currently undergoing a separate CEQA review. *See id.* at 1-5. Because DTSC might not approve the cleanup, and Rise Gold might not complete it, the DEIR's use of a hypothetical post-remediation baseline in its analysis of Project impacts on the Centennial Site is inappropriate. The DEIR's baseline for the site ignores this uncertainty, simply assuming the future cleanup will occur. The CEQA Guidelines clearly state that "[a]n existing conditions baseline shall not include hypothetical conditions, such as those that might be allowed, but have never actually occurred, under existing permits or plans, as the baseline." CEQA Guidelines § 15125(a)(3). An EIR's failure to accurately determine existing baseline conditions "renders the identification of environmental impacts legally inadequate and precludes a determination that substantial evidence supports" the

EIR's conclusions about the significance of project impacts or the effectiveness of mitigation. *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994) 27 Cal.App.4th 713, 729. Without "an adequate baseline description . . . analysis of impacts [and] mitigation measures . . . becomes impossible." *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 953. Because the DEIR's analysis of aesthetic impacts, agriculture and forestry, biological resources, hazardous materials, and wildfire risk is based on this flawed and uncertain baseline, that analysis is legally inadequate and cannot be supported by substantial evidence.

Anticipating criticism of this glaring flaw, the DEIR preemptively seeks to defend its use of the post-remediation baseline for the Centennial Site. DEIR at 1-3 to 1-7. The DEIR cites the CEQA Guidelines, which provide that "where necessary to provide the most accurate picture practically possible of the project's impacts, a lead agency may define existing conditions by referencing historic conditions, or *conditions expected when the project becomes operational*, or both, that are supported with substantial evidence" CEQA Guidelines Section 15125(a)(1) (emphasis added); DEIR at 1-3 to 1-4. The DEIR also cites *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority*, where the court noted that "in appropriate circumstances an existing conditions analysis may take account of *environmental conditions that will exist when the project begins operations*; the agency is not strictly limited to those prevailing during the period of EIR preparation. An agency may, where appropriate, adjust its existing conditions baseline to account for a major change in environmental conditions that is expected to occur *before project implementation*." *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013) 57 Cal.4th 439, 452 (emphasis added); DEIR at 1-4.

The DEIR's attempted defense is unavailing. As the italicized language makes clear, the quoted portions of CEQA Guidelines Section 15125(a)(1) and *Neighbors for Smart Rail* allow an EIR to use a baseline that consists of conditions that "will exist when the project begins operations." But here there is no guarantee that the Centennial Site cleanup will have even started—let alone been completed—before the Project begins operations. As discussed above, the DEIR expressly acknowledges that the Centennial Site cleanup may not be approved by DTSC and may *never* be completed within the entire 80-year term of the mine permit. DEIR at 1-3, 3-26. The DEIR asserts that "the Idaho-Maryland Mine Project can proceed independently from the Centennial Clean-Up Project, *even if the Centennial Clean-Up Project is not completed within the term of the mining permit*, in which case, material from the Idaho-Maryland Mine Project would not be placed on the Centennial Industrial Site." DEIR at 1-7 (emphasis added). This statement is flatly inconsistent with its assumption for baseline purposes that the Centennial cleanup would be completed before the mine begins operations.

The DEIR incorrectly asserts that it is *not* using a "future baseline" for the Centennial Site, noting that "[a] future baseline is understood to be a point in time beyond the date of project operations." DEIR at 1-4. This assertion misrepresents the relevant legal standard. A future

baseline is one that does not currently exists, but is assumed to exist in the future when the Project becomes operational. But again, the DEIR acknowledges that its chosen post-remediation baseline for the Centennial Site may not occur until after Project operations have begun. *Id.* at 1-3, 3-26 (noting possibility that "the remediation of the Centennial Industrial Site, currently under DTSC oversight, is not complete upon commencement of mining"). Therefore, in order to use post-remediation conditions as the sole baseline, the DEIR would need to satisfy CEQA's requirements for "future baselines." The Guidelines provide that "[a] lead agency may use projected future conditions (beyond the date of project operations) baseline as the sole baseline for analysis only if it demonstrates with substantial evidence that use of existing conditions would be either misleading or without informative value to decision-makers and the public. Use of projected future conditions as the only baseline must be supported by reliable projections based on substantial evidence in the record." CEQA Guidelines § 15125(a)(2). The DEIR fails to meet that standard here: it does not demonstrate with substantial evidence that the Centennial cleanup can be reliably projected to occur, nor does it show that using existing conditions as the Centennial baseline would be either misleading or without informative value to decision-makers or the public. The DEIR's attempted use of a future baseline therefore violates CEQA.

The DEIR must be revised to consistently use existing conditions as the baseline for the Centennial Site, and cannot merely assume that the proposed Centennial cleanup will be approved or completed. The document's analysis of aesthetic impacts, agriculture and forestry resources, biological resources, hazards and hazardous materials, and wildfire risk (which all use the assumed post-remediation baseline) must be revised to evaluate those impacts with reference to existing contaminated conditions on the Centennial Site, and must consider the possibility that the cleanup may not occur before mine operations begin, or at all.

**Grp 21-14**

Moreover, the DEIR must analyze other additional environmental impacts that might result from the Project if the Centennial cleanup does *not* occur. If the Centennial Site is never remediated during the term of the mine permit, the site will never become available for dumping of mine waste, and an additional 1.6 million tons of mine waste from the Project will need to be trucked offsite once the dumping area at the Brunswick Site is full. DEIR at 1-3, 3-32 to 3-33, 3-26. The DEIR must evaluate the potential impacts of the offsite trucking of those additional 1.6 million tons of mine waste on air quality, GHG emissions, energy use, and noise. It currently fails to do so. *See* DEIR at 4.3-50, 4.3-53 to 4.3-54, 4.3-67 to 4.3-68 (air quality and GHG analysis assumes dumping of fill at Centennial site); *id.* at 4.10-33, 4.10-35 (noise analysis). Furthermore, the DEIR must explain how the Applicant will meet its commitment to reclaim the Centennial Site for future industrial use (DEIR at 3-12, 3-42, 3-46) if the Centennial cleanup is not completed. The DEIR must be revised to correct these flaws and then recirculated.

**Grp 21-15**

**C. The DEIR's Project Description Improperly Excludes the Cleanup of the Centennial Site from the Project Scope.**

The DEIR also lacks an adequate project description because it wrongly excludes the Centennial cleanup from the scope of the Project. CEQA requires that an EIR contain an accurate and comprehensive project description which contains enough detail to allow informed analysis of environmental effects. *County of Inyo v. City of Los Angeles* (1977) 71 Cal.App.3d 185, 193; CEQA Guidelines § 1512. "[A] correct determination of the nature and scope of the project is a critical step in complying with the mandates of CEQA." *Nelson v. County of Kern* (2010) 190 Cal.App.4th 252, 267 (citing *Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007) 155 Cal.App.4th 1214, 1222. "The entirety of the project must be described, and not some smaller portion of it." *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 654 ("*County of Merced*").

Under CEQA, a "project" is an activity that may cause either a direct or reasonably foreseeable indirect change in the environment, and that involves the issuance of a permit or other entitlement for use by one or more public agencies. Pub. Resources Code § 21065. The project includes the "whole of an action," and "does not mean each separate governmental approval." CEQA Guidelines § 15378(a), (c). Where two actions are integrally related or where one action is conditioned on another action, they must both be considered together as one project in a single EIR. *Nelson*, 190 Cal.App.4th at 271; *Tuolumne County Citizens*, 155 Cal.App.4th at 1222. When "an individual project is a necessary precedent for action on a larger project, or commits the lead agency to a larger project, with significant environmental effect, an EIR must address itself to the scope of the larger project." CEQA Guidelines § 15165.

Segmenting a portion of a project from the whole is forbidden under CEQA. *Assn. for Sensible Development of Bishop Area v. County of Inyo* ("*County of Inyo*") (1985) 172 Cal.App.3d 151, 165-66 (*County of Inyo*"). A project applicant cannot "file separate environmental reports for the same project to different agencies thereby preventing 'consideration of the cumulative impact on the environment.'" *Nelson*, 190 Cal.App.4th at 271 (internal citation omitted). "CEQA's conception of a project is broad," and it "prevents a proponent or a public agency from avoiding CEQA requirements by dividing a project into smaller components which, when considered separately, may not have a significant environmental effect." *Id.* (citations omitted). Such piecemeal environmental review that breaks up projects into smaller pieces to evade a complete impact analysis therefore violates CEQA. *See Christward Ministry v. Superior Court* (1986) 184 Cal.App.3d 180, 193; *Bozung v. LAFCO* (1975) 13 Cal.3d 263, 283.

Here, the DEIR's project description violates CEQA because it improperly excludes the cleanup of the Centennial Site from the scope of the Project, wrongly contending that this cleanup is separate from the Project. DEIR at 3-10; *see* Exhibit A (Baseline Report) at 3. The project description states that the Project would involve dumping 1.6 million tons of mine waste on a 44-acre area of the 56-acre Centennial Site over a period of five years. *Id.* at 3-32 to 3-33. However, as discussed above, the Centennial Site is currently contaminated with arsenic, lead, thallium, mercury, and nickel. *Id.* at 4.7-3. Because of this existing pollution and unstable soil

conditions, the DEIR acknowledges that the Centennial Site cannot be redeveloped until the contamination is remediated by Rise Gold in accordance with an RAP approved by DTSC. *Id.* at 3-10, 3-33. Despite this, the DEIR asserts that "[t]he environmental cleanup work at the Centennial Industrial Site [carried out by the Applicant] under the DTSC voluntary cleanup program . . . is not a component of the proposed project." *Id.* This is incorrect.

The Applicant's cleanup of the Centennial Site proposed in the RAP is a necessary first step toward using the site as a dumping ground for "engineered fill" from the Project. The DEIR acknowledges that the Project includes dumping waste rock excavated from the mine onto the Centennial Site. *Id.* at 1-3, 3-26, 3-28, 3-32 to 3-33. It states that after "environmental cleanup work is completed [at the Centennial Site] and a No Further Action letter is issued by DTSC, engineered fill from the Brunswick Industrial Site would be placed, graded, and compacted on the Centennial Industrial Site" as part of the Project. *Id.* at 3-33. The DEIR also states that one of the Project objectives is to "[i]ncrease the usable land area at the Centennial Industrial Site to allow its future use as industrial land." *Id.* at 3-12. The DEIR therefore calls for a "Reclamation Plan" in which the engineered fill at the Centennial Site would be graded into a "pad" for future industrial development after dumping is complete, and the remainder of the site would be revegetated. *Id.* at 3-42, 3-46. Since the DEIR acknowledges that the Applicant's remediation of the Centennial Site is a necessary prerequisite to the Project's proposed dumping on the site and the site's eventual reclamation for industrial use (*id.* at 3-10, 3-33), the DEIR's claim that this remediation is not part of the Project is incorrect. The Centennial Site remediation will be carried out by the Applicant to facilitate the use of the site for the proposed Project.

The Centennial RAP itself demonstrates that the RAP should be considered part of the Project. The RAP repeatedly refers to work to be done on the Centennial Site that goes beyond remediation, but rather is intended to prepare for the future stages of the IMM Project. The RAP acknowledges that "[p]ost-remediation use of the property" includes "the placement of additional mine waste . . . resulting from future mining operations." Exhibit C (RAP) at 19. It states that contaminated materials on the site "are to be reworked in place as engineered fill and covered with clean engineered fill *to prepare the site for future commercial/industrial site development*." *Id.* at XVIII (emphasis added); *see also id.* at 39, 45. Because the RAP is not solely focused on remediating the Centennial Site, but rather is intended to prepare the site for future use in the IMM Project, the RAP is a part of the IMM Project. Recognizing that the two actions are integrally related, DTSC acknowledges that it is considering "combining the [environmental review for the Centennial RAP] project with the IMM EIR." *See* Email from Dean Wright, Project Manager, DTSC, to Ralph Silberstein, February 4, 2022, attached as Exhibit D. Moreover, the Central Valley Regional Water Quality Control Board (RWQCB) has called for exactly that approach, commenting that "the cumulative impacts to water quality incurred by the project described in the [Centennial] RAP and potential future discharge of mine waste generated by the proposed Idaho-Maryland Mine-Rise Grass Valley project should be considered in a single environmental document." *See* Central Valley RWQCB, Review of Draft Final Remedial

Action Plan Centennial M-1 Property, Nevada County, September 24, 2021, attached as Exhibit E, at 5.

In determining whether a particular action should be considered part of a CEQA project, courts "examine how closely related" the action is "to the overall objective of the project." *Tuolumne County*, 155 Cal.App.4th at 1226. "The relationship between the particular act and the remainder of the project is sufficiently close when the proposed physical act is among the 'various steps which taken together obtain an objective.'" *Id.* In *Tuolumne County*, because the objective of the project was to open and operate a home improvement center, and that objective was "conditioned upon the completion of the realignment of a road," the road realignment was deemed part of "a single CEQA project" with the proposed home improvement center. *Id.* at 1227. In *Nelson*, the court invalidated a mitigated negative declaration that reviewed only a mining reclamation plan for a proposed mining project while excluding the associated surface mining operations from the review. 190 Cal.App.4th at 269, 272. The court held that "the entire CEQA project that had to be reviewed by the County included *both* the mining operations and the reclamation plan," because "both aspects were integrally related and constituted the whole of the action" for which approvals were sought. *Id.* at 272. The reclamation plan "was simply the final phase of the overall usage of the land." *Id.*

Here, as in *Tuolumne County* and *Nelson*, the remediation of the Centennial Site is an essential step which the Applicant must take in order to accomplish the objectives of the IMM Project. The DEIR acknowledges that the IMM Project's proposed dumping of engineered fill on the Centennial Site cannot occur until the site is remediated under the RAP. DEIR at 3-10, 3-33. The Centennial cleanup is also necessary to achieve the stated IMM Project objective to "[i]ncrease the usable land area at the Centennial Industrial Site to allow its future use as industrial land." *Id.* at 3-12. Accordingly, the Centennial RAP is an integral part of the IMM Project, and the RAP's exclusion from the Project description (*id.* at 3-10) violates CEQA.

The DEIR argues that the Centennial RAP should not be considered a part of the IMM Project for several reasons, all of which are meritless. *Id.* at 1-7 to 1-8. First, the DEIR asserts that "the Idaho-Maryland Mine Project can proceed independently from the Centennial Clean-Up Project, even if the Centennial Clean-Up Project is not completed within the term of the mining permit, in which case, material from the Idaho-Maryland Mine Project would not be placed on the Centennial Industrial Site." *Id.* at 1-7. The DEIR thus denies that the RAP is an essential prerequisite to the IMM Project. *Id.* at 1-8. But while it may be true that the IMM Project does not need the Centennial Site for disposal of waste rock from the mine, since that material can be dumped on the Brunswick Site or disposed of elsewhere, the same is not true for the Project's other goals. The IMM Project commits to reclamation of the Centennial Site for future industrial use. *Id.* at 3-42, 3-46. As noted above, the Centennial RAP is a necessary prerequisite to achieving the IMM Project objective to "[i]ncrease the usable land area at the Centennial Industrial Site to allow its future use as industrial land." *Id.* at 3-12. Even if the Applicant never

dumps any mine waste on the Centennial Site, the Applicant cannot abandon its commitment to reclaim the Centennial Site without altering the basic nature of the IMM Project.

Second, the DEIR argues that "[t]he utility and purpose of the Centennial Clean-Up Project is to ensure timely and efficient cleanup of the Centennial Industrial Site due to existing site conditions, and is required under both California and federal environmental regulations—not because it would benefit the Idaho- Maryland Mine Project. . . the Centennial Clean-Up Project would happen whether or not an underground mine is approved by Nevada County for the Brunswick Industrial Site." DEIR at 1-7. But as discussed above, the Centennial RAP itself clearly indicates that it is intended to prepare the site for future placement of engineered fill as part of the IMM Project, and eventual reclamation for industrial use. Exhibit C (RAP) at 19, 39, 45. One of the purposes of the RAP *is* to benefit the IMM Project. Moreover, the DEIR notes that the Applicant, Rise Gold, has entered a "Voluntary Cleanup Agreement" with DTSC "for the voluntary cleanup of soil contamination on the Centennial Industrial Site," and that the RAP has been prepared pursuant to that agreement. DEIR at 1-4, 3-10; *see* Exhibit C (RAP) at xii. The Voluntary Cleanup Agreement states that the Applicant "reserves the right to unilaterally terminate this Agreement for any reason" after 30 days' notice. Voluntary Cleanup Agreement at 5, Section 18.1, attached as Exhibit F. Rise Gold would not have entered the Voluntary Agreement to undertake the Centennial cleanup and its associated costs if it did not serve the Applicant's ultimate goal of dumping fill on the site as part of the IMM Project. If the IMM Project does not go forward, the Applicant could withdraw from its commitment to the Centennial cleanup.

The DEIR argues that the Centennial RAP should be analyzed separately because the situation here allegedly resembles that in *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1223. DEIR at 1-7 to 1-8. But that case is factually inapposite. In *Banning Ranch*, a City proposed building a park and associated access road, which was reviewed in one EIR, while another EIR reviewed a residential subdivision proposed by a private developer on adjacent property, which called for a much larger access road in the same location. 211 Cal.App.4th at 1216-17. While the projects would share the same access road, neither project depended on or assumed completion of the other project. *Id.* at 1218-19. The court found that there was no piecemealing because these two projects had different proponents and served different purposes, and because the park's smaller access road was only a "baby step" towards the residential project. *Id.* at 1225-26. Here, by contrast, both the Centennial cleanup and the remainder of the IMM Project have the same project proponent, Rise Gold, and share the objective of making the Centennial Site suitable for industrial development, as discussed above. Unlike *Banning Ranch*, the Centennial cleanup is a necessary prerequisite to the dumping of engineered fill from the IMM Project, and the DEIR assumes that the cleanup will occur.

**Grp 21-16**

Segmenting the IMM Project from the Centennial RAP also prevents a full environmental analysis of the combined impacts of the RAP and the subsequent dumping of fill on the site. For example, this piecemeal approach risks understating the impacts to wetlands on the Centennial

Site. The Centennial RAP plans to excavate clean fill from portions of the Site that are not contaminated and to use this fill to cap the contaminated areas. Exhibit C (RAP) at xx, 63. The RAP states that it could destroy up to 4.35 acres of wetlands on the site, which may be mitigated via onsite wetland restoration or creation. *Id.* at 60. The Initial Study/Mitigated Negative Declaration (MND) for the RAP contends that impacts on these wetlands will be less than significant following mitigation. MND at 29, attached as Exhibit G. The IMM Project, in turn, plans to dump mine waste on 44 acres of the 56-acre Centennial Site, avoiding only 12 acres that include Wolf Creek, a 100-foot setback from the Creek, and areas containing certain sensitive plant species. DEIR at 3-15. Because the IMM Project and Centennial RAP are analyzed piecemeal in separate documents, it is impossible for the public to determine whether wetlands impacted by the RAP would be further impacted by the dumping of fill from the IMM Project, or whether that dumping would destroy or impair wetland mitigation proposed as part of the RAP.

**Grp 21-17**

The DEIR ignores the reality that the Centennial RAP is an integral part of the IMM Project, and improperly segments the Project by excluding the cleanup. This piecemeal description prevents an analysis of the IMM Project as a whole, and therefore violates CEQA. The DEIR's project description must be revised to recognize the cleanup of the Centennial Site as an integral part of the Project, and DEIR must analyze all of the environmental effects of the RAP as part of the Project.

**D. The DEIR Lacks a Stable and Complete Project Description.**

**Grp 21-18**

In addition to omitting the Centennial RAP and equivocating as to whether the cleanup will happen, the DEIR's project description is also unstable and incomplete in other respects. An accurate, stable and finite project description is an essential component of an informative and legally sufficient EIR. *San Joaquin Raptor/Wildlife Rescue Center*, 27 Cal.App.4th at 730. Here, the Project description is incomplete because it fails to adequately describe the duration of required water quality permits, and the DEIR fails to consistently describe mining and exploration activities over the entire permit period. Moreover, the DEIR does not consistently describe the duration of Project construction.

The Conditional Use Permit (CUP) for the Project would span 80 years. DEIR at 3-12, 3-28, 3-47. The Project also requires several different types of Water Board permits (*see id.* at 3-15, 3-18, 3-52), none of which would have anything approaching an 80-year time frame. For example, under the federal Clean Water Act, National Pollutant Discharge Elimination System (NPDES) permits for discharges to surface water expire every five years unless renewed. 40 C.F.R. § 122.46. As discussed in the hydrology and water quality section of this letter, Section II.A, *infra*, the DEIR relies on compliance with these regulatory requirements and permits to conclude that the Project's impacts would be less than significant. Yet the DEIR fails to clearly describe the timeframe of these Water Board permits, nor does it make any attempt to reconcile

an 80-year CUP with Water Board permits that may expire every five years. This informational deficiency makes the project description inadequate.

**Grp 21-19**

The DEIR also relies on a shifting project description. Despite the DEIR's clear statement that the Project's permitted mining operations would span 80 years (DEIR at 3-12, 3-28, 3-47), the DEIR's hydrology and water quality analysis refers to a 2045 "base-case" mining scenario. It states that the proposed mining plan or "base-case" scenario evaluated by the Applicant's consultant Itasca Denver, Inc. represents the exploration target over a 25-year period based on historic mapping and drill core sampling conducted to date. *Id.* at 4.8-55. Neither the Project description nor the hydrology chapter explain the basis for this "base-case scenario" or how it is compatible with the Project's 80-year timespan. Relatedly, the DEIR's hydrology and water quality chapter contains a section on "potential future exploration and mining" that discusses "possible future mining scenarios" that would extend from 26 years to 60 years after Project approval. This "additional, deeper exploration and mining" may occur as part of the Project within the 2,585-acre mineral rights boundary owned by Rise. *Id.* at 4.8-62. Once again, the DEIR's project description makes no mention of this potential future exploration and mining. The DEIR fails to explain where exactly this future exploration and mining would occur, what it would entail, and how it would relate to the 80-year conditional use permit for the Project. This omission violates CEQA. *See San Joaquin Raptor/Wildlife Rescue Center*, 27 Cal.App.4th at 730.

**Grp 21-20**

Finally, the DEIR provides an inconsistent description of the Project construction period. The DEIR's project description states that Project construction would last for 18 months. DEIR at 3-37. By contrast, the DEIR's air quality, GHG, and energy chapter assumes that Project construction would last for only 12 months, and bases its impact analyses on that assumption. *Id.* at 4.3-44 to 4.3-46, 4.3-66 to 4.3-67, 4.3-74, 4.3-92. The DEIR is therefore internally contradictory and improperly minimizes the Project's significant impacts. "[S]uch an unexplained discrepancy precludes the existence of substantial evidence" for the EIR's conclusions. *Preserve Wild Santee v. City of Santee* (2012) 210 Cal.App.4th 260, 284. The DEIR must be revised so that the project description and the impact analyses consistently describe the duration of construction activities.

**II. The DEIR's Fails to Adequately Analyze and Mitigate the Project's Environmental Impacts.**

**Grp 21-21**

The discussion of a proposed project's environmental impacts is at the core of an EIR. *See* CEQA Guidelines §15126.2(a) ("[a]n EIR shall identify and focus on the significant environmental effects of the proposed project"). As explained below, the DEIR's environmental impacts analysis is deficient under CEQA because it fails to provide the necessary facts and analysis to allow the County and the public to make informed decisions about the Project. An EIR must effectuate the fundamental purpose of CEQA: to "inform the public and responsible

officials of the environmental consequences of their decisions before they are made." *Laurel Heights Improvement Assn. v. Regents of Univ. of Cal.* (1993) 6 Cal.4th 1112, 1123 ("*Laurel Heights II*"). To do so, an EIR must contain facts *and* analysis, not just an agency's bare conclusions. *Citizens of Goleta Valley v. Bd. of Supervisors* (1990) 52 Cal.3d 553, 568. Thus, a conclusion regarding the significance of an environmental impact that is not based on an analysis of the relevant facts fails to fulfill CEQA's informational mandate.

Additionally, an EIR must identify feasible mitigation measures to mitigate significant environmental impacts. CEQA Guidelines §15126.4. Under CEQA, "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." Pub. Resources Code § 21002.

Although it is clear that the proposed Project has the potential to cause extraordinary environmental degradation, neither the public nor decisionmakers have any way of knowing the magnitude of this harm. As we explain below, the DEIR fails to provide detailed, accurate information about the Project's significant environmental impacts and to analyze mitigation measures or project alternatives that would reduce or avoid such impacts.

**A. The DEIR Fails to Adequately Analyze and Mitigate the Project's Hydrology and Water Quality Impacts.**

**1. The DEIR Does Not Adequately Analyze or Mitigate the Project's Impacts on Domestic Water Supply Wells.**

**Grp 21-22**

The proposed Project would intentionally affect local groundwater resources by dewatering the aquifer in the Project vicinity to lower groundwater levels. According to Baseline's hydrogeologist, Bruce Abelli-Amen, mine workings would essentially act as an enormous groundwater extraction well that would be pumped continuously for the Project's duration, i.e., 80 years. Exhibit A (Baseline Report) at 4, 5. The mine's groundwater levels would be lowered by over 3,000 feet. DEIR at 4.5-55. Despite this massive dewatering operation, the DEIR fails to accurately evaluate how this loss of water would affect groundwater levels. Consequently, the document also fails to adequately evaluate the effect on residences and businesses in the Project vicinity that rely solely on private groundwater wells for their water supply.

**(a) The DEIR Fails to Accurately Describe Existing Hydrologic Conditions in the Project Study Area.**

**Grp 21-23**

The DEIR's analysis of impacts on domestic water supplies fails from the outset because it lacks an adequate description of existing hydrological conditions. As discussed above, an accurate depiction of existing environmental conditions is critical to a complete assessment of

project impacts. First, as the DEIR admits, "baseline groundwater levels" have yet to be established. *See* DEIR Mitigation Measure 4.8-2(a) (p. 4.8-67), stating "[F]or each domestic well, a projected and seasonally averaged water level shall be estimated based on the domestic well location and the background potentiometric conditions, which will serve as a baseline groundwater level and shall be developed prior to the initiation of dewatering of the underground mine workings." Until the DEIR identifies baseline groundwater levels absent the Project, it is not possible to evaluate how mining operations will impact groundwater levels and domestic water supply wells.

**Grp 21-24**

Second, the DEIR provides no evidence that the hydrologic analysis covers the full geographic area where impacts might occur. CEQA requires that an EIR must analyze environmental impacts over the entire area where one might reasonably expect these impacts to occur. *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721-23. This principle stems directly from the requirement that an EIR analyze all significant or potentially significant environmental impacts. Pub. Resources Code §§ 21061, 21068. An EIR cannot analyze all such environmental impacts if its study area does not include the geographical area over which these impacts will occur. Here, the DEIR states that "drawdowns of the water table are *generally* within the mineral rights boundary." DEIR at 4.8-58 (emphasis added). By including the word "generally," the DEIR admits to being uncertain about the geographic extent of where drawdowns might occur. Moreover, the DEIR provides no explanation as to how it determined that drawdowns would likely be limited to the area within the mineral rights boundary. As discussed below and as elaborated on in the Baseline Report, the area surrounding the Project site contains a fractured bedrock system which affects groundwater occurrence and flow. Exhibit A (Baseline Report) at 6, 7. Due to this complex hydrogeologic environment, it is certainly possible for drawdowns of the water table to extend beyond the mineral rights boundary. Until the DEIR accurately identifies where drawdowns would occur, the DEIR cannot provide a full and accurate accounting of the Project's hydrologic impacts.

**Grp 21-25**

Baseline Environmental echoes this concern, explaining that the Applicant does not intend to monitor water levels in the actual water supply wells at overlying and nearby residences and businesses that may be affected by the Project. Instead, the Applicant proposes to install 15 monitoring wells across the Project site. Exhibit A (Baseline Report) at 11. According to Baseline, there are likely hundreds of supply wells in the region. It is possible that some of these wells are just barely satisfying the well owners' needs under existing conditions, and that any reduction to their water level caused by the Project's operations could lead to water levels dropping below the well pump intake. *Id.* at 10. However, because the DEIR does not cast its geographic net widely enough, the potential impacts to well users caused by the Project's operations remain undisclosed. The DEIR must be revised to correct these deficiencies and then recirculated for public review and comment.

**(b) The DEIR Lacks Thresholds of Significance for Evaluating the Project's Impacts on Groundwater Supplies.**

CEQA's most basic purpose is to inform governmental decisionmakers and the public about the potentially significant environmental effects of a proposed project. CEQA Guidelines § 15002 (a) (1); 40 C.F.R. § 1500.1(b). Determining whether a project may result in a significant adverse environmental effect is one of the key aspects of CEQA. Guidelines § 15064(a) (determination of significant effects "plays a critical role in the CEQA process"). CEQA specifically anticipates that agencies will use thresholds of significance as an analytical tool for judging the significance of a Project's impacts. *Id.* § 15064.7. The determination of significance "is critical, because once 'significant effects' have been identified in the EIR, an agency must explore implementing feasible mitigation measures or alternatives to avoid or reduce the effect." *Berkeley Keep Jets Over the Bay Com. v. Bd. of Port Comrs.* (2001) 91 Cal.App.4th 1344, 1373.

Thus, one of the first steps in any analysis of an environmental impact is to select a threshold of significance and to support this threshold with substantial evidence. CEQA Guidelines § 15064.7 (b). Here, the DEIR contains no thresholds of significance for the Project's impacts on groundwater supplies. This flaw leads to a cascade of other failures: without a threshold, the DEIR cannot identify whether a particular effect will be significant and it cannot identify adequate mitigation to address that impact. In short, the DEIR cannot do its job. Thus, although the DEIR ultimately asserts that the Project would potentially impact groundwater supplies, the document provides no standard by which to evaluate this impact's significance.

**Grp 21-26**

This defect becomes most apparent when reviewing Mitigation Measure 4.8-2 (b): "If, based on the [Groundwater Monitoring Plan], it is determined that mining operations are resulting in a significant impact to any well(s) (i.e., a 10 percent or greater reduction of the water column of any well), pursuant to Nevada County General Plan Policy 17.12, the project applicant shall be responsible for providing a comparable supply of water to such homes or businesses whose wells are significantly impacted." DEIR at 4.8-68.

Although the DEIR never states this, it appears that the authors are relying on this 10 percent reduction figure as an ad hoc threshold of significance. The problem is that the DEIR provides no justification for this arbitrary number. Exhibit A (Baseline Report) at 10. Indeed, although Mitigation Measure 4.9-2(b) references Nevada County General Plan Policy 17.12, nothing in this policy mentions a 10 percent reduction criterion. This 10 percent figure is almost meaningless because, as discussed above, it is certainly possible that of the hundreds of supply wells in the region, some of them are just barely satisfying the well owners needs under existing conditions, and *any* reduction could lead to adverse impacts on area wells.

It is therefore critically important that the revised DEIR identify thresholds of significance, based on substantial evidence (i.e., data related to the characteristics and function of

the existing domestic wells in the Project study area). The DEIR's failure to include this information is fatal flaw requiring that the DEIR be revised and recirculated.

**(c) The DEIR Does Not Accurately Evaluate the Project's Impacts Because It Relies on a Flawed Groundwater Model.**

The DEIR relies on a numerical groundwater model to assess the Project's impacts on groundwater levels and specifically to determine which private wells would experience excessive drawdown. Experts agree that these models can be inaccurate and unreliable under the best of circumstances. As Baseline explains,

> Accurately characterizing the flow patterns and behavior of groundwater using mathematical equations (models) is a challenging endeavor in any geologic environment. The types of hydrogeologic systems that are most readily modeled accurately are uniform (homogeneous), isotropic (consistent structure from place to place) rock and or sediments, like a uniform unfractured sandstone where water flows slowly through pore spaces around the grains of the geologic material.
>
> Groundwater occurrence and flow within complex fractured bedrock systems, like those that occur at the project site, are exceedingly difficult to model with accuracy or reliability. It is widely known by practitioners in the hydrogeologic community that accurate prediction of groundwater behavior in fractured bedrock using groundwater models, where most of the flow occurs within the unknowable sets of primary and secondary fracture patterns, rarely occurs.

Grp 21-27

Exhibit A (Baseline Report) at 6, 7.

In addition to the inherent uncertainties of relying on models to predict groundwater impacts in a complex hydrogeologic environment such as this one, Baseline identified numerous deficiencies in the DEIR's groundwater model. For example, the model was calibrated based on pumping rates from the historical Idaho-Brunswick Mine and only one water level measurement was collected from the flooded (i.e., inactive) Union Hill shaft in 1956. Using only one water level measurement to calibrate a complex bedrock aquifer system over a large region introduces a significant amount of uncertainty to the model. Exhibit A (Baseline Report) at 7. Moreover, as Baseline explains, based on the DEIR's appendix, there is a poor hydraulic connection between the two mines, which suggests the water level measurement collected from the Union Hill Shaft is not ideal for calibrating the groundwater model. *Id.*

**Grp 21-28**

Nor does the model describe how drawdown would be determined relative to baseline conditions. Private domestic wells in the Project vicinity have seasonal fluctuations that may vary from 10 to 50 feet between wet and dry seasons. Exhibit A (Baseline Report) at 11 (citing DEIR Appendix K.3 at 7).The DEIR provides no explanation as to how these seasonal water fluctuations would be distinguished from Project-related drawdown.

**Grp 21-29**

Nor does the groundwater model accurately account for the groundwater depression that will be created by the constant drainage from the existing mine workings. As Baseline explains, calibrating the groundwater model without incorporating the proper mechanisms to simulate the drainage of groundwater from existing mine workings could introduce substantial error to the overall modeling results. Exhibit A (Baseline Report) at 8.

These and other deficiencies identified in the Baseline Report demonstrate that the DEIR's groundwater model likely does not accurately and reliably predict the Project's groundwater impacts. Indeed, even the water resources expert retained by the Applicant expressed concerns about the reliability of the DEIR's groundwater model's results. *See* Exhibit A (Baseline Report) at 7.

**Grp 21-30**

Finally, the DEIR calls for a Groundwater Monitoring Plan (GMP) that calls for the collection of groundwater-level information. DEIR at 4.8-67. But the GMP does not propose to monitor water levels in the actual water supply wells at overlying and nearby residences and business that may be affected by the Project. Instead, as discussed above, it proposes to install monitoring wells across the Project site at 15 different locations. Exhibit A (Baseline Report) at 11, 12 (citing the GMP at 1). The DEIR never explains how the placement of 15 monitoring wells in complex fractured bedrock spread over thousands of acres of land could provide sufficient data to evaluate the Project's impacts on residences and businesses. As Baseline explains, a monitoring well could be placed in proximity to an existing supply well and respond very differently to changing water levels in the mine during dewatering if a water-bearing bedrock fracture intersects one of the wells, but not the other. Exhibit A (Baseline Report) at 12.

**Grp 21-31**

Based on the flawed groundwater model output, the DEIR concludes that wells only within the East Bennett area could be affected and that impacts in all other areas would not be significant. DEIR page 4.8-62. Specifically, the DEIR determines that the Project would impact just seven supply wells in the East Bennett area during the 80-year life of the mining operation. DEIR at 4.8-66. The DEIR further notes that while only seven wells are projected to be affected, the Project would install a potable water supply line and connect up to 30 properties in the same area to the Nevada Irrigation District potable water as part of a Well Mitigation Plan. DEIR at 4.8-66, 4.8-68 (Mitigation Measure 4.8-2(c).

However, for the reasons discussed above, and as Baseline confirms, the DEIR lacks evidentiary support that the Project would not significantly impact residences and businesses (i.e., beyond the impacts to the seven supply wells that the DEIR does disclose or the 30

properties that may be retrofitted with a water supply line). Exhibit A (Baseline Report) at 12. And as discussed below, the DEIR's mitigation measures are flawed and incapable of lessening the Project's significant impacts.

**2. The DEIR's Mitigation Measures Would Not Mitigate the Project's Groundwater Impacts.**

**Grp 21-32**

The primary goal of an EIR is to identify a project's significant environmental impacts and find ways to avoid or minimize them through the adoption of mitigation measures or project alternatives. Pub. Resources Code §§ 21002.1(a), 21061.The lead agency must adopt all feasible mitigation measures that can substantially lessen the project's significant impacts, and it must ensure that these measures are enforceable. *Id.*, § 21002; CEQA Guidelines §§ 15002(a)(3), 15126.4(a)(2); *City of Marina v. Bd. of Trustees of the Cal. State Univ.* (2006) 39 Cal.4th 341, 359, 368-69. The requirement for enforceability ensures "that feasible mitigation measures will actually be implemented as a condition of development, and not merely adopted and then neglected or disregarded." *Federation of Hillside and Canyon Assns. v. City of Los Angeles* (2000) 83 Cal.App.4th 1252, 1261 (italics omitted); CEQA Guidelines § 15126.4(a)(2). The DEIR fails to comply with these requirements.

The DEIR relies on three mitigation measures to conclude that the Project's impacts on groundwater supplies would be less than significant. None of these measures would effectively reduce the Project's impacts. Mitigation Measure 4.8-2 (a) calls for the Project's GMP to be implemented prior to the dewatering of the mine. Mitigation Measure 4.8-2(b)calls for the provision of supplemental water from the Nevada Irrigation District if any wells experience a 10 percent reduction in water. Mitigation Measure 4.8-2(c) calls for the connection of 30 properties to the Nevada Irrigation District (NID) potable water system. DEIR at 4.8-67 to 4.8-68. For the reasons discussed below, all three measures are deficient.

**Grp 21-33**

The DEIR explains that in order to implement the GMP, the Applicant must collect additional groundwater level data and then perform a water-level assessment for individual wells. These steps are necessary in order to evaluate *baseline* groundwater level conditions and to determine the Project's impacts on individual domestic wells. DEIR at 4.8-67. This post-approval data collection and impact analysis constitutes an inappropriate deferral of mitigation. "Formulation of mitigation measures should not be deferred until some future time." CEQA Guidelines § 15126.4(a)(1)(B). However, where mitigation for an impact "is known to be feasible," but where "practical considerations prohibit devising such measures early in the planning process," an agency "can commit itself to eventually devising mitigation measures that will satisfy specific performance criteria articulated at the time of project approval." *Cleveland Nat. Forest Foundation v. San Diego Assn. of Govs.* (2017) 17 Cal.App.5th 413, 442-43. In order to defer formulation of mitigation measures, therefore, an agency must demonstrate (a) that mitigation of the impact is feasible; (b) that practical considerations preclude devising measures at the time of review; (c) specific, articulated performance criteria that will avoid or lessen the

impact; and (d) a binding commitment to adopt measures that will meet or exceed those performance standards. Here, the DEIR does not meet these criteria.

Of paramount concern is the DEIR's failure to include performance criteria that will avoid or lessen the Project's impacts. As discussed above, the DEIR lacks thresholds of significance. Without thresholds of significance, the DEIR is unable to identify performance standards. To the extent that the DEIR preparers intend to suggest that Mitigation Measure 4.8-2(b) (Applicant will supply water to those wells that experience a 10 percent or greater reduction in water), constitutes a performance standard, it cannot do so. As discussed above, and as elaborated fully in the Baseline Report, the DEIR does not provide any factual support for its 10 percent figure. Exhibit A (Baseline Report) at 10-11. And, again, until the DEIR accurately describes existing conditions for the properties that rely exclusively on well water, the DEIR has no basis to conclude that any reduction in the amount of water caused by mining operations would not result in significant impacts. *Id.*

Mitigation Measure 4.8-2 (c) is equally problematic. Here, the DEIR calls for the connection of 30 properties to the NID water system. Again, this measure fails at the outset because there is nothing in the DEIR to suggest that the Project's impacts would not exceed 30 properties. Nor does the DEIR provide any evidence as to how this measure would reduce impacts. Courts will not defer to an agency's conclusions about the effectiveness of a mitigation measure where, as here, the measure's efficacy in reducing an impact is not apparent and there is no evidence in the record showing that it will be effective. *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 866, 875-76. As Baseline explains, to effectively ensure there is no discontinuation of water service to potentially affected users, this mitigation measure should include, at a minimum, the following components:

**Grp 21-34**

- Completion of a detailed water supply well inventory for all wells within the Mineral Rights Boundary, plus a substantial buffer zone;
- Investigation of all available details about each potentially affected well such as the construction design (i.e., depth, diameter, screened interval); type and use of the well (e.g., domestic, irrigation, industrial, etc.); water demand (installing totalizer meters if necessary to determine water use); and recharge rates (installing pressure transducers if necessary to monitor drawdown and recharge); and seasonal variations in water levels; and
- Development of a plan for each well to ensure that an immediate alternate water supply can and will be provided should an impact to that well occur. This plan must include provisions to ensure alternate water supplies will be provided throughout the 80-yearlife of the Project and beyond.

**Grp 21-35**

In addition, we direct the County to Safeguards for Well Owners and the Idaho-Maryland Mine, CEA Foundation, December 1, 2021, attached as Exhibit H. This document outlines recent permitting history at the Idaho-Maryland Mine and raises additional deficiencies in the DEIR's flawed approach to groundwater protection. This document explains that the 1996 Emperor Gold project was less impactive than the proposed Project but offered far more substantive protections for area wells. Mitigation Measure 4.8-2 must be revised to include, at a minimum, the safeguards identified in this document.

**Grp 21-36**

Finally, it is important to note that, because Baseline has determined that the Project would threaten water supplies in the area, the Project is inconsistent with Nevada County General Plan Policy 17.12. This policy places the burden of proof on the Applicant to show that a mining operation did not create the water problem and requires the Applicant to remedy the water problem.[3]

**3. The DEIR Does Not Adequately Analyze or Mitigate the Project's Groundwater Quality Impacts.**

Water samples from the New Brunswick shaft and drains reveal that groundwater and surface water quality are already severely degraded. *See* DEIR at 4.8-21, 4.8-22 stating that primary constituents of interest from these water samples are iron and manganese. Arsenic has also been detected above regulatory limits as has the compound cis-1,2- dichloroethylene (DCE). *Id.* Other contaminants of concern include ammonia, hexavalent chromium, pH, total suspended solids, antimony, copper and nitrate. *See* David M. Chambers' Report, submitted under separate cover.

**Grp 21-37**

The Project's construction and operations involve multiple activities that could result in adverse effects to water quality, including but not limited to the discharge of mine water containing iron and manganese, discharge of construction area dewatering water, erosion and sedimentation associated with the placement of engineered fill at the Centennial and Brunswick Sites, and use of cemented-paste backfill in the underground workings. DEIR at 4.8-51.

Instead of fully evaluating the Project's water quality impacts, which would require a detailed analysis of the operational water quality treatment processing, including modeling water quality, the DEIR effectively assumes that no such impacts would occur because the Applicant would be required to comply with water quality standards and waste discharge requirements.

[3] *See* Chapter 17, Mineral Management, of the Nevada County General Plan; available at: https://www.mynevadacounty.com/DocumentCenter/View/12589/Chapter-17-Mineral-Management-1995-PDF; accessed March 3, 2022.

DEIR at 4.8-45, 4.8-52, 4.8-53.[4] This "trust us" approach is not sufficient to mitigate a potentially significant impact. Under well-established case law, compliance with existing policies and regulations does not excuse the agency from describing project activities or from analyzing resulting impacts. *See Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-09 (environmental effect may be significant despite compliance with such requirements). To simply assert that water quality standards will be met is not sufficient for the public or decisionmakers to assess either the adequacy of water treatment methods proposed or the adequacy of the standards proposed for the discharge permit.

**Grp 21-38**

Moreover, although the Project entails a conditional use permit (CUP) that will span 80 years, the DEIR makes no attempt to reconcile the timeframe of the CUP with water quality permitting. As discussed above, the Applicant will need to obtain several different types of Water Board permits, none of which would have anything approaching an 80-year time frame. For example, NPDES permits for discharges to surface water expire, unless renewed, every five years per the federal Clean Water Act. 40 C.F.R. § 122.46. The DEIR provides no evidence that water quality will be protected for the entire 80-year Project duration given the timeframes of the various Water Board permitting requirements.

The extensive flaws in the DEIR's analysis of groundwater supply and groundwater quality impacts requires that the DEIR be comprehensively revised and recirculated.

**B. The DEIR Fails to Adequately Analyze and Mitigate the Project's Noise and Vibration Impacts.**

**Grp 21-39**

The Project's activities are expected to generate substantial noise levels. Many of these operations would generate noise levels of 85 dBA and begin early in the morning and extend into the evening. Certain operations would occur 24 hours per day for 80 years (*see e.g.*, above ground facility operations (gold mineralization processing)). Other operations, including the offsite hauling of gold concentrate and "engineered fill," would begin at 6:00 a.m. and run until 10:00 p.m. seven days a week. DEIR at 3-26; 3-37; 4.10-31. Although tunneling and blasting would occur throughout the Project's 80-year duration, the DEIR does not identify the hours of these operations. All of these mining operations would occur in a rural residential area and as close as 300 feet from the nearest residence. DEIR at 3-11, 3-15, 4.10-33.

**Grp 21-40**

Despite the potential for severe noise and vibration impacts, the DEIR's analysis of and mitigation for these impacts is utterly deficient. The DEIR's failure to accurately account for and disclose all of the Project's noise and vibration impacts prejudicially impairs the ability of

**Grp 21-37**

[4] Although DEIR Chapter 4.8, Hydrology and Water Quality, includes numerous references to the groundwater supply model, we could find no indication that any modeling was conducted to evaluate the Project's impacts on water quality.

decisionmakers and the public to understand how the Project would affect the surrounding community.

**1. The DEIR Declines to Conduct Impact Analyses Relying on the Flawed Premise that the Project Would Be Required to Comply with County Standards.**

The DEIR repeatedly asserts that the Project would not have significant noise impacts because it would be required to comply with generalized County noise standards. *See* Tables 4.10-12, 4.10-13, 4.10-14. Yet, mere compliance with the County's standard does not necessarily mean noise impacts are insignificant. *Oro Fino Gold Mining Corporation v. County of El Dorado* (1990) 225 Cal.App.3d 872, 881-82. The proper question is not the relative amount of noise resulting from the Project, but "whether any additional amount of [] noise should be considered significant" in light of existing conditions. *Los Angeles Unified School Dist. v. City of Los Angeles* (1997) 58 Cal.App.4th 1019, 1025-26. In *King and Gardiner Farms*, the court recently rejected a noise analysis that concluded that a project's impacts would be insignificant simply because they complied with the County's noise ordinance and general plan. Of particular importance here, the court found the "conclusion that conformity with the absolute or maximum noise level specified in a general plan does not prevent a fair argument from being made that the proposed project will generate environmentally significant noise impacts." 45 Cal.App.5th 814, 887. Rather, as established in *Keep Our Mountains Quiet v. County of Santa Clara*, "the lead agency should consider both the increase in noise level and the absolute noise level associated with a project." (2015) 236 Cal.App.4th 714, 733.

**Grp 21-41**

Here, the rural-residential noise setting is exceptionally quiet. The median/L50 noise levels indicate that people in the area enjoy noise levels below 40 dBA to 50 dBA 50% of the time (specifically, 50% of each hour). Exhibit B (Salter Report) at 4. In addition, residents in the area are currently located away from notable sources of ambient noise and thereby currently enjoy very low nighttime background noise levels between 30 dBA and 45 dBA. *See Id.* at 2, (citing DEIR Appendix L, Appendix B-1).

In light of this very quiet ambient environment, the DEIR should have thoroughly examined the Project's potential to generate nighttime noise. Unfortunately, it does no such thing. The DEIR asserts that because the Project's on-site noise sources must comply with the County's nighttime noise level standards, an evaluation of sleep disturbance is not warranted. DEIR at 4.10-23. This assertion is absurd. The Project includes many operations that will occur during early morning or nighttime hours, including dewatering, indoor facility construction, truck loading/unloading and off-site hauling mineralization processing, and water treatment. DEIR at 3-37. The combination of morning and nighttime industrial activities and low background/ambient noise levels represent a significant risk for Project-related noise to impact the community, annoy residents, and cause sleep disturbance. The revised DEIR must evaluate these impacts and identify and implement appropriate mitigation.

**Grp 21-42**

**Grp 21-43**

The DEIR also fails to take into account the absolute increase in noise levels compared to ambient background conditions. As the Salter Report explains, certain operations could be 25-35 dB above background ambient noise levels. These noise levels would be perceived as more than four times as loud as the median ambient noise levels and would be expected to result in an aggressive community response and complaints. Yet here too, the DEIR incorrectly determines such impacts would be less than significant because overall noise from these operations would not exceed the County's standards. Exhibit B (Salter Report) at 4. The revised DEIR must evaluate both the increase in noise level and the absolute noise level associated with the Project.

**2. The DEIR Fails to Disclose the Geographic Extent of the Project's Noise and Vibration Impacts.**

**Grp 21-44**

The DEIR defines the Project as consisting of two separate project sites; the Centennial and Brunswick Sites totaling 175 acres. DEIR at 4.9-1. The DEIR identifies the noise and vibration measurement locations occurring solely at the Centennial Site, the Brunswick Site and along the proposed pipeline location between the two sites. *See* DEIR Figure 4.10-3 (p. 4.10-6).

It appears the DEIR is artificially restricting the geographic size of the study area. While processing would occur on the Centennial and Brunswick sites (175-acres), mine development (tunneling) and gold mineralization production (tunneling and production blasting) would occur throughout the Applicant's 2,585 acre mineral rights boundary owned by the Applicant. DEIR at 3-19, 4.9-1; *see also* Figure 3-2 (p. 3-4). Tunneling and production blasting could certainly result in excessive noise levels and vibration. Despite this fact, the DEIR provides no evidence that noise and vibration impacts were measured throughout the entire mineral rights boundary. As discussed above, an EIR must analyze environmental impacts over the entire area where one might reasonably expect these impacts to occur. *Kings County Farm Bureau*, 221 Cal.App.3d at 721-23. Contrary to this requirement, the DEIR fails to provide the required evidentiary support that the DEIR accurately accounts for the full extent of the Project's noise impacts. The revised DEIR must disclose the Project's potential for noise and vibration impacts throughout the entire mineral rights boundary.

**3. The DEIR Fails to Adequately Distinguish the Project's Construction from Its Operational Activities and thus Potentially Fails to Recognize that Certain Impacts Could Be Significant Under CEQA.**

**Grp 21-45**

The DEIR's analysis of construction-related noise raises more questions than it answers. As an initial matter, the DEIR fails to clearly distinguish the Project's construction-related noise sources from its operational noise sources. This distinction is critical because the DEIR asserts that the County's noise standards do not apply to construction-related activities. *See* DEIR at 4.10-16; *see also* Table 4.10-11 (p. 4.10-29, fn. 2) "[b]cause the Nevada County Zoning Ordinance exempts construction activities from the noise standards, these criteria are not applicable to this component of the project. Results of this analysis are provided to give an

indication as to whether or not construction noise increases would be substantial relative to existing ambient conditions at these nearest receptors." If, as appears evident, the DEIR characterizes an operational activity as a construction project it may have incorrectly determined such impacts to be exempt from the County's noise standards and also determined the impact to be less-than-significant under CEQA. For example, the DEIR states that mine development (tunneling) would be constructed throughout the life of the mine. DEIR at 3-19. This would require drilling and the use of explosives. DEIR at 3-19. Similarly, a new mine shaft would be developed on the Brunswick Site. DEIR at 3-22. These massive project components appear to be characterized as construction activities. Yet, they have the potential to be extraordinarily noisy as they would require extensive drilling and rock excavation. *Id.* If the DEIR characterizes these and other project components as construction rather than operation, it inappropriately assumes the noise from these sources would be exempt from the County's noise standards.

**Grp 21-46**

The first step in remedying this deficiency is to clearly categorize each Project component as either construction-related or operation-related. For each construction-related Project component, the DEIR must disclose fundamental details such as the construction-phasing plan, including the timing and duration of each and every project. This analysis must also disclose each construction-project that is expected to occur over the Project's 80-year timeframe. Finally, in order for the public and decisionmakers to verify whether the DEIR actually accounts for the increase in noise and vibration levels for each construction-related component, the DEIR must identify the location (i.e., page number) in the DEIR and/or its technical appendices depicting the results of the specific noise calculations.

**Grp 21-47**

Second, although the DEIR acknowledges that the Project's construction activities at the Centennial Site and Brunswick Site could result in substantial temporary increases in noise exposure at eight receptors, it incorrectly concludes that these substantial increases in noise would not result in a significant impact under CEQA. DEIR at 4.10-29, 4.10-30. As discussed above, in evaluating a project's impacts under CEQA, an agency must address the actual impacts of a project and cannot hide behind metrics obscuring evidence of those impacts. *Protect Amador Waterways*, 116 Cal.App.4th at 1110-11 (finding that narrowly designed significance standards improperly foreclose complete consideration of a project's impacts). Here, the Project would result in a substantial increase in noise levels; that these impacts may be exempt from regulation under the County's noise ordinance does not make these impacts insignificant. If anything, the County's failure to regulate these noise impacts reinforces the need to identify them as significant and adopt adequate mitigation, as required by CEQA. The revised DEIR must identify this increase as a significant impact and identify feasible mitigation measures and/or project alternatives to reduce this impact.

**4. The DEIR Fails to Identify the Timing of Tunneling and Blasting Operations and Therefore Likely Underestimates the Project's Noise and Vibration Impacts.**

The DEIR identifies mine development (tunneling) and gold mineralization production (tunneling and production blasting) as part of the Project, but it does not identify the hours of operation for these Project components. *See* DEIR at 3-19; Figure 3-2 (p. 3-4); Table 3-7 (p. 3-37). The DEIR states that underground exploration and mining would occur 24 hours per day, 7 days per week. DEIR at 3-37. Assuming that underground exploration and mining include mine development and gold mineralization production, tunneling and blasting could occur at night. If this is the case, the Project's noise and vibration impacts would be far more severe than the DEIR discloses.

**Grp 21-48**

To the extent the County intends to rely on assumptions in the DEIR's technical appendix to suggest that tunneling and blasting would only occur during the day time, it cannot. The DEIR's Appendix M (Blasting Report) states, "[t]herefore, it is assumed that on average 7 drifts round blasts will be required per day. Blasting of drift rounds is normally done between shifts and therefore, on average, 3 to 4 drifts rounds would be blasted every 12 hours between shift changes." Appendix M at 15. The DEIR indicates that the 12 hour shifts will change at 7:00 a.m. and 7:00 p.m. DEIR at 3-36. Yet, the data included in Appendix M are simply modeling assumptions. Without explicit restrictions in the DEIR's project description pertaining to the hours of tunneling and blasting, coupled with conditions of approval, the DEIR cannot simply assume that tunneling and blasting operations would not occur at night and would not adversely impact nearby receptors. The revised DEIR must clearly identify the hours of mine development and gold mineralization production. If these operations occur at night or early in the morning, the revised DEIR must evaluate the potential for noise and vibration to cause sleep disturbance.

**5. The DEIR Omits an Analysis of the Noise Impacts Resulting from Remediation of the Centennial Site.**

The majority of the Centennial Site cannot be developed because of unstable soils and/or contamination. DEIR at 4.9-1, 4.7-3. As discussed above, DTSC's remediation project calls for engineered fill to be transported by truck from the Brunswick Site and placed on the Centennial Site. DEIR at 2-2. As we have explained, the DEIR assumes the baseline condition at the Centennial Site is post-remediation. DEIR at 1-6. However, the DEIR also acknowledges the possibility that clean up on the Centennial Site would not be complete upon commencement of mining, in which case engineered fill would be placed at the Brunswick Site or transported offsite to be utilized in local and regional construction markets. *See e.g.*, DEIR at 4.7-37.

**Grp 21-49**

According to the DTSC MND for the Centennial M1 Property Clean-Up Project Remedial Action Plan, activities involved with site remediation will include site clearing, excavation, grading, material transport, and compaction. Exhibit G (MND) at 64. Although

remediation of the Centennial Site could occur during commencement of mining, the DEIR does not analyze noise from remediation-related operations or the truck trips that would occur from these remediation activities.

**6. The DEIR Substantially Underestimates Operational Noise Impacts.**

The DEIR's analysis of the Project's operational noise and vibration impacts fails to comply because it substantially underestimates the Project's impacts. As a result, the DEIR avoids disclosing significant impacts and avoids having to identify feasible mitigation measures. Examples of the most egregious errors are set forth below.

**(a) The DEIR Fails to Adequately Analyze Noise Impacts from the Placement and Compaction of "Engineered Fill" Operations.**

**Grp 21-50**

Placement and compaction of "engineered fill" operations are expected to occur for at least five to six years at the Brunswick and Centennial sites. These operations would require the use of bulldozers, graders, excavators, front-end loaders and compactors. The DEIR relies on a computer noise model to estimate noise levels at nearby sensitive receptors and concludes that noise from "engineered fill" activities would not exceed the County noise standards at any receptor location. DEIR Table 4.10-14 (p. 4.10-33). However, a peer review of the DEIR's analysis conducted by Salter determined that the DEIR substantially underestimates the level of noise the surrounding community would experience. In fact, many of the calculated noise levels exceed the DEIR's estimates by up to 14 dB. Exhibit B (Salter Report) at 3, 4. By underestimating the actual noise levels that would be generated by the Project's operations, the DEIR avoids identifying significant impacts at 11 receptor locations near the Brunswick Site. *Id.*

**Grp 21-51**

Salter determined that the DEIR further underestimates the DEIR's noise impacts because it compares Project-related noise to ambient conditions near roadways. When noise monitoring devices are placed near roadways, they detect intermittent noise associated with passing cars and trucks. Yet, the median and "background" ambient noise levels indicate that much of the time people experience notably lower noise levels. Exhibit B (Salter Report) at 4. As discussed above, had the DEIR evaluated the absolute increase in projected noise levels against accurate ambient conditions, the DEIR would have determined that noise levels with the Project could increase by 20 to 35 db. As the DEIR reveals, a 5.0 dB increase in noise level is considered a significant impact.[5] *See* DEIR at Table 4.10-5 (p. 4.10-17). In addition to comparing the

[5] Inexplicably, the DEIR relies on varying thresholds for the Project's traffic and on-site noise sources. The DEIR relies on a numerical increase in noise only to determine the significance of the Project's traffic noise impacts. *See* DEIR Table 4.10-5 (p. 4.10-17), identifying +5.0 dB or more as constituting a significant traffic noise impact. For on-site noise sources, it relies on the noise limits included in the Nevada County General Plan Noise Element and the Nevada County Land Use and Development Code. DEIR Table 4.10-4 (p. 4.10-12); 4.10-15.

Project's noise levels to the County's standards, it should have evaluated the Project's impacts against ambient noise, i.e., the noise levels that people actually experience. Exhibit B (Salter Report) at 4. The revised DEIR must provide this analysis.

**(b) The DEIR Relies on Flawed Assumptions Regarding Equipment "Upgrades" to Conclude the Project Would Not Exceed the County's Noise Standards.**

Grp 21-52

The DEIR assumes the implementation of various "upgrades" to mechanical equipment in its calculation of projected noise levels but it fails to include any enforceable commitment to actually implement these upgrades. The DEIR concludes that with implementation of these upgraded measures, operational noise would be below County standards and the Project's impacts would be less than significant. DEIR at 4.10-41. For example, as Salter explains, the DEIR assumes the Project's metal buildings would achieve the highest possible sound insulation system and the project's ventilation fan(s) would employ high performance industrial fan silencers. Exhibit B (Salter Report) at 5-6. Yet, we can find no evidence in the DEIR or the technical appendices that the Applicant has committed to installing this equipment. Similarly, the DEIR appears to rely on specific assumptions regarding backup generators, including engine exhaust mufflers, sound isolating building construction, and radiator fan silencers, but again, the document does not identify the specific type of equipment. Nor does it identify the expected noise-attenuation of each piece of equipment. *Id.* By assuming that these "upgrades" are already incorporated into the Project when conducting the noise analysis, the DEIR obscures the true extent of the Project's noise impacts. As Salter explains, "the DEIR appears to 'promise' a less-than-significant noise impact, but omits the controls, assurances, and appropriate mitigation to ensure that this claim is actually achieved. Without requiring the aforementioned noise reducing measures, or assumed 'upgrades,' the DEIR fails to adequately protect the community from the potential for excessive noise." *Id.* The revised DEIR must evaluate the significance of the Project's noise impacts without these upgrades. *Lotus v. Dept. of Transportation* (2014) 223 Cal.App.4th 645, 655-57.

**(c) The DEIR Fails to Adequately Analyze or Mitigate the Noise and Vibration Impacts from the Project's Blasting Operations.**

Grp 21-53

The DEIR relies on an overly lenient threshold of significance to assert that vibration from the Project's blasting operations would be barely perceptible to nearby receptors. Exhibit B (Salter Report) at 7-8. The DEIR identifies a 0.4 in/sec peak particle velocity (PPV) vibration limit based primarily on a vibration study performed following an underground nuclear blast in Mississippi in 1964. Exhibit B (Salter Report) at 8; DEIR at 4.10-58. Salter explains that human responses to a single blast does not reflect the impact on the community from ongoing, perceptible and potentially unpleasant vibration over the 80-year lifespan of this Project. Exhibit B (Salter Report) at 7-8. Nevertheless, the DEIR references this study as it is described in a U.S. Bureau of Mines (USBM) 1971 document entitled "Blasting Vibrations and Their Effects on

Structures." *Id.* The claim extracted from the USBM document is that "less than 8% of people would complain about blasting activities if the peak particle velocity (PPV) was below 0.4 in/sec." DEIR, Appendix M, at 7. However, as Salter explains, the original chart this is drawn from provides additional context: The proposed limit of 0.4 in/sec. PPV is characterized as clearly perceptible and borderline unpleasant. Exhibit B (Salter Report) at 8. A Caltrans Manual confirms that blasting vibration of 0.4 in/sec would be considered "strongly perceptible." *Id.*

Salter explains that a 0.4 in/sec vibration limit might be appropriate in certain scenarios, such as for a short-term event. However, this Project involves ongoing mining operations for 80 years. According to Salter, this impact would be far more severe when blasting operations occur at night, especially because the DEIR does not include any restrictions on nighttime operations. Exhibit B (Salter Report) at 9. In this regard, the DEIR ignores crucial guidance set forth by the U.S. Office of Surface Mining and Reclamation and Enforcement (OSMRE):

> All blasting must take place during daylight hours unless more restrictive times are specified. If night-time blasting is approved by the regulatory authority, it must be based on evidence from the operator that the public will be protected from adverse noise and other impacts.

Exhibit B (Salter Report) at 9 (citing OSMRE Blasting Guidance Manual).

The DEIR provides no evidence that the public will be protected from adverse effects from the Project's blasting operations. It provides no special consideration and therefore no additional restrictions on blasting vibration during evening and nighttime hours. According to Salter, subjecting residents to "strongly perceptible" and borderline "unpleasant" vibration for the rest of their lives constitutes a significant impact. Exhibit B (Salter Report) at 9. Because the DEIR fails to disclose this impact, it must be revised and recirculated.

**Grp 21-54**

The DEIR errs further in its evaluation of noise from the Project's blasting operations. To evaluate the Project's blasting-related noise impacts, the DEIR relies on noise measurements conducted at the Sutter Gold underground mine in Amador County. DEIR at 4.10-44. The Sutter Gold study found blasting noise to be 75 dBA, on average, at a distance of 200 feet from the mine portal. *Id.* However, to translate those findings to the Project's Brunswick Site, the DEIR assumes that noise at the Project site would be reduced by 20 dB compared to the Sutter Gold mine. *Id.* Other than mentioning the difference in orientation and size of the portal, this claim of 20 dB noise reduction is unsubstantiated. As the Salter Report explains, twenty decibels of noise reduction is a substantial change in noise emission. *Id.* Without further data or evidence to back up this 20 dB claim, the DEIR cannot simply assume these lower noise levels.

According to Salter, without the unsubstantiated 20 dB of reduction, blasting noise at the nearest sensitive receptors would be between 72 and 77 dBA. Exhibit B (Salter Report) at 10. As stated above and in the DEIR, ambient median and "background" noise levels at many sensitive receptors is between 35 dBA and 50 dBA. Thus, the blasting noise could be substantially above the ambient noise levels, by approximately 25 to 40 dB. Salter determines such an event to be considered a disturbance, likely resulting in complaints, particularly at night when sleep disturbance would be expected. *Id.* This is a significant undisclosed impact requiring that the DEIR be revised and recirculated.

**C. The DEIR Fails to Adequately Analyze and Mitigate the Project's Impacts Relating to Hazards and Hazardous Materials.**

**1. The DEIR Omits an Accurate Description of Existing Conditions.**

For the reasons discussed above, an accurate depiction of the existing environmental setting is critical to a complete assessment of the Project's impacts. Yet here too, the DEIR fails to provide an adequate description of the hazardous conditions on the Project's Centennial Site.

**Grp 21-55**

The existing waste rock and mine tailings that were generated from historic mining activities contain contaminants at levels exceeding regulatory thresholds, including California hazardous waste thresholds. Exhibit A (Baseline Report) at 2. These existing waste rock and mine tailings at the Centennial Site have been present (and have represented a persistent environmental hazard) since the former mining operation at the site shut down over 60 years ago (circa 1956). As discussed above, the owner of the Centennial Site entered into a Voluntary Cleanup Agreement with the DTSC to address the hazards associated with the legacy waste rock and mine tailings generated from previous mining operations. It should be noted that cleanup actions were not initiated by the site owner until they were ready to reopen the mine. It is also important to note that under existing conditions, the majority of the Centennial Site cannot be developed due to unstable soils and/or contamination. DEIR at 4.7-3.

Despite these circumstances, the DEIR assumes as baseline conditions that the Centennial Site will be cleaned up pursuant to the Voluntary Clean Up Agreement with DTSC. *See* DEIR at 4.7-3, 4.7-4, "this EIR does not use the existing condition at the site for the environmental baseline and instead uses an environmental baseline that reflects the anticipated conditions for the Centennial Industrial Site following implementation of the [Remedial Action Plan];" and 4.7-32, "the baseline condition for the Centennial Industrial Site has been adjusted for this analysis to reflect post-remediation condition."

The problem with this approach is that the DEIR does not provide the necessary assurance that this cleanup will occur prior to implementation of other Project components. In several instances, the DEIR acknowledges that clean up on the Centennial Site may not be complete upon commencement of mining and that it may not even be completed within the 80-

year permit life. *See* DEIR at 3-26, "[i]t is the applicant's *intent* to prioritize the placement of the engineered fill at the Centennial Industrial site" (emphasis added); *see also* DEIR at 3-26, "Notwithstanding the priority of placing engineered fill at the Centennial Site, the ultimate approach to engineered fill placement will need to remain flexible to address any potential unforeseen circumstances. One such scenario would be if the remediation of the Centennial Site, currently under DTSC oversight, is not complete upon commencement of mining, in which case engineered fill would be placed at the Brunswick Industrial Site and/or transported off-site to be utilized in local and regional construction markets."

Absent full disclosure of existing, baseline hazardous conditions on the Project site, it is impossible for decisionmakers or the public to fully evaluate the hazardous impacts associated with the Project.

**2. The DEIR Fails to Analyze or Mitigate Hazardous Impacts Relating to Waste Rock and Mine Tailings.**

The DEIR fails to evaluate how future waste rock and mine tailings generated by the proposed Project would be managed to ensure that they do not pose a health hazard to people or the environment. The DEIR provides almost no information that demonstrates the chemical quality of the rock proposed to be mined would differ in any way from the rock that was mined historically. According to the Baseline Report, in the absence of this information, it is reasonable to assume that any newly generated waste rock and mine tailings would have similar chemical characteristics as the rock mined in the past. Therefore, the waste rock and mine tailings generated by the proposed Project will almost certainly contain asbestos, silica, and trace heavy metal toxic air contaminants (TACs) including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium that could pose a health risk to people and the environment. DEIR at 4.3-79; Exhibit A (Baseline Report) at 3.

**Grp 21-56**

As mentioned above, the DEIR tries to "rebrand" the waste rock and mine tailings as "engineered fill," apparently in the hopes that the waste material can be transported off-site for use at various unspecified construction sites throughout the region as fill material. Although this material would almost certainly result in numerous new contaminated wastes sites that pose a threat to the public and the environment, the DEIR fails to provide *any* analyses of these impacts.

The DEIR suggests that any impacts would be mitigated because the Applicant will comply with RWQCB requirements. Yet, for the reasons discussed in this letter, it is not sufficient to rely on regulatory permitting to assert that impacts will be mitigated. The DEIR must first comprehensively analyze these impacts and then demonstrate how regulatory compliance will ensure impacts are sufficiently mitigated. This analysis must take into account the fact that similar historic actions have been demonstrated to result in environmental harm that has persisted for decades.

**3. The DEIR Fails to Evaluate or Mitigate Flight Hazards at Nevada County Air Park.**

Grp 21-57

The closest public use airport to the Project site is the Nevada County Air Park, less than one-mile (approximately 4,000 feet) northeast of the Brunswick Site. DEIR at 4.7-36. When the weather is cool, the Project will cause saturated air to become super-saturated and create a continuous plume cloud. *See* Report prepared by CEA Foundation, submitted under separate cover. A southwest breeze will move this plume towards the airport and potentially obstruct the airspace surrounding the airport. *Id.* This large volume of heated air will updraft, possibly causing turbulence for air traffic. It could also develop into a standing cloud or fog that will impede visibility for aircraft and/or the tower and thus pose a hazard to flight. *Id.* Because the DEIR neither discloses, analyzes or mitigates this impact, it must be revised and recirculated.

**4. The DEIR Fails to Adequately Analyze the Project's Cumulative Impacts Relating to Hazards and Hazardous Materials.**

Grp 21-58

The DEIR fails to analyze cumulative hazards to the public and environment related to increases in the transport, storage, and use of hazardous materials. The DEIR suggests there would be no cumulative impacts because no other cumulative projects are anticipated to haul hazardous materials along Brunswick Road on an ongoing basis. DEIR at 4.7-39. This is incorrect. As discussed above, DTSC's RAP would require transporting by truck "engineered fill" from the Brunswick Site to the Centennial Site. DEIR at 2-2; Exhibit G (MND). The MND clearly acknowledges that implementation of the RAP may temporarily increase the risk of exposure of soil contaminants to the public. Exhibit G (MND) at 50. Consequently, the DEIR should have analyzed how the transport, storage and use of hazardous materials from the proposed Project together with the RAP would affect public health and safety. To the extent that the DEIR preparers might suggest that the cleanup of the Centennial Site would occur prior to the proposed Project, it cannot do so. Again, as discussed above, according to the DEIR, the possibility exists that clean up on the Centennial Site would not be complete upon commencement of mining. DEIR at 4.7-37. It also acknowledges the possibility that clean up on the Centennial Site would not be completed within the 80-year permit life of the proposed mine Project, and that "engineered fill" would be placed at the Brunswick Site and/or transported off-site to be utilized in local and regional construction markets. *Id.* The revised DEIR must analyze the cumulative effects of the RAP along with the proposed Project.

**D. The DEIR Fails to Adequately Analyze and Mitigate the Project's Air Quality Impacts.**

Grp 21-59

The DEIR's analysis of air quality contains numerous flaws. First, the DEIR fails to analyze the Centennial Site's cleanup's impact on air quality, or the air quality impacts that may result from the Project if the Centennial cleanup does not occur. Second, the DEIR's analysis of air quality impacts from Project construction assumes a construction timeline that contradicts the

Project description. Third, the DEIR improperly relies on assumed mitigation measures for air quality impacts, failing to acknowledge those measures as mitigation. Fourth, the DEIR fails to mitigate significant air quality impacts from operational emissions of criteria air pollutants. Finally, the DEIR's Health Risk Assessment fails to disclose essential information and lacks substantial evidence to support its conclusions. The DEIR must be revised to correct these flaws.

**1. The DEIR Fails to Analyze the Centennial RAP's Impact on Air Quality.**

The Centennial RAP is an integral part of the IMM Project, as discussed in Section I.C, *supra*. Remediation of the Centennial Site is a necessary prerequisite to the dumping of mine waste from the Project on that site, and the Project's eventual reclamation of the site. *Id.* As explained above, the DEIR must therefore include the Centennial RAP as part of the Project, and must analyze all of the environmental impacts resulting from the RAP, including air quality impacts.

**Grp 21-60**

The Centennial RAP would involve mixing soil with over 335 tons (22 truckloads) of cement to stabilize the contaminants in that soil. Exhibit G (MND) at 3. It would require the clearing of existing vegetation, the excavation and grading of 36.7 acres of land on the Centennial Site, and the movement of 129,100 cubic yards of soil using backhoes and other heavy equipment. *Id.* at 3-4; Exhibit E (RAP) at 44. The MND for the Centennial RAP finds that the cleanup would generate potentially significant criteria air pollutant emissions that require mitigation. Exhibit G (MND) at 24-25. The DEIR improperly fails to disclose or analyze the impacts of these cleanup activities on air quality. DEIR at 4.3-66 to 4.3-102. The DEIR's omission of these impacts violates CEQA. *See County of Inyo*, 172 Cal.App.3d at 165-66; *Nelson*, 190 Cal.App.4th at 271. By failing to include this essential information, the DEIR prevents informed analysis of the Project's impacts and is therefore legally inadequate.

**2. The DEIR Fails to Analyze Air Quality Impacts that May Result from the IMM Project if the Centennial Cleanup Does *Not* Occur.**

The DEIR also fails evaluate air quality impacts that may result from the Project if the Centennial cleanup does not occur. The DEIR acknowledges that the Centennial Site might never be remediated during the 80-year term of the mine permit. DEIR at 1-3, 3-26. If that occurs, the Centennial Site will never become available for dumping of mine waste, and an additional 1.6 million tons of mine waste from the Project will need to be trucked offsite once the dumping area at the Brunswick Site is full. *Id.* at 1-3, 3-32 to 3-33, 3-26. The DEIR must evaluate the potential impacts of the offsite trucking of those additional 1.6 million tons of mine waste on air quality. The DEIR lacks this analysis. Instead, the DEIR's air quality analysis simply assumes that the Centennial RAP will be completed and that dumping of fill at the Centennial site will occur in the first five years of Project operations. *See id.* at 4.3-50, 4.3-53 to 4.3-54, 4.3-67 to 4.3-68, 4.3-93.

**Grp 21-61**

Because there is no assurance that remediation of the Centennial Site will be completed within the lifetime of the Project, it's speculative to assume that the site will be available for fill placement. *See* Exhibit A (Baseline Report) at 12-13. If the Centennial RAP is never completed and no fill is ever placed at the Centennial Site, that fill must be trucked offsite for an additional five years, resulting in additional air pollutant emissions not disclosed in the DEIR. The document's failure to disclose or analyze this impact deprives the public and decision-makers of essential information in violation of CEQA. *See Banning Ranch*, 2 Cal.5th at 941-42. The DEIR's analysis for criteria air pollutants should be revised to assume that remediation of the Centennial Site may not be completed within the lifetime of the Project, and must evaluate the resulting air quality impacts of additional off-site trucking. *See* Exhibit A (Baseline Report) at 13. As demonstrated in Baseline's analysis of daily $NO_x$ emissions, these additional off-site truck trips would result in more severe air quality impacts than those disclosed in the DEIR. *Id.*

**5. The DEIR's Analysis of Construction Emissions Contradicts the Project Description.**

**Grp 21-62**

The DEIR's analysis of air quality impacts from Project construction is unsupported because it contradicts the Project description regarding the duration of construction. The Project description states that construction would last for 18 months. DEIR at 3-37. By contrast, the DEIR's air quality analysis assumes that Project construction would last for only 12 months, and bases its impact evaluation on that assumption. *Id.* at 4.3-44 to 4.3-46, 4.3-66 to 4.3-67, 4.3-74. The DEIR is therefore internally contradictory. "[S]uch an unexplained discrepancy precludes the existence of substantial evidence" for the EIR's conclusions. *Preserve Wild Santee*, 210 Cal.App.4th at 284. The DEIR asserts that "the construction scenario assessed herein is the worst-case, because if the same construction activities were to be spread over a longer period (i.e., a period in excess of 12 months), the amount of overlap of equipment usage would be reduced, which would result in reduced max daily and annual emissions." DEIR at 4.3-44. However, the DEIR fails to provide any evidence in support of this statement, which fails to account for the fact that a longer construction period would result in a longer period of construction-related air pollution exposure for nearby receptors. The DEIR's air quality analysis must be revised to assume the same construction duration as the Project description.

**3. The DEIR Improperly Relies on Assumed Air Quality Mitigation Measures, Preventing Informed Impact Analysis.**

**Grp 21-63**

The DEIR lists three "applicant-proposed emissions reduction measures" intended to reduce the Project's air quality impacts. DEIR at 4.3-65. However, the DEIR does not classify these measures as mitigation, explaining that "[t]he analysis presented within this chapter *assumes* that all of the applicant proposed measures (APMs) presented below would be implemented." *Id.* (emphasis added). The DEIR assumes the APMs will be incorporated into the Project, but the APMs were not identified as Project features in the Project description, and there

is no assurance that these measures will be implemented as a part of the Project. *See* Exhibit A (Baseline Report) at 14. These applicant-proposed measures are in reality mitigation measures, which the DEIR improperly fails to recognize as such. This approach violates CEQA. In evaluating a project's impacts, an agency may not "compress[] the analysis of impacts and mitigation measures into a single issue" by incorporating an assumed mitigation measure into a project's features. *Lotus*, 223 Cal.App.4th at 656. A project's significant impacts must be determined first, and then the CEQA document must identify enforceable mitigation that will address those impacts. *Id.* at 656, 658.

**Grp 21-64**

Here, applicant-proposed measure APM-AQ-1 (Exhaust Emission Controls) requires that "[a]ll off-road diesel-fueled equipment and emergency generators owned by Rise Grass Valley Inc. shall be equipped with Tier 4 Final engines." DEIR at 4.3-65. It also requires that "[u]nnecessary construction vehicle idling time shall be minimized" and that "[a]ll off-road equipment shall be maintained in accordance with manufacturer's specifications." *Id.* APM-AQ-2 (Surface Fugitive Dust Controls) calls for wetting or covering of "all exposed soil surfaces (e.g., unpaved disturbed areas, unpaved parking areas, and unpaved staging areas, and soil piles)" to prevent fugitive dust emissions during construction and operations, and calls for construction techniques to minimize dust from roadways. DEIR at 4.3-65. APM-AQ-3 calls for the Applicant to implement an "ASUR Plan, which incorporates measures designed to minimize asbestos in engineered fill produced by the project, as well as minimize the emission of asbestos-containing dust from the underground mine." *Id.*

Each of these three measures are de facto mitigation measures, as they are clearly intended to minimize the Project's air quality impacts by reducing emissions sources. *See* CEQA Guidelines §15370 (defining "mitigation"); DEIR at 4.3-81 (asserting that APM-AQ-2 would reduce the fugitive dust generated by the Project); 4.3-82 (finding that APMs would reduce Project emissions of criteria pollutants); 4.3-87 (noting that APM-AQ-1 would reduce air pollution). However, the DEIR's calculation of "unmitigated" emissions of criteria air pollutants expressly assumes that APM-AQ-1 and APM-AQ-2 have already been implemented. DEIR Table 4.3-17 (p. 4.3-70); 4.3-73. The DEIR makes no attempt to calculate what the Project's emissions would be without the APMs, and does not separately quantify the emission reductions that would result from these measures. By assuming that these measures are already incorporated into the Project when conducting its air quality analysis, the DEIR obscures the true extent of the Project's air quality impacts. The DEIR must be revised to classify the APMs as mitigation measures, and must evaluate their effectiveness in reducing air quality impacts. The DEIR must evaluate the significance of the Project's air quality impacts without these mitigation measures, *before* considering the effectiveness of mitigation and the significance of Project impacts after mitigation. *Lotus*, 223 Cal.App.4th at 656, 658; *see* Exhibit A (Baseline Report) at 14. Only then can decisionmakers and the public fully understand the Project's impacts.

**4. The DEIR Fails to Mitigate Significant Air Quality Impacts from Operational Emissions of ROG, $NO_X$ And $PM_{10}$.**

The DEIR concludes that the Project would not conflict with or obstruct implementation of an applicable air quality plan, and that this impact would be less than significant after mitigation. DEIR at 4.3-66. However, the DEIR's proposed mitigation fails to account for the Project's operational emissions of criteria air pollutants. The DEIR concludes that daily operational emissions of ROG, $NO_X$ and $PM_{10}$ are significant under Northern Sierra Air Quality Management District (NSAQMD) significance criteria and require mitigation. *Id.* at 4.3-67 to 4.3-70, 4.3-73; *see* Exhibit A (Baseline Report) at 14. It finds that without mitigation, these significant operational emissions could conflict with or obstruct implementation of the NSAQMD's Ozone Attainment Plan. DEIR at 4.3-70; *see id.* at 4.3-66.

**Grp 21-65**

Despite finding that operational emissions of ROG, $NO_X$, and $PM_{10}$ require mitigation, the DEIR does not propose any mitigation measures to address operational emissions of those pollutants. *Id.* at 4.3-77 to 78. The DEIR includes two mitigation measures (Mitigation Measures 4.3-1(a) and 4.3-1(b)) which exclusively address *construction* emissions. *Id.* at 4.3-77 to 78. As written, nothing in Mitigation Measures 4.3-1(a) and 4.3-1(b) would do anything to reduce the Project's operational emissions. *See* Exhibit A (Baseline Report) at 14. Mitigation Measure 4.3-1(a) states that it contains measures "for use during construction," including the use of grid power where feasible "during construction" and temporary traffic control "during all phases of the construction." DEIR at 4.3-77. Mitigation Measure 4.3-1(b) calls for a "Construction Exhaust Emissions Minimization Plan" which applies to equipment used during construction. *Id.* at 4.3-77 to 4.3-78.

Inexplicably, however, the DEIR claims that *operational* emissions of ROG, $NO_X$, and $PM_{10}$ would be mitigated to a less than significant level after implementation of these purely construction-related mitigation measures. *Id.* at 4.3-75 to 4.3-76 (Table 4.3-19, showing "mitigated" operational emissions levels for those pollutants as not significant). The DEIR does not provide any evidence as to how operational emissions of ROG, $NO_X$, and $PM_{10}$ —which it acknowledges are significant before mitigation—could be reduced to a less than significant level when the DEIR does not include any mitigation measures for those operational impacts. *See* Exhibit A (Baseline Report) at 14. "[S]uch an unexplained discrepancy precludes the existence of substantial evidence" for the EIR's conclusions. *Preserve Wild Santee*, 210 Cal.App.4th at 284. Courts will not defer to an agency's conclusions about the effectiveness of a mitigation measure where, as here, the measure's efficacy in reducing an impact is not apparent and there is no evidence in the record showing that it will be effective. *King & Gardiner Farms*, 45 Cal.App.5th at 866, 875-76.

This unexplained discrepancy between the DEIR's significance conclusion for pre- and post-mitigation operational emissions of ROG, $NO_X$, and $PM_{10}$ and the lack of operational

mitigation measures cannot be attributed to any impact of the applicant-proposed measures for emissions reduction identified in the DEIR. *See* DEIR at 4.3-65. In fact, the DEIR expressly notes that its calculations of "unmitigated" emissions of these criteria pollutants already reflect reductions from the assumed applicant-proposed measures discussed above in Section II.D.4, which the DEIR does not classify as mitigation. *Id.* at 4.3-73 ("The emission data presented in Table 4.3-17 (i.e., unmitigated emissions) reflect the reductions that would occur with implementation of APM-AQ-1 and APM-AQ-2."). The DEIR must be revised to fully explain the basis for its conclusion that operational emissions of ROG, $NO_X$, and $PM_{10}$ would be mitigated to a level below significance, and then recirculated.

**6. The DEIR's Health Risk Assessment Fails to Disclose Essential Information and Lacks Substantial Evidence to Support Its Conclusions.**

The DEIR indicates that the Project would generate toxic air contaminants that could pose health risks to people in the vicinity of the Project site. DEIR at 4.3-79. However, the DEIR fails to provide sufficient information to enable informed analysis of these health impacts, and therefore lacks substantial evidence for its conclusion that these impacts would be less than significant after mitigation. *See* Exhibit A (Baseline Report) at 17-18.

**Grp 21-66**

The DEIR states that Project construction and operations would produce diesel particulate matter (DPM) emissions from off-road equipment, haul truck trips, and generators, while mining activities such as blasting and crushing, ore processing, and soil movement would generate emissions of asbestos, silica, and trace heavy metal TACs including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium. DEIR at 4.3-79. The DEIR includes a health risk assessment (HRA) for nearby sensitive receptors exposed to concentrations of TACs generated by the Project. *Id.* at 4.3-79 to 4.3-80; *see* DEIR Appendix E.1 (Air Quality and GHG Technical Report); Appendix B (Health Risk Assessment) at 26-27. The HRA analyzes air dispersion of 25 sources of TAC emissions during construction and operation of the Project. *See* HRA at 8-12. Based on the air dispersion model results, the HRA estimated the health risks for a sensitive receptor exposed to 33 different TACs. *Id.* at 25.

The DEIR concludes that before mitigation, the Project's effect on increased cancer risk for the "Maximally Exposed Individual Resident" would be 10.4 persons per million, exceeding the applicable NSAQMD significance threshold of 10 persons per million, resulting in a significant impact. DEIR at 4.3-80. However, with implementation of Mitigation Measure 4.3-1(b), which requires Tier 4 engines during construction, the DEIR concludes that the Project would result in an incremental cancer risk of 7.6 persons million. *Id.* at 4.3-80. The DEIR's asserted 27 percent reduction in cancer risk is surprising, because Mitigation Measure 4.3-1(b)

only reduces emissions during the one-year Project construction period,[6] and does not reduce any emissions over the remaining 80 years of Project operations. *Id.* at 4.3-77 to 4.3-78. The DEIR finds that after mitigation, the Project's impacts on increased cancer risk and other health risks would be less than significant. *Id.* at 4.3-79, 4.3-80, 4.3-82. This conclusion is not adequately supported, because the DEIR fails to provide essential information about how health risks were calculated, making it impossible to evaluate the effectiveness of Mitigation Measure 4.3-1(b).

**Grp 21-67**

The DEIR fails to adequately disclose or document the results of the HRA for the numerous sources of TAC emissions associated with the Project. *See* Exhibit A (Baseline Report) at 17-18. The DEIR only presents the total cancer risk, chronic health risk, and acute health risk for a sensitive receptor, despite finding that receptors could be exposed to 33 different TACs from 25 different sources at different times over a 30-year period. DEIR at 4.3-80; *see* HRA at 8-12, 25-27. The individual health-risk contributions from each emission source, TAC, and year of exposure are not documented or summarized anywhere in the DEIR or HRA. In addition, no graphics are provided to show the location of the modeled emission sources, sensitive receptors, and results of the air dispersion modeling. As a result, the DEIR fails to provide sufficient information for the public or decisionmakers to review the findings of the health risk assessment and evaluate the effectiveness of the proposed mitigation measures. *See* Exhibit A (Baseline Report) at 17-18. An EIR must include adequate data to enable the public and decisionmakers to understand a project's impacts and draw informed conclusions. *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 442. Here, because the DEIR air quality analysis fails to provide this essential information about its analytical methods, it also lacks substantial evidence to support its conclusions. The DEIR must be revised to properly document the findings of the HRA.

**E. The DEIR Fails to Adequately Analyze or Mitigate the Project's GHG Emissions.**

**Grp 21-68**

The DEIR's analysis of GHG emissions suffers from several key deficiencies. First, the DEIR fails to analyze the Centennial Site cleanup's impact on GHG emissions, or the emissions that may result from the IMM Project if the Centennial cleanup does not occur. Second, the DEIR's analysis of GHG emissions from Project construction assumes a construction timeline that contradicts the Project description. Third, the DEIR improperly relies on assumed mitigation measures for GHG impacts, failing to acknowledge those measures as mitigation. Fourth, the DEIR's significance threshold for operational GHG emissions is unsupported. Finally, the DEIR relies on third-party GHG mitigation offsets which lack adequate performance standards and are improperly deferred.

[6] While the DEIR's air quality analysis assumes that construction would last for one year (DEIR at 4.3-44), the DEIR's project description states that construction would last for 18 months (DEIR at 3-37). The DEIR is therefore internally inconsistent, as discussed above in Section I.D.

**1. The DEIR Fails to Analyze the Centennial RAP's Impact on GHG Emissions.**

**Grp 21-69**

As discussed in Sections I.C and II.D.1, *supra*, the DEIR must include the Centennial RAP as part of the Project, and must analyze all of the environmental impacts resulting from the RAP. *Id.* Accordingly, the DEIR must evaluate the GHG emissions that result from the cleanup of the Centennial Site. The Centennial RAP would involve cement mixing, clearing of existing vegetation, excavation and grading of 36.7 acres of land, and the use of backhoes and other heavy equipment. Exhibit G (MND) at 3-4; Exhibit E (RAP) at 44. The MND concludes that the RAP's operation of off-road diesel equipment would generate approximately 1,077.25 metric tons of $CO_2$ equivalent in GHG emissions. Exhibit G (MND) at 47. The DEIR improperly fails to disclose or analyze the impacts of these RAP activities on GHG emissions. DEIR at 4.3-66 to 4.3-102. The DEIR's omission of these impacts prevents informed analysis and violates CEQA. *See County of Inyo*, 172 Cal.App.3d at 165-66; *Nelson*, 190 Cal.App.4th at 271. The revised DEIR must provide this analysis.

**2. The DEIR Fails to Analyze GHG Emissions that May Result from the Project if the Centennial Cleanup Does *Not* Occur.**

**Grp 21-70**

The DEIR also fails to evaluate GHG emissions that would result from the Project if the Centennial Site cleanup does not occur, as discussed in Sections I.B and II.D.2, *supra*. The DEIR acknowledges that the Centennial Site might never be remediated during the 80-year term of the mine permit, which would require trucking an additional 1.6 million tons of mine waste to offsite locations after the Brunswick Site is full. DEIR at 1-3, 3-32 to 3-33, 3-26. The DEIR must evaluate the GHG impacts of that additional offsite trucking, but fails to do so. Instead, the DEIR's GHG analysis simply assumes that the Centennial RAP will be completed and that fill dumping at the Centennial Site will occur in the first five years of Project operations. *See id.* at 4.3-50, 4.3-53 to 4.3-54, 4.3-67 to 4.3-68, 4.3-93. Because there is no assurance that remediation of the Centennial Site will be completed within the lifetime of the Project, it's speculative to assume that the site will be available for fill placement. *See* Exhibit A (Baseline Report) at 12-13. As discussed in Section I.B, *supra*, the DEIR must evaluate Project impacts relative to existing conditions at the Centennial Site, considering the possibility that the RAP may never occur and analyzing the impacts that would result in that scenario.

The DEIR finds that the Project would generate annual operational GHG emissions of 7,221 MT $CO_2e$ in years 2022 to 2026, when it assumes fill would be dumped at the Centennial Site, 6,999 MT $CO_2e$ in years 2027 to 2032, when fill would be dumped at the Brunswick Site, and 9,041 MT $CO_2e$ in years 2033 to 2,102, when fill would be trucked offsite. DEIR at 4.3-93 to 4.3-94. The DEIR indicates that almost all of the variation in annual emissions between these three time periods is attributable to on-road vehicle emissions, which include emissions from trucks carrying mine waste. *Id.* If the Centennial RAP is never completed and no fill is ever

placed at the Centennial Site, that fill must be trucked offsite for an additional five years, resulting in an annual increase of 1,820 MT $CO_2e$ for each of those years. The DEIR does not disclose this important impact. The document's failure to disclose or analyze this impact deprives the public and decision-makers of essential information in violation of CEQA. *See Banning Ranch*, 2 Cal.5th at 941-42. The DEIR's GHG analysis should be revised to assume that remediation of the Centennial Site may not be completed within the lifetime of the Project, and must evaluate the resulting GHG impacts of additional off-site trucking. *See* Exhibit A (Baseline Report) at 13.

**3. The DEIR's Analysis of Construction GHG Emissions Contradicts the Project Description.**

Grp 21-71

The DEIR's analysis of GHG impacts from Project construction is unsupported because its assumptions regarding the duration of construction contradict the Project description. The DEIR's Project description states that Project construction would last for 18 months. DEIR at 3-37. By contrast, the DEIR's GHG analysis assumes that Project construction would last for only 12 months, and bases its impact evaluation on that assumption. *Id.* at 4.3-44 to 4.3-46, 4.3-92. The DEIR is therefore internally contradictory. "[S]uch an unexplained discrepancy precludes the existence of substantial evidence" for the EIR's conclusions. *Preserve Wild Santee*, 210 Cal.App.4th at 284. The DEIR asserts that "the construction scenario assessed herein is the worst-case, because if the same construction activities were to be spread over a longer period (i.e., a period in excess of 12 months), the amount of overlap of equipment usage would be reduced, which would result in reduced max daily and annual emissions." DEIR at 4.3-44. The DEIR fails to consider whether an 18-month construction period could result in greater total GHG emissions than a 12-month construction period, even if those emissions are spread out over a longer period. The DEIR's GHG analysis must be revised to assume the same construction duration as the Project description.

**4. The DEIR Likely Underestimates the Project's GHG Emissions Because it Assumes the Use of Electrically Powered Equipment.**

Grp 21-72

The DEIR assumes the implementation of electrically powered equipment for its construction and operations and almost certainly relies on these features in its calculations of the Project's GHG emissions. *See e.g.*, DEIR Tables 4.3-7 and 4.3-10 (pp. 4.3-46 and 4.3-51). Yet, we can find no evidence in the DEIR that this equipment would actually be electrified. Unless the Project includes electrification as a condition of approval, the DEIR cannot take credit for these features in its GHG emissions' inventories. This defect also pertains to the DEIR's air quality and energy analyses.

**5. The DEIR Improperly Relies on Assumed GHG Mitigation Measures, Preventing Informed Impact Analysis.**

As discussed in Section II.D.4, *supra*, the DEIR lists several "applicant-proposed emissions reduction measures" which it does not classify as mitigation, and simply assumes that those measures would be implemented when conducting impact analysis. DEIR at 4.3-65. The APMs were not identified as Project features in the Project description, and there is no assurance that these measures will be implemented as a part of the Project. *See* Exhibit A (Baseline Report) at 14. These applicant-proposed measures are in reality mitigation measures, which the DEIR improperly fails to recognize as such. As explained above, this approach violates CEQA. *See Lotus*, 223 Cal.App.4th at 656. A project's significant impacts must be determined first, and then the CEQA document must identify enforceable mitigation measures and evaluate the measures' effectiveness in addressing project impacts. *Id.* at 656, 658; *see* Exhibit A (Baseline Report) at 14.

Grp 21-73

This error invalidates the DEIR's analysis of GHG emissions, just as it does for the air quality and energy use analyses. In addition to requiring Tier 4 engines, applicant-proposed measure APM-AQ-1 (Exhaust Emission Controls) requires that "[u]nnecessary construction vehicle idling time shall be minimized" and that "[a]ll off-road equipment shall be maintained in accordance with manufacturer's specifications." DEIR at 4.3-65. APM-AQ-1 thus seeks to reduce the Project's GHG emissions as well as its air quality and energy impacts. *Id.* at 4.3-87 (noting that APM-AQ-1 would reduce GHG emissions). APM-AQ-1 is a de facto mitigation measure. *See* CEQA Guidelines §15370. The DEIR's analysis of the Project's GHG emissions impermissibly assumes that APM-AQ-1 has been implemented *before* evaluating the significance of impacts or considering mitigation. DEIR at 4.3-65; Table 4.3-23 (p. 4.3-94). The DEIR makes no attempt to calculate what the Project's GHG emissions would be without APM-AQ-1, and does not separately quantify the emission reductions that would result from that "applicant proposed" measure. This approach prevents informed analysis of Project impacts, violating CEQA. *Lotus*, 223 Cal.App.4th at 656. The DEIR must be revised to classify the APMs as mitigation measures, analyze the Project's GHG impacts without those measures, and then evaluate the APMs' effectiveness in reducing GHG missions.

**6. The DEIR's Significance Threshold for Operational GHG Emissions Is Not Supported by Substantial Evidence.**

Grp 21-74

The DEIR uses an unsupported significance threshold for operational GHG emissions, understating the significance of the Project's emissions and improperly avoiding mitigation for those emissions. The DEIR calculates that the Project would generate annual operational emissions of 7,221.64 metric tons of $CO_2$ equivalent (MT $CO_2e$) in years 2022 to 2026, 6,999.63 MT $CO_2e$ in years 2027 to 2032, and 9,041.23 MT $CO_2e$ in years 2033 to 2102. DEIR at 4.3-93 to 4.3-94. By far the largest source of the Project's operational GHG emissions would come from

consumption of grid power by electric mining equipment. *See id.* The Project would consume 49,613 MWh of PG&E-supplied electricity annually during operations, generating 4,635.82 MT $CO_2e$ per year. *See id.* at 4.3-88, 4.3-93 to 94.[7] Once the Brunswick and Centennial sites have reached their maximum capacity for dumped fill, and mine waste is instead trucked offsite beginning in 2033, emissions from on-road vehicles would become the second-largest source of annual GHG emissions, generating over 3,123.46 MT $CO_2e$ per year for the remaining 70 years of the permit. *Id.* Other sources of GHG emissions generated during Project operations would include off-road vehicles and equipment, emergency generator use, underground blasting, and solid waste. *Id.* The DEIR fails to adequately analyze these emissions, and lacks adequate support for the significance threshold used to evaluate them.

**Grp 21-75**

The CEQA Guidelines mandate that "[i]n determining the significance of a project's greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change" and that "[t]he agency's analysis should consider a timeframe that is appropriate for the project." CEQA Guidelines § 15064.4(b). "[W]hen determining the significance of impacts from greenhouse gas emissions on the environment," an EIR must consider not only "[w]hether the project emissions exceed a threshold of significance that the lead agency determines applies to the project," but also "[t]he extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting," and "[t]he extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions." *Id.* GHG significance thresholds that are not supported by substantial evidence violate CEQA. *Golden Door Properties, LLC v. County of San Diego* (2018) 27 Cal.App.5th 892, 904-05.

Here, the DEIR relies on a significance threshold of 10,000 MT $CO_2e$ per year to conclude that operational GHG emissions are less than significant, but fails to adequately justify its chosen threshold. While the DEIR acknowledges that the Project's unmitigated GHG emissions during Project construction would be significant (DEIR at 4.3-93), the DEIR claims the Project's much larger operational GHG emissions across the remainder of the 80-year permit period would be less than significant, with no need for mitigation (*id.* at 4.3-93 to 4.3-94). The DEIR sets a significance threshold of 1,100 MT $CO_2e$ per year for the Project's construction emissions, and found that the Project would generate annual emissions of 3,444 MT $CO_2e$ during construction, exceeding this threshold. *Id.* at 4.3-92. However, the DEIR found that the Project

[7] The DEIR does not discuss its assumptions regarding the current carbon intensity of PG&E's power generation mix, but concludes that the Project will not interfere with PG&E's ability to meet California's Renewable Portfolio Standard mandate that all electricity produced within the state be renewably sourced by the year 2045. DEIR at 4.3-88. The DEIR should disclose its assumptions regarding the carbon intensity of fuel used to generate electricity for the Project so that the full scope of its impacts are disclosed and mitigated.

would generate annual operational emissions of 7,221.64 MT $CO_2e$ in years 2022 to 2026, 6,999.63 MT $CO_2e$ in years 2027 to 2032, and 9,041.23 MT $CO_2e$ in years 2033 to 2102, less than the DEIR's chosen significance threshold of 10,000 MT $CO_2e$ per year for the Project's operational emissions. *Id.* at 4.3-93 to 4.3-94. As discussed below, the DEIR's 10,000 MT $CO_2e$ threshold for operational emissions is not supported by substantial evidence. If the DEIR had applied an appropriate significance threshold for operational GHG emissions, impacts would be significant in every year of the permit period, and would require mitigation.

The DEIR states that "neither the NSAQMD nor the County has adopted numerical thresholds of significance for GHG emissions that would apply to the project." *Id.* at 4.3-42. The DEIR seeks to justify its chosen significance threshold of 10,000 MT $CO_2e$ for operational GHG emissions by looking to other air districts. The DEIR notes that the Sacramento Metropolitan Air Quality Management District (SMAQMD), Placer County Air Pollution Control District, Bay Area Air Quality Management District (BAAQMD), and South Coast Air Quality Management District (SCAQMD) use a 10,000 MT $CO_2e$ significance threshold for operational GHG emissions from stationary sources. *Id.* at 4.3-42 to 4.3-43. The DEIR therefore concludes that it is appropriate to use the same 10,000 MT $CO_2e$ threshold for the Project's operational GHG emissions "because the project is an industrial project that includes stationary sources." *Id.* at 4.3-43. [8]

However, the DEIR cannot simply rely on the significance thresholds chosen by other air districts, because the justifications for adopting these thresholds are unique to each air district. *See* Exhibit A (Baseline Report) at 18-19. These air districts have prepared detailed GHG inventories to identify and evaluate strategies for achieving the statewide GHG reduction goals within their air district. *Id.* The DEIR does not discuss the justifications provided by each air district for adopting the 10,000 MT CO2e significance threshold. The DEIR cannot simply assume that the justifications used by other air districts to adopt that threshold also apply in Nevada County, which has not adopted a numerical threshold. *Id.* The DEIR thus lacks substantial evidence that this significance threshold should be applied to the Project.

Moreover, the DEIR's 10,000 MT $CO_2e$ significance threshold is not consistent with California's latest GHG-reduction targets. Other air districts referenced in the DEIR originally adopted 10,000 MT $CO_2e$ s GHG thresholds for stationary sources to achieve the statewide GHG reduction goal set under A.B. 32 (2006), which was to reduce GHG emissions to 1990 levels by the year 2020. *Id.*; *see* DEIR at 4.3-26. Those thresholds are now outdated. In September 2016, S.B. 32 established a new statewide target, calling for reductions in GHG emissions to 40 percent

[8] The DEIR's analysis fails to acknowledge that for 70 years of the Project's 80-year lifespan, more than 35 percent of annual operational GHG emissions will come from vehicles, which are mobile sources. *Id.* at 4.3-93 to 4.3-94. Vehicles would be the second-largest GHG emissions source during that period, after electricity consumption.

below 1990 levels by 2030. *Id.* SCAQMD's GHG threshold for stationary sources was adopted in 2008 (*see* DEIR at 4.3-42), BAAQMD's threshold was adopted in 2010, and the SMAQMD threshold was adopted in 2014. None of these thresholds were designed to meet S.B. 32's more ambitious GHG reduction mandate. The DEIR's 10,000 MT CO2e significance threshold is not consistent with the S.B. 32's statewide GHG reductions goals for 2030 and beyond. *See* Exhibit A (Baseline Report) at 18-19.

**Grp 21-76**

The DEIR must use a significance threshold that will achieve California's new statewide GHG reductions goals over the proposed 80-year lifetime of the Project. In light of those state goals and the severity of climate change, *any* operational GHG emissions over existing conditions should be considered significant. Since 2010, scientific research has made clear that any additional GHG emissions will contribute to the serious and growing climate crisis. *See* Intergovernmental Panel on Climate Change, Climate Change 2021: The Physical Science Basis, Summary for Policymakers (October 2021), attached as Exhibit I. Recognizing this reality, in 2018 Governor Brown signed Executive Order 55-18, calling for the state to achieve carbon neutrality as soon as possible and no later than 2045, and to achieve and maintain net-negative emissions thereafter. *See* DEIR at 4.3-29. Given these facts, the DEIR should establish a net zero threshold for new GHG emissions from the Project. *See e.g.,* CARB 2017 Climate Change Scoping Plan, attached as Exhibit J, at 101 ("Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development."). The DEIR does not explain why the Project should not be judged by a significance threshold requiring no net increase in GHG emissions.

**Grp 21-77**

The DEIR also fails to consider the full scope of operational emissions over the Project's 80-year lifespan. While the DEIR concludes that the Project would generate annual operational emissions of 7,221.64 MT $CO_2e$ in years 2022 to 2026, 6,999.63 MT $CO_2e$ in years 2027 to 2032, and 9,041.23 $CO_2e$ in years 2033 to 2102 (DEIR at 4.3-93 to 4.3-94), it never bothers to calculate the total operational GHG emissions that will be generated from the Project over the 80-year permit period. By failing to provide this essential information, the DEIR forces the public and decisionmakers to calculate this total themselves: the Project's total operational GHG emissions over the 80-year permit period would be approximately 710,992 MT CO2e, not including construction or reclamation ((7,221.64 x 5 years)+(6,999.63 x 6 years)+(9,041.23 x 70 years)). The DEIR's failure to provide this key fact makes it inadequate as an informational document, violating CEQA. *See Banning Ranch*, 2 Cal.5th at 941-42.

**Grp 21-78**

Because the DEIR does not adequately analyze operational GHG emissions, its finding that those emissions are less than significant is unsupported, and there is no basis to conclude that no mitigation is required for those emissions. The DEIR must be revised to analyze operational GHG emissions against a net zero significance threshold, and must include enforceable mitigation for any net increase in GHG emissions from the Project.

SHUTE, MIHALY
& WEINBERGER LLP

**7. The DEIR's GHG Mitigation Offsets Lack Adequate Performance Standards and Are Improperly Deferred.**

The DEIR relies on unenforceable, improperly deferred third-party carbon credits to offset the Project's construction-related GHG emissions.[9] The DEIR finds that the Project's GHG emissions from construction are significant and require mitigation. DEIR at 4.3-92 (Impact 4.3-7; Table 4.3-23). The DEIR sets a significance threshold of 1,100 MT $CO_2e$ per year for the Project's construction emissions, and found that the Project would generate annual emissions of 3,444 MT $CO_2e$ during construction, exceeding this threshold. *Id.* The DEIR proposes to mitigate the Project's construction-related GHG emissions in part by requiring the Applicant to "retire carbon offsets in a quantity sufficient to offset the project's construction greenhouse gas (GHG) emissions to below the 1,100 [MT $CO_2e$] per year construction threshold," mandating that "Rise shall retire carbon offsets equaling 2,345 MT CO2e" before Nevada County issues a grading permit for the Project. *Id.* at 4.3-96 (Mitigation Measure 4.3-7(b)).

**Grp 21-79**

The DEIR thus proposes to mitigate only 68 percent of the Project's construction-related GHG emissions and the entirety of that mitigation will rely on offsets. (The DEIR includes another mitigation measure for construction-related GHG emissions, Mitigation Measure 4.3-7(a), but does not attempt to quantify that measure's effect on emissions). *Id.* at 4.3-95 to 4.3-96. Assuming that Project construction is projected to last for only one year (*id.* at 4.3-92),[10] Mitigation Measure 4.3-7(b) calls for a one-time purchase of GHG offsets, rather than a recurring annual commitment.

Here, the DEIR's proposed GHG mitigation offsets are inadequate for several reasons. First, the DEIR fails to ensure that the proposed offsets are additional, real, permanent, verifiable, and enforceable, as required by California Air Resources Board (CARB) regulations and the terms of the mitigation measure itself. Second, the proposed GHG offset mitigation measure is impermissibly deferred without adequate performance standards, in violation of CEQA. Third, the EIR fails to evaluate the foreseeable environmental impacts of offset projects. Finally, the DEIR fails to analyze additional feasible on-site mitigation for GHG emissions.

[9] The DEIR does not propose to mitigate the Project's (much larger) operational GHG emissions, because it relies on a higher significance threshold to find those emissions less than significant, as discussed in Section II.E.5, *supra*.

[10] While the DEIR's GHG analysis assumes that construction would last for one year (DEIR at 4.3-44, 4.3-92), the DEIR's project description states that construction would last for 18 months. DEIR at 3-37. The DEIR is therefore internally inconsistent. *See* Sections I.D and II.E.3, *supra*.

**(a) The DEIR Fails to Ensure that Proposed Mitigation Offsets Are Additional, Real, Permanent, Verifiable, and Enforceable.**

The CEQA Guidelines require that "lead agencies shall consider feasible means, supported by substantial evidence and subject to monitoring or reporting, of mitigating the significant effects of greenhouse gas emissions" from a project. CEQA Guidelines § 15126.4(c). The Guidelines authorize "[o]ff-site measures, including offsets that are not otherwise required, to mitigate a project's emissions." *Id.* § 15126.4(c)(3). However, like other mitigation measures, such offsets "must be fully enforceable through permit conditions, agreements, or other legally-binding instruments." *Id.* § 15126.4(a)(2).

**Grp 21-80**

Here, the DEIR's GHG offset mitigation measure is unenforceable, impermissibly delegates verification and enforcement to private third parties, and lacks specific performance standards essential to ensure the effectiveness of the mitigation. Mitigation Measure 4.3-7(b) defines an eligible carbon offset as "an instrument, credit or other certification verifying the reduction of GHG emissions" issued by one of three private, third-party registries: "the Climate Action Reserve, the American Carbon Registry, or Verra (previously, the Verified Carbon Standard)." DEIR at 4.3-96. Measure 4.3-7(b) provides that the "protocols and methodologies that define the eligibility of carbon offset projects and set forth standards for the estimation, monitoring and verification of GHG reductions" from those offsets "shall . . .[b]e developed by the registries" and must "[a]dhere to the principles set forth in the program manuals of each of the aforementioned registries." *Id.* at 4.3-97. The DEIR thus delegates the task of developing appropriate protocols for the mitigation offsets to the third-party registries.

**Grp 21-81**

The measure requires that "[e]ach carbon offset used to reduce GHG emissions shall achieve additional, real, permanent, quantifiable, verifiable, and enforceable reductions." *Id.* at 4.3-97. This language parallels CARB's regulations for GHG offsets, which mandate that "[a] registry offset credit must . . . [r]epresent a GHG emission reduction . . .that is real, additional, quantifiable, permanent, verifiable, and enforceable." Cal. Code Regs., tit. 17, § 95970(a). But section 95970 is not cited or incorporated in Measure 4.3-7(b), and the mitigation measure fails to adequately ensure that these criteria will be met. The measure asserts that "[t]he protocols and methodologies of the Climate Action Reserve, the American Carbon Registry, and Verra establish and require carbon offset projects to comply with standards designed to achieve additional, real, permanent, quantifiable, verifiable and enforceable reductions." DEIR at 4.3-98. However, there is no guarantee that the registry's protocols will achieve these standards.

**Grp 21-82**

Mitigation Measure 4.3-7(b) requires that the offset protocols and methodologies "shall . . . [b]e approved by the California Air Resources Board, and be compliant with 17 CCR § 95972." *Id.* at 4.3-97. Section 95972 mandates that GHG offset protocols must "[a]ccurately determine the extent to which GHG emission reductions and GHG removal enhancements are achieved by the offset project type," "[e]nsure GHG emission reductions and GHG removal

enhancements are permanent," and "[e]stablish the eligibility and additionality of projects using standard criteria." Cal. Code Regs., tit. 17, § 95972(a). However, Measure 4.3-7(b)'s mandate that offset protocols be CARB-approved and compliant with Section 95972 is *not* a sufficient basis to conclude that the GHG offsets used by the mitigation measure will be additional, real, permanent, quantifiable, verifiable, and enforceable.

In *Golden Door*, 50 Cal.App.5th at 511-15, the court invalidated an EIR's GHG mitigation measure which allowed the purchase of offset credits from any carbon offset registry approved by CARB. The court found that the mitigation measure violated CEQA because it lacked sufficient safeguards to ensure the GHG offsets were real, permanent, verifiable, and enforceable, as required under A.B. 32. *Id.* at 511. The court concluded that CARB's approval of a registry administering an offset did not necessarily mean an emissions reduction protocol developed by that registry complied with A.B. 32's realness, permanency, verifiability, and enforceability requirements. *Id.* at 511-512.

Mitigation Measure 4.3-7(b) has many of the same flaws as the measure invalidated in *Golden Door*. Like the offset measure in *Golden Door*, here the measure relies entirely on protocols adopted by voluntary market registries, which may not meet standards necessary to ensure that Project emissions actually will be reduced to a less than significant level. *See Golden Door*, 50 Cal.App.5th at 511-12. In fact, studies have shown that third-party offset registry protocols frequently fail to ensure compliance with standards necessary for offset quality, as explained in comments prepared by Dr. Barbara Haya in connection with a recent development project in San Diego County. *See* Comments of Barbara Haya, Ph.D. in Response to Additional Information Regarding Carbon Offset Protocols for Greenhouse Gas Emission Reduction (Sept. 17, 2020) ("Haya 2020 Comments"), attached as Exhibit K, at 1, 3-5.[11] Moreover, the measure outsources enforcement of offset standards to those same third-party registries. Measure 4.3-7(b)'s requirement that CARB approve the offset *protocol* does go slightly further than the measure invalidated in *Golden Door*, which simply required that a *registry* be approved by CARB. 50 Cal.App.5th at 511. However, CARB's approval of a protocol developed by a third-party registry is still not sufficient grounds to conclude that offsets generated under that protocol will be real, permanent, verifiable, and enforceable. Like the measure invalidated in *Golden Door*, Measure 4.3-7(b) relies on "unspecified and undefined offset protocols, occurring in unspecified locations." *Id.* at 520. Measure 4.3-7(b) therefore fails to satisfy CEQA's requirements for specific, effective, enforceable mitigation. *See* CEQA Guidelines § 15126.4.

[11] Dr. Haya is an expert in energy policy and carbon offsets at the University of California, Berkeley. Dr. Haya's comments on the Otay Ranch Resort Village (Village 13) project in San Diego County are directly relevant to the IMM Project because the EIR for that project similarly proposed the use of offsets to mitigate the project's GHG emissions.

Perhaps anticipating comparisons to the mitigation measure invalidated in *Golden Door*, Mitigation Measure 4.3-7(b) claims that it is "not intended to apply or incorporate the requirements of any other statutory or regulatory scheme not applicable to the project (e.g., the Cap-and-Trade Program)." DEIR at 4.3-98. But while the measure here does not purport to adhere to California's cap and trade regulations, it seeks to rely on CARB approval and CARB regulations, like the measure in *Golden Door*. Measure 4.3-7(b) expressly relies on the requirement that the offset protocols be approved by CARB and comply with the offset regulations at California Code of Regulations, title 17, section 95972 (DEIR at 4.3-97), in much the same way that the mitigation measure in *Golden Door* relied on the cap-and-trade regulations at Health & Safety Code section 38562(d)(2). The relevant substantive provisions of the regulations are similar, and the same principle applies: CARB approval and compliance with CARB regulations is not enough to ensure that GHG offsets are additional, real, permanent, quantifiable, verifiable, and enforceable.

**(i) Measure 4.3-7(B) Allows Out-Of-State Offsets that May Be Unenforceable or Fall Short of California's Standards.**

Like the measure invalidated in *Golden Door*, the GHG mitigation measure here also lacks adequate limits on the geographic location of GHG offsets. In *Golden Door*, the court found that the offset mitigation measure was invalid because CARB lacked the means to determine the validity of offsets located in foreign countries, including whether emissions reductions would be additional to reductions that would otherwise occur, and because CARB lacked enforcement authority over foreign offsets. 50 Cal.App.5th at 512-513.

**Grp 21-83**

Here, by requiring that offset protocols must comply with California Code of Regulations, title 17, section 95972 (DEIR at 4.3-97), Measure 4.3-7(b) limits offsets to those generated in the United States or its territories. (Section 95972 requires that "[a] Compliance Offset Protocol must specify where the protocol is applicable" and that "[t]he geographic boundary must be within the United States or United States Territories." Cal. Code Regs., tit. 17, § 95972(c).) However, Measure 4.3-7(b) specifies that an eligible offset "shall include, *but is not limited to*, an instrument, credit or other certification issued by [the listed] registries for GHG reduction activities within the Nevada County region." DEIR at 4.3-96 (emphasis added). Thus, the mitigation measure here does *not* require GHG offsets to be located in Nevada County or in the State of California: eligible offsets may be located in any U.S. state or territory. The measure therefore suffers from a similar problem as the one in *Golden Door*: The County lacks enforcement jurisdiction over out-of-county projects, and neither the County nor CARB has authority to enforce offsets located outside of California. Moreover, the County may lack the ability to determine the validity of offsets located in other U.S. states or territories. The mitigation measure does not require that offsets generated by out-of-state projects be subject to

laws at least as stringent as California's. The lack of narrower geographic limits on GHG offsets makes Measure 4.3-7(b) unenforceable.

**(ii) Measure 4.3-7(B) Relies on Registries that Use Ineffective Protocol Methodologies.**

Measure 4.3-7(b) allows the use of offsets issued by the Climate Action Reserve, the American Carbon Registry, or Verra registry, but many protocols used by those registries have been shown to be ineffective. Studies have shown that the "standardized" approach to additionality used by many Climate Action Reserve protocols has failed to ensure effective "additional" emissions reductions due to substantial "over-crediting" and leakage problems. *See* Exhibit K (Haya 2020 Comments) at 1-5. The County's reliance on registries that use Clean Development Mechanism (CDM) methodologies and additionality standards also undermines the effectiveness of proposed mitigation. *See id.* at 2. Studies have shown that offsets that rely on CDM methodologies and additionality tools do not produce additional GHG reductions. *Id.* Numerous Verra and American Carbon Standard protocols explicitly rely on CDM methodologies, CDM additionality tests, or both. *See id.* Those methodologies and tools have been imported into the named registries' manuals and protocols. Measure 4.3-7(b) provides that "[t]he Project shall neither purchase offsets from the Clean Development Mechanism (CDM) registry nor purchase offsets generated under CDM protocols." DEIR at 4.3-96. But this provision does not go far enough: while it prohibits offset purchases from the CDM registry and purports to exclude offsets generated under protocols developed by that registry, it does not expressly prohibit offsets from other registries that use equivalent methods or tools. Measure 4.3-7(b) thus fails to ensure that offsets from the Climate Action Reserve, the American Carbon Registry, or Verra will effectively mitigate Project impacts.

Grp 21-84

**(iii) Measure 4.3-7(B) Relies on the County's Discretionary Review Where It Lacks Expertise.**

Measure 4.3-7(b) inappropriately relies on the County's judgment to decide whether a GHG offset is adequate. DEIR at 4.3-98 to 4.3-99. The measure's "Reporting and Enforcement Standards" require that "[p]rior to issuance of requested grading permits, Rise [Gold] shall submit a report to the County that identifies the quantity of emission reductions required by this mitigation measure, as well as the carbon offsets to be retired to achieve compliance with this measure." *Id.* at 4.3-98. The County will then review the report and determine whether the project's carbon offsets meet the requirements of the mitigation measure. *Id.* at 4.3-98 to 4.3-99.

Grp 21-85

The County's judgment is not sufficient to support a conclusion that all offset credits issued under these protocols will satisfy necessary standards. Offset protocol methodologies are a highly technical field, and there is no evidence that the County has the relevant expertise to conduct such a review. Rather, it appears likely that the County will simply accept the registries' own review of their protocols and/or CARB approval of those protocols as sufficient evidence of

their adequacy. *See id.* at 4.3-96 ("offsets may be used if report is submitted to the County "demonstrating that each registry *shall continue its existing practice* of requiring [the standards listed below] for the development and approval of protocols or methodologies") (emphasis added); *id.* at 4.3-98 ("The protocols and methodologies of the Climate Action Reserve, the American Carbon Registry, and Verra establish and require carbon offset projects to comply with standards designed to achieve additional, real, permanent, quantifiable, verifiable and enforceable reductions.") The County's apparent failure to recognize that numerous protocols included in Climate Action Reserve, the American Carbon Registry, or Verra registries rely on CDM methodologies and additionality tests—even as the measure claims credits generated under CDM protocols will not be accepted—demonstrates that County officials may not be able to render an informed judgment as to whether specific protocols are adequate.

**(iv) The DEIR Lacks Substantial Evidence that Measure 4.3-7(B) Would Be Effective.**

**Grp 21-86**

When a lead agency relies on mitigation measures to find that project impacts will be reduced to a level of insignificance, there must be substantial evidence in the record demonstrating that the measures are feasible and will be effective. *Sacramento Old City Assn. v. City Council of Sacramento* (1991) 229 Cal.App.3d 1011, 1027; *Kings County*, 221 Cal.App.3d 690, 726-29. An agency's conclusion that a proposed mitigation measure will in fact reduce GHG emissions below the significance threshold must be both legally sound and supported by specific, quantitative evidence. *See Center for Biological Diversity v. California Dept. of Fish & Wildlife* (2015) 62 Cal.4th 204, 227-28.

Here, for all of the reasons discussed above, the DEIR does not provide substantial evidence to support its conclusion that GHG offsets obtained through Measure 4.3-7(b) actually will achieve the claimed reduction in emissions. The DEIR therefore lacks legal and evidentiary support for its conclusion that the Project's GHG emissions will be less than significant. The DEIR must be revised to provide enforceable mitigation for the Project's GHG emissions.

**(b) The GHG Offset Mitigation Measure Is Impermissibly Deferred Without Adequate Performance Standards.**

**Grp 21-87**

Mitigation Measure 4.3-7(b) impermissibly defers the DEIR's mitigation for the Project's construction-related GHG emissions without sufficient performance standards or assurances of effectiveness. As we explain above, CEQA allows deferral of mitigation measures until after Project approval only when it is "impractical or infeasible" to develop those measures before approval, the agency "commits itself to the mitigation," and the EIR "adopts specific performance standards" and identifies actions that can "feasibly achieve" those standards. CEQA Guidelines § 15126.4(a)(1)(B). These requirements apply to mitigation measures that employ GHG offsets. *See id.* § 15126.4(c)(3). Mitigation for a project's GHG impacts is impermissibly deferred if it relies on development of future management plans without articulating specific,

objective performance standards and providing assurances that the proposed mitigation will be effective. *Golden Door*, 50 Cal.App.5th at 518-525; *Communities for a Better Environment v. City of Richmond* (2010) 184 Cal.App.4th 70, 92-95.

The court in *Golden Door* concluded that the GHG offset mitigation measure in that case violated CEQA because it improperly deferred development of the mitigation until after project approval, leaving it for County officials to later determine whether particular offsets met the criteria for the mitigation measure. 50 Cal.App.5th at 518-25. The court found that the mitigation measure lacked adequate performance standards to guide the exercise of the County's discretion in approving these deferred GHG offsets. *Id.* The mitigation measure allowed County officials to determine whether any particular offset program was acceptable based on subjective criteria, including that offsets located geographically closer to the County were not "available" or "financially feasible," and that the offset registry must be "reputable." *Id.* at 520-22.

Here, Measure 4.3-7(b) similarly defers the County's determination as to whether GHG offsets are adequate until after Project approval. DEIR at 4.3-98 to 4.3-99. The measure's "Reporting and Enforcement Standards" require that "[p]rior to issuance of requested grading permits, Rise [Gold] shall submit a report to the County that identifies the quantity of emission reductions required by this mitigation measure, as well as the carbon offsets to be retired to achieve compliance with this measure." *Id.* at 4.3-98. The County will then review the report and determine whether the project's carbon offsets meet the requirements of the mitigation measure. *Id.* at 4.3-98 to 4.3-99. Grading permits may be issued once the County approves the use of the offsets as mitigation. *Id.*

Like the measure invalidated in *Golden Door*, Measure 4.3-7(b) fails to provide specific, objective performance standards to ensure that the GHG offsets will effectively mitigate Project impacts. The measure requires that "[e]ach carbon offset used to reduce GHG emissions shall achieve additional, real, permanent, quantifiable, verifiable, and enforceable reductions." *Id.* at 4.3-97. However, the mitigation measure fails to adequately ensure that these criteria will be met, as discussed above in Section II.C.6(a). Measure 4.3-7(b) provides that the "protocols and methodologies that define the eligibility of carbon offset projects and set forth standards for the estimation, monitoring and verification of GHG reductions" from those offsets "shall . . .[b]e developed by the registries" and must "[a]dhere to the principles set forth in the program manuals of each of the aforementioned registries." *Id.* at 4.3-97. The DEIR thus delegates the task of developing appropriate protocols for the mitigation offsets to the third-party registries. The measure asserts that the registries' protocols require carbon offset projects to achieve additional, real, permanent, quantifiable, verifiable and enforceable reductions. *Id.* at 4.3-98. Again, there is no guarantee that the registry's protocols will achieve these standards.

**Grp 21-88**

As discussed above in Section II.E.6(a), Measure 4.3-7(b)'s mandate that offset protocols be CARB-approved and compliant with Cal. Code Regs., tit. 17, § 95972 is *not* a sufficient basis

to conclude that the GHG offsets used by the mitigation measure will adequately mitigate Project impacts. The GHG mitigation measure invalidated in *Golden Door* called for the use of CARB-approved offset registries and required offsets to be "consistent" with Health & Safety Code § 38562(d)(2). 50 Cal.App.5th at 518. The court nevertheless found the measure improperly deferred because it relied on "unspecified and undefined offset protocols, occurring in unspecified locations." *Id.* at 520.

The same is true here: Measure 4.3-7(b) does not specify what offset protocols must be used, or where offsets must occur, and requiring CARB approval of offset protocols does not cure this defect. Asserted compliance with regulatory standards is not a sufficient ground to conclude that a project's impacts would be less than significant. *Californians for Alternatives to Toxics v. Dept. of Food & Agriculture* (2005) 136 Cal.App.4th 1, 15-17. And requiring approval from responsible regulatory agencies cannot make up for a lack of performance standards in a deferred mitigation measure. *County of Merced*, 149 Cal.App.4th at 669-70 (mitigation measure for mining project impermissibly deferred despite requiring "concurrence of applicable regulatory agencies").

The DEIR also violates CEQA by failing to demonstrate why it is "impractical or infeasible" to identify the mitigation offset protocols or offsets that will be used prior to Project approval. Measure 4.3-7(b) is also improperly deferred for this reason. *See* CEQA Guidelines § 15126.4(a)(1)(B). Measure 4.3-7(b) must be revised to identify which offset protocols will be used, and where offset projects will be located.

**(i) Measure 4.3-7(B) Improperly Allows Offsets Based on "Forecasted" Emissions Reductions.**

**Grp 21-89**

Measure 4.3-7(b) is also inadequate because it allows offsets based on "forecasted" emissions reductions. *See* DEIR at 4.3-97 ("any carbon offset used to reduce the project's GHG emissions shall be a carbon offset that represents the past *or forecasted* reduction or sequestration of one MT of CO2e") (emphasis added). Reliance on "forecasted" reductions that have not yet occurred would allow the adverse impacts of GHG emissions to persist, potentially for many years, before being mitigated. CEQA does not permit an agency to defer implementation of mitigation measures until after significant impacts occur. *King & Gardiner Farms*, 45 Cal.App.5th at 860. Rather, "[o]nce the project reaches the point where activity will have a significant adverse effect on the environment, the mitigation measures must be in place." *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 738.

Measure 4.3-7(b)'s reliance on future "forecasted" reductions to mitigate present GHG emissions fails to address the Project's immediate climate impacts. Delaying implementation of climate mitigation has a real, adverse effect on warming; although $CO_2$ persists in the atmosphere for centuries, the maximum warming effect of a pulse of $CO_2$ emissions occurs

within a relatively short time frame. *See* Katharine L. Ricke & Ken Caldeira, Maximum warming occurs about one decade after a carbon dioxide emission, 2014 Environ. Res. Lett. 9 124002, attached as Exhibit L. Accordingly, even if a "forecasted" reduction eventually occurs, the Project's emissions will be in the atmosphere at least until that time, exacerbating climate impacts.[12] Measure 4.3-7(b)'s use of "forecasted" emissions reductions would allow the Project's GHG impacts to occur before they are mitigated, violating CEQA. *King & Gardiner Farms*, 45 Cal.App.5th at 860.

The registries relied on by Measure 4.3-7(b) acknowledge this time lag in emissions reductions. The Program Manual for Climate Action Reserve's "Climate Forward" program states that project emissions may occur well in advance of "forecasted reductions." The manual explains the difference between offsets (which represent emissions reductions verified to have already occurred) and "forecasted mitigation units" (or "FMUs") that might occur in the future. Climate Forward Program Manual, March 2020, attached as Exhibit M, at 6-7. The manual explicitly acknowledges "that there could be a time period, or a temporal disconnect, between the occurrence of the emissions and the occurrence of reduction or sequestration represented by" Climate Forward projects; "[t]hat is, the emission reductions expected to be generated might occur after the actual emissions from the new initiative." *Id.* at 7. Climate Action Reserve thus advises developers to ensure that credits based on "forecasted" emissions will be accepted for CEQA purposes before purchase. *Id.* at 6. The "temporal disconnect" between emissions and reductions is incompatible with CEQA's standards. The DEIR should be revised to remove all references suggesting the Project may rely for mitigation on "forecasted" emissions reductions.

**(ii) There Is No Way for the County to Enforce Offsets After Grading Permits Are Issued.**

**Grp 21-90**

Once grading permits for the Project are issued, the County will effectively lose its ability to enforce the DEIR's GHG offset mitigation. If the County later determines that previously retired offset credits no longer meet standards, its only recourse is to "cease permitting activities." DEIR at 4.3-99. Measure 4.3-7(b) provides that "[T]he County may issue a notice of non-consistency and cease permitting activities in the event that the County determines the carbon offsets provided to reduce project GHG emissions are not compliant with the aforementioned standards. In the event of such an occurrence, project permitting activities shall not resume until Rise has demonstrated that the previously provided carbon offsets are compliant

[12] Even if instruments promising forecasted reductions have been secured before Project construction occurs, the "offsets" themselves—i.e., the actual reductions necessary to offset Project emissions—may not occur until well after emissions are generated by the Project.

with the standards herein or have provided substitute carbon offsets achieving the standards of this mitigation measure in the quantity needed to achieve the required emission reduction." *Id.*

However, this provision does nothing to address the scenario in which the County approves the GHG offsets, issues all applicable permits for the Project, and then later discovers that the offset protocol is not being followed. This is especially problematic because Measure 4.3-7(b) allows offsets based on "forecasted" emissions reductions that have not yet occurred at the time the offset is retired and permits are issued. *See* DEIR at 4.3-97. If permits already have been issued, not "resuming" permitting activities is an empty gesture. Like the measure invalidated in *Golden Door*, Measure 4.3-7(b) relies almost entirely on third party registries and project developers over whom the County has no direct enforcement authority. Measure 4.3-7(b) therefore fails to provide enforceable mitigation as required by CEQA. CEQA Guidelines § 15126.4(a)(2).

**(c) The EIR Fails to Evaluate the Foreseeable Environmental Impacts of Offset Projects.**

**Grp 21-91**

CEQA requires an EIR to address the potentially significant environmental impacts of proposed mitigation measures. CEQA Guidelines § 15126.4(a)(1)(D). Here, the DEIR fails to consider whether the GHG offsets used as mitigation may cause significant and adverse environmental effects. GHG offset projects may have significant environmental impacts. Just by way of example, the protocols may contemplate construction of organic waste digesters and gas recovery units; changes in forest, wetlands, and rangelands management; construction of carbon capture and storage facilities; installation of landfill gas projects; and construction of new cogeneration facilities. Any one of these activities may have foreseeable direct and indirect environmental impacts. Because the DEIR has identified a set of registries that will generate eligible offset credits (DEIR at 4.3-96), the County cannot claim the environmental impacts of reliance on those registries' offset projects are entirely speculative. The EIR's failure to consider the environmental impacts associated with Measure 4.3-7(b) violates CEQA's standards.

**(d) The DEIR Fails to Analyze Additional Feasible On-Site Mitigation for GHG Emissions.**

**Grp 21-92**

The EIR fails to ensure that GHG reductions are achieved from on-site mitigation measures to the maximum extent feasible before offsets are purchased. CEQA provides that "public agencies should not approve projects as proposed if there are . . . feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." Pub. Resources Code § 21002; *see id.*, § 21002.1(b) (agencies must mitigate significant effects of projects they approve "whenever it is feasible to do so"); CEQA Guidelines §15126.4(a)(1) ("An EIR shall describe feasible measures which could minimize significant adverse impacts."). Because of the known problems with enforcement and additionality of offsets, agencies typically strictly limit the use of offsets as part of an overall emissions reduction

program. CARB's 2017 Climate Change Scoping Plan Update cautions that reliance on offset credits is appropriate only where further on-site reductions and direct local investments "are infeasible or not proven to be effective." *See* CARB 2017 Climate Change Scoping Plan Update, attached as Exhibit J, at 102. California's cap and trade program currently allows regulated emitters to use GHG offsets to fulfill no more than four percent of their GHG reduction obligations, and at least half of the offsets used must "provide direct environmental benefits in state." Health & Saf. Code § 38562(c)(2)(E).

Here, by contrast, *100 percent* of the mitigation for the Project's construction-related GHG emissions will rely on offsets, and there is no requirement that those offsets be located in California. *See* DEIR at 4.3-96.[13] The DEIR's excessive reliance on GHG offsets to mitigate all of the Project's construction emissions conflicts with established state policy, which limits offset use. The DEIR fails to adequately consider alternative mitigation measures.

The DEIR includes another mitigation measure for construction-related GHG emissions, Mitigation Measure 4.3-7(a), which calls for electric-powered or non-diesel construction equipment where feasible, carpooling for construction workers, and the use of locally sourced or recycled construction materials. *Id.* at 4.3-95 to 4.3-96. However, these measures lack any specificity or enforceability and the DEIR makes no attempt to quantify that measure's effect on emissions. *Id.* Mitigation Measure 4.3-7(a) calls for construction emissions to be reduced to the DEIR's chosen significance threshold of 1,100 MT $CO_2e$ using GHG offsets, but does not mandate any reduction below that level. *Id.* at 4.3-96.

The DEIR does not explain why it is infeasible to require that all GHG offsets used by the Project be located in California. The DEIR also fails to show that further on-site GHG mitigation measures for construction emissions are infeasible or ineffective. For example, the DEIR does not consider whether more of the existing vegetation on the site could be preserved rather than removed. Nor does it consider whether any of the Project's electricity demand during construction could be met via the use of solar-powered equipment (e.g. portable solar-powered lighting). The DEIR also fails to require vehicle electrification of the mine's truck fleet as well as the trucks that serve the mine. The DEIR must be revised to consider additional feasible on-site measures to reduce the Project's GHG emissions.

**F. The DEIR Fails to Adequately Analyze and Mitigate the Project's Impacts on Energy Use.**

**Grp 21-93**

The DEIR's analysis of Project energy use suffers from several flaws. First, the DEIR fails to analyze the Centennial cleanup's energy use, or additional energy consumption by the

[13] As noted above, the DEIR should use a no net increase threshold to determine whether the Project will have significant GHG emissions and should require mitigation for all of the Project's GHG emissions, not just a portion of them.

IMM Project if the Centennial cleanup does not occur. Second, the DEIR's analysis of energy use from Project construction assumes a construction timeline that contradicts the Project description. Finally, the DEIR improperly relies on assumed mitigation measures for energy impacts, failing to acknowledge those measures as mitigation. The DEIR must be revised to address these deficiencies.

**1. The DEIR Fails to Analyze the Centennial RAP's Energy Usage.**

Grp 21-94

The DEIR must include the Centennial RAP as part of the Project, and must analyze all of the environmental impacts resulting from the RAP, as discussed in Sections I.C, II.D.1 and II.E.1, *supra*. Accordingly, the DEIR must evaluate the Centennial cleanup's energy usage. The Centennial RAP would involve cement mixing, excavation and grading of 36.7 acres of land, and the use of backhoes and other heavy equipment. Exhibit G (MND) at 3-4; Exhibit E (RAP) at 44. The DEIR improperly fails to disclose or analyze the impacts of these RAP activities on energy use. DEIR at 4.3-66 to 4.3-102. The DEIR's omission of these impacts prevents informed analysis and violates CEQA. *See County of Inyo*, 172 Cal.App.3d at 165-66; *Nelson*, 190 Cal.App.4th at 271.

**2. The DEIR Fails to Analyze Energy Use that May Result from the IMM Project if the Centennial Cleanup Does *Not* Occur.**

Grp 21-95

The DEIR also fails evaluate additional energy use that would result from the Project if the Centennial cleanup does not occur. The DEIR acknowledges that the Centennial Site might never be remediated during the 80-year term of the mine permit, which would require trucking an additional 1.6 million tons of mine waste to offsite locations after the Brunswick Site is full. DEIR at 1-3, 3-32 to 3-33, 3-26. The DEIR must evaluate the energy usage (e.g. fuel consumption) associated with that additional offsite trucking, but fails to do so. Instead, the DEIR simply assumes that the Centennial RAP will be completed and that fill dumping at the Centennial site will occur in the first five years of Project operations. *See id.* at 4.3-50, 4.3-53 to 4.3-54, 4.3-67 to 4.3-68. As discussed in Sections I.B, II.D.2 and II.E.2, *supra*, the DEIR must consider the possibility that the RAP may never occur and analyze the impacts that would result in that scenario. If the Centennial RAP is never completed and no fill is ever placed at the Centennial site, that fill must be trucked offsite for an additional five years, resulting in additional fuel consumption. The DEIR's failure to disclose or analyze this impact deprives the public and decision-makers of essential information in violation of CEQA. *See Banning Ranch*, 2 Cal.5th at 941-42.

**3. The DEIR's Analysis of Construction Energy Use Contradicts the Project Description.**

Grp 21-96

The DEIR's analysis of energy use from Project construction is unsupported because its assumptions regarding the duration of construction contradict the Project description. The

DEIR's project description states that Project construction would last for 18 months. DEIR at 3-37. By contrast, the DEIR's energy analysis assumes that Project construction would last for only 12 months, and bases its impact evaluation on that assumption. DEIR at 4.3-44 to 4.3-46. The DEIR is therefore internally contradictory. "[S]uch an unexplained discrepancy precludes the existence of substantial evidence" for the EIR's conclusions. *Preserve Wild Santee*, 210 Cal.App.4th at 284. The DEIR asserts that "the construction scenario assessed herein is the worst-case, because if the same construction activities were to be spread over a longer period (i.e., a period in excess of 12 months), the amount of overlap of equipment usage would be reduced." *Id.* at 4.3-44. The DEIR fails to consider whether an 18-month construction period could result in greater total energy use than a 12-month construction period. The DEIR's energy analysis must be revised to assume the same construction duration as the Project description.

**4. The DEIR Improperly Relies on Assumed Energy Use Mitigation Measures, Preventing Informed Impact Analysis.**

As discussed above, the DEIR lists several "applicant-proposed emissions reduction measures" which it does not classify as mitigation, and simply assumes that those measures would be implemented when conducting impact analysis. DEIR at 4.3-65; *see* Sections II.D.4 and II.E.4, *supra*. The APMs were not identified as Project features in the Project description, and there is no assurance that these measures will be implemented as a part of the Project. *See* Exhibit A (Baseline Report) at 14. These "applicant-proposed" measures are in reality mitigation measures, which the DEIR improperly fails to recognize as such. As explained above, this approach violates CEQA. *Lotus*, 223 Cal.App.4th at 656. A project's significant impacts must be determined first, and then the CEQA document must identify enforceable mitigation and evaluate its effectiveness in addressing project impacts. *Id.* at 656, 658.

**Grp 21-97**

This error invalidates the DEIR's analysis of energy usage, just as it does for the air quality and GHG analyses. In addition to requiring Tier 4 engines, applicant-proposed measure APM-AQ-1 (Exhaust Emission Controls) requires that "[u]nnecessary construction vehicle idling time shall be minimized" and that "[a]ll off-road equipment shall be maintained in accordance with manufacturer's specifications." DEIR at 4.3-65. APM-AQ-1 thus seeks to reduce the Project's energy consumption as well as its air quality and GHG impacts. *Id.* at 4.3-87 (concluding that APM-AQ-1 would "avoid inefficient energy consumption in several ways"). These measures are vague and unenforceable and cannot be relied upon to demonstrate any reductions in the Project's air quality, GHG, or energy impacts.

Even if APM-AQ-1 were specific and enforceable, it is a de facto mitigation measure. *See* CEQA Guidelines §15370. The DEIR's analysis of the Project's energy usage impermissibly assumes that APM-AQ-1 has been implemented *before* evaluating the significance of impacts or considering mitigation. DEIR at 4.3-65, 4.3-87 to 4.3-88, 4.3-102. The DEIR makes no attempt to calculate what the Project's energy usage would be without APM-AQ-1, and does not

separately quantify the emission reductions that would result from that "applicant proposed" measure. This approach prevents informed analysis of Project impacts, violating CEQA. *Lotus*, 223 Cal.App.4th at 656. The DEIR must be revised to classify the APMs as mitigation measures, and must evaluate their effectiveness in reducing energy usage.

**G. The DEIR's Analysis of Project Alternatives Is Inadequate.**

Under CEQA, a proper analysis of alternatives is essential to comply with the Act's mandate that significant environmental damage be avoided or substantially lessened where feasible. Pub. Resources Code § 21002; CEQA Guidelines §§ 15002(a)(3), 15021(a)(2), 15126(d); *Citizens for Quality Growth v. City of Mount Shasta* (1988) 198 Cal.App.3d 433, 443-45. As stated in *Laurel Heights I*, "[w]ithout meaningful analysis of alternatives in the DEIR, neither the courts nor the public can fulfill their proper roles in the CEQA process. . . . [Courts will not] countenance a result that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the consequences of action by their public officials." 47 Cal.3d at 404.

**Grp 21-98**

Critically, an EIR must consider a "reasonable range" of alternatives "that will foster informed decision-making and public participation." CEQA Guidelines § 15126.6(a); *Laurel Heights* I, 47 Cal.3d at 404 ("An EIR's discussion of alternatives must contain analysis sufficient to allow informed decision-making."). The discussion of alternatives must focus on alternatives to the project or its location that are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly. CEQA Guidelines § 15126.6(b). The DEIR for the Project fails to heed these basic mandates.

**1. The DEIR Fails to Include a Reasonable Range of Alternatives.**

As described throughout this letter, the DEIR fails to adequately describe the Project and fails to reveal the severity and extent of numerous environmental impacts. In many instances, the DEIR incorrectly determines that impacts would be less than significant. As we explained, the DEIR incorrectly found the Project's impacts to air quality, GHG emissions, energy, hazards, hazardous materials, hydrology, water quality, noise, and vibration to be less than significant. Had the DEIR conducted a proper impact analysis, it should have recognized that numerous, if not all of these impacts would be significant and unavoidable. In this case, the DEIR would have been obligated to identify and evaluate alternatives to the Project capable of reducing those impacts. CEQA Guidelines § 15126.6 (b). Thus, the DEIR must be recirculated to analyze the Project's full environmental impacts and identify mitigation measures or alternatives that could feasibly avoid or minimize those impacts.

**Grp 21-99**

**Grp 21-100**

However, even for those significant impacts that the DEIR does acknowledge, the document's analysis of alternatives is deficient. The DEIR determines that the Project would

result in significant and unavoidable impacts relating to aesthetics, noise, and transportation. DEIR at 6-7, 6-8. Yet, except for the "No Project" alternative, which "would not meet any of the project objectives," none of the examined alternatives would reduce the Project's impacts on aesthetics, noise, and transportation to a less than significant level. *See* DEIR at 6-44. In fact, in certain instances, the Project's alternatives would result in similar or even greater impacts than the proposed Project. *Id.*

While there is no "magic number" for how many alternatives an EIR should examine to present a "reasonable range," at a minimum CEQA requires an agency to examine at least potentially feasible alternatives to try to avoid or substantially lessen significant environmental impacts that are central to a project. *See Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1089-90 (EIR was deficient for failing to include reduced development alternative that would avoid or substantially lessen the project's primary growth-related significant impacts); *Habitat and Watershed Caretakers v. City of Santa Cruz* (2013) 213 Cal.App.4th 1277, 1285, 1305 (invalidating EIR that failed to discuss any feasible alternative addressing the project's primary water supply impact). Furthermore, with the inherent dangers and environmental harms associated with underground mining activities that will impact the environment for a minimum of 80 years, in close proximity to existing residential and other land uses, the DEIR should evaluate multiple alternatives in order to help inform the decisionmakers and the public of the environmental consequences of this Project.

Other than the "No-Project" alternative, the DEIR identifies only three alternatives: Alternative 2: the Elimination of Centennial Industrial Site and Expansion of Brunswick Fill Pile; Alternative 3: Expansion of Centennial Engineered Fill Pile and Elimination of Brunswick Engineered Fill Pile; and Alternative 4: Reduced Throughput. Again, by the DEIR's own admission, each of these alternatives would result in significant and unavoidable impacts relating to aesthetics, noise, and transportation. DEIR at 6-44.

**2. The DEIR Does Not Provide a Meaningful Comparison of the Project and the Alternatives.**

**Grp 21-101**

The Project's objectives are defined so narrowly that they essentially call for the Project itself. An EIR cannot provide a meaningful comparison between a proposed project and various alternatives unless the project's objectives are defined broadly enough to make such options at least potentially possible. *See Kings County Farm Bureau*, 221 Cal.App.3d at 735-37; *City of Santee v. County of San Diego* (1989) 214 Cal.App.3d 1438, 1455. Here, the DEIR calls for the construction of an underground gold mine operation that will produce 1,000 tons per day (365,000 tons per year) of gold mineralization on property that Rise Grass Valley, Inc. owns. DEIR at 3-11. This is tantamount to saying that the objective of the Project is to implement the Project. Narrowing the Project's goals in this way tilts the analysis of alternatives unavoidably—and illegitimately—toward the Project as proposed. Rather than providing the required reasoned,

objective analysis, the DEIR has become "nothing more than [a] post hoc rationalization[]" for a decision already made. *Laurel Heights I*, 47 Cal.3d at 394.

**3. All of the Project Alternatives Incorrectly Assume the Remediation of the Centennial Site.**

**Grp 21-102**

All three of the Project alternatives assume the remediation of the Centennial Site. As we explain throughout this letter, DTSC has not yet approved the Centennial Site cleanup, which is currently undergoing a separate CEQA review. Because DTSC might not approve the cleanup, and Rise Gold might not complete it, the DEIR's use of a hypothetical post-remediation baseline in its alternatives analysis is inappropriate. The revised DEIR's alternatives analysis must evaluate the impacts of each alternative assuming the remediation is not completed.

**4. The Revised EIR Should Evaluate Alternatives that Avoid the Project's Significant Environmental Impacts and that Would Be Consistent with the County's and the City's General Plans.**

**Grp 21-103**

The revised DEIR must examine feasible Project alternatives that could reduce the Project's significant environmental impacts. CEA explicitly requested that the DEIR analyze alternative locations for the dumping of waste rock and tailings from the mine. The DEIR fails to consider this alternative.

**Grp 21-104**

Moreover, the DEIR errs because it does not seriously consider an alternative industrial use that would be consistent with the Industrial designation on the Brunswick site and the Industrial /Urban Medium Density designation on the Centennial site.[14] While the DEIR did discuss alternative uses under the No Project alternative (*see* DEIR at pp 6-11 through 6-13), it rejects such an alternative from further consideration claiming that such a use would be more intensive than the proposed Project. *Id.* Yet, the DEIR certainly could have considered a less intensive alternative use than that proposed by the No Project alternative. For example, a mixed use employment center not requiring a use permit would be more in keeping with the aesthetics of this entry point to the City. To the extent the County would argue that it need not consider

[14] The County's General Plan designates the Centennial site as "Industrial" whereas the City of Grass Valley designates the Centennial site as "Urban Medium Density." If approved, the Project would violate the County's General Plan policy calling for its land use designations to be consistent with the City's designations: Nevada County General Plan Land Use Policy 1.8.3: *Within the City/Town spheres of influence, the Nevada County General Plan Land Use Maps will generally reflect the City's/Town's General Plan land use mapping. In some instances, the County may provide for a less intensive land use due to infrastructure capability, environmental constraints or effect on land use and development patterns outside the city's sphere. However, the County's Plan will not preclude implementation of the City's/Town's Plan by providing for a significantly more intensive land use than the City's/Town's Plan.*

alternatives that do not meet the Project's objectives, this argument would have no merit. An EIR cannot provide a meaningful comparison between a proposed project and various alternatives unless the project's objectives are defined broadly enough to make such options at least potentially possible. *Kings County Farm Bureau*, 221 Cal. App. 3d at 735-37; *City of Santee v. County of San Diego* 214 Cal. App. 3d 1438, 1455 (1989). Here, the DEIR states that a gold mine operation must be built as planned by the proposed Project. DEIR at 6-2. This is tantamount to saying that the objective of the Project is to implement the Project. Narrowing the Project's goals in this way tilts the analysis of alternatives unavoidably—and illegitimately—toward the IMM Project as proposed. Rather than providing the required reasoned, objective analysis, the DEIR has become "nothing more than [a] post hoc rationalization[]" for a decision already made. *Laurel Heights I*, 47 Cal. 3d at 394. CEQA forbids the use of this sort of circular logic to justify a project. Accordingly, the revised DEIR must consider a less intensive alternative use alternative, and one that is consistent with the County's and the City's General Plans.

**5. The County May Not Approve the Project if a Feasible Alternative Exists that Would Meet the Project's Objectives and Would Diminish Its Significant Environmental Impacts.**

**Grp 21-105**

Under CEQA, an agency may not approve a proposed project if a feasible alternative exists that would meet a project's objectives and would diminish or avoid its significant environmental impacts. Pub. Res. Code § 21002; *Kings County Farm Bureau*, 221 Cal.App.3d at 731; *see also* CEQA Guidelines §§ 15002(a)(3), 15021(a)(2), 15126(d); *Citizens for Quality Growth*, 198 Cal.App.3d at 443-45. An alternative need not meet every Project objective or be the least costly in order to be feasible. *See* CEQA Guidelines § 15126.6(b).

The DEIR readily admits that Alternative 2: Elimination of Centennial Industrial Site and Expansion of Brunswick Fill Pile is the environmentally superior alternative. DEIR at 6-42. It further acknowledges that this alternative would further nearly all of the Project objectives. *Id.* at 6-42, 6-43. Consequently, approval of the Project, or any alternative project with greater impacts than Alternative 2 would violate CEQA.

**III. The DEIR Must Be Recirculated.**

**Grp 21-106**

Under California law, this DEIR cannot properly form the basis of a final EIR. CEQA and the CEQA Guidelines describe the circumstances that require recirculation of a draft EIR. Such circumstances include: (1) the addition of significant new information to the EIR after public notice is given of the availability of the DEIR but before certification, or (2) the draft EIR is so "fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded." CEQA Guidelines § 15088.5.

Here, both circumstances apply. Decisionmakers and the public cannot possibly assess the Project's impacts, or even its feasibility, through the present DEIR, which is riddled with errors. Among other fundamental deficiencies, the DEIR repeatedly understates the Project's significant environmental impacts and concludes incorrectly that these impacts would be less than significant. It also assumes that unformulated or clearly useless mitigation measures will effectively reduce these impacts. And the DEIR's Project Description is so unstable and uncertain that meaningful review of the Project's environmental impacts is essentially impossible. In order to resolve these issues, the County must prepare a revised EIR that would necessarily include substantial new information.

**Conclusion**

As set forth above, the DEIR suffers from numerous deficiencies, many of which would independently render it inadequate under CEQA. Taken as a whole, the deficiencies of the DEIR necessitate extensive revision of the document and recirculation for public comment.

Very truly yours,

SHUTE, MIHALY & WEINBERGER LLP

San Francisco, CA 94102-4421

**Subject:** **Review of Idaho-Maryland Mine Project, Draft Environmental Impact Report, SCH# 2020070378**

Dear Ms. Impett:

**Grp 21-107**

At your request, Baseline Environmental Consulting has reviewed the Hazards and Hazardous Materials, Hydrology and Water Quality, and Air Quality, Greenhouse Gas Emissions and Energy sections (and associated technical studies) of the Draft Environmental Impact Report (DEIR) for the proposed Idaho-Maryland Mine Project dated December 2021 and prepared for the County of Nevada (County). In order to provide a meaningful context for the analyses of the sections listed above, we also reviewed the DEIR Project Description. Following are our comments on the DEIR, organized by topical sections.

## DEIR SECTION 4.7 HAZARDS AND HAZARDOUS MATERIALS

### Legacy Contamination, Project Segmentation, and CEQA Baseline

**Grp 21-108**

The types of geological materials/rock historically mined at the site contain heavy metals, and when excavated, the waste rock and mine tailings have been found to contain contaminants that pose a potential risk to people and the environment. The Centennial Industrial Site was historically used by the Idaho-Maryland Mine to deposit mine tailings and waste rock. The DEIR (page 4.7-3) confirms that:

> *Extensive site investigation, overseen by DTSC, has identified mill tailings, waste rock, and affected soil at the site that contain lead, arsenic, mercury and other metals at concentrations exceeding background soil metals concentrations and regulatory benchmark concentrations. Elevated soil metals concentrations present a potential human health risk resulting from routine, long-term exposures, as well as ecological concerns in terms of impacts to plant and animal species. As a result, under existing conditions, the majority of the Centennial Industrial Site cannot be developed due to unstable soils and/or contamination.*

Per the California Department of Toxic Substances Control (DTSC) EnviroStor database, the Centennial Industrial Site is characterized as follows:

388 17th Street, Suite 230, Oakland, CA 94608 | P: (510) 420-8686 | www.baseline-env.com

> *Based upon information from existing documents, mining waste rock and mine tailings are present throughout much of the property. Results of sampling that has been completed to date indicates that the soil at the site contains lead, arsenic, nickel, and mercury at maximum concentrations of 35,111 milligrams per kilogram (mg/kg), 3010 mg/kg, 2100 mg/kg, and 41 mg/kg, respectively. These concentrations are above background and California hazardous waste levels.*

Based on this DTSC description, the existing waste rock and mine tailings that were generated from historic mining activities contain contaminants at levels exceeding regulatory thresholds, including California hazardous waste thresholds. These existing waste rock and mine tailings at the Centennial Industrial Site have been present (and have represented a persistent environmental hazard) since the former mining operation at the site shut down over 60 years ago (circa 1956). In 2019, the owner of the Centennial Industrial Site entered into a Voluntary Cleanup Agreement with the DTSC to address the hazard associated with the legacy waste rock and mine tailings generated from previous mining operations. It should be noted that cleanup actions were not initiated by the site owner until they were ready to reopen the mine.

The DEIR inappropriately establishes a future baseline condition (that may or may not actually exist in the future) for the DEIR hazards analysis as follows (DEIR page 4.7-1):

> *As discussed in Section 1.3, "Approach To Centennial Industrial Site Baseline," of this EIR, for the purposes of this hazards analysis, the environmental baseline for the Centennial Industrial Site has been adjusted to be consistent with anticipated site conditions at the completion of the separate Centennial Industrial Site Clean-up Project.*

This is clearly not allowed by CEQA. CEQA Guidelines Section 15125 states:

> *An EIR must include a description of the physical environmental conditions in the vicinity of the project, as they exist at the time the notice of preparation is published, or if no notice of preparation is published, at the time environmental analysis is commenced, from both a local and regional perspective. This environmental setting will normally constitute the baseline physical conditions by which a lead agency determines whether an impact is significant.*

In addition, the timing of the action related to the proposed cleanup of the legacy contamination (which began in 2019 – over 60 years after the waste was placed at the site) strongly indicates that the cleanup is related to, and part of the proposed mine reopening project (i.e., the site owner would not have entered into a Voluntary Cleanup Agreement unless they were planning to reopen the mine). Development of the Centennial Industrial Site for reopening of the mine is contingent on the completion of cleanup activities. However, the preparers of the DEIR have separated the project that would clean up the existing waste rock

and mine tailings contamination at the Centennial Industrial Site from the proposed new mining project. The DEIR asserts that these are two separate projects.

By separating the two projects (the waste rock cleanup and the proposed new mining activities), the applicant is violating the CEQA Guidelines (Section 15378). The CEQA Guidelines define a project under CEQA as "the whole of the action" that may result either directly or indirectly in physical changes to the environment. This broad definition is intended to provide the maximum protection of the environment. Piecemealing or segmenting means dividing a project into two or more pieces and evaluating each piece in a separate environmental document, rather than evaluating the whole of the project in one environmental document. This is explicitly forbidden by CEQA, because dividing a project into a number of pieces would allow a Lead Agency to minimize the apparent environmental impacts of a project by evaluating individual pieces separately, each of which may have a less-than-significant impact on the environment, but which together may result in a significant impact.

The DEIR should be revised to address the current baseline condition and segmentation of the environmental review process, which would require the project to include the cleanup of legacy contamination at the Centennial Industrial Site.

**Project-related Waste Rock and Mine Tailings**

**Grp 21-109**

Neither the DEIR Project Description nor the Hazards and Hazardous Materials section adequately describes how future waste rock and mine tailings generated by the proposed project would be managed to ensure that they do not pose a health hazard to people or the environment (as the placement of similar waste materials from the same mine did in the past). Since Section 4.7 Hazards and Hazardous Materials of the DEIR contains almost no discussion of the impacts associated with generation and disposal of potentially hazardous mine waste, it should be revised to include a detailed description of waste rock and mine tailings, including all historic analytical data and chemical characterization of the waste, so that the reader can gain a better understanding of the nature of this waste.

The DEIR provides little or no analytical data that demonstrates the chemical quality of the rock proposed to be mined would differ in any way from the rock that was mined historically. In the absence of data to the contrary, it is reasonable to assume that any newly generated waste rock and mine tailings would have similar chemical characteristics as the rock mined in the past. Therefore, the waste rock and mine tailings generated by the proposed project will almost certainly contain metals contaminants that could pose a health risk to people and the environment, and the DEIR includes no detailed plan as to how these contaminated wastes will be managed so that they do not create another environmental hazard. In fact, the DEIR appears to try to "rebrand" the waste rock and mine tailings as "engineered fill", apparently in the hopes that the waste material can be transported off-site for use at various unspecified

construction sites throughout the region as fill material, which would almost certainly result in numerous new contaminated wastes sites that pose a threat to the public and the environment. Unless it can be clearly demonstrated using substantial evidence that the waste rock and mine tailings can be safely used at uncontrolled constructions sites, this waste management option should be eliminated from the proposed project and the DEIR.

The only assurance provided by the DEIR (in section 4.8 Hydrology and Water Quality) that the project would not create another environmental hazard associated with placement of waste rock and mine tailings at the Centennial Industrial Site, which is already contaminated with previous placement of waste rock and mine tailings, is as follows (DEIR page 4.8-50):

> *Rise will be required as part of the project to submit a Report of Waste Discharge and obtain Waste Discharge Requirements from the Regional Water Quality Control Board for construction of the engineered fill areas.*

It is not adequate to state that the project will get permits without providing substantial evidence that the proposed action will not result in environmental impacts, particularly when very similar historic actions have been demonstrated to result in environmental impacts that have persisted for decades.

## DEIR SECTION 4.8 HYDROLOGY AND WATER QUALITY

### Impacts to Groundwater Resources and Domestic Water Supply Wells

The proposed project would intentionally affect local groundwater resources by dewatering the aquifer in the project vicinity to lower groundwater levels. The dewatered groundwater resources would be converted to surface water that is discharged into existing creek channels and quickly conveyed out of the area.

**Grp 21-110**

As described on page 3-15 of the DEIR:

> *The Idaho-Maryland Mine would be dewatered using the Brunswick shaft to access the underground workings.*

And page 4.5-55 of the DEIR:

> *As dewatering occurs, the water level within the underground workings would decrease from its current depth of approximately 250 feet bgs down to the maximum depth of the New Brunswick shaft at about 3,460 feet bgs. These depths are equivalent to elevations of approximately 2,500 feet msl and -700 feet msl, respectively. Thus, the water level within the mine workings would eventually decrease as much as 3,200 feet due to the project. As previously discussed, the transmissivity of the fractured bedrock decreases by several orders of magnitude at deeper depths, due to a reduction in the number of*

> *fractures and a decrease in the width of the fracture openings caused by increased lithostatic pressures at depth. As a result, dewatering of deeper tunnels and drifts would have less impact on groundwater levels in the fractured bedrock than would dewatering of shallower mine workings.*

As described in the DEIR, groundwater levels within the mine would be lowered by over 3,000 feet. Under the proposed project, the mine workings would essentially act as an enormous groundwater extraction well that would be pumped continuously for generations (the requested permit term is 80 years – DEIR page 2-3).

The applicant's consultants have prepared a numerical groundwater model to attempt to predict how this proposed long term dewatering effort would affect overlying and surrounding groundwater levels where rural residences and businesses rely solely on private groundwater wells for their water supply. Per the DEIR (page 4.8-55):

> *...based on the variation in the transmissivity and hydraulic conductivity of the fractured bedrock, 99 percent of groundwater inflow would occur within 550 feet of the ground surface, as previously discussed. Based on the fractured bedrock aquifer properties and the maintenance dewatering rates, it is anticipated that the drawdown near the mine area would cause the water levels in several of the wells in the East Bennett area to be affected.*

Based on this groundwater model output, the DEIR concludes that the East Bennett wells area could be affected and that impacts in all other areas would not be significant (DEIR page 4.8-62):

> *Thus, in the perimeter areas and including a safety factor of 100 percent in calculations, the project would not have any significant impact on groundwater supplies.*

In Mitigation Measure 4.8-2(a) (DEIR page 4.8-67) the DEIR acknowledges that more groundwater level data is needed to assess the potential impacts of the project to groundwater levels. The DEIR inappropriately defers the collection of additional data (via a Groundwater Monitoring Plan) to the future.

Mitigation Measure 4.8-2(a)(4) (DEIR page 4.8-67) is internally inconsistent and not implementable as stated. The first part of the measure requires an assessment be conducted "once dewatering of the underground mine workings commences", as stated (DEIR page 4.8-67) [underline emphasis added]:

> *A projected water-level impact assessment for individual domestic wells shall be performed once dewatering of the underground mine workings commences, based on responses of the measured groundwater levels of the project monitoring wells. The*

> *projected groundwater drawdown shall be estimated for each domestic well in the project area. This impact assessment shall be performed by tabulating the variation of the measured water levels from the project monitoring wells over the monitoring period and during the dewatering of the underground mine workings and mining operations.*

The second part of the same mitigation measure refers to determination of "baseline groundwater level", which would be based on the assessment discussed above, "shall be developed prior to the initiation of dewatering of the underground mine workings", per the DEIR (page 4.8-67) [underline emphasis added]:

> *For each domestic well, a projected and seasonally averaged water level shall be estimated based on the domestic well location and the background potentiometric conditions, which will serve as a baseline groundwater level and shall be developed prior to the initiation of dewatering of the underground mine workings.*

It would not be possible for pre-dewatering baseline levels to be determined when they would be based on an assessment that would not start until after dewatering begins. Consequently, this Mitigation Measure 4.8-2(a) (DEIR page 4.8-67) would be impossible to implement.

The lack of clarity and implementability of the proposed approach demonstrates that the DEIR does not provide a clear and feasible methodology for protecting groundwater resources and domestic well users. A groundwater management plan that includes information gathering and data collection from a broad network of existing domestic wells (not monitoring wells - refer to additional discussion below under **Proposed Reliance on a Groundwater Monitoring Well Network**) should be implemented prior to preparation the DEIR.

CEQA does not allow the deferment of important studies that would allow full characterization of impacts and deny decision-makers information that would allow them to make well-reasoned decisions regarding the viability of the project. Groundwater monitoring networks should be established and resulting data included in the DEIR.

As described below, the approach that the DEIR takes to assessing and mitigating potential impacts to groundwater levels and existing water supply wells is flawed in numerous ways.

***Uncertainty of Groundwater Model Predictions***

**Grp 21-111**

Accurately characterizing the flow patterns and behavior of groundwater using mathematical equations (models) is a challenging endeavor in any geologic environment. The types of hydrogeologic systems that are most readily modeled accurately are uniform (homogeneous), isotropic (consistent structure from place to place) rock and or sediments, like a uniform unfractured sandstone where water flows slowly through pore spaces around the grains of the geologic material.

BASELINE ENVIRONMENTAL CONSULTING

Laurel L. Impett
15 February 2022
Page 7

Groundwater occurrence and flow within complex fractured bedrock systems, like those that occur at the project site, are exceedingly difficult to model with accuracy or reliability. It is widely known by practitioners in the hydrogeologic community that accurate prediction of groundwater behavior in fractured bedrock using groundwater models, where most of the flow occurs within the unknowable sets of primary and secondary fracture patterns, rarely occurs.

The DEIR bases its entire approach to characterizing and mitigating the impacts to groundwater resources and water levels in existing domestic wells on the results of a numerical model for a complex aquifer system with many intricacies that can never be fully understood. Even the water resources firm hired by the applicant to conduct a peer review of the mathematical model expressed concerns about the reliability of the model results:

From Wes Yost (page 12)

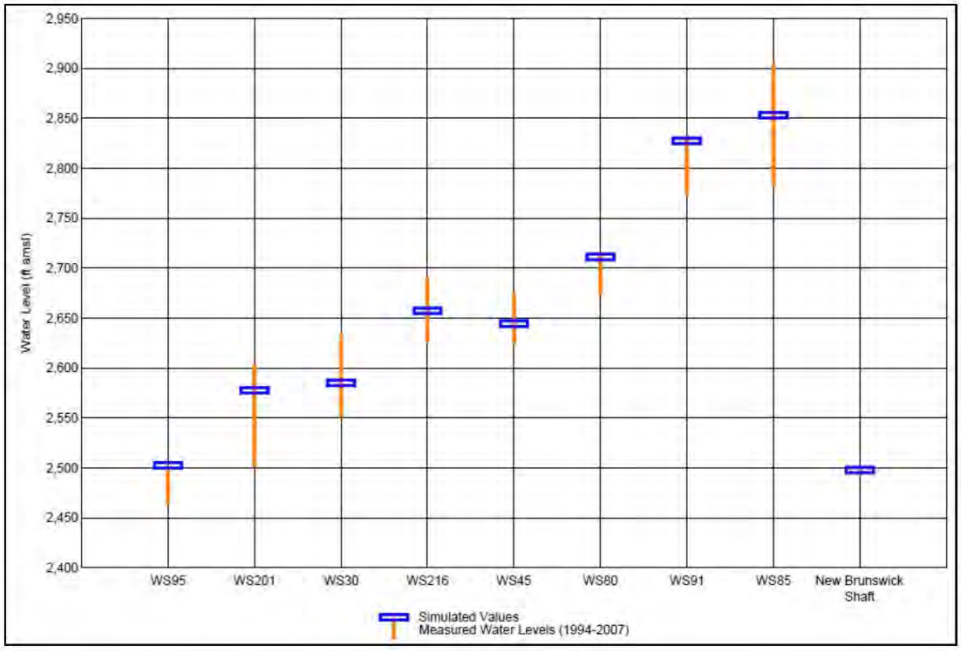
> *A major assumption is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth. However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of this uncertainty and the overall uncertainty of the model predictions with respect to groundwater level impacts on individual wells should be provided.*

The DEIR does not explicitly acknowledge the concern related to the "subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty" raised by Wes Yost.

**Grp 21-112**

Additional uncertainties in the groundwater model are evident based on review of the groundwater model report included in Appendix K.3 of the DEIR. The groundwater model was calibrated based on pumping rates from the historical Idaho-Brunswick Mine and one water level measurement collected from the flooded (i.e., inactive) Union Hill shaft in 1956. Using only one water level measurement to calibrate a complex bedrock aquifer system over a large region introduces a significant amount of uncertainty to the model. In addition, page 6 of Appendix K.3 states "...there is a poor hydraulic connection between these two mines", which suggests the water level measurement collected from the Union Hill Shaft is not ideal for calibrating the groundwater model.

**Grp 21-113**



According to groundwater model report in Appendix K.3, the model was further calibrated or verified by terminating the pumps in the historical Idaho-Brunswick Mine (represented in the model by drainage nodes in the mine workings) and allowing the groundwater levels to recover from 1957 to 2019. The simulated groundwater levels at the end of the recovery period (2019) were then compared to water levels measured in eight domestic wells in the project vicinity from 1994 to 2007. As shown in Figure 4-8 from the groundwater model report (see below), the

BASELINE ENVIRONMENTAL CONSULTING

Laurel L. Impett
15 February 2022
Page 8

simulated water levels recovered within the range of measured water levels in the select domestic wells; however, the variation in measured water levels for each domestic well ranges from about 40 feet (well WS95) to 120 feet (well WS85). Demonstrating that the simulated groundwater levels can recover within a 40- to 120-foot range of measured water levels does not provide much assurance regarding the accuracy and reliability of the groundwater model. This is particularly true when the model is being used to predict that the project will have a maximum groundwater level drawdown of 10 feet in the project vicinity.

**Figure 4-8 of Appendix K.3: Simulated Water Levels Compared to Select Domestic Wells**

As summarized on page 4.8-19 of the DEIR, groundwater currently appears to be seeping into the existing mine shafts and then discharging to several drains located along Wolf Creek. As stated on page 4.8-19 of the DEIR:

**Grp 21-114**

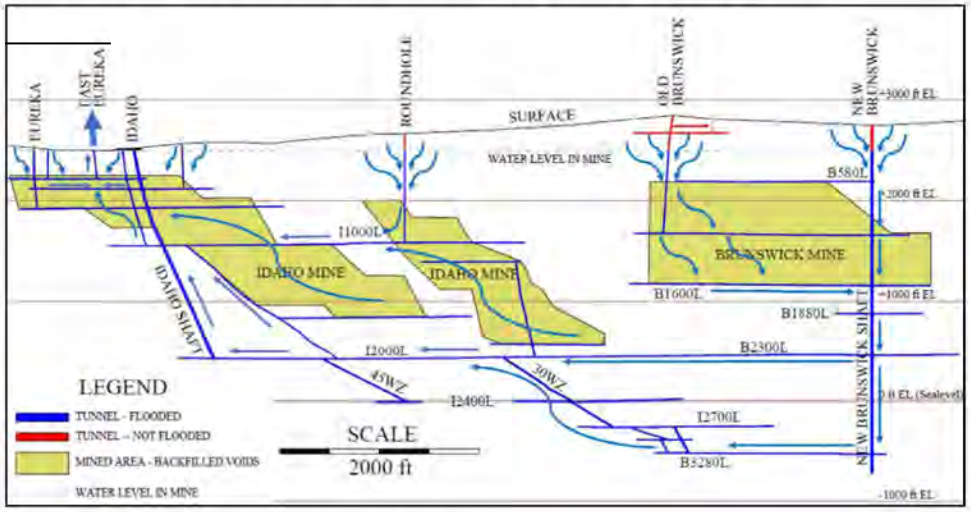
> *The elevation of the water in the New Brunswick shaft averages 2,497 feet msl. This elevation is about 25 feet to 265 feet below the static water level in the domestic supply wells in the East Bennett area. Thus, the underground workings connected to the New Brunswick shaft must have a connection to a point that allows the workings to be*

*drained, resulting in a lower water level in the shaft than in the wells in the surrounding bedrock.*

Page 4.8-19 of the DEIR also states the following:

*Because the water level in the shafts appears to be consistently below the static groundwater levels in the wells in the East Bennett area, groundwater will continually seep into the shafts. As a result, the shafts act as "wells" that constantly draw groundwater from the surrounding shallow bedrock (i.e., above a depth of 500 feet, where the transmissivity is highest).*

As a result, there is currently a groundwater depression created by constant drainage from the existing mine workings. This groundwater movement is generalized in Figure 4.8-7 of the DEIR shown below. The groundwater model report in Appendix K.3 of the DEIR also simulated this existing groundwater depression. However, the groundwater model report provides no discussion of how this condition was simulated. Since the static water level in the mine workings remains at about 2,497 feet msl, the model should apply boundary conditions (e.g., drainage nodes or pumping wells) along the mine workings located above 2,497 feet msl to create the specified head of the current water level in the mine workings. There is no discussion of such a boundary condition being applied to the groundwater model to simulate the current drainage of the mine workings. Calibrating the groundwater model without incorporating the proper mechanisms to simulate the drainage of groundwater from existing mine workings could introduce substantial error to the overall modeling results.



**Grp 21-115**

In summary, there is a high level of uncertainty associated with the groundwater model that was used in the DEIR as justification to identify a very small subset of the domestic wells in the East Bennett area that are likely to be adversely affected by the project, and to characterize impacts to a vast number of other domestic wells in the project vicinity as less than significant. This is a flawed approach and provides no assurance that residences and businesses that rely on groundwater wells in the region will have a reliable water supply if the project were to be approved.

BASELINE ENVIRONMENTAL CONSULTING

Laurel L. Impett
15 February 2022
Page 10

**Figure 4.8-7 of DEIR: Groundwater Movement in Mine Workings (Existing Condition)**

***Arbitrary Impact Criteria of 10% Drawdown***

Grp 21-116

DEIR Mitigation Measure 4.8-2(b) states that:

> *If, based on the GMP, it is determined that mining operations are resulting in a significant impact to any well(s) (i.e., a 10 percent or greater reduction of the water column of any well), pursuant to Nevada County General Plan Policy 17.12, the project applicant shall be responsible for providing a comparable supply of water to such homes or businesses whose wells are significantly impacted…*

Grp 21-117

This mitigation measure attempts to establish this "10 percent or greater reduction of the water column of any well" as a criterion of significance which would trigger a significant impact requiring mitigation. Nowhere is the arbitrary groundwater level of 10 percent reduction justified in the DEIR. It is certainly possible that of the hundreds of supply wells in the region, that some of them are just barely satisfying the well owners needs under existing conditions, and that a water level reduction of 10 percent could lead to water levels dropping below the well pump intake, adversely impacting the quantity of water available from the well with the existing pumping system. The DEIR presents no details related to the characteristics and function of the existing domestic wells that the project may affect and allow for the development of a fact-based criterion of significance. The DEIR needs to disclose this fact and gather the data needed to make such a determination, then discuss and mitigate the impacts.

Baseline Consulting Report 2.15.2022

The mitigation measure also does not describe how drawdown would be determined relative to baseline conditions. As stated on page 7 of Appendix K.3, private domestic wells in the project vicinity have seasonal fluctuations that may vary from 10 to 50 feet between wet and dry seasons. It is not clear how these seasonal water fluctuations would be distinguished from project-related drawdown.

Also, it should be noted that the General Plan policy referred to (Policy 17.12) says nothing about a 10 percent reduction criterion. Verbatim, this General Plan policy states:

> *In approving mining projects which according to expert opinion may threaten the existing quality or quantity of surface or subsurface water which supply adjacent homes and businesses, the County shall require the operator to guarantee a comparable supply of water to such homes or businesses through accessible forms of security or alternate sources of water.*
>
> *Where water quantity and quality problems occur, an immediate water supply shall be provided by the operator until the source of the problem is determined. The burden of proof shall be on the operator to show that the mining operation did not create the water problem. If it is determined that the operator is at fault, impacted owners shall be compensated by the operator.*

**Grp 21-118**

According to the General Plan policy, the correct criterion for mitigating potential impacts to water resources from mining projects is based on expert opinion and not an unsubstantiated 10 percent reduction criterion. For the reasons stated within this letter, it is Baseline's expert opinion that the project may threaten the existing quality or quantity of surface or subsurface water which supply adjacent homes and businesses in a much wider area than is indicated in the DEIR. The DEIR criterion of impact should be revised to be consistent with General Plan policy 17.12 and Mitigation Measure 4.8-2(c) should be revised to include all wells that may be affected instead of only the 30 wells in the East Bennett area.

***Proposed Reliance on a Groundwater Monitoring Well Network***

The DEIR and associated Groundwater Monitoring Plan (GMP) (Itasca, Feb. 2021) does not propose to monitor water levels in the actual water supply wells at overlying and nearby residences and businesses that may be affected by the project, but proposes to install monitoring wells to (GMP page 1):

**Grp 21-119**

> *...provide data for assessing groundwater conditions during dewatering of mine workings and mining operation at the Project. The GMP includes the installation of monitoring wells across the Project site at 15 different locations.*

BASELINE
ENVIRONMENTAL CONSULTING

Laurel L. Impett
15 February 2022
Page 12

It is not explained in the DEIR or GMP how 15 monitoring wells in complex fractured bedrock spread out over thousands of acres could possibly be relied upon to provide data to ensure that groundwater level impacts to the hundreds of existing water supply wells in the project vicinity are immediately identified and mitigated. For example, a monitoring well could be placed in proximity to an existing supply well and respond very differently to changing water levels in the mine during dewatering if a water-bearing bedrock fracture intersects one of the wells, but not the other. To comply with the requirements of General Plan Policy 17.12, the applicant should, at minimum, do the following:

- Complete a detailed water supply well inventory for all wells within the Mineral Rights Boundary (plus a substantial buffer zone);
- Investigate all available details about each well such as the construction design (i.e., depth, diameter, screened interval); type and use of the well (e.g., domestic, irrigation, industrial, etc.); water demand (installing totalizer meters if necessary to determine water use); and recharge rates (installing pressure transducers if necessary to monitor drawdown and recharge); and seasonal variations in water levels.
- Develop a plan for each well to ensure that an immediate alternate water supply can and will be provided should an impact to that well occur. This plan should include provisions to ensure alternate water supplies will be provided throughout the 80-year life of the project and beyond. For example, if the project causes a domestic well to go dry, and the well collapses or partially collapses (which older wells often do when they go dry), the applicant should be required to replace the well at no cost to the owner.

We understand that this well identification and mitigation planning will be a substantial effort and need to be funded by the applicant, but the consequences of not committing to full compliance with General Plan Policy 2.17 are dire for local property owners who rely on groundwater.

**Grp 21-120**

It should be noted that the County has already required a similar program for a previous mining project. Please refer to the Conditional Use Permit (File Number: U94-017) for the Extension of Time for Emperor Gold (U.S.) Corporation dated March 28, 2001 (Attachment A), in which the County required: 1) a monitoring program to establish baseline data on local wells and the collection of at least 12 months of baseline data from these wells. The proposed project should be required to at least implement as rigorous of a well protection program for the proposed project as was previously required in the use permit of a previous mining project. DEIR Mitigation Measure 4.8-2 should be revised to more fully address potential impacts to water supply wells and meet or exceed the requirements previously required by the County.

***Impacts to Groundwater Dependent Biological Resources Not Adequately Characterized and Mitigated***

For similar reasons as described above for potential impacts to water supply wells, proposed mine dewatering activities could, and likely will, have a significant impact on groundwater dependent biological resources by drying up springs and reducing or eliminating groundwater discharges to certain creek segments. This is not addressed at all in section 4.8 of the DEIR. The applicant's own consultant identifies this problem (West Yost, page 18):

> *Baseflow in the South Fork of Wolf Creek and Wolf Creek is from bedrock fractures. The reported hydrogeologic conceptual model for groundwater flow acknowledges this, but the numerical model necessarily assumes a relatively uniform distribution of hydraulic properties in the subsurface. The subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of this uncertainty and its impact on the model's predicted impacts of mine dewatering on stream flow should be provided.*
>
> *Based on the data and analysis presented in the Itasca Report and EMKO Report, it is possible that mining activities, including blasting, backfilling with CPB, and sealing of drains or areas of the underground workings, could activate leaching and groundwater flow in new subsurface areas, potentially resulting in impacts to neighboring wells, and discharges to surface water of groundwater with water quality exceeding applicable standards. These impacts could potentially occur during the mining or post-mining periods. Because of the uncertainty inherent in the bedrock fracture flow system, monitoring will be needed, as mining activities progress, to assess potential impacts, design appropriate solutions and attain necessary permits to mitigate these potential impacts. These efforts should be addressed in the monitoring and mitigation requirements for the mining and post-mining phases of the Proposed Project.*

Grp 21-121

This potential impact needs to be fully addressed and mitigated.

**DEIR SECTION 4.3 AIR QUALITY, GREENHOUSE GAS EMISSIONS, AND ENERGY**

**Underestimated Emissions of Criteria Air Pollutants and GHGs from Haul Trucks Transporting Engineered Fill**

Grp 21-122

The air quality analysis for the DEIR assumed that waste rock and mine tailings would be used as engineered fill at the following locations over time:

- Years 2022–2026: Fill placement at the Centennial Industrial Site;
- Years 2027–2032: Fill placement at the Brunswick Industrial Site; and
- Years 2033–2102: Fill placement at off-site locations.

BASELINE ENVIRONMENTAL CONSULTING

The DEIR estimated the annual average emissions of criteria air pollutants and greenhouse gases (GHGs) for the haul trucks that would transport engineered fill from the Brunswick Industrial Site to the Centennial Industrial Site (1.8 miles per trip) from 2022 to 2026 and then to off-site locations (60 miles per trip) starting in 2033. The DEIR analysis assumed that remediation of the Centennial Industrial Site would be completed and approved by the DTSC prior to the opening year. However, since remediation of the Centennial Industrial Site is not included as part of the CEQA analysis for the project, there is no assurance that remediation of the site will be completed prior to the opening year of the project or within the lifetime of the project. As a result, it's speculative to assume that the Centennial Industrial Site will be available for fill placement.

A more reasonable analysis is to assume the Centennial Industrial Site is not available for fill placement and the haul trucks will need to travel to the more distant off-site locations for an additional five years starting as early as the opening year. Since the fleetwide air pollutant emissions from haul trucks are expected to improve over time as older equipment is replaced with newer technology (e.g., cleaner engines), estimating haul truck emissions to off-site locations in the opening year also provides the most conservative analysis. To illustrate the severity of impacts that could result under this assumption, Baseline prepared an updated analysis of the project's daily nitrogen oxide (NOx) emissions in the opening year related to haul trucks transporting engineered fill to the off-site locations.

As shown in **Table 1**, the project's daily NOx emissions for haul trucks transporting engineered fill to off-site locations (89.6 pounds per day [lbs/day]) would be substantially higher than the results of the DEIR analysis of haul trucks transporting engineered fill to the nearby Centennial Industrial Site (4.0 pounds per day [lbs/day]). The updated analysis would result in the project's total NOx emissions (193.1 lbs/day) exceeding the Northern Sierra Air Quality Management District's (NSAQMD's) Level C threshold of significance (136 lbs/day) in the opening year, which would result in a significant and unavoidable impact if emissions are not mitigated below the NSAQMD's Level C threshold.

BASELINE ENVIRONMENTAL CONSULTING

Laurel L. Impett
15 February 2022
Page 15

**Table 1: Comparison of NOx Emissions for Haul Truck Transporting Engineered Fill to the Centennial Industrial Site and Off-Site Locations in the Opening Year (2022)**

| Haul Truck Destination in Opening Year (2022) | Haul Truck Annual VMT | NOx Emissions (lbs/day) | | |
|---|---|---|---|---|
| | | Haul Truck Emissions[1] | Total Project Emissions[2] | NSAQMD Threshold Level |
| Existing Analysis for Centennial Industrial Site | 65,700 | 4.0 | 107.5 | Level B (24-136 lb/day) |
| Updated Analysis for Off-Site Locations | 2,190,000 | 89.6 | 193.1 | Level C (>136 lb/day) |

Notes: VMT = vehicle miles traveled; NSAQMD = Northern Sierra Air Quality Management District
[1] Haul truck emissions were estimated based on the annual VMT, trips, idling, and emissions factors reported for Haul Trucks in Appendix E.1 of the DEIR.
[2] Total project emissions were estimated based on the unmitigated NOx emissions from other project sources summarized in Table 4.3-17 of the DEIR.

Emissions of other criteria air pollutants and GHGs would also similarly increase if the Centennial Site is not available for fill placement. The project analysis for criteria air pollutants and GHGs should be updated to assume that remediation of the Centennial Industrial Site may not be completed within the lifetime of the project and, therefore, off-site locations may be needed for fill placement for an additional five years starting as early as the opening year. As demonstrated in Baseline's updated analysis of daily NOx emissions, this is expected to result in more severe air quality and GHG impacts than disclosed in the DEIR.

## Failure to Evaluate the Effectiveness of Applicant Proposed Measures to Reduce Air Quality, GHG, and Energy Impacts

Grp 21-123

As described on page 4.3-65 of the DEIR, the following three applicant proposed measures (APMs) will be implemented during construction, operation, and reclamation of the project:

- APM-AQ-1: Exhaust Emission Controls
- APM-AQ-2: Surface Fugitive Dust Controls
- APM-AQ-3: ASUR Plan

Similar to mitigation measures, these APMs are intended to reduce the project's air quality, GHG, and energy impacts. The DEIR included the APMs in the project's unmitigated analysis of air quality, GHG, and energy impacts. It appears that the preparers of the DEIR intended to incorporate the APMs into the project design; however, the APMs were not identified as features in the project description. Therefore, there is no assurance that these APMs will be implemented as a part of the project.

Based on the *Lotus v. Department of Transportation* (223 Cal. App.4th 645) decision, the DEIR should first evaluate if the project's air quality, GHG, and energy impacts would exceed the

thresholds of significance without implementation of the APMs, and then evaluate how the APMs would reduce the impacts to or maintain them at a less-than-significant level. Furthermore, the APMs need to be analyzed for their effectiveness in reducing the impact and a mitigation monitoring or reporting plan needs to be adopted to ensure these measures are implemented.

The DEIR should be updated to properly incorporate of APMs into the project design or convert the APMs into CEQA mitigation measures and include them in the Mitigation Monitoring and Reporting Program. More importantly, the DEIR analysis of unmitigated air quality, GHG, and energy impacts should be updated to evaluate the effectiveness of the APMs in reducing impacts to a less-than-significant level.

**Inadequate Mitigation of Criteria Air Pollutant Emissions**

Grp 21-124

According to Table 4.3-17 in the DEIR, the project's unmitigated emissions of NOx would exceed the NSAQMD's Level B threshold during the 1-year period of construction and over the entire 80-year period of the mining permit, while unmitigated emissions of reactive organic gases (ROG) and respirable particulate matter (PM10) would exceed NSAQMD's Level A threshold during that period. Therefore, the project would have a potentially significant air quality impact that should be mitigated to reduce emissions from both short-term and long-term sources. The DEIR analysis has incorporated the minimum mitigation measures recommended by the NSAQMD; however, these mitigation measures only reduce project emissions during the 1-year period of construction. The mitigation measures do not address any of the long-term NOx, ROG, and PM10 emissions over the 80-year permit of the project. As result, there is no evidence that the project's long-term NOx, ROG, and PM10 emissions have been mitigated to a less-than-significant level. The DEIR analysis should be updated to identify and evaluate feasible mitigation measures that would reduce long-term criteria air pollutant emissions from project operations, not just construction.

BASELINE ENVIRONMENTAL CONSULTING

Laurel L. Impett
16 February 2022
Page 17

**Health Risk Assessment Fails to Provide Essential Information and Lacks Substantial Evidence to Support Conclusions**

The DEIR prepared a health risk assessment (HRA) for nearby sensitive receptors exposed to concentrations of toxic air contaminants (TACs) generated by the project. TACs of concern include diesel particulate matter (DPM), asbestos, silica, and trace heavy metals, as described on page 4.3-79 of the DEIR:

> *Project construction, operations, and reclamation activities would produce DPM emissions (with PM10 exhaust modeled as surrogate) due to off-road equipment and haul truck trips, and other TAC emissions from mining and soil movement. The TAC emissions associated with blasting and crushing, ore processing, and earthwork and material handling would include asbestos, silica, and trace heavy metal TACs including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium. In addition, for purposes of the HRA, diesel emergency generators were assumed to operate for up to 100 hours per year in accordance with CARB's ATCM for Stationary Compression Ignition Engines.*

**Grp 21-125**

The methodology and input parameters used for the HRA are documented in the *Health Risk Assessment for The Idaho-Maryland Mine Project* included in Appendix E.1 of the DEIR. The HRA included air dispersion modeling of 25 unique sources of TAC emissions during construction and operation of the project, such as ore processing exhaust fans, diesel generators, diesel storage tanks, and fugitive dust from off-road equipment. Based on the air dispersion model results, the HRA estimated the health risks for a sensitive receptor exposed to 33 different TACs of concern, such as DPM, asbestos, and silica. Consistent with guidance from the Office of Environmental Health Hazard Assessment (OEHHA), the sensitive receptor exposure was assumed to begin in the 3rd trimester of pregnancy for a duration of 30 years.

The estimated unmitigated cancer risk at the maximally exposed individual resident was reported to be 10.4 in a million, which is above the threshold of significance (10.0 in a million). With implementation of higher-tier engines during construction, as required by Mitigation Measure 4.3-1(b), the DEIR estimated that the project would result in an incremental cancer risk of 7.6 in one million. This 27 percent reduction in cancer risk is surprising, because Mitigation Measure 4.3-1(b) only reduces emissions during 1 year of construction and does not reduce any of the emission sources over the 80 years of operation. However, there is no way to review the validity of the HRA results and effectiveness of Mitigation Measure 4.3-1(b) because the results of the HRA analysis are poorly documented and non-existent in most cases.

**Grp 21-126**

For the HRA results, the DEIR only presents the total cancer risk, chronic health risk, and acute health risk for a sensitive receptor exposed to 33 different TACs from 25 different sources at different times over a 30-year period. The individual health-risk contributions from each

emission source, TAC, and year of exposure are not documented or summarized anywhere in the DEIR. In addition, no graphics are provided to show the location of the modeled emission sources, sensitive receptors, and results of the air dispersion modeling. As a result, there is no reasonable method for the public or decision makers to review the validity of the HRA findings and evaluate the effectiveness of proposed Mitigation Measure 4.3-1(b). According to *Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal. 4th 412, 442, the data in an EIR must be presented in a manner to adequately inform the public and decision makers. Here, the DEIR air quality analysis lacks substantial evidence to support its conclusions and should be revised to properly document and summarize the findings of the HRA.

## Unsubstantiated GHG Threshold of Significance

Neither the NSAQMD nor the County has adopted numerical thresholds of significance for GHG emissions that would apply to the project. Therefore, the DEIR uses a bright-line GHG threshold of 10,000 metric tons of carbon dioxide equivalents (MT CO2e) per year for operations based on the following justification described on page 4.3-43 of the DEIR:

**Grp 21-127**

> *For operations, because the project is an industrial project that includes stationary sources (i.e., diesel generators used for emergency power), the project's GHG emissions were compared to the 10,000 MT CO2e per year quantitative threshold, which, as described above, is used by SMAQMD, PCAPCD, BAAQMD, and SCAQMD for industrial and/or stationary source emissions of GHGs. The substantial evidence for this GHG emissions threshold is based on the expert opinion of various California air districts, which have applied the 10,000 MT CO2e per year threshold in numerous CEQA documents where those air districts are the lead agency.*

The justifications for adopting this threshold are unique to each air district. These air districts have prepared detailed GHG inventories to identify and evaluate strategies for achieving the statewide GHG reduction goals within their air district. While these air districts have adopted the same bright-line threshold of 10,000 MT CO2e per year for stationary sources, the justification for adopting this threshold is not the same for each air district. Furthermore, these air districts originally adopted the stationary GHG threshold to achieve the 2020 statewide GHG goal under California Assembly Bill 32, which was to reduce GHG emissions to 1990 levels by the year 2020. In September 2016, Senate Bill 32 established the State target to reduce GHG emissions 40 percent below 1990 levels by 2030. The Bay Area Air Quality Management District (BAAQMD), which is referenced above, is in the process of updating their GHG thresholds to address California's long-term GHG goals for 2030 and beyond, and is proposing a new stationary source threshold of 2,000 MT CO2e per year or compliance with Cap-and-Trade.[1]

[1] Bay Area Air Quality Management District (BAAQMD), Air District Update to CEQA Thresholds of Significance for Greenhouse Gases; Public Workshop. December 9, 2021.

BASELINE
ENVIRONMENTAL CONSULTING

The DEIR does not discuss the justification provided by each air district for adopting the 10,000 MT CO2e per year threshold, nor does it provide substantial evidence for applying this threshold to the project to demonstrate how it will achieve a fair share of the statewide GHG reductions goals for 2030 and beyond. The DEIR should be updated to identify and provide justification for a GHG threshold of significance that will achieve the statewide GHG reductions goals for 2030 and beyond over the proposed 80-year lifetime of the mining permit.

**CONCLUSIONS**

**Grp 21-128** Based on our review of the DEIR and supporting appendices for the proposed project, Baseline recommends that the County revise and recirculate the environmental analysis to address the environmental concerns related to the issues described above.

Sincerely,

Patrick Sutton, PE
Senior Environmental Engineer

RE: Extension of Time for Emperor Gold (U.S.) Corporation – Conditional Use Permit File Number: U94-017

Dear Mr. Galati:

At their regular meeting of March 22, 2001, the Nevada County Planning Commission considered your extension request dated December 13, 2000, for an extension of time for the Conditional Use Permit application of Emperor Gold, File Number U94-017.

The Commission, by a 5-0 vote, granted the extension of time for two (2) years. The dewatering activities for the Conditional Use Permit on this project must be commenced no later than January 25, 2003 .

If you have any questions, please contact the project planner, Tod Herman, Associate Planner, at (530) 265-1257.

Very truly yours,

**NEVADA COUNTY PLANNING COMMISSION**
Mark Tomich, Ex-Officio Secretary

ENVIRONMENTAL ACTION: Certified EIR

You are hereby notified that the Nevada County Planning Commission, at a regular meeting held on January 25, 1996, after public hearing, did duly consider your application for the dewatering of the existing underground workings of the Idaho Maryland Gold Mine, and the subsequent underground exploration and sampling of those workings, on property located on 117 acres of contiguous property located southwest of the intersection of Brunswick Road and E. Bennett Road, including the Bohemia Mill site. A legal description of the property is on file in the Planning Department, 950 Maidu Avenue, Nevada City, California.

The Planning Commission hereby notifies you that your application for a use permit was granted, on a 4-0 vote, subject to the following mitigation measures and conditions:

The agency references are: Planning Department (PD), Department of Transportation (DOT), Environmental Health (EH), Building Department (BD), and the Northern Sierra Air Quality Management District (NSAQ).

### I. GENERAL CONDITIONS

**PD 1** All operations shall be conducted in accordance with the project description in Section 3.0 (Draft EIR), and as amended in the EIR Errata (Section 3.0 of the Final EIR). All other conditions required by this permit shall be considered as modifications to the project description. All mitigation measures attached to this project shall also be considered as conditions of this permit.

**PD 2** Under applicable law, this use permit will "run with the land" and the entitlements and obligations will be fully assumed by any subsequent owner of the property covered by this use permit. Any party or entity acquiring the property and electing to continue with the use of the property as authorized by this use permit will be required to fully comply with all of the conditions and obligations created by the use permit, including, but not limited to, being required to post and maintain adequate security as required under MM 4.3.6 of this permit.

**PD 3** Once the dewatering portion of the Exploration Phase has commenced, the operator shall have four and a half years to complete the Exploration Phase and an additional six months to complete the site clean up activities outlined in the Post Project phase (Section VIII) of this use permit. All mine dewatering shall cease at the end of the Exploration Phase (Section VII).

**PD 4** Every two years, beginning from the commencement of the Site Preparation Phase, this Use Permit shall be reviewed before the Nevada County Planning Commission. The purpose of the review will be to evaluate the success of the established performance standards and of the operator in complying with these Conditions of Approval. Additionally, the review will monitor the status of the project and any deviations from the anticipated impacts described in the Final EIR. Adjustments to the monitoring program may be made in order to accommodate any such deviations.

**PD 5** If the review hearings in Condition PD 4 above reveal serious violations and/or unexpected significant environmental or public health impacts that either have not or cannot be corrected, the Planning Commission shall recommend that the Board of Supervisors hold a hearing to consider revocation of the Use Permit.

NOTE: Notwithstanding any other provision, use permit revocation hearing(s) may be held any time by the Board of Supervisors pursuant to Section L-II 31.6 of the Land Use and Development Code whenever non-compliance on the part of the operator is demonstrated such that the established conditions of approval are not being followed.

**PD 6** These conditions may not be changed without amending this permit except that minor adjustments to the project and conditions may be made if approved by the Planning Department staff, and if such changes do not result in a major departure from the approval either individually or cumulatively as defined in Section L-II 3.49 of the Land Use and Development Code. Staff will report all such adjustments to the Planning Commission and Community Liaison when applicable.

**PD 7** The operator shall fund the County's monitoring and inspection for this project. All such fees shall be based on an at-cost basis pursuant to Section K.1 of the latest fee schedule adopted by the Board of Supervisors.

**PD 8** The following is the definition of the Community Liaison with whom the Mine Operator shall be required to coordinate:

a. At their election, and on an "as available" basis, the Bohemia Area Residents Committee (BARC) will provide the operation with the name, address, and phone number of a person designated as the "Community Liaison." This volunteer will serve both the community near the mine and the operator as the main line of communication between the two. For example, the liaison may:

   i. Pass on BARC or community member's concerns in an orderly fashion.
   ii. Stay informed about the project and notify BARC or community members of the current stage of the project including, as examples, temporary noisy events or the status of the monitoring results.

iii. Review monitoring data on file at the County as necessary.
iv. Serve on the Review Team for various contracts administered by or requiring review by the County.

b. The liaison will be notified concurrently with the County of any changes to the operation requiring County approval.

c. The operator shall allow the Community Liaison (when accompanied by County staff) to review on-site monitoring procedures and related activities. These on-site visits however, will be subject to conditions of the operator's liability or product loss insurance carriers and the necessary safety training of the liaison.

d. Periodic "Review Team" meetings with the County, the Community Liaison, and the operator shall be held to discuss the project's status. These meetings shall occur at a minimum on a quarterly basis, but may also be held on a more-frequent "as-needed basis." If deemed desirable by the "Review Team," the County will provide notice (at the operator's expense) to area residents of project events, status, etc. which may be of interest to such persons.

## II. SUBSEQUENT PERMIT ACQUISITION

**EH 1** Valid Hazardous Waste Permits are required prior to remedial action or hazardous waste operations. If necessary, obtain a Hazardous Waste Permit from the Nevada County Department of Environmental Health prior to the start of operations.

**EH 2** A Hazardous Material Storage Permit is required prior to installing any hazardous material on site which equals or exceeds 55 gallons, 500 pounds, or 200 cubic feet of compressed gas. Obtain a valid permit(s) from the Nevada County Department of Environmental Health prior to the start of operations.

**EH 3** Bulk storage of hazardous materials, hazardous substances, hazardous wastes and/or fuels require the submittal of a Hazardous Materials Release Response Plan and Inventory (HMRRP&I) pursuant to California Health and Safety Code Chapter 6.95. Operator shall submit a HMRRP&I to the Nevada County Department of Environmental Health 30 days prior to the start of operations at this site.

**NSAQ 1** Obtain an Authority to Construct and Permit to Operate from the Northern Sierra Air Quality Management District prior to constructing anything that requires such a permit.

**MM 4.4.2** The water quality and quantity parameters associated with surface discharge resulting from the proposed project shall conform to Order No. 94-005 (for quality) and any other waste discharge requirements and standards as set forth by the California Regional Water Quality Control Board, Central Valley Region. The operator shall submit any required background documentation to CRWQCB to obtain these permits, and these permits shall be in place before dewatering commences. The operator shall also submit to the Nevada Irrigation District any discharge plans or proposals which may affect NID facilities. NID shall be treated as an affected or reviewing agency.

**MM 4.4.5** As supporting documentation to assess receiving water quality, the operator shall conduct additional upstream and downstream testing within the South Fork channel, as required by the CRWQCB.

**MM 4.4.6** The operator shall conduct a discharge Monitoring and Reporting Program during dewatering, as set forth by the CRWQCB. Such monitoring will include testing for metals as well as pH levels.

**III. ON-SITE PREPARATION**

**PD 9** During the On-Site Preparation Phase, the operator may conduct the following site preparation activities:

a. Do the necessary geotechnical work for the dewatering pond.

b. Installation of the on-site power lines.

c. Develop the internal road system.

d. Begin preliminary site clearing and development of the on-site buildings and structures.

Prior to the establishment of any of these activities, the operator shall demonstrate by documentation that all appropriate mitigation monitoring has been performed. All such activities must comply with the other applicable requirements of this permit and those of the other permit issuing agencies.

**PD 10** The activities in Condition PD 9 above shall be conducted in the following manner:

a. All surface activities (PD 9 above) shall comply with those noise standards established in Policy 9.1 of the Noise Chapter of the Nevada County General Plan and shall be conducted in accordance with Mitigation Measures 4.9.2, and 4.9.3.

b. All required permits from the CRWQCB, or waivers therefrom, shall be obtained prior to the dewatering.

**PD 11** Site plan standards shall be as follows:

a. Administration Office Parking: A minimum of 12 parking stalls (including Disabled parking) shall be provided in accordance with Article 28 of the Land Use and Development Code. Parking area shall be paved to control fugitive dust.

b. Shop Area Parking: A minimum of 30 parking stalls shall be provided in accordance with Article 28 of the LUDC. Parking area shall be paved to control fugitive dust.

c. Buildings: All permanent building shall be colored to blend with their respective background settings.

d. Lighting: All exterior lighting shall be shielded and directed down to prevent direct off-site light spill. Permanent exterior lighting shall be limited to the Administration Office Area, Shop Area, Watchman's Quarters, and those areas reasonably necessary to provide safety measures during nighttime operations. Within an hour after the evening's activities, all unnecessary exterior lighting shall be turned off.

e. Site Plan: After buildings are permanently located, a revised site plan shall be submitted to the Planning Department and kept on file.

f. Watchman's Quarters: A watchman's quarters shall be permitted for the purposes of mine security.

**BD 1** Obtain the proper permits from the Building Inspection Department for all building construction and grading activities. Such permits shall meet the minimum requirements of the Uniform Building Code and Chapter XV of the Nevada County Land Use and Development Code (Grading Ordinance).

**DOT 1** Provide proof of access rights to Brunswick Road through the S.P.I. property. (Note that the "Concept Plan" as submitted with the rezoning application, Z93-004, depicts a redesigned interior road system for the S.P.I. property.)

**DOT 2** The Road Improvement Fee in accordance with Nevada County Ordinance No. 1829 creating and establishing the authority for imposing and charging a road improvement fee within the unincorporated territory of Nevada County, will be levied for this development and will be based on the latest fee schedule adopted by the Board of Supervisors. (Note: Class of Use = 5; Zone = 5)

**EH 4** Sewage disposal from any facility on the project site shall be in compliance with Nevada County Land Use and Development Code, Chapter X, and any subsequent revisions or amendments pertaining to the disposal of sewage in Nevada County.

**MM 4.2.1** Prior to the construction of water treatment improvements to the treatment pond, the operator shall conduct a geotechnical evaluation of the pond and earthen dam structure. This evaluation should include (but not be limited to) the following:

Testing using the hollow stem-auger drilling method to bore test holes through the containment dam and into underlying materials.

A slope stability study of the containment structure based upon an evaluation of the drilled soil samples, their condition, and encountered ground water conditions within the earthen structure;

A determination of the dam's existing factor of safety under normal conditions and during a seismic event.

Recommendations for remedial measures, if necessary, to ensure the stability and integrity of the structure for the life of the project. Such measures, if found to be necessary, may include re-compaction, stabilization with additional engineered material, or excavation and caulking of the existing structure. Necessary remedial measures shall be completed concurrent with construction of treatment facilities.

**MM 4.2.2** Commensurate with site grading and improvement activities, the following measures shall be taken to help prevent the loss of soil within the construction area around the shaft:

Regular spraying of water on exposed soils during the dry season from a hose or water truck to prevent the generation of dust.

Construct a brow ditch above (up-gradient) from the construction area to divert the overland flow of rainfall around construction activities.

Place straw bails below the construction site (down-gradient) to help prevent discharge of muddy runoff.

**MM 4.5.1** Prior to approval of a building permit for on-site improvements, the operator shall obtain from NID any necessary permits, approvals, will-serve letters, or agreements required for the extension of treated water to areas of the site not currently served.

**MM 4.5.2** Prior to the issuance of building permits for on-site structures, the operator shall submit detailed wastewater treatment plans to the County of Nevada Department of Environmental Health for review and approval. Prior to finalizing plans, operator shall work with the Department to determine site-specific soil/percolation conditions and optimum facility locations. All wastewater disposal permitting will be conducted through the Department of Environmental Health.

**MM 4.5.3** The operator shall coordinate with PG&E staff to assess the technical requirements for utilizing existing primary lines. This process, although at the operator's discretion, should begin immediately considering that all electrical equipment must be in place prior to dewatering. Operator will incur the costs of connections and other equipment, such as on-site transformers.

**MM 4.5.5** Concurrent with site preparation activities, all access and service roads shall be made available for use by all emergency response units, including fire suppression, medical aid, and law enforcement.

**MM 4.5.6** Concurrent with site preparation activities, the operator shall provide signage that will make all project entries and on-site buildings easily identifiable by emergency service providers.

**MM 4.5.9** Prior to approval of grading permits for site improvements, the operator shall designate an area of the project site to be used as a helispot (for use in medical emergencies only) for County review and approval. This area shall be cleared and void of all vegetation and loose gravel materials.

**MM 4.6.1** Concurrent with final site plans for the project, the underground powder magazine shall be located in accordance with the American Table of Distance for Storage of Explosives. All use and transport of explosives will conform to applicable federal, State and local regulations, requirements, and specifications.

**MM 4.6.2** Concurrent with project operations, all activities relative to site preparation, dewatering, shaft rehabilitation and mineral exploration shall be conducted in conformance with MSHA and CALOSHA regulations.

**MM 4.6.4** Prior to commencement of dewatering, the operator shall establish a bond for the removal and disposal of the precipitate sludge.

NOTE: At the completion of the dewatering and exploration phase, the operator shall contract for this task if necessary. The material (if determined to be hazardous via MM 4.6.5) shall be removed and transported by a certified hazardous materials hauler and disposed of in a pre-approved facility licensed by the State.

**MM 4.8.1** During site construction, the operator shall utilize the following dust control measures:

Water sprays to control dust during demolition, loading and unloading activities;

Suspend dust-producing activities during periods of high winds when dust control measures are unable to avoid visible dust plumes;

During the dry season (May-October) provide equipment and staffing for watering of unpaved haul roads, areas being graded and equipment/vehicle parking areas at least twice daily;

Daily removal of mud and dirt carried out from the site to adjacent paved roads;

Limit the speed of equipment and vehicles to 15 miles per hour while traveling on unpaved surfaces on the site; and

Earthen or other materials which may become entrained in ambient air will be sprayed or tarped as necessary to prevent fugitive emissions while in transport to or from the site.

**MM 4.8.2** Concurrent with site construction operations, parking areas and access roads on-site shall be paved, graveled or treated with a dust palliative to control fugitive dust.

✓**MM 4.9.1** Unless weather conditions (which may result in an impact upon the public health or safety) require early morning or late night construction activities, the operator shall limit site surface construction activities to daytime hours, Monday through Friday (7 a.m. to 6 p.m.).

✓**MM 4.9.2** During initial site construction (and throughout the life of the project), the operator shall ensure that all equipment utilizing internal combustion engines shall be properly maintained and fitted with mufflers in accordance with the manufacturers recommendations.

**MM 4.10.1** Prior to the construction of any outfall facilities within the stream banks of South Fork Wolf Creek, the operator shall obtain an Army Corps permit under Section 404 of the Clean Water Act as required. The operator will be required to submit all information required for such a permit, and shall be subject to all mitigation requirements set forth by the Corps.

**MM 4.10.2** Prior to the construction of any outfall facilities within the stream banks of South Fork Wolf Creek, the operator shall obtain a Streambed Alteration Agreement under Sections 1600-1603 of the California Fish a and Game Code. The operator will be required to submit all information needed for such a permit, and shall be subject to all conditions (if any) set forth by the Department of Fish and Game (DFG).

**MM 4.11.1** Concurrent with final site planning and site improvement activities, disturbance to the Union Hill Mine, prospects landscape area and narrow gauge railroad bed shall be avoided by design and left intact. If, by change in design or plan, it is determined that the project will affect one or more of these sites, a qualified historical archaeologist shall be required to reevaluate the sites(s), determine the effect(s), and suggest appropriate measures to mitigate the impacts identified.

**MM 4.11.2** Should cultural or historic resources be uncovered in the course of grading operations, all work in the immediate vicinity of the uncovered material shall be halted until a qualified archaeologist can evaluate the finds and propose suitable recommendations for further action.

**MM 4.11.3** Should human remains be discovered, work must stop immediately and the county coroner must be contacted, as required by State law. If the remains are Native American, then the coroner will notify the Native American Heritage Commission.

**MM 4.11.4** Should historic mining artifacts be encountered and recovered concurrent with dewatering and exploration activities, such artifacts will undergo an evaluation to determine the material's significance. Such an evaluation will be conducted by a qualified archaeologist.

**MM 4.12.1** Concurrent with project implementation, the operator will use the minimum number of light sources and minimum wattage necessary to provide a safe working environment and security at the site. All building permits shall note the locations of the exterior light sources.

**MM 4.12.2** Concurrent with project implementation, the operator shall ensure that light sources will be mounted at the lowest feasible height in order to minimize the line of sight from surrounding properties.

**MM 4.12.3** Concurrent with project implementation, the operator shall locate and shield light sources so as to minimize the spill of light into unwanted areas. The operator shall utilize cut-off lenses, baffles or other methods to control the focus of the light sources, specifically protecting the adjacent residential areas.

**IV. OFF-SITE PREPARATION**

**MM 4.4.1** Prior to dewatering, the operator shall conduct an engineering study to quantify the ultimate volume capacities of downstream public and private drainage facilities. Once facility capacities are known and quantified, the operator shall:

Reduce or cease outflow into South Fork Wolf Creek during storm events to the point where the combined natural flow and discharge flow do not exceed 75% capacity of downstream drainage facilities (75% of capacity allows for a storm buffer, so that the creekshed can "bleed", or drain after discharge is throttled back). This option will require accurate monitoring of downstream volumes in order to make appropriate outflow adjustments. Monitoring of storm events will require measuring precipitation with a rain gauge to determine the amount of precipitation entering the drainage basin, monitoring water volume at several downstream locations, and visually monitoring for stream bank erosion along the length of the South Fork below the project site. Monitoring of volume will occur hourly once facility capacities reach 50%. The operator shall be responsible for parcel-specific erosion damage, if such damage is shown by the third-party consultant that mine discharge was responsible.

**DOT 3** A copy of the comprehensive hydrological analysis (required in MM 4.4.1 above) shall be submitted to the Nevada County Department of Transportation upon completion of the study. A fee based on the latest adopted hourly rate will be charged for the actual time spent reviewing the analysis.

## V. PRE-DEWATERING WATER SUPPLY

Monitoring Program, and Property Notices

**MM 4.3.1** As mitigation for the potential well impacts, the project will require a monitoring program to establish baseline data on local wells. As the first step in this process, the operator (or consultant acceptable to the County) shall locate and collect survey data for any remaining wells within the identified study area which have not yet been logged and assigned a risk category. To identify such wells and their owners, the operator shall send a notification letter/questionnaire to the owner of each parcel within the study area to ensure 100% coverage. This notification letter/questionnaire will serve to accomplish the following:

a) To identify any new or previously unknown wells within the study area;

b) To inform property owners (with and without wells) as to the purpose of the data collection, and that the data may later be used to determine if a well is impacted;

c) To provide an informational update to well owners currently participating in the operator-sponsored well monitoring program;

d) To request permission from un-categorized well owners to allow the operator or County-approved professional to collect specific well data needed to determine the well's risk group;

e) To solicit well owner participation in the 12-month baseline monitoring program;

f) To inform well owners that specific well characteristics and monitoring data is very helpful for early identification of impacts .

**MM 4.3.2** Based upon the authorizations received and additional well data collected, any new data shall be applied to the County's model of risk assessment and a risk category determined for that well. Once a risk category is determined and monitoring is allowed by a well owner, that well will be considered "in the monitoring program".

**MM 4.3.3** At least 12 months prior to the commencement of dewatering, the operator shall be responsible for establishing and implementing a ground water monitoring program which shall be approved by the County targeted for all wells within the study area. This 12 month period will establish baseline well data for the four seasons of the year. The monitoring effort shall be conducted by a qualified professional acceptable to the County, and will consist of the following:

a) Baseline monitoring of all identified wells will occur monthly, and will consist of measuring the static water level of each well. The 12 month monitoring time line will begin only after the notification letter/questionnaire has been sent and personal contact with the owners of all the high and moderate risk wells has been made or attempted by the operator, as described below. After or during this initial contact with well owners, an initial monitoring date and regular monitoring schedule will be established. This first monitoring date will establish the beginning of the 12 month time line for baseline data collection. Well data previously collected by the operator may be considered for inclusion into the baseline data.

b) Prior to the first monitoring date described above, the operator shall conduct follow-up contact efforts, either in person or by telephone, to each well owner to further ensure that each owner has been given ample opportunity to participate in the monitoring program. Property owners shall be provided the results of all monitoring in a timely fashion with direction to review the results to insure that they coincide with the property owner's experience. In the event of any disagreement, the operator shall be required to retest the well.

c) In order assess the rate of owner participation, the operator shall report back to the County prior to this first monitoring date, to evaluate the effectiveness of the letter/questionnaire and follow-up contact efforts. A qualified professional acceptable to the County shall be consulted (if necessary) to determine that the rate of well owner participation is sufficient to establish baseline data.

d) A second follow-up contact effort shall be conducted for the remaining wells within the Western Study Group. This follow-up effort is intended to maximize participation in the monitoring program. Any new participants from the Western Study Group resulting from this follow-up effort shall be identified and shall begin participating in the program by the second monthly monitoring date. The rate of well owner participation will also be reported to a qualified professional acceptable to the County to determine that the rate of owner participation within the Western Study Group is sufficient for establishing baseline data.

e) A third follow-up contact effort shall be conducted for the remaining wells within the entire Study Area. This follow-up effort is intended to maximize total participation in the monitoring program. Any new participants within the Study Area resulting from this follow-up shall be identified and shall be included in the program by the third monthly monitoring date. The rate of well owner participation will also be reported to a qualified professional acceptable to the County to determine that the rate of participation within the remaining areas is sufficient for establishing baseline data.

Third Party Consultant

**MM 4.3.8** Prior to the commencement of the dewatering process, a qualified third party consultant selected mutually by the County, the Community Liaison, and the operator, shall be retained (at operator's expense) to interpret the ground water monitoring results on behalf of all parties. If the three parties cannot agree on the selection of the third party consultant, the County, at its sole discretion, shall select the third party consultant. In any event, the operator shall fund a qualified third party consultant for the life of the project.

The duties of the third-party consultant are to independently interpret data, to conduct well impact analysis, to review the baseline stream conditions developed in the hydrological study required by MM 4.4.1 and DOT 3, to determine when an adverse impact has occurred, to determine size and locations of temporary systems, and to determine the difference between NID and electricity costs, as outlined in subsequent measures. Other related duties may be added as conditions and issues arise over the live of the project.

Design, Engineering, Annexation, and Contract

**MM 4.3.4** Prior to the commencement of mine dewatering, the operator shall prepare complete engineering and design plans, as well as an installation schedule, all of which shall be submitted to and accepted by Nevada Irrigation District (NID) for water main trunk line infrastructure (including individual laterals for all High and Moderate risk wells) to all properties within the Study Area, with a permanent water source to be supplied through NID facilities. Such plans will be provided for all parcels.

**PD 12** Prior to the commencement of mine dewatering, the operator shall conduct a "windshield" survey of all parcels within the Study Area to determine potential locations for temporary water storage tanks. For all parcels with High and Moderate risk wells and those parcels identified during this survey to pose siting difficulties, plans for the location and size of temporary water systems shall be completed and submitted to the County. Upon submittal, the third party consultant shall review those plans with those parcel owners to ensure the determined locations are agreeable. Any disagreement shall be settled by the third party consultant.

**MM 4.3.5** Prior to commencement of dewatering, the operator shall complete the following:

a) Successfully annex any parcel within the Study Area with a well to NID which is currently outside of NID's district boundaries; or enter into a private water supply agreement with the owner of such a parcel until annexation is complete. The operator shall be responsible for any and all costs associated with NID annexation.

b) Enter into a conveyance agreement with NID to allow for infrastructure construction;

c) Enter into an agreement with an engineering company, acceptable to NID, to supervise and direct a contractor to install the water trunk lines and individual residence connections. The County shall be notified of the contractor selected; and

d) Confirm water capacity of NID systems and water availability per NID requirements as a component of any conveyance agreement.

e) Obtain and document all necessary permits and approvals, and identify all right-of-way, variances, easements, and agreements necessary to guarantee installation and delivery of water service from NID to any and all residences in the study area.

**MM 4.3.6** Prior to dewatering, the operator shall post financial assurances in a form acceptable to and to be approved of by the Nevada County Counsel and consisting of either a performance and security bond, a letter of credit, cash, certificate of deposit with a recognized financial institution, or a combination thereof, in an amount that will cover 100% of the costs, as determined by a registered civil engineer and as accepted by the County, of providing for permanent water sources to all of the properties within the study area defined in the Final EIR. At least $100,000 of this amount shall be available for immediate use of the County to address emergency water supply needs should the operator not respond to such problems within the 24 hour period designated in MM 4.3.9. The financial security shall contain a provision (to be approved by County Counsel) that creates, in addition to the rights of the County, an independent right of action against the security deposit or bond in favor of any of the owners of the private property whose water supply may be deemed to be adversely impacted by the dewatering of the mine and obligates the operator, the surety/bonding company, or party or financial institution holding the cash deposit to honor any demand by such impacted private property owner, only in the event of non-action by the County for a period of 45 days in response to any such demand for County action by a private property owner. Non-action by the County as used herein is defined as: 1) The County failing to provide written notice to the operator demanding provision of a permanent water source to any affected property when required by conditions of approval; or 2) The County failing to continue for a successive period of 45 days to direct the operator to remedy the situation or to take initiate any claim against the financial assurances when no continuing progress is being made toward provision of a permanent water source until it is provided. The County shall maintain a log of all such contacts from which the 45 successive day period would run. Any independent right exercised hereunder would be in lieu of, rather than in addition to, any right of the County to make a claim against the financial assurance for the affected property concerned.

The amount of the financial security shall include all of the following:

a) Installation of all necessary infrastructure and any necessary improvement to the existing system water supply system, based upon the accepted final design plans (MM 4.3.4).

b) Estimated costs for the installation of the individual laterals to each residence within the study area.

c) Construction costs for the moderate to high risk groups (based upon prevailing wage rates) to perform all the work associated with a) and b) above. All other risk groups shall use construction costs at a non-prevailing wage rate.

d) Costs of providing individual meters to each residence within the study area.

e) NID system capacity charges for each residence.

f) Contingency for administrative costs.

Any lapse or failure to provide or maintain the security deposit or bonds shall result in the immediate suspension of the right to continue any of the use of the property as authorized under the use permit but shall not invalidate the operator's, security's or depository institution's obligation under the security provisions as required under this Mitigation Measure.

In the event that the operator is required to provide a permanent water supply to any of the private property owners under the terms of this use permit, in lieu of providing a permanent water supply the operator may, and subject to the separate and independent concurrence of the private property owner whose well or ground water is deemed adversely affected, purchase any of the affected private properties at a fair market value. Nothing in this permit shall de deemed to require the private property owners to sell their property.

**PD 13** In the event the operator is required to provide a permanent water supply to any property or area pursuant to the conditions of this permit, and in the event the operator has successfully and satisfactorily provided the water source, the costs associated with that task may be subtracted from the total financial assurance amount required by MM 4.3.6 above.

Within 24 months, but not less than 6 months from completely dewatering the workings (below the 3,280 foot level), the financial assurance amount may be reviewed by the County (through a public hearing) for the purposes of reconsidering the required amount. If evidence can be provided supporting the fact that the risks have either been reduced or no longer exist, the percentage amount required by MM4.3.6 may be altered. The intent of this provision is to provide an opportunity to reconsider the necessary financial assurance amount. It may be possible to reduce the required amount at this hearing if it is demonstrated that the risks no longer warrant 100% of the total costs required by MM 4.3.6 above. In no case however, will the County consider releasing the entire requirement for the financial assurance.

**PD 14** Prior to the commencement of the dewatering, this Use Permit shall be reviewed by the Nevada County Planning Department staff and the results of the review shall be reported to the Planning Commission and the Community Liaison. The purpose of this review will be to evaluate the operator's compliance with the permit conditions of approval and the success of the established performance standards.

## VI. ON-GOING WATER SUPPLY

Monitoring Program

**MM 4.3.7** Throughout the dewatering process, the operator shall continue the ground water monitoring program, and reports shall be provided to the County as follows:

Weekly intervals for wells within the high and moderate risk groups;

Twice-monthly intervals for wells in the low risk group; and

Monthly intervals for wells in the very low risk group.

Twelve months following the dewatering to the 3,280 level, monitoring will be required at quarterly intervals for the life of the project and until the mine refills (to the pre-project level) with water.

**PD 15** Should an impact occur to any residence, the monitoring sequence for the adjacent homes (from the impacted well) shall increase to a weekly interval.

Third Party Consultant

**MM 4.3.12** All well owners within the study area will be notified by the third-party consultant if other wells in the study area are showing an impact or change in yield. This condition will allow another chance for non-participating well owners to join the monitoring program, and will generally serve to inform the owner of the surrounding conditions of nearby properties.

**MM 4.3.16** All parcels within the study area that are not yet developed shall be connected to the permanent water system at the operator's expense if the well owner can establish to the third party consultant and the County that mine dewatering has adversely affected the property's ability to support a well. The operator shall make notice to properties currently without wells that the burden remains with the well owner to determine the source of impact to any future well.

Temporary Water Source and Compensation

**EH 5** In the event that any parcel within the study areas is adversely affected by the mine dewatering, potable water service shall be provided to the properties in accordance with MM 4.3.9 and MM 4.3.9A below. All water provided (on a temporary or permanent basis) for service to habitable structures shall be potable and from an approved source, in compliance with Nevada County Land Use and Development Code, Chapter VI.

**MM 4.3.9** Should any well be impacted a temporary water source shall be immediately provided to the affected well owner prior to the installation of a permanent water source. The temporary water source shall be in place within and operational 24 hours after telephonic notification to the third party consultant. The operator shall be required to provide a phone number to all property owners were such notification can be accepted at all times.

Where feasible and subject to the permission of any affected property owners, any temporary water source may include the installation of a water tank on or near the affected property. In some instances, a single tank may serve more than one affected property

Any temporary water supply needed as a result of mine dewatering will be of sufficient capacity and pressure so that the daily lifestyles and average water usage of individual families will not be affected.

Any temporary water supply needed as a result of mine dewatering will be in place only as long as necessary to hook up the residence to the permanent water source.

Temporary water systems will be located, configured and sized by the third-party consultant with the concurrence of the property owner (identified within MM 4.3.8). Property owners must be immediately informed of the identified impact, and permission must be received prior to temporary system installation.

**PD 16** In the event the temporary system cannot be installed within 24 hours (as outlined in the first paragraph of MM 4.3.9), a fine in the amount of $500.00 per day (paid weekly) shall be paid to the County starting 24 hours after telephonic notification up until such time that the temporary water system is installed and operating. The County shall deposit the fine(s) into a trust account and will have the choice of utilizing the fines for either permit monitoring costs or property owner(s) compensation.

**MM 4.3.9A** Should an impact occur in the form of an unexpected and sudden failure of a well, the affected resident shall be provided an immediate source of water supply for the period of time prior to temporary system installation (maximum 24 hours). This immediate supply may include water delivered by truck, bottled water, alternative lodgings (or cash equivalent), at the property owner's discretion, until the temporary supply is established. The costs of all immediate and temporary water supplies and storage facilities will remain the burden of the operator. Furthermore, all water carriers contracted by the operator shall be properly insured and licensed, and certified to carry and deliver potable water as required by law.

**MM 4.3.9B** Upon removal of the temporary system or installation of the permanent system, the operator shall either restore the property to its original state, including the repair of any damage or scarring caused by tank installation (and/or hook-up) or water truck delivery, or, the property owner will be financially compensated, at the property owner's discretion, for such damages. If financially compensated, a mutual agreement must be reached regarding the existing condition of the property prior to tank installation.

**MM 4.3.13** Any well owner impacted by the project who requires NID service will be compensated by the project applicant for any additional costs for monthly water service. The operator shall compensate for the difference between current monthly rates (as determined by the third party consultant), and NID rates. This compensation shall continue for as long as the owner's well is impacted by the project.

**MM 4.3.14** In cases where an affected property currently utilizes NID service and well water, the operator shall compensate for the cost of additional NID water usage caused by the unavailability of supplemental well water. Water usage will be determined by the third-party consultant based upon historic water usage patterns.

Permanent Water Source

**MM 4.3.10** Installation of a permanent water source shall be initiated immediately after the well(s) have displayed a significant impact (partial or complete dewatering). Such a response will be determined as significant on a case by case basis by the third party consultant identified in MM 4.3.8. Temporary water systems shall be removed once permanent service is in place and operational. The costs associated with engineering and installing the permanent system will be the responsibility of the operator.

On the first day of impact identification to an individual residence, the operator shall coordinate with NID to finalize the service agreement application and pay the necessary hook-up fees for the affected residence. The process and payments will be completed in the quickest manner afforded by NID staff. The contractor hired to make the final connection shall be available, at the operator's expense, immediately upon NID's meter installation.

**PD 17** In the event the operator becomes responsible for providing a permanent water source to any residence (as outlined in the above mitigation measure, MM 4.3.10), the operator shall be held to an acceptable time frame for completing the project. Said time frame will be mutually agreed upon by the County, the operator, the third party consultant, and the community liaison. Should the operator fail to complete the project within this time frame, a penalty ($1,000 per week) will be paid to the County up until such time as NID water service is hooked up and operational to all applicable residences. This payment is a penalty only and is not payment in lieu of a permanent water system or supply. The County shall deposit the fine(s) into a trust account and will have the choice of utilizing the fines for either permit monitoring costs or property owner(s) compensation.

## VII. EXPLORATION PHASE

Miscellaneous Operations

**EH 6** All waste generated shall be classified by Waste Determination Methods pursuant to the California Health and Safety Code, Chapter 6.5 and the California Code of Regulations, Title 22, Sections 66261.2, 66261.3, 66261.20, and all other applicable regulations.

**PD 18** The hours of operation for the miscellaneous surface activities associated with this phase of the project shall be limited to 8:00 a.m. to 5:00 p.m., Monday through Friday. This does not apply to the following activities as long as such activities do not result in a violation of any existing County Standards, including but not restricted to, noise impacts:

a. activities associated with dewatering;
b. activities associated with water treatment;
c. indoor equipment maintenance (where the entire activities are enclosed);
d. activities associated with project management;
e. activities associated with the logging of rock core samples;
f. response to life- or property-threatening emergencies; and
g. underground activities.

However. it is recognized that the operator shall attempt to minimize incidental noise impacts during all operations.

**MM 4.4.3** In the event that discharge quantities exceed those proposed within the Project Description (6 cfs), the operator shall notify the Regional Board, NCDEH, NID, and the Planning Department immediately to implement a remedial action program or other requirements as set forth by the Board.

**MM 4.4.4** In the event that the quality of discharged water exceeds effluent limitations as set forth by Order 94-005 or the individual order for this project, the operator shall take action including but not limited to temporary cessation, reduction, or treatment of the discharge to acceptable levels. The operator shall also immediately notify the Regional Board, NCDEH, NID, and the Planning Department and develop/submit a remedial action program for Regional Board approval and implementation.

**MM 4.5.4** Concurrent with project operation, the operator will adopt and adhere to the relevant fire prevention and hazardous material response methods as defined in the County's Fire Protection Ordinance, County Hazardous Material Ordinance and other established regulations regarding emergency response.

**MM 4.6.3** Prior to any on-site disposal of timber wastes, the operator must demonstrate, through analytical testing of the timbers, that the wood is untreated and safe. This analysis (waste determination and classification) will be demonstrated to the satisfaction of the County of Nevada Department of Environmental Health. The operator shall be responsible for the hauling and disposal of the material at an appropriate disposal facility, if necessary, once a waste determination is made.

**MM 4.7.1** For the duration of the project, haulage vehicles moving equipment and/or materials to and from the site will be restricted to Brunswick Road and that section of East Bennett Road between Brunswick and Millsite Road (E. Bennett entrance). The operator shall post signage on site exit points alerting drivers to designated haul routes.

**MM 4.9.2** Throughout the life of the project, the operator shall ensure that all equipment utilizing internal combustion engines shall be properly maintained and fitted with mufflers in accordance with the manufacturers recommendations.

**MM 4.11.2** Should cultural or historic resources be uncovered in the course of grading operations, all work in the immediate vicinity of the uncovered material shall be halted until a qualified archaeologist can evaluate the finds and propose suitable recommendations for further action.

**MM 4.11.3** Should human remains be discovered, work must stop immediately and the county coroner must be contacted, as required by State law. If the remains are Native American, then the coroner will notify the Native American Heritage Commission.

**MM 4.11.4** Should historic mining artifacts be encountered and recovered concurrent with dewatering and exploration activities, such artifacts will undergo an evaluation to determine the material's significance. Such an evaluation will be conducted by a qualified archaeologist.

**MM 4.12.1** Concurrent with project implementation, the operator will use the minimum number of light sources and minimum wattage necessary to provide a safe working environment and security at the site.

Underground Operations

**MM 4.3.7** Throughout the dewatering process, the operator shall continue the ground water monitoring program, and reports shall be provided to the County as follows:

Weekly intervals for wells within the high and moderate risk groups;

Twice-monthly intervals for wells in the low risk group; and

Monthly intervals for wells in the very low risk group.

Twelve months following the dewatering to the 3,280 level, monitoring will be required at quarterly intervals for the life of the project and until the mine refills with water.

**MM 4.3.15** Should water be encountered within any core drill hole during the exploration process, that drill hole shall be immediately sealed or plugged upon removal of the core material to prevent the continued flow of water. The operator shall then notify the County and the Community Liaison of said encounter.

**MM 4.4.7** During implementation of the shaft rehabilitation, timbers pressure-treated with substances which may leach toxins into future mine water shall not be used. The project applicant shall indicate the type and amount of replacement timber to the County prior to its use.

**MM 4.5.7** Prior to the commencement of project activities which require the work of personnel below ground, the project applicant shall coordinate with other local mining operations and local fire protection districts to establish and maintain a cooperative mine rescue station, per the requirements of Title 8, Article 30 of the California Code of Regulations.

**MM 4.5.8** Prior to the commencement project activities which require the work of personnel below ground, the operator shall contact the Mining and Tunneling Unit of the Division of Occupational Safety and Health or other certified entity to schedule and receive specialized safety and rescue training pursuant to the provisions of Title 8. The operator shall include and invite appropriate OHFPD and NCCFPD personnel in any scheduled training sessions. The Districts and the operator shall decide cooperatively upon the appropriate fire protection district personnel to be trained.

**MM 4.6.1** Concurrent with final site plans for the project, the underground powder magazine shall be located in accordance with the American Table of Distance for Storage of Explosives. All use and transport of explosives will conform to applicable federal, State and local regulations, requirements, and specifications.

**MM 4.6.2** Concurrent with project operations, all activities relative to site preparation, dewatering, shaft rehabilitation and mineral exploration shall be conducted in conformance with MSHA and CALOSHA regulations.

**MM 4.9.3** Concurrent with dewatering operations, the operator shall retain a consultant acceptable to the County to conduct a noise level measurement survey with the project in normal operation to ensure compliance with Nevada County noise standards. If it is determined that project noise emissions are excessive, noise control devices shall be incorporated into the project design to reduce noise impacts to a less-than-significant level.

**VIII. POST PROJECT**

**MM 4.6.5** At the completion of dewatering and exploration, the removal of waste sludge will be accomplished under proper permitting through the Department of Toxic Substances Control (DTSC), the Nevada County Department of Environmental Health (NCDEH) or other responsible agency. Prior to removal, the material will be analyzed (to the satisfaction of the RWQCB and NCDEH) to determine if it exhibits characteristics of hazardous waste. Based upon the analytical results and prior to off-site removal, the operator will explore the possibility of on-site (stope) disposal.

**MM 4.6.6** Prior to pond sediment removal, the operator shall apply for and appropriate any necessary hazardous material, hazardous waste, or other permits or plans as required through the authority of the NCDEH.

**PD 19** Upon completion of the project, the New Brunswick Shaft shall be safely secured to prevent further mine entry. If prior to project completion, a new application is sought to reopen the mine, this condition may be sustained until a determination is made on that application.

The applicant/operator is also responsible for compliance with applicable State Laws and County Ordinances including Article 32 of the Land Use and Development Code. In order to maintain a valid permit, Article 32 requires that you commence your project no later than January 25, 1998, and complete the dewatering and exploration and all post project activities (Section VIII of this Permit) no later than January 25, 2000. If you will not have commenced on-site construction activities (Section III of this Permit) prior to that starting date, you may apply for an extension of time **prior** to January 25, 1998. If you do not commence your project pursuant to Section L-II 32.1.A of the Nevada County Land Use Code by the above-referenced dates or do not request in writing an extension of time for those dates, the permit shall become null and void.

Pursuant to the requirements of the Land Use and Development Code, you are hereby notified that this permit is not valid until the expiration of ten (10) days from the date of the Planning Commission action. If the granting of the permit is appealed or submitted to the Board of Supervisors for final action, the effective date is stayed until final action by said Board. Any appeal must be submitted on the proper form which is available from the Clerk to the Board of Supervisors, Eric Rood Administrative Center, Nevada City, California 95959 (Deadline for appeal: February 5, 1996, at 5:00 p.m.).

You are advised not to commence any work on this permit until the ten-day period expires and to check with the Planning Department to determine if any appeal has been submitted.

Should you have any questions, please contact the project planner, Tod Herman, at (916) 265-1257.

**NEVADA COUNTY PLANNING COMMISSION**
**STAFF REPORT**

**APPLICANT:** Emperor Gold (U.S.) Corporation
**SUPERVISORIAL DISTRICT:** III
**HEARING DATE:** January 25, 1996
**FILE #:** U94-017

**PROJECT:** **U94-017.** Use permit application of ***Emperor Gold (U.S.) Corporation*** for the dewatering of the existing underground workings of the Idaho Maryland Gold Mine, and the subsequent underground exploration and sampling of those workings. Specifically, the dewatering activities will necessitate the clearing of the entire underground mine workings to a depth 3,280 feet below the shaft collar. Approximately 6 cfs (12 acre-feet/day) of water will be pumped into the existing 40 acre-foot pond on site. The estimated volume of water within the workings is 2,500 acre-feet, which will take approximately 7 months to dewater. Once the mine is dewatered, the pumping will be maintained (at an estimated average of 1.1 cfs to 2.7 cfs) in order to allow the exploration activities to continue. The retention pond water will be aerated to allow excess iron, manganese, and arsenic to precipitate. From that point, the water will either be discharged in the South Fork of Wolf Creek, or a portion may be diverted for domestic uses. The exploration activities will be conducted within the existing underground workings (the sampling will occur off-site). Diamond drilling and blasting will be conducted at or below 2,000 feet beneath the surface, and channel samples will be collected from selected areas. Bulk samples of gold-quartz mineralized rock will be shipped off-site in containers for further testing. Bulk sample size could range from 0.25 to 10 tons, with the maximum estimated tonnage of bulk samples at 70 tons. All waste rock from the exploration activities will be stored underground in the abandoned stopes. Most of the on-site exploration activities will be completed over a 20 month period. However, the New Brunswick shaft could be kept open for up to 5 years in order to continue economic evaluation. If the exploration and sampling results are encouraging to the operator, an additional permit may be sought to formally re-open the mine for production. No mining is proposed with this application.

**LOCATION:** The Idaho Maryland Mine project location is described in two formats: 1) where the surface activities (office, underground mine access, and the dewatering process) will be located; and 2) the extent of the underground mineral rights. Emperor Gold controls the surface rights to 117 acres of contiguous property located southwest of the intersection of Brunswick Road and East Bennett Road. This includes the 80 acre Bohemia Mill site. The Idaho Maryland subsurface mineral rights includes 2,750 contiguous acres which irregularly extends into portions of Sections 23, 24, 25, 26, and 36 of Township 16 North, Range 8 East, and Sections 19, 29, 30, and 31 of Township 16 North, Range 9 East.

Emperor Gold (U.S.) Corporation

**RECOMMENDED ACTIONS:**

Use Permit: Approve subject to staff's recommended Mitigation Measures and Conditions of Approval.

---

**ATTACHMENTS:**

1. Project Findings of Fact
2. Use Permit Mitigation Measures and Conditions of Approval
3. Mitigation Monitoring Program

---

**BACKGROUND**

The last association the Planning Commission had with this project was the certification of the Final EIR in October. That action was appealed to the Board of Supervisors who considered the appeal last December. After the close of the public hearing, the Board determined the Final EIR was adequate - with the addition of a proposed Water Supply Plan the applicant has prepared - and upheld your Commission's determination.

Outside of the public hearing process, there have been a number of meetings involving Planning Department staff, County Counsel, members of the Bohemia Area Residents Committee (BARC), and the applicant. The purpose of these meetings has been to negotiate the conditions of approval (and the mitigation measures) through agreement with various parties. In a few cases our recommendation does not represent a consensus since there wasn't agreement on some issues. Staff will highlight those in our presentation.

**PROJECT PROPOSAL**

The Planning Commission will be familiar with the proposed project through its review of the specific project description section within the environmental impact report (Section 2.0 of the Draft EIR, and as revised in Section 5 - 2.0 of the Final EIR).

Essentially, the project will remove the water from the underground workings of the Idaho Maryland Mine. During this process of dewatering, the main shaft (New Brunswick Shaft) will be rehabilitated as necessary. The applicants propose to perform some exploration drilling and sampling to determine the extent of the resources. The sampling activities will occur off site at some other location. When the mine is empty, the condition of the workings will also be evaluated. The results of these activities will determine whether it will be feasible to reopen the mine at some future date, under a new use permit.

**STAFF COMMENT / USE PERMIT**

The last step in this process is to consider the use permit for the project. Throughout the various hearings on the EIR, a few issues have been deferred to this point. Also, ingrained within the use permit is the Remedial Water Supply Plan, something identified in the EIR as critical to an approval of this project. This is the program for insuring that no home will be left without water as a result of this project. And, coupled with the water supply plan is the need for a financial assurance to guarantee the plan will be carried out if ever needed. Last, but not least, the permit process also involves the adoption of a Mitigation Monitoring Program. Each of these items will be discussed below.

The Planning Commission should take note that the conditions of approval for this use permit are divided into eight separate categories - each representing an identifiable step in the project. These categories (or steps) are as follows: General (applicable throughout the project), Subsequent Permit(s) Acquisition, On-Site Preparation, Off-Site Preparation, Pre-Dewatering Water Supply, On-Going Water Supply, Exploration Phase (on-going project), and Post Project. To make the conditions fit neatly into these categories, the numbering format has been modified somewhat. This will make clear which conditions (and mitigation measures) are applicable to each step in the project.

**Pre-project Infrastructure**

Much of the focus on this project has been aimed at the potential impacts associated with the dewatering. That "potential" has resulted in a series of debates as to whether the risk warrants the installation of some of the infrastructure before the dewatering activities begin. On one side of the debate, having the main infrastructure in place (only for the high and moderate risk wells) before the dewatering would reduce the overall time to bring permanent water to those impacted residences. On the other side, everyone will be covered by the financial assurance (adequate to cover all the costs to hook homes up to permanent water) anyway and if the impact never occurs, the money spent on the infrastructure would be unnecessarily spent.

This critical debate has not yet been decided by the County, although it has been raised many times throughout the EIR process (including the appeal). The County's position has been that this will be an issue for the use permit to decide. In anticipation of this opportunity, staff has attempted to negotiate a resolution to this issue.

The applicant had shown a willingness to consider the partial installation of the infrastructure (defined as the main trunk line down E. Bennett Road serving those parcels in the high and

moderate risk groups) on the condition that a substantial "portion" of the financial assurance be released after the risk has been "substantially diminished" (defined as approximately six to twelve months after the entire workings have been dewatered). Although there are merits to this argument, staff has chosen to err on the conservative side and - at this time - recommend not to relinquish the financial assurances based, solely on the theory that all of the impacts will be known soon after the mine working have been emptied.

Because of this conservative approach, staff also cannot support the requirement for the pre-dewatering infrastructure installation. Staff believes that having an appropriate financial assurance in place (covering those costs associated with the entire study area infrastructure installation) will ensure that if any problems do occur, a solution will be available. Granted, it may not be as quick - but it would happen. This also avoids having to second-guess the definition of the terms such like "portion" and "substantially diminished."

**Remedial Water Supply Plan**

Assuming the use permit is approved as recommended, the Remedial Water Supply Plan will be as follows:

Prior to the commencement of mine dewatering, the complete design of the water system infrastructure, easements, and individual hook-ups needed for all homes within the established study area will be completed by the operator. Those plans will then be checked and accepted by the County and NID. Additionally, the operator will secure a list of contractors who will be ready and able to carry out the installation project.

A complete monitoring program will [again] be established [or added to]. All parcels within the study area will be notified of the approved project and given additional opportunities to sign up for the program.

The County will hire a qualified independent Consultant to review/coordinate the monitoring program and evaluate the results of the monitoring. Additionally, a variety of other assignments related to water issues will be assigned to this person.

The community will establish a contact person (or liaison) who will serve both the surrounding community and the mine operator. This liaison will help to transfer information between the operation and the community.

A financial assurance will be provided to the County to cover those cost associated with the installation of the permanent water system.

The operator will secure temporary systems and keep them on site and available for an instant response to any ground water loss. Additionally, the particulars associated with the location of these systems will be established.

All of these items will be in place before any dewatering begins. When the dewatering begins, the ground water monitoring will be closely watched by the County's consultant. Then, should a well ever become impacted, the temporary system(s) can be installed and the plans for bringing in permanent water will be in place ready to give to a construction company. Additional incentives (read: fines) have also been incorporated into the recommended conditions to ensure that the operator quickly responds.

**Limits to the Plan**

In addition to how this Plan works, a question has been raised as to who is actually covered by this Plan. The question has come from a few people who live beyond the defined study area. In response to this question, staff's interpretation of General Plan Policy 17.12 is that the Remedial Water Supply Plan should cover only those who in the "expert's opinion" may be impacted. In this case, the County has hired a qualified consultant (Willdan/PMC and Sierra Pacific Groundwater Consultants) to evaluate the ground water issue.

The first step of the EIR's ground water study actually addresses this question by defining the study area. The area was defined (in Section 4.3) using both the surface and subsurface features. These include the boundaries of the local drainage basin (surface features) and the location of those fault structures containing dense, impermeable barriers (subsurface features). Using that study, the County can make a qualified decision based on factual evidence. Your Commission may recall that within this study area, all the known wells (101) were placed into one of four risk groups ranging from High to Very Low. And even though "Very Low" has been determined to be highly unlikely to be impacted, those wells are still covered under this proposal. Staff would not recommend going beyond those established boundaries at this time.

**Financial Guarantee of Permanent Water Supply**

As stated above, staff is recommending that a financial assurance be in place to cover 100% of the costs for providing permanent water to all parcels within the study area. Mitigation Measure 4.3.6 has been modified from the version in the Final EIR to provide the structure for this financial assurance.

Staff has, however, recommended (through Condition PD 13) two opportunities for this financial assurance to be reduced. The first would be if the operator ever has to provide permanent water to any area, and only after the water has been provided, those costs associated with that water project may be returned to the operator from the original financial assurance amount. Obviously, the theory being that if the area now has water, there is no longer a need for the County to hold those costs. The second opportunity is not an absolute either. Staff is recommending reevaluation of the financial assurance amount 24 months after the entire workings have been dewatered. Going back to the EIR's ground water hydrology study, the impacts (if any) should (in theory) be realized sometime after the workings have been dewatered below the fractured rock zone (approximately 330 feet). Again, as a safety measure, two years is being recommended as a conservative time to allow for those impacts to occur. If at that time those

impacts have not yet been realized, then it may be a safe bet to assume the impacts might not ever occur. Assuming that can later be proved, staff is recommending a public hearing be held in order to discuss a partial release of the financial assurance.

**Mitigation Monitoring Program**

Associated with the use permit is the Mitigation Monitoring Program, established through the EIR. The purpose of this monitoring program is to identify the timing and responsibility of each mitigation measure. Attachment #2 is a draft Mitigation Monitoring Program prepared by Willdan Associates/PMC. You will note that the measures listed in the monitoring program resemble those found in the Final EIR. The many cases, the text of the mitigation measures have been clarified - resulting in changes to the wording from those found in the Final EIR. But, in those cases, the measures remain consistent with the purpose of the original mitigation, and with who and when will be responsible for the measure. Thus, the basic program still works and can be used as a matrix for the purposes of the monitoring program.

**Other Issues**

There is general agreement on the mitigation needed to deal with issues other than water, including light and noise. Again, staff will highlight those in our presentation.

---

**ACTIONS FOR CONSIDERATION**

Staff recommends the Planning Commission take the following actions:

I. Prior to taking action on the project, review and consider the previously certified Final EIR and determine that the project is consistent with the project description.

II. Pursuant to Section 15092 of the CEQA Guidelines, review and consider making the **Environmental Findings** for this project found in Attachment #1 of this staff report.

III. Approve the Use Permit (U94-017) subject to the Mitigation Measures and Conditions of Approval found in Attachment #2 of this staff report.

IV. Also based upon the certification of the Final EIR, and the approval of the Use Permit, adopt the Mitigation Monitoring Program found in Attachment #3 for this project complete with any changes to the Mitigation Measures resulting from the public hearing.

V. Pursuant to Section L-II 31.5 of the Land Use and Development Code, upon approval of U94-017, make the **Use Permit Findings** found in Attachment #1 of this staff report.

Certified Hydrogeologist No. 96, 1995

Professional Geologist No. 5593, 1993

**Years of Experience**

31 Years

**Bruce Abelli-Amen**, owner and Principal of Baseline, is a Certified Hydrogeologist, Professional Geologist, and a CEQA project manager. He also manages hazardous materials investigations. He has experience in all phases of CEQA and NEPA projects, including a wide range of project types from small focused projects to managing large multi-disciplinary teams of specialists in the preparation of Expanded Initial Studies, Mitigated Negative Declarations, and Environmental Impact Reports and Statements. He has managed CEQA projects for landfill decommissioning, new wastewater treatment plants, mining projects, resource management plans, mixed-use developments, and major water and sewer conveyance infrastructure projects (including tunnels and pipelines).

Bruce has managed numerous on-call environmental services contracts for municipal agencies, including SF Public Works, SF Public Utilities Commission (SFPUC), Port of Oakland, Port of SF, Yolo County, City of Milpitas, Town of Windsor, and others.

He also has experience with construction management, mitigation monitoring, and permitting, which provides useful insights into the development of feasible and practical bid specifications and mitigation measures for identified significant CEQA impacts.

He has extensive experience managing hazardous materials investigations and has designed and implemented groundwater aquifer tests and remediation systems for the cleanup of contaminated shallow groundwater aquifers. He has managed numerous underground storage tank (UST) investigations and is familiar with local, state, and federal regulatory requirements for such investigations. He has supervised soil excavation, large scale bioremediation projects, and backfill operations.

## Project Experience

**Various On-Call Environmental Consulting Contracts,** Contract and Project Manager for on-call contracts with City of Berkeley, San Francisco Public utilities Commission, SF Public Works, City of Milpitas and Sonoma County Water Agency.

**SFPUC Channel Tunnel EIR**, Project Manager for preparation of comprehensive CEQA documents (detailed initial Study and focused EIR).

**KC BBQ Meat Smoker Emission Evaluation**, Project Manager in assisting City of Berkeley Attorney's Office in evaluation of air quality impacts associated with wood smoke emissions.

**Foster City Levee Improvement Project EIR**, Technical Project Manager for preparation of EIR. Prepared and/or provided review for technical sections including hydrology, geology, hazardous materials, noise, air quality, GHG, and alternatives.

**City Place EIR, Santa Clara**, Project Manager for Geology, Groundwater Hydrology and Water Quality, and Hazardous Materials sections.

**Apple Campus EIR, Cupertino**, Project Manager for Geology, Hazards, and Hydrology EIR sections.

BASELINE ENVIRONMENTAL CONSULTING

**Senior Environmental Engineer**

**Areas of Expertise**

Air Quality, GHGs, Hazardous Materials, Geology, and Hydrology

**Education**

M.S., Civil and Environmental Engineering, University of California – Davis

B.S., Environmental Science, Dickinson College

**Registration**

Professional Engineer No. 13609 (RI)

**Years of Experience**

17 Years

**Patrick Sutton** is an environmental engineer who specializes in the assessment of hazardous materials released into the environment. Mr. Sutton prepares technical reports in support of environmental review, such as Phase I/II Environmental Site Investigations, Air Quality Reports, Greenhouse Gas (GHG) Reduction Plans, and Health Risk Assessments. He has prepared numerous CEQA/NEPA evaluations for air quality, GHGs, geology, hazardous materials, and water quality related to residential, commercial, and industrial projects, as well as large infrastructure developments. His proficiency in a wide range of modeling software (AERMOD, CalEEMod, RCEM, CT-EMFAC) as well as relational databases, GIS, and graphics design allows him to thoroughly and efficiently assess and mitigate environmental concerns.

For mixed-use development projects, Mr. Sutton has prepared health risk assessments for sensitive receptors exposed to toxic air contaminants based on air dispersion modeling. He has also prepared GHG Reduction Plans to demonstrate how projects can comply with State and/or local GHG reduction goals. For large highway infrastructure improvement projects, Mr. Sutton has prepared air quality and hazardous materials technical reports in accordance with Caltrans requirements. Air quality assessments include the evaluation of criteria air pollutants, mobile source air toxics, and GHG emissions to support environmental review of the project under CEQA/NEPA and to determine conformity with the State Implementation Plan. Hazardous materials investigations include sampling and statistically analysis of aerially-deposited lead adjacent to highway corridors.

## Project Experience

**Oakland Downtown Specific Plan EIR.** Prepared a program- and project-level Air Quality and GHG Emissions analysis. Developed a mitigation measure with performance standards to ensure GHG emissions from future projects comply with the Citywide 2030 GHG reduction target.

**I-680 Express Lanes from SR 84 to Alcosta Boulevard Project**. Prepared Initial Site Assessment and Preliminary Site Investigation to evaluate contaminants of potential concern in soil and groundwater. Prepared Air Quality Report to determine the project's conformity to federal air quality regulations and to support environmental review of the project under CEQA and NEPA.

**Altamont Corridor Expressway (ACE/Forward) Project EIR/EIS.** Prepared a program- and project-level Hazardous Materials analysis for over 120 miles of railroad corridor from San Jose to Merced. Hazardous materials concerns, such as release sites, petroleum pipelines, agricultural pesticides, and nearby school sites were evaluated in GIS.

**Stonegate Residential Subdivision EIR.** Prepared a project-level Hydrology and Water Quality analysis for a residential development located within the 100-year floodplain. The proposed project included modifications to existing levees and flood channels.

**BART Silicon Valley Extension Project.** Prepared Initial Site Assessment and Hazardous Materials EIS/EIR section for extending 6 miles of proposed BART service through the Cities of San Jose and Santa Clara.

impett@smwlaw.com

**Subject:** **Idaho-Maryland Mine Project, Nevada County, CA**
**Acoustical Comments on Draft Environmental Impact Report**
**Salter Project 22-0039**

Dear Laurel:

As requested, we reviewed Chapter 4.10 Noise and Vibration of the Draft Environmental Impact Report (DEIR) for the proposed mine project in Nevada County, CA. We also reviewed information in Appendices L (Noise and Vibration Study) and M (Blasting Report). This letter summarizes our review and comments.

## EXECUTIVE SUMMARY

In our opinion, the DEIR does not sufficiently assess or mitigate potential noise impacts and, therefore, fails to protect the community from excessive noise. Our comments focus on the following issues:

**Grp 21-129**

1. In general, nighttime noise is not adequately addressed in the DEIR. It outright dismisses the potential for noise impacts due to sleep disturbance and inappropriately excludes this consideration from the analysis. The combination of nighttime industrial activities amongst a community that currently enjoys low ambient noise levels represents a significant risk for project noise to impact the community, annoy residents, and cause sleep disturbance. Additional details of likely impacts are outlined below.
2. Engineered fill operational noise is underestimated in Impact 4.10-2. This 5 to 6-year long activity could generate noise levels at least 10 to 18 dB higher than predicted in the DEIR. This is a significant deficiency in the impact analysis. As such, the project's noise levels could be 20 to 35 dB louder than current median/background ambient noise levels, causing a severe impact. In several cases, the DEIR analysis fails to address sensitive receptors located farther away from existing roadways that currently have a lower background noise.

Salter

Acoustics
Audiovisual
Telecommunications
Security

3. The DEIR fails to adequately analyze the project's impact from mineral processing operations because assumptions are made regarding conditions or constructions that would constitute notable "upgrades" to standard measures. However, these upgrades are not disclosed as being required to meet the County standards and reduce noise to a less than significant level. Without these upgraded measures, mineral processing noise could exceed the County noise standards. As currently written, the DEIR appears to "promise" an insignificant noise impact, but fails to include the controls, assurances, and appropriate mitigation to ensure this claim is actually achieved.
4. Blasting vibration impact is not adequately analyzed (see Impact 4.10-4). In our opinion, potentially subjecting residents to "strongly perceptible" and borderline "unpleasant" vibration on a regular basis for the rest of their lives should be considered a significant impact. In particular, the DEIR fails to include crucial guidance from the U.S. OSMRE Blasting Guidance Manual restricting blasting vibration during evening and nighttime hours. If blasting must be allowed at these sensitive times, the DEIR must also incorporate adequate mitigation with a notably stricter limit at all sensitive receptors.
5. The DEIR includes a claim anticipating a 20 dB reduction of blasting noise at the portal compared to the reference Sutter Gold mine project. However, this 20 dB claim is unsubstantiated. If this claim is in error, the community could be subject to excessive noise levels, up to 75 dBA, during blasting. This would be concerning during daytime hours, but a particularly egregious condition at night.

**COMMENTS**

**#1 – Nighttime Noise Impact is Not Adequately Addressed**

Grp 21-130

The DEIR states that "an evaluation of sleep disturbance is not warranted for this project." (DEIR, page 4.10-23, paragraph 2) However, the conditions of this project and the community certainly warrant a detailed analysis of nighttime noise and the potential for sleep disturbance. This project includes many operations that will occur at nighttime hours, including dewatering, indoor facility construction, truck loading/unloading and off-site hauling (from 6 to 7 am), mineralization processing above ground, and water treatment (DEIR, page 3-37). In addition, many of the nearby sensitive receptors are located away from notable sources of ambient noise, and thereby currently enjoy very low nighttime background noise levels between 30 dBA and 45 dBA (DEIR, Appendix L, Appendix B-1 within). The combination of nighttime industrial activities and low background/ambient noise levels represents a potentially significant risk and an undisclosed impact to the community, as it could annoy residents and cause sleep disturbance. A revised EIR should identify appropriate mitigation, including limitations on nighttime noise.

**#2 – Engineered Fill Operation Noise is Underestimated (Impact 4.10-2)**

Grp 21-131

Placement and compaction of engineered fill operations are expected to occur for at least 5 to 6 years at the two industrial sites. The DEIR assesses noise from bulldozer, grader, excavator, front-end loader, and compactor use. It assumed that noise from such activities would generate levels up to 85 dBA at a

distance of 50 feet from each source. It assumed this level for both average (Leq)[1] and maximum (Lmax)[7] levels. The analysis was performed using a SoundPlan computer noise model to estimate sound propagation away from the sites.

***2A – The Brunswick Site***

The DEIR lists predicted noise levels around the Brunswick Site in DEIR Table 4.10-14, compares the results to proposed daytime noise criteria and concludes that operational noise from engineered fill operations in this area would be less than significant. However, Salter performed basic calculations of one 85 dBA noise source (equal to the DEIR assumption that a machine would generate 85 dBA at a distance of 50 feet). We determined that the DEIR has significantly underestimated noise levels at the nearest receptors. We provide this comparison in Table 1 below.

*Table 1. Comparison of DEIR predicted noise levels to noise levels from one construction noise source.*

| Receptor | Receptor Distance | DEIR Predicted Noise Levels ($L_{eq}$ & $L_{max}$, Table 4.10-14) | Calculated Noise Level (dBA) from one 85 dBA source at the Receptor Distance | Delta (dB) |
|---|---|---|---|---|
| 26 | 300 | 51 | 69 | +18 |
| 24 | 350 | 50 | 68 | +17 |
| 23 | 400 | 55 | 67 | +11 |
| 22 | 500 | 52 | 65 | +12 |
| 28 | 500 | 47 | 65 | +17 |
| 27 | 600 | 46 | 63 | +16 |
| 25 | 650 | 50 | 63 | +11 |
| 21 | 700 | 47 | 62 | +13 |
| 20 | 1000 | 46 | 59 | +10 |
| 29 | 1200 | 40 | 57 | +14 |
| 19 | 1300 | 40 | 57 | +13 |

Comparing the levels listed above, it appears that the DEIR predictions are substantially underestimating the level of engineered fill operational noise that the surrounding community is expected to experience. Based on our review of the DEIR methodology, analysis descriptions, and commentary, we find no apparent reason for the discrepancy. For example, we would not expect noise to be further reduced at these nearest receptors from "shielding" by the terrain as they are located on the surrounding hillsides which overlook the Brunswick industrial area. In addition, noise levels could be even higher since multiple

1 $L_{eq}$ – The equivalent steady state A-weighted sound level that, in a stated period of time, would contain the same acoustic energy as the time-varying sound level during the same period.

7 $L_{max}$ (Maximum Sound Level) – The maximum sound level for a specified measurement period of time as defined in ASTM E1686.

machines and activities are expected to operate simultaneously at the site. In our professional opinion, the DEIR analysis needs to be revised.

**Grp 21-132**

By underestimating the noise levels at sensitive receptors, the DEIR fails to identify and mitigate a significant noise impact. We compared the calculated noise levels from a single 85 dBA noise source to the DEIR criteria. Per Table 1 above, noise from a single 85 dBA source is expected to be between 57 dBA and 69 dBA at the 11 nearest receptors to the Brunswick Site (i.e., nearest the engineered fill area). The Daytime Noise Criteria for these receptors are between 53 dBA and 65 dBA (per DEIR Table 4.10-14). Many of the calculated noise levels from a single 85 dBA source exceed these criteria, by up to 14 dB. This is a significant increase over the criteria established in the DEIR. Therefore, we expect that an updated analysis would identify a significant impact and therefore require mitigation of the engineering fill operations that are expected to last for many years.

**Grp 21-133**

Furthermore, we compared the calculated noise levels from a single 85 dBA noise source to the ambient noise levels in the surrounding areas, particularly areas with lower background noise levels. The DEIR fails to pay special attention to these sensitive receptors. Away from the major roadway, ambient noise levels were measured to be approximately as follows (see DEIR Appendix L – Appendix B-6 for Monitoring Sites 1 through 4):

- $L_{eq}$: 60 dBA to 65 dBA (the hourly average noise level, includes intermittent noise)
- $L_{50}$: 40 dBA to 50 dBA (the median noise level; 50% of the hour noise is below this level)
- $L_{90}$: 35 dBA to 45 dBA (the "background" noise level)

The $L_{eq}$ metric is the hourly average noise levels and includes the effect of intermittent noise, which appears to be the cause for the higher $L_{eq}$ levels. However, the median and "background" ambient noise levels indicate that much of the time people experience notably lower noise levels (e.g., between those intermittent events). The median/$L_{50}$ noise levels indicate that people in the area enjoy quieter noise levels below 40 dBA to 50 dBA 50% of the time (specifically, 50% of each hour). Therefore, it is appropriate to review expected engineered fill operational noise levels in light of these lower ambient noise levels that people actually experience.

As stated above, noise from a single 85 dBA source is expected to be between 57 dBA and 69 dBA. Therefore, engineered fill operational noise could be approximately 20 to 30 dB louder than the median ambient noise levels of 40 to 50 dBA. Project noise could be up to 25 to 35 dB above "background" ($L_{90}$) ambient noise levels of 35 to 45 dBA. Based on our experience with community noise and commonly used thresholds of significance (e.g., a 5 dB increase), 20 to 35 dB increases in noise would be a severe noise impact. These levels would be perceived as more than 4 times as loud as the median ambient noise levels and would be expected to result in an aggressive community response and complaints. This should be taken into consideration in the DEIR analysis and further mitigation applied to reduce the expected noise impact on the nearby community from engineered fill operations.

***2B – The Centennial Site***

Our review of the DEIR's analysis of engineered fill operations at the Centennial Site is similar to our findings for the Brunswick Site, see a summary in Table 2 below. Again, the DEIR appears to underestimate noise from these operations at the nearest sensitive receivers. In our opinion, the DEIR analysis is inadequate and needs to be revised.

*Table 2. Comparison of DEIR predicted noise levels to noise levels from one construction noise source.*

**Grp 21-134**

| Receptor | Receptor Distance | DEIR Predicted Noise Levels ($L_{eq}$ / $L_{max}$, Table 4.10-12) | Calculated Noise Level (dBA) from one 85 dBA source at the Receptor Distance | Delta over DEIR $L_{eq}$ (dB) |
|---|---|---|---|---|
| 1 | 500 | 54 / 61 | 64 | +10 |
| 2 | 600 | 50 / 60 | 62 | +12 |

In addition, it is worthy to note that the area with the greatest planned quantity of fill and elevation change at the Centennial Site is nearest these sensitive receptors (#1 and #2) to the north. We would expect there to be many times where activity, and noise, is focused in the northern portion of the site, close to sensitive receptors.

**#3 – The DEIR Underestimates the Project's Potential Noise Impact from Mining Operations (Impact 4.10-3)**

**Grp 21-135**

In the analysis of several mining operational components, the DEIR assumes the implementation of several notable "upgrades" to standard measures. The DEIR concludes that mining operational noise would be below County standards and the project's impact would be less than significant. The DEIR provides no evidence that these upgrades will be implemented in the design and construction of the mining facility. If the facility were to be constructed without these measures, the project's noise would be higher than the DEIR discloses, and the project's impacts could be significant. The DEIR should be revised to analyze the project's noise impacts with and without these "upgrades." It is also important to note that if this analysis were not to occur until after the project is approved and if noise was found to exceed the criteria, it would be challenging, time consuming, and possibly infeasible to add these measures after the fact. Meanwhile, the community would be impacted by excessive noise.

Examples of such assumed upgrades are listed below:

- The metal building enclosing noise generating activities, such as mineral processing, is quoted in the DEIR as having sound transmission loss ratings ranging from "31 dB at 125 Hz to 75 dB at 4,000 Hz. In addition, the metal building would have double doors (i.e., airlock) to prevent sound escaping when one set of exterior doors are open" (DEIR, page 4.10-38, paragraph 4). In the Noise and Vibration Study (DEIR, Appendix L), information on proposed metal building construction is provided (DEIR, Appendix L, Appendix page D-3 within). The construction options include systems with STC ratings between STC 21 and STC 54. The sound ratings quoted in the DEIR indicate that the analysis assumes

that the STC 54 construction will be used. This is the highest rating achievable by the example metal building system. The DEIR must disclose whether this highly sound isolating construction is needed to reduce noise from mineral processing to meet the County's noise standards.

- The ventilation fan(s) required for the mine will be very large industrial units. The DEIR assumes "the effects of a silencer providing comparable sound attenuation as the other industrial buildings proposed at the site" (DEIR, page 4.10-41, paragraph 1). The DEIR analysis implies that this silencer will provide more than 40 decibels of fan noise reduction. This would require the selection of a high-performance industrial fan silencer. The DEIR must disclose whether this high-performance silencer is needed to reduce ventilation fan noise to meet the County's noise standards.

**Grp 21-136**

- The project's water treatment noise attenuation assumptions are vague and unsubstantiated.
  - The primary noise source associated with the water treatment plant would be the pumps and the turbine aerator (DEIR, page 4.10-42). The DEIR quotes the Auburn California Wastewater Treatment Plant noise level of 50 dBA at a distance of 500 feet as the basis for its analysis (DEIR, page 4.10-43, paragraph 1). To generate 50 dBA at 500 feet, a single source of noise would also be generating a noise level of 90 dBA at a distance of 5 feet. However, the DEIR analysis of water treatment equipment noise is based on a noise level of 75 dBA inside the treatment plant (DEIR Appendix L, page 55, paragraph 5). It seems that either the assumed noise level of 75 dBA inside the plant is an error or the analysis is based on additional attenuating measures that are not disclosed in the DEIR. Therefore, either the DIER analysis should be revised to account for accurate noise levels or The DEIR must disclose whether attenuation of pumps and turbine aerators is needed to reduce the noise to meet the County's noise standards.

**Grp 21-137**

  - The DEIR also states that the water treatment equipment "will be located inside a building providing a high degree of sound reduction" (DEIR Appendix L, page 55, paragraph 5). The DEIR must disclose whether this high-performance building enclosure is needed to reduce water treatment equipment noise to meet the County's noise standards.

- The DEIR appears to rely on specific assumptions regarding backup generators, including engine exhaust mufflers, sound isolating building construction, and radiator fan silencers, but the document does not identify the specific nature of this equipment. Nor does it identify the expected noise attenuation of each piece of equipment.

**Grp 21-138**

- The DEIR does not provide the required information about the noise reducing enclosure for the mine compressor.

**Grp 21-139**

- The DEIR does not provide the required information about acoustical performance of the sound-isolating headframe building construction (to reduce "shaft skipping" noise).

**Grp 21-140**

As currently written, the DEIR appears to "promise" a less-than-significant noise impact, but omits the controls, assurances, and appropriate mitigation to ensure this claim is actually achieved. Without requiring the aforementioned noise reducing measures, or assumed "upgrades," the DEIR fails to adequately protect the community from the potential for excessive noise.

**Grp 21-141**

**#4 – Blasting Vibration Impact is Not Adequately Addressed (Impact 4.10-4)**

The DEIR and associated Blasting Report (DEIR, Appendix M) include lengthy discussions and analyses regarding blasting vibration purporting to show that vibration would be barely perceptible, as summarized below:

**Grp 21-142**

> "Regular drift round blasting would be undetectable below 900 feet depth or distance, and would be barely perceivable at 500 feet depth. The largest longhole blasts, occurring once every three to four days on average, would be undetectable below 1,400 feet depth or distance from a receiver. The maximum ground vibration that the mine would produce to nearby receptors is 0.23 in/s PPV, which considers a rare scenario where a longhole blast occurs directly underneath a receptor at 500 feet depth. The maximum ground vibration of 0.23 in/s PPV is comparable to the vibration level from running a garbage disposal in a house..." (DEIR, page 4.10-58, paragraph 3)

In response, the DEIR incorporates a blasting vibration limit of 0.4 in/sec PPV with no restrictions regarding time of day. In our opinion, the DEIR does not adequately address blasting vibration and understates the project's potential vibration impact for reasons provided below.

***4A – Comments on the Blasting Vibration Limit***

**Grp 21-143**

The 0.4 in/sec PPV vibration limit from the DEIR appears to be based primarily on a vibration study performed following an underground nuclear blast in Mississippi in 1964. The first concern is that human responses to this one blast may not be equal to the community response to ongoing perceptible and potentially unpleasant vibration over the 80-year lifespan of this project. Nevertheless, the DEIR references this study as it is described in Bulletin 656 titled "Blasting Vibrations and Their Effects on Structures" published by the U.S. Bureau of Mines (USBM) in 1971. The claim extracted from the USBM document is that "less than 8% of people would complain about blasting activities if the peak particle velocity (PPV) was below 0.4 in/sec." (DIER, Appendix M, page 7, paragraph 3). However, the original chart this is drawn from provides additional context. Figure 3.10 from Bulletin 656 is provided below with dashed lines highlighting the DEIR proposed limit:

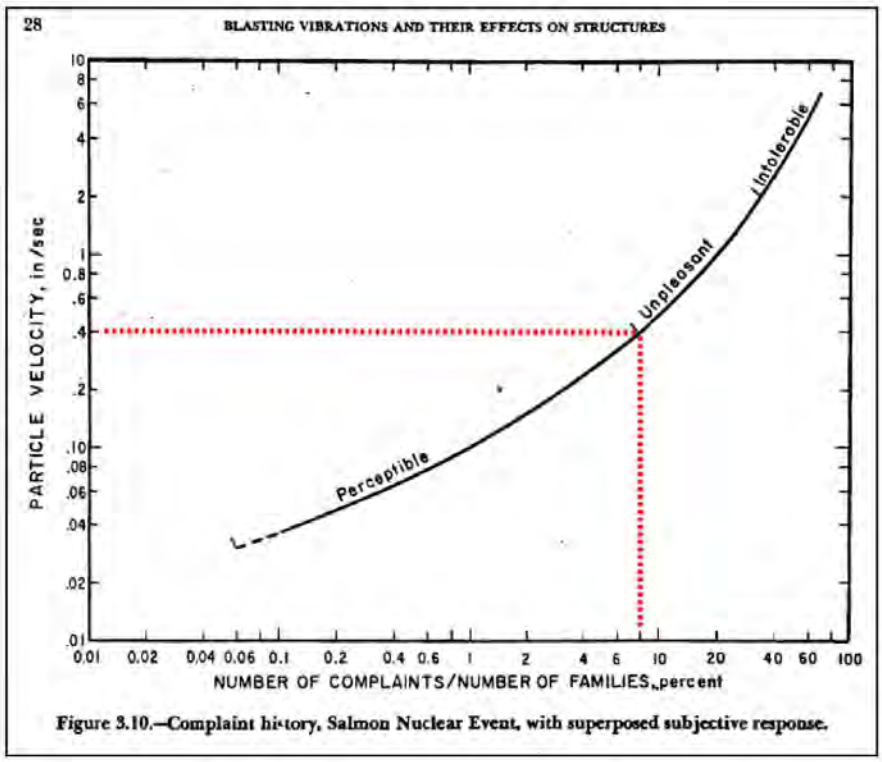

**Figure 3.10.—Complaint history, Salmon Nuclear Event, with superposed subjective response.**

The proposed limit of 0.4 in/sec. PPV is characterized as clearly perceptible and borderline unpleasant. This description is supported by the Caltrans Transportation and Construction Vibration Guidance Manual (April 2020). Table 21 below, an excerpt from the Caltrans Manual, indicates that blasting vibration of 0.4 in/sec. would be considered "strongly perceptible."

Table 21. Human Response to Blasting Ground Vibration

| Average Human Response | PPV (in/sec) |
|---|---|
| Barely to distinctly perceptible | 0.02–0.10 |
| Distinctly to strongly perceptible | 0.10–0.50 |
| Strongly perceptible to mildly unpleasant | 0.50–1.00 |
| Mildly to distinctly unpleasant | 1.00–2.00 |
| Distinctly unpleasant to intolerable | 2.00–10.00 |

The 0.4 in/sec. vibration limit might be appropriate in certain scenarios, such as a short-term event. However, this project involves ongoing mining operations for 80 years. In our opinion, potentially subjecting residents to "strongly perceptible" and borderline "unpleasant" vibration on a regular basis for the rest of their lives should be considered a significant impact. This is particularly true for evening and nighttime operations, which is the subject of our next comment.

***4B – Comments on Nighttime Blasting Vibration***

The DEIR suggests that the predicted "ground vibration of 0.23 in/s PPV is comparable to the vibration level from running a garbage disposal in a house..." (DEIR, page 4.10-58, paragraph 3). However, the DEIR would currently allow the project to conduct blasting and generate that vibration, equivalent to a garbage disposal, in the bedrooms of residents at night while they are trying to sleep. Despite the project's on-going operations, the DEIR fails to require any restrictions on evening and nighttime blasting vibration operations. This is a serious deficiency of the DEIR.

**Grp 21-144**

The DEIR and the Blasting Study reference the U.S. Office of Surface Mining and Reclamation and Enforcement (OSMRE) standards to support their analysis. However, the DEIR fails to include crucial guidance from the OSMRE Blasting Guidance Manual (dated March 1987). In the "Citizen Interests" chapter of the OSMRE Manual the following notes on blasting times and schedules is provided:

> "All blasting must take place during daylight hours unless more restrictive times are specified. If night-time blasting is approved by the regulatory authority, it must be based on evidence from the operator that the public will be protected from adverse noise and other impacts." (OSMRE Blasting Guidance Manual, page 114, paragraphs 4 and 5)

The DEIR provides no evidence that the public will be protected from adverse effects from the project's blasting operations. It provides no special consideration and therefore no additional restrictions on blasting vibration during evening and nighttime hours. In our opinion, potentially subjecting residents to "strongly perceptible" and borderline "unpleasant" vibration during evening and nighttime hours would be a significant impact on the community.

**#5 – Claim Regarding 20 dB Reduction of Blasting Noise at Portal is Unsubstantiated**

**Grp 21-145**

To evaluate potential noise impacts from blasting noise, the DEIR evaluates noise measurements conducted by Bollard Acoustical Consultants at the Sutter Gold underground mine in Amador County. Those measurements found blasting noise to be 75 dBA, on average, at a distance of 200 feet from the mine portal (DEIR, page 4.10-44, paragraph 5). However, to translate those findings to the Brunswick site of the project, the author assumes that noise at the project site would be reduced by 20 dB compared to the Sutter Gold mine (DEIR, page 4.10-44, paragraph 6). Other than mentioning the difference in orientation and size of the portal, this claim of 20 dB noise reduction is unsubstantiated. Twenty decibels of noise reduction is a substantial change in noise emission. Without further data or evidence to back up this 20 dB claim, the DEIR cannot simply assume these lower noise levels. The DEIR Noise Study states the following:

> "If the 75 dBA $L_{max}$ level collected at Sutter Gold is conservatively reduced by 20 dB to assess blasting noise impacts at the Brunswick site, worst-case maximum noise levels at the nearest receptors would range from 52 to 57 dBA $L_{max}$ on average." (DEIR, Appendix L, page 58, paragraph 4)

However, without the unsubstantiated 20 dB of reduction, blasting noise at the nearest sensitive receptors would be between 72 and 77 dBA. As stated above and in the DEIR, ambient median and "background" noise levels at many sensitive receptors is between 35 dBA and 50 dBA. Thus, the blasting noise could be substantially above the ambient noise levels, by approximately 25 to 40 dB. We would expect such an event to be considered a disturbance, likely resulting in complaints, particularly at night when sleep disturbance would be expected.

The DEIR noise study should be revised to provide evidence for the substantial claim that blasting noise levels at the Brunswick site would be 20 dB quieter than the referenced Sutter Gold mine project. Such a claim must be explained for the public to review and have confidence in the findings of the DEIR. If the claim cannot be substantiated, the potential blasting noise must be adequately mitigated to avoid community disturbance from the excessive noise.

## GROUP LETTER 21: ELLISON FOLK, SHUTE MIHALY LAW FIRM/COMMUNITY ENVIRONMENTAL ADVOCATES FOUNDATION

### Response to Comment Grp 21-1

This comment is introductory. The commenter generally states that the DEIR is deficient but does not identify any specific deficiencies. Responses to commenter's specific comments are provided below. Comment noted.

### Response to Comment Grp 21-2

The commenter states that the DEIR does not accurately describe the project because it does not accurately describe the cleanup of the Centennial Site and uses post-cleanup conditions as a baseline. The commenter is referred to Master Response 4 – Clean-Up Project is a Separate Project Under CEQA.

### Response to Comment Grp 21-3

This comment alleges that the DEIR does not properly analyze or mitigate significant environmental impacts, including the design details of engineered fill and geochemistry of waste rock and tailings. Please see Master Response 8 – Mine Waste Characterization. In addition, regarding the commenter's footnote 1, the term "engineered fill" is defined by the DEIR as min[ing] waste, stating that it will be used to create elevated pad areas at the Centennial and Brunswick Industrial Sites. (DEIR p. 4.8-29.)

The comment also refers to a report submitted by David M. Chambers. Please see responses to Group Letter 9.

### Response to Comment Grp 21-4

A full analysis of hydrology and potential impacts in the project vicinity begins with the Project Description, including a disclosure of potential impacts during dewatering and treatment (DEIR p. 3-15) and operational dewatering (DEIR p. 3-18); and is followed in detail by Chapter 4.8 Hydrology and Water Quality. (DEIR p. 4.8-1) Careful consideration was given to regional groundwater occurrence in the immediate area, including review of driller logs, seasonal fluctuations in groundwater levels, and recharge each year. Of particular concern to the County and Project Applicant was the potential effect on private domestic wells in the Project Area (DEIR p. 4.8-8.) The private domestic wells that occur in the Wolf Creek and South Fork

Wolf Creek watersheds are primarily located in four distinct areas, as shown on DEIR Figure 4.8-4. In addition to the four main areas, additional areas or isolated wells are located inside or close to the boundaries of the mineral rights where groundwater supply wells are present, as shown on Figure 4.8-4 (See also DEIR pp. 4.8-10 through -12.) Thresholds of significance can be found in the same chapter on page 4.8-36. The analysis indicates that reductions in the water column of 20 percent to 40 percent could cause the production rate of wells to become unstable by incrementally decreasing the water column much more than would occur under existing conditions. The DEIR uses a 100 percent factor of safety as applied to the potential reduction resulting in unstable conditions, such that a criterion of 10 percent of the water column is used to define wells that might be substantially affected by dewatering of the underground mine workings. For thresholds of significance, discussion and mitigation specific to groundwater supplies, recharge, specific wells in the vicinity and groundwater management, please see Mitigation Measure 4.8-2. (DEIR p. 4.8-54 – 4.8-66.)

Please also see Response to Comment Grp 21-110, Master Response 14 – Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Grp 21-5

The commenter provides general concerns regarding the DEIR's noise and vibration analysis, ostensibly based on the Salter comment letter, included as Exhibit B to Group Letter 21. For example, with regard to hours of blasting, please see Responses to Comments Grp 21-143 and Grp 21-144. With regard to sleep disturbance analysis, please see Response to Comment Grp 21-130.

County noise standards are not the only standard of significance used for the noise analysis, as the DEIR also considered a substantial increase in ambient noise levels to be a significant increase, even if the noise does not exceed the County noise standard. Please see Response to Comment Grp 12-28.

Regarding the geographic extent of potential noise and vibration impacts, please see Master Response 7 - Location of Future Mining Areas. As noted in Master Response 7, to address public concerns regarding the scope of future mining within the mineral rights area, the applicant has agreed to an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area (shown on maps A101, A201 and A202, included as Appendix A to the Final EIR), and will also prohibit blasting closer than 500 feet below ground surface except for construction of the service shaft.

Regarding the Centennial Industrial Site, please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-6

Regarding clean-up of the Centennial Industrial Site, please see Master Response 4 – Clean-Up Project is a Separate Project Under CEQA. Regarding the concerns about waste rock and mine tailings, please see Master Response 8 – Mine Waste Characterization. Regarding the concern related to a plume cloud, please see Response to Comment Grp 7-95.

## Response to Comment Grp 21-7

Regarding the commenter's concerns about the air quality, GHG, and energy effects of the Centennial Site cleanup, please see Master Response 4 – Clean-Up Project is a Separate Project

Under CEQA. Regarding the concern about the construction timeline, please see Master Response 24 – Project Construction Schedule. Regarding project design, CEQA Guidelines sections 15070(b)(1) and 15126.4(a)(1)(A) specifically permit the incorporation of project design features into a project. These project design features are specifically listed in the Project Description and will become conditions of approval of the project's conditional use permit. For example, the applicant's Asbestos, Serpentinite, and Ultramafic Rock Management (ASUR) Plan is described on page 3-20 of Chapter 3, Project Description, of the DEIR. The ASUR is identified as an applicant proposed measure (APM) in Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR (see pg. 4.3-65). Chapter 4.3 identifies two more APMs that are hereby incorporated into Chapter 3 of the DEIR for clarification purposes, under the "Aboveground Facilities Construction and Operations" header (pg. 3-20), as follows:

> APM-AQ-1: Exhaust Emission Controls
>
> The following measures, required as project conditions of approval, shall be implemented during construction, operation, and reclamation to reduce exhaust emissions:
>
> - All off-road diesel-fueled equipment and emergency generators owned by Rise Grass Valley Inc. shall be equipped with Tier 4 Final engines.
> - Unnecessary construction vehicle idling time shall be minimized. The ability to limit construction vehicle idling time is dependent on the sequence of activities and when and where vehicles are needed or staged. Certain vehicles, such as large diesel-powered vehicles, have extended warm-up times following start-up that limit their availability for immediate use. Where such diesel-powered vehicles are required for repetitive construction tasks, these vehicles may require more idling time. The project shall apply a "common sense" approach to vehicle use such that idling is reduced as much as possible below the maximum of 5 consecutive minutes required by regulation (13 CCR 2449 and 2485). If a vehicle is not required for use immediately or continuously for activities or for other safety-related reasons, its engine shall be shut off.
> - All off-road equipment shall be maintained in accordance with manufacturer's specifications. All equipment shall be checked by a qualified mechanic, and equipment shall be confirmed that it is in proper condition prior to operation.
>
> APM-AQ-2: Surface Fugitive Dust Controls
>
> The following measures, required as project conditions of approval, shall be implemented to reduce surface fugitive dust emissions:
>
> - During construction, operation, and reclamation, all exposed soil surfaces (e.g., unpaved disturbed areas, unpaved parking areas, and unpaved staging areas, and soil piles) shall be adequately wetted to ensure that no visible dust crosses the property boundary, except when rains are occurring. As an alternative to watering, inactive soil piles shall be covered to minimize wind erosion.
> - During construction, all on-site roadways shall be paved as soon as possible after grading and any unpaved gravel roads shall be treated with chemical stabilizers in order to control fugitive dust.

The above three APMs are included in the project design and project air quality assessment, required as project conditions of approval, and included in Chapter 4 of the FEIR, Mitigation Monitoring and Reporting Program. Therefore, including a description of all three APMs in the

project description chapter of the EIR is for clarification purposes and does not alter the conclusions of the DEIR.

The commenter also provides other general concerns regarding the DEIR's air quality analysis, health risk assessment and GHG emissions significance threshold, but provides no evidence as to why these analyses are inadequate. Please see Master Response 18 – Air Quality Thresholds; Master Response 19 – NSAQMD Criteria Pollutant Thresholds during Operations; and Master Response 27 – Greenhouse Gas Thresholds.

## Response to Comment Grp 21-8

The commenter asserts that the DEIR did not consider a reasonable range of alternatives. Section 6 of the DEIR considers project alternatives. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. (See CEQA Guidelines, Section 15126.6(a).) The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis given that they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers. The commenter does not suggest any specific alternative. Comment noted.

## Response to Comment Grp 21-9

The commenter asserts that the DEIR does not fully and accurately inform decisionmakers and the public of the environmental consequences of the project, and requests recirculation of the DEIR. However, the comment does not provide any specific example of an issue with the DEIR requiring recirculation. The County has determined that recirculation of the DEIR is not required as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met. Please see the Introduction chapter of this Final EIR for a more detailed discussion of recirculation criteria, pursuant to CEQA Guidelines 15088.5.

## Response to Comment Grp 21-10

The commenter refers to technical comments attached to its comment letter. For responses to the Baseline Environmental Consulting comments, please refer to Responses to Comments Grp 21-107 to Grp 21-128; for responses to the Salter comments, please refer to Responses to Comments Grp 21-129 to Grp 21-145; and for responses to CEA comments, please see Responses to Group Letters 7 and 8. Please also see the following responses to the commenter's specific comments.

## Response to Comment Grp 21-11

The commenter asserts that the DEIR's project description is flawed because it does not include the Centennial cleanup project. Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA. The commenter also asserts that the project description is flawed because it improperly uses an adjusted baseline representing post-cleanup conditions on the Centennial Site as the baseline rather than existing conditions. As discussed in Section 1.3 of the DEIR, the baseline for the Centennial Site was adjusted because the proposed project could not possibly impact that site unless and until the DTSC cleanup project has already been completed. As such,

presenting the project's impacts to the Centennial Site based on the pre-DTSC Project conditions would be misleading to the public and decision-makers and would not represent the actual project impacts. This adjusted baseline is appropriate under CEQA Guidelines Section 15125(a)(1) and is supported by substantial evidence in the record. The commenter also asserts that the DEIR's project description is flawed because it does not adequately describe the duration of the required permits or the duration of construction and phasing of mining and exploration activities over the entire permit period. However, the commenter does not provide any specifics on what information is not provided. The DEIR's project description details all required permits, explains that the term of the project would be for 80 years, and provides sufficient detail on construction and other project activities. Also see Master Response 24 - Project Construction Schedule.

## Response to Comment Grp 21-12

The commenter summarizes details regarding the DTSC Cleanup Project and the Idaho-Maryland Mine Project and does not address the adequacy of the DEIR. Comment noted.

## Response to Comment Grp 21-13

The commenter asserts that the DEIR does not include a proper description of the environmental setting because it uses an adjusted baseline for the Centennial Site. Please see Master Response 4 – Clean-Up Project is a Separate Project Under CEQA.

Regarding the possibility that the Centennial Site will not be cleaned up and therefore not be available for placement of engineered fill, the commenter further asserts that the DEIR "ignores this uncertainty, simply assuming the future cleanup will occur." However, the DEIR explicitly addresses this situation and states "[i]f the separate DTSC cleanup project is not approved by DTSC and completed within the term of the Idaho-Maryland Mine Project use permit, engineered fill would be placed on the Brunswick site, but not the Centennial site, and the remainder would be hauled to local and regional markets." (DEIR, p. 1-3.) Accordingly, the DEIR did not ignore the possibility of not placing material on the Centennial Site, but specifically addressed and analyzed impacts under that possible scenario.

The commenter further argues that the DEIR cannot use the adjusted baseline as the "sole" baseline because there is a possibility the cleanup may not occur, and requests analysis based on an existing conditions baseline. The commenter mistakenly references CEQA Guidelines Section 15125(a)(2), for "future conditions" baselines, but the DEIR relied on CEQA Guidelines Section 15125(a)(1), which allows use of a baseline consisting of "conditions expected when the project becomes operational." In this case, it is reasonably expected that the DTSC cleanup project will be complete when the project becomes operational.

## Response to Comment Grp 21-14

The commenter asserts that the DEIR is flawed because it did not analyze the impacts of transporting 1.6 million tons of mine waste from the project site. However, the commenter mischaracterizes the circumstances that would occur if the Centennial Site were not available for fill placement. The material that would have been placed on the Centennial Site was already analyzed by the DEIR as being transported from the Brunswick Site to the Centennial Site. Thus, the DEIR already analyzed impacts from the transport of that material. However, if the Centennial Site were not available for placement of fill material when the project commences, that material would be transported to local construction aggregate consumers rather than the Centennial Site. The commenter asserts that the air quality, GHG emissions, energy use, and noise impacts of

transporting the fill material to regional construction were not addressed in the situation where the Centennial Site is not available for placement of fill material. However, the impacts of transporting material to the regional construction market was already addressed in the DEIR.

The DEIR analyzed the impacts of off-site hauling of rock material to the construction aggregate market, starting in 2033; however, it was assumed in the DEIR that prior to 2033, rock material would be placed on the Brunswick engineered fill pile and Centennial Site engineered fill pile. Based on public comments regarding the air quality and GHG impacts associated with hauling of rock material to construction aggregate purchasers earlier than anticipated, the applicant has agreed to a condition of approval that would require the applicant to use electric trucks for any offsite sale or transport of waste rock or sand tailings from the Brunswick site (other than to the Centennial Site) if such transport occurs prior to 2033. Hauling of material to offsite locations for use as construction aggregate starting in 2033 was already assumed in the DEIR's analysis; thus, the emissions impacts associated with this activity are already included in the DEIR, regardless of whether the Centennial Site is available for placement of fill material. The below condition would ensure that the project would not have greater air quality and GHG emissions impacts or energy use impacts than analyzed under the DEIR even if the Centennial Site is not available for placement of engineered fill. The text of the condition of approval is provided below:

> COA 4: In the event that sand tailings or waste rock material is transported from the Brunswick Site prior to 2033 to locations other than the Centennial Site, all transport of such material shall be accomplished using electric vehicles.

Further, noise impacts from transport of material to regional construction aggregate markets were already addressed in the DEIR's noise analysis. The commenter does not explain how the unavailability of the Centennial Site for fill placement could result in greater noise impacts than were already analyzed by the DEIR. Regarding wasteful energy, the commenter does not explain how transport of aggregate that would be used in construction projects would cause wasteful use of energy or fuel. Notably, the new condition of approval above requiring use of electric vehicles for any sand tailings and waste rock transported from the mine prior to 2033 would provide an environmental benefit in terms of air quality and energy use, as the vehicles would be electric rather than powered by diesel.

## Response to Comment Grp 21-15

The commenter asserts that the Centennial Site DTSC Cleanup Project should be analyzed in the DEIR. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-16

The commenter asserts that the Centennial Site DTSC Cleanup Project should be analyzed in the DEIR. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-17

The commenter asserts that the Centennial Site DTSC Cleanup Project should be analyzed in the DEIR. Please see Master Response 4 -Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-18

The commenter asserts that the Project Description is not stable and therefore the DEIR is inadequate because the County Conditional Use Permit (CUP) would last for 80 years but other agency permits such as National Pollutant Discharge Elimination System (NPDES) permits

typically have shorter terms and need to be renewed at regular intervals. The commenter asserts that lack of correlation between the CUP term and the term of other permits, along with the DEIR's failure to discuss this discrepancy is a deficiency that makes the project description inadequate. However, the commenter does not explain how the difference in permit terms would cause a new significant environmental impact or would lead to more severe environmental impacts. Rather, the DEIR discloses that other state and federal agencies have authority over ancillary permits required for the project, and requires that the applicant obtain those permits as necessary for project operations. Those agencies' continuing oversight of the project, including the need to renew such permits at various intervals, adds an additional layer of protection guaranteeing project compliance with applicable laws and regulations. The commenter does not offer any statutory, regulatory or case law authority for its argument that the permit terms should be identical, as there is no such requirement. Rather, counties routinely issue use permits, and other approvals (such as building permits) that require continuing oversight of other agencies and the need to renew ancillary permits during the life of that use permit or structure. Discussion of the various permits terms is not required by CEQA, and does not directly relate to the existence or severity of an environmental impact. Moreover, while the DEIR provides a thorough analysis and disclosure of the project and its related impacts, including every detail requested by the commenter, where those details are not necessary for public disclosure or analysis of impacts, would create an unreasonably lengthy EIR, and is not required by CEQA. As stated by California Courts: "The need for thorough discussion and analysis is not to be construed unreasonably… to serve as an easy way of defeating projects. Absolute perfection is not required." (*Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d at p. 406.)

## Response to Comment Grp 21-19

The commenter asserts that the Project Description is "shifting" and inadequate because the groundwater model relied on a 25-year hydrogeologic model to assess groundwater impacts from project implementation, while the project CUP term is proposed as 80 years. The 25-year model is based on known locations of mineralized gold ore and represents the underground location of where mining would occur during the first 25 years of mine operation. For subsequent years of mine operation, the precise location of mining would be determined by further geologic exploration that would be conducted during mine development and cannot be known until additional mining and exploration is completed. However, Sensitivity Scenario 6 used in the groundwater model considered the significant expansion of mining in areas with potential for mineralization, as shown in Figure 5.10 of Appendix K.3 of the DEIR for an additional 40 years of mining. This groundwater model scenario represents the reasonably foreseeable location of where future mining would likely take place after the initial 25-year period. As shown in Figure 5-12, and discussed on page 29 of the report, the 5-ft drawdown contour extent of Scenario 6 at the end of potential additional mining (to Year 65) relative to the 2019 water level expands less than 500 ft from that of the Base-Case Scenario. The drawdown contour of the Base-Case Scenario is at the end of the original planned future mining (Year 25) relative to the 2019 water level. The comparison of drawdown contours between Scenario 6 and the Base-Case Scenario suggests that the added potential mining (beyond the 65 years modeled) will not lead to large incremental drawdowns as the mining progresses because the mining activities occur in deep, low-K rocks.

As stated in Response to Comment Grp 7-82, the groundwater flow model would be updated periodically after dewatering commences and additional groundwater level data is collected to evaluate dewatering impacts. New groundwater level data and updated modeling would

incorporate changes to the long-term mining plan, data from monitoring wells, and measured pumping rates.

The commenter asserts that the DEIR does not disclose that mining may progress beyond the area analyzed for the initial 25 years; however, the DEIR Project Description states explicitly that "[t]he project would also involve underground mining within an approximately 2,585-acre mineral rights boundary owned by the applicant," which discloses that underground mining could occur within this 2,585-acre area, not just the smaller area analyzed for the initial 25-year groundwater model analysis. (DEIR, p. 3-1.)

Importantly, based on public comments regarding the geographic scope of underground mining, the applicant will be subject to a condition of approval that will reduce the area in which it is allowed to conduct underground mining during the term of the 80-year permit to a smaller subset of the 2,585-acre mineral rights boundary, as discussed in Master Response 7 - Location of Future Mining.

While the commenter asserts that the DEIR does not disclose where future mining would occur, the DEIR does in fact disclose that underground mining may occur within the 2,585-acre mineral rights boundary below a depth of 500 feet, subject to the further limitation discussed in Master Response 7 - Location of Future Mining Areas. As stated on page 1-2 of the DEIR, one of the listed project components is "Underground mining at a depth of 500 feet or more in areas underlying the mineral rights properties." The groundwater model's analysis of the first 25-years of mining and its impact on groundwater impacts, along with analysis of an additional 65-years of potential future mining locations, does not make the project description unclear or unstable, as the DEIR is explicit that underground mining could occur within the mineral rights area.

## Response to Comment Grp 21-20

The commenter asserts that the DEIR's project description is inconsistent because it states that construction would take 18 months, while the air quality analysis assumes that construction would occur over a 12-month period. As discussed in Master Response 24 - Project Construction Schedule, the air quality analysis assumed a 12-month construction period that overlapped some construction activities that may be done sequentially, in order to assess the most conservative air emissions impacts scenario. The Project Description is explicit in its disclosure that project construction activities would likely take place over 18 months; however, the air quality analysis takes a more conservative approach in order to ensure that air quality emissions from construction are not underestimated due to the assumption that activities will be staggered rather than overlapping. The analytical approach used for the air quality analysis used to provide a conservative impact analysis does not in any way make the Project Description inconsistent or unstable. Please see Master Response 24 - Project Construction Schedule.

## Response to Comment Grp 21-21

The commenter asserts generally that the DEIR is insufficient and fails to provide accurate information about project impacts or appropriate alternatives and mitigation measures. The comment provides no specific information on its general statements. The commenter's specific comments are addressed below in subsequent responses to comments.

## Response to Comment Grp 21-22

The commenter asserts generally that the DEIR does not adequately evaluate the impact of dewatering on residences and businesses in the project vicinity. Contrary to the commenter's assertion, the DEIR provides extensive analysis of groundwater, water quality and hydrology impacts in Chapter 4.8 of the DEIR and appendices K.1 through K.9, including analysis of impacts to nearby groundwater wells. Please see Master Response 14 - Adequacy of Groundwater Model and Response to Comment Grp 21-110.

## Response to Comment Grp 21-23

The commenter asserts that the DEIR is inadequate because baseline groundwater levels have not been established. However, the DEIR includes a detailed groundwater model that included decades of groundwater level measurements to establish the regional groundwater level baseline and to calculate groundwater impacts due to dewatering based on those levels and the expected project dewatering activities. In addition, to mitigate dewatering impacts, the DEIR requires a groundwater well monitoring plan that includes placement of a network of groundwater monitoring wells to collect additional data over a 12-month period before dewatering of the mine commences. Further, the applicant has agreed to an additional condition of approval requiring the applicant to offer individual groundwater well monitoring for all owners of wells within the expected 1-foot drawdown area as predicted by the groundwater model. For those well owners that agree to allow individual monitoring of their wells, this additional data will be used to ensure that any individual well impacts are mitigated. The groundwater baseline data, groundwater model, impact conclusions and proposed mitigation measures have been independently reviewed by the County's independent experts, who provided input on the model and the mitigation, finding that that the analysis and mitigation is sufficient after incorporation of their independent expert input. Please also see Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 21-24

The commenter asserts that the DEIR provides no evidence that the hydrologic analysis covers the full geographic scope of the project and the geographic scope of the expected drawdown impacts, when concluding that the drawdowns will be generally within the mineral rights boundary. However, the groundwater model included analysis of an area much larger than merely the mineral rights boundary or the mine itself. As stated on page x of Appendix K.3 of the DEIR "Using the hydrogeologic conceptual model and the available data, Itasca developed a 3-D finite element numerical groundwater flow model of the Mine and the surrounding area." Contrary to the commenter's assertion, the groundwater model's conclusion that groundwater impacts would be limited to areas generally within the mineral rights boundary is based on expert analysis and use of an industry-standard groundwater model, not upon a mere assumption that impacts would be limited to a certain geographic area. The groundwater baseline data, groundwater model, impact conclusions and proposed mitigation measures have been independently reviewed by the County's independent experts, who provided input on the model and the mitigation, finding that that the analysis and mitigation is sufficient after incorporation of their independent expert input. Please also see Master Response 14 - Adequacy of Groundwater Model.

## Response to Comment Grp 21-25

The commenter asserts that the groundwater model and proposed monitoring well network does not account for potential impacts at individual domestic wells and summarizes the related

comment from Baseline (Comment Grp 21-119). Please see Response to Comment Grp 21-119. Note that the applicant has also agreed to an additional condition of approval requiring the applicant to offer individual groundwater well monitoring for all owners of wells within the expected 1-foot drawdown area as predicted by the groundwater model. For those well owners that agree to allow individual monitoring of their wells, this additional data will be used to ensure that any individual well impacts are mitigated. Please also see Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 21-26

The commenter asserts that no impact threshold has been set for groundwater drawdown impacts, and then inconsistently argues that the threshold used by the DEIR in Mitigation Measure 4.8-2(b) (10 percent or greater reduction of the water column of any well), is arbitrary and is not based on substantial evidence. This comment mirrors Comment Grp 21-117 provided by Baseline. Please see Response to Comment Grp 21-117 for a full explanation of this threshold. The selection of the 10% reduction as a threshold of significance is discussed in Section 3.2.1, page 80, of Appendix K.2 of the DEIR, and this threshold was deemed appropriate by groundwater experts, including the County's independent experts. As discussed in CEQA Guidelines Section 15064(b)(2), CEQA lead agencies have discretion to establish appropriate impact thresholds based on substantial evidence. As discussed in Response to Comment Grp 21-117, this threshold was established based on substantial evidence and reviewed by the County's independent experts. Note that the applicant has also agreed to an additional condition of approval requiring the applicant to offer individual groundwater well monitoring for all owners of wells within the expected 1-foot drawdown area as predicted by the groundwater model. For those well owners who agree to allow individual monitoring of their wells, this additional data will be used to ensure that any individual well impacts are mitigated. To the commenter's assertion that some individual wells may barely be functional, such that a drawdown of less than 10 percent of the existing well water column would result in impacts due to poor well function, the additional condition of approval agreed to by the applicant will provide additional data on individual wells that are barely operational, that would trigger the applicant's obligation to mitigate said well impacts under Mitigation Measure 4.8-2(b) and under General Plan Policy 17.12, if said wells experienced a significant impact due to dewatering.

## Response to Comment Grp 21-27

The commenter asserts that the DEIR's analysis is inadequate because it relies on a flawed groundwater model. In making its arguments, the commenter relies on arguments from the Baseline comments Grp 21-111 and Grp 21-112. Please see Responses to Comments Grp 21-111 and Grp 21-112, and Master Response 14 - Adequacy of Groundwater Model. As discussed in the referenced responses to comments and Master Response, the groundwater model relies on industry standard software modelling, and uses conservative assumptions to model groundwater conditions and project impacts. The model analysis was peer-reviewed by the County's independent expert who provided input on the model, analysis, and mitigation measures. Thus, the information provided in the DEIR on groundwater impacts constitutes substantial evidence.

## Response to Comment Grp 21-28

The commenter asserts that the DEIR does not provide explanation on how drawdown impacts would be determined in connection with seasonal fluctuations in groundwater wells. This comment mirrors the Baseline comment Grp 21-117. Please see Response to Comment Grp 21-117.

Further, the additional condition of approval agreed to by the applicant to offer individual monitoring of groundwater wells within the expected 1-foot drawdown area will provide additional data on individual wells, as data is collected (including data on seasonal fluctuations) over a 12-month period prior to initiation of dewatering activities. Please see Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 21-29

The commenter asserts that the groundwater model used in the DEIR does not account for the groundwater depression that will be created by constant drainage from the existing mine workings, and further does not account for existing drainage from existing mine workings. This comment is a summary of points argued in Baseline's comments Grp 21-113 and 21-114. Please see Responses to Comments Grp 21-113 and Grp 21-114, and Master Response 14 - Adequacy of Groundwater Model.

## Response to Comment Grp 21-30

The commenter asserts that the Groundwater Monitoring Plan required by Mitigation Measure 4.8-2(a) is flawed because it does not include monitoring of individual groundwater wells, and rather relies on a network of groundwater monitoring wells. This comment summarizes the comments made in Baseline's comment Grp 21-119. Please see Response to Comment Grp 21-119. Further, the additional condition of approval agreed to by the applicant to offer individual monitoring of groundwater wells within the expected 1-foot drawdown area will provide additional data on individual wells, as data is collected (including data on seasonal fluctuations) over a 12-month period prior to initiation of dewatering activities. Please see Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 21-31

The commenter summarizes its previous comments and generally asserts that the DEIR's conclusion on the extent of dewatering impacts is incorrect because the groundwater model is flawed and that the mitigation is inadequate. Please see Responses to Comments Grp 21-21 through Grp 21-30 above, and also see Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 21-32

The commenter asserts generally that the mitigation measures provided to mitigate the project's impacts to groundwater supply are deficient. This comment does not identify any specific deficiencies in the mitigation measures. The commenter's specific assertions are addressed in the responses below. Comment noted.

## Response to Comment Grp 21-33

The commenter asserts that the DEIR's groundwater supply mitigation measures are improperly deferred because under the groundwater monitoring plan, additional data will be collected prior to dewatering and then during dewatering to anticipate any unexpected impact to groundwater wells. Specifically, the commenter alleges that the mitigation is inadequate because the DEIR fails to include performance criteria for the mitigation measures, does not include factual support for its 10 percent impact threshold, and does not accurately describe existing conditions. With regard to the commenter's assertion that no evidence exists to support the 10 percent threshold, please see Response to Comment Grp 21-26. With regard to the commenter's assertion that the mitigation measures are improperly deferred, in the case *Center for Biological Diversity v.*

*California Department of Conservation, etc.* (2019), the court explains that "[g]enerally, it is improper to defer the formulation of mitigation measures…However, an exception to this general rule applies when the agency has committed itself to specific performance criteria for evaluating the efficacy of the measures to be implemented in the future, and the future mitigation measures are formulated and operational before the project activity that they regulate begins." (36 Cal.App.5th 210, 239.) The court determined both conditions were met in that case and upheld the deferred mitigation measures. Similarly, the mitigation measures presented in the DEIR for mitigation of groundwater supply impacts require compliance with specific performance standards and also require implementation prior to dewatering activities. Specifically, Mitigation Measure 4.8-2(a) requires establishment of a Groundwater Monitoring Plan that will collect data for a 12-month period prior to dewatering; Mitigation Measure 4.8-2(b) requires immediate replacement of water supply for any water well that is impacted by the project; and Mitigation Measure 4.8-3(c) requires that the Project Applicant connect 30 properties to Nevada Irrigation District potable water supply prior to dewatering activity, even though only 7 wells are expected to be impacted, based on quantitative groundwater modeling. These mitigation measures include specific performance standards that ensure any impacts will be adequately mitigated. Moreover, the commenter ignores the fact that the DEIR's conservative analysis anticipates that only 7 wells will be impacted, provides replacement water prior to dewatering to those 7 wells and 23 other properties that are not anticipated to be impacted, and further, that the Groundwater Monitoring Plan and replacement requirement in Mitigation Measures 4.8-2(a) and 4.8-2(b) are provided as an extra layer of security for unanticipated impacts to wells that were shown by the groundwater model not to experience significant impacts. As such, the mitigation for impacts anticipated by the DEIR has already been fully formulated and is not deferred, due to the requirement that water connections be provided to the 7 wells expected to have impacts (and 23 additional properties) prior to dewatering. The additional Groundwater Monitoring Plan and water replacement mitigation is provided to ensure mitigation of unanticipated impacts that are beyond the impacts actually predicted by the DEIR, and detailed performance standards are provided in Mitigation Measures 4.8-2(a) and 4.8-2(b) and in Appendices K.8 (Groundwater Monitoring Plan) and K.9 (Well Mitigation Plan). Please see Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. Further, the additional condition of approval agreed to by the applicant to offer individual monitoring of groundwater wells within the expected 1-foot drawdown area will provide additional data on individual wells, as data is collected over a 12-month period prior to initiation of dewatering activities.

## Response to Comment Grp 21-34

The commenter asserts that Mitigation Measure 4.8-2(c) is inadequate in providing water supply to 30 properties because the commenter asserts that the DEIR has no evidence that the dewatering impact will be limited to 30 properties. However, the DEIR actually concludes that dewatering will only significantly impact 7 wells, and the requirement to connect 30 properties goes beyond what is required to mitigate the project's impact. (See DEIR Impact 4.8-2.) The commenter cites *King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5$^{th}$ 814, 866, for the proposition that courts will not defer to agency conclusions about effectiveness of mitigation where there is no evidence in the record showing that it will be effective. However, the DEIR contains voluminous evidence documenting the DEIR's conclusion that only 7 groundwater wells will be significantly impacted (see DEIR Chapter 4.8, and Appendices K.2, K.3, K.7, K.8, K.8 and K.9), includes a comprehensive Groundwater Monitoring Plan to monitor groundwater levels in the case that unanticipated significant impacts occur to wells other than the 7 wells, and

includes a strict requirement that water supply be provided in case unanticipated significant impacts occur to other wells beyond the 30 for which replacement water supply is already provided. The commenter summarizes comments from Baseline comment Grp 21-119 in describing the actions that Baseline believes are necessary to analyze and mitigate groundwater impacts. Please see Response to Comment Grp 21-119.

## Response to Comment Grp 21-35

The commenter asserts that Mitigation Measure 4.8-2 must be revised to include the mitigation elements proposed for the 1996 Emperor Gold project, and references Exhibit H to its comment letter. Please see Master Response 13 - Historic Hydrogeologic Assessments.

## Response to Comment Grp 21-36

The commenter asserts that the project is inconsistent with General Plan Policy 17.12 because it will threaten water supplies in the project area. However, the DEIR specifically addresses General Plan Policy 17.12 (see DEIR p. 4.8-66) and concludes that the project is consistent with the General Plan Policy's requirement to replace any water supply impacted by mining activities, through implementation of Mitigation Measure 4.8-2(c), which requires replacement water supply for 30 properties. Further, to eliminate concern over groundwater well impacts that are not anticipated by the DEIR's analysis, Mitigation Measure 4.8-2(b) specifically incorporates the General Plan Policy 17.12 requirement for water replacement for unanticipated impacts to wells beyond the 30 properties for which replacement water is already being provided. As such, the DEIR provides substantial evidence that the project is in compliance with General Plan Policy 17.12.

## Response to Comment Grp 21-37

The commenter generally asserts that the DEIR did not fully evaluate the project's impacts to water quality due to construction, dewatering discharge, erosion and sedimentation and placement of cemented-paste backfill. Contrary to the commenter's assertion, the DEIR fully analyzes impacts to water quality related to the project's dewatering discharge, construction, fill placement, erosion and sedimentation and use of cemented-paste backfill in Chapter 4.8-1 of the DEIR. Please also see Master Response 35 - Discharge to South Fork Wolf Creek. The commenter references comments from David M. Chambers as support for its arguments. Please see the separate responses to comments Grp 8-174 to Grp 8-200 with regard to responses to comments from David M. Chambers. The commenter asserts that no analysis of water quality and the project's ability to meet water quality standards has been performed; however, this is incorrect. For example, see Appendix K.4 which includes analysis of the project's proposed water treatment plant, and Appendix K.2 which includes groundwater quality analysis. Additionally, please see Master Response 8 - Mine Waste Characterization. With regard to the commenter's assertion that the DEIR's reliance on regulatory permitting requirements is inappropriate, the CEQA Guidelines state that compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards. (CEQA Guidelines Section 15126.4.) The DEIR's incorporation of water quality permit requirements from the Regional Water Quality Control Board (RWQCB) (see Mitigation Measures 4.8-1(a) through 4.8-1(e)) provides adequate mitigation for the referenced water quality impacts, as the permit requirements apply before project activities can commence, and the RWQCB's permit process includes strict regulatory requirements and performance standards, as outlined in the mitigation measures. Moreover, the commenter is

incorrect in asserting that the DEIR simply relies on a "trust us" approach and provides no analysis of water quality impacts. The potential for water quality impacts is addressed in detail in the DEIR and Appendices, for every aspect of the project, including analysis of existing water quality, mine water discharge treatment, erosion controls, chemical properties of historic and expected mine waste, and analysis of mitigation.

## Response to Comment Grp 21-38

The commenter asserts that the DEIR is deficient because the conditional use permit is proposed for a term of 80 years; however, the likely term of the project's water quality permits would be shorter and therefore require renewals of those permits. This comment mirrors the arguments made in comment Grp 21-18 above. Please see Response to Comment Grp 21-18. The commenter also asserts that the DEIR should be revised and recirculated due to flaws in the groundwater supply and groundwater quality impact analyses. The County has determined that recirculation of the DEIR is not required as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met (please refer to Chapter 1 of this Final EIR for more discussion on this point).

## Response to Comment Grp 21-39

The commenter generally asserts that the DEIR's noise analysis is inadequate and summarizes noise generating activities at the project site. The commenter also asserts that operational hours for tunnelling and blasting were not disclosed in the DEIR; however, as stated on page 4.7-28 of the DEIR, "[b]lasting activities are proposed to take place twice daily with blasting between shifts at 7AM and 7PM with 3 to 4 drift rounds blasted every 12 hours between shift changes and longhole blasts of approximately 3,300 tons of rock taking place once every 3-4 days." Further, as described in the PBS Technical Report, minor blasting (such as misholes in drift rounds) could be done periodically during work shifts but would be only a single hole per delay versus the four assumed in the PBS Technical Report for drift round blasting and consequently would result in only 25% of the vibration produced by drift round blasting. As such, contrary to the commenter's assertion, the hours of operation for blasting activities are disclosed in the DEIR, and blasting would typically occur at 7AM and 7PM, with some minor blasting at other hours, including nighttime hours.

## Response to Comment Grp 21-40

The commenter generally asserts that the DEIR does not properly analyze or disclose the project's noise impacts. No specific deficiencies are identified in this comment; therefore, no further response is necessary.

## Response to Comment Grp 21-41

The commenter asserts that the DEIR's noise analysis is deficient because the DEIR only analyzed project noise in comparison to County noise standards and did not analyze whether the project would result in a significant increase in ambient noise conditions regardless of the County standards. The commenter cites the *King and Gardiner Farms, LLC v. County of Kern* case and *Oro Fino Gold Mining Corporation v. County of El Dorado* case for the proposition that an EIR must analyze the increase in noise above ambient caused by a project rather than solely the County noise standards. However, the commenter is factually incorrect about the DEIR's noise analysis, as the County noise standards are not the only standard of significance used for the noise analysis. The project's DEIR also considered a substantial increase in ambient noise levels

to be a significant increase, even if the noise does not exceed the County noise standard. Please see Chapter 4.10.3, Table 4.10-5 of the DEIR, and Response to Comment Grp 21-133.

## Response to Comment Grp 21-42

The commenter asserts that the DEIR did not examine the project's potential to generate nighttime noise and should analyze potential for sleep disturbance. Please See Response to Comment Grp 21-130.

## Response to Comment Grp 21-43

The commenter restates its previous comment that the DEIR did not consider changes above ambient noise levels and only considered County noise standards. This is factually incorrect, as the DEIR analyzed impacts from noise increases that are still below County noise standards. Please see Chapter 4.10.3, Table 4.10-5 of the DEIR, and Response to Comment Grp 21-133.

## Response to Comment Grp 21-44

The commenter asserts that the DEIR needs to analyze noise and vibration impacts over the entire mineral rights area. The DEIR analyzed noise impacts from all noise generating sources; however, the commenter is incorrect that tunnelling and blasting would be a noise generating activity throughout the entire mineral rights area. As opposed to vibration, audible noise from underground blasting can only propagate to surface from through the mine tunnels and shafts. Therefore, noise impacts from blasting are relative to a receptor's proximity to the shaft headframes at the Brunswick site and not the location of the underground workings. As stated on page 4.10-44 of the DEIR, the noise from blasting is less than significant even for the closest receptors to the Brunswick shaft headframe.

With regard to vibration impacts throughout the mineral rights area, while most blasting would take place at 1,000 feet below surface or deeper, a condition of approval has been added to the FEIR to limit blasting to 500 feet below the surface and deeper. Contrary to the commenter's assertion, the DEIR did not limit analysis of vibration impacts to only the Centennial or Brunswick sites; rather, the analysis modeled vibration impacts at multiple locations and under varying scenarios. (See DEIR Chapter 4.10-4.) As discussed in Chapter 4.10-4 of the DEIR and the PBS Technical Report, a maximum of 0.23 inches per second vibration is modelled where a longhole blast could occur directly beneath a receptor at 500 feet depth. Notwithstanding the rarity of this situation, such a blast might occur every three or four days between shift changes (7AM and 7PM) and would last for only seconds. At 500 feet depth and a horizontal offset of 1,400 feet, such a longhole blast would be undetectable by blasting seismograph (PPV <0.05 in/sec). Regular drift round blasting, occurring approximately twice daily over several seconds, is modelled to result in a maximum of 0.14 inches per second vibration at a depth of 500 feet directly beneath a receptor. Note that the 0.14 inches per second vibration that would occur at a receptor if blasting took place 500 feet directly below that receptor is less than the 0.40 inches per second vibration that the DEIR sets as the threshold below which there are "No significant concerns about public annoyance." (DEIR p. 4.10-22.) At 500 feet depth and a horizontal offset of 900 feet, a drift round blast would be undetectable by blasting seismograph (PPV <0.05 in/sec). Therefore, the DEIR appropriately considers vibration impacts to be less than significant after mitigation.

## Response to Comment Grp 21-45

The commenter asserts that the DEIR is inadequate because it mistakenly mischaracterizes project operational noise sources as construction noise sources and therefore assumes that those

operations are exempt from County noise standards. The commenter implies that tunnelling and blasting may be considered "construction" noise sources by the DEIR rather than operational noise sources, such that the DEIR assumed that they are exempt from County noise standards. However, this is incorrect, as tunnelling and blasting were considered to be operational noise sources by the DEIR. (See DEIR Chapter 4.10-3.) Moreover, despite the fact that construction noise is considered exempt under the County Code (County Code Section L-II 4.1.7.D.8), the DEIR compared all construction noise sources to the applicable County noise standards and determined that some construction noise sources were temporarily significant and unavoidable despite the County Code construction noise exemption. (See DEIR p. 4.10-30.)

Accordingly, the DEIR appropriately categorized project activities as construction or operational activities, respectively. However, even if such activities were mischaracterized (which they are not), the DEIR compared construction activities to the County noise standards despite the construction noise exemption; thus, the DEIR contains an adequate analysis of noise impacts based on substantial evidence.

## Response to Comment Grp 21-46

Please see Response to Comment Grp 21-45.

## Response to Comment Grp 21-47

The commenter implies that the DEIR concludes that the impacts analyzed in Impact 4.10-2 of the DEIR were found to be less than significant because the County relied on the County Code's construction noise exemption. The commenter is confused about the conclusions of the DEIR, as the DEIR cites the County Code construction noise exemption for informational purposes, but ultimately concludes that the construction noise impact is "significant and unavoidable" despite incorporation of feasible mitigation due to the construction noise experienced at 8 receptors due to the potable water pipeline construction. (See DEIR Table 4.10-11; DEIR p. 4.10-30.) The commenter states that the impact conclusion should be changed to "significant and unavoidable" on page 4.10-30; however, the impact conclusion is already significant and unavoidable, despite incorporation of feasible mitigation.

## Response to Comment Grp 21-48

The commenter asserts that operational hours for tunnelling and blasting were not disclosed in the DEIR; however, as stated on page 4.7-28 of the DEIR, "[b]lasting activities are proposed to take place twice daily with blasting between shifts at 7AM and 7PM with 3 to 4 drift rounds blasted every 12 hours between shift changes and longhole blasts of approximately 3,300 tons of rock taking place once every 3-4 days." Further, as described in the PBS Technical Report, minor blasting (such as misholes in drift rounds) could be done periodically during work shifts but would be only a single hole per delay versus the four assumed in the PBS Technical Report for drift round blasting and consequently would result in only 25% of the vibration produced by drift round blasting. As such, contrary to the commenter's assertion, the hours of operation for blasting activities are disclosed in the DEIR, and blasting would typically occur at 7AM and 7PM, with some minor blasting at other hours, including nighttime hours.

As opposed to vibration, audible noise from underground blasting can only propagate to surface from through the mine tunnels and shafts. Therefore, noise impacts from blasting are relative to a receptor's proximity to the shaft headframes at the Brunswick site and not the location of the underground workings. As stated on page 4.10-44 of the DEIR, the noise from blasting is less

than significant even for the closest receptors to the Brunswick shaft headframe. Notably, the DEIR states that "[t]he range of predicted worst-case blasting noise levels of 52 to 57 dBA Lmax is below the daytime, evening, and nighttime dBA Lmax criteria at the nearest receptors." (DEIR p. 4.10-45.) As such, the commenter's assertion that nighttime blasting was not analyzed and would result in significant impacts not disclosed in the DEIR is incorrect. Noise impacts from blasting at all hours were disclosed in the DEIR and found to be less than significant after mitigation. (Id.)

## Response to Comment Grp 21-49

The commenter asserts that the DEIR is deficient because it does not evaluate noise impacts associated with the separate Centennial Site Cleanup project under the authority of DTSC. The Centennial Site Cleanup project is separate from the Idaho-Maryland Mine Project and its impacts are therefore not required to analyzed in the project's DEIR. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-50

The commenter asserts that the DEIR failed to adequately analyze noise impacts from placement and compaction of engineered fill and cites a separate comment from Salter (Comment Grp 21-131) for the proposition that the DEIR underestimates noise impacts by up to 14 dB, resulting in significant impacts at 11 receptors that were not disclosed by the DEIR. Please see Response to Comment Grp 21-131.

## Response to Comment Grp 21-51

The commenter asserts that the DEIR underestimates the project's impacts because it compares project-related noise to ambient conditions near roadways. Please see Response to Comment Grp 21-133. The commenter also states that the DEIR did not consider changes above ambient noise levels and only considered County noise standards. This is factually incorrect, as the DEIR analyzed impacts from noise increases that are still below County noise standards. Please see Chapter 4.10.3, Table 4.10-5 of the DEIR, and Response to Comment Grp 21-133.

## Response to Comment Grp 21-52

The commenter asserts that the DEIR is inadequate because it incorporates noise reducing project design features. As discussed in Responses to Comments Grp 21-135 to Grp 21-141, the Project Design incorporates numerous noise-reducing features such as placing equipment within enclosed buildings and use of silencers. The noise analysis was based on the implementation of these features, and as part of the Project Description, the County has authority to require that such features are installed during project construction and implementation. The commenter asserts that each feature needs to be specifically identified; however, CEQA does not require every piece of equipment to be specifically identified, only that the equipment be commercially available. Engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.). Furthermore, Mitigation Measure 4.10-3 requires a comprehensive noise monitoring program to be conducted of each facet of the operation to verify the modelling assumptions of the project and to ensure that compliance with the applicable Nevada County noise standards is being achieved at nearby sensitive receptors. If results indicate that noise standards are being exceeded, operations shall cease until additional engineering controls can be implemented as needed. The required mitigation measure will therefore ensure that any necessary engineering controls for reduction of noise are implemented for the project.

Nonetheless, to clarify that the noise reducing technology discussed in Chapter 4.10 of the DEIR is implemented through an enforceable mechanism, the County will require the following condition of approval be imposed as part of project approval:

> COA 7: The applicant shall be required to install all noise reducing project features and equipment included in the Project Description, and assumed in the noise impact analysis included in Chapter 4.10 of the DEIR. While the applicant is not required to use the specific brands and models assumed in the DEIR, the applicant shall be required to demonstrate that the noise reducing project features and equipment actually installed as part of the project achieve the same or better noise reduction as was assumed in the DEIR. The applicant shall be required to provide specifications on all installed noise reduction features and equipment to the County to verify that the noise reductions comply with the assumptions in the DEIR. Further, the County will verify and enforce use and operation of noise reduction equipment and features through implementation of Mitigation Measure 4.10-3.

## Response to Comment Grp 21-53

This comment summarizes the arguments made by Salter in Comments Grp 21-143 and Grp 21-144. Please see Responses to Comments Grp 21-143 and Grp 21-144.

## Response to Comment Grp 21-54

This comment summarizes the arguments made by Salter in Comment Grp 21-145. Please see Response to Comment Grp 21-145.

## Response to Comment Grp 21-55

The commenter asserts that the DEIR needs to include more analysis of the existing environmental contamination conditions at the Centennial Site, in the event that the DTSC cleanup project is not completed. Section 1.3 of the DEIR provides an overview of conditions at the Centennial Site and an explanation regarding the baseline approach used by the DEIR. However, the commenter's concerns regarding the existing environmental contamination on the Centennial Site are misplaced because the project cannot utilize the Centennial Site for placement of engineered fill unless and until such cleanup work, under the authority of the DTSC, has been completed. The Project Description does not allow for placement of fill on the Centennial Site until such cleanup is completed, and the ongoing DTSC cleanup project precludes use of this site until the voluntary cleanup is complete. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-56

The commenter asserts that the DEIR fails to analyze or mitigate hazardous impacts relating to waste rock and mine tailings and cites the comment from the Baseline comment Grp 21-109. Please see Response to Comment Grp 21-109, Master Response 8 - Mine Waste Characterization, and Master Response 9 - Historical Mine Waste at Centennial Site.

## Response to Comment Grp 21-57

Please see Response to Comment Grp 7-95.

## Response to Comment Grp 21-58

The commenter asserts that the DEIR failed to analyze the cumulative hazard impacts of the separate DTSC project along with the project and specifically asserts that the DEIR should have analyzed the impacts of the Centennial DTSC Cleanup Project hauling hazardous materials along Brunswick Road in conjunction with the project. While the DTSC Cleanup project is separate from the project, the DTSC Cleanup project does not propose to haul hazardous material along Brunswick Road and proposes to cap any contaminated material in-place on the Centennial Site. Accordingly, the commenter's premise that the DTSC Cleanup project would have cumulative hazard impacts along with the project due to the DTSC Cleanup project hauling hazardous material is unfounded. The separate DTSC Cleanup project would be required to comply with applicable local, state and federal laws and regulations regarding release of hazardous materials, as such no cumulative impact is expected.

As discussed in the DEIR, "*In general, hazardous materials and other public health and safety issues are site specific and/or project-specific, and would not be significantly affected by other development within the project area. While the proposed project would involve haul of hazardous materials to and from the Brunswick Industrial Site via Brunswick Road, no other cumulative projects are anticipated to similarly haul hazardous materials along Brunswick Road on an ongoing basis. In addition, cumulative development projects would be subject to the same federal, State, and local hazardous materials management requirements as would the proposed project, which would minimize potential risks associated with increased hazardous materials use in the community*." As concluded in the DEIR, the project along with other projects that are subject to local, state and federal requirements would not cause a cumulative hazard impact due to the application of those laws and regulations. The DTSC Cleanup project is clearly subject to ongoing state oversight, and therefore would not contribute to a cumulative hazard impact in connection with the project. Also, please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-59

The commenter generally states that the DEIR is inadequate because it fails to analyze the DTSC Cleanup project's impact on air quality, the project's impact on air quality that will occur if the DTSC Cleanup project does not occur, includes a contradictory project construction timeline, improperly relies on assumed mitigation measures, fails to mitigate significant air quality impacts from operational emissions of criteria pollutants, and that the health risk assessment fails to disclose essential information and lacks substantial evidence of its conclusions. The commenter's arguments are addressed in responses to the commenter's more specific comments that ensue in the letter. Please see Responses to Comments Grp 21-60 through Grp 21-67 below.

## Response to Comment Grp 21-60

The commenter asserts that the project's DEIR must analyze air quality impacts from the DTSC Cleanup project, asserting that the DTSC Cleanup project is an essential part of the project. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-61

The commenter argues that the DEIR did not adequately address the project's air quality impacts that would occur in the situation where the Centennial Site clean-up is not completed within the life of the project and sale of waste rock and sand tailings were to occur sooner than anticipated. The DEIR analyzed the impacts of off-site hauling of rock material to the construction aggregate

market, starting in 2033; however, it was assumed that prior to 2033, rock material would be placed on the Brunswick engineered fill pile and Centennial Site engineered fill pile.

Based on public comments regarding the air quality and GHG impacts associated with hauling of rock material to construction aggregate purchasers earlier than anticipated, the applicant has agreed to a condition of approval that would require the applicant to use electric trucks for any offsite sale or transport of waste rock or sand tailings from the Brunswick site (other than to the Centennial Site) if such transport occurs prior to 2033. Hauling of material to offsite locations for use as construction aggregate starting in 2033 was already assumed in the DEIR's analysis; thus, the emissions impacts associated with this activity are already included in the DEIR, regardless of whether the Centennial Site is available for placement of fill material. The below condition would ensure that the project would not have greater air quality and GHG emissions impacts than analyzed under the DEIR even if the Centennial Site is not available for placement of engineered fill. The text of the condition of approval is provided below:

> COA 4: In the event that sand tailings or waste rock material is transported from the Brunswick Site prior to 2033 to locations other than the Centennial Site, all transport of such material shall be accomplished using electric vehicles.

## Response to Comment Grp 21-62

The commenter asserts that the DEIR is inadequate because the Project Description states that project construction is expected to take 18 months; however, the air quality analysis assumes that the project construction would take only 12 months. Please see Master Response 24 - Project Construction Schedule.

## Response to Comment Grp 21-63

The commenter asserts that the DEIR is deficient because the applicant proposed measures (APMs) included in the air quality analysis are not incorporated as mitigation measures or as part of the Project Description and therefore there is no assurance that these APMs will be implemented. As the applicant proposed these measures as part of the project, prior to analysis of air quality impacts of the project, they are properly considered part of the Project Description. Regarding project design, CEQA Guidelines 15070(b)(1) and 15126.4(a)(1)(A) specifically permit the incorporation of project design features into a project. Nonetheless, to clarify that the APMs are enforceable conditions, a condition of approval shall be imposed on the project, and incorporated into the MMRP to require that applicant proposed measures APM-AQ-1, APM-AQ-2, and APM-AQ3 will be implemented by the mine operator, as already discussed in Response to Comment Grp 21-7.

The commenter cites *Lotus v. Department of Transportation* (2014) 223 Cal.App.4th 645, for the proposition that the APMs should be considered mitigation measures rather than incorporated into the project, to allow for evaluation of the effectiveness of mitigation. However, unlike the situation in Lotus, the DEIR contains APMs, which were proposed by the applicant as part of the project, but also contains Mitigation Measure 4.3-1(a) and Mitigation Measure 4.3-1(b), which are evaluated separately from the project's pre-mitigation impacts. The project is clearly distinguishable from the situation in *Lotus*, which involved mitigation of Caltrans' impacts to old growth redwood roots based on incorporation of nine avoidance, minimization, and/or mitigation measures including methods of excavation in root zones, watering regimes, plant care, fill management, and replanting methods. Unlike the *Lotus* case where the mitigation was

incorporated as part of the project leading to a less-than-significant conclusion without analysis of those measures and based on a subjective judgment that was not clearly disclosed to the public, the project's criteria air pollutant emissions incorporating the APMs as part of the proposed project can be directly measured against numerical emissions thresholds established by the Northern Sierra Air Quality Management District. In other words, while the EIR in *Lotus* involved a subjective threshold related to root damage where the analysis was hidden from the public, the APMs in the DEIR relate to an objective threshold for which the public and decision makers can clearly assess whether the project (including the APMs) is below or exceeds. Finally, the incorporation of separate mitigation for this same air quality impact (Mitigation Measure 4.3-1(a) and Mitigation Measure 4.3-1(b)), also distinguishes the DEIR's APMs from the situation in *Lotus.*

## Response to Comment Grp 21-64

Please see Response to Comment Grp 21-63.

## Response to Comment Grp 21-65

The commenter asserts that the DEIR is deficient due to the lack of explanation on the reduction of criteria air pollutant emission impacts to a less than significant level. Please see Master Response 19 – NSAQMD Criteria Pollutant Thresholds during Operations.

## Response to Comment Grp 21-66

The commenter asserts that the health risk assessment in the DEIR fails to disclose essential information and lacks substantial evidence to support its conclusions. Extensive documentation of project emissions in different phases of the project are provided in Appendix E.1 of the DEIR. Mitigation Measure 4.3-1(b) requires that prior to the initiation of construction, Rise Grass Valley Inc. or its designee shall submit a Construction Exhaust Emissions Minimization Plan which includes the use of Tier 4 Final engines for off-road equipment with engines equal to or greater than 50 horsepower. As discussed on pages 4.3-79 and 4.3-80 of the DEIR, this mitigation measure would result in a significant decrease of calculated cancer risk at the Maximally Exposed Individual Resident from 10.4 to 7.6 per million. Detailed emission data is provided in Appendix E.1 of the DEIR. As shown on pages 114 of Appendix E.1, the annual emissions of $PM_{10}$ (used to calculate health risk from diesel exhaust) from offroad equipment in the unmitigated scenario is 0.27 tons/year, and as shown on page 118 of Appendix E.1, the annual emissions of $PM_{10}$ from offroad equipment in the mitigated scenario is 0.08 tons/year. This substantial reduction in diesel exhaust emissions during construction results in a substantial reduction to health risk at the MEIR. A memo showing health risk isopleths, sensitive receptor locations, and health risk at the MEIR by pollutant and project phase has been prepared to clarify the results of the health risk assessment. Please see Dudek Health Risk Memorandum attached to the Final EIR as Appendix K. The cancer health risk exposure at the MEIR (see pages 1632-1634 of memo) is summarized in the table below. Pollutants with negligible associated health risk are excluded from the table. Construction emissions of asbestos and diesel exhaust comprise the majority of calculated health risk and the use of Tier 4 engines for construction in the mitigated scenario significantly decreases calculated health risk as shown in the below table.

**Calculated Caner Risk at the MEIR**

| Activity | Cancer Risk per million Mitigated | Unmitigated |
|---|---|---|
| Construction - Asbestos in Dust | 3.7 | 3.7 |
| Construction - Diesel Exhaust | 1.2 | 4.1 |
| Operations - Asbestos in Dust | 1.8 | 1.8 |
| Operations - Diesel Exhaust | 0.6 | 0.6 |
| Operations - Arsenic in Dust | 0.3 | 0.3 |
| Total | 7.6 | 10.4 |

## Response to Comment Grp 21-67

Extensive documentation of project emissions in different phases of the project are provided in Appendix E.1 of the DEIR. A memo showing health risk isopleths and sensitive receptor locations has been prepared to clarify the results of the health risk assessment. Please see Dudek Health Risk Memorandum attached to the Final EIR as Appendix K. The commenters request visual representations of the results of the Health Risk Assessment (HRA) for the project. The HRA for the project describes the impact to the maximally exposed individual resident (MEIR), which is the residential receptor north of the Brunswick site. The isopleths shown on Exhibits A through D of the Dudek Memo at the Brunswick site are based on the HRA provided in the DEIR for residential receptors. There are no residential receptors in proximity of the Centennial site. In order to plot the isopleth of health risk in this area, a Worker Health Risk Assessment was prepared for the Final EIR. The locations of residential and worker receptors are annotated on Exhibits A through D of the memo. In the case of the calculated worker health risk, no isopleths are shown at the Centennial site because there is no location onsite or offsite where health risk exceeds a level of significance. The health risk to the maximally exposed individual worker (MEIW) is calculated in the memo. As described in the memo, all project emissions, including trucks, off-road equipment, underground/blasting/crushing, ore processing, fuel tank storage, backup diesel generators, and material handling were incorporated into the Worker Health Risk Assessment. The commenter requests detailed information on the activities and pollutants that comprise the calculated health risk at the MEIR. This information is provided on pages 1632 through 1637 of the Dudek Memo. The cancer health risk exposure at the MEIR (see pages 1632-1634 of memo) is summarized in the table below. Pollutants with negligible associated health risk are excluded from the table. Construction emissions of asbestos and diesel exhaust comprise the majority of calculated health risk and the use of Tier 4 engines for construction in the mitigated scenario significantly decreases calculated health risk. Asbestos emissions during construction are based on very conservative estimates (see Response to NSAQMD Comment Agcy 11-17). Asbestos during operations is also conservatively estimated, see Master Response 22 - Conservatism of Asbestos Assumptions. An Asbestos Dust Mitigation Plan is required for both construction and operations in order to minimize exposure of the public to naturally occurring asbestos.

**Calculated Caner Risk at the MEIR**

| Activity | Cancer Risk per million Mitigated | Unmitigated |
|---|---|---|
| Construction - Asbestos in Dust | 3.7 | 3.7 |
| Construction - Diesel Exhaust | 1.2 | 4.1 |
| Operations - Asbestos in Dust | 1.8 | 1.8 |
| Operations - Diesel Exhaust | 0.6 | 0.6 |
| Operations - Arsenic in Dust | 0.3 | 0.3 |
| Total | 7.6 | 10.4 |

## Response to Comment Grp 21-68

The commenter asserts that the DEIR fails to adequately analyze or mitigate the project's GHG emissions. This is an introductory comment that summarizes several of the commenter's arguments. The commenter's specific arguments are addressed in Responses to Comments Grp 21-69 through Grp 21-92 below.

## Response to Comment Grp 21-69

The commenter asserts that the DEIR fails to adequately analyze the Centennial Cleanup project's GHG emissions impacts. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-70

Please see Response to Comment Grp 21-14.

## Response to Comment Grp 21-71

Please see Master Response 24 - Project Construction Schedule.

## Response to Comment Grp 21-72

The commenter asserts that the project's commitment to use electrical (non-diesel) equipment for underground mining operations must be an enforceable condition of approval to be used in the GHG emission analysis and energy analysis. While the use of electrical equipment underground is an enforceable part of the Project Description, to clarify the analysis, the County has required the following condition of approval, as also shown in Chapter 4, Mitigation Monitoring and Reporting Program, of this Final EIR:

> COA 8: The applicant shall be required to use only electrical, pneumatic, or battery powered mining equipment in the underground mine.

## Response to Comment Grp 21-73

Please see Response to Comment Grp 21-63.

## Response to Comment Grp 21-74

Please see Master Response 27 - Greenhouse Gas Thresholds. The commenter states that the DEIR fails to adequately analyze certain GHG emissions generated during project operations, specifically, off-road vehicles and equipment, emergency generator use, underground blasting, and solid waste, etc. No evidence is provided to justify this claim. These GHG emissions sources

were clearly accounted for in the project-specific GHG modeling, as stated on page 80 of Appendix E.1 to the DEIR.

**Response to Comment Grp 21-75**
Please see Master Response 27 - Greenhouse Gas Thresholds.

**Response to Comment Grp 21-76**
Please see Master Response 27 - Greenhouse Gas Thresholds.

**Response to Comment Grp 21-77**
The commenter asserts that the DEIR fails to calculate the total amount of GHG emissions over the life of the project. However, the total amount of GHG emissions over the life of the project is not relevant to the applicable significance threshold. In addition, the annual anticipated GHG emissions for each year range is provided, such that a reader could calculate the sum easily, if desired. The commenter calculated this amount in its comment; thus, the DEIR did not fail in disclosing this information to the Public. The commenter fails to provide evidence as to why the failure to provide a sum of numbers already provided is a serious deficiency. Please see Master Response 27 - Greenhouse Gas Thresholds.

**Response to Comment Grp 21-78**
The commenter asserts that the DEIR must analyze operational emissions against a net-zero GHG threshold. Please see Master Response 27 - Greenhouse Gas Thresholds.

**Response to Comment Grp 21-79**
The commenter asserts that the DEIR's GHG mitigation offsets lack adequate performance standards and are improperly deferred. Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-80**
The commenter asserts that the DEIR's GHG mitigation offsets are not additional, real, permanent, verifiable and enforceable. Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-81**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-82**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-83**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-84**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-85**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-86**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-87**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-88**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-89**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-90**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-91**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-92**
Please see Master Response 28 - Greenhouse Gas Credits.

**Response to Comment Grp 21-93**
This comment is introductory and generally alleges that the DEIR fails to adequately analyze and mitigate the project's impacts on energy use. The commenter's specific arguments are addressed in Responses to Comments Grp 21-94 through Grp 21-97 set forth below.

**Response to Comment Grp 21-94**
The commenter asserts that the DEIR fails to analyze the energy use of the Centennial Cleanup project. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

**Response to Comment Grp 21-95**
The commenter asserts that the DEIR failed to evaluate the additional energy use that would result from the project if the Centennial Cleanup project does not occur, because rock would need to be transported to the aggregate market rather than to the Centennial site. The DEIR analyzed the impacts of off-site hauling of rock material to the construction aggregate market, starting in 2033; however, it was assumed in the DEIR that prior to 2033, rock material would be placed on the Brunswick engineered fill pile and Centennial Site engineered fill pile. Based on public comments regarding the air quality and GHG impacts associated with hauling of rock material to construction aggregate purchasers earlier than anticipated, the applicant has agreed to a condition of approval that would require the applicant to use electric trucks for any offsite sale or transport of waste rock or sand tailings from the Brunswick site (other than to the Centennial Site) if such transport occurs prior to 2033. Hauling of material to offsite locations for use as construction aggregate starting in 2033 was already assumed in the DEIR's analysis; thus, the energy use impacts associated with this activity are already included in the DEIR, regardless of whether the Centennial Site is available for placement of fill material.

**Response to Comment Grp 21-96**
Please see Master Response 24 - Project Construction Schedule. The 12-month project construction schedule assumed in the air quality analysis for purposes of conservatively estimating air pollutant emissions includes the same activities and energy use as an 18-month project construction schedule. The difference in the schedules is only that the 12-month schedule

assumes that many of the construction activities happened concurrently rather than sequentially. As such, the sum energy consumption under either scenario would be the same.

## Response to Comment Grp 21-97

Please see Response to Comment Grp 21-63.

## Response to Comment Grp 21-98

The commenter asserts that the DEIR's Alternative Analysis is inadequate, but does not identify any specific deficiencies in the analysis.

## Response to Comment Grp 21-99

The commenter asserts that the DEIR failed to include a reasonable range of alternatives for the project because the DEIR mistakenly concluded that multiple impacts were less than significant when, according to the commenter, these impacts should have been determined to be significant and unavoidable. The commenter does not explain why the DEIR is incorrect about the other impacts listed in the comment. See responses to the commenter's other comments above and below regarding the DEIR's impact conclusions. The commenter also asserts that the DEIR should be revised and recirculated. The County has determined that recirculation of the DEIR is not required as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met. Please also see Response to Comment Grp 21-100.

## Response to Comment Grp 21-100

As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis since they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers.

## Response to Comment Grp 21-101

The commenter asserts that the project objectives are defined so narrowly that they essentially call for the project itself, and do not allow for meaningful comparison for the project and the alternatives. However, the commenter is incorrect that the project objectives were purposefully drafted to allow for automatic elimination of all alternatives and selection of the proposed project. Underground gold mining is an extremely capital-intensive business, which is the reason that daily ore production levels were set in project objective no. 1 at a level at which the project could realistically obtain financing to construct the full project buildout (1,000 tons per day). The commenter scoffs at this objective by arguing this is saying "the objective of the project is to implement the project;" however, financing and construction of a mine that will take in excess of 100 million dollars to construct would not be feasible with lower throughput levels than requested by the applicant in project objective no. 1. Notably, the historic mining operation averaged approximately 1,000 tons per day of production in the years before the forced closure in 1942 and the proposed throughput for the project proposed re-opening of the mine at a similar throughput is therefore a reasonable objective.

Regarding the commenter's sharp dismissal of project objective no. 2 (locate the project on property that Rise Grass Valley, Inc. owns that provides an existing access to the underground workings), the commenter appears to be unfamiliar with the fundamentals of geology and with CEQA Guidelines Section 15126.6. (Consideration and Discussion of Alternatives to the Proposed Project.) Economical quantities of gold only exist in very limited locations throughout the world; therefore, placement of Rise's gold mining project on land that it owns (which is known to contain gold - unlike most other properties) is clearly a more important project objective than would be the case for other projects where numerous locations might be suitable. Gold is a very rare mineral that does not occur on most properties; thus, Rise Gold cannot readily consider moving its project to alternative locations. As stated in CEQA Guidelines Section 15126.6(f)(2)(B), "in some cases there may be no feasible alternative locations for a geothermal plant or mining project which must be in close proximity to natural resources at a given location."

Accordingly, contrary to the commenter's assertion, the project objectives reflect the specialized nature of the project, not a narrowly defined set of objectives designed to eliminate consideration of any alternative.

## Response to Comment Grp 21-102

The commenter asserts that the project alternatives are flawed because, like the project, they assume that the Centennial Cleanup Project will be completed. The commenter does not explain why the DEIR must assume the DTSC project is not completed for the purpose of analyzing alternatives to the project, and provides no legal authority for this position. Please also see Master Response 4 – Clean-Up Project is a Separate Project Under CEQA.

## Response to Comment Grp 21-103

Please see Responses to Comments Grp 21-100 and Grp 21-101.

## Response to Comment Grp 21-104

Please see Responses to Comments Grp 21-100 and 21-101. The commenter generally suggests a mixed-use employment center as an alternative but does not provide enough detail for the County to analyze this proposal (e.g., it is unclear which site the commenter is referring to). In footnote 14 the commenter asserts that the County's General Plan designates the Centennial site as "Industrial" whereas the City of Grass Valley designates the site as "Urban Medium Density" and asserts that the project would violate the County's General Plan policy 1.8.3. The commenter characterizes General Plan Policy as "calling for its land use designations to be consistent with the City's designations;" however, the commenter overstates the County policy of "consistency." Rather than require strict consistency, General Plan Policy 1.8.3 states that "the Nevada County General Plan Land Use Maps will generally reflect the City's/Town's General Plan land use mapping." (General Plan Land Use Element, p. 1-43 (emphasis added).) The project is not proposing to change the general plan designation of the Centennial site, and the Centennial site will retain its existing Industrial County General Plan designation that existed prior to the project being proposed. As the project is not proposing any change to the existing General Plan designation (or zoning) that currently exists, the commenter's argument that the project is causing a land use conflict between City and County zoning is baseless.

The last sentence of General Plan Policy 1.8.3, states "the County's Plan will not preclude implementation of the City's/Town's Plan by providing for a significantly more intensive land use than the City's/Town's Plan." The commenter implies that the project violates this policy with

respect to the Centennial Site because the Industrial land use designation in the County's General Plan allows more intense land uses than the City's Urban Medium Density designation. Again, the project is not inconsistent with this portion of Policy 1.8.3 as the project does not propose to change the General Plan designation of the Centennial Site. The General Plan designation of the Centennial Site was established by the County prior to and separately from the proposed project. Accordingly, even if the Industrial land use designation was inconsistent with the City's Urban Medium Density land use designation and allowed much more intense use, the project is not the cause of any alleged inconsistency. Moreover, the project is not proposing any specific Industrial land use and is therefore not creating a "more intensive land use" than allowed by the City's land use designation. Rather, the project merely proposes placement of engineered fill on the Centennial Site, which would create a level area adequate for future industrial use. Nonetheless, no industrial use is proposed, and the placement of engineered fill would also make the site more conducive to development of uses anticipated under the City's Urban Medium Density designation. The project does not include any entitlements that would require the Centennial Site to be developed for industrial use in the future. In summary, the project is not changing the land use designation of the Centennial Site and is not approving any specific land use that would conflict with the City's land use designation; therefore, the project is not in violation of General Plan Policy 1.8.3.

## Response to Comment Grp 21-105

The commenter asserts that the County may not approve the proposed project because Alternative 2 (Elimination of Centennial Industrial Site) would meet nearly all of the project objectives and is the environmentally superior alternative. In support for its argument the commenter cites Public Resources Code Section 21002 for the proposition that "an agency may not approve a proposed project if a feasible alternative exists that would meet a project's objectives and would diminish or avoid its significant environmental impacts." (Comment Grp 21-105, emphasis added) However, Public Resources Code Section 21002 states that "public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." (Emphasis added.) The commenter mistakenly uses the term "diminish" when the actual CEQA statute uses the term "substantially lessen," which has a different meaning, due to the qualifying term "substantially."

While the DEIR acknowledges that Alternative 2 may lessen some traffic impacts, it would still result in significant and unavoidable traffic impacts and all other significant impacts of the project would remain unchanged under Alternative 2. (DEIR pp. 6-21 to 6-29.) As such, while Alternative 2 would somewhat lessen traffic impacts, it is not an alternative that "would substantially lessen the significant environmental effects of such projects" and therefore Alternative 2 does not preclude approval of the proposed project. (Public Resources Code Section 21002 (emphasis added).)

The commenter cites *Citizens for Quality Growth v. City of Mt. Shasta* (1988) 198 Cal.App.3d at 443-45 in support of its argument; however, this case uses the "substantially lessen" standard from the CEQA statute rather than the different "diminish" standard used by commenter. (Id. At 438.) Further, *Citizens for Quality Growth* is distinguishable from the project, because in that case the City of Mount Shasta failed to make any findings regarding the infeasibility of the alternatives. In this case, the County has not yet made any findings regarding the project and will do so at the time of project approval or denial.

The other case cited by the commenter, *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 720, includes the same correct "substantially lessen" standard used in the CEQA statutes rather than the commenter's asserted "diminish" standard and also includes commentary on the *Citizens for Quality Growth* case (also cited by commenter), which shows that commenter's interpretation of that case was misguided. As stated by the court in *Kings County Farm Bureau,* "[c]ontrary to appellant's contention, *Citizens For Quality Growth* v. *City of Mt. Shasta, supra,* 198 Cal.App.3d 433, did not hold CEQA compelled adoption of one of the alternative projects if it would avoid the identified environmental damage … [i]t merely required the agency to weigh the feasibility of the proposed alternatives and to make findings regarding feasibility." The County will make any appropriate findings at the time of project approval or denial.

The commenter also cites CEQA Guidelines Section 15126.6(b) for the proposition that "the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly." The commenter argues that under CEQA Guidelines Section 15126.6(b), Alternative 2 must be selected and approved rather than the proposed project even though Alternative 2 does not satisfy all of the project objectives. However, CEQA Guidelines Section 15126.6(b) relates to what alternatives should be discussed in an EIR, and does not include a mandate as to what alternative must be selected. In this case, the DEIR does include discussion of alternatives that do not satisfy all project objectives, and is therefore consistent with the requirements of CEQA Guidelines Section 15126.6(b).

## Response to Comment Grp 21-106

The commenter summarizes its prior comments and then asserts that the DEIR should be revised and recirculated. Please see Responses to Comments Grp 21-1 through Grp 21-105. As discussed in more detail in the Introduction chapter of this Final EIR, the County has determined that recirculation of the DEIR is not required as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met.

## Response to Comment Grp 21-107

This is an introductory comment. The commenter's specific comments and questions are addressed below.

## Response to Comment Grp 21-108

The commenter asserts that the DTSC cleanup project and the mine project should be analyzed under one CEQA document. Please see Master Response 4- Cleanup Project is a Separate Project Under CEQA. Also see Section 1.3 of the DEIR regarding the DEIR's approach to the Centennial Industrial Site CEQA baseline.

## Response to Comment Grp 21-109

The commenter asserts that the character of historic mine waste found on the Centennial site is evidence that the project will cause hazards and water quality impacts. The commenter also asserts that the DEIR's mitigation requirement of submitting a Report of Waste Discharge to the Regional Water Quality Control Board for placement of engineered fill is insufficient. Description of the waste rock and mine tailings, including the related analytical data, are presented in Chapter 4.8 of the DEIR and the analysis of air quality and health risk assessment are provided in Chapter 4.3 of the DEIR. Geochemical testwork of mine materials is presented in section 4.4 of Appendix K.2. Accordingly, the impacts associated with the chemical composition of the rock that will be

mined at the project site is included in multiple sections of the DEIR. The commenter dislikes that these discussions are not placed into the Hazards section of the DEIR; however, the individual impacts related to the chemical composition of the rock are analyzed in the most appropriate sections of the DEIR for those impacts.

The commenter asserts that based on the quality of historic mine waste at the project sites, the project would "almost certainly result in numerous new contaminated waste sites that pose a threat to the public and the environment." However, the proposed project would produce mine waste with lower sulfide and metal content than those produced historically. Further, the historic mine waste has been determined to be Group C mining waste (Please see Master Response 9) from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity. Please see Master Response 9 – Historical Mine Waste at Centennial Site. While the commenter alleges that mitigation requiring submittal of a Report of Waste Discharge, and compliance with water quality standards is not proper mitigation, compliance with a regulatory permit or other similar process may be identified as mitigation if compliance would result in implementation of measures that would be reasonably expected, based on substantial evidence in the record, to reduce the significant impact to the specified performance standards. (14 CCR Section 15126.4.)

The same paragraph on page 4.8-50 of the DEIR, cited in this comment, discusses the data sets used to evaluate the potential impacts on water quality related to the placement of engineered fill. Based on that information, the DEIR concludes that there would be a potentially significant impact related to the placement of engineered fill (at page 4.8-51, Conclusion paragraph) and provides Mitigation Measure 4.8-1(e). This mitigation measure lists the evaluations that the Water Board will use to determine the appropriate mining waste classification, which would be based on existing data, as presented in the DEIR, and future data, to be provided in the Report of Waste Discharge. Determination of the mining waste classification would define the CCR Title 27 specifications for construction of the disposal units that will contain the engineered fill. The Title 27 specifications identify the measures that would be required to prevent any leaching of hazardous materials and other non-hazardous constituents at levels that would exceed applicable water quality standards. Please see Master Response 8 – Mine Waste Characterization. As noted in Master Response 8, Mitigation Measure 4.8-1(e) has been revised in response to the CVRWQCB comment letter on the DEIR for clarification purposes (see Response to Comment Agcy 5-4). The revised mitigation language clarifies that, in accordance with Title 27 of the California Code of Regulations (CCR), the applicant shall prepare and implement a Waste Characterization Plan which shall be incorporated into the approved WDR. The purpose of the Characterization Plan is to continually evaluate the different forms of mining wastes and to appropriately classify these wastes as Group A, Group B, or Group C based on an assessment of the potential risk of water quality degradation posed by each waste. Through the WDR these wastes shall be managed, treated, stored, or disposed of in a manner that is protective of water quality. The applicant shall not sell or utilize waste rock and tailings from the project for construction aggregate or fill purposes offsite (i.e., sites other than the applicant's Brunswick and Centennial sites) unless such material has been tested and confirmed to qualify as Group C mining waste under California Code of Regulations Section 22480 and the approved WDR. The specific methods, volumes and frequency of characterization shall be established in the approved WDR.

## Response to Comment Grp 21-110

The analysis provided in Chapter 4.8-2 of the DEIR concludes that the proposed mining operations could result in adverse effects to seven domestic water supply wells in the East Bennett area during the life of the mining operation. Pursuant to Nevada County General Plan Policy 17.12, the project would address this by installing a potable water supply line in East Bennett Road and providing individual well owners with a connection to the potable water line. No significant impacts to domestic water wells are predicted in the Greenhorn, Woodrose, Beaver or other areas. The predictions include the use of a 100% safety factor, multiple sensitively scenarios, which have been peer reviewed by the County's independent expert consultant. However, the DEIR acknowledges that without the implementation of a groundwater monitoring plan and well mitigation plan, the project could result in a significant impact to groundwater supplies.

A Groundwater Monitoring Plan (GMP) is required for the project under Mitigation Measure 4.8-2(a). As described on page 4.8-66 of the DEIR, the measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented.

The commenter states it would not be possible for pre-dewatering baseline levels to be determined when they would be based on an assessment that would not start until after dewatering begins. However, the commenter is not correct in its understanding of the required mitigation. Mitigation Measure 4.8-2(a)(1) requires water-level monitoring data for a minimum of 12 months before commencement of dewatering of the mine. This data will be used to establish the baseline for each well before commencement of mine dewatering. As such, the commenter is incorrect that groundwater monitoring and baseline data collection is deferred until after dewatering.

As stated in Section 3.0 of the GMP, the drawdown caused by project dewatering will propagate outward over time. Monitoring wells in closer proximity to the mine will generally experience drawdowns before wells farther away. The measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. Obviously, the dewatering of the mine workings cannot take place until the appropriate permits are in place and the CEQA process is complete.

The commenter asserts that the collection of groundwater data from monitoring wells as part of Mitigation Measure 4.8-2(a) is not appropriate because it defers the mitigation to the future. However, deferred mitigation may be appropriate where a local agency commits itself to mitigation and specific performance criteria are articulated. (*San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 670-671; see also *North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. of Directors* (2013) 216 Cal.App.4th 614, 647 [upholding deferred mitigation measure for potential pile-driving impacts on special-status fish species]; *Riverwatch v. County of San Diego* (1999) 76 Cal.App.4th 1428, 1448–1450 [a deferred approach may be appropriate where it is not reasonably practical or feasible to provide a more complete analysis before approval and the EIR otherwise provides adequate information of the project's impacts].) Deferred mitigation measures are also explicitly permissible under the CEQA Guidelines. (See 14 CCR Sec. 15126.4(a)(1)(B).)

In this case, the deferral of setting up a monitoring well network until after project approval is appropriate, because Mitigation Measure 4.8-2(a) and Mitigation Measure 4.8-2(b) include specific performance criteria that ensure impacts will be mitigated. Further, the commenter's criticism is misplaced, because the collection of data from monitoring wells, even if done as part of the DEIR process, would not change the impact analysis. The groundwater impact analysis was based on a computer model of regional groundwater flow, which is already calibrated against levels of individual groundwater wells under existing (pre-dewatering) conditions. Additional measurements would not substantially inform or change that analysis.

In addition, as discussed in Master Response 15 – Adequacy of Groundwater Monitoring Wells, to provide property owners additional assurance regarding impacts of mine dewatering, a condition of approval will be imposed on the project requiring that monitoring of domestic water wells will be conducted upon request for property owners within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. Some of these properties do not have a domestic water well but to ensure that well owners are not excluded all owners will be contacted by the Company.

## Response to Comment Grp 21-111

The commenter states that the DEIR does not appropriately acknowledge the uncertainty associated with groundwater supply in fractured bedrock and implies that the groundwater model used in the DEIR is not appropriate for the project site. Please see Master Response 14 - Adequacy of Groundwater Model. Page 25 of DEIR Appendix K.3 acknowledges that there are uncertainties in groundwater modelling and states that the predicted contours are based upon the numerical groundwater flow model and the assumptions inherent in the model. Actual, in-field measured water levels may be different from the predicted water levels due to heterogeneities in the hydrogeologic system.

## Response to Comment Grp 21-112

The commenter asserts that the water level measurements used to calibrate the groundwater model are insufficient. However, the groundwater model is calibrated to measured water levels in domestic wells and not just the water level in the Union Hill Mine.

Itasca simulated pre-historical mining conditions (before any mining had taken place). Itasca calibrated the model against current water levels measured in wells outside of the mine area. (DEIR Appendix K.3, Section 4.5). Using the simulated groundwater from the pre-historical mining condition, Itasca calibrated the model using the known inflow rates and underground mine workings from two periods of mining - the Idaho mine in 1918 and the entire connected Idaho-Maryland-Brunswick mine in 1956. The model was also calibrated against the known level of water in the Union Hill Mine in 1956. (Appendix K.3, Section 4.6 pages 21-22). The drain nodes for the mine workings were turned off and mine voids were simulated with a zone of high K and the drains along Wolf Creek (which currently drain the mine) were added at their known elevation. Please see Itasca Clarification of Modeling Components Memo attached to the Final EIR as Appendix O. The model was then compared against current water levels measured in wells in the mine area. The model was found to be correctly calibrated to the current measured water levels. (DEIR Appendix K.3, Section 4.5 page 22).

## Response to Comment 21-113

The commenter argues that the groundwater model is inadequate because it predicts water levels to recover after dewatering ceases to a specific range of water level rather than a specific exact water level. As stated on page 25 of Appendix K.3, the model is not designed to simulate seasonal or annual changes resulting from variations in groundwater recharge associated with variations in precipitation and groundwater recharge that would occur over the model simulation period. Therefore, a simulated value is expected to be within the range of seasonal water level variation measured in domestic wells.

In addition to the eight wells shown in Figure 4-8 of the report, as discussed on page 22 of Appendix K.3, the comparison between simulated and measured groundwater levels is shown in Figure 4-9, which shows that the simulated hydraulic heads in 2019 reasonably agree with the measured groundwater levels in numerous other wells in the area. As shown in Figure 4-9, wells with higher quality hydrograph data show higher correlation with simulated water level. Furthermore, as discussed on page 22 of Appendix K.3, the hydraulic conductivity (k) values derived from the groundwater flow model calibration are within the range of EMKO's estimated K values (See Section 3.3.5 of Appendix K.2) and literature values.

Figures 4-8 and 4-9, of Appendix K.3 show that the model reliably predicts historical water levels in domestic wells. Water-level measurements in domestic wells can be influenced by many factors, such as seasonal variations, pumping variations, measurement errors, and so forth. The Groundwater Monitoring Plan (Appendix K.8 of the DEIR) recommends the installation of 30 groundwater monitoring wells at 15 locations to assess variations in groundwater levels. The water-level data from specially designed monitoring wells is more reliable because the data will not be subject to uncertainties associated with individual domestic wells. Water levels will be collected at least 12 months prior to the implementation of dewatering of the existing mine workings. As stated in Section 3.0 of the GMP, the dewatering of the existing mine workings, prior to the commencement of actual mining, is analogous to a largescale pumping test that is a common tool in the field of hydrogeology to assess how drawdowns in the water-bearing zones, for example, the fractured bedrock at the project site, propagate with time as a result of pumping. The water-level data will be used to update the model.

## Response to Comment Grp 21-114

The commenter asserts that the groundwater model used for the DEIR did not properly simulate drainage of groundwater from existing mine workings. However, in the calibration of the model during recovery (1956 to 2019), mine voids were simulated with a zone of high K (5,000 ft/day) and high specific yield (effective porosity of 50%) for the area with drifts and raises. The drain nodes for the mine workings were turned off. The drains along Wolf Creek were simulated as drains with surveyed elevations from 2,497 ft to 2,502 ft amsl. Please see Itasca Clarification of Modeling Components Memo attached to the Final EIR as Appendix O.

## Response to Comment Grp 21-115

The commenter summarizes its comments from Comments Grp 21-110 through 21-114. Please see Responses to Comments Grp 21-110 through Grp 21-114.

## Response to Comment Grp 21-116

This comment is a reproduction of Figure 4.8-7 of the DEIR. Comment noted.

## Response to Comment Grp 21-117

The commenter asserts that the selection of a 10% reduction threshold for significant groundwater well supply impacts is not justified. The selection of the 10% reduction as a threshold of significance is discussed in Section 3.2.1, page 80, of Appendix K.2 of the DEIR.

Drawdowns within wells completed in unconfined aquifer conditions are sensitive to the amount of drawdown that occurs as a percent of the total water column. This sensitivity is due to the reduction in the effective transmissivity that occurs as the height of the water column decreases in unconfined aquifers. Simulations using the Theis equation (Domenico and Schwartz, 1990) indicate that reductions in the water column of 20 percent to 40 percent could cause the production rate of the well to become unstable by incrementally decreasing the water column much more than would occur under existing conditions. For this analysis, a 100 percent factor of safety is applied to the potential reduction resulting in unstable conditions, such that a criterion of 10 percent of the water column is used to define wells that might be substantially affected by dewatering of the underground mine workings.

The characteristics of domestic wells in the area is discussed in Sections 3.3 and 4.2 of Appendix K.2 of the DEIR. The position of the well pumps is not known but are not likely positioned with the pump intake barely above the water level. Normal seasonal fluctuation occurs in the groundwater level of 10 ft to 30 ft or more. A water well pump would likely be placed closer to the bottom of the well casing to be below the drawdown created from its own pumping and take advantage of storage volume of the well.

The commenter also states that the DEIR does not describe how drawdown would be determined relative to baseline conditions. Mitigation Measure 4.8-2(a)(1) requires water-level monitoring data for a minimum of 12 months before commencement of dewatering of the mine. This data will be used to establish the baseline for each well before commencement of mine dewatering and would capture seasonal variation in each monitoring well. Further, Mitigation Measure 4.8-2(a)(3) requires the preparation of potentiometric-surface contour maps showing the groundwater elevations across the site. Mitigation Measure 4.8-2(a)(4) requires that for each domestic well, a projected and seasonally averaged water level shall be estimated based on the domestic well location and the background potentiometric conditions, which will serve as a baseline groundwater level and shall be developed prior to the initiation of dewatering of the underground mine workings. A potentiometric map is a map of the water table elevation contours which is constructed from the measurements at monitoring wells. The water level in domestic water wells in the mine area can be estimated from this map and the water column for each well can be calculated based on the estimated water level and depth of each well.

As discussed on page 16 of the GMP (Appendix K.8 of the DEIR), actual monitoring well installation locations will be surveyed, and a map of the installed well locations superimposed upon a map or aerial photograph. The locations of domestic wells, project boundaries, and other relevant features will be included on this map. The map will serve as the basis for constructing potentiometric surface maps for baseline water levels. Potentiometric-surface contour maps show the groundwater elevations across the site.

In addition, as discussed in Master Response 15 – Adequacy of Groundwater Monitoring Wells, to provide property owners additional assurance regarding impacts of mine dewatering, a condition of approval will be imposed on the project requiring that monitoring of domestic water wells will be conducted upon request for property owners within or nearby the predicted 1-ft

drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. Some of these properties do not have a domestic water well but to ensure that well owners are not excluded all owners will be contacted by the Company.

## Response to Comment Grp 21-118

The commenter asserts that selection of the 10% reduction of water column as a threshold is unsubstantiated. Please see Response to Comment Grp 21-117.

The commenter asserts that under General Plan Policy 17.12, the correct threshold for determining when a mining project may threaten quantity or quality of water supply, is "expert opinion". The analysis provided in Chapter 4.8-2 of the DEIR concludes that the proposed mining operations could result in adverse effects to seven domestic water supply wells in the East Bennett area during the life of the mining operation. No significant impacts to domestic water wells are predicted in other areas. The predictions include the use of a 100% safety factor, multiple sensitivity scenarios, and the analyses have been peer reviewed by the County's independent expert consultant. However, the DEIR acknowledges that without the implementation of a groundwater monitoring plan and well mitigation plan, the project could result in a significant impact to groundwater supplies.

## Response to Comment Grp 21-119

The commenter asserts that to properly comply with General Plan Policy 17.12, the applicant needs to complete a detailed water supply inventory for all wells within the mineral rights boundary including a buffer zone, investigate details for each well, and develop a plan for each well to ensure that immediate water supply can be provided. The proposed analysis suggested by the commenter is not warranted, because there is no evidence that drawdown could impact the entire mineral rights area, given that there is only gold mineralization in certain limited areas. Further, sensitivity studies used in the groundwater model to simulate expanded mining areas did not significantly change the drawdown impacts. Moreover, the groundwater model and water supply analysis included in the DEIR, along with the mitigation provided in Mitigation Measures 4.8-2(a) and 4.8-2(b), provide substantial evidence of the DEIR's conclusions and also provides compliance with General Plan Policy 17.12.

As stated in Section 3.0 of the GMP, the dewatering of the existing mine workings, prior to the commencement of actual mining, is analogous to a largescale pumping test that is a common tool in the field of hydrogeology to assess how drawdowns in the water-bearing zones, for example, the fractured bedrock at the project site, propagate with time as a result of pumping. Monitoring wells in closer proximity to the mine will generally experience drawdowns before wells farther away. The measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. As discussed in the Groundwater Monitoring Plan, 30 groundwater monitoring wells will be installed at 15 locations, not 15 monitoring wells. The locations of the monitoring wells are strategically placed between the mining zone and domestic wells to monitor the potential drawdown extent as the result of mining and assess the potential impacts on domestic wells. As discussed in Section 6.0 of Appendix K.3, after each monitoring well has been installed and developed, the wells will undergo a hydraulic test to obtain hydraulic-conductivity information. As discussed on pages 2-3 of the Groundwater Monitoring Plan (Appendix K.8 of the DEIR) assessment of impacts of water-level changes in domestic wells is difficult to perform when

examining each domestic well on an individual basis because of operational and depth considerations for each well.

The characteristics of domestic wells in the area are discussed in Sections 3.3 and 4.2 of Appendix K.2 of the DEIR. The example in the comment of "a monitoring well could be placed in proximity to an existing supply well and respond very differently to changing water levels in the mine during dewatering if a water-bearing bedrock fracture intersects on of the wells, but not the other" is speculative. This behavior of drawdown can only occur if there were continuous fracture networks that connect the mine with one of the wells. However, as discussed in Appendix K.2, mine workings are not connected to the wells by through-going fractures, but are instead interconnected by a complex pattern of many fractures present throughout the bedrock (page 81 Appendix K.2). Both EMKO's analysis and Itasca's model show that there is currently drawdown from the partially dewatered mine workings and that there will be drawdown from future dewatering. The evidence shows that the fractures are ubiquitous but are not large and continuous. Thus, the monitoring wells will encounter the same fracture networks as the domestic wells and the evidence against continuous fractures is strong. Domestic wells in each different area tend to behave in a similar way (as described in Sections 3.3. and 4.2 of Appendix K.2 to the DEIR).

As discussed in Section 3.3.2 and shown on Sheet 12 of Appendix K.2 of the DEIR, over 1,200 Water Well Driller Reports (also known as Well Completion Reports) available from the California Department of Water Resources (DWR)'s online database for private domestic wells are located within approximately one to two miles of the project site. Many of these wells are geolocated by property location in the DWR database while some are only located by the US Public Land Survey System (PLSS) township, range, and section. In areas within the predicted 1-foot drawdown from the groundwater model, wells with only general PLSS locations in the DWR database were matched to properties and plotted. The well database was also augmented with well data from previous applicant Emgold, which provides additional well information within the 1-foot drawdown isopleth that is not available in the DWR database. All available details about well construction and testing in the area of the 1-foot drawdown isopleth were reviewed and tabulated from the Well Completion Report or Emgold records and are provided and discussed in Section 3.3.2 of Appendix K.2., which are available for the majority of properties. The Well Mitigation Plan has been clarified to include measures to identify any wells not in the well database and gather individual well characteristics should an impact be predicted by the Groundwater Monitoring Plan. The revised Well Mitigation Plan is attached to the Final EIR as Appendix D. The commenter states that a complete inventory of domestic water wells within and beyond the mineral rights boundary is required for the analysis of the DEIR. However, wells outside the 1-ft drawdown were not specifically analyzed for impacts from mine dewatering because they would experience negligible drawdown and therefore would not be impacted by mine dewatering. More effort in including these wells in the well database would not change the analysis or conclusions of the DEIR and therefore is not required.

Nevertheless, as discussed in Master Response 15 – Adequacy of Groundwater Monitoring Wells, to provide property owners additional assurance regarding impacts of mine dewatering, a condition of approval will be imposed on the project requiring that monitoring of domestic water wells will be conducted upon request for property owners within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure

1 of Master Response 15. Some of these properties do not have a domestic water well but to ensure that well owners are not excluded all owners will be contacted by the Company.

## Response to Comment Grp 21-120

The Groundwater Monitoring Plan already incorporates the collection of 12 months baseline data from monitoring wells. The applicant has ownership of all previous well monitoring data conducted by Emgold from numerous domestic water wells in the area over multiyear periods. Additional detail has been added to the Well Mitigation Plan, which is attached to the FEIR as Appendix D for clarity of the measures that would be undertaken under this plan.

## Response to Comment Grp 21-121

The commenter asserts that the project will have significant impacts related to groundwater dependent biological resources. As discussed on page 121 of Appendix K.2 of the DEIR, discharge of treated water to South Fork Wolf Creek would prevent the lowering of the groundwater levels along the reach of South Fork Wolf Creek because the full dewatering volume would be discharged to the creek, whereas only a small fraction of the groundwater that was removed from the subsurface would come from that area. Thus, the potential increased recharge due to the enhanced base flow in South Fork Wolf Creek would more than offset any effects from dewatering in the area near the creek. Along Wolf Creek, the change in base flow would be a small percentage of the existing flow, with NID releases during the summer being a dominant factor in the dry season.

As discussed on page 3.31 of the DEIR, a buried 48-inch culvert crosses the Brunswick Industrial Site. The culvert transports off-site surface drainage from Brunswick Road and a portion of the watershed to the east and south of the Brunswick Industrial Site. South Fork Wolf Creek originates from the outlet of this 48-inch culvert. The primary source that feeds this section of the creek, upstream of the proposed discharge point, is therefore not associated with groundwater nearby the area.

As such, the project would not lower groundwater levels along the creeks, and consequently would not affect groundwater dependent biological resources. Please see Master Response 33 – Groundwater Dependent Vegetation.

## Response to Comment Grp 21-122

The commenter assumes that if the Centennial site was not available for fill placement that fill would be immediately hauled to offsite locations. However, if the Centennial site were not available, fill placement would take place initially at the Brunswick site rather than being hauled to local and regional construction projects. For the purpose of the Air Quality analysis, it was assumed that construction would start in 2021 which has already passed. It is not known when construction would actually start but it could not be before 2023, given the current project schedule. Construction has been assumed for the purpose of the analysis to take 1 year. The placement of fill at the Brunswick site would be placed over a duration of an estimated 6 years, immediately following the completion of construction. Based on the placement of fill at the Brunswick site rather than Centennial, on-road vehicle miles traveled (VMT) and associated emissions would be reduced for this initial phase of operations, as compared to the analysis included in the DEIR. However, assuming that the Centennial site was still not available after this time, offsite hauling of all materials, up to 60 miles one-way, would then commence in year 2033.

A realistic scenario therefore is to use the emissions rates presented for the year 2027 for NOx (see pages 215ff of the pdf document Appendix E.1) rather than the 2021 emission rates used in the commenter's provided calculation. Since logging and chipping at the Centennial site would not be taking place in this alternate scenario, this activity would be removed from the maximum daily NOx emissions. It should also be noted that the maximum daily NOx emissions are calculated for comparison to Northern Sierra Air Quality Management District (NSAQMD) thresholds, rather the annual emissions. As such, the analysis assumes 100 trips per day in the calculation of daily emissions rather than the average 50 trips per day for trucks hauling engineered fill.

Maximum daily project emissions of NOx for the Year 2027 of 100.2 pounds per day is shown in Table 16 of Appendix E.1. After removal of logging associated emissions (41 pounds per day) and on-site haul trucks (3.5 pounds per day – see pages 230 and 231 of Appendix E.1 pdf), the daily NOx emissions without any fill trucking is 55.7 pounds per day NOx. With the shift to off-site hauling, daily NOx for truck hauling would be 69.2 pounds per day, which can be calculated using the 2027 NOx emission rates (page 218 of Appendix E.1 pdf) and VMT, trips, and idling time for off-site hauling (2,190,700 VMT per year for fill haul trucks – see page 246 of the Appendix E.1 pdf). The total NOx emissions per day in this scenario would be approximately 125 pounds per day, which would be at NSAQMD significance threshold level B.

A similar analysis can be made for greenhouse gas emissions using the emission factors, annual VMT, and idling minutes contained within Appendix E.1 of the DEIR. Assuming hauling of all fill off-site starting in 2027, this scenario would result in a total of 9,800 metric tons $CO_2e$ per year, which would also be below the threshold of significance.

Based on the preceding considerations, this scenario, whereby the Centennial Site would not be available for fill placement, would not change the significance determination or conclusions presented in the D EIR for either criteria air pollutants or GHGs. Nevertheless, as noted in Master Response 4, a condition of approval shall be imposed on the project to require that in the event the Centennial Site is not immediately available for placement of engineered fill, that sand tailings or waste rock material transported offsite prior to 2033 would be transported using electric vehicles.

The County has determined that recirculation of the DEIR is not required as the factors set forth under CEQA Guidelines 15088.5 for recirculation are not met. Please see the Introduction chapter of this Final EIR for a more detailed discussion of recirculation criteria, pursuant to CEQA Guidelines 15088.5.

## Response to Comment Grp 21-129

Nighttime noise is thoroughly addressed in the project's noise study. Appendix B of the project noise study (DEIR Appendix L), presents the results of 50 individual days of noise surveys representing 24-hour noise level measurements (including every nighttime hour), conducted at 12 locations in the project vicinity. This extensive noise survey data was utilized to adjust the County's daytime, evening, and nighttime noise level standards to reflect the baseline ambient conditions so that noise impacts could be properly evaluated relative to County standards during ***all*** hours of the day. The results of those adjustments are contained in Table 6 of the project noise study. As noted in Table 9 of the project noise study, off-site hauling would be limited to the hours of 6 am to 10 pm, effectively avoiding the most sensitive nighttime periods when the potential for sleep disturbance would be greatest. The engineered fill activities occurring at both the Brunswick and Centennial Sites are proposed to occur between the hours 7 am - 3:30 pm, also avoiding the more sensitive nighttime hours. While nighttime processing operations are proposed at the Brunswick Site, the most significant noise-generating activities would occur within sound-treated buildings. Figure 10 of the project noise study clearly illustrates the nighttime noise generation of the Brunswick operations, illustrating that exterior noise levels during nighttime hours are predicted to be approximately 40 dBA or less at the nearest residences. Additional information pertaining to the more detailed comments contained in the Salter letter is provided in the specific responses to those comments below.

Table 17 of the project noise study contained in DEIR Appendix L inadvertently included predicted average (Leq) noise levels for engineered fill operations at the Brunswick Site in the column identified as maximum (Lmax) noise levels. This table was included as Table 4.10-14 of the DEIR. In addition, Table 16-A (Table 4.10-12 of the DEIR) and 17 of the project noise study inadvertently included preliminary, not final, modelling run results. These adjustments further affect the combined daytime noise Table 21 of the Noise Report (DEIR Appendix L), which is included in the DEIR as Table 4.10-19. Thus, Tables 4.10-12, 4.10-14, and 4.10-19 are hereby corrected in the Final EIR, as shown below.

**Table 4.10-12**
**Centennial Industrial Site: Engineered Fill Activity Noise Levels**

| Receptor | Minimum Distance | Predicted Noise Level | | Daytime Noise Criteria | | Criteria Exceeded? | |
|---|---|---|---|---|---|---|---|
| | | $L_{eq}$ | $L_{max}$ | $L_{eq}$ | $L_{max}$ | $L_{eq}$ | $L_{max}$ |
| 1 | 500 | ~~54~~56 | ~~61~~71 | 63 | 81 | **NO** | **NO** |
| 2 | 600 | ~~50~~52 | ~~60~~68 | 68 | 86 | **NO** | **NO** |
| 8 | 1000 | ~~44~~51 | ~~42~~65 | 55 | 75 | **NO** | **NO** |

Note: Engineered fill placement, grading and compaction activities would be limited to daytime hours. As a result, only the daytime criteria are utilized for the assessment of potential noise impacts for this activity.

In neither case did the corrected tables result in identification of exceedance of the project's standards at any of the nearest potentially affected noise-sensitive receptors. Additional information pertaining to the more detailed comments contained in the Salter letter is provided in the specific responses to those comments below.

The project proposes several specific measures designed to minimize the transmission of sound from project operations and equipment into the neighboring community. Preliminary noise impact analysis revealed that noise control measures would be required of certain aspects of this project to satisfy the County's noise standards at nearby residences. As a result, the applicant elected to incorporate such industrial noise control measures into the project design and description so as to avoid impacts from the outset. Such "pre-mitigating" of a project's noise generation is common practice. The statement that the project fails to include assurances that the project will not result in noise impacts is incorrect. In fact, an extensive noise monitoring program will be required by Mitigation Measure 4.10-3 of the DEIR upon project start-up and thereafter for the expressed purpose of assuring compliance with the County's noise standards and avoiding noise impacts. Additional information pertaining to the more detailed comments contained in the Salter letter is provided in the specific responses to those comments.

In response to the question as to how blasting at the Brunswick site would be 20 dB quieter at the surface than at the Sutter Gold Site, the commenter is directed to the third and fourth paragraphs of page 58 of the noise analysis prepared for the project. Those paragraphs specifically state that the Sutter Gold shaft is horizontal, whereas the Idaho-Maryland Mine shafts are vertical. In addition, the Idaho-Maryland Mine portals will be smaller than the Sutter Gold shafts. Finally, the Idaho-Maryland Mine portals will be enclosed in buildings providing at least 20 dBA of sound attenuation, whereas the Sutter Gold portal was not. The net effect of these differences is expected to provide blast noise levels of a minimum of 20 dB lower than those generated at Sutter Gold.

## Response to Comment Grp 21-130

Comment states that nighttime noise and sleep disturbance analysis should be included. As noted in the Response to Comment Grp 21-129 of this letter, nighttime noise is thoroughly addressed in the project's noise study. Appendix B of the project noise study (DEIR Appendix L) presents the results of 50 individual days of noise surveys representing 24-hour noise level measurements

(including every nighttime hour), conducted at 12 locations in the project vicinity. This extensive noise survey data was utilized to adjust the County's daytime, evening, and nighttime noise level standards to reflect the baseline ambient conditions so that noise impacts could be properly evaluated during all hours of the day. The results of those adjustments are contained in Table 6 of the project noise study.

As noted in Table 9 of the project noise study, off-site hauling would be limited to the hours of 6 am to 10 pm, effectively avoiding the sensitive nighttime periods when the potential for sleep disturbance would be greatest. The engineered fill activities occurring at both the Brunswick and Centennial Sites are proposed to occur between the hours of 7 am - 3:30 pm. While nighttime operations are proposed at the Brunswick Site, the most significant noise-generating activities would occur within sound-treated and insulated buildings. (DEIR 4.10-24.) Figure 10 of the project noise study (Figure 4.10-8 of the DEIR) clearly illustrates the nighttime noise generation of the Brunswick operations, disclosing that exterior noise levels during nighttime hours are predicted to be approximately 40 dBA or less at the nearest residences. Evaluations of sleep disturbance frequently focus on maximum instantaneous noise levels (Lmax), or sound exposure levels (SEL) for discrete individual events. As noted in project noise study Table 22 (Table 4.10-20 of the DEIR), predicted cumulative nighttime maximum noise exposure from all project noise sources would range from 15 dBA to 49 dBA Lmax at the nearest residences. These predicted nighttime maximum noise levels are an average of 39 dBA ***below*** the applicable nighttime maximum noise level standards. The closest any predicted maximum nighttime noise exposure would get to the applicable nighttime noise standard would occur at Receptor 16, where predicted maximum noise levels would be 19 dB ***below*** the applicable nighttime noise standard. These results confirm that significant nighttime noise impacts were not identified for this project and that additional analysis of nighttime noise exposure is unwarranted.

## Response to Comment Grp 21-131

Commenter believes the calculated noise level from engineered fill operations would be greater than modeled in the DEIR. A description of engineered fill placement and compaction operations is provided on DEIR page 4.10-31. As noted in the last paragraph of this page, "maximum noise levels were predicted based on the closest proximity of the heavy equipment to each receptor whereas average noise levels were predicted based on the assumption that the earthmoving equipment would be spread out on the project site". As a result, the distances to the receivers shown in Table 4.10-14 are used to compute maximum noise levels at the nearest receptors, but not average noise levels at those receptors. Average noise levels associated with engineered fill operations at both the Brunswick and Centennial sites were computed assuming the fill areas were "area" noise sources within the SoundPlan noise prediction model, thereby placing the collective noise center of the engineered fill operations further from the boundaries of the fill operations. A sound power level of 120 dBA was applied to the area noise source representing the engineered fill operations (see Lw value of 120 dBA in Appendix F of the project noise study (contained within Appendix L of the DEIR). Because average noise levels associated with engineered fill operations were computed assuming the equipment would be spread out on the site (as will actually occur), computed average noise levels associated with engineered fill operations will be lower than computed maximum noise levels associated with that same equipment operating at the closest point to the residences. Table 1 of the Salter letter (incorporated here by reference), provides Salter's computations of noise levels from an 85 dBA noise source associated with engineered fill operations. The levels computed by Salter are based

on a sound level decay rate of 6 dB per each doubling of distance from the noise source, which is consistent with spherical spreading of sound from a point source of noise. However, spherical spreading of sound is only one factor affecting the propagation and attenuation of sound over distance and Salter ignored all other factors affecting attenuation. Other factors affecting sound attenuation which were considered in the SoundPlan model, but which were ignored by the Salter computations, include: atmospheric absorption, shielding by intervening topography or structures, ground absorption, and attenuation caused by tree cover (which is extensive in the area). Another reason the Salter levels were computed to be so much higher than the average noise levels reported in Table 4.10-14 of the DEIR is that Salter is comparing their computed worst-case maximum (Lmax) sound levels against computed average noise levels (Leq), which is not a consistent, apples-to-apples, comparison and will, of course, present a skewed result. CEQA does not require a worst-case scenario analysis, especially one based on maximum sound levels and assuming all equipment will be at the same location.

## Response to Comment Grp 21-132

Please see Response to Comment Grp 21-131.

## Response to Comment Grp 21-133

In this comment Salter appears to be recommending evaluation of noise impacts relative to median (L50) or background (L90) levels at the nearest receptors. However, the footnotes to Nevada County General Plan Table 9.1 (Noise Standards), which is reproduced as DEIR Table 4.10-4, contains the County's requirements for evaluating compliance with the County's noise standards. Footnote a of GP Table 9.1 specifically states: "Compliance with the above standards shall be determined by measuring the noise level based on the **mean average** of not less than three (3) 20-minute measurements for any given time period. Additional noise measurements may be necessary to ensure that the ambient noise level is adequately determined (emphasis added). Although median (L50) and background (L90) noise levels are lower than average (Leq) noise levels measured during the project's ambient noise surveys, the County's noise standards are provided in terms of averages (Leq) and maximum (Lmax) noise levels, not in terms of median or background noise levels. As a result, the evaluation of ambient conditions for this project focused on average and maximum noise levels, consistent with County noise standards. It should be noted that median noise levels and certainly background noise levels generated during engineered fill operations would be considerably lower than predicted average noise levels for those operations. As such, an evaluation of the project's noise impacts relative to median or background ambient conditions would require utilizing the project's median and background noise generation for a consistent comparison. However, because the County's adopted noise level standards are written in terms of average and maximum noise levels, the impact evaluation conducted for the project appropriately utilized measured average and maximum noise levels to establish baseline ambient conditions, and an evaluation using other descriptors would be inconsistent with the adopted County noise policy.

Please also see Response to Comment Grp 12-28.

## Response to Comment Grp 21-134

This comment is similar to Comment Grp 21-133. As a result, the commenter is referred to the Response to Comment Grp 21-133.

## Response to Comment Grp 21-135

Commenter believes the DEIR underestimates the potential noise impact from mining. The applicant is proposing that the Sound Transmission Class (STC) 54 construction be utilized where identified in the noise study. It is clear from the DEIR noise analysis that noise control measures would not only be required of this operation but that the applicant is proposing to implement those measures as part of project design and made a condition of approval of the project. (DEIR 4.10-24.) As such, the DEIR does provide the type of disclosure being requested in this comment. Please also see Response to Comment Grp 21-52.

## Response to Comment Grp 21-136

Comment is concerning the use of an industrial silencer to provide sound attenuation for the ventilation fans. This comment is similar to Comment Grp 21-135. As with Comment Grp 21-135, the applicant is aware that high-performance industrial silencers would be required for the ventilation fans. As noted in this comment and as stated on Page 4.10-41 of the DEIR, "This reference noise level was projected to the nearest representative receptors to the Brunswick Industrial Site, including the effects of a **silencer providing comparable sound attenuation as the other industrial buildings proposed at the site** (emphasis added). Hence, the DEIR discloses that an industrial silencer is proposed for the shaft ventilation fans.

## Response to Comment Grp 21-137

The commenter is concerned with the description of the water treatment plant components provided by the Project Applicant, and whether it is consistent with the project plans, which it is. (DEIR p. 4.10-42.) The 90 dBA noise level at a distance of 5 feet suggested in the Salter comment is irrelevant as the proposed water treatment plant building will be 8,500 square feet in size. Although noise levels within the water treatment plant building could perhaps reach 90 dB at a distance of 5 feet from certain operating equipment, the overall levels within the large building would be far lower. Based on the size of the building, interior noise levels within the water treatment plant building were projected to be approximately 75 dBA. The Salter comment fails to recognize that the predicted noise level of 28 dBA (or less) from the water treatment plant would be 27 dB ***below*** the nighttime noise level standard applicable at the nearest residence. As such, even using Salter's erroneous assumption that sound levels inside the water treatment plant would be 15 dB louder than identified in the DEIR, the resulting levels at the nearest residence would still be 12 dB ***below*** the applicable nighttime noise level standard at the nearest residence. Drawing C-100 and C-101 of Appendix K.4 of the DEIR shows the proposed location of mechanical equipment associated with the water treatment plant. As shown on Drawing C-100, the air/compressor blower for the aerator and the solid separation system are located in their own isolated room, which will allow for extensive enclosure for noise mitigation. Two finish water pumps are located outside of the water treatment building. These pumps would likely be centrifugal pumps and could be enclosed for noise attenuation, if necessary. A submersible pump would be located on the south end of the water treatment pond where an existing metal platform and vertical culverts designed for pump placement are present. This vertical culvert structure provides noise attenuation and could be further improved by installing a cover. The submersible pumps would likely be fully submerged underwater which further attenuates noise from the pump. The exact specifications of all equipment types and engineered enclosure are either not known at this time or could change. It is for this reason that CEQA does not require every piece of equipment to be specifically identified, only that the equipment be commercially available. Engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare*

(1999) 70 Cal.App.4th 20, 26.). Furthermore, Mitigation Measure 4.10-3 requires a comprehensive noise monitoring program to be conducted of each facet of the operation to verify the modelling assumptions of the project and to ensure that compliance with the applicable Nevada County noise standards is being achieved at nearby sensitive receptors. If results indicate that noise standards are being exceeded, operations shall cease until additional engineering controls can be implemented, as needed. The required mitigation measure will therefore ensure that any necessary engineering controls for reduction of noise from the compressor are implemented for the project.

As stated on page 4.10-43 of the DEIR, noise level measurements conducted by Bollard at the Auburn California Wastewater Treatment Plant determined that noise levels of approximately 50 dBA were recorded at a distance of 500 feet from the plant. This noise was generated primarily by pumps and an aeration system and therefore has some similarities to the proposed water treatment plant for the project. Based on a reference level of 50 dBA at 500 feet, the predicted level at the nearest residence 900 feet away would be approximately 45 dBA even without the building. This level would be satisfactory relative to the 55 dBA Leq nighttime noise level standard applicable at the nearest residence. Nonetheless, the water treatment plant building is proposed to be constructed of sound attenuating materials, as disclosed in the noise study prepared for the DEIR, to ensure compliance with County noise standards.

As such, no additional analysis of water treatment plant noise generation or revisions to the DEIR are considered to be warranted.

## Response to Comment Grp 21-138

The comment states that all equipment must be specifically identified in the DEIR. As noted on Page 4.10-43 of the DEIR, the four diesel generators will be located inside of the generator building, and would be used for emergency power during interruptions to grid power from PG&E. The overall noise level within the generator building is estimated in the DEIR as being 105 dBA. The applicant is proposing that the STC 54 construction identified in the noise study Appendix D be utilized for this building and has incorporated the STC 54 rating into the project design. It should be noted that there are options for specific components of the generator and other project equipment, and because current equipment models may change by the time specific orders are placed for that equipment, the exact specifications of all equipment types are either not known at this time or could change. It is for this reason that CEQA does not require every piece of equipment to be specifically identified, only that the equipment be commercially available. Engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.). However, the estimated noise generation of the various equipment types are based on equipment substantially similar to that which will ultimately be utilized for the project. Generator enclosures, mufflers, and cooling air silencers are also commonly manufactured and can reduce noise from generators substantially in addition to the noise attenuation of the building. For example, a 1.2 MW Triton enclosed generator is reported to have a noise level of 70 dBA[10] at 7m distance. This is substantially les than the 105 dBA assumed in the analysis of the DEIR. Furthermore, Mitigation Measure 4.10-3 requires a comprehensive noise monitoring program to be conducted of each facet of the operation to verify the modelling assumptions of the project and to ensure that compliance with the applicable Nevada County

[10] https://tritonpower.com/wp-content/uploads/2022/04/1425kVA-Triton-Rental-Grade-Diesel-Generator-TP-RV1425-T4F-RENTAL-TWIN-PACK.pdf

noise standards is being achieved at nearby sensitive receptors. If results indicate that noise standards are being exceeded, operations shall cease until additional engineering controls can be implemented, as needed. The required mitigation measure will therefore ensure that any necessary engineering controls for reduction of noise from the compressor are implemented for the project.

## Response to Comment Grp 21-139

Page 4.10-43 describes the general parameters of the mine air compressor. Similar construction is proposed for the compressor building as for the generator building and other noise-generating components of the project. More specific information is not required by CEQA as engineering level detail is not required in an EIR. (*Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.) Large compressors used for underground mine air are sophisticated machines and enclosed units which provides noise attenuation without consideration of the building itself. For example, a 7 bar Atlas Copco compressor with 3,200 CFM capacity is reported to have a noise level of 75 dBA[11] at the workstation of the compressor. This is substantially les than the 110 dBA assumed in the analysis of the DEIR. Furthermore, Mitigation Measure 4.10-3 requires a comprehensive noise monitoring program to be conducted of each facet of the operation to verify the modelling assumptions of the project and to ensure that compliance with the applicable Nevada County noise standards is being achieved at nearby sensitive receptors. If results indicate that noise standards are being exceeded operations shall cease until additional engineering controls can be implemented, as needed. The required mitigation measure will therefore ensure that any necessary engineering controls for reduction of noise from the compressor are implemented for the project.

## Response to Comment Grp 21-140

The County's approval of the project would not grant the applicant the ability to generate noise at ***any*** level in the neighboring community. Rather, the community will be protected against the potential for ***excessive*** noise by virtue of the fact that the applicant will be required to demonstrate compliance with the County's noise standards through a detailed noise monitoring program, which is a mitigation measure (Mitigation Measure 4.10-3) and will be a condition of approval for the project. As noted in the DEIR (page 4.10-43), the concrete sleeve of the silo and the headframe building is predicted to substantially reduce maximum noise levels generated by shaft-skipping operations. In addition to the steel cladding used to construct the headframe, the STC 54 metal building walls would provide additional attenuation of this noise source. The estimated shaft-skipping noise level is predicted to be attenuated to levels below 50 dBA Lmax at the nearest residences, which would be satisfactory relative to the County's applicable nighttime noise level standards.

## Response to Comment Grp 21-141

The comment states that without requiring noise reducing measures it fails to protect the area from excessive noise. As stated above, the noise reducing measures, or “upgrades” as referred to by the commenter, are incorporated into the project design and the project is only approved with those upgrades included. Additionally, the conditions of approval for the project will require these measures. Please see Response to Comment Grp 21-52.

[11] https://www.atlascopco.com/content/dam/atlas-copco/compressor-technique/oil-free-air/documents/ga-355-500/2935036820%20GA%20355-500%20leaflet%20EN%20Antwerp_LR.pdf

## Response to Comment Grp 21-142

Commenter opines that it does not agree with the DEIR's analysis regarding blasting vibrations. Please see Responses to Comments Grp 21-143 and Grp 21-144.

## Response to Comment Grp 21-143

The project does not expose residents to 0.4 in/sec vibrations on a regular basis for the rest of their lives. Blasting activities are intermittent. As discussed in Chapter 4.10-4 of the DEIR and the PBS Technical Report, a maximum of 0.23 inches per second vibration is modelled where a longhole blast could occur directly beneath a receptor at 500 feet depth. Notwithstanding the rarity of this situation, such a blast might occur every three or four days between shift changes (7AM and 7PM) and would last for only seconds. This level of vibrations is approximately half of the 0.4 inches per second the commenter defines as "borderline unpleasant" based on Figure 3.10 from Bulletin 656. This level of vibrations would be "distinctly perceptible" and approximately 1/5$^{th}$ of the level considered "mildly unpleasant" based on the Caltrans table of human response to blasting ground vibration provided by the commenter. At 500 feet depth and a horizontal offset of 1,400 feet, such a longhole blast would be undetectable by blasting seismograph (PPV <0.05 in/sec).

Regular drift round blasting, occurring approximately twice daily over several seconds, are modelled to result in a maximum of 0.14 inches per second vibration at a depth of 500 feet directly beneath a receptor. At 500 feet depth, and a horizontal offset of 900 feet, a drift round blast would be undetectable by blasting seismograph (PPV <0.05 in/sec).

Historic mining was completed to approximately 1600 feet depth and the majority of future mining would be below the historic mine. At this distance, regular drift round blasting and longhole blast would be undetectable by blasting seismograph (PPV <0.05 in/sec) at receptor locations directly above the blast location. Commenter's characterization of blasting activities and vibration is misleading, assuming a near constant, standard and uniform ground vibration, but is contradicted by both the Technical Blasting Report and DEIR. As commenter states, 0.4 in/sec vibration limit might be appropriate in a short-term event. Episodic underground blasting no more than twice per day is a short-term event.

## Response to Comment Grp 21-144

The comment suggests restrictions on evening and nighttime blasting vibration operations. Commenter fails to note that the project is not subject to regulations under the Surface Mining Control and Reclamation Act of 1977, which deals *exclusively* with the regulation of surface coal mining operations. Non-coal mining is regulated by each State under its own laws and regulations. Given the foregoing, it is not surprising that the OSMRE Blasting Guidance Manual also applies exclusively on surface blasting to uncover surface coal deposits. There is no analogy that can be drawn between surface blasting a coal mine under federal regulations and minor blasting 1600 feet underground under state regulations.

Blasting noise is discussed in Chapter 4.10-3 of the DEIR and the worst-case maximum noise levels at the nearest noise-sensitive receptors would range from 52 to 57 dBA Lmax. The range of predicted worst-case blasting noise levels of 52 to 57 dBA Lmax is below the daytime, evening, and nighttime dBA Lmax criteria at the nearest receptors.

As discussed in Chapter 4.10-4 of the DEIR and the PBS Technical Report, a maximum of 0.23 inches per second vibration is modelled where a longhole blast could occur directly beneath a

receptor at 500 feet depth. Historic mining was completed to approximately 1600 feet depth and the majority of future mining would be below the historic mine. At this distance, regular drift round blasting and longhole blast would be undetectable by blasting seismograph (PPV <0.05 in/sec) at receptor locations directly above the blast location. Please see Response to Comment Grp 21-143.

As described in the PBS Technical Report, blasting normally occurs between shift changes at approximately 7AM and 7PM. This is normal practice in underground mining so that work heading can be ventilated before the new crew arrives at their work area. Minor blasting (such as misholes in drift rounds) could be done periodically during work shifts but would be only a single hole per delay versus the four assumed in the PBS Technical Report for drift round blasting, and consequently, would result in only 25% of the vibration produced by drift round blasting.

## Response to Comment Grp 21-145

Commenter suggests that the noise study does not substantiate its conclusions regarding noise at the Brunswick site portal. On Page 58 of the project noise study (DEIR Appendix L), the following statement from the project blasting analysis is quoted in the discussion of air overpressure caused by underground blasting: "Air overpressure is caused by numerous factors including the explosive detonation, movement, and collapse of a mine face which are in open air. In underground mining, especially the type proposed at the Idaho-Maryland Mine, there would be no air overpressure produced on the surface. The blast would not cause this pressure wave to form or an audible sound produced. **The air overpressure from the underground blasting at the proposed mine would be zero**." (Emphasis added by BAC). As noted in the study, and in light of this statement, the conditions at the Sutter Gold Mine while informative in the study's conclusions, differ significantly from the Idaho-Maryland Mine. The assessment of maximum blasting noise levels at the mine surface based on blasting measurements conducted at the Sutter Gold Mine site is considered to be very conservative.

In response to the question as to how blasting at the Brunswick site would be 20 dB quieter at the surface than at the Sutter Gold Site, the commenter is directed to the third and fourth paragraphs of page 58 of the noise analysis prepared for the project (DEIR Appendix L). Those paragraphs specifically state that the Sutter Gold shaft is horizontal whereas the Idaho-Maryland Mine shafts are vertical. In addition, the Idaho-Maryland Mine portals will be smaller than the Sutter Gold shafts. Finally, the Idaho-Maryland Mine portals will be enclosed in buildings providing at least 20 dBA of sound attenuation, whereas the Sutter Gold portal was not. The net effect of these differences is expected to provide blast noise levels of a minimum of 20 dB lower than those generated at Sutter Gold.

**Group Letter 22**

March 30, 2022

To: Matt Kelley, Senior Planner
Nevada County Planning Department Staff
950 Maidu Ave, Suite 170
Nevada City, CA 95959

Email: matt.kelley@co.nevada.ca.us
DEIR Comment Email: idaho.mmeir@co.nevada.ca.us

**Grp 22-1**

The Sierra Foothills Audubon Society's mission is to educate ourselves and others to the variety and beauty of our natural environment and protect our wildlife and natural places. We are located in Nevada County and have over 1,000 members in Nevada County, Placer County, and Yuba County.

We are writing in response to the Draft Environmental Impact Report for the Idaho-Maryland Mine Project.

**Biological Resources**

Sierra Foothills Audubon has been supporting a bird banding study by Gold Country Avian Studies since 2018 at the Bennett Street Grasslands banding station within 1/2 mile from the proposed Idaho-Maryland Mine.

Section 4.4-2 of the DEIR states: "Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status wildlife species in local or regional plans, policies, or regulations, or by the CDFW or USFWS. Based on the analysis below and with implementation of mitigation, the impact is less than significant."

**Grp 22-2**

Page 4.4-31 -The only avian species called out in this section is the California Black Rail
Note: The landmark Rosenberg et al. study indicating that we have lost ~30% of our birds in the last 50 years, so we must not take actions that will put more bird species on a special status.

*Page 4.4-38* "California black rail (Laterallus jamaicensis coturiculus) – CA State Threatened California black rail inhabits freshwater marshes, wet meadows and shallow margins of saltwater marshes bordering larger bays. The species requires water depths of approximately one inch that does not fluctuate during the year and dense vegetation for nesting habitat. Centennial Industrial Site: The species has been identified within five miles to the southeast and southwest of the Centennial Industrial Site. Suitable habitat for this species occurs within the large marsh wetlands within the eastern section of the Centennial Industrial Site, though these are anticipated to be removed during remediation activities. Nevertheless, as previously discussed, this action has already been analyzed in an independent CEQA document with DTSC as the lead agency.

However, out of an abundance of caution, in the event that the currently proposed remediation boundary limits were somehow modified by DTSC prior to commencement of remediation, this EIR addresses the possibility that some amount of freshwater emergent marsh wetland habitat may remain on the Centennial Industrial Site post-remediation."

We do not see the Draft EIR addressing actions for protecting habitat for this species.

**Grp 22-3**

Gold Country Avian Studies has submitted to the county, California Natural Diversity Database (CNDDB) detections of special status species in an email to county planner Matt Kelley on March 10, 2021 and attached a zip file of pdfs all submissions and a list of all bird species detected and captured at the site. There have been over 15 separate Special Status detections (of one or more individuals) submitted to CNDDB. A physical list of those detections was provided to all planners in a folder at the meeting.

The data indicates that the SF Wolf Creek may be used regularly during migration season by the endangered Willow Flycatcher, and species of special concern – Olive Flycatcher, Yellow-breasted Chat and Yellow Warbler.

*Empidonax traillii* willow flycatcher
State rank: S1/S2; critically imperiled/imperiled in the state at subspecies level (State listing of the full species includes all subspecies.)
CESA (California Endangered Species Act): Endangered
USFS: Sensitive
USFWS: Bird of Conservation Concern

*Contopus cooperi* olive-sided flycatcher
State rank: S3 vulnerable
CDFW: Species of Special Concern
IUCN: Near Threatened
NABCI: Yellow Watch List
USFWS: Bird of Conservation Concern

*Icteria virens* yellow-breasted chat
State rank: S3 = Vulnerable
CDFW: Species of Special Concern

*Setophaga petechia* yellow warbler
State rank: S3/S4 Vulnerable
CDFW: Species of Special Concern
USFWS: Bird of Conservation Concern

The DEIR must include recognition of these species as Special Status and protect them accordingly.

We ask that Rise Gold perform studies in all seasons to verify species that could be impacted by the mine both at Centennial and east Brunswick.

**Grp 22-4**

The Madrone Peer Review Report produced from a request of Raney concluded on page 8 for Cooper's Hawk that "for consistency we would recommend that the author add a sentence regarding the species' potential to occur within the study area. We feel that the potential to occur is high." Please add that sentence to the DEIR.

**Hydrology and Water Quality**

Mine Dewatering

**Grp 22-5**

Page 4.8-32 "As previously discussed, the proposed project includes mine dewatering and discharge of the treated groundwater to the South Fork Wolf Creek."

There is no discussion of impacts to avian species that changes in the volume and quality of water will have on the food obtained from the riparian habitat. The DEIR should address this issue.

**Noise and air quality**

Table 4.3-11 indicate 36,500 Engineered fill trucks trip per year plus 120,788 employee trips per year. This additional traffic on Centennial Drive and East Bennett Roads will cause excessive noise and air quality impacts that would affect nesting birds in the area.

**Grp 22-6**

In a study published in the January 2016 Proceedings of the National Academy of Sciences, researchers found that adults and nestlings of three bird species including the Western Bluebird showed multiple signs of chronic stress caused by noise pollution, including skewed stress hormone levels, due to increased anxiety, distraction, and hypervigilance.

The DEIR should address this issue.

Thank you for your consideration of these comments.

Donald L Rivenes

Donald L Rivenes
rivenes@sbcglobal.net
Conservation Chair
Sierra Foothills Audubon Society

## GROUP LETTER 22: DONALD RIVENES, SIERRA FOOTHILLS AUDUBON SOCIETY

### Response to Comment Grp 22-1
Comment noted. This is an introductory comment and does not pertain to an environmental issue in the DEIR.

### Response to Comment Grp 22-2
Please see Master Response 37 - Birds and Raptors. As noted by the commenter, the California black rail was analyzed in the DEIR and Mitigation Measure 4-4.2(d) was provided to mitigate potential impacts. Note that the California Black Rail was considered to have a very low likelihood of presence onsite. The imposed mitigation measure requires both preconstruction surveys and preparation of a watercourse/wetlands/riparian management plan. The project has been designed to limit potential impacts to the riparian areas surrounding Wolf Creek and South Wolf Creek and no specific habitat protection measures are provided beyond the mitigation measures identified in the DEIR. Given the limited amount of surface disturbance to riparian areas that are commonly utilized by the California black rail, the very low likelihood of presence on the site, and implementation of the mitigation measures, this impact is considered less than significant.

### Response to Comment Grp 22-3
Please see Master Response 37 - Birds and Raptors.

### Response to Comment Grp 22-4
Comment noted. The DEIR already concluded that "[t]he Centennial Industrial Site and Brunswick Area contain many larger trees, several of which contain suitable habitat for nesting raptors, including suitable nesting sites for Cooper's hawk." (DEIR p. 4.4-76.) As such, potential for presence was already acknowledged by the DEIR, and the DEIR then concluded that "on-site removal of vegetation could result in adverse effects to nesting raptors and other birds protected under the MBTA should they be nesting on-site prior to commencement of construction." (Id.) As such, a potential impact to this species was already assumed by the DEIR. Mitigation Measure 4.4-2(g) was therefore included requiring preconstruction surveys and buffers from nests if the species is present.

### Response to Comment Grp 22-5
Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

### Response to Comment Grp 22-6
Noise impacts to wildlife and bird species was analyzed in Impact 4.4-2 and determined to be less than significant. Air Quality impacts were assessed in Chapter 4.3 of the DEIR and were found to be less than significant. The commenter provides no evidence that the project's incremental increase in regional emissions would cause significant impacts to bird species.

**Group Letter 23**

Re: Idaho-Maryland Mine Project Draft EIR comments

To: Matt Kelley, Senior Planner

From: Barbara Rivenes, Sierra Nevada Group/Sierra Club

**Grp 23-1** The Sierra Nevada Group of the Sierra Club has concerns about the Idaho-Maryland Mine re-opening in Nevada County. Some of our Group has worked with Community Environmental Advocates Foundation on their research of the Idaho-Maryland Mine Draft Environmental Impact Report findings. We would like to associate our comments with their submitted DEIR comments. However, we also have a few more specific comments and discussion to add here.

**Grp 23-2** As part of the Sierra Club which is our nation's largest and most influential grassroots organization with millions of members and supporters, the Sierra Nevada Group serves approximately 1400 members in Nevada, Yuba and Sierra counties. Our mission includes working to promote clean energy, safeguard the health our communities and protect wildlife through activism, public education, lobbying and legal action.

The California Environmental Quality Act (CEQA) is an important tool to help communities understand the scope and impact of a project being proposed. As such, it requires that all the information regarding the proposed project be examined and found to be complete and answer all the questions that could arise should the project be approved. In the case of the Idaho-Maryland Mine re-opening, clearly a large industrial venture will pose a considerable impact on its rural residential neighbors and the nearby city.

**Grp 23-3** The release of the Idaho-Maryland Mine DEIR enumerated the number of impacts the re-opening would have. That number was a staggering 83 potential impacts with 3 that would not be able to be mitigated and the other 80 were considered to be significant or less than significant and could be successfully mitigated below that level.

Following are a few of the incomplete and inadequate responses to the impacts raised in the Draft EIR and ones that we have serious concerns regarding.

**Grp 23-4**

**CEQA issues**: CEQA requires the DEIR to identify the whole of the project's activities as a single and complete project in order to analyze its potential impacts. The full project includes the use of the toxic laden Centennial property as a repository for "engineered fill" from the mine. It assumes that the property will have been cleaned up in advance, but does not discuss this clean-up and its impacts as part of the project. Those environmental impacts rightfully need to be described, enumerated and counted as part of the entire project. A CEQA requirement is to identify the "whole" of the project as single and complete project and should not have parts excluded. It could lead to an underestimation of impacts and not inform the public of the actual harm this project could cause.

The Centennial cleanup is not a stand alone project and the considerable impacts of grading, traffic, air quality and wetland disturbance associated with it should be added to the project as a whole. It is a serious failure of the Draft EIR not to have incorporated the impacts of the Centennial site cleanup as part of the project.

**Grp 23-5**

**Noise**: Calculations regarding the changes in noise levels in the Brunswick industrial site where the actual mine entrance is located along with various mine and waste processing, two silos, mine dewatering and filtration pond, truck loading and unloading and most of the employees was found in the DEIR calculations not to exceed normal decibels. The project's location is surrounded by a rural residential neighborhood with generally low ambient noise thresholds.

An expert in noise and vibration analysis noted that this project includes many operations that will occur at nighttime hours. In addition, many of the nearby sensitive receptors are located away from notable sources of ambient noise and therefore receive very low nighttime background noise. The project's noise levels could be 20 to 35 decibels louder than the current median/background ambient noise levels, causing a severe impact. The DEIR fails to address sensitive receptors located farther away.

**Grp 23-6**

**Groundwater**: Groundwater resources are extreme concern. The proposed Project would significantly affect local groundwater resources by dewatering the mine thereby lowering groundwater levels. The DEIR recognizes that 242 well owners will be affected, but assumes others in the vicinity will not be dramatically effected, but merely have their wells lowered a couple of feet. Looking forward to positive indications of drought and future climate change, this arbitrarily low impact threshold is invalid.

**Grp 23-7**

The mitigations proposed are inadequate with respect to the number of affected well-owners in the large area of uncertainty. Monitoring should be required for at least three years.

**Grp 23-8**

Further, the groundwater modeling done for the DEIR is limited to a very narrow region. More basic data needs to be gathered and a valid groundwater hydrological model must be built. These and other pressing groundwater issues need to be rectified in the DEIR and possibly recirculated.

The above are just a few of the 83 impacts which have not been adequately addressed by the proponents.

**Grp 23-9**

**Conclusion**: 482 citizens came to a Planning Commission meeting on the Idaho-Maryland DEIR and about 100 people spoke. Each shared their legitimate concerns about either the inadequacies of the report or of the outsized impact that a large industrial project will have on some neighborhoods in particular or the ambience of the area in general.

Machines rumbling around beneath homes, blasting, trucks laden with toxic dust particles (impossible to contain), nighttime noise/glare, 7 stories of "engineered fill" on two properties within ¼ mile of a city of 36,000 people.

**Grp 23-10**

A creek, Wolf Creek and South Fork Wolf Creek, borders each of these mine properties and will be impacted by dewatering and being used as a conduit for used mine water.

The overall environmental damage is significant and cannot be adequately mitigated.

Thank you for your attention to my comments on behalf of the Sierra Nevada Group of the Sierra Club.

Barbara L. Rivenes

Barbara Rivenes, Vice-chair

## GROUP LETTER 23: BARBARA RIVENES, SIERRA NEVADA GROUP OF THE SIERRA CLUB

### Response to Comment Grp 23-1
This is an introductory comment. The commenter acknowledges their concurrence with comments provided by Community Environmental Advocates. Please see responses to Group Letters 7 and 8. Responses to specific comments are provided below.

### Response to Comment Grp 23-2
The commenter provides a summary of its membership and mission. Comment noted.

### Response to Comment Grp 23-3
The commenter expresses general concerns regarding the project and the findings of the DEIR. Please see Master Response 1. The commenter's specific comments are addressed below.

### Response to Comment Grp 23-4
The commenter states that the Centennial cleanup is not a separate project. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Grp 23-5
The commenter states that an expert in noise noted that the project noise levels could be 20 to 35 decibels louder than current ambient noise levels, causing a severe impact. Please see Response to Comment Grp 21-130 and 21-133. The commenter states that the DEIR fails to address sensitive receptors located father away but provides no information on these sensitive receptors. Noise impacts to sensitive receptors have been appropriately evaluated in the DEIR. See Chapter 4.10 of the DEIR.

### Response to Comment Grp 23-6
The commenter mischaracterizes the DEIR when stating that the DEIR "recognizes that 242 well owners will be affected" by the project. The analysis of the DEIR concludes that proposed mining operations could result in significant effects to seven domestic water supply wells (see page 4.8-66 of the DEIR).

The commenter states the threshold for impact to domestic water wells used in the DEIR is invalid due to drought and climate change. Please see Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. The commenter asserts that the impact threshold used to determine significant dewatering impacts is "arbitrary" and "invalid" but does not suggest a different threshold nor explain why the threshold is inappropriate. The commenter implies that a drawdown of a few feet would be significant, but a drawdown of this level would likely have no impact on groundwater well function. In addition, as noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

### Response to Comment Grp 23-7
The commenter states that mitigation for well owners is insufficient and monitoring should be required for at least three years. Please see Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change. As noted in Master Response 15, the applicant has provided

a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Grp 23-8

The commenter states that more data needs to be gathered to build a valid groundwater model. Please see Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 16 - Drought and Climate Change.

## Response to Comment Grp 23-9

The commenter states that other impacts in the DEIR have not been adequately addressed and other commenters have concerns with the DEIR and the project. The commenter provides no specifics on these inadequacies and is directed to Section 4 of the DEIR and Master Response 1. The commenter's specific comments are addressed above in Responses to Comments Grp 23-1 to Grp 23-8.

## Response to Comment Grp 23-10

This is primarily a conclusory comment. For concerns related trucks and dust, see section Impact 4.3-2 of Chapter 4.3, and Mitigation Measure 4.3-2 (Asbestos Dust Mitigation Plan) of the DEIR. The commenter's opposition to the project will be provided to the County decision makers for their consideration.

**Group Letter 24**

Jeff Lauder, PhD
Executive Director
Sierra Streams Institute
117 New Mohawk Rd., Suite H
Nevada City, CA 95959

April 4th, 2022

Mr. Matt Kelley
Senior Planner
Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902 (530) 265-1423
Via email: Idaho.MMEIR@co.nevada.ca.us

Mr. Kelley:

SSI is a regional watershed science organization based in Nevada City, California, dedicated to increasing watershed stewardship capacity throughout the Sierra Nevada region.

Our mission is to promote scientific knowledge and stewardship of Sierra Nevada watersheds through research, restoration, education, and community science.

**Grp 24-1**

We work with local, state, and federal agencies as well as universities and community groups to find solutions to the problems that afflict Deer Creek, Bear River and other watersheds throughout the region that share the challenges resulting from a century and a half of gold mining, development, and agriculture. SSI's emphasis on rigorous science and consistent data collection provides the basis for restoration decisions that are made on behalf of watersheds, and makes us an especially valuable partner of local, state and federal government agencies who lack the funding and capacity to gather their own data.

The following letter summarizes Sierra Streams Institute's (SSI) comments on the Draft Environmental Impact Report (DEIR) that relate to some of our areas of research and expertise.

**Grp 24-2**

1. The hydrologic analyses of the impacts of flow from dewatering discharges to the South Fork of Wolf Creek are insufficient to assess effects on the benthic aquatic life of the stream, and need to provide data on the existing conditions upstream and downstream of the point of discharge (reference to Chapter 4.8 of the DEIR) and the effects of long-term sustained high flows from dewatering discharges to this small creek.

SIERRA Streams INSTITUTE

**Grp 24-3**

2. Chemical analyses given in Tables 4.8-2 and Appendix K2 Table 3.6 are incomplete and inadequate to evaluate toxicity of the mine dewatering effluent before and after treatment and must report real values with improved analytical detection methods and value ranges from locations throughout the drowned mine workings.

**Grp 24-4**

3. The long-term impact of Arsenic (As) is of concern since it is a human carcinogen and aquatic toxin. Figure 4.7-1 indicates that less than half of the Brunswick site was sampled for toxic metals. The number of samples and data on As levels in current mine water, as well as levels of As in existing rock and tailings at the Brunswick site are insufficient. Page 590 and Figure 4.7-1 discusses elevated levels of As at one part of the Brunswick site. The report says "*the material beneath this southeastern paved area was likely imported to the site and did not originate from mining operations at the Brunswick Mine Shaft*". This is speculation and more areas of the site need to be assessed for toxic metals including As.

**Grp 24-5**

4. The DEIR fails to address the hazardous conditions of the Centennial site and respective actions. Hazardous levels of As, lead, nickel, cyanide (free), nickel and mercury (a neurotoxin) are located in the soil of the Centennial site. There is currently no proposed plan in the DEIR that connects the cleanup of this site to its proposed use for depositing engineered fill. Heavy metal content of the engineered fill is needed to properly assess risk. Long-term contamination should be a concern for water resources and appropriate handling is required. Of note is that post-project Superfund cleanup of nearby Lava Cap site has cost more than one million dollars per year so far for the past decade. Centennial cleanup would likely be similar in expense (cost estimates come directly from EPA).

Thank you for consideration of our comments

Sierra Streams Institute

117 New Mohawk Rd. Ste. H Nevada City, CA 95959 (530) 470-6037

## GROUP LETTER 24: JEFF LAUDER, SIERRA STREAMS INSTITUTE

### Response to Comment Grp 24-1
Comment noted. This is an introductory comment and does not provide a comment on an environmental issue associated with the project.

### Response to Comment Grp 24-2
Please see Master Response 35 - Discharge to South Wolf Creek and Master Response 36 - Flows in South Fork Wolf Creek. As explained in detail in those Master Responses, discharge into South Wolf Creek was extensively analyzed looking at the potential degradation of water quality, increase in erosion, and increase in flow. These impacts were all considered less than significant. Please also see Response to Comment 31-12 regarding benthic macroinvertebrates.

### Response to Comment Grp 24-3
The commenter characterizes the chemical analysis information provided in DEIR Chapter 4.8, Hydrology and Water Quality, as "incomplete and inadequate" but does not provide explanation. Subsection 4.8.4 of Chapter 4.8 provides a summary of the groundwater sampling used to analyze existing water quality and identify water treatment measures. A detailed discussion of groundwater sampling to characterize existing water quality is found in section 3.4, Water Quality, of Appendix K2, "Groundwater Hydrology and Water Quality Analysis" prepared by Dr. Andy Kopania of EMKO Environmental. As discussed in these two documents, groundwater samples occurred on three separate occasions to identify overall water quality. Samples were taken from various depths within the New Brunswick shaft and from the drains where groundwater drains from underground workings. Water quality sampling locations are found on Sheets 2 and 3 of Appendix K2. Water samples were provided to California Laboratory Services, a lab certified with the California State Water Resources Control Board (SWRCB), to conduct the analysis. Appendix K2, Tables 3.5 – 3.9, provide the field parameters measured and laboratory analytical results for the samples collected. The result of the water sampling provided in these tables are "real values" based on extensive and representative sampling of the existing groundwater.

### Response to Comment Grp 24-4
Please see Response to Comment Grp 24-3 above regarding water sampling conducted for this project.

The commenter questions whether sufficient analysis of arsenic was conducted. Please see Master Response 10 - Explosives, Reagents, and Brunswick Fill. As explained in DEIR sections 4.7.4 and 4.7.2, a Phase I and II was conducted by NV5 and a second Phase I was conducted by the County's consultant, ECM. As stated on DEIR page 4.7-20, the overall purpose of the Phase I and II studies "was to provide Nevada County with knowledge of the full range of environmental issues and liabilities associated with the project sites and satisfy requirements of American Society for Testing and Materials (ASTM) Standard E1527-13, the CERCLA, and Innocent Landowners, Standards for Conducting All Appropriate Inquiries (40 CFR part 312)."

DEIR Figure 4.7-1 shows soil sampling locations conducted by NV5 on the Brunswick property. As discussed in subsection 4.7.2, NV5's Phase II analysis included excavation of 36 exploratory trenches, collection of mine waste and soil samples, and laboratory analysis for metals. NV5 obtained 68 samples from the 36 exploratory trenches. The samples were delivered to ACZ Laboratories, Inc. and analyzed for total arsenic (EPA Method 6010B). In addition, a subset of eight samples was analyzed for total concentrations of Title 22 (CAM 17) metals (EPA Methods 6010/7471) and Acid Base Accounting (ABA; Modified Sobek). Arsenic concentrations detected in mine waste samples were relatively low except for the mixed soil and rock fill beneath a five-

acre paved area near the Brunswick Road entrance, within approximately 300 feet southwest of Brunswick Road, as depicted in Figure 4.7-1, which contained total and soluble arsenic concentrations that exceeded regulatory benchmarks (i.e., the total threshold limit concentration [TTLC] for arsenic of 500 milligrams per kilogram [mg/kg]).

Due to the elevated arsenic levels, the DEIR identified a potentially significant impact and required Mitigation Measure 4.7-2(a). Mitigation Measure 4.7-2(a) requires that if disturbance of the mine waste beneath the southeastern paved area within the Brunswick Industrial Site is proposed as part of the project, the site-specific arsenic concentration data resulting from the Phase I/II ESA prepared by NV5 for the proposed project shall be furnished to the project contractor(s) so the contractor(s) can comply with applicable health and safety requirements accordingly. The project contractor(s) shall retain a Certified Industrial Hygienist to develop specific handling procedures for the mine waste, including dust mitigation. Mine waste shall not be removed from the site without regulatory approval by the RWQCB or DTSC. Verification of proper handling and disposal of the mine waste shall be provided to the Nevada County Planning Department. As such, appropriate levels of sampling for arsenic and other chemicals has already been performed, and appropriate mitigation has been required to ensure impacts are less than significant.

## Response to Comment Grp 24-5

The commenter asserts that the DEIR fails to address the conditions of the Centennial site and the cleanup project. Please see Master Response 4 - Cleanup Project is a Separate Project under CEQA, and Master Response 9 - Historical Mine Waste at Centennial Site.

RE: Nevada County Idaho-Maryland Mine Draft Environmental Impact Report

The South Yuba River Citizens League (SYRCL) respectfully submits comments and recommendations for the Draft Environmental Impact Report (DEIR) as required by the California Environmental Quality Act (CEQA) for Rise Gold Corporation s (Rise Gold) proposed re-opening of the Idaho-Maryland Mine (Project or Mine)[1]. We request that these comments be received regarding the substance of the environmental review and the potential impacts of an active gold mine on our watersheds and community.

**Grp 25-1**

In summary, SYRCL s comments are focused on the following resources, as defined in CEQA, that will be impacted by the Project:

- Agriculture and Forestry Resources
- Air Quality, Greenhouse Gas Emissions, and Energy
- Biological Resources
- Hydrology and Water Quality

[1] County of Nevada, Community Development Agency, Planning Department (2022). Draft Environmental Impact Report. *Idaho-Maryland Mine Project.* Prepared by Raney Planning and Management, Inc.

313 Railroad Ave., Suite 101 | Nevada City, CA 95959 | (530) 265-5961 | www.yubariver.org

SYRCL appreciates the 30-day extension by the County granting additional time for the public to review and provide comments on this matter. Robust public engagement is vital to truly assess the environmental impacts of this Mine to our community and precious waterways.

**Introduction**

SYRCL was founded in 1983 by grassroots activists determined to protect the South Yuba River from dams. Ultimately, SYRCL won permanent protections for 39 miles of the South Yuba River under California s Wild and Scenic Rivers Act. Today, SYRCL is the central hub of community activism to protect, restore, and celebrate the Yuba River watershed. With 39 years of achievements, 3,500 members and 1,000 active volunteers, SYRCL is doing great things for the Yuba and Bear River watersheds. Some of our work includes restoring wild salmon populations and habitat, headwater meadow restoration, and large-scale forest health and fire resiliency planning.

**Grp 25-2**

SYRCL is committed to advocating for long-term solutions for a sustainable water future in the Yuba River watershed, especially in light of the climate crisis.[2,3] The negative environmental impacts of gold mining range from water, soil, and air pollution to large-scale seismic instability and extraordinary unmitigated energy consumption. In California, outdated and ineffective land management strategies and the impacts of climate change have further exacerbated the historical environmental impacts from mining. Each of the important potential environmental issues are explored in more detail below. SYRCL is watchdogging the Project due to negative mining impacts within the Yuba and Bear River watersheds from past operations and analysis from recently proposed projects to reopen gold mines within the watershed; therefore, SYRCL has grave concerns about future mining activities.

SYRCL encourages the County to utilize the wealth of community and organizational resources during this environmental review process and welcomes additional consultation.

## I. Overarching Comments

***Two projects, one set of impacts***

Grp 25-3

Separating the Centennial Industrial Site Remedial Action Plan project impacts from the Idaho-Maryland Mine project impacts misrepresents the impacts that will be experienced by the community. While it is reasonable that the California Department of Toxic Substances Control is Lead Agency for the Centennial Site Remedial Action Plan, separating these two directly related projects misrepresents the fundamentally linked impacts that Grass Valley and Nevada County will, factually, endure. As stated in the Idaho-Maryland Mine Project Draft Environmental Impact Report (DEIR) "...engineered fill would be transported by truck from the Brunswick Industrial Site and placed on approximately 44 acres of the Centennial Industrial Site to create approximately 37 acres for potential future industrial use." At minimum, traffic, dust, and noise impacts will be considerable. Dividing project impacts across two functionally linked "sub-projects" serves only to conceal or reduce the significance of impacts.

***The 'Substantial Evidence' and 'Practicable and Reasonable' Standards***

Grp 25-4

While CEQA analysis may only need to meet a standard of 'practicable and reasonable' in developing data, analysis, and determining the level of significance of impacts, the State CEQA Guidelines (guidelines) first require meeting a standard of 'substantial evidence.'[4] The guidelines state, "The findings required ... shall be supported by substantial evidence in the record."[5] Substantial evidence, "...means *enough relevant information and reasonable inferences from this information* that a fair argument can be made to support a conclusion..." [emphasis added]. Many of the specific concerns identified below point to inadequate and insufficient data or information used to draw conclusions. The 'practicable and reasonable' standard must be considered in the context of (1) making data available, or (2) characterizing data, to ensure there is 'substantial evidence' in the record for the lead agency and community to make an informed decision. The guidelines also state, "The draft EIR which is sent out for public review must reflect the independent judgment of the lead agency. The lead agency is responsible for the adequacy and objectivity of the draft EIR."[6]

***Risk embedded in uncertainty is 'relevant information'***

Risk is embedded in the decision-making process when conclusions are made in the absence of adequate information. Drawing foundational conclusions about significance of

[4] *For CEQA guidelines, see* 14 CCR § 15384 (a)(b)
[5] *See* 14 CCR § 15091 (b)(a)
[6] *See* 14 CCR § 15084 (e)

impacts based on non-existent, small, or outdated data, or inadequately characterized uncertainty exacerbates risk. There are many examples throughout the DEIR of this failing, some specifically identified below, which must be corrected or properly characterized. Without such a characterization, decision makers and the community cannot fully understand the risks associated with relying on the conclusions. Explicitly articulating uncertainty and the inherent decision risk to which it leads is, as stated in the guidelines, "... relevant information and reasonable inferences from this information..."[7]

The DEIR must articulate the uncertainty underlying conclusions that have been based on inadequate or insufficient data or information. The DEIR, as written, leaves it to the reader to decode and comprehend the decision risk embedded in the uncertainty resulting from the use of inadequate information. The DEIR must either provide demonstrably statistically significant data sets to support its conclusions, or specifically articulate the nature and extent of the uncertainty of the conclusions in a statistically correct manner.

***Downstream impacts***

The DEIR does not consider downstream impacts of the Project, and instead wrongly narrows its environmental analysis to only the Project footprint. Due to the nature of biological resources, especially streams and rivers, this narrowed approach is unfounded and does not capture direct Project impacts to downstream ecological communities[8].

**Grp 25-5**

Groundwater pumping will result in increased flows in South Fork Wolf Creek and will have several negative environmental impacts. Increased flows will cause channel scouring, which will alter aquatic communities, especially macroinvertebrate communities. Macroinvertebrates are a food source for many aquatic species and are essential food for salmonid species. Additionally, increased flows will cause changes to water chemistry and turbidity, which will affect vegetation communities and wildlife habitat. It is inappropriate to narrow environmental impact analysis to only the geographic boundary of the Project when it will have direct impacts to biological and other resources downstream. These impacts must be assessed so they may be mitigated.

Below we reference several instances where downstream impacts were not considered.

**Grp 25-6**

**I. Agriculture and Forestry Resources**

[7] *See* 14 CCR § 15384(a)
[8] Richey, J. E., & Swanson, F. J. (1989). The river continuum concept: a basis for the expected ecosystem behavior of very large rivers?. In Proceedings of the International Large River Symposium. Can. Spec. Publ. Fish. Aquat. Sci (Vol. 106, pp. 49-55).

An impact indicated in the DEIR[9] is the potential loss of forest land or conversion of forest land to non-forest use. The DEIR claims this impact is *less than significant,* however, it provides no clear indication of how the threshold of significance" is determined. In fact, the DEIR states that 25 acres of forest land would be lost on the Project site. No clear line of logic or facts are cited to support this determination, aside from speculation. Further, overall character of forestry resources was not assessed on the Project site, meaning no data about forest quality, health, or age of stands (including old growth) were used in this determination.

Additionally, the analysis of cumulative impacts ignores major factors affecting Sierran forests, including forest loss due to disease and pests, climate change, drought stress, and the current reality for Sierran forests—catastrophic wildfire[10]. The Project would undoubtedly contribute to the loss of California forests. Discussion of cumulative impacts to Agriculture and Forestry is incomplete without a thorough assessment of impacts in the above context.

**II. Air Quality, Greenhouse Gas Emissions, and Energy**

**Grp 25-7**

The DEIR has insufficient mitigation measures to reduce NOx, ROG, and PM10 emissions to a less-than-significant" level[11]. The proposed measures are the very minimum required by the local regulatory agency responsible for air quality management and only reduce these emissions for a one-year period. These emissions should be monitored and mitigated for the entire 80-year lifetime of the Project, and the DEIR should include a proposal that proves mitigation efforts would consistently reduce emissions to a less-than-significant level.

**Grp 25-8**

Additionally, asbestos and silica are toxic air contaminants that will become respirable due to mining operations[12]. There is no identified safe" threshold for these air pollutants[13], meaning any amount of these materials in the air is a danger to human health. Asbestos and silica have been inappropriately categorized as *fugitive dust*[14], which subverts regulations for toxic air contaminants. If regulated as fugitive dust, toxicity and cumulative effects are not considered, which is a danger to local public health. Asbestos and silica must be

[14] *See* DEIR sec. 4.3-1 (p. 4.3-61)

considered as toxic air contaminants to ensure proper mitigation and to limit impacts to human health.

**Grp 25-9**

Due to extreme wildfires in California, our community is already enduring severely compromised air quality much of the year. Ensuring this project will not contribute further to dangerous air quality is essential to protect the health of our community and the environment.

### III. Biological Resources

**Grp 25-10**

The analysis of Biological Resources in the DEIR is insufficient because there is an overall lack of sufficient references to appropriately recent data and science. In many instances the only information cited to support conclusions are general references made to decades-old reports or poorly executed surveys onsite. In other instances, no site-specific data is used to support conclusions of "low likeliness"—even when conditions would reasonably suggest high probability for a species to occur (i.e., suitable habitat exists onsite, and the species is known to occur near the Project site).

The DEIR also insufficiently analyzes impacts to Aquatic Resources and Riparian Habitat. Specifically, the DEIR does not include analysis of impacts to ecologically connected downstream resources and understates the significance of impacts to Riparian Habitat.

**Grp 25-11**

SYRCL appreciates the third-party peer review of the biological resources reports prepared by Greg Matuzak Environmental Consulting because it improves objectivity and transparency. However, SYRCL concurs with issues noted by the peer review[15]. One such issue is the timing of the special-status plant surveys, which were conducted during seasons where plants are not present or blooming. The proposed solution, which is to conduct additional surveys before ground disturbance, is not adequate unless it provides the same opportunity for public input as this environmental review.

We describe the above issues in more detail below.

***Vegetation Communities and Special Status Plants***

**Grp 25-12**

The DEIR s analysis of endangered plant species relies heavily on a single outdated report from 1973[16]. Using this report, especially as a primary source of information, is unreasonable and does not constitute 'substantial evidence.' Local climate has shifted drastically from the 1970s, and changes in environmental conditions must be accounted for

[15] *See* DEIR sec. 4.4.1 (p. 4.4-1)
[16] *See* DEIR sec. 4.4-1, Table 4.4-5 (p. 4.4-22), "a report in 1973"

when considering which special status species may exist on the Project site. The environmental analysis of special status plants should use the best available science and data, or appropriate and current survey methods to capture an accurate understanding of onsite resources. It is unscientific and unreasonable to conclude that a species has "low likeliness to occur" if underlying data is flawed or lacking. Several conclusions were made, specified below, without any site-specific data at all. Asstated in our 'Overarching Comments' section above, this does not meet the CEQA guideline 'substantial evidence' standard.

**Grp 25-13**

Additionally, the special-status plant surveys were conducted outside the blooming period for many special-status plant species with potential to occur in the Project area. In fact, vegetation communities which are the foundation of habitat for several special status species can be found throughout the project site. Although the DEIR states that follow up surveys will be required before any ground disturbance, the lack of accurate baseline information is concerning, and does not meet the 'substantial evidence' standard. Any additional surveys should occur as part of the DEIR process and include ample time for public review and comment. At minimum, the DEIR should state the uncertainties or confidence level of conclusions. Specific issues with the analysis of this resource are as follows:

**Grp 25-14**

- The DEIR did not indicate what native plant species exist in the understory of each listed forest type[17].

**Grp 25-15**

- Project impacts were noted as *significant* for the federally endangered Pine Hill Flannelbush[18], a beautiful species native to the region. Eighteen individual flannelbushes would be destroyed as a direct result of Project operations. Although mitigation measures have been proposed, (such as seed collection, transplantation, and monitoring), the main goal should always be to prevent loss, rather than mitigating for it afterward. Mitigation is not always effective or monitored adequately. Additionally, cumulative impacts of the Project on the species were not considered.

**Grp 25-16**

- Finger Rush, a native species in the Project region, was considered to have a low potential to exist on the site[19]. This conclusion is unreasonable and unsupported by evidence because (1) the plant occurs less than one mile away, and (2) surveys were completed outside key identification period.

[17] *See* DEIR sec. 4.4.2 (p. 4.4-5 thru 4.4-10)
[18] *See* DEIR sec. 4.4.2 (p. 4.4-24 thru 4.4-25)
[19] *See* DEIR sec. 4.4.2 (p. 4.4-27)

7

**Grp 25-17**

- Sierra blue grass, a native species in the Project region, was considered to have a moderate potential to exist on the site[20]. This conclusion is unreasonable because this species thrives in lower montane coniferous forest, which is a dominant vegetation community on the Project site. Additionally, it is unclear if field surveys occurred during key identification periods.

**Grp 25-18**

- The Dubious pea, a CNPS List 3 species was surveyed outside its key identification period[21]. Therefore, the conclusion that it has low potential to occur because it was not identified during the surveys is unreasonable.

**Grp 25-19**

- The DEIR improperly excluded Layne's ragwort from analysis.

***Aquatic Resources and Riparian Habitat***

The DEIR improperly asserts that a baseline for the Centennial Industrial Site aquatic resources cannot be established due to the planned remediation efforts[22]. Although the DEIR states that disturbance acreages were conservatively estimated, shifting and unclear baselines are inappropriate for environmental analyses.

**Grp 25-20**

California has lost roughly 97% of its historic wetland habitat[23]. The remaining wetland and riparian habitat are hotspots for biodiversity in California, with many endemic and migratory species using this habitat for some part of their life history[24]. Further, riparian- and wetland-dependent species are being listed as threatened or endangered at higher rates than terrestrial species[25]. Therefore, any impacts to this precious resource should be very closely considered in environmental analyses due to the amplified consequences of impacts. Indeed, the DEIR lists many impacts to riparian habitat, including permanent fill at the Centennial site, Project encroachment on Wolf Creek, and loss or disturbance of over one-half acre on the Brunswick site[26]. Downstream wetlands and riparian habitat should also be included. Although the DEIR claims impacts will be less than significant with mitigation, it provides no clear evidence to support this claim[27]. Not only must mitigation measures be adequate, but they also must cover downstream impacts and provide

[20] *See* DEIR sec. 4.4.2 (p. 4.4-27)
[21] *See* DEIR sec. 4.4.2 (p. 4.4-29 thru 4.4-30)
[22] *See* DEIR sec. 4.4.2 (p. 4.4-10)

[26] *See* DEIR sec. 4.4
[27] *See* DEIR Table 2-1

evidence that they will be effective. If uncertainty exists about effectiveness of mitigation measures, the DEIR must articulate these uncertainties.

**Grp 25-21**

Further, the DEIR excluded from its analysis (1) the Western Ridged Mussel, a sensitive aquatic species that could be impacted by degraded water quality from mining operations, and (2) the Vernal pool fairy shrimp.

***Special Status Wildlife***

**Grp 25-22**

Several conclusions about special status wildlife are based on reconnaissance-level" biological surveys[28]. This survey method provides only general information on the presence or potential presence of sensitive species. This method is based only on information available at the time of the survey and onsite conditions that were present on the date(s) the site was visited. Reconnaissance-level surveys should be considered a preliminary effort, where more due diligence is necessary to understand with confidence the presence or absence of special status wildlife in the Project area. The following special status wildlife species were evaluated with only reconnaissance-level information:

- California black rail[29]: The DEIR's conclusion that this species has low likeliness to occur is unreasonable because (1) reconnaissance-level surveys are not 'substantial evidence' to support this conclusion, (2) the species has been identified within 5 miles of the Project area, (3) suitable habitat exists onsite, and (4) this is a highly mobile species.

**Grp 25-23**

- Foothill yellow-legged frog[30]: The DEIR's conclusion that this species is unlikely to occur is unreasonable because (1) reconnaissance-level surveys are not 'substantial evidence' to support this conclusion, and (2) suitable habitat for this species exists just downstream of the project within an area that would be directly impacted by project operations[31].

**Grp 25-24**

Additionally, the DEIR unreasonably concluded that the following species are unlikely to occur in the Project area.

- Townsend's big-eared bat[32] (p. 433): The DEIR unreasonably concluded that this species has low potential to occur within the Project area. However, it occurs less

[28] *See* DEIR sec. 4.4.2 (p. 4.4-36 thru 39, 52 thru 53)
[29] *See* DEIR sec. 4.4.2 (p. 4.4-39)
[30] *See* DEIR sec. 4.4.2 (p. 4.4-37)
[31] Public comment by Bear Yuba Land Trust staff at the County of Nevada, Planning Commission, meeting regarding the Idaho-Maryland Mine DEIR. March 24, 2022.
[32] *See* DEIR sec. 4.4.2 (p. 4.4-36)

than three miles away from the Project area and suitable habitat exists on the Project site. Further, onsite habitat was not even surveyed. Thus, it is unreasonable to conclude that this species has low likeliness to occur onsite when a population exists so close to the site, and suitable habitat is available onsite. Site-specific data and monitoring are necessary to support such a conclusion.

- Hoary bat and Pallid bat[33]: – The DEIR concludes that these species are unlikely to occur on the Project site. In reaching this conclusion, it references recent data (a CDFW report from 2019), but the conclusion that both have low likeliness to occur seems unreasonable without site-specific data. An onsite survey should be conducted to support this conclusion because suitable habitat exists onsite.

**Grp 25-25**

The DEIR excludes several aquatic wildlife species that could be impacted by project operations. Steelhead, Rainbow trout, Chinook salmon, and North American green sturgeon all rely on the Bear River below Camp Far West Reservoir for critical habitat that supports their continued survival. These listed species are particularly affected because they are vulnerable to low flows, increased sedimentation, and toxic contamination. Additionally, soil erosion also increases fine sediment in streams, damaging spawning and rearing habitat for salmon downstream, such as the local spring-run Chinook salmon.

**Grp 25-26**

Lastly, the DEIR unreasonably excludes several species listed under the California Endangered Species Act (CESA). The Willow flycatcher (listed as Endangered under CESA) is a riparian bird that has been documented only two miles downstream of the project site at a Bear Yuba Land Trust Conservation Easement and was not analyzed in the DEIR[34]. Bears, deer, and mountain lions have also been documented using the South Fork of Wolf Creek. The DEIR is incomplete without a thorough analysis of potential impacts to these species.

## IV. Hydrology and Water Quality

**Grp 25-27**

Hydrology and Water Quality has been poorly analyzed in the DEIR. The Overarching Comments section above describes, generally, issues with this resource analysis. Here, we describe these issues in more detail.

The hydraulic analysis only considers existing onsite conditions and doesn't consider climate change precipitation scenarios. Modeling efforts need to account for extreme variability, especially considering the 80-year lifetime of this project.

[33] *See* DEIR sec. 4.4.2 (p. 4.4-39)
[34] Public comment by Bear Yuba Land Trust staff at the County of Nevada, Planning Commission, meeting regarding the Idaho-Maryland Mine DEIR. March 24, 2022.

**Grp 25-28**

Additionally, in its analysis of Hydrology and Water Quality, the DEIR fails to draw meaningful conclusions between an observation or set of observations and an appropriate response. An example of this occurs when discussing Flooding[35]. This section indicates the project site is located within a FEMA Special Flood Hazard Area (SFHA). There is no discussion about how this magnitude of flood risk could impact mine operations, and no discussion about how the Project could impact the SFHA potentially increased flood crest elevation. The DEIR should model how the project will alter the FEMA Special Flood Hazard Area in aggregate of all development within the SFHA upstream and downstream of the project site. The model must analyze if surface water elevation will not increase beyond the FEMA designated thresholds. The DEIR must also discuss how the presence of infrastructure relevant to the project footprint could be affected by flooding, especially those areas used as part of water treatment.

***Issues with Water Quality***

**Grp 25-29**

- The DEIR does not disclose or discuss any surface water quality data. Without baseline information about water quality in South Fork Wolf Creek, changes in water quality due to mine operations can't be measured or adequately evaluated.

**Grp 25-30**

- The DEIR does not address legacy mining impacts. The mercury lost to the environment during the hydraulic mining era still persists in and continues to cause health advisories throughout the Sierra Nevada, including the Bear River. Unfortunately, due to use of mercury in hydraulic mining, loss of mercury during the Gold Rush was estimated to be 10 to 30 percent per season,[36] totaling about 10,000,000 pounds across California[37]. Many parts of the Yuba and Bear River watersheds are listed as impaired due to mercury contamination under the Clean Water Act Section 303(d), including the confluence of Wolf Creek and Bear River, which is downstream of the Project[38]. During rain events these areas contribute to elevated levels of metals and sediments in our local streams and rivers. The Project could increase sedimentation and erosion, and has the potential to disturb contaminated land. The DEIR should (1) analyze whether Project operations will contribute to legacy mining impacts that already exist within and around the Project

[35] *See* DEIR sec. 4.8.2 (p. 4.8-24)
[36] Bowie, A.J. 1905. A practical treatise on hydraulic mining in California: New York, Van Nostrand, p. 313.
[37] Churchhill, R.K.. 2000. Contributions of mercury to California's environment from mercury and gold mining activities; Insights from the historical record, in Extended abstracts for the U.S. EPA sponsored meeting, Assessing and Managing Mercury from Historic and Current Mining Activities, November 28-30, 2000, San Francisco, Calif., p. 33-36 and S35-S48.
[38] *See* 33 U.S. Code § 1313 (d).

area, and (2) Rise Gold should prepare an adequate mitigation plan for legacy mining impacts before, during, and after project operations cease in 80 years.

**Grp 25-31**

- The DEIR does not adequately analyze potential impacts of using Ammonium Nitrate on water quality[39].

**Grp 25-32**

- The DEIR does not discuss the extent of contamination in the historic flooded mine tunnels, and does not describe, with adequate detail and specificity, how the water will be treated. These omissions may result in serious health consequences for our community.

***Issues with Hydrology***

**Grp 25-33**

- The DEIR uses point in time hydrologic measurements and fails to identify when those measurements were taken with more specificity than month and year[40]. The frequency and timing of hydrologic measurements in low-order stream systems is paramount to understanding water quality. Without specificity in sampling timing, it is impossible to know the range of baseline conditions. Without specific and hydrologically relevant sampling, the DEIR is missing essential information necessary to analyze impacts.

**Grp 25-34**

- The hydrologic analysis only considers existing conditions[41]. It does not consider changes to impervious surfaces (e.g., parking lots and buildings). Additions of such surfaces would result in shorter lag-times and a flashier hydrograph—which means water moving faster through developed areas of the project have less opportunity to be absorbed into the soil. More swift surface water will contribute to greater rates of erosion. Planned changes, which would impact project effects on hydrology, should be accounted for in this analysis.

**Grp 25-35**

- The groundwater analysis lacks the necessary spatial and temporal rigor to conclusively state that "... there are not any direct connections... between the domestic wells and any of the underground mine workings."[42] The difference between seasonal variation in residential water elevations and those observed at the New Brunswick Shaft (Figure 4.8-5) do not conclusively prove that there is no hydrologic connection between the mine and residential wells. Ground water follows the same laws of physics as surface water but with significantly slower

[39] *See* DEIR p. 4.3-56
[40] *See* DEIR sec. 4.8.2
[41] *See* DEIR sec. 4.8.2
[42] *See* DEIR sec. 4.8.2 (p. 4.8-13)

response times to external signals (e.g., rainfall) and changes in porosity (e.g., fractures). Changes to porosity, such as that caused by mine shafts, will fundamentally alter the nature and magnitude of the signal that groundwater may respond to. The argument that because groundwater elevations are not changing in unison across space and through conditions with different porosity in no way proves that there is not a hydrologic connection. The DEIR does not demonstrate that there is no groundwater connection between the existing mine shafts and future mine shafts, and potentially impacted residential wells. To conclude otherwise has placed the cart firmly before the horse—complete and accurate modeling efforts must guide this analysis in order to provide 'substantial evidence' for these conclusions.

**Grp 25-36**

- Related to the above bullet, the DEIR analysis of groundwater seepage, draw down, and depression cone[43] does not appear to address future conditions. Analysis and modeling by EMKO and Itasca use analytical models which rely on "current seepage into the shaft" (EMKO) and "current conditions" (Itasca) when modeling the groundwater cone of depression. However, current conditions represent the tunnels as full of water. When drained as part of operations, the slope of the hydraulic gradient line will steepen thus increasing the rate of seepage into the tunnels and alter the groundwater cone of depression. For an adequate analysis of this resource, these future conditions should be addressed.

**Grp 25-37**

- The DEIR inappropriately uses annual precipitation rates based on *historic data* rather than predicted climate change scenarios[44]. Local hydrology has already changed compared to historic data and will continue to change. Precipitation is expected to shift from snow- to rain-dominated with greater inter-annual variability.[45] A model that appropriately incorporates climate change must account for longer periods of drought with infrequent high intensity rain events and consider low, medium, and high greenhouse gas emissions scenarios and regionally relevant assumptions. Further, this type of analysis should be done for all portions of the DEIR that address impacts to surface and/or ground water, including water use and use impacts as related to existing water infrastructure.

**Grp 25-38**

- The DEIR estimates that there are 1,118 acre-feet (385,000,000 gallons) of water in the mine[46]. It estimates it would take 160 days to pump all water out of the mine, which suggests a pumping rate of approximately 10 acre-feet (2.4M gallons) of

[43] *See* DEIR sec. 4.8.2 (p. 4.8-19 thru 21)
[44] *See* DEIR sec. 4.8.2 (p. 4.8-37)
[45] Swain, D. L., Langenbrunner, B., Neelin, J. D., & Hall, A. (2018). Increasing precipitation volatility in twenty-first-century California. Nature Climate Change, 8(5), 427-433.
[46] *See* DEIR sec. 4.8.2 (p. 4.8-42)

13

water per day. The onsite retention pond capacity is 40 acre-feet, or 23 acre-feet with two feet of freeboard. Therefore, the retention pond only has approximately two days of processing storage assuming a maintained two feet of freeboard. Two days of storage is a very small threshold in terms of hydrologic events, especially with climate change expectations and increasing occurrences of atmospheric rivers, such as the October 2021 rainfall events. The following bullets list concerns and unanswered questions regarding groundwater pumping and pond capacity.

**Grp 25-39**

- How fast will water be treated? Anything less than 2.4M gallons per day means the pond will fill faster than it's being treated. If the pond fills, will they slow or stop pumping? Additionally, how, when, and by whom are those decisions made and enforced?

**Grp 25-40**

- It is unclear how rainfall is considered as related to pond capacity. When and if the pond fills, what are the protocols to prevent overflow and mitigate the risk of catastrophic overflow or failure of the pond walls caused by rapid erosion?

**Grp 25-41**

- Freeboard of two feet is only enough to accommodate a 24-hour 100-year storm, but it has tight margins (Two-foot freeboard holds 6.6 acre-feet, and a 100-year storm modeled 5.7 acre-feet). After 24 hours, little room will remain in the storage pond, assuming it does not rain in the days leading up to and after the 100-year 24-hour storm. 100-year precipitation events are often longer than 24 hours, with some lasting for days[47]. The small buffer in storage is likely to result in spill of untreated water during major precipitation events.

**Grp 25-42**

- The DEIR does not address settling of solids or fill rate in the pond. Although it mentions cleaning every 10 years, there is no information on how that interval was calculated[48]. Rather than a time-bound cleaning cycle, the DEIR needs to clarify what conditions trigger the need for cleaning and clearly outline all of the metrics which will be considered as necessitating cleaning, what thresholds in each metric dictate the need for cleaning, and how, by whom, and with what frequency will each metric be monitored and enforced.

**Grp 25-43**

- How quickly can processing rates be ramped up or down as related to precipitation or other changing conditions? Additionally, what emergency backup protocols are in place? The project should have emergency shut offs

[47] Swain, D. L., Langenbrunner, B., Neelin, J. D., & Hall, A. (2018). Increasing precipitation volatility in twenty-first-century California. Nature Climate Change, 8(5), 427-433.
[48] *See* DEIR sec. 4.8.2 (p. 4.8-42)

for groundwater pumping if sensors detect pond water surface elevation has exceeded an unspecified safety threshold. Additionally, groundwater pumping rates should automatically decrease if processing slows. In addition, the DEIR should clarify how changes in pumping rates will impact the rate at which mine shafts re-flood and what safety protocols are in place for personnel working underground and the community if planned clean up cannot occur prior to evacuation of the mine shafts.

**Grp 25-44** The above issues and questions must be addressed in order to provide 'substantial evidence,' as required by the CEQA guidelines. The DEIR lacks evidence to support conclusions that water treatment facilities and protocols are adequate under future climate change conditions and 80 years of operation. Without more information, the public can't understand hydrologic risks associated with the project, and these risks can't be properly mitigated and managed over time.

## VI. Appendix N: Water Supply Assessment

**Grp 25-45** The Water Supply Assessment[49] is deeply flawed and based on inaccurate assumptions. The claim that Rise Gold would be a net water producer" is false and misleading and ignores the body of science that proves that surface and groundwater are fundamentally linked[50]. Surface and groundwater, together, constitute the water bank" for our community. With the large number of well owners per capita and continued drought in the County, mining activities are likely to have a major impact on water security in the region.

**Grp 25-46** The Assessment claims, without substantial evidence, that operations would only impact 31 wells[51], while past analyses to reopen the mine estimated an order of magnitude more wells would be impacted for a smaller project[52]. The flaws in the underlying assumptions must be addressed in order to ensure no County residents will lose access to fresh water they currently enjoy.

**Grp 25-47** The DEIR states that, to mitigate for possible impacts to groundwater wells, municipal water will be installed for any home that could be potentially impacted. Nevada Irrigation

[51] *See* DEIR Appendix N: Water Supply Assessment, p. 9
[52] County of Nevada, Community Development Agency, Planning Department (2008). Draft Environmental Impact Report. *Idaho-Maryland Mine Project.* More information about this project can be found here: https://www.mining.com/emgold-moves-forward-with-idaho-maryland-project-permitting/#:~:text=Emgold%20is%20in%20the%20advanced%20stage%20of%20permitting,followed%20by%20the%20original%202005%20Project%20Permit%20Applications.?msclkid=814d9c3bb46611ecca7d0c1c2e9c08ebb

District (NID) has confirmed it has enough water to supply the 31 homes that the DEIR currently estimates based on flawed analysis (likely a gross underestimation). If 300+ wells are affected, as has been modeled in the past, there is no guarantee that NID would be able to supply that water. Additionally, the long-term plan for the new municipal water infrastructure is unclear. Would Rise Gold be responsible for maintaining the infrastructure? Will residents' water rates be subsidized or paid by Rise Gold if water rates are more expensive than well pumping costs? Who is responsible for maintaining infrastructure if Rise Gold goes out of business? And lastly, how will new construction not already connected to City or NID service within the Project s groundwater impact zone get water?

**Grp 25-48**

VII. **Conclusion**

We appreciate the County's time and dedication to improving the environmental review of this project. We also appreciate the robust public participation and the opportunity to provide written comments on this Draft Environmental Impact Report. At this time, there are still severe and dangerous deficiencies with the DEIR—our community needs a thorough evaluation to understand the potential environmental impacts of the Idaho-Maryland Mine in the context of past and proposed future gold mining operations.

**Grp 25-49**

We welcome the opportunity to provide further input or to further support the County's environmental review efforts. For coordination, clarification, or discussion of any issues raised in this letter, please do not hesitate to contact our Executive Director, Melinda Booth, or Policy Manager, Keiko Mertz, by email or phone (530-265-5961).

Sincerely,

Melinda Booth, Executive Director
melinda@yubariver.org

Keiko Mertz, Policy Manager

## GROUP LETTER 25: KEIKO MERTZ, SOUTH YUBA RIVER CITIZENS LEAGUE

### Response to Comment Grp 25-1
Comment noted. This is an introductory comment and does not provide a comment on an environmental issue associated with the project. Please see below responses to comments.

### Response to Comment Grp 25-2
Comment noted. This is an introductory comment and does not provide a comment on an environmental issue associated with the project.

### Response to Comment Grp 25-3
Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

### Response to Comment Grp 25-4
The commenter characterizes the legal standard for "substantial evidence" under CEQA. Comment noted. The commenter asserts that the DEIR's conclusions are based on inadequate data, and must disclose the risks associated with the nature of the data used. This comment is general in nature and does not point to specific errors with the DEIR. The DEIR is a good faith attempt by the County to provide a comprehensive description of the project, identification of project's impacts based on substantial technical study and analysis, enforceable mitigation measures, and potential alternatives that could reduce significant impacts. The DEIR was based upon almost 40 technical studies that were peer reviewed by the County and/or the County's independent experts. These technical studies included analysis of aesthetics, water quality, biology, cultural resources, and numerous others and served as the foundation for the DEIR's impact analysis, significance determinations, and mitigation measures. The County believes the level of technical analysis supporting the impact analysis and significance determinations represent substantial evidence that will allow the decision-makers to make informed decision making about the environmental impacts of the proposed project.

### Response to Comment Grp 25-5
Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 34 - Resident Fish, Master Response 38 - Foothill Yellow Legged Frog and California Yellow Legged Frog, and Master Response 35 - Discharge to South Wolf Creek, and Response to Comment Grp 31-12 regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

### Response to Comment Grp 25-6
As discussed in Chapter 4.2.1 of the DEIR, Existing Environmental Setting (subsection Forest Resources), the project site is not zoned for forest land or timberland uses. The project site does have lands meeting the definition of forested land (10 percent or more of native tree cover) and timberland (available for, or capable of, growing a crop of trees). As noted in Impact 4.2-3, the amount of forest and timberland converted by this project is insignificant compared to the available forest and timberland resources in the County and Statewide. For example, the conversion of 25 acres within the project site is approximately 35% of the resources within the project site, and less than 1/10 of 1 percent of the County forestlands per the General Plan. The EIR correctly concluded this impact is less than significant.

## Response to Comment Grp 25-7

Please see Master Response 19 – NSAQMD Criteria Pollution Thresholds during Operations. As discussed in Master Response 19, the project incorporates all mitigation measures required by the NSAQMD to reduce impacts related to NOx, ROG and PM10 to a less than significant level; and also includes applicant proposed measures such as use of Tier-4F engines which further reduces impacts. The County has concluded that the project's NOx, ROG and $PM_{10}$ impacts are less-than-significant after incorporation of NSAQMD measures and the applicant proposed measures.

## Response to Comment Grp 25-8

The commenter asserts that health risk from asbestos and silica were not considered and that the DEIR mis-analyzed these substances as fugitive dust. The commenter's assertion is incorrect. Asbestos and silica (crystalline, respirable) are included in the Air Toxics Hot Spots program and are analyzed in the Health Risk Assessment used for the DEIR in accordance with OEHHA guidelines.

As stated on page 4.3-42 of the DEIR, the NSAQMD's cancer and noncancer thresholds to assess health risk significance for CEQA are consistent with what are used for the AB 2588 risk assessment procedures. The threshold of significance for health risk is an increased cancer risk of >10 cases per million persons. OEHHA has developed chronic reference exposure level (REL)'s for assessing noncancer health impacts from long-term exposure. OEHHA has established a REL for Crystalline silica (quartz, cristobalite, tridymite) of respirable size (defined as 4 micrometer particle aerodynamic diameter). A chronic REL is an airborne level of a chemical at or below which no adverse health effects are anticipated in individuals indefinitely exposed to that level. As discussed on page 4.3-79 and shown in Table 4.3-21 of the DEIR, the threshold of significance for chronic exposure is a Hazard Quotient of 1. The Chronic Hazard Quotient is equal to the annual average concentration at the receptor location divided by the Chronic REL. The Health Risk Assessment prepared for the project's DEIR concludes that the non-cancer chronic health risk, which includes silica, to the most sensitive receptor will be below these thresholds (see Table 4.3-21 of the DEIR).

The Health Risk Assessment is based on conservative assumptions. Please see Master Response 22 – Conservatism of Asbestos Assumptions and Master Response 21 – Conservatism of Silica Assumptions.

Nevertheless, the DEIR concludes that the project could result in a significant impact with respect to exposing receptors to substantial concentrations of asbestos and requires mitigation to reduce the impact to a less than significant level. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP. The NSAQMD may revise the ADMP on the basis of air monitoring. Components of the ASUR Plan will become part of the approved ADMP and other components will be used as company policy and procedures to assist with compliance with the ADMP.

## Response to Comment Grp 25-9

Please see Master Response 1.

## Response to Comment Grp 25-10

Please see Master Response 30 - Biological Study Technical Adequacy, regarding the level of biological technical study prepared for this project. It should be noted, the DEIR included a twelve-page appendix with over 150 references. In addition, each biological technical report included as an appendix to the DEIR includes a references section.

Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

## Response to Comment Grp 25-11

The commenter asserts that the analysis of biological resources in the DEIR is inadequate because the biological studies ae inadequate, old and not site-specific. Please see Master Response 30 - Biological Study Technical Adequacy, Master Response 33 - Groundwater Dependent Vegetation, Master Response 37 - Birds and Raptors, Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog, and Master Response 36 - Rare Plants.

## Response to Comment Grp 25-12

The reference to 1973 included in Table 4.4-5 referenced by the commenter is the last time an occurrence of that species was identified and reported to CNDDB. The CNDDB was queried in 2019, and supplemental information contained in the CNDDB includes when records were reported; in this case the records were reported in 1973. This information is pertinent to the analysis as it provides an understanding of how widespread the species may occur in the region. Please see Master Response 30 - Technical Study Adequacy, discussing the significant amount of site-specific technical study and peer review that informed the DEIR.

## Response to Comment Grp 25-13

Please see Master Response 31 - Rare Plants, and Master Response 30 - Biological Study Technical Adequacy.

## Response to Comment Grp 25-14

Appendices F-6 and F-11, botanical surveys for the Centennial and Brunswick Industrial Sites, included a full list of plant species identified during on-site surveys as Appendix A to each report.

## Response to Comment Grp 25-15

As the commenter notes, Pine Hill flannelbush will be impacted by the proposed project. Mitigation Measure 4.4-1(a) includes requirements for a Habitat Management Plan in order to mitigate impacts to the species. The commenter does not identify any specific deficiencies with the analysis or mitigation measures other than a preference for avoidance. It should be noted the project was designed to avoid the majority of Pine Hill flannelbush onsite, as shown on DEIR Figure 4.4-9. The commenter asserts that cumulative impacts related to Pine Hill flannelbush were not considered in the DEIR; however, this is incorrect. Cumulative impacts to special-status species including Pine Hill flannelbush were analyzed in Impact 4.4-6 of the DEIR, in which impacts were considered not to be cumulatively considerable.

## Response to Comment Grp 25-16

Please see Master Response 31 - Rare Plants.

## Response to Comment Grp 25-17

Please see Master Response 31 - Rare Plants. As discussed in Appendix F-11, Table 1, the closest species occurrence is seven miles to the east and last identified over 50 years ago. This species was not identified during rare plant surveys during 2019 and 2020.

## Response to Comment Grp 25-18

Please see Master Response 31 - Rare Plants. As discussed in Appendix F-11, Table 1, the closest species occurrence is three miles from the study area and last identified over 90 years ago. This species was not identified during rare plant surveys during 2019 and 2020.

## Response to Comment Grp 25-19

Layne's ragwort, a CNPS 1B.2 list species, has not been previously mapped within 5 miles of the project site per the most recent CNDDB update (expires on November 1, 2022), nor is it included in the most up to date 9 quad CNDDB search (9 Quad CNDDB search with Grass Valley Quad as central quad run on April 20, 2022). Additionally, it has never been documented in Nevada County in the CNDDB. The species blooming period is between April and August and was not identified within the project site during surveys conducted in July and August 2019 and in June 2022. Given the species was not known as a special-status plant species that has previously occurred within either 5 miles of the project site or within the 9 quad CNDDB search, and given the local botanists with 15+ years of local experience each that conducted botanical and special-status plant surveys within the project area had no previous knowledge of the species being located within the greater Grass Valley region, the species was not considered as a focal species in the pre-survey background research. However, given the species was not identified within the project site during the blooming period for the species in 2019 and 2022, the species is considered absent from the project site and the project will have no impact on the species.

## Response to Comment Grp 25-20

Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

The DEIR demonstrates that the potential impacts to riparian habitat are mitigated to a less than significant level through implementation of mitigation measures 4.4-3(a-d). These measures include but are not limited to implementation of Watercourse/Wetlands/Riparian Areas Management Plans for the Centennial Industrial Site and Brunswick Industrial Site, avoidance or compensatory mitigation

## Response to Comment Grp 25-21

The project area does not contain vernal pools, and therefore, habitat for vernal pool fairy shrimp is not present within the project area. As a result, they were not assessed within the DEIR. The western ridged mussel is not listed by either the state or federal Endangered Species Act, and is not a California species of concern. This species does not have sufficient rarity to be considered special-status and require analysis under CEQA. Furthermore, even if this species was listed in the future, the species has not been documented to occur in Nevada County. The project will have no impact on vernal pool fairy shrimp and no impact on the western ridged mussel.

## Response to Comment Grp 25-22

Please see Master Response 37 - Birds and Raptors, and Master Response 30 - Biological Study Technical Adequacy.

## Response to Comment Grp 25-23

Please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog and Master Response 30 - Biological Study Technical Adequacy.

## Response to Comment Grp 25-24

The DEIR (see Impact 3.4-4) conservatively concludes a potential impact to bat species despite determining bat species have a low likelihood of occurring onsite. Mitigation Measure 4.4-2(f) provides extensive detail regarding the survey of bats, specifically that surveys shall occur no more than seven days prior to surface disturbance, reporting requirements if bats are not found, passive removal if bats are identified, and avoidance until breeding roosts have dispersed. This mitigation measure allows for potential bats to be identified, prevented from returning to disturbance areas, and/or avoidance of bats to limit the potential for impact. As a result, this impact was considered less than significant following mitigation.

## Response to Comment Grp 25-25

Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 34 - Resident Fish, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts. Given that the project will not adversely impact water temperature, water quality or cause increased sedimentation movement or erosion, and will not result in low flows, the project will not cause adverse impacts to the fish species mentioned by the commenter.

## Response to Comment Grp 25-26

Please see Master Response 37 - Birds and Raptors, regarding the willow flycatcher. Bears, deer, and mountain lions are not special-status species and therefore, were not included in the DEIR.

## Response to Comment Grp 25-27

The commenter states generally that hydrology and water quality were not adequately analyzed in the DEIR, and that the DEIR should consider climate change precipitation scenarios. The impact on water quality and hydrology of climate change is speculative as there is no consensus on whether climate change will result in reduced or increased recharge in certain areas of California and to what extent and when that impact will occur. Please see Master Response 16 – Drought and Climate Change. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As analysis of the project and climate change's combined impacts on hydrology and water quality amounts to speculation, no further response is necessary. Nonetheless, the drainage calculations and detention basins are specifically designed to respond to the drainage requirements of the County of Nevada. The Nevada County drainage requirements indicate that new storm drain systems and channels shall be designed to convey the 10- and 100-year, 24-hour storm event. In addition, the County EIR consultant prepared a water supply assessment (WSA) for the proposed project (see Appendix N), the information from which is presented in DEIR Chapter 4.11. The WSA evaluated the adequacy of NID's total projected water supplies, including existing water supplies

and future planned water supplies, to meet the existing and projected future water demands, including those future water demands associated with the proposed project, under all hydrologic conditions (Normal Years, Single Dry Years, and Multiple Dry Years) (see DEIR page 4.11-8). As such, the DEIR hydrology analysis made every attempt to conservatively analyze project conditions under both heavy rainfall and drought conditions where appropriate.

## Response to Comment Grp 25-28

The commenter asserts that the DEIR failed to analyze impacts related to a portion of the project site within the FEMA special flood hazard area (SFHA). However, this comment mischaracterizes the extent of the FEMA SFHA and misunderstands the discussion within the DEIR. The discussion in the DEIR specifically cited in this comment (page 4.8-24 in Chapter 4.8.2) states:

> "…the only part of either project site that is located within a flood hazard zone is the northern edge of the Centennial Industrial Site along Wolf Creek."

As discussed in Impact 4.8-3 (at page 4.8-74), any placement or grading of materials to create usable industrial areas on the Centennial Site would occur outside of flood hazard zones. Given that the project will not encroach on the SFHA, there would be no effect on the hydrology of Wolf Creek and no further analysis is needed.

## Response to Comment Grp 25-29

The commenter asserts that the DEIR does not include any baseline data for surface water quality; however, this statement is incorrect. Baseline surface water quality data are discussed on pages 4.8-23 and 4.8-24, based on a more detailed discussion in Section 3.4.1.2 of Appendix K.2 of the DEIR. The data are presented in Tables 3.8, 3.9, and 3.10 of Appendix K.2. The surface water quality data are evaluated further in Section 3.4.2 and plotted on Figures 3-12, 3-17, 3-18, and 3-19 of Appendix K.2.

## Response to Comment Grp 25-30

The commenter asserts that the DEIR fails to account for legacy mining impacts, and specifically that the DEIR did not consider mercury impacts on the Property as a result of historic hydraulic mining. However, hydraulic mining never occurred at the Idaho-Maryland Mine site and there is no evidence that mercury was ever used at the site. Therefore, there are no known legacy impacts to which the project could contribute. Furthermore, the water samples collected from the New Brunswick shaft, and from Wolf Creek in 2018, were analyzed for a range of total petroleum hydrocarbons (TPH), semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and mercury. These analyses include the suite of industrial chemicals that could potentially occur as a result of legacy mining operations at the site and other adjacent past industrial activities. Other than the occurrence of cis-1,2-dichloroethylene, there were no detections of any other organic chemicals or mercury. As stated on page 4.8-21 of the DEIR, the compound cis-1,2-dichloroethylene (cis-1,2-DCE) is detected in all samples from the New Brunswick shaft at concentrations ranging from 1.8 µg/L to 4.2 µg/L. This compound generally occurs as a breakdown product of the industrial solvent trichloroethylene (TCE) or the dry-cleaning solvent tetrachloroethylene (PCE). Neither of these parent compounds were detected in any of the water samples. The presence of cis-1,2-DCE in the water samples from the New Brunswick shaft could be due to two potential sources. One potential source is historic solvent use within the New Brunswick mine for equipment repair or maintenance. The second potential source is seepage of shallow groundwater into the New Brunswick shaft from the adjacent former SPI Mill site, located to the southeast. The Mill site was known to have industrial solvent impacts, including cis-1,2-DCE, in shallow groundwater in the past. If future mining activity disturbs areas where some unknown residual chemicals currently reside, the monitoring required

under the Central Valley Water Board WDR permits (see Mitigation Measure 4.8-1(a)) would detect any exceedances of water quality standards and the treatment systems would need to be adjusted, if necessary, to maintain compliance with discharge requirements.

## Response to Comment Grp 25-31

As discussed on page 4.8-48 of the DEIR, the primary residual components of the ammonium nitrate-fuel oil (ANFO) used for blasting, ammonia and nitrate, are very soluble and mobile in water. This means that any blasting residuals would be continually removed from the mine over time through the dewatering system. The proposed WTP is designed to treat ammonia and other blasting residuals that might occur due to incomplete detonation. Thus, when the mine is allowed to flood again following the completion of mining, there is no reasonable potential that residuals from former blasting activities would cause a violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality. As stated on page 4-5 of Appendix K.4, low concentrations of NH3 may occur as a result of explosives used during periods of active mining and will be removed by the aeration process. If required, the efficiency of this aeration can be enhanced by increasing the pH. This will generate more of the gaseous form of NH3 which can be stripped from the water. Therefore, as a contingency component for Fe (and Fe/As), Mn, and ammonia treatment, sodium hydroxide (NaOH) will be included in the permitting efforts for pH adjustments should it become necessary to add alkalinity to the water for Fe (along with Fe/As) and Mn treatment, or to treat NH3 more efficiently or in higher concentrations than have been previously detected. In regard to ammonia treatment, this may occur as a result of explosives used during periods of active mining. Also see Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment Grp 25-32

As discussed in the Response to Comment Grp25-30 above, the water samples collected from the New Brunswick shaft, and from Wolf Creek in 2018, were analyzed for a range of total petroleum hydrocarbons (TPH), semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), polychlorinated biphenyls (PCBs), and mercury. These analyses include the suite of industrial chemicals that could potentially occur as a result of legacy mining operations at the site and other adjacent past industrial activities. Appendix K.4 of the DEIR provides the Water Treatment Plant Design Report, upon which the analysis of potential effects from mine dewatering and treated water discharge is based, in part. Please see Master Response 35 - Discharge to South Fork Wolf Creek.

## Response to Comment Grp 25-33

The commenter asserts that the DEIR is inadequate because the hydrologic measurements are provided with month and year, but not day. However, the commenter does not explain how the requested information relates to an impact that was not disclosed or mitigated under CEQA. As stated in Chapter 4.8.1 of the DEIR, the information upon which the hydrology and water quality analysis is based is provided in Appendices K.1 through K.9 of the DEIR. Details regarding the dates and times of the hydrology measurements are provided in Appendices K.1 and K.2. Appendix I of Appendix K.2 includes a near-continuous (15 minute) streamflow data recorded since January 24,2020 at South Fork Wolf Creek.

## Response to Comment Grp 25-34

The commenter asserts that the DEIR failed to consider the impacts of impervious surfaces and the associated hydrology impact, and instead only considers baseline conditions. The analysis in Chapter 4.8.2 of the DEIR, as referenced by footnote 41 in this comment, presents the existing environmental setting, also referred to as baseline conditions, consistent with CEQA. Analysis of

the effects of planned changes that would occur as a result of the project, including parking lots and other impervious surfaces, are provided in Section 4.8.4, and are also discussed in Appendices K.1, K.2, and K.5 of the DEIR.

## Response to Comment Grp 25-35

The commenter asserts that the DEIR does not include adequate data and analysis to prove that there is no connection between the groundwater wells and the underground mine workings. The discussion on page 4.8-13 of the DEIR, as referenced in footnote 42 in this comment, is based on a more detailed analysis in Section 3.3.3.3 in Appendix K.2 of the DEIR (as footnoted on page 4.8-13). The analysis in Appendix K.2 provides a more detailed comparison of water levels in the mine compared to rainfall amounts. Appendix K.2 also includes discussions of the water levels in the private domestic wells in the mine vicinity, in Section 3.2.2.1. As noted in that discussion, not only are the seasonal responses in the wells different than that in the existing mine workings, but the groundwater levels in the wells are also approximately 50 feet to over 400 feet shallower than the groundwater level in the mine. These data provide substantial evidence of a lack of any direct hydraulic connection between the wells and the mine workings. The modeling work conducted in Appendix K.2 and Appendix K.3 further support this conclusion. The DEIR concluded that there is a potential impact to groundwater wells due to dewatering and provided mitigation including a groundwater monitoring plan and the construction of a potable water line for 30 parcels, as well as a requirement that the mine operator replace water supply for any other impacted wells. This analysis was peer-reviewed by the County's groundwater experts, who concurred with the analysis that the impact would be less than significant after mitigation.

## Response to Comment Grp 25-36

The commenter asserts that the DEIR's groundwater analysis did not consider future conditions; however, this statement is incorrect. The EMKO (Appendix K.2) and Itasca (Appendix K.3) models are calibrated using existing conditions, as is standard practice in groundwater modeling. The calibrated models are then used to predict future conditions due to the expanded and dewatered underground workings. See, for example, Section 4.2.2 of Appendix K.2 and Section 5.2 of Appendix K.3 for discussion of the modeled effects of future mining conditions.

## Response to Comment Grp 25-37

The commenter asserts that the DEIR did not account for climate change scenarios with respect to water supply impacts. Please see Response to Comment Grp 25-27 above relating to climate change scenarios. The specific discussion in the DEIR cited in footnote 44 is describing the groundwater model developed by Itasca and presented in Appendix K.3 of the DEIR. It is appropriate for the groundwater model to use long term averages based on historic rainfall data because part of the model development is to calibrate the model output to past observations. Furthermore, while there are publications that indicate that precipitation patterns are evolving as the climate evolves, there is no technical basis upon which to predict exact changes or to quantify the specific change in the long-term averages over time. Such an effort would be speculative, which is not considered substantial evidence under CEQA. In addition, the rainfall data used throughout the analysis in the DEIR and the supporting appendices is shown on Figure 3-4 of Appendix K.2 of the DEIR. As shown on that figure and discussed in the related narrative, rainfall patterns in the project area are already subject to lengthening periods of drought and an increase in high-intensity rainfall events. During the period considered (1967 through 2018), the annual rainfall varied from a minimum of 18.48 inches to a maximum of 95.93 inches. Figure 3-4 also shows that over this period, there has been a reduction in the number of years of sequential above-average rainfall and an increase in the number of below-average rainfall years. Thus, the

potential influences suggested in this comment are already reflected in the data used for the analysis.

## Response to Comment Grp 25-38

The commenter generally summarizes information presented in the DEIR. Please see Responses to Comments Grp -39 25to 25-44 below with respect to the commenter's specific questions and statements.

## Response to Comment Grp 25-39

The commenter asks how quickly the water will be treated and how the operational decisions are made with regard to pumping speed. Appendix K.4 of the DEIR describes the design and operation of the water treatment system. The treatment plant would be sized to treat the maximum pumping rate from the mine of 2,500 gpm (3,600,000 gallons per day). The initial dewatering of the mine requires the pumping of the water volume currently in the flooded mine, as well as groundwater inflow into the mine. If this maximum pumping rate is not achieved during initial dewatering due to operational concerns, the duration of time to complete initial dewatering would be extended. The pumping rates during initial dewatering would be determined by company management and supervisors in accordance with relevant permit requirements and operational concerns. The discharge from the mine into South Fork Wolf Creek will be governed by the Central Valley Regional Water Quality Control Board, who will have enforcement authority over discharges from the mine. Please see Master Response 35 - Discharge to South Fork Wolf Creek and Master Response 32 - Temperature of Mine Water Discharge.

## Response to Comment Grp 25-40

The commenter asks how rainfall is considered related to water treatment pond capacity, and questions whether the pond has sufficient capacity to handle storm events. The site drainage plan for the Brunswick site routes the majority of precipitation run-off from the site to the proposed storm water detention basin, not the water treatment pond, as shown in Drawing H-4 of Appendix K.5. Section 4.5 of Appendix K.2 discusses the 6.4-acre catchment area where precipitation runoff would inflow into the water treatment pond and confirms that the designed freeboard volume is more than adequate to retain the runoff from an extreme storm event. An emergency overflow spillway prevents water from overflowing the water treatment pond berm and mitigates the risk of catastrophic overflow or failure of the pond walls caused by rapid erosion. (See DEIR pp. 4.8-73 to 4.8-74.) The spillway would be reconstructed during the replacement of the southwestern pond dam.

## Response to Comment Grp 25-41

The commenter questions whether the freeboard provided in the water treatment pond is sufficient to handle storm events. As discussed in Appendix K.5, design storm depths for these events were attained from information published on the National Oceanic and Atmospheric Administration (NOAA) "Hydrometeorological Design Studies Center, Precipitation Frequency Data Server" website for the specific location of the Brunswick Site (Station Nevada City (04-6136). The PDS-based precipitation frequency estimate for a 100-year storm over durations from 24 hours to 7 days and the daily precipitation inflowing into the water treatment pond (6.4-acre catchment area) is shown in the table below. The water treatment plant has a designed capacity of 2,500 gpm which is equivalent to 11-acre feet per day and is more than sufficient to manage the estimated precipitation over multiple days during a 100-year storm event.

| Duration | Total Precipitation inches | Precipitation to water treatment pond (acre feet) Total | Daily |
|---|---|---|---|
| 24 hours | 10.7 | 5.7 | 5.7 |
| 2 days | 14.9 | 7.9 | 2.2 |
| 3 days | 18.2 | 9.7 | 1.8 |
| 4 days | 20.4 | 10.9 | 1.2 |
| 7 days | 25.2 | 13.4 | 0.9 |

https://hdsc.nws.noaa.gov/hdsc/pfds/pfds_map_cont.html?bkmrk=ca

## Response to Comment Grp 25-42

The commenter asserts that the DEIR does not analyze settling of solids, nor fill rate of the water treatment pond. However, the commenter is incorrect, as these issues are addressed in the DEIR. The settling of solids, impact to volume, and cleaning of the water treatment pond is discussed in detail in Section 5.4 of Appendix K.4 to the DEIR.

## Response to Comment Grp 25-43

The commenter questions how the processing rates can be adjusted if necessary due to precipitation or changing conditions, and what protocols will be in place to adjust pumping and evacuate the mine tunnels. The water treatment plant is designed for a maximum treatment rate of 2,500 gallons per minute and all equipment would be in place to increase treatment to this capacity at any time it was necessary. Pumps in the underground mine would pump water to the water treatment pond and can be turned on and off as necessary by mine employees. Supervisors on surface can communicate with underground and surface workers though radio communications to provide necessary instructions. The water treatment pond provides water storage capacity so that the mine pumping and water treatment are not required to be identical but would average the same rates over a day or several days. As discussed in section 4.5 of Appendix K.2, at the maximum mine dewatering rate of 2,500 gpm, the pond has the capacity to hold the volume of water that would be dewatered during two days of pumping. At the maintenance dewatering rate of 850 gpm, the pond has the capacity to hold the volume of water that would be pumped over more than six days. This capacity allows time for any necessary maintenance or repairs to the water treatment plant without curtailment of underground dewatering. As discussed in Section 5.4 of Appendix K.4, the removal of sludge from the water treatment pond can be achieved with slurry pumps. Therefore, the periodic removal of settled solids would not require the curtailment of mine dewatering. In addition, the underground mine has a substantial capacity if it were ever necessary to curtail water pumping for an extended period of time. An estimate of the volume of existing mine workings is provided in Section 3.3.3.2 of Appendix K.2 with the lower levels (2300 – 3280 level) having a volume of 84-acre ft and the entire mine having a total volume of 1,183 acre-ft. At an average inflow rate of 850 gpm (3.75-acre ft per day) it would take approximately 22 days for the lower levels of the mine to flood and approximately 314 days for the entre mine to flood.

## Response to Comment Grp 25-44

The commenter asserts that due to the issues it raised in comments Grp 25-39 to 25-44, the DEIR does not provide substantial evidence that the DEIR's conclusions are correct. Please see Responses to Comments Grp 25-39 to 25-44. The DEIR provides substantial evidence to support the conclusions of the environmental analysis in the DEIR.

## Response to Comment Grp 25-45

The commenter asserts that the water supply assessment and groundwater analysis in the DEIR are flawed and based on inaccurate assumptions because they ignore the link between groundwater and surface water. However, the groundwater model and hydrologic analysis discuss in detail the linkage between surface water and groundwater, which is fundamental to the analysis. As shown in Figure 4-5 of Appendix K.3, the regional groundwater flows westerly past the project site. Some groundwater enters the mine workings, is pumped to surface, treated and discharged into South Fork Wolf Creek where it flows to Wolf Creek and then to the Bear River. The project produces treated water that is discharged to South Fork Wolf Creek (rather than flowing underground) and does not change the overall water balance. The DEIR's analysis was reviewed by the County's independent groundwater experts, who concurred with the DEIR's analysis and conclusions.

## Response to Comment Grp 25-46

The commenter asserts that the DEIR's groundwater analysis is flawed because it predicts less wells to be impacted than previous assessments. However, previous assessments have come to similar conclusions as the current analysis despite the use of simplistic analytic solutions. Please see Master Response 13 – Historic Hydrogeologic Assessments, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 – Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 25-47

The commenter questions whether there would be sufficient water to supply 300+ wells if the mine caused a larger drawdown than expected. The DEIR's analysis concluded that only 7 wells would be impacted and conservatively provided mitigation to supply potable water to 30 parcels, despite the fact that less wells are expected to be impacted. This analysis was reviewed by the County's independent groundwater experts, who concurred with the DEIR's analysis and conclusions. There is no evidence that 300+ wells would be impacted, and this impact is speculative. The County is not required to analyze speculative impacts under CEQA. (CEQA Guidelines Section 15384.)

The analysis provided in Chapter 4.8-2 of the DEIR concludes that the proposed mining operations could result in adverse effects to seven domestic water supply wells in the East Bennett area during the life of the mining operation. Pursuant to Nevada County General Plan Policy 17.12, the project would address this by installing a potable water supply line in East Bennett Road and providing individual well owners with a connection to the potable water line. No significant impacts to domestic water wells are predicted in the Greenhorn, Woodrose, Beaver or other areas. The predictions include the use of a 100% safety factor, multiple sensitively scenarios, and have been peer reviewed by the county's independent expert consultant. However, the DEIR acknowledges that without the implementation of a groundwater monitoring program and well mitigation plan, the project could result in a significant impact to groundwater supplies.

A Groundwater Monitoring Plan (GMP) is required for the project under Mitigation Measure 4.8-2(a). As described on page 4.8-66 of the DEIR, the measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. Mitigation Measure 4.8-2(b) requires that if, based on the GMP, it is determined that mining operations are resulting in a significant impact to groundwater wells, the Project Applicant shall be responsible for providing a comparable supply

of water to such homes or businesses whose wells are significantly impacted. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells.

The assumption that impacts to water wells outside of the East Bennett area would occur, and which would require mitigation is speculative and the mitigation that would be performed for this scenario is not known. Therefore, it is not appropriate to include in the Water Supply Assessment.

## Response to Comment Grp 25-48

The proposed extension to the NID potable water system would be part of NID infrastructure and therefore would be owned and maintained by NID. Certain properties along E. Bennett Road that are not currently NID customers will be compensated for the use of up to 400 gallons per day of water. The compensation would be at the NID rate at the time of use. There is one vacant property in the East Bennet area. This property would be provided a NID water meter and the capacity charge would be paid by the applicant. If a home is built at this location in the future, the owner would be responsible for water use charges. Please see the revised Well Mitigation Plan, attached as Appendix D to the Final EIR.

## Response to Comment Grp 25-49

The commenter summarizes its prior comments and generally asserts that the analysis in the DEIR is inadequate. Please see Responses to Comments Grp 25-1 to Grp 25-48 for responses to the commenter's specific assertions and questions.

**Group Letter 26**

THE SIERRA FUND

204 Providence Mine Rd
Suite 214
Nevada City, CA 95959
P: 530.265.8454

March 30, 2022

Matt Kelley, Senior Planner
Nevada County Planning Department
Via Email: Idaho.MMEIR@co.nevada.ca.us

**The Sierra Fund Comments on the Idaho-Maryland Mine Project Draft Environmental Impact Report SCH No. 2020070378**

Dear Nevada County Planning Commissioners and Staff,

The Sierra Fund (Fund) appreciates the opportunity to offer comments on the Draft Environmental Impact Report (DEIR) for the Idaho-Maryland Mine Project (Project). We first summarize our concerns and recommended actions briefly, and then offer extensive comments about each item in the body of the letter.

**Summary and Recommended Action**

Grp 26-1

Our review has found that the scientific and site assessment work conducted as part of the DEIR is deeply flawed, providing a totally inadequate base on which the environmental review and mitigation measures were based. The DEIR fails to describe basic aspects of the project including how the existing hazards on the site will be remediated. The DEIR lacks crucial information needed in order to adequately define the potential geochemistry impacts of the 80-year operation, much less the impacts on surface and groundwater quantity in the area. The DEIR is inadequate to serve its proper role in permitting.

**We believe that addressing these concerns calls for a significant re-write of the DEIR, which should then be re-circulated for public comment prior to certifying the final EIR.**

**Our Qualifications**

Grp 26-2

The Sierra Fund is a 501(c)(3) non-profit corporation dedicated to improving the environmental health of the Sierra Nevada and the health of those people who make the Sierra their home. The Fund worked closely with Governor Brown and the legislature on the substantial revisions to the Surface Mining and Reclamation Act that became law in 2017. The Fund has led the development of research and projects on abandoned mine lands throughout the region and has published numerous reports of best available methods and technologies for assessing and remediating these compromised lands. We are working collaboratively with a number of local, state and federal agencies to support abandoned mine land reclamation.

Our program is led by Dr. Carrie Monohan who holds a Ph.D. in Hydrology from the University of Washington and is also an adjunct professor at the California State University in Chico. The Fund is advised by hydrologists, geologists, mining engineers, lawyers, medical doctors, geochemists and environmental health specialists.

**Scope of Our Comments**

The Sierra Fund has signed on to the group community comment letter that raises issues from transportation to green-house gas impacts. In this letter we will not comment on every issue that might be appropriate to raise in a review of this DEIR, such as land use issues raised by the Project proposal to place a major working mine in the middle of a city that depends to a great extent on tourism for its revenue base. However, we echo the comment by our colleague David Chambers with the Center for Public Participation "This mine development proposal lacks the economic and environmental data necessary to evaluate a full mine development proposal. "

**Grp 26-3**

This letter focuses on two topics in which we are deeply qualified to comment: hydrology and water quality. Our comments mostly follow the same order in which the various issues are reviewed in the DEIR. The Fund makes its comments based on the California Environmental Quality Act (CEQA) and the regulations (Guidelines) adopted to implement CEQA. Court decisions interpreting CEQA and the Guidelines are not referenced in the interest of not detracting from the factual points the Fund wishes to present. However, we believe each of our major contentions concerning the DEIR is grounded in the requirements of CEQA and the Guidelines and supported by court decisions interpreting them.

**Overall Comment #1:**
**Site Assessment Methods Used & Proposed Monitoring Need Improvement**

One deep flaw running through this DEIR is an assumption first articulated in the public notice, which states flatly that the project sites are not on a list of hazardous materials complied pursuant to Government Code Section 65962.5. This finding and phrase seems to allow the entire DEIR to ignore the obvious presence of legacy hazardous mining waste on and around the proposed development sites. We believe this is because the current site assessment methods are inadequate to properly evaluate the properties slated for mining.

We do not believe that the assessment methods used to assess the area have found the problems on the site. We do not believe that proper assessment has been done of the ore that will become waste rock; the water that will leach from the site during rain events; or the amount of particles such as asbestos fibers, that will be released as a result of the massive amount of rock and water that are being moved around.

**Grp 26-4**

The Idaho-Maryland mine drilling cores is not sufficient to provide the necessary information on the geochemistry of the waste rock and tailings and there is no surface water-quality modeling. These are elements that are critical in evaluating the potential impacts of a proposed mine. As a result, it is not known whether the mine waste could leach contaminants into ground and/or surface waters. Rise Gold lack of an adequate number of drill samples results in the lack of data required to adequately characterize the geochemistry of the waste rock and tailings that will be produced, or to supply test data on the leachate from this waste that would allow modeling of potential impacts to surface water.

Rise completed 19 drill exploration drill core holes, totaling 67,500 linear feet, from 2017-2019.

From this drill core, Benchmark Resources collected six drill core samples that it used to characterize the geochemistry of the waste rock. These samples are listed in Table 4-6. The geochemical predictions for approximately 96% of the waste rock to be produced comes from one 10-foot interval of drill core (Sample MA-2 from 3959.7 ' to 3969.7'), and one 1-foot sample (MA-3 from 3265' to 3266').

Another way to describe this is that the geochemical characterization of the 2 million tons of waste rock produced during the first 11-years of mining, and nominally the waste rock production from the entire 80- life of the proposed permit, is represented by these two samples, which come from a total of 11 feet of drill core.

If this site is to be mined for 80 years the environmental monitoring needs to be improved now – and needs to create mechanisms to incorporate additional methods of assessment as they are developed.

*THE DEIR needs to be halted until the methods used to assess this site are improved and implemented.* Water sampling must be done during storm events and EPA certified laboratories able to do trace metal detection must be used. Soil testing must use judgmental and targeted sampling of areas with mine features identified by the cultural site evaluation that details the site history and uses.

**Overall Comment #2: The Centennial disposal site is part of the mining project, and must be addressed as such in this DEIR.**

Grp 26-5

The DEIR goes to great lengths to put distance between the ongoing voluntary clean-up at the Centennial Industrial Site and the proposed mine at the Brunswick Industrial site. It argues that the conditions of the Centennial Industrial site now should not be considered as the project baseline, instead they will be "adjusting the environmental baseline for Centennial Industrial Site to use the above-described post-remediation condition instead of existing conditions at the Centennial Industrial Site" (DEIR Page 1-4).

CEQA is clear that a project must be considered as a whole. Projects are not allowed to be piece meal when doing a DEIR. The fact that the DEIR notes that if the Centennial Industrial site can't be used to accept all of the waste generated by the mine that they will just find another undescribed site to place the material, makes it clear that the projects are joined – or are not joined? There is enough capacity or there isn't? This is not planning. This is guessing.

*This decision is a judgement call that is really up to the Nevada County Planning Commission to decide. The Commission needs to decide that these projects are related and bring them back as one unified project*

**Detailed Comments**

Grp 26-6

**CHAPTER 4.6: GEOLOGY, SOILS, AND MINERAL RESOURCES**

**Collapses**

The DEIR states (pdf p. 542) that "the underground mine workings focused on removal of quartz vein materials that are generally narrow, so the collapse of a deep (e.g., 100 feet bgs) mine feature is not likely to be expressed at the ground surface." However, as described in the DEIR on pdf pages 574-576, there are several existing collapses at this mine site. The scientific basis for the 100-foot cut-off is not presented. The DEIR states of ECM that "They believe that in all areas where the separation equals or exceeds 100 feet there is no chance that ground water drawdown could affect surface structures." Belief is not an adequate technical basis for such a crucial determination.

Due to previous surface instability in the community from underground mine stope collapses, *the DEIR should be revised to provide a robust scientific basis to support the relevant contentions/beliefs, or be more forthcoming about the possibility of collapses originating from more than 100 feet bgs.*

**CHAPTER 4.7: HAZARDS AND HAZARDOUS MATERIALS**
**Assaying**

Grp 26-7

A significant omission in the DEIR is the topic of the environmental impacts of a mining operation's mineral assays, which may have environmental impacts due to emitted lead fumes and disposal of lead-contaminated crucibles and cupels. As noted in the DEIR on pdf page 199 (Table 3-8) and pdf page 733 (Table 4.9-6), the mining operations workforce is proposed to include the task of assaying. Assaying is ongoing as mining progresses through variations in the host rock and its ore grade, in order to determine where or whether in the ore body to continue mining. As described in the currently-posted Investopedia article[1] on mineral assessment, "The fire assay method is the most popular method and consists of grinding samples into a fine powder, mixing the sample with lead oxide and appropriate flux. Subsequently, the sample is heated in a ceramic or metal crucible, which decomposes the sample into a lead button containing gold, silver, etc., and slag. The lead button is placed into a shallow cup (cupel) and *the lead is boiled off in a fire assay furnace [emphasis added].* A bead of precious metals is left in the cupel after the lead is boiled off. The bead is weighed and analyzed for precious metals and these data are used to determine ore grade (richness)." A metallurgy website[2] goes on to describe the disposition of the lead contaminated "cupels" left over after the instrumental analysis, as follows, "The disposable *[sic]* of the used, lead-contaminated cupels should done by certified environmental company with accordance of the environmental laws set out by the regulations of the governing body." In California, these lead-contaminated wastes may be determined to be hazardous and therefore pose an additional environmental impact not analyzed in the DEIR.

[1] https://www.investopedia.com/terms/a/assay.asp, accessed on February 4, 2020
[2] https://www.911metallurgist.com/blog/fire-assay , accessed on February 4, 2020

According to the DEIR, assaying will be done five days a week (pdf page 199, Table 3-8) but the DEIR does not describe how many used, lead-contaminated crucibles and cupels Rise plans to dispose of per day and how will be they be handled in an environmentally safe manner. In addition, the DEIR does not address the potential release of lead fumes on a daily basis from the fire assaying process, as described above.

*The DEIR should be revised to address the potential daily and long-term release of hazardous wastes both from crucible and cupel disposal as well as potentially from lead fumes.*

**CHAPTER 4.8: HYDROLOGY AND WATER QUALITY**

The threat to water quality posed by the mine waste to be discharged to land will be regulated by the Central Valley Regional Water Quality Control Board under the Land Disposal Program. The DEIR (pdf page 652) correctly states that Water Board regulations governing discharge of mining waste to land are located in Title 27 of the California Code of Regulations, Section 22470 et seq. The DEIR (pdf page 652) also correctly states that "The project will discharge mining waste, which is appropriately regulated under the Title 27 Mining Waste Management Regulations." Mining wastes are defined and classified as follows in Title 27:

**Grp 26-8**

Mining Waste Management Regulations, apply to all discharges of mining wastes and to owners/operators of a waste management unit for the treatment, storage, or disposal of mining waste. The Mining Waste Management Regulations define "mining waste" as "waste from the mining and processing of ores and mineral commodities. Mining waste includes: (1) overburden; (2) natural geologic material which have been removed or relocated but have not been processed (waste rock); and (3) the solid residues, sludges, and liquids from the processing of ores and mineral commodities" (CCR, Title 27, § 22480(a)).

- Group A: mining waste of Group A are wastes that must be managed as hazardous waste pursuant to Chapter 11 of Division 4.5, of Title 22 of the CCR, provided the RWQCB[3] finds that such mining wastes pose a significant threat to water quality.

- Group B: mining waste of Group B are either: (A) mining wastes that consist of or contain hazardous wastes, that qualify for a variance under Chapter 11 of Division 4.5, of Title 22 of the CCR, provided that the RWQCB finds that such mining wastes pose a low risk to water quality; or (B) mining wastes that consist of or contain nonhazardous soluble pollutants of concentrations which exceed water quality objectives for, or could cause, degradation of waters of the state.

- Group C: mining wastes from Group C are wastes from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity.

[3] RWQCB is defined as the Regional Water Quality Control Board. In the case of the IMM, this would be the Central Valley Regional Water Quality Control Board.

The DEIR does not contain any data that would serve as a basis for classifying waste rock. Waste rock from mines has the potential to generate poor quality effluent that threatens water quality unless adequate containment is provided. As a result, waste rock's potential to produce poor quality effluent should be thoroughly characterized using appropriate tests to the satisfaction of the Water Board (e.g., ASTM D 5744) over a sufficient period, also to the satisfaction of the Water Board (e.g., 40 weeks). Moreover, if the mine began operating, testing would need to continue because the mineral makeup of the waste is likely to be heterogeneous. The same can be said for the mill tailings that are proposed to be either incorporated into cement paste backfill or discharged along with waste rock into the two proposed waste rock piles.

A previous submittal by Rise did include some acid base accounting test data (Desktop Study of Cemented Past Backfill, Itasca Inc. Feb. 24, 2020), from a 47-kilogram (103 pound) composite sample of "ore". Based on the data from the single test, Rise concludes that the tailings will not generate acid. Rise's conclusion, however, fails to recognize that acid base accounting does not provide any data regarding effluent quality data are used to classify mining waste under Title 27 discharge of waste to land regulations. The mill tailings should be thoroughly characterized using appropriate tests (e.g., ASTM D 5744).

**Grp 26-9**

According to the DEIR, the proposed mine will produce 350,000 tons of ore per year, meaning a very large total of 28 million tons if the mine operates for the planned 80 years. Itasca's desktop study does recommend follow up sampling and analyses during mining to catch changes in ore mineralogy that might affect effluent quality.

*The DEIR should be revised to clarify that follow-up ore sampling and analyses can be expected to continue indefinitely during mining. Furthermore, if the analyses indicate that the nature of expected effluent quality has changed for the worse, further actions may be required by the Water Board in the future to protect water quality.*

**Grp 26-10**

**Terminology**

The term "Engineered Fill" introduced in the DEIR on pdf page 32 is undefined and is used throughout the DEIR. Mined rock that does not have enough gold to warrant processing is more correctly referred to as waste rock. Such rock may be useful in constructing an engineered fill provided that it has been classified as a waste that does not pose a threat to water quality by the appropriate Regional Water Board that has authority over the location of discharge. The DEIR (pdf page 653) acknowledges that "the engineered fill...is a mining waste."

*Therefore, for clarity and conformance with regulations, the DEIR should discontinue use of the misleading term "Engineered Fill" and globally replace it with "waste rock".*

The term "Barren Rock" is introduced on pdf page 181 but does not fall under the definition of mining waste in CCR, Title 27, § 22480(a). For clarity and conformance with regulations, "Barren Rock" should be globally replaced with "waste rock."

**Grp 26-11**

The DEIR indicates on pdf page 33 that Rise plans to sell waste rock on the open market if it is still being produced after the two proposed waste rock piles reach capacity. This is an unrealistic proposal unless the appropriate Regional Water Board (with jurisdiction over the location where the waste rock is to be discharged to land) determines that the waste rock does not pose a threat to water quality. It should be noted that dispersing waste rock and other mine waste over large areas without containment often results in contamination (e.g., Calcine mercury mine tailings used for road construction in San Luis Obispo County).

*The DEIR must specify where the waste rock will go after the waste rock piles reach capacity, or if the Centennial site cannot be used to accept all of the rock generated by the project.*

**Grp 26-12**

**Waste Characterization**

The DEIR, on pdf page 33 as well as later in the document, describes DTSC's characterization work at the Centennial site (the discharge site of historic Idaho Maryland Mine waste). The Centennial site cleanup potentially provides insight into how the waste rock and tailings from the proposed mine might behave under surface conditions over the long term. According to the description in the DEIR (pdf page 534), it appears that the historic mining wastes from this very mine have been undergoing a form of long term (over 60 years), uncontrolled Kinetic test. The DEIR states (pdf page 534), "Extensive site investigation, overseen by DTSC, has identified mill tailings, waste rock and affected soil at the site that contain lead, arsenic, mercury and other metals at concentrations exceeding background soil metals concentrations and regulatory benchmark concentrations." The information suggests that there is a serious risk that the proposed new waste rock piles would produce effluent that would pose a significant risk to water quality unless the Water Board requires adequate containment.

*The DEIR should acknowledge that data from DTSC's characterization work at the Centennial site undercuts the notion that mining waste from a new operation would not pose an environmental threat.*

**Grp 26-13**

**Waste Rock Piles**

The two proposed waste rock piles (30 acres at the Brunswick site, 44 acres at the Centennial) border Wolf Creek and its South Fork. There should be a real concern that effluent from these waste rock piles could severely degrade not only the South Fork of Wolf Creek and Wolf Creek, but groundwater as well, if the waste rock piles are permitted under Title 27 as unlined and uncapped mine waste management units.

*The DEIR should characterize the risk of effluent from these waste rock piles getting into surface and groundwater and design an appropriate mitigation measure.*

**Grp 26-14**

**Financial Assurances**

The DEIR fails to mention that regulations require that the discharger (mine operator) provide, in advance, financial assurances to cover closure and post-closure mining activities to the satisfaction of the Regional Water Board. The applicable regulations [27CCR 22510(h)] state that the post-closure period ends only when the Regional Water Board "determines that water

quality aspects of reclamation are complete and waste no longer poses a threat to water quality." Robust and ongoing financial assurances are vital to preventing long-term environmental effects from the waste piles, since they will presumably remain in place indefinitely into the future.

*The Reclamation Plan and associated DEIR must describe potential mitigation measures – including those that might be needed to treat water discharge – in one project. Water quality treatment can be expensive and have its own potential environmental impacts. These issues should be included in the DEIR and considered in the Financial Cost Estimate and Financial Assurance Mechanisms created when the project is approved.*

**Cement Paste Backfill**

Grp 26-15

Cement Paste Backfill (CPB) is made from mill tailings, cement, and water and is used to fill underground workings. Aggregate (e.g., crushed waste rock) is added when unstable underground workings need support. Rise has proposed to backfill portions of the mine with CPB. Backfilling with CPB may present problems under the Title 27 regulations because tailings (mine waste) would be deposited underground and would likely be submerged by groundwater after mining (and thus pumping) ceases, and the water in the mine ("mine pool") returns to its pre-mining elevation. It is unclear how the Water Board 's requirements would address this scenario in order to protect water quality into the future.

*The DEIR must be amended to address these long term water quality impacts and potential mitigation measures.*

**Permitting Period**

Grp 26-16

The DEIR repeatedly refers to a proposed permit period of 80 years. For example, the DEIR states on pdf page 32 that "The proposed project would reinitiate underground mining and gold mineralization processing for the Idaho-Maryland Mine over an 80-year permit period..." This time period characterization is incorrect for water quality permitting. The proposal would entail obtaining several different types of Water Board permits, none of which would have anything approaching an 80-year time frame. The waste discharge requirements issued for waste rock piles and other discharges of mining waste to land all must be reviewed periodically and made available for public comment during each review; they are subject to changes in specific requirements. In addition, NPDES permits for discharges to surface water expire, unless renewed, every five years per the federal Clean Water Act. The NPDES permit re-issuance process is also subject to public comment.

*The DEIR should be revised so that it does not misleadingly imply that there is an 80-year permit period for any water quality permits.*

**Summary**

Grp 26-17

What the DEIR describes is a proposed mining operation that if initiated, would be quite similar to historical mining operations in Grass Valley, only larger. The DEIR does not propose any significant innovative techniques to improve management of mine wastes or process ore. The

DEIR indicates that the mine would rely on surface disposal of waste rock and tailings, just as the historical mines in Grass Valley once did.

Nevada County has more than its share of legacy waste rock and tailings sites, mine water discharges, and mine collapses left over from historical mining operations. Today's Grass Valley residents have to live with and sometimes pay for cleaning up mine wastes from historical mines.

The DEIR claims that the two waste rock piles produced as part of the mining process will be suitable for development, however that claim is pure speculation at this time. No data are presented to support that claim, but plenty of data are available about the water quality and air quality impacts of legacy gold mines working in the same ore body.

**Grp 26-18**

What isn't pure speculation is that the two waste rock piles that would result from operating the mine would be eyesores at best and more likely, attractive nuisances and environmental liabilities that current and future residents of Nevada County would have to live with in perpetuity. As stated in the DEIR (pdf page 1052), the No Project Alternative is environmentally superior.

Please feel free to contact me if you have any questions about our comments. Thank you again for this opportunity to participate in this public process.

## GROUP LETTER 26: CARRIE MONOHAN, THE SIERRA FUND

### Response to Comment Grp 26-1
This comment is introductory in nature. The commenter asserts that the DEIR is inadequate and should be revised and recirculated. The commenter's specific comments are addressed in the following responses to comments below.

### Response to Comment Grp 26-2
This comment details the commenter's background. Comment noted.

### Response to Comment Grp 26-3
This comment is introductory in nature and expresses general concerns regarding the project. Please see Master Response 1.

### Response to Comment Grp 26-4
The commenter asserts that the DEIR ignores the history of hazardous mine waste at the project site, and that the site assessment methods used to characterize the rock at the project site for waste rock leachates and asbestos are inadequate. The commenter also asserts that the samples taken from drilling cores are inadequate to provide information on the geochemistry of the rock and that there is no surface water quality modelling provided. Please see Master Response 8 - Mine Waste Characterization, Master Response 9 - Historic Mine Waste at Centennial Site, and Master Response 10 - Explosives, Reagents, and Brunswick Fill. Please also see Responses to Comments Grp 7-158 and 7-162. The proposed project would likely produce mine waste with lower sulfide and metal content than those produced historically, and the historic mine waste has been determined to be Group C mining waste from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity (See Master Response 9 - Historical Mine Waste at Centennial Site). Section 4.4 of Appendix K.2 of the DEIR provides geochemical testwork conducted on tailings and barren rock samples from the project. Mitigation measures require the applicant to submit a Report of Waste Discharge (RoWD) and receive an approved Waste Discharge Requirement (WDR) from the Central Valley Regional Water Control Board (CVRQCB) prior to the placement of cemented paste backfill (Mitigation Measure 4.8-1(d) and engineered fill (barren rock and sand tailings) (Mitigation Measure 4.8-1(e)).

### Response to Comment Grp 26-5
The commenter asserts that the Centennial cleanup project should be analyzed as part of the DEIR. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA. Please also see Section 1.3 of the DEIR regarding the adjusted baseline used for the Centennial Site.

### Response to Comment Grp 26-6
The commenter asserts that the DEIR does not include sufficient analysis for its statement that collapse of deep workings that are 100 feet or more below ground surface would not be expressed on the surface. Please see Master Response 29 – Near Surface Workings.

### Response to Comment Grp 26-7
The commenter asserts that environmental impacts from lead used in the assaying process was not properly analyzed in the DEIR. Fume hoods and a scrubber system, capable of removing fine lead dusts, are required to be used for assay labs in order to meet health and safety regulations. Therefore, no significant emissions of lead to the environment from fire assaying would occur.

Dust from the scrubber is collected in sealed containers and disposed of in an appropriate offsite facility. The engineering of the mechanical systems will be completed before submittal of building permits to the County. Cupels from assaying would also by disposed of in an appropriate manner. The mass of these materials is trivial, and the transport of solid waste (205 tons per year) is accounted for in the air quality assessment. Mitigation Measure 4.7-1(d) requires the approval of a Hazardous Materials Business Plan which would incorporate the storage and transport of dust or materials that qualify as hazardous waste.

## Response to Comment Grp 26-8

The commenter asserts that insufficient testing was done to characterize mine waste for the project and that further testing should be done. The comment also asserts that the DEIR does not contain any data that would serve as a basis for classifying waste rock. Regarding tests performed on rock from the project site as a basis for waste rock characterization, please see Master Response 8 – Mine Waste Characterization. As requested by the commenter, further testing will be required of the mine waste as a prerequisite to submitting a Report of Waste Discharge and obtaining Waste Discharge Requirements for the project, as required by the DEIR. Section 4.4 of Appendix K.2 of the DEIR provides geochemical testwork conducted on tailings and barren rock samples from the project. Testwork included Acid Based Accounting (ABA), Total Metals, and California Waste Extraction Testing (WET). Per California regulations, the Waste Extraction Test (WET), which was used for the DEIR's analysis, should be used to determine the amount of extractable substance in waste rock (CCR Title 22 Division 4.5, Chapter 11, Article 5, Appendix II).

The DEIR has already concluded that the project may have a potentially significant impact on water quality and has identified mitigation measures to address these potential impacts. Mitigation measures require the applicant to submit a Report of Waste Discharge (RoWD) and receive an approved Waste Discharge Requirement (WDR) from the Central Valley Regional Water Control Board (CVRQCB) prior to the placement of cemented paste backfill (Mitigation Measure 4.8-1(d) and engineered fill (barren rock and sand tailings) (Mitigation Measure 4.8-1(e)). Please note that Mitigation Measure 4.8-1(e) has been revised in the Final EIR (cf. Response to Comment Agcy 5-4) in response to the Central Valley Water Board's clarifications on the requirements for ongoing waste characterization in the approved WDR.

## Response to Comment Grp 26-9

In accordance with CCR Title 27 Section 21710(a)(4) the CVRQCB must be notified of any material change in the types, quantities, or concentration of mining wastes discharged within a reasonable time before those changes are made effective. Therefore, as exploration and mine planning continue throughout the life of the mining operation, any significant change in mine waste chemistry would be provided to the CVRWQCB and if necessary, incorporated into the WDRs. Additionally, as part of WDRs for mining waste units, the RWQCB will require monitoring of any effluent from the engineered fill piles. Please see Master Response 8 – Mine Waste Characterization, and Response to Comment Agcy 5-4.

## Response to Comment Grp 26-10

The commenter asserts that the term "engineered fill" should not be used in the DEIR, and instead use the term waste rock. However, the term "engineered fill" is specifically used to refer to the mix of barren rock and sand tailings that will be combined to create the engineered fill pads on both the Centennial and Brunswick sites. As described in the DEIR, barren rock and sand tailings are to be compacted in lifts to engineering standards in order to provide a useful surface appropriate for construction of potential future buildings on the sites. (See DEIR, p. 3-26; 3-32 through 3-33.) This is contrasted to a more conventional mining operation where tailings may be placed by slurry

in a tailings pond facility and waste rock simply dumped uncompacted into piles. The commenter does not identify any impacts that were not addressed in the DEIR due to the use of this terminology.

## Response to Comment Grp 26-11

Please see Master Response 11 – Engineered Fill Utilized in Local and Regional Construction Markets.

The commenter states that the DEIR must identify all locations where the construction aggregate produced by the mining operation will go after the engineered fill piles are full. The mine operator cannot accurately estimate every construction project that may purchase construction aggregate from the project, so the commenter's requested analysis would be speculation. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, the requested analysis is not necessary. Regarding the commenter's concern with mercury, the rock samples taken from drilling cores have not been shown to contain elevated mercury. As shown in Table 4.7 of Appendix K.2, mercury ranges from 11.4 to 71.3 nanograms/gram, which is less than the average crustal abundance for mercury of 86 nanogram/gram (see Table 3 of Itasca Desktop Study of Cemented Paste Backfill attached to the Final EIR as Appendix Q).

In addition, as shown in Response to Comment Agcy 5-5, Mitigation Measure 4-8-1(e) has been modified to clarify the requirement that the applicant shall not sell or utilize waste rock and tailings from the project for construction aggregate or fill purposes offsite (i.e., sites other than the applicant's Brunswick and Centennial sites) unless such material has been tested and confirmed to qualify as Group C mining waste under California Code of Regulations Section 22480 and the approved WDR which will establish the specific methods, volumes and frequency of characterization. See revised language of Mitigation Measure 4.8-1(e) in Response to Comment Agcy 5-4.

## Response to Comment Grp 26-12

The commenter states that the mine waste present on the Centennial Site is evidence that the waste rock from the project would create an environmental threat. Please see Master Response 9 - Historical Mine Waste at Centennial Site, and Master Response 8 - Mine Waste Characterization. The proposed project is expected to produce mine waste with lower sulfide and metal content than those produced historically due to modern processes, and the historic mine waste has been determined to be Group C mining waste from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity (See Master Response 9 - Historical Mine Waste at Centennial Site). Based on testing on samples taken from the project site, and the binding mitigation measures addressing water quality, the DEIR concluded that impacts to water quality would be less than significant after mitigation. The commenter states that the Water Board should require containment of mine waste. As required by Mitigation Measure 4.8-1(e), prior to placement of engineered fill, the mine operator is required to submit a report of waste discharge including additional mine waste characterization testing, and the CVRWQB will require such containment measures as are appropriate under California Code of Regulations, Title 27, for mining waste units. Mining waste containment measures deemed necessary by the CVRWQB would be incorporated into the waste discharge requirements for the project. Please see Response to Comment Grp 26-11 above.

## Response to Comment Grp 26-13

The commenter states that water quality impacts could result from placement of engineered fill. This impact was already addressed in Chapter 4.8 of the DEIR, found to be potentially significant, but less than significant after implementation of Mitigation Measure 4.8-1(e). Please see Responses to Comments Grp 26-4, 26-8 and 26-12, and Master Response 8 - Mine Waste Characterization.

## Response to Comment Grp 26-14

The commenter asserts that the DEIR needs to discuss bonding requirements and that the reclamation plan needs to address mitigation measures to treat water discharge. Bonding requirements under the Surface Mining and Reclamation Act are discussed on page 2-3 of the DEIR. As the commenter implies, the CVRWQCB will require specific financial assurances for closure and post-closure maintenance of mining waste units as required by Title 27 section 22510. This may include the need for long-term water treatment of mine-related discharges. This issue will be addressed in the approval of the WDR required by Mitigation Measure 4.8-1(d) and 4.8-1(e)). The specifics of that bonding requirement cannot be determined until after a RoWD is submitted to the CVRWQCB, which would occur after approval of the project. The reclamation plan required under SMARA relates to reclamation of surface mining features; as such, the treatment of water relating to underground mining, and any required bonding, is more properly addressed through the waste discharge requirements for the project.

## Response to Comment Grp 26-15

The DEIR has already analyzed water quality impacts from use of cement paste backfill and pursuant to Mitigation Measure 4.8-1(e), a report of waste discharge must be submitted to the CVRWQCB and waste discharge requirements must be issued by the CVRWQCB prior to placement of cement paste backfill. Please see Responses to Comments Grp 26-4 and 26-8.

As discussed on page 4.8-47 of the DEIR, use of cemented paste backfill for the project is an environmentally favorable method for tailings disposal because it can significantly reduce potential release of metals from the tailings. As stated on page 4.8-50 of the DEIR, once mining is completed and underground workings are allowed to flood, the same reducing conditions that occur under existing conditions would develop again, preventing oxidation of sulphide minerals.

## Response to Comment Grp 26-16

The commenter asserts that the DEIR should be revised to clarify that the water board permits will not have 80-year terms. The DEIR does not state that any water board permit would be issued for an 80-year term, but rather proposes a project with an 80-year term for the conditional use permit. (DEIR, p. 1-3.) Ancillary permits required for the project, such as waste discharge requirements from the CVRWQCB, will have separate permit lengths and may need renewal during the life of the project. This is typical for any long-term industrial project in California. The commenter does not identify any environmental impact that was not analyzed in the DEIR.

## Response to Comment Grp 26-17

This comment is a summary of the previous comments. Please see Responses to Comments 26-1 through 26-16. Unlike historical mining, the proposed Idaho-Maryland Mine Project would not produce large quantities of mineralized waste rock and would remove most sulfide minerals from the sand tailings before the sand tailings are placed as engineered fill. Given that the proposed future mine waste will by nature and by process design be less mineralized than the historical mine waste, the future mine waste will likely also be classified as Group C waste. Regardless of the future waste classification, the future placement of mine waste as engineered fill will be subject to regulation under the California Code of Regulations (CCR) Title 27, which sets forth

requirements pertaining to the discharge of mine waste to land and requires the development of Waste Discharge Requirements (WDRs) by the CVRWQCB. Please see Master Response 9 - Historical Mine Waste at Centennial Site.

## Response to Comment Grp 26-18

The commenter asserts that the engineered fill piles would be eyesores, attractive nuisances, and environmental liabilities, and recommends the No Project Alternative. The commenter does not provide any specific commentary on the adequacy of the DEIR in this comment. Note that the DEIR, Chapter 4.1, concludes that the proposed engineered fill piles would contribute toward the project's significant and unavoidable aesthetic impacts.

Matt Kelley, Senior Planner

Nevada County Planning Department

950 Maidu Avenue, Suite 170

Nevada City, CA 95959

Matt.Kelley@co.nevada.ca.us

April 4, 2022

Subject: Comments on the Idaho-Maryland Mine project Draft Environmental Impact Report - Well owners in the vicinity of the Idaho-Maryland Mine request adequate safeguards.

Dear Mr. Kelley:

The undersigned members of the Wells Coalition respectfully request adequate safeguards for well owners in a recirculated Draft Environmental Impact Report (DEIR) for the Idaho-Maryland Mine.

The Wells Coalition is a group of property/well owners in the vicinity of the Idaho-Maryland mine that have formed for the purpose of protecting our only source of water, our wells.

The DEIR Well Mitigation Plan cites "expert opinion" and states being in compliance with The County Policy 17.12 [1], which designates protections for wells from potential mining impacts. However, our review of the report leads us to conclude otherwise.

The Nevada County General Plan 17.12 (complete policy)

**Grp 27-1**

In approving mining projects which according to expert opinion may threaten the existing quality or quantity of surface or subsurface water which supply adjacent homes and businesses:

1) The County shall require the operator to guarantee a comparable supply of water to such homes or businesses through accessible forms of security or alternate sources of water.

2) Where water quantity and quality problems occur, an immediate water supply shall be provided by the operator until the source of the problem is determined.

3) The burden of proof shall be on the operator to show that the mining operation did not create the water problem.

4) If it is determined that the operator is at fault, impacted owners shall be compensated by the operator.

The applicants DEIR Well Mitigation Plan states:

"Expert opinion has determined that there is no threat to water quality to domestic water wells from the Idaho-Maryland Mine Project." [2] and " All potentially impacted wells are located in the E. Bennett Road area. Domestic water wells outside this area will not be impacted." [2], [3]

The following statements from the DEIR and additional expert opinion contradict the certainty of the applicant's Well Mitigation Plan statements, citing repeatedly, uncertainties in hydrologic and hydrogeologic predictions and impacts to wells due to groundwater response from dewatering of the Idaho-Maryland Mine:

"In our opinion and based on the data and analysis presented in the Itasca Report and EMKO Report, it is possible that mining activities, including blasting, backfilling with CPB, and sealing of drains or areas of the underground workings, could activate leaching and groundwater flow in new subsurface areas, potentially resulting in impacts to neighboring wells, and discharges to surface water of groundwater with water quality exceeding applicable standards.
These impacts could potentially occur during the mining

or post-mining periods. Because of the uncertainty inherent in the bedrock fracture flow system, monitoring will be needed, as mining activities progress, to assess potential impacts, design appropriate solutions and attain necessary permits to mitigate these potential impacts. These efforts should be addressed in the monitoring and mitigation requirements for the mining and post-mining phases of the Proposed Project." [4]

"The EMKO Report describes a three-step procedure used to assess potential drawdown effects in perimeter areas. A major assumption underlying the procedure is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth. However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of this uncertainty and the overall uncertainty of the analytical and numerical model predictions with respect to groundwater level impacts on individual wells should be provided. expanded to include an assessment of the uncertainty in the conclusions developed by Todd Engineers."[4]

"Although the analysis is considered conservative in methodology, several complexities in the groundwater system could potentially result in a larger or smaller radius of influence. Although larger impacts seem unlikely, it is difficult to prove that aberrations in the system do not exist." [5]

"Uncertainties in the analysis indicate that monitoring should occur over a slightly larger area than where impacts are predicted. In addition, the monitoring program should consider adjustments specifically for geologic faulting." [5]

"Monitoring locations should also include areas outside of the predicted impact zone to account for uncertainties in the analysis," [5]

"Due to the uncertainties regarding the complex geology, groundwater flow, flow dynamics in the mine, and the presence of faults, dewatering impacts to domestic water supply wells cannot be accurately predicted. However property owners within the

estimated area of influence around the proposed project must be ensured a continuous source of water is available to their property."[6]

"The geologic formation in which the mine is located is fractured bedrock whose hydrogeology is difficult to predict. Therefore, reliance on Domestic Well Level Monitoring Program data will be required to assess impacts and discern appropriate mitigation measures for each domestic well owner." [7]

"Even a well calibrated model has a large uncertainty to it, in its predictions. It turns out that this model is not well calibrated, so the uncertainties are almost certainly larger. It's not well calibrated because it tries to make predictions of what will happen in the shallow aquifer without historic shallow well water levels to calibrate to." [8]

"The fracture systems existing in buried bedrock beneath Grass Valley are not map-able within the resolution needed to predict specific dewatering effects. Technology and state-of-the-art hydrogeology have not developed to a level that fracture mapping is possible. Due to this limitation, hydrogeologic modeling is attempted by making an assumption on fracture connectivity." [9]

"The groundwater in this particular area is contained in and flows through fractures in near surface bedrock and because of this fracture flow regime, the groundwater flow in quantity varies considerably with location and cannot be predicted with certainty. Furthermore, complete hydraulic separation between the deeper groundwater within the underground mine workings and the shallow groundwater within fractures and supplying the domestic wells cannot be assumed." [11]

"Based upon the significance criteria established on page 4.3-4, the risk to all wells within the study area, regardless of risk category, represent a potentially significant impact." [12]

"It is expected that the actual mining areas will change from the modeled mining areas due to vein geometry and discoveries, which will only be known after extensive underground exploration is completed in the future."[13]

"The study area has not been monitored by an approved groundwater monitoring system designed to observe the dynamics associated with subsurface hydrology. Therefore, many of the initial unknown hydrogeologic and geologic parameters located within the earth between well and mine elevations still exist."

"With fractured rock there will always be uncertainty and during my career there won't be any 100% confidence in predictions."[14]

The overwhelming consensus of the experts listed above is that the project "... may threaten the existing quality or quantity of surface or subsurface water which supply adjacent homes and businesses" per County Policy 17.12 [1], and therefore the applicant is not in compliance with that policy. In light of the uncertainty present in the hydrogeology predictions, the DEIR Well Mitigation Plan is inadequate.

The mitigation plan is inadequate because it does not satisfy the condition of the County Policy, and it has no means of even determining whether those conditions will be met.

The DEIR has not adequately defined an area of potential impacts.

The DEIR acknowledges that more groundwater level data is needed to assess the potential impacts on groundwater levels [15]

The DEIR's analysis of groundwater impacts is so fundamentally deficient that those of us who rely on groundwater wells for our drinking supply do not have the fundamental information necessary to evaluate the Project's effects on our wells. The DEIR's analysis must be comprehensively revised to fully account for the severity and extent, including the geographic magnitude, of the Project's impacts. Until the EIR accurately discloses the Project's groundwater impacts, it is not possible to determine whether the mitigation the DEIR relies on would even be close to sufficient to protect our wells.

The Wells Coalition intends to weigh in again on the EIR's approach to well mitigation once the EIR's groundwater impact analysis is thoroughly revised and recirculated for public review.

Thank you for your time and consideration.

Sincerely,

Collier Road, Grass Valley 95945

## GROUP LETTER 27: THE WELLS COALITION

### Response to Comment Grp 27-1

**Subject: Comments on the Idaho-Maryland Mine project Draft Environmental Impact Report - Well owners in the vicinity of the Idaho-Maryland Mine request adequate safeguards.**

Dear Mr. Kelley:

The undersigned members of the Wells Coalition respectfully request adequate safeguards for well owners in a recirculated Draft Environmental Impact Report (DEIR) for the Idaho-Maryland Mine.

The Wells Coalition is a group of property/well owners and a few renters in the vicinity of the Idaho-Maryland mine that have formed for the purpose of protecting our only source of water, our wells.

**Grp 28-1**

The DEIR Well Mitigation Plan cites "expert opinion" and states being in compliance with The County Policy 17.12 [1], which designates protections for wells from potential mining impacts. However, our review of the report leads us to conclude otherwise.

> *The Nevada County General Plan 17.12 (complete policy)*
>
> *In approving mining projects which **according to expert opinion** may threaten the existing quality or quantity of surface or subsurface water which supply adjacent homes and businesses:*
> *1) The County shall require the operator to guarantee a comparable supply of water to such homes or businesses through accessible forms of security or alternate sources of water.*
> *2) Where water quantity and quality problems occur, an immediate water supply shall be provided by the operator until the source of the problem is determined.*

*3) The burden of proof shall be on the operator to show that the mining operation did not create the water problem.*
*4) If it is determined that the operator is at fault, impacted owners shall be compensated by the operator.*

The applicants DEIR *Well Mitigation Plan* states:

*"Expert opinion has determined that there is no threat to water quality to domestic water wells from the Idaho-Maryland Mine Project."* [2] and *" All potentially impacted wells are located in the E. Bennett Road area. Domestic water wells outside this area will not be impacted."* [2], [3]

The following statements from the DEIR and additional expert opinion contradict the certainty of the applicant's *Well Mitigation Plan* statements, citing repeatedly, uncertainties in hydrologic and hydrogeologic predictions and impacts to wells due to groundwater response from dewatering of the Idaho-Maryland Mine:

**Grp 28-2**

*"In our opinion and based on the data and analysis presented in the Itasca Report and EMKO Report, it is possible that mining activities, including blasting, backfilling with CPB, and sealing of drains or areas of the underground workings, could activate leaching and groundwater flow in new subsurface areas, potentially resulting in impacts to neighboring wells, and discharges to surface water of groundwater with water quality exceeding applicable standards. These impacts could potentially occur during the mining or post-mining periods. Because of the* ***uncertainty inherent in the bedrock fracture flow system****, monitoring will be needed, as mining activities progress, to assess potential impacts, design appropriate solutions and attain necessary permits to mitigate these potential impacts. These efforts should be addressed in the monitoring and mitigation requirements for the mining and post-mining phases of the Proposed Project."* [4]

*"The EMKO Report describes a three-step procedure used to assess potential drawdown effects in perimeter areas. A major assumption underlying the procedure is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth.* ***However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of this uncertainty and the overall uncertainty of the analytical and numerical model predictions with respect to groundwater level impacts on individual wells should be provided. expanded to include an assessment of the uncertainty in the conclusions developed by Todd Engineers."***[4]

**Grp 28-3**

*"Although the analysis is considered conservative in methodology,* ***several complexities in the groundwater system could potentially result in a larger or smaller radius of influence. Although larger impacts seem unlikely, it is difficult to prove that aberrations in the system do not exist."*** [5]

***"Uncertainties in the analysis indicate that monitoring should occur over a slightly larger area than where impacts are predicted. In addition, the monitoring program should consider adjustments specifically for geologic faulting."*** [5]

***"Monitoring locations should also include areas outside of the predicted impact zone to account for uncertainties in the analysis,"*** [5]

**Grp 28-4**

***"Due to the uncertainties regarding the complex geology, groundwater flow, flow dynamics in the mine, and the presence of faults, dewatering impacts to domestic water supply wells cannot be accurately predicted.*** *However property owners within the estimated area of influence around the proposed project must be ensured a continuous source of water is available to their property."*[6]

***"The geologic formation in which the mine is located is fractured bedrock whose hydrogeology is difficult to predict.*** *Therefore, reliance on Domestic Well Level Monitoring Program data will be required to assess impacts and discern appropriate mitigation measures for each domestic well owner."* [7]

**Grp 28-5**

***"Even a well calibrated model has a large uncertainty to it, in its predictions. It turns out that this model is not well calibrated, so the uncertainties are almost certainly larger.*** *It's not well calibrated because it tries to make predictions of what will happen in the shallow aquifer without historic shallow well water levels to calibrate to."* [8]

***"The fracture systems existing in buried bedrock beneath Grass Valley are not map-able within the resolution needed to predict specific dewatering effects. Technology and state-of-the-art hydrogeology have not developed to a level that fracture mapping is possible. Due to this limitation, hydrogeologic modeling is attempted by making an assumption on fracture connectivity."*** [9]

*"The groundwater in this particular area is contained in and flows through fractures in near surface bedrock and because of this fracture flow regime, the groundwater flow in quantity varies considerably with location and* ***cannot be predicted with certainty. Furthermore, complete hydraulic separation between the deeper groundwater within the underground mine workings and the shallow groundwater within fractures and supplying the domestic wells cannot be assumed."*** [11]

*"Based upon the significance criteria established on page 4.3-4,* ***the risk to all wells within the study area, regardless of risk category, represent a potentially significant impact."*** [12]

**Grp 28-6**

*"It is expected that the* ***actual mining areas will change from the modeled mining areas*** *due to vein geometry and discoveries, which will only be known after extensive underground exploration is completed in the future."*[13]

**Grp 28-7**

*"The study area has not been monitored by an approved groundwater monitoring system designed to observe the dynamics associated with subsurface hydrology. Therefore,* ***many of the initial unknown hydrogeologic and geologic parameters located within the earth between well and mine elevations still exist."***

***"With fractured rock there will always be uncertainty and during my career there won't be any 100% confidence in predictions."***[14]

The overwhelming consensus of the experts listed above is that the project "... may threaten the existing quality or quantity of surface or subsurface water which supply adjacent homes and businesses" per County Policy 17.12 [1], and therefore the applicant is not in compliance with that policy. In light of the uncertainty present in the hydrogeology predictions, the DEIR Well Mitigation Plan is inadequate.

*The mitigation plan is inadequate because it* ***does not satisfy the condition of the County Policy, and it has no means of even determining whether those conditions will be met.***

The DEIR has not adequately defined an area of potential impacts.

**Grp 28-8**

The DEIR acknowledges that more groundwater level data is needed to assess the potential impacts on groundwater levels [15]

The DEIR's analysis of groundwater impacts is so fundamentally deficient that those of us who rely on groundwater wells for our drinking supply do not have the fundamental information necessary to evaluate the Project's effects on our wells. The DEIR's analysis must be comprehensively revised to fully account for the severity and extent, including the geographic magnitude, of the Project's impacts. Until the EIR accurately discloses the Project's groundwater impacts, it is not possible to determine whether the mitigation the DEIR relies on would even be close to sufficient to protect our wells.

The Wells Coalition intends to weigh in again on the EIR's approach to well mitigation once the EIR's groundwater impact analysis is thoroughly revised and recirculated for public review.

Thank you for your time and consideration.

Sincerely,

**The Wells Coalition**

Our membership represents almost 100 properties and is still growing. A number of our members wanted to have their signatures added to this letter. Their consent was gathered electronically and the names are shown below. Contact details are available by request to the Nevada County Planning Commission only.

## GROUP LETTER 28: THE WELLS COALITION

### Response to Comment Grp 28-1

The commenter implies that the project is not in compliance with Nevada County General Plan Policy 17.12, but does not provide details on why the commenter believes the project is inconsistent in this comment. The commenter's specific comments are addressed below in Response to Comments Grp 28-2 through Grp 28-8.

### Response to Comment Grp 28-2

The commenter implies that the project is not consistent with County General Plan Policy 17.12 based on statements from the County's independent groundwater expert, West Yost, made upon reviewing the draft groundwater analysis. However, the peer-review comments by West Yost that are referenced by the commenter were previously addressed by revisions to Technical Reports during the preparation of the DEIR; thus, the statements quoted by the commenter relate to a preliminary draft of the groundwater analysis and do not represent the final analysis presented in the DEIR. Moreover, consistent with County General Plan Policy 17.12, Mitigation Measure 4.8-2(b) already requires replacement water for any well impacted by the project; thus, the project is consistent with County General Plan Policy 17.12.

A Groundwater Monitoring Plan (GMP) is required for the project under Mitigation Measure 4.8-2(a). As described on page 4.8-66 of the DEIR the measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, for an updated description of the proposed monitoring approach, which now also includes a proposal by the applicant to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

As stated in Section 5.2 of Appendix K.2 of the DEIR, the following discussion addressed West Yost's peer-review comments:

> During mining, there will be a net inflow of groundwater into the underground workings due to the on-going dewatering. Any residual constituents associated with blasting would be contained within the water pumped from the mine workings and would not affect the quality of the groundwater outside of the mine workings. The treatment plant is designed to treat ammonia and other blasting residuals that might occur due to incomplete detonation. The net inflow of groundwater into the underground workings would also ensure that mining activities such as blasting, backfilling with CPB, or sealing of drains would not have the potential to affect domestic supply wells during the active mining and dewatering period.

The proposed mining areas will primarily be at equivalent or deeper depths than the existing underground mine workings, while the potential future expansion areas all involve mining at greater depths, typically more than 1,000 feet below the surface and deeper (see Figures 5-1 and 5-10 of Itasca, 2020b). At those greater depths, the hydraulic conductivity is several orders of magnitude lower than it is at the depths of the domestic supply wells, as shown on Figures 3-9 and 3-10, due primarily to the lack of open fractures as a result of the large pressures exerted by the overlying rock mass (i.e., the lithostatic pressure). Since the new mining activity would occur at equivalent or greater depths than the proposed mining, there is little or no potential for the proposed mining and mining in the future expansion areas to affect the quality of the groundwater

in the domestic supply wells that are completed at much shallower depths. Please also see Master Response 7 – Location of Future Mining Areas.

There is currently no evidence to indicate that the historic underground mine workings have caused any water quality impacts at any domestic well. During mining, there will be a net inflow of groundwater into the mine workings, such that any mining activities would not affect water quality within the fractured bedrock. After mining ceases, conditions would return to those that currently exist. The proposed new mining activities would all occur at depths that are comparable to or much deeper than the historic mine workings. Due to the substantial reduction in hydraulic conductivity at those depths, compared to the depths of the domestic supply wells, it is highly unlikely that the proposed project would affect water quality in those wells.

Further, as stated in Section 6.0 of Appendix K.3 of the DEIR, the following discussion addressed West Yost's additional peer-review comments referenced by the commenter:

> The model is constructed based on the available data. Because of the fractured nature of the intermediate and deeper geologic units, one may argue that unknown fractures may impact the results of the modeling. Fractures or geologic discontinuities decrease with depth due to the weight of overlying geologic materials. The mining will occur in the deeper geologic units where the fractures, if present, are closed or have smaller apertures, which will not transmit significant quantities of water. The scenarios addressed in the modeling cover a wide range of probable situations that may be encountered and the potential impacts to groundwater levels and surface-water baseflows. …Itasca recommends a rigorous groundwater monitoring program to assess how the hydrogeologic system responds to mining, whether the measured results are within those modeled under the various scenarios.

As such, contrary to the commenter's assertion, West Yost's peer-review comments were addressed, the County's independent expert does not have the "expert opinion" that the project will impact more wells than disclosed in the DEIR's analysis. Moreover, Mitigation Measure 4.8-2(b) already requires replacement water for any well impacted by the project; thus, the project is consistent with County General Plan Policy 17.12.

## Response to Comment Grp 28-3

The commenter cites statements from a Todd Groundwater analysis prepared in 2007 for a previously proposed mining project. While the commenter uses the cited language to imply that the prior groundwater study reached different results, in actuality, previous assessments including the Todd Groundwater report have come to similar conclusion as the current analysis despite the use of simplistic analytic solutions. Please see Master Response 13 – Historic Hydrogeologic Assessments.

As was requested for the previously proposed project by Todd Groundwater, for the current project, groundwater monitoring is required for a larger area than just the expected impact zone. (see Mitigation Measure 4.8-2(a) and Appendix K.8 of the DEIR).

Please also see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 28-4

The commenter cites to language from materials prepared for a previous Emgold project at the same site in 2008 and 2011. The 2008 Emgold DEIR came to similar conclusion as the current

analysis despite the use of simplistic analytic solutions. Please see Master Response 13 – Historic Hydrogeologic Assessments.

As was requested for the previously proposed project in the cited language, groundwater monitoring is required for the current project (see Mitigation Measure 4.8-2(a)). Mitigation Measure 4.8-2(b) also requires the mine operator to guarantee continuous water supply for properties surrounding the project in the event of drawdown impacts. (See Mitigation measures 4.9-2 (b) and 4.8-2(c).)

Please also see Master Response 7 - Location of future mining areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. As noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Grp 28-5

The commenter cites to a video presentation by June Oberdorfer in October 2021 (footnote 8). A specific comment was submitted on the DEIR by June Oberdorfer regarding calibration of the groundwater model. Please see the response to referenced Oberdorfer comment - Response to Comment Grp 8-128.

The commenter also refers to language from a comment letter submitted by Steve Baker on a previous DEIR in 2008 (footnote 9). Steven Baker submitted a comment on the current DEIR, asserting that fractured bedrock cannot be modelled for groundwater impact purposes. Please see Responses to Comment Letter Ind 29 (Steven Baker Letter). Contrary to the assertions in the submitted Steven Baker letter, the groundwater model was compared against water levels measured in wells in the mine area, and was found to be accurately calibrated as compared to the measured water levels. (Section 4.5 page 22). This correlation contradicts the assertions made in the quoted language that the model cannot predict groundwater levels in a fractured bedrock system.

The commentor refers to the 2008 Idaho-Maryland Mine Project DEIR page 4.7.29 (footnote 11). The hydrogeologic studies used for the 2008 DEIR came to similar conclusions as the current DEIR despite the use of simplistic analytical solutions. Please see Master Response 13 - Historic Hydrogeologic Assessments. Like the current DEIR, the previous 2008 DEIR found the impact to groundwater wells was potentially significant and proposed mitigation measures to reduce the impact to a less than significant level. See Impact 4.8-2 of the DEIR.

The commentor refers to the 1995 Idaho-Maryland Mine DEIR page 4.3.5 (footnote 12). Like the current DEIR, the previous 1995 DEIR found the impact to groundwater wells was potentially significant and proposed mitigation measures to reduce the impact to a less than significant level. See Impact 4.8-2 of the DEIR.

Please also see Master Response 7 - Location of future mining areas, Master Response 13 - Historic Hydrogeologic Assessments, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

## Response to Comment Grp 28-6

The commenter provides language from the Itasca groundwater study that provides background on how Itasca modelled possible expansion of mining for Sensitivity Scenario 6. Please see Response to Comment Grp 7-82 in CEA Letter #1.

Itasca analyzed the impacts of new underground mining excavations based upon information provided by the applicant, as shown on Figure 5-1 of Appendix K.3 and Sheet 15 of Appendix K.2. As shown in these figures, assumed mining areas are based on the projected down-dip extensions to mineralized veins historically mined. Sensitivity Scenario 6 considered the significant expansion of mining in areas with potential for mineralization, as shown in Figure 5.10 of Appendix K.3. As shown in Figure 5-12, the major mining expansion studies in Scenario 6 did not result in a significant expansion in the simulated 5-foot drawdown contour versus the base case.

As stated on page 31 of Appendix K.3, while the targeted mining areas analyzed in the groundwater model are accurate and representative of where mining will occur in the near and mid-term, it is expected that over time the actual mining areas will change from the modeled mining areas due to vein geometry and discoveries, which will only be known after extensive underground exploration is completed in the future. Itasca recommends that the groundwater flow model be updated periodically after dewatering commences. Updated modeling would incorporate changes to the long-term mining plan, data from monitoring wells, and measured pumping rates. The DEIR acknowledges that without the implementation of a groundwater monitoring program and well mitigation plan, the project could result in a significant impact to groundwater supplies.

A Groundwater Monitoring Plan (GMP) is required for the project under Mitigation Measure 4.8-2(a). As described on page 4.8-66 of the DEIR, the measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. As stated in Section 3.0 of the GMP, the dewatering of the existing mine workings, prior to the commencement of actual mining, is analogous to a largescale pumping test that is a common tool in the field of hydrogeology to assess drawdowns in the water-bearing zones. Monitoring wells in closer proximity to the mine will generally experience drawdowns before wells farther away. The measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. Mitigation Measure 4.8-2(a) requires that a projected water-level impact assessment for individual domestic wells shall be performed once dewatering of the underground mine workings commences, based on responses of the measured groundwater levels of the project monitoring wells. The projected groundwater drawdown shall be estimated for each domestic well in the project area. This impact assessment shall be performed by tabulating the variation of the measured water levels from the project monitoring wells over the monitoring period and during the dewatering of the underground mine workings and mining operations. For each domestic well, a projected and seasonally averaged water level shall be estimated based on the domestic well location and the background potentiometric conditions, which will serve as a baseline groundwater level and shall be developed prior to the initiation of dewatering of the underground mine workings. If the water level impact assessment showed a potential impact to wells outside of the E. Bennett area, assuming the 100% safety factor, the applicant would be required to mitigate this impact before it occurs in accordance with Mitigation Measure 4.8-2(b). The mitigation would be for properties which may be potentially impacted as determined in the projected water-level impact assessment. As

discussed in the Well Mitigation Plan, if a dewatering impact to an area outside of the E. Bennett area were projected during operations, pre-emptive action would be taken as necessary to ensure immediate water supply and compensation. The 10% drawdown threshold of significance is extremely conservative and, in most cases, would not lower the water level below the casing of the domestic well. Therefore, well mitigation may not be required after inspection. If reduction of the water column was great enough to reduce the well's yield, a simple adjustment to the pumping system may only be required. For example, by pumping at a lessor rate over a longer duration and if necessary, installing or increasing the size of a pressure or holding tank. In the unlikely case where these measures were not sufficient, appropriate mitigation could be the deepening of a single well, drilling of a new well, or the provision of potable water service to a group of wells. The Well Mitigation Plan has been modified to clarify the actions that would be taken as described above. Please see Appendix D to this Final EIR for the Revised Well Mitigation Plan.

Nonetheless, as discussed in Master Response 7 – Location of Future Mining Areas, to address public concerns regarding the scope of future mining within the mineral rights area, the applicant has agreed to an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area.

In addition, as noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

## Response to Comment Grp 28-7

The commenter cites verbal statements from a hydrogeologist at Itasca who was speaking at a Nevada Irrigation District (NID) meeting relating to the water supply assessment under consideration by NID at that hearing. The Itasca hydrogeologist noted that monitoring wells had not yet been installed, and that there is never 100% certainty in groundwater level predictions. The commenter cites this language to imply that the lack of 100% certainty, and the DEIR's requirement to obtain data as part of the groundwater monitoring plan after project approval, is a violation of CEQA. However, CEQA does not require 100% certainty, as this could never be achieved. Rather, as stated by California Courts, "[t]he need for thorough discussion and analysis is not to be construed unreasonably… to serve as an easy way of defeating projects. Absolute perfection is not required." (*Laurel Heights Improvement Assn., supra,* 47 Cal.3d at p. 406.)

The analysis provided in Impact 4.8-2 of the DEIR concludes that the proposed mining operations could result in adverse effects to seven domestic water supply wells in the East Bennett area during the life of the mining operation. No significant impacts to domestic water wells are predicted in the Greenhorn, Woodrose, Beaver or other areas. The predictions include the use of a 100% safety factor, multiple sensitivity scenarios, and have been peer reviewed by the County's independent expert consultant. This sensitivity analysis addresses the uncertainties in the data used as inputs to the model. The sensitivity analysis showed that variations in the input parameters (such as hydraulic conductivity) did not change the predicted drawdowns significantly, primarily due to the low permeabilities of the deep rock in which mining will occur.

Page 25 of Appendix K.3 acknowledges that there are uncertainties in groundwater modelling and states that the predicted contours are based upon the numerical groundwater flow model and the assumptions inherent in the model. Actual, in-field measured water levels may be different from the predicted water levels due to heterogeneities in the hydrogeologic system. The DEIR acknowledges that without the implementation of a groundwater monitoring program and well

mitigation plan, the project could result in a significant impact to groundwater supplies. Despite the lack of 100% certainty (which is impossible and not required for CEQA analysis) the DEIR provides very conservative analysis of groundwater impacts, and also provides mitigation to the expected impact area and guaranteed water replacement for other areas in case there are future unexpected impacts.

## Response to Comment Grp 28-8

The commenter asserts that the overwhelming consensus of the experts is that the project will threaten the water quality and quantity of adjacent businesses and homes and is therefore inconsistent with County Policy 17.12. However, the commenter's selective quotes from various studies and documents mischaracterizes the relevant information. Moreover, County Policy 17.12 requires where such threats exist, that the mine operator guarantee a replacement supply of water, which is already incorporated into the DEIR's mitigation requirements; thus, the project is consistent with County Policy 17.12. Finally, the County has discretion to determine which expert opinion to adopt. CEQA case law has been clear for decades that a disagreement among experts does not make an EIR inadequate. (See, e.g., *Association of Irritated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1396; CEQA Guidelines § 15151.)

The analysis in the DEIR has defined the potential impacts to groundwater levels. Additional groundwater level data is not required for analysis of the DEIR and would not change the conclusions of the EIR.

Groundwater monitoring is required for the project (see Mitigation Measure 4.8-2(a)). Well mitigation is required to guarantee continued water supply for properties surrounding the project (see Mitigation measures 4.9-2 (b) and 4.8-2(c). Therefore, the project complies with Nevada County General Plan Policy 17.12.

The analysis provided in Impact 4.8-2 of the DEIR concludes that the proposed mining operations could result in adverse effects to seven domestic water supply wells in the East Bennett area during the life of the mining operation. Pursuant to Nevada County General Plan Policy 17.12, the project would address this by installing a potable water supply line in East Bennett Road and providing individual well owners with a connection to the potable water line. No significant impacts to domestic water wells are predicted in the Greenhorn, Woodrose, Beaver or other areas. The predictions include the use of a 100% safety factor, multiple sensitively scenarios, and have been peer reviewed by the County's independent expert consultant. However, the DEIR acknowledges that without the implementation of a groundwater monitoring program and well mitigation plan, the project could result in a significant impact to groundwater supplies.

A Groundwater Monitoring Plan (GMP) is required for the project under Mitigation Measure 4.8-2(a). As described on page 4.8-66 of the DEIR, the measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented.

Mitigation Measure 4.8-2(a) (1) requires water-level monitoring data for a minimum of 12 months before commencement of dewatering of the mine. This data will be used to establish the baseline for each well before commencement of mine dewatering.

The collection of groundwater level data through the proposed monitoring wells (required by Mitigation Measure 4.8-2(a)) would not by themselves provide information needed to assess the potential impacts of the project to groundwater levels in the EIR. As stated in Section 3.0 of the GMP, the dewatering of the existing mine workings, prior to the commencement of actual mining,

is analogous to a largescale pumping test that is a common tool in the field of hydrogeology to assess how drawdowns in the water-bearing zones, for example, the fractured bedrock at the project site, propagate with time as a result of pumping. Monitoring wells in closer proximity to the mine will generally experience drawdowns before wells farther away. The measurements of water levels in the monitoring wells can be used to verify the groundwater drawdowns as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented. Obviously, the dewatering of the mine workings cannot take place until the appropriate permits are in place and the CEQA process is complete.

Nonetheless, as noted in Master Response 15, the applicant has provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

Re: Comments on DEIR for proposed re-opening of Idaho-Maryland Mine

February 3, 2022

Dear Matt Kelley,

As a local watershed organization working to promote environmental health for the benefit of our community we welcome the opportunity to be involved in offering comments on the draft environmental impact report (DEIR) for the proposed Idaho Maryland Mine. Previously, we submitted scoping comments following the Notice of Preparation (NOP). As we work to carefully consider the DEIR, however, we have been met with a number of obstacles that suggest an extension for the DEIR comment deadline is in the public interest.

**Grp 29-1**

First, the lives and routines of most members of our community have been severely disrupted by the impacts of the late December storm that caused much damage and extended outages. Some of us have lost power for two weeks and internet for four weeks. This disruption occurred just as the DEIR was submitted on January 4th. Thus, many community organizations and individuals have had significantly less time to start reviewing the DEIR.

Secondly, the DEIR is immensely complex, very lengthy and very technical. The potential impacts to our community are also very large and long-lasting. Sufficient time to

process the details of the DEIR is essential for full public participation.

Third, the DEIR, although it organizes comments received on the NOP in section 1.8 of the introduction and includes all comments in an appendix, nonetheless makes it very difficult to see that the 25 areas of concern we submitted in our comment to the NOP are actually addressed in the DEIR. Nowhere are our concerns specifically noted or footnoted in the text. Section 1.8 simply indicates in which chapter various concerns are addressed. We are left, then, to 'sift' through many pages of text hoping to find sections or appendixes that address our concerns.

As it is, upon reading section 1.8 we do not see listed any concern items mentioning "monitoring plan for South Fork Wolf Creek," "monitoring for benthic macroinvertebrates," inaccuracies to "perennial stream" designations, "enforcement of permits," "surveys of trout," "alternatives to dewatering" via South Fork Wolf Creek, "Centennial Drive and Spring Hill Drive realignment," "property values," low viability of "transplanting" Pine Hill flannelbush, inclusion of "climate change modeling" including "higher intensity storms," "waste rock" causing increased TDS in Wolf Creek, "oversight," "enforcement," "fines," and "bonding," all specific concerns included in our comment letter to the NOP. Section 2.1 of the DEIR does seem to refer to a few of these unlisted issues, but others seem to be absent and ignored.

A better system should have been devised whereby concerns were cross-referenced to the actual comment letters so that the public could easily see how and whether their concerns were addressed. Surely, Raney, in their due diligence carefully checked that each individual concern raised following the NOP was considered. Some mechanism showing that should have been included. As it is, the DEIR is far less accessible to public participation than it should be to satisfy CEQA requirements.

For these reasons, all in the public interest, we have two requests:
1) That the DEIR comment period be extended by at least 30 days.
2) That the County circulate an index that will allow the public to easily verify that our concerns submitted during the NOP scoping process are addressed in the DEIR.

Thank you for your consideration of these requests, and for all you do to preserve, promote, and protect the well-being of our County.

Please acknowledge receipt of these preliminary comments.

Sincerely,

Jonathan Keehn
Gary Griffith

## GROUP LETTER 29: JONATHAN KEEHN, WOLF CREEK COMMUNITY ALLIANCE

### Response to Comment Grp 29-1

The commenter requests an extension of the DEIR public review period. CEQA requires a minimum 45-day public review period for DEIRs submitted to the State Clearinghouse (PRC 21091). In response to public comment, the County elected to provide an extended DEIR review period of 91 days from January 4, 2022, to April 4, 2022.

The commenter requests an index that will allow the public to easily verify that their concerns submitted during the Notice of Preparation are addressed in the DEIR. No such index is required under CEQA. The commenter also provides a list of general concerns which are brought up in their subsequent comment letters on the DEIR. Please see Responses to Group Letters 30 and 31.

**Group Letter 30**

3/30/2022

Comments on the Idaho-Maryland Mine DEIR
Follow-up on WCCA NOP Comment submittals of August 16, 2020 and December 22, 2019.
Copies of both submittals are copied below for your convenience.

To All Concerned:

Most of the issues we raised in the letters referenced above were not properly addressed in the current Draft Environmental Impact Report (DEIR) for the IMM project. The purpose of the Notice of Preparation is to ask interested parties, such as ourselves, to point out substantive issues that should be addressed in the CEQA process and specifically in the DEIR. Because the DEIR did not adequately address these issues, we request that the DEIR be revised and recirculated to the public and agencies.

**Grp 30-1**

Following is a breakdown of the 25 issues raised in the 8/16/2020 letter, and the additional issue raised in the letter of 12/22/2019. It is possible that some of these issues were in fact addressed somewhere in the DEIR, but we were unable to locate them. If that is the case please direct us to the correct pages.

**Grp 30-2**

**1 & 2) Surface water monitoring program.** We are suggesting a robust surface water quality monitoring program, at least in South Fork Wolf Creek, beginning before the start of the project to provide several years of baseline data. The program should extend through the working life of the proposed project, and several years after decommissioning. These issues were partially addressed in Chapters 4.4 and 4.8, but the monitoring plan was not discussed, and many of our questions were not answered.

**Grp 30-3**

**3 & 4) 48" culvert, pond, SFWC headwaters.** We did find some discussion of this issue in the DEIR, but it was insufficient. We stand by the statements in the letters: that SFWC is a perennial "water of the US" upstream to and beyond Brunswick Road. The same is

true for the pond (PD-1). The DEIR must propose a Project Alternative that would include day-lighting of the creek and protecting these important riparian resources.

Grp 30-4 **9) Hydrology.** There is some discussion of Hydrology in Chapter 4.8, but the analysis was based on insufficient data. The specific questions we asked were not answered in the DEIR.

Grp 30-5 **16) Interpretation of LUDC L-II 4.3.17.** On these large properties, avoidance of impacts is possible, therefore no exceptions to the development code should be allowed.

Grp 30-6 **17, 18, & 23) Flannelbush, frogs, and other listed species.** This issue is addressed in Chapter 4.4, but the mitigations suggested are not sufficient to protect these species, and the comments and questions we submitted were not resolved in the DEIR.

Grp 30-7 Below are the remaining items from our NOP comment letter. They were either not addressed in the DEIR, or our specific questions were not answered.

**5) Timber Harvest Plans**

Grp 30-8 **6) Ongoing Enforcement of Permits**

Grp 30-9 **7) Protection and Monitoring of Rainbow Trout**

Grp 30-10 **8) Alternatives for Mine Water Discharge**

Grp 30-11 **10) Surface and groundwater.**

Grp 30-12 **11) Realignment of Centennial and Springhill Drives.**

Grp 30-13 **12 & 13) Public trails.**

Grp 30-14 **14) Wells.**

Grp 30-15 **15) Loss of tax revenue.**

Grp 30-16 **19) Flooding.** The contradictory findings were not addressed in the DEIR.

Grp 30-17 **20) Climate Change.**

Grp 30-18 **21) Nitrification/ammonia nitrate.**

Grp 30-19 **22) Centennial surface waters.**

Grp 30-20 **24) 100' and 50' buffer zones.**

Grp 30-21 **25) Adequate bonding.**

Grp 30-22 In summary, we reiterate our concern that many issues raised in our NOP comments to you, in 2019 and 2020, were not addressed, and/or specific questions were not answered in this DEIR. We believe this violates the intent of the environmental review process as required by CEQA. These deficiencies, and others, should be corrected, and the Draft EIR should be recirculated to the public and agencies.

Thank you.

Jonathan Keehn

August 16, 2020
Matt Kelley, Senior Planner
Nevada County Planning Department, 950 Maidu Ave., Suite 170
Nevada City, CA 95959
Re: Rise NOP Comments
Dear Mr. Kelley,
Thank you for the opportunity to comment on this project.

**Grp 30-23** As you know, we have found it extremely difficult to fully understand the scope of the documents provided because of the very short time period allotted to research it. The video slide show distributed by the Planning Department in late July left only 20 days for most folks to locate, review, read, try to understand some very complicated data, and then collect our thoughts into a coherent letter before submitting them to you. And that is only for people with good internet; others have almost no way to find the documents, much less respond in a meaningful way.

Nonetheless a volunteer crew of concerned citizens have managed to put together this preliminary list of comments. We hope you will extend the comment period to fully comply with CEQA's goal of allowing the general public adequate time to comment.

**Grp 30-24** 1. The EIR must describe a comprehensive monitoring plan for South Fork Wolf Creek (SFWC) and its watershed. Here is a sample of questions that must be answered in the EIR regarding this monitoring plan: What kind of pre-project monitoring of South Fork Wolf Creek (SFWC) will be done to establish baseline data for water quality? What type of ongoing monitoring will be in place during the dewatering process, to ensure there is no deleterious effect on water quality? What is the proposed monitoring program for water quality in SFWC during the 80-year life of the project? Who will oversee this monitoring, and what structure will be in place to enforce compliance? Who will pay for this? The parameters monitored should include, but are not limited to: pH, water temperature, dissolved oxygen levels, dissolved solids, turbidity, nitrogen, phosphorus, heavy metals, manganese, iron, other mining residue. Please provide a scientific design of the proposed monitoring program, including suitable goals, exceedance levels, etc.

**Grp 30-25** 2. Please describe similar monitoring plans for other important riparian parameters, including but not limited to: benthic macroinvertebrates (BMIs), physical habitat, canopy coverage, and sediment loading.

**Grp 30-26** 3. Contrary to the report in the applicant's submitted documents, SFWC is a perennial stream, fed by two streams above Brunswick, flowing through the entire Brunswick site, not just the downstream half. As per definitions in Nevada County LUDC Sec. L-II 4.3.17 B:

*3. **Watercourses, Perennial** - Natural or once natural flowing bodies of water, including*

*natural waterways that have been channelized, which flow continuously through a bed or channel having banks. All streams, creeks, lakes, ponds and reservoirs shown on the 7.5 minute USGS maps as perennial are included in this definition unless professional evaluation determines the watercourse to be intermittent or seasonal.*
SFWC is a blue line on 7.5 minute USGS maps all the way through the Brunswick property.
WCCA has been collecting data from our monitoring site upstream of Brunswick Road on Woodrose for 10+ years, and we dispute the finding in the submitted Management Plan that the upstream portion of the stream on this property is not perennial. The fact that a previous property owner "channelized" a portion into a 48" culvert is not sufficient evidence to determine whether this stream is perennial or intermittent. The EIR must describe how the entire length of the creek on the property will be protected with minimum 100' setbacks during the life of the project, and how the creek will be restored to a fully functioning healthy creek during and after the project. Please see our letter to Matt Kelly regarding this matter dated 12/22/2019, attached hereto.

4. Whether the steam is determined to be perennial or intermittent, the setbacks required by the county LUDC must be maintained throughout. Any work performed, including the proposed removal and replacement of the culvert, will require special permits for streambed alteration etc. from (including but not limited to) California Fish and Wildlife, USACE, Cal SWRCB, etc. The EIR must describe the status of these permit applications, and the scope of work proposed. Please note that the applicant violated the County's minimum setback requirements (twice) in 2018, and was required to submit a second Management Plan because the first one was insufficient. See The Union Other Voices, 6/24/2020: https://www.theunion.com/opinion/columns/jonathan-keehn-reopening-idaho-maryland-mine-still-a-bad-idea/

**Grp 30-27**

5. Please describe the status of CalFire Timber Harvest permits, or other forest harvesting permits that may be required for the life of this project. Please note that the applicant was cited for violations in this regard on March 29, 2018, attached hereto.

**Grp 30-28**

6. The EIR must delineate how the on-going enforcement of these permits (and any others required) will be achieved over the 80-year life of the project, and the reclamation/maintenance phase post-project. e.g: Who will be enforcing them and collecting fines if any aspect of the project is found to be in violation of the spirit and intent of a permit, whether or not the original enforcement agency is still in existence?

**Grp 30-29**

7. SFWC has populations of native rainbow trout that are highly sensitive to warm water and other changes in their habitat, as are many of the macroinvertebrate species that they

**Grp 30-30**

feed on. The EIR must describe how these fish and their habitat will be protected. This program would include, but not be limited to twice-yearly surveys of trout and BMIs downstream from the project, to monitor the effect of the project on trout.

**Grp 30-31**

8. The applicant has determined that SFWC is the proper conduit for discharge of all dewatering. However, the previous property owner (Emgold) went to great lengths to determine that a better solution would be to pipe the discharge to the main stem of Wolf Creek. The EIR must describe these former studies, assumptions, and findings, and describe why the current project applicant disagrees with the previous discharge analysis in favor of the current proposal. Alternative methods of disposal of the water must also be analyzed by the EIR, e.g. trucking off-site.

**Grp 30-32**

9. The EIR must address the following questions regarding the hydrological impact of dewatering: What is the level of confidence of the accuracy of the hydrological studies regarding dewatering? Describe the impacts of dewatering on ground water, surface water, riparian habitat, wetlands, and wells in the Wolf Creek watershed and beyond. What structure will be in place to measure negative impacts? What action thresholds have been set that will trigger remediation and fines if any negative impacts to the water resources of Nevada County and the Wolf Creek watershed occur? Who will enforce the rules, and who will pay for remediation? Please describe the public notification process, including real-time updates of all monitoring programs, in an easily-searchable data-base.

**Grp 30-33**

10. The project plan includes extensive exploratory drilling operations under neighboring properties and watersheds. The EIR must address the impacts on water resources (including but not limited to ground water, surface water, riparian zones, wetlands, and wells) of both the exploratory operations and the mining operations. How will negative impacts discovered by the monitoring program be remediated? What is the plan to halt operations, when significant changes in the water table are discovered, and how will alternative plans be made to stem the tide of destruction and depletion? In addition to SFWC, we are concerned about the main stem of Wolf Creek, the wetlands on the Centennial site that drains into Wolf Creek, all ephemeral and intermittent streams in the watershed, and the wet meadow on East Bennett Road that is on Empire Mine State property. How will these be monitored, and how will the general public and concerned citizens know if these wetlands and riparian areas are becoming degraded due to changes in the hydrology? And what will be done when negative impacts are discovered?

**Grp 30-34**

11. At the Centennial Site, the maps show that Centennial Drive and Spring Hill Drive are to remain in their current locations. However, the city of Grass Valley intends to realign this intersection, which would impact Wolf Creek proper, and its riparian zone. How will this

project be designed to accommodate the realignment? How will the realignment be constructed in a way to enhance the creek and riparian area? The EIR must address these issues collectively as part of this project, because of their anticipated cumulative effects, and not separately or piecemeal.

**Grp 30-35**

12. How will the project enable and enhance the city's plan to create a public trail along the Wolf Creek/Idaho Maryland Road corridor? This project is currently in the design and engineering phase. The EIR must address these issues collectively as part of this project because of their anticipated cumulative effects, and not separately or piecemeal. The EIR must describe any and all easements that will be granted to the city or the County, and the impacts they will have in the riparian corridors.

**Grp 30-36**

13. The EIR must address how the project will encourage trails and bike path accessibility, both on the Centennial site, the Brunswick site, and East Bennett and Idaho Maryland Roads.

**Grp 30-37**

14. Please describe how all the wells that might be affected will be monitored before, during, and after the project, including exploration and during the reclamation phase. Describe all the parameters that will be monitored - e.g. well production, water level, clarity, taste, potability, iron, manganese, arsenic, etc. Describe the underground hydrological features that may be affected by dewatering abandoned mine for 80 years, and how these features and activity will affect residential wells.

**Grp 30-38**

15. Please describe the projected loss to county tax revenues due to depressed property values over the next 80 years.

**Grp 30-39**

16. Regarding the "Aquatic Resources Management Plan" (Matuzak 2/2020): this report incorrectly interprets Nevada County Land Use and Development Code. LUDC L-II 4.3.17 – which states that any disturbance of wetlands, streams, etc. is to be allowed ONLY if there are no alternatives to a project going forward. *"**Sec. L-II 4.3.1 Purpose** The primary purpose of site development resource standards is to avoid the impact of development projects on sensitive environmental resources and natural site constraints. Where avoidance is not possible....."*
The EIR must describe alternative designs for the project that will avoid the impacts mentioned.

**Grp 30-40**

17. *Fremontedendron decumbens* (Pine Hill flannelbush) is a federally listed: Endangered and CA listed: Rare, and is known from only 12 populations in Yuba,

Nevada and El Dorado Counties. There is a population of 62 plants on the Centennial site and the project, as currently designed will lead to a loss of 18 plants and impact to another 4 plants. Over one third the population could be lost. This is an unacceptable take for a federally listed plant. A population of this size is very vulnerable and may not survive this level of impact. We would like the Draft EIR to demonstrate that the proposed mitigation described in Mauzak 2/2020 **Centennial Industrial Site *Habitat Management Plan for the Pine Hill Flannelbush (Fremontodendron decumbens)***, will not result in a loss of viability for the population and the meta population. We do not believe that transplanting is at all an option for this species. This genus is almost impossible to transplant when young, much less mature. The EIR must address how this plant will be protected and the population made to thrive on this site. Provide details of how this will be achieved, and include specific, proven methods of successful transplantation, if transplantation remains part of the plan. Provide a "performance based" monitoring plan to assure success of the project at 6 months, at least annually thereafter, for the life of the project and reclamation phase.

**Grp 30-41**

18. Regarding the **Technical Memorandum for the Idaho-Maryland Mine Project – South Fork Wolf Creek Discharge Biological Resources Assessment** (Matuzak 2019). After this report was completed, the foothill yellow-legged frog was listed by the State of California as Threatened. Because of this recent listing, additional protocol-level surveys of the creek below the Brunswick site, including on the Empire Mine SHP property, must be made, and the reports included in the EIR. The previous study was surprising given how few benthic macroinvertebrates were found. Our organization has several years of data on the BMIs of this location and it scored high for species richness and abundance, making this a prime habitat for trout, yellow-legged frogs, and Western Pond Turtles. The substrate is more than adequate as well for the frogs to lay eggs. New protocol-level surveys must be done by an aquatic biologist with frog experience, and the reports included in the EIR.

**Grp 30-42**

19. Serious and destructive flooding occurs during large storm events, along the main stem of Wolf Creek behind Mill Street, which is mostly residential. Homes are very close to this channelized portion of the creek and there has been considerable property damage during high water events. The EIR must describe the plan that will be in place to ensure that the water pumped into SFWC will not cause additional flooding along Mill St. and other parts of Grass Valley during high volume precipitation events. Please describe the plan to prevent the spill of toxic waste into the creek during high intensity storms, including remediation and funding sources. The Nevada City Engineering, Inc. (2019) Preliminary Drainage Analysis states that post project storm-water discharge from the Brunswick Site, including the treated mine water discharge of 5.6 cfs, will be *equal to or less than the estimated pre- project storm-water discharge levels*. However, as stated in the report,

the project will be adding an additional 5.6 cfs in perpetuity. The report also states that the construction of the storm-water detention ponds and the project will have *no impact or increase of flows in creeks during storm events* (NCE, 2019). The EIR must address these contradictory findings and describe a remediation plan.

**Grp 30-43**

20. Please describe the plans to mitigate the effects of climate change over the duration of the project. In the foothills, our main issues are flooding, fire, air pollution, CO2 emissions, carbon-based energy use, and drought. Please address all of these issues. With climate change, we have already, and will continue to experience higher intensity storms. The EIR must describe how these storms will affect the water quality and volume of the dewatering of the mine shafts, the levels of toxic water in your settling ponds, and the amounts of water pumped into the creek. Please describe the measures that will be implemented to reduce the proposed high use of carbon-based energy and your (very high) CO2 emissions. Describe the impact of these proposed emissions on the stated goals for reduced emissions by the City of Grass Valley, the County of Nevada, and the State of California. Please address the measures that will be taken to make your properties fire-safe, in a fire regime that will be increasing in danger over the 80-year life of the project. Please describe the modeling used to anticipate the effects of climate change on all parameters over the life of the project and into the reclamation phase.

**Grp 30-44**

21. Please describe the plans to reduce nitrification of the creek and environs from the use of ammonium nitrate. Please describe the effects of ammonium nitrate on riparian systems, including but not limited to the range/distance of the effect of ammonium nitrate in general and specifically in the systems that may be impacted by this project.

**Grp 30-45**

22. The Centennial site has wetlands, ephemeral, and intermittent streams throughout the project area. The EIR must address the impact of the piles of waste rock and whether there will be an increase the total dissolved solids and/or lowering of the pH of the water in these wetland areas, further degrading the water quality before emptying into Wolf Creek. In light of climate change, the EIR must reassess the 100 year floodplain in keeping with the increased likelihood of higher intensity storms on a more frequent basis.

**Grp 30-46**

23. The EIR must include protocol-level surveys to be done by experts for all Federal and State listed species at both Brunswick and Centennial sites, and also at the precious meadow and riparian sections of the SFWC watershed owned by Empire Mine State Park, just downstream of the Brunswick site.

**Grp 30-47**

24. The **Centennial Industrial Site Idaho-Maryland Mine Project** ***Watercourse / Wetlands / Riparian Areas Management Plan***, states that, "temporary disturbance or

encroachment may occur within the 100-foot non-disturbance buffer to Wolf Creek due to construction activities though such disturbance is not currently being proposed." This statement is vague and unenforceable. The EIR must make it clear that the project will maintain 100' setbacks to perennial streams, and 50' setbacks from all other water resources throughout the project, and describe the steps that will be implemented to achieve this goal during construction and for the life of the project and reclamation phase. The EIR must describe any sedimentation that may occur as a result of the dust and disturbance caused by the project activities at Centennial on all water resources. Also describe the oversight and enforcement of these rules: how the impacts will be monitored, to whom they will be reported, the fine schedule for violations, and the bond amount that will be posted to ensure compliance.

**Grp 30-48**

25. The EIR must determine an adequate bonding amount to ensure compliance and remediation of all facets of this project. It must include a financial structure sufficient to protect the County and its citizens from financial harm during every year of the proposed project, including through final reclamation.

**Grp 30-49**

Thank you again for the opportunity to submit these comments.
Please acknowledge receipt.
Sincerely,

Jonathan Keehn President  Josie Crawford Executive Director

Wolf Creek Community Alliance

**Grp 30-50**

December 22, 2019
Matt Kelley, Senior Planner 950 Maidu Ave., Suite 170 Nevada City, CA 95959
RE: Rise Grass Valley application for Conditional Use Permit and Reclamation Plan for the Idaho Maryland Mine project – mischaracterization of headwaters of South Fork Wolf Creek (SFWC)
Dear Mr. Kelley
Please review the following wording in the applicant's document, which can be found at page 17 (labeled pg 13) at:
https://www.mynevadacounty.com/DocumentCenter/View/31023/Applicants-Project-Description
"A buried 48-inch culvert crosses the Brunswick Industrial Site. The culvert transports off-site surface drainage from Brunswick Road. South Fork Wolf Creek originates from the outlet of this 48-inch culvert. As shown on Sheets 1 and 2, this culvert will be upgraded and replaced to avoid proposed facilities and development. The new 48-inch culvert will discharge at the same location as the existing 48-inch culvert."
This is not an accurate description. The 48" culvert does much more than simply "transport off-site surface drainage from Brunswick Road". In fact it conveys all of the upstream reaches of the headwaters of South Fork Wolf Creek. There are springs and streams on the east side of Brunswick Road that flow through a culvert under the road, and there is a significant stretch of SFWC on the west side of Brunswick Road before it enters into the grated 48" culvert. There is important riparian habitat along all of these reaches, including on the subject property, that must be protected.
As you may know, Wolf Creek Community Alliance manages a robust water-quality monitoring program all over the Wolf Creek Watershed that has been operating continuously since 2003. We currently monitor 25 sites, one of which (Site 6.1) is on SFWC on the upstream (east) end of the Brunswick Road culvert. We call this site the SFWC Headwaters Site, but in fact the headwaters are farther to the east, up Wood Rose Road.
Any project that may come before you on the property currently owned by Rise GV should include daylighting this important stretch of SFWC that is currently in a 48" culvert. This stretch should be restored to a healthy open creek with a functioning riparian zone with habitat for a viable fish population.
Many thanks for the opportunity to comment.
Jonathan Keehn

## GROUP LETTER 30: JONATHAN KEEHN, WOLF CREEK COMMUNITY ALLIANCE

### Response to Comment Grp 30-1

Comment noted. This is an introductory comment and does not provide a comment on an environmental issue associated with the project.

### Response to Comment Grp 30-2

The commenter suggests a surface water monitoring program, at least in South Fork Wolf Creek, during the project, and which would extend after the end of the project, and refers to Comments #1 and 2 of their August 16, 2020 NOP comment letter. However, the commenter does not identify any significant impacts that would be avoided or reduced by this suggestion. As discussed in DEIR Section 4.8.2, extensive monitoring of South Fork Wolf Creek was conducted to prepare the technical studies that support the hydrology and biology impact analyses. As discussed in Impact 4.8-1, monitoring will be required by the project's Regional Water Quality Control Board Limited Threat Discharge Permit, Report of Waste Discharge, and Industrial General Permit demonstrating compliance with standards that prevent degradation of water quality throughout the life of the project. Monitoring will be paid for by the applicant and enforced by the County and the RWQCB. As such, surface water monitoring will already be required as part of mitigation imposed on the mine operator, and the RWQCB will have enforcement authority based on that monitoring data.

Please also see Response to Comment Grp 30-25.

### Response to Comment Grp 30-3

The commenter asserts the upstream and offsite portion South Fork Wolf Creek is a perennial water of the United States. The DEIR, including Appendix F.7, identifies the onsite portion of South Fork Wolf Creek as perennial. The upstream portion of South Fork Wolf Creek is offsite and would not be impacted by the project. The existence of the culvert is the baseline condition for the project and the restoration to an open creek as suggested by the commenter is not required by CEQA.

The commenter also asserts the onsite pond is a perennial water of the United States. The DEIR, and Appendix F.7, identifies the onsite pond as a historic man-made clay-lined pond that was associated with historic saw milling operations. The pond is not a jurisdictional "water of the United States" as it is an industrial pond built and maintained for industrial purposes. (DEIR, p. 4.4-15.) Water is typically found in the pond year-around.

Section 6 of the DEIR considered project alternatives. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. (See CEQA Guidelines, Section 15126.6(a).) The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis given that they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail. (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the

public and decisionmakers. The commenter's suggested alternative would not avoid any significant impacts of the project, but would include a creek restoration component that has no nexus to the project's impacts. As such, this alternative is rejected from further consideration.

## Response to Comment Grp 30-4

The commenter states generally that the hydrology analysis in the DEIR was based on insufficient data, but does not provide any specific comments on the DEIR's analysis or data. The commenter references several related questions the organization raised in its August 16, 2020 NOP comment letter and states that many of the questions were not answered in the DEIR. The commenter specifically references Comment #9 of the NOP comment letter. Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependent Vegetation, and Master Response 35 -Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts. In addition, please see Response 30-29 regarding enforcement of conditions of approval, mitigation measures, and agency permits.

## Response to Comment Grp 30-5

The commenter cites the portion of the County Land Use and Development Code (L-II 4.3.17) regarding "watercourses, wetlands, and riparian areas" and asserts no exceptions to the development code should be allowed on large properties where avoidance is possible. This portion of the County Code includes in its purpose an objective to "minimize the disruption of watersheds and watercourse"; however, avoidance is not required. DEIR Chapter 4.9 analyzed the project's consistency with the General Plan and applicable development code requirements. The project was determined to be consistent with the General Plan and development code, and therefore this impact was considered less than significant. Please see Response to Comment 31-58 regarding infeasibility of wetland avoidance.

## Response to Comment Grp 30-6

The commenter asserts that mitigation measures for flannelbush, frogs and other listed species were insufficient and refers to Comments #17, 18, and 23 of their August 16, 2020 NOP Comment Letter.

Regarding Comment #17, the commenter generally questions the effectiveness of transplantation for Pine Hill flannelbush. As explained in Appendix F.4, a maintenance and monitoring program is identified for transplanted Pine Hill flannellbush. Monitoring will occur every six months for the first two years. If transplantation does not meet success criteria, monitoring and maintenance will continue until those success criteria are achieved (see Appendix F.4, section 6.3.2). Irrigation is not prohibited and could be utilized if determined necessary to ensure the success of transplantation. The monitoring and maintenance will continue until success criteria are achieved. If those success criteria cannot be achieved, the Mitigation Measure 4.4-1(a)(5) and the draft management plan provides alternative maintenance transplantation measure to help achieve success criteria.

Regarding Comment #18, please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog. Contrary to commenter's assertion, protocol level surveys are not required for CEQA.

Regarding Comment #23, where impacts were identified, mitigation measures have been provided requiring additional agency permitting and surveys. These surveys will be conducted in

the appropriate areas based on the potential for surface disturbance and by qualified professionals. Protocol level surveys are not required for the purposes of CEQA.

## Response to Comment Grp 30-7

The commenter asserts that timber harvest plans were not addressed in the DEIR; however, timber harvest plans were discussed in DEIR Section 4.2.3 and Impacts 4.2-3 and 4.2-4.

## Response to Comment Grp 30-8

The commenter asserts that ongoing enforcement of permits was not addressed in the DEIR; however, on page 2-4 of the DEIR, the County stated that the mitigation measures would be incorporated into a mitigation monitoring and reporting program that will be enforced by the County.

## Response to Comment Grp 30-9

The commenter states that protection and monitoring of rainbow trout was not addressed in the DEIR. Please see DEIR Section 4.4.4 and Master Response 34 - Resident Fish.

## Response to Comment Grp 30-10

The commenter states that alternatives for mine water discharge were not addressed in the DEIR, and refers to Comment #8 of their August 16, 2020 NOP Comment Letter. Please see Response to Comment 30-31. In addition, Section 6 of the DEIR considered project alternatives. As summarized in DEIR section 6.2, and provided in CEQA Guidelines section 15126.6, an EIR shall provide a reasonable range of alternatives that achieves the project objectives but avoids or reduces significant project impacts. The alternatives analysis is not required to consider every project alternative but is governed by a "rule of reason" that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice." The alternative analysis in the DEIR considered nine different alternatives. Five alternatives were considered but rejected from detailed analysis given that they did not meet most project objectives, were infeasible, and/or did not avoid significant project impacts. Four alternatives were analyzed in detail. (see DEIR section 6.3.) The County believes this provides a reasoned choice of alternatives for consideration by the public and decisionmakers.

## Response to Comment Grp 30-11

The commenter asserts that surface and groundwater were not addressed in the DEIR, and refers to Comment #10 of their August 16, 2020 NOP Comment Letter. However, DEIR Chapter 4.8 includes comprehensive analysis of surface and groundwater baseline conditions, project impacts and mitigation measures. Please see Response to Comment 30-33.

## Response to Comment Grp 30-12

The commenter asserts that the DEIR did not properly address the realignment of Centennial and Springhill Drives. However, the project does not propose realignment of Centennial and Springhill Drive and no potentially significant traffic impacts were identified where mitigation requiring realignment would reduce any impact to a less than significant level. Please also see DEIR Chapter 4.12.

## Response to Comment Grp 30-13

The commenter asserts that the DEIR did not address public trails, and refers to Comments #12 and 13 of their August 16, 2020, NOP Comment Letter. Please see Responses to Comments Grp 30-35 and Grp 30-36.

## Response to Comment Grp 30-14

The commenter generally asserts that "wells" were not addressed by the DEIR, and refers to Comment #14 of their August 16, 2020, NOP Comment Letter. However, DEIR Chapter 4.8 provided a comprehensive discussion of groundwater wells and the potential for the project to lower the water levels of surrounding wells. In addition, please see Master Response 7 - Location of Future Mining, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring.

## Response to Comment Grp 30-15

Comment noted. Please see Master Response 1 - Non-EIR/Administrative, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Grp 30-16

The comment generally states that flooding and the contradictory findings were not addressed in the DEIR, but does not identify what specific impacts or contradictory findings were not addressed. Please see Response to Comment 30-42.

## Response to Comment Grp 30-17

The commenter asserts that climate change was not addressed in the DEIR; however, DEIR Chapter 4.3 analyzes the project's impact on greenhouse gas emissions and associated climate change impacts. Please also refer to Master Response 16 – Drought and Climate Change. Emissions of greenhouse gas impacts were considered less than significant after mitigation.

## Response to Comment Grp 30-18

The commenter generally asserts that the DEIR did not address nitrification/ammonia nitrate, and refers to Comment #21 of their August 16, 2020 NOP Comment Letter. Please see Response to Comment 30-44.

## Response to Comment Grp 30-19

The commenter asserts that the DEIR did not address the project's impacts on Centennial Site surface waters, and refers to Comment #22 of their August 16, 2020 NOP Comment Letter. Please see Response to Comment 30-45.

## Response to Comment Grp 30-20

The commenter asserts that the DEIR did not address the project's impacts on 100' and 50' buffer zones, and refers to Comment #24 of their August 16, 2020 NOP Comment Letter. Please see Response to Comment 30-47.

## Response to Comment Grp 30-21

The commenter asserts that the DEIR did not address adequate bonding for the project. However, the DEIR discusses bonding on pages 2-4, 3-47, 4.6-24 and 4.9-20. Please see Master Response 1 - Non-EIR/ Administrative.

## Response to Comment Grp 30-22

The commenter asserts that concerns and issues raised in the commenters NOP comment were not addressed in the DEIR. However, as set forth in Responses to Comments Grp 30-1 through Grp 30-21, the DEIR does address the identified issues. Comment noted.

## Response to Comment Grp 30-23

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Comment noted. This is an introductory comment and does not provide a comment on an environmental issue associated with the project.

## Response to Comment Grp 30-24

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Response to Comment Grp 30-2 above.

## Response to Comment Grp 30-25

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. DEIR Impact 4.4-3 analyzed the project's potential impact to riparian habitat and concluded this impact was potentially significant but could be reduced to a less than significant level with mitigation. Four mitigation measures were identified including preparation of a management plan for work conducted adjacent to riparian areas and waters on both the Centennial and Brunswick Industrial sites. (See DEIR Impact 4.4-3.) A draft management plan was included as Appendix F.5 and F.8. Other related impacts related to Wolf Creek and South Wolf Creek were considered less than significant and mitigation was not proposed.

Please see Response to Comment Grp 30-2 regarding monitoring of water quality.

## Response to Comment Grp 30-26

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Response to Comment Grp 30-3 regarding South Fork Wolf Creek being a perennial stream. As discussed in the comment above, DEIR Impact 4.4-3 requires the preparation of aquatic resources management plans that will mandate setbacks and other requirements to minimize impacts to Wolf Creek, South Fork Wolf Creek, and surrounding habitat. Draft management plans were included as Appendices F.5 and F.8. As discussed in DEIR section 3, the existing culvert transporting offsite flows under the Brunswick Industrial Site would be replaced and upgraded. The culvert would daylight at its existing location. The existence of the culvert is the baseline condition for the project and the restoration to an open creek as suggested by the commenter is not required.

## Response to Comment Grp 30-27

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Responses to Comments Grp 30-25 and Grp 30-26 above. Regarding future agency permitting, DEIR Chapter 4.4 requires the applicant to received Corps section 404 permit and CDFW 1600 agreement prior to surface disturbance that would impact jurisdictional waters. Please see Master Response 3 – Operator Responsibility.

## Response to Comment Grp 30-28

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. At this time, the applicant has not applied for CalFire timber harvest permits, but is required to do so prior to

harvesting of timber. As stated on page 4.2-20 of the DEIR, "With respect to harvesting the timber on the Centennial and Brunswick Industrial Sites, pursuant to Article 7 of the FPR, the Project Applicant will be required to prepare a THP and TCP application for submittal to CAL FIRE. A THP is similar to a CEQA document in that a THP includes an analysis of environmental impacts related to timber harvesting."

## Response to Comment Grp 30-29

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. The County will enforce conditions of approval and mitigation measures. Please see Master Response 3 – Operator Responsibility. To the extent the applicant receives permits from other state and federal agencies, those agencies will be responsible for their enforcement.

## Response to Comment Grp 30-30

Please see Master Response 34 - Resident Fish. Please see Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 36 - Flows in South Fork Wolf Creek, and Master Response 32 - Temperature of Mine Water Discharge.

## Response to Comment Grp 30-31

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. The commenter states that previous applicant Emgold determined a better solution was to pipe water discharge to Wolf Creek rather than discharge to South Fork Wolf Creek. However, the 2008 DEIR for the Emgold project specifically examined the currently proposed discharge point at South Fork Wolf Creek (see Figure 4.7-4 of ESA 2008) and determined that the potential impact of this discharge with respect to inducing substantial erosion and downstream sedimentation and/or resulting in a violation of existing water quality standards is considered less than significant (see page 4.7-42 of ESA 2008). A pipeline and discharge to Wolf Creek was not proposed or analyzed in the 2008 DEIR.

Please see Response to Comment Grp 30-3 regarding analysis of alternatives.

References

ESA (Environmental Science Associates). (2008). *Draft Idaho-Maryland Mine Project Environmental Impact Report* San Francisco, California.

## Response to Comment Grp 30-32

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependent Vegetation, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts. In addition, please see Response to Comment Grp 30-29 regarding enforcement of conditions of approval, mitigation measures, and agency permits.

## Response to Comment Grp 30-33

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Underground exploration drilling creates small diameter holes which are irrelevant in comparison to the mining excavations which have been analyzed in the groundwater model for the DEIR. As stated on page 13 of Appendix M, the vibration or effects of drilling cannot be detected only feet away from the drill and no impact to the community would exist from these drilling activities.

Regarding groundwater impacts that may result from project dewatering, please see Chapter 4.8 of the DEIR, and Master Response 7 - Location of Future Mining, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring.

Please see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

## Response to Comment Grp 30-34

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. DEIR Chapter 4.12, and the supporting traffic study (see Appendix O), analyzed twenty-four intersections and six roadway segments. As described and analyzed in DEIR Section 4.12.4, based on consultation with Nevada County and the City of Grass Valley, seven different scenarios were analyzed. The project does not propose to realign Centennial Drive and Spring Hill Drive and project-related traffic impacts were not identified that would require realignment of these roadways. However, the project would not preclude the realignment of the referenced roadways, if that was proposed at a later date.

## Response to Comment Grp 30-35

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. No trail has been formally proposed by the City of Grass Valley or the County. The project site is private property and the property owner (the applicant) does not propose construction of a publicly accessible trail as part of the project. As a result, construction and use of a public trail was not analyzed in the DEIR.

## Response to Comment Grp 30-36

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. DEIR Chapter 4.12 provided a description of existing bicycle facilities near the project site, cited or summarized existing County policies and plans regarding bicycle facilities, and analyzed the project's potential impact to these facilities. The impact analysis concluded the proposed project would not conflict with a program, plan, ordinance or policy addressing transit, bicycle, and pedestrian facilities, and impacts would be less than significant (see DEIR Impact 4.12-4).

## Response to Comment Grp 30-37

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see DEIR Impact 4.8-2 and Master Response 15 - Adequacy of Groundwater Monitoring.

## Response to Comment Grp 30-38

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Master Response 1 - Non-EIR/Administrative, and Master Response 2 - Social and Economic Impacts.

## Response to Comment Grp 30-39

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Response to Comment Grp 30-5 regarding LUDC L-II 4.3.17 and Response to Comment Grp 30-3 regarding alternatives.

## Response to Comment Grp 30-40

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. The commenter generally questions the effectiveness of transplantation for Pine Hill flannelbush. As explained in Appendix F.4, a maintenance and monitoring program is identified for transplanted Pine Hill flannellbush. Monitoring will occur every six months for the first two years. If transplantation does not meet success criteria, monitoring and maintenance will continue until those success criteria are achieved (see Appendix F.4, section 6.3.2). Irrigation is not prohibited and could be utilized if determined necessary to ensure the success of transplantation. The monitoring and maintenance will continue until success criteria are achieved. If those success criteria cannot be achieved, the Mitigation Measure 4.4-1(a)(5) and the draft management plan provides alternative maintenance transplantation measure to help achieve success criteria.

## Response to Comment Grp 30-41

Please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog. Contrary to commenter's assertion, protocol level surveys are not required for CEQA.

## Response to Comment Grp 30-42

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. The commenter states that more precautionary measures are required in the event of storm events and extreme flood events to prevent overflow of untreated mine water to South Fork Wolf Creek. A Preliminary Drainage Analysis (PDA) (Nevada City Engineering, 2019) was prepared and included as DEIR Appendix K.5. As described in DEIR Section 4.8.4, the PDA was peer reviewed by the County and potential impacts were analyzed in Impact 4.8-3. As stated in the conclusion to Impact 4.8-3:

> "The drainage analyses discussed above conclude that the project would not significantly alter the drainage patterns of the sites in a manner which would result in substantial erosion or siltation on- or off-site, nor substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site, nor create or contribute to runoff water which would exceed the capacity of existing stormwater drainage systems, nor impede or redirect flood flows. West Yost's independent peer review concurs with this conclusion." (DEIR page 4.8-75)

As stated in Appendix K.5 of the DEIR, the drainage calculations and detention basins are specifically designed to respond to the drainage requirements of the County of Nevada. The Nevada County drainage requirements indicate that new storm drain systems and channels shall

be designed to convey the 10- and 100-year, 24-hour storm event. Section 4.5 of Appendix K.5 discusses the 6.4-acre catchment area where precipitation would inflow into the water treatment pond and confirms that the designed freeboard volume is more than adequate to retain the runoff from a 100-year storm event.

Please also see Appendix K.5 detailing Brunswick Industrial Site drainage and stormwater facility sizing, as well as Master Response 36 - Flows in South Fork Wolf Creek, and Response to Comment Agency 1-38.

## Response to Comment Grp 30-43

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. The project's greenhouse gas emissions and associated impacts and mitigation were analyzed in Chapter 4.3 of the DEIR. The commenter provides a list of various potential environmental changes that could occur at some future date because of climate change. As identified in CEQA Guidelines section 15125, the environmental analysis presented in the DEIR should compare physical environmental conditions as they exist at the time of the Notice of Preparation. The DEIR analyzed the projects potential impacts consistent with requirement in addition to reviewing potentially significant cumulative impacts based on known or planned development in the region. Hypothesizing on potential future impacts that may occur in the future because of climate change is speculative and not required by CEQA. Please also see Master Response 16 – Drought and Climate Change.

## Response to Comment Grp 30-44

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see DEIR sections 4.3 and 4.8 analyzing the project's ammonium nitrate fuel oil use and impacts on air quality and hydrology. As discussed on page 4.8-48 of the DEIR, "The primary residual components of the ammonium nitrate-fuel oil (ANFO) used for blasting, ammonia and nitrate, are very soluble and mobile in water. This means that any blasting residuals would be continually removed from the mine over time through the dewatering system. The proposed water treatment plant is designed to treat ammonia and other blasting residuals that might occur due to incomplete detonation." The soluble nature of any blasting residuals will result in these constituents being removed from the mine by the dewatering system, such that they would not accumulate on the tailings or barren rock.

Please see Master Response 35 - Discharge to South Wolf Creek, explaining the water treatment process and elimination of potential contaminants in groundwater prior to discharge.

## Response to Comment Grp 30-45

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

DEIR Impact 4.4-3 analyzed the projects potential to impact state or federally protected waters and wetlands and determined this impact was potentially significant. Surface disturbance on the Centennial Industrial Site has the potential to impact approximately 0.033-acre of ephemeral streams. Mitigation measures 4.4-3(a-d) were identified that reduce this impact to a less than significant level. Mitigation Measure 4.4-3(b) specifically requires the applicant prepare a watercourse/wetlands/riparian area management plan, a draft of which was included as Appendix

F.5 to the DEIR. The management plan includes best management practices and erosion control to prevent discharge to Wolf Creek. In addition, the project will be required to have a construction SWPPP that will outline similar measures to reduce erosion and sedimentation from project construction.

The DEIR has already analyzed the impact of waste rock piles to the environment and water quality, including pH and dissolved solids. Please see Chapter 4.8 of the DEIR and Master Response 8 - Mine Waste Characterization.

Please see Response to Comment Grp 30-43 regarding assessing of impacts resulting from climate change.

## Response to Comment Grp 30-46

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Where impacts were identified, mitigation measures have been provided requiring additional agency permitting and surveys. These surveys will be conducted in the appropriate areas based on the potential for surface disturbance and by qualified professionals. Protocol level surveys are not required for the purposes of CEQA.

## Response to Comment Grp 30-47

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. As stated in DEIR Impact 4.4-3, temporary or permanent impacts would not occur to Wolf Creek from the proposed project, but this potential temporary impact was included in the event that temporary encroachment within the Wolf Creek 100-foot non-disturbance buffer would be required as part of construction.

## Response to Comment Grp 30-48

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. Please see Chapter 4.3 of the DEIR relating to fugitive dust emissions and related mitigation requirements. Please also see Response to Comment Grp 30-8 regarding monitoring and enforcement of conditions of approval, mitigation measures, and agency permits.

Please see Response to Comment Grp 30-45 regarding prevention of sedimentation from construction activities. In addition, the project would be required to implement a dust mitigation plan to reduce dust resulting from project construction activities. (See Mitigation Measure 4.3-2, and APM-AQ-2 Surface Dust Controls.)

## Response to Comment Grp 30-49

This comment is a copy of an NOP comment letter previously sent by the commenter in 2020, and was considered by the County in connection with the preparation of the DEIR. The DEIR discusses bonding on pages 2-4, 3-47, 4.6-24 and 4.9-20. A final assurance cost estimate will be required annually pursuant to SMARA and the County Code that will estimate the cost of reclamation based on existing surface disturbance. Once concurrence with this estimate is received from the County and Department of Conservation, Division of Mine Reclamation, the application will be required to post a financial assurance mechanism (FAM) in the estimated amount.

**Group Letter 31**

## Comments on the Idaho-Maryland Mine DEIR
## Chapter 4.4 Biological Resources

**Wolf Creek Community Alliance** (WCCA) is pleased to submit comments on impacts to biological resources presented in the *Idaho-Maryland Mine draft Environmental Impact Report*.

**Qualifications**

Grp 31-1

Since 2004, WCCA has collected extensive stream and biological data in the Wolf Creek Watershed, including water quality, stream flow, benthic macroinvertebrate collection and analysis, and surveys of biological diversity. In collaboration with the City of Grass Valley and Nevada County, we regularly monitor and comment on development projects with regard to their impact on the Wolf Creek Watershed. Our team of scientists and protocol-trained citizen volunteers collaborates with our fellow stream monitoring organizations, Sierra Streams Institute and South Yuba River Citizens League, to calibrate instruments, share data, and refine best practices. We follow protocols that adhere to CA State Water Quality Control Board standards and comply with the Quality Assurance Project Plan (QAPP) version 1.5 of the Yuba Bear Monitoring Committee, of which we are a member. The Committee reports annually to the State Water Quality Control Board.

Grp 31-2

### Background & Summary

1. Accurate **characterization of the environmental setting** (DEIR, chapter 4.4, section 4.4.2) and its biological resources is essential for predicting potential impacts to those resources. The DEIR omits, mistakes, mischaracterizes, and generally fails to fully consider the biological resources that would be impacted by this project. A lack of sufficient data is apparent regarding a number of potential impacts as well as a presentation of conclusions that cannot be justified, given the lack of that data. Without accurate characterization of both the environmental setting and its biological resources, significant or even unavoidable impacts may be missed. Specifically, the DEIR…

**Grp 31-3**
   a. Improperly separates and therefore does not consider the current baseline environmental setting of the Centennial site, including its wetlands, riparian habitats, and associated species.

**Grp 31-4**
   b. Gives an inaccurate hydrological assessment of the Brunswick site, ignoring the connectivity of the South Fork Wolf Creek (SFWC) upstream and downstream of the culvert on the Brunswick property, along with the movement of trout and other species upstream and downstream.

**Grp 31-5**
   c. Without sufficient examination or evidence considers the pond on the Brunswick site NOT to be an aquatic resource, disregarding impacts to its biological resources

**Grp 31-6**
   d. Through omission, lack of data, and lack of sufficient analysis, fails to adequately address potential impacts to the South Fork of Wolf Creek (SFWC) and the main stem of Wolf Creek due to mine water discharge, including
      i. The lack of hydrological or biological data in whole reaches of the SFWC
      ii. The lack of sufficient observation over time to create clear stream hydrographs
      iii. Inadequate study and characterization of the hydrological impacts of mine water discharge, including sedimentation, flow velocity, loss of seasonality, and loss of streambed or bank habitat
      iv. Omission of any qualitative observations and data regarding benthic macro-invertebrates (BMI)
      v. Inadequate consideration of chronic and cumulative impacts to BMI, trout and other aquatic species, including special concern amphibians, rather than simple tests of acute impacts.

**Grp 31-7**
   e. Includes mistaken and incomplete identifications of species
   f. Does not include or downplays the potential presence of special status species potentially impacted by the project

**Grp 31-8**
2. When **significant impacts** are identified (DEIR 4.4.4), their impacts need to be **mitigated** to the extent possible and the success and permanency of those mitigations need to be fully presented in order for the lead agency, the county, and its citizens, to be able to accurately and confidently assess the individual and overall impacts on the community. Further, the mitigations must be shown to sufficiently protect biological resources from significant harm. The mitigations presented in the DEIR omit important species of concern and sufficient mitigation for impacts to wetland and aquatic species.

The mitigation plans that are presented are in part inaccurate, vague, and generally to be detailed and approved AFTER approval of the project. Further, they are without sufficient oversight, mechanisms for stoppage, and penalty. They do not assure protection of biological resources in a manner that is measurable, monitorable, and adequate. Specifically, the DEIR mitigations…

**Grp 31-9**
a. Present a Pine Hill Flannelbush Management Plan without data indicating short and long-term success methods, particularly including the viability of transplanting, sufficient setbacks and management for biologically necessary propagation due to wildfire. (4.4-1)

**Grp 31-10**
b. Ignore and do not consider mitigation plans for species of special concern — Monarch Butterfly & Showy Milkweed (known to be present at the Centennial site), California Spotted Owl (reported as present in Empire Mine State Historical Park, which is adjacent to the Brunswick site), Yellow-breasted Chat and Willow Flycatcher (known to be present in the meadow/grassland reach of the SFWC downstream of the Brunswick site). (4.4-1) (4.4-2)

**Grp 31-11**
c. Do not consider potential impacts to biological resources of the Brunswick site pond (PD1). (4.4-2) (4.4-3) (4.4-4)

**Grp 31-12**
d. Do not consider adequate mitigation for potentially impacted aquatic species, including BMI and trout. Nor does it include analysis and mitigation for the movement of trout and other aquatic species both upstream and downstream of the industrialized portion of the Brunswick site. (4.2-2) (4.4-4)

**Grp 31-13**
e. Consider that habitat loss is an acceptable option if the species has not yet been observed, even if the likelihood of the species being present is high, including the destruction of nesting habitat for birds after the nesting bird has departed. (4.4-2)

**Grp 31-14**
f. Unreasonably suggest that a one-to-one replacement of wetland or monetary compensation is a preferred option for mitigating loss of wetland (4.4-3)

**Grp 31-15**
g. Allow disturbance within 100 foot setbacks from the SFWC, mischaracterizing the extent and degree of disturbance (4.4-3)

**Grp 31-16**
3. **Cumulative impacts** (DEIR chapter 4.4, section 4.4.4 Impacts and Mitigation Measures, Impact 4.4-6, pages 4-4-93 and following) that compound and accumulate both in terms of the interactions of discrete impacts, their impacts in the context of wider environmental settings and impacts over the length of the project are crucial in weighing the potential impacts of a project. This proposed project spreads out over a wide area, potentially impacting two watershed drainages, adjacent state park land, the full range of biological communities at this elevation in the foothills, and multiple neighborhoods of the wildland-urban interface that harbor significant habitat for biological resources. The matrix of these resources is not addressed in the DEIR, including the overall impacts on forest habitat, on species both aquatic and terrestrial, and on the headwaters of the Wolf Creek Watershed. Nor does the DEIR address changing impacts to these resources over the long 80 year period of the project, given the accelerating nature of climate change, with its various impacts that include drought, megafires, increased numbers of invasive species, and increased stress on species due to factors such as beetle infestation and fungal disease. Overall, in spite of its specificity, the DEIR does not

adequately address the cumulative potential impacts of this project, over space and time, to biological resources. Specifically, the DEIR…

**Grp 31-17**
a. Does not address the loss of forest land and associated stresses on forests as an essential factor of environmental health for the community (4.2-3)

**Grp 31-18**
b. Does not address potential cumulative impacts of impaired air quality on forests, nearby meadows, wetlands, and their associated species (4.3-1) (4.3-2)

**Grp 31-19**
c. Does not consider the loss of habitat an impact to special-status species, present or potentially present (4.4-1) (4.4-2) (4.4-6)

**Grp 31-20**
d. Considers the net loss of wetland within the Wolf Creek Headwaters area in which the project is proposed an acceptable mitigation, significantly reducing and unduly impacting the environmental resiliency of the associated local ecosystems. (4.4-3)

**Grp 31-21**
e. Does not adequately consider the cumulative impact of mine water discharge or failure of water treatment or water retention at the Brunswick site. (4.6-2) (4.8-3) (4.8-7)

**Grp 31-22**
f. Does not address environmental impacts of decreased groundwater in the the meadow/grassland reach of SFWC or other projected impact areas of the watershed. (4.8-2)

**Grp 31-23**
g. Does not consider the need to monitor existing mine seeps on the main stem of Wolf Creek in the event that mine dewatering impacts these seeps in ways that are not predicted.

**Grp 31-24**
h. Does not address the impact to overall development impacts for the community of changing the land use zoning designation from light industrial to heavy industrial/mining. (4.9-4)

**Grp 31-25**
i. Does not adequately address impacts of increased noise on species, habitats, and ecosystems. (4.10-1) (4.10-2) (4.10-3)

**Grp 31-26**
j. Does not fully address potential increases in risk of wildfire in an 80 year period that will see increasingly large and uncontrollable fire. (4.13-2) (4.13-5)

**Grp 31-27**
**In Conclusion**: Each of the issues listed above (and detailed below) must be addressed in this Draft Environmental Impact Report. If there were only 2 or 3 concerns, they could perhaps be addressed in a FEIR, but because of the sheer volume of omissions and insufficiencies in this chapter alone, a new DEIR must be prepared and recirculated for public and agency review.

**Grp 31-28**
Comments and Questions

4.4.2 Existing Environmental Setting

*WCCA - DEIR Comments - 4.4 Biological Resources 4*

**Issue 1.a - Improperly separates and therefore does not consider the current baseline environmental setting of the Centennial site, including its wetlands, riparian habitats, and associated species.**

At its outset, the DEIR unreasonably separates impacts to the baseline conditions of the Centennial site from the rest of the DEIR, and this continues in the chapter on Biological Impacts:

> *As discussed in Section 1.3, "Approach To Centennial Industrial Site Baseline," of this EIR, for the purposes of this biological resources analysis, the environmental baseline for the Centennial Industrial Site has been adjusted to be consistent with anticipated site conditions at the completion of the separate Centennial Industrial Site Clean-up Project. 4.4-2*

This avoidance in describing the current baseline of the Centennial site obstructs any agency or individual from considering the actual impacts of this proposed project. The "anticipated site conditions" are speculative, not established, particularly as at the date of these comments no approved RAP has been issued by the DTSC. Further, any separation of consideration of impacts into a voluntary RAP for a site that RiseGold clearly intends to use for the proposed project only obscures any question of cumulative impacts. We cannot evaluate biological impacts of this project when a significant part of those impacts are detailed in a document (the DTSC Centennial Site RAP) that is not even included in the DEIR or its appendices?

> *"...a limited amount of aquatic resources, the primary feature of which is Wolf Creek." 4.4-2*

The "limited amount of aquatic resources" omits the considerable amount of riparian and wetland resources currently existing at the Centennial site. Impacts to Wolf Creek here cannot adequately be assessed without considering the whole of the current hydrology of the site.

Similarly, at 4.4-3, the DEIR avoids consideration of vegetation communities for the Centennial site saying,

> *"The acreage of each vegetation community type at the Centennial Site is a good-faith estimate because it cannot be precisely established for the baseline condition given that the baseline has been adjusted…"*

How can the reader make assessments of completeness based on "good-faith" when trying to ascertain the true extent of vegetation communitie? This parceling out of biological resources and potential impacts on them in regard to the Centennial site occurs again and again throughout the DEIR and each time it obscures the true nature of both existing conditions regarding biological resources and the potential impacts upon them. The DEIR must include the considerations put forth in the RAP so that we can see in an integrated way all baseline

conditions and all potential impacts together. The same is true for cumulative impacts (as in Mitigation 4.4-6).

For example, again at 4.4-3 the DEIR identifies parts of the Centennial Site as "Graded/Remediation Areas," without describing the actual situation where contaminated soils in the current alternative proposed in the RAP would be capped with clean soil from the wetland and riparian areas of the site, areas not contaminated and not needing to be capped or removed. The DEIR goes on to say:

> *The areas identified for remediation within the RAP comprise approximately 28.25 acres, or roughly half of the Centennial Industrial Site. The excavation areas would be backfilled and regraded with clean fill…*

Reading this, the reader would not be aware that the "clean fill" to be used potentially could be taken from wetland and riparian areas on site, an action that might have clear alternatives. Yet, in this DEIR we are not allowed to consider the impacts or the alternatives. In fact, based on reading the DEIR alone, we would not even know about it. Again, how can this DEIR be considered accurate and complete when it purposely omits significant biological resources and impacts to them?

Finally, the DEIR excludes mention of most biological resources of the Centennial site while also briefly characterizing them, in a dismissive way that, without clear evidence, minimizes their biological value without giving the reader an opportunity to assess for themselves, on the basis of careful research and observation, the real import of these biological resources:

**Grp 31-29**

> *The wet meadows in the Centennial Industrial Site are typically created where extreme disturbance has occurred in the past or the presence of placer diggings. These wet meadows are characterized by bentgrass (Agrostis) and various rush (Juncus) species 4.4-6*

In this view the origins of the wet meadows in the Centennial site are summarized with unsubstantiated speculation, and the plant diversity is obscured by the mention of only two genera, while in fact these areas contain a much greater diversity of species, including two species of special concern - White Brodeaia and Showy Milkweed. Why does the DEIR include such incomplete, one-sided descriptions? The DEIR must be more thorough and balanced in these regards.

**Grp 31-30**

**Issue 1.b - Gives an inaccurate hydrological assessment of the Brunswick site, ignoring the connectivity of the South Fork Wolf Creek (SFWC) upstream and downstream of the culvert on the Brunswick property, along with the movement of trout and other species upstream and downstream.**

South Fork Wolf Creek (SFWC), a headwaters tributary of Wolf Creek has been studied, mapped, and assessed by Wolf Creek Community alliance since 2004. The Brunswick site that the DEIR undertakes to describe sits within the SFWC watershed, with the stream beginning above the Brunswick site and continuing below it. As the DEIR states:

> *The Brunswick Area is located in an area containing South Fork Wolf Creek, a perennial stream. Several intermittent and ephemeral streams connect directly to South Fork Wolf Creek within the Brunswick Industrial Site. South Fork Wolf Creek also flows to the south of the East Bennett Road ROW within the Brunswick Area. South Fork Wolf Creek contains associated riparian woodland and scrub and large tracts of wet meadow wetlands dominant in the northwestern section of the Brunswick Industrial Site.*

Yet the DEIR ignores the headwaters and continuity of the stream by stating the following:

> *South Fork Wolf Creek begins at a 48-inch culvert fed by surface drainage and road runoff from both the east and west sides of Brunswick Road, which crosses Brunswick Road through the culvert within the Brunswick Industrial Site. The culvert is located south of a large manmade clay-lined pond and flows northwest across the Brunswick Area. The 48-inch diameter culvert is approximately 1,600 feet long (Regional Water Quality Control Board [RWQCB] Order No. 88-185, December 18th, 1990). Additionally, perennial surface drainage from the west side of Brunswick Road drains north to the 48-inch culvert inlet. 4.4-2 & 3*

The South Fork of Wolf Creek (SFWC) is a drainage that has been documented from the earliest days of the city of Grass Valley. Nisenan established a village, Yolosyan, along its banks,[1] and the city of Grass Valley itself was named after the meadow/grassland that still exists and is part of Reach D of the SFWC (as identified in Appendix K.1).[2] USGS maps from the 1870s onward show a perennial stream beginning at least as far as Brunswick Road which forms its southern tributary source, and from the Loma Rica Ridge, which forms its northern tributary source. Wolf Creek Community Alliance, in its monitoring of the SFWC has made observations and collected data at a number of publicly-accessible sites on the stream, including a monitoring site upstream of the "48-inch culvert," on the east side of Brunswick Road (WCCA, site 6.1), and another downstream on a section of the South Fork the DEIR characterizes as Reach C (WCCA, site 6).[3] The South Fork Wolf Creek begins not below the culvert, but above it and, indeed, on the other side of Brunswick Road, upstream of WCCA site 6.1 at Wood Rose Way. At that location, which has been monitored for a number of years, we observe a perennial flow of water.[4] The DEIR itself observes perennial flow both above the

[2] Appendix K.1,
[3] DEIR 4.8-24 and following; WCCA, Wolf Creek Watershed Map showing monitoring sites, https://www.arcgis.com/apps/Embed/index.html?webmap=aee3c0af93a245efb1a8c503182d66b5&extent=-121.2014,39.0785,-120.8721,39.2916
[4] WCCA, Wolf Creek Water-Quality Monitoring Data Analysis, 2013, page 70, https://www.wolfcreekalliance.org/documents/MonitoringDataSummaryFinal.pdf; WCCA, Wolf Creek

culvert near Brunswick Road, entering the culvert and exiting it below. As there is continuous, perennial flow from a point near Brunswick Road to the point where water exits from the culvert into what the DEIR calls South Fork Wolf Creek, it is accurate to consider the perennial flow of water one, continuous creek. The DEIR, however, mischaracterizes the origins and extent of the South Fork by stating that "South Fork Wolf Creek begins at a 48-inch culvert" and that it is "fed by surface drainage and road runoff from both the east and west sides of Brunswick Road, which crosses Brunswick Road through the culvert within the Brunswick Industrial Site." In fact, the "drainage" going through "the culvert within the Brunswick Industrial Site" is the South Fork of Wolf Creek. Just as downstream of the proposed project the creek flows into the box culvert at Ophir Street in Grass Valley and disappears underground only to reappear downstream of the Safeway Parking lot in Grass Valley, having joined with the main stem of Wolf Creek to be a continuous part of one hydrologically active and perennial stream and not some disjointed, human-created "drainage", so too we must treat the flow going through the "industrial culvert" on the Brunswick site as part of the South Fork. To do otherwise is to unreasonably disconnect the free-flowing connected aquatic habitat and to mis-characterize potential biological impacts by excluding that portion of the creek from consideration as part of the environmental setting. The DEIR must not exclude a portion of the SFWC from consideration as a biological feature when it is connected to perennial flow both upstream and down. How can this section of creek be disregarded and not analyzed for impacts when aquatic species including trout have been observed both above and below the culvert? At least one map in the DEIR shows SFWC as continuous:

DEIR, Appendix K.1, page 10

The Brunswick site shows a 100 ft building setback and an NID spill easement on an open creek, South Fork Wolf Creek. The map is dated 1987. Apparently this perennial stream was buried in a culvert after 1987, based upon the map's date. Was the burial of SFWC done under an authorized permit? What is the status of the NID spill easement? Have the 100 ft setback and NID spill easement been waived or reconveyed to the land owner? Any existing easements or setbacks which may be encroached by the Project must be waived or modified by the consent of the entitled party.

---

Watershed Disturbance Inventory and Assessment of Conditions, part 1, 2017; https://www.wolfcreekalliance.org/documents/WolfCreekDisturbanceInventory4.13.18.pdf

In other maps, however, and in text, SFWC is not considered as a continuous stream for its whole length. This is a serious inaccuracy that needs to be rectified in the DEIR.

Further, it must be noted that the DEIR, particularly in Appendix K.1 mischaracterizes the furthest upstream portions of SFWC, which are its headwaters, instead to be NID "spillway channels."[5] Though it is true that NID ditches are situated on the ridges above both tributaries and that there is some seepage, overflow, and occasional release events on the part of NID into those tributaries, neither drainage was created by NID for spillage. The watershed topography clearly shows stream channels and folds in the typography that were created by the natural stream flow in these tributaries over thousands of years. The 'Loma Rica' tributary, shown as a perennial stream in many early USGS maps, indeed could use further study as it may not flow perennially in drought periods or for other reasons. Nonetheless, WCCA has observed free flow on the tributary ABOVE and below the point where it crosses the NID ditch. It is not simply a spillway for NID. The case against the other tributary that parallels Wood Rose Lane on the east side of Brunswick Road being a non-biological "spillway" is also strong. It flows perennially from two sources (parallel to Wood Rose and roughly parallel to Brunswick Road). The natural topography confirms that it has been part of the headwaters of the South Fork for thousands of years. Small ponds created on residential properties have doubtless impacted stream flow and some seepage from an NID ditch has been observed at the top of the Wood Rose drainage, but neither it or the 'Brunswick' stream flow WCCA has monitored at the corner of Brunswick and Wood Rose can be explained solely by excess NID ditch water. In any case, for the DEIR to summarily mischaracterize the headwaters of the SFWC as "spillway", and its continuation through the Brunswick site as culvert separate from any stream stands in the face of evidence to the contrary and is supported only by generalized, summary observation and no clear data. How can the DEIR consider the SFWC to begin below the culvert when there is perennial flow all the way from the other side of Brunswick Road? The DEIR must make a more careful study of the sources of the SFWC, its perennial flow and connectivity above and below the culvert. A full assessment of the impacts to biological resources cannot be made when portions of streams with perennial flow are excluded from consideration.

**Issue 1.c - Without sufficient examination or evidence considers the pond on the Brunswick site (PD1) NOT to be an aquatic resource, disregarding impacts to its biological resources**

**Grp 31-31**

The large pond on the Brunswick site should be considered as an aquatic resource. Not to do so is to ignore potential impacts on its biological resources. Yet the DEIR claims:

> *A man-made clay lined pond (PD-1) associated with previous saw milling operations does not have a direct outlet or connection to the South Fork Wolf Creek. PD-1 receives its water mainly from surface runoff and precipitation. PD-1 was used previously as a recycling pond for site runoff containment and log watering during mill operations. PD-1*

[5] DEIR, Appendix K.1, 10

> *is non-jurisdictional pursuant to federal Clean Water Act (CWA) regulations given it receives water from sheet flow within the Brunswick Industrial Site and does not connect directly or indirectly with South Fork Wolf Creek or any other "waters of the U.S."* [5] *4.4-15*

The use of the word "mainly" in the above citation is an admission by the DEIR that at least some of the pond water is received from other sources, likely springs, other underground seepages, and even SFWC itself. Reviewing the Brunswick Industrial Site and E. Bennett Road ROW Aquatic Resources Delineation, Appendix F.7, the background to this questionable delineation is also given, again without qualitative data or sufficient observation. As background, it includes a regulatory overview that states:

> *"Waters of the U.S." include wetlands and lakes, rivers, streams, and their tributaries. Wetlands are defined for regulatory purposes as areas "...inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated solid conditions..."*[6]

*The report goes on to state that recent court cases rule out certain "isolated" wetlands, but*

> *does not prevent CWA jurisdiction if a "significant nexus" such as a hydrologic connection exists, whether it be man-made (e.g., roadside ditch) or natural tributary to navigable waters, or direct seepage from the wetland to the navigable water, a surface or underground hydraulic connection, an ecological connection (e.g., the same bird, mammal, and fish populations are supported by both the wetland and the navigable water)...*

So why does the DEIR choose to exclude the Brunswick Pond? Because it is an "isolated" pond and only "contains water in direct response to rainfall (e.g.) ephemeral features."[7] As Appendix F.7 claims, the pond

> *receives its water mainly from surface runoff and precipitation. PD-1 is a man-made pond used historically as a recycling pond for site runoff containment and log watering during mill operations.*
>
> *PD-1 is non-jurisdictional per federal CWA regulations given it receives water from sheet flow within the Brunswick Industrial Site and does not connect directly or indirectly with South Fork Wolf Creek or any other "waters of the U.S." and therefore, it does not receive water from or connect to a "waters of the U.S."*
>
> *However, upon regulatory agency review, PD-1 may be determined to be regulated as a "Waters of the State of California."*[8]

[5] DEIR, Appendix F.7, page 2.1
[6] DEIR, Appendix F.7, 2.2
[7] DEIR, Appendix F.7, 4.3

On this basis the main text of the DEIR also excludes the pond for consideration both in terms of being an aquatic resource and in regard to its biological resources.

This is so in spite of the fact that it potentially should be regulated as a "Waters of the State of California." This consideration must also be included in the conclusions of the DEIR.

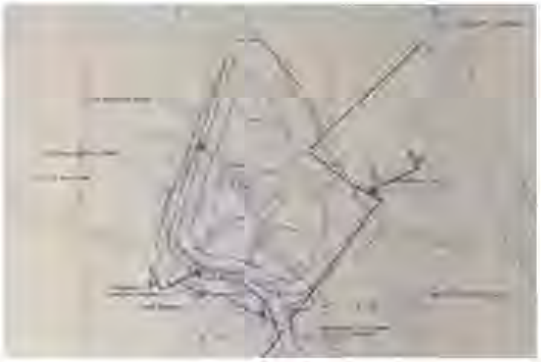
Beyond this, the lack of solid qualitative evidence in the DEIR and the existence in the DEIR of several suggestions that there ARE connections between the pond and the SFWC and that a "significant nexus" does exist, together indicate that the DEIR's analysis and conclusions are incomplete.

First of all, field observations are vague and do not in any way quantify water, either runoff into the pond or seepage/groundwater flow from the pond. As the Brunswick ARD itself states:

> *field surveys in December 2018, July 2019, and August 2019 followed very little seasonal rain events and therefore, direct observation of hydrology in some areas of the Brunswick Area was not possible.*[9]

Why weren't field studies done during periods during or after seasonal rains? Conclusions about the hydrology of the pond are invalid without "direct observation" and real data.

Second, though observation and data is incomplete, the DEIR nonetheless makes definitive judgements not warranted by the analysis. If pond recharge is "mainly," but not wholly from runoff and if the pond "may" be determined as "waters of the State of California" why hasn't that been considered and included in the conclusions of the DEIR?



Third, there are actually suggestions in Appendix H.1 and studies appended to it, that there is a "significant nexus" between the pond and "waters of the US" including South Fork Wolf Creek and wetlands immediately downstream.

The Geotechnical Engineering Project for the Brunswick Industrial Site, Appendix H.1, referring to the report from Vector Engineering states that:

> *Groundwater monitoring revealed that groundwater movement appeared to be in a west to southwesterly direction, flowing towards the South Fork of Wolf Creek drainage. Findings included that "any seepage that may occur through the clay liner could potentially flow through the previous coarse mine tailings (and sawdust) located beneath the west (and southwest) side of the pond."*[10]

[9] DEIR, Appendix F.7, 3.5
[10] DEIR, Appendix H.1, page 10

The study goes on to state that "the cross-section from the same study indicates that the groundwater flow observed was over bedrock,"[11] and that "the existing culvert which diverts the South Fork of Wolf Creek crosses underneath the pond...[12] Another suggestion of water connectivity is its map of the pond showing an "emergency overflow spillway" into SFWC.[13]

Finally, it concludes, much as the Brunswick ARC does

> *that seasonal variations in the groundwater levels may occur across the site.*[14]

The other report appended to H.1 by Holdrege & Kull also gives suggestions of a potentially significant nexus:

> *Vegetation around the dam consisted of alders, willows, and riparian grasses and shrubs...We observed riparian plants and trees in the meadow downstream of the earthen dam. We observed erosion in a relatively dry stream bed near the downstream side of the southern section of the dam. More significant erosion was evident downstream of the corrugated metal pipe (CMP) culvert under the dam.*

As shown in the accompanying map.[15]

---

[11] DEIR, Appendix H.1, page 106
[12] DEIR, Appendix H.1, page 94
[13] A detail of the map is attached. The full map is available at DEIR, Appendix H.1, page 112.
[14] DEIR, Appendix H.1, page 96
[15] DEIR, Appendix H.1, pages 139 & 146.

Fourth, the topography and geomorphological history of the Brunswick site itself suggests a significant hydrological connection with South Fork Wolf Creek. Given that the pond is located directly in the bottom of the drainage topography of the valley created by South Fork Wolf Creek, that the pond is immediately next to the perennial flow of South Fork Wolf Creek, and that it is immediately upstream of identified wetlands, the DEIR should carefully determine whether the pond is connected to other aquatic features. Why hasn't the DEIR done this? In this regard it is wholly negligent, both in terms of insufficient data collected and unwarranted conclusions made. The omission is significant. As the report from Holdrege & Kull indicates, the pond is a significant biological resource, with abundant riparian species surrounding it, including alder, willow, and riparian grasses. Aerial and field photos show this clearly.[16]

**Grp 31-32**

The pond itself is known to be a significant habitat for waterfowl and migratory birds, including breeding Wood ducks[17] It may also be a significant habitat for BMI, amphibians, including Western Pond Turtle, a species of special concern, and fish. This needs to be studied instead of ignored if the DEIR is to complete an adequate analysis of impacts to biological resources. Why has the field work to ascertain biological resources of the pond not been completed? In summary, the environmental setting regarding the pond is inaccurate and must be rewritten. Because of the evidence cited above, it is clear that the pond IS jurisdictional, and must be afforded all the environmental protections afforded to waters of the US. It is a vibrant, vital, interconnected part of the headwaters of South Fork Wolf Creek.

[16] DEIR, Appendix F.7,
[17] Personal communication, Steve & Diane Rose, Sierra Foothills Audubon, 2021

**Issue 1.d - Through omission, lack of data, and lack of sufficient analysis, fails to adequately address potential impacts to the South Fork of Wolf Creek (SFWC) and the main stem of Wolf Creek due to mine water discharge**

Notably, chapter 4.4 of the DEIR does not analyze or mention biological resources downstream of the Brunswick site. This is negligent, given the potential impacts of initial and maintenance mine dewatering which would cause significant mine water discharge into South Fork Wolf Creek. The analysis and conclusions for this omission are provided in chapter 4.8 Hydrology and Water Quality, one of its appendices, K.1 Geomorphic Assessment of South Fork Wolf Creek. A final appendix to the Biological Resources chapter of the DEIR, F.10 SF Wolf Creek Technical Memo. Appendix F.10, attempts to rectify the absence of biological resource assessment due to downstream mine water discharges. It fails to be comprehensive and complete, however. Also, its conclusions are based on the faulty assumptions and conclusions of the two hydrological reports - 4.8 and K.1. Following is a summary of the issues highlighting the inadequacy of the DEIR in this regard.

**I. The lack of hydrological or biological data in whole reaches of the SFWC**

**Grp 31-33**

The DEIR identifies 6 reaches (A through F) of the South Fork Wolf Creek, the first two of which are within the Brunswick site.

Figure 4.8-9
South Fork Wolf Creek Reaches in Project Vicinity

DEIR, 4.8, page 4.8-25

However, Reach C, where WCCA has established a monitoring location since 2004 is only summarily analyzed for its hydrology, without a single collection of qualitative data provided. There is no stream flow data, no erosion testing, no stream velocity profiles provided. This is a crucial omission as data from WCCA and Sierra Streams Institute shows that the center of this reach, within the State Park section shown with dotted lines on the map, consistently exhibits the highest diversity and richness of benthic macroinvertebrates (BMI) in the whole Wolf Creek

Watershed.[18] Why wasn't this stream reach surveyed with a collection of qualitative data? How can we accurately assess impacts to aquatic ecosystems downstream of the proposed project if we are lacking key data about this reach of the stream?

**Grp 31-34**

Similarly, Reach D, also part of the State Park, and identified as a key biological and ecological resource for the park and the county, is completely neglected in the Technical Memo (Appendix F.10) which attempts to summarize biological resources for the South Fork Wolf Creek as a whole. There are no photos, no observations of stream features, vegetation communities or individual species. Yet, the State Park has expended significant resources into documenting the biological richness of this meadow/grassland reach of SFWC, including a 5-year study documenting wetland resources and ongoing restoration. Included are observations of the rare Sidalcea gigantea(CNPS Inventory of Rare and Endangered Plants, 4.3) in the riparian area of SFWC.[19] Why isn't this species included in the survey of biological resources? The richness and diversity of species present along Reach D is also made clear through the work of Gold Country Avian Studies, which has been conducting weekly bird banding at the meadow and along the creek for more than 4 years.[20] So we must ask again, why wasn't this stream reach surveyed for biological resources? How can biological resource assessment be considered adequate and complete without qualitative data from this stream reach? The DEIR must be considered inadequate until these issues are fully addressed.

**II. The lack of sufficient observation over time to create clear stream hydrographs**

**Grp 31-35**

The qualitative stream data that is included is limited and questionable in terms of resolving key questions about increased streamflow impacting biological resources. EMKO measured flow only on two occasions- in April and August of 2019 - along points of the Loma Rica headwaters tributary of South Fork Wolf Creek (simply labeled variously as a 'natural creek' or an 'NID spillway'). Data from NID meant to corroborate conclusions about flow in this tributary is gathered only from 2018.[21] How can an adequate characterization of the hydrology of this important headwaters be ascertained from two data points during one water year, along with three data points during a period of only two months from a different water year?

**Grp 31-36**

Similarly, the data collected by Balance Hydrologics on the main stem of South Fork Wolf Creek is also limited and insufficient. Only two locations are considered, one just downstream of the Loma Rica Ridge headwaters tributary ("the natural creek"), which is proposed to be the mine water discharge site, the other downstream at Ophir Street, just as the South Fork enters the box culvert.[22] In between these two sites are significant reaches of the South Fork that would

[18] WCCA, Wolf Creek Watershed Disturbance Inventory and Assessment Of Conditions, part II, 2021, page 27, https://www.wolfcreekalliance.org/documents/Wolf_Creek_Watershed_Disturbance_Inventory.pdf

[20] Gold Country Avian Studies, www.facebook.com/goldcountrybirds/
[21] DEIR, 4.8-4
[22] DEIR, 4.8-4

need to be assessed, given the diverse character of the stream along these reaches and the important biological resources present in different abundance along the creek.[23]

Equally lacking is sufficient study over time, Balance collected data only in September of 2019 and in January of 2020. The more continuous measurements from 2020 to 2021, again, are only from one location, and in itself cannot be used to create an accurate hydrograph for the whole creek.[24]

**III. Inadequate study and characterization of the hydrological impacts of mine water discharge, including stream flow, sedimentation, stream velocity profiles, loss of seasonality, and loss of streambed or bank habitat**

Finally, the data collected fails to adequately assess potential for sediment load and fails to create stream velocity profiles. Potential loss of seasonality of flow is not considered, nor is stream bank habitat loss due to increased stream depth. Analysis of sediment loading in the stream is crucial. The observations presented by Balance, again, are based only on a single test in a single portion of the South Fork. That the DEIR uses this single data point as the basis of significant claims about the lack of potential for sedimentation caused by mine water discharge is a problem. The conclusions presented in the DEIR simply cannot be justified by this single data point. Apart from stream flow, other analysis should have been undertaken in order to assess impacts on the South Fork. It is a living stream, with a vibrant aquatic ecosystem along much of its length. Stream velocity profiles, crucial for measuring impacts on benthic macroinvertebrates and fish, should have been completed. Calculations showing potential changes in the seasonal hydrograph of the stream should have been produced. Measurements and conclusions regarding increased stream depth along with reduced stream bank or cobble habitat at various points along the stream should have been made. These studies must be included in the DEIR.

**Grp 31-37**

Stream flow in the Sierra Nevada foothills is increasingly variable, from month to month and from year to year. Small-volume streams such as the South Fork Wolf Creek undergo significant change that varies over time, according to the occurrence of drought or above-average precipitation, and varies greatly in different reaches. Aquatic and terrestrial ecosystems are greatly dependent on this mosaic of changes, over time and space. The data presented in the DEIR is not sufficient to adequately characterize this variability. Without that data, we cannot adequately measure potential impacts to the stream.[25]

**IV. Inadequate study of biological resources**

**Grp 31-38**

[23] DEIR, Appendix K.1, page 21 and following, Appendix F.10
[24] DEIR, Appendix K.1, page 26 and following
[25] Dave Herbst, Life of the Bottom-Feeders in the Shallow and Deeps of Streams, Sierra Stream Institute, Science Presentation, 3/1/2022, https://sierrastreamsinstitute.org/2022/02/21/virtual-science-speaker-series-talk/

If impacts of this project are to be adequately assessed, a careful and complete survey of biological resources of SFWC, the body of water potentially impacted by mine water discharge, needs to be included. This is simply not the case. The technical memo is clearly not a full assessment of biological resources for the creek. It completely excludes any consideration of a significant stream reach (D), currently projected as part of the state park. It is primarily a one-time survey for Yellow-legged Frog and only summarily considers other biological resources within that context. For example, it notes "fish"..."most probably small rainbow trout" in the stream without further investigation. In this instance and many others, it does not include qualitative observations sufficient to fully analyze the existence of biological resources and their habitats.[26] This lack of precision and paucity of observation occurs in other biological surveys included as part of the DEIR as well, for example, where in the Brunswick BRA it is stated that "surveys did not record any observations of deer."[27] They were not observed because no adequate study was made to verify their presence, for example through placement and monitoring of a trail camera.[28] In general, biological assessments in the DEIR attempt the minimum and doing so fail to assess the full extent of biological resources potentially impacted. Without such a detailed survey of biological resources, how can this DEIR be considered complete?

**V. Omission of any qualitative observations and data regarding benthic macro-invertebrates (BMI)**

**Grp 31-39**

A crux of the matter is that the DEIR as a whole, in the chapter on Biological Resources (4.4) or in the various appendices do not offer any data regarding benthic macroinvertebrates (BMI). BMI indexing is a standard protocol for assessing stream ecology health and It is impossible to judge impacts to stream health without adequate baseline data and repeated collection of data. BMI populations exist as a crucial foundation for the whole ecological food pyramid that includes fish, crustaceans, amphibians, fish, and birds.[29]As the stream ecologist David Herbst recently observed, through mine water discharge BMI can be subjected to habitat alteration, increased sediment load, toxins in the water, and chronic stress due to continuous increases in stream flow.[30] Without a baseline measurement of BMI communities in various reaches of the South Fork Wolf Creek, over time and to the genus or species level, we cannot consider any future impacts to those aquatic communities. Why does the DEIR not include BMI observations and measurements? The DEIR cannot be considered complete without data on BMI.

**VI. Inadequate consideration of chronic and cumulative impacts to BMI, trout and other aquatic species, including special concern amphibians, rather than simple tests of acute impacts.**

Related to the lack of BMI data is a basic misunderstanding of stream health regarding aquatic organisms. The DEIR, in its appendix K.2 Groundwater Hydrology and Water Quality Analysis Report for the Idaho-Maryland Mine, when considering water quality for the project, tests water quality from the New Brunswick Mine Shaft by using an acute toxicity test for rainbow trout. On this basis the DEIR gives no further consideration to the impacts of mine water discharge into SFWC.[31] Yet, there is not enough data to confirm that the limited test using water from one source location in the mine is representative of the chemical composition of water that would be discharged from the mine. Nor is such an acute toxicity test useful in assessing the overall impacts to trout and other aquatic organisms, as higher levels of heavy metals or high levels of Specific Conductance (EC), which tested above healthy levels for benthic macroinvertebrates, can have significant chronic effects.[32] A much more logical place to collect representative contaminated water from the mine tunnels would be the current outfall locations, currently flowing unimpeded into Wolf Creek near Centennial Drive.

**Grp 31-40**

Overall, the data provided to construct an adequate and reliable baseline for considering potential impacts to the South Fork Wolf Creek is wholly insufficient. Further data is needed, both to better assess the range in chemical composition of mine water discharge, the remaining impacts to sensitive aquatic organisms even after proposed levels of water treatment, and careful testing for the impacts of potential chronic stress to organisms. Mine dewatering impacts to biological resources downstream is well documented.[33] Why does the DEIR include so little data in this crucial area of potential impact? How can the DEIR purport to identify and mitigate impacts to this project if it does not fully address the complexity of mine discharge impacts downstream?

**Issue 1.e - Includes mistaken and incomplete identifications of species**

**Grp 31-41**

In addition to the issues mentioned above, the description of vegetation communities includes mistakes in identification, typographical errors, and incomplete identifications. Some of these mistakes are glaring or could easily be fixed and suggest a lack of precision and care in the description. For example, at 4.4-9 the DEIR suggests that the

> Montane riparian…are characterized by black cottonwood (Populus tremuloides)…

[31] DEIR, Appendix K.2-41
[32] DEIR Appendix K.2, 40-46; Dave Herbst, Sierra Stram Institute, personal communication, February, 2022
[33] Clements, W.H., D.B. Herbst, M.I. Hornberger, C.A. Mebane, and T.M. Short. 2021. Long-term monitoring reveals convergent patterns of recovery from mining contamination across 4 western US watersheds. Freshwater Science 40:407-426

This is a confusion in identification in describing the site apparent even without field-checking the property. Referring to the Jepson Manual,[34] the authoritative source for California plant identification, one finds that the common name, 'black cottonwood,' has the scientific name *Populus trichocarpa* NOT *Populus tremuloides* and that it natively grows in this region only at higher elevations, for example at over 5,500 feet at Cisco Grove along Hwy 80.[35] Or if we consider that perhaps the observation refers to the scientific name, *Populus tremuloides*, we find that this refers to Quaking Aspen, another higher elevation deciduous tree for which no herbarium records exist in the area below 1524m (5,000 feet).[36] In short the identification appears to be confused and dramatically inaccurate.

Other problems relate to incomplete identifications, such as at 4.4-10 where the text refers to

> "California Black Oak, Pine, and Douglas Fir"

Without identifying the specific species of pine.

Finally, some of the generalizations of vegetation communities characterize them as wholly consisting of invasive or non-native plants when a careful review of the botanical survey for the site indicates an actual majority of species as native.[37] This generalization misrepresents the character of the vegetation community and does not allow the reader to accurately comprehend the degree of biological resources that might be impacted.

What is the actual species of tree being referred to at 4.4-9 if it is not 'black cottonwood?' What species of 'pine' is meant at 4.4-10? Why is the abundance of native plants not mentioned at 4.4-...? These questions suggest that a comprehensive review of species identifications and vegetation community descriptions must be undertaken. Otherwise, how can we have confidence that the DEIR in this regard is complete and accurate?

**Issue 1.f - Does not include or downplays the potential presence of special status species potentially impacted by the project**

**Grp 31-42**

Finally, in regard to environmental setting, the DEIR should include analysis of the following species of concern that are not included in its text:

The California Spotted Owl (Strix occidentalis occidentalis) is listed as a California Species of Special Concern, a sensitive species by the USFS, and is under review as an endangered species by the US Fish and Wildlife Service.[38] A pair has been observed within Empire Mine

[37] Appendix F.6, Centennial Botanical Report, Appendix A
[38] California Fish and Wildlife Service, https://fws.gov/sacramento/es_species/Accounts/Birds/ca_spotted_owl/

State Historical Park, adjacent to the Brunswick site, and in other locations within a 5 mile radius of the proposed sites.[39] Suitable mature forest habitat is present in parts of the Brunswick property, in forest close to proposed Brunswick site mine operations and downstream within the South Fork Wolf Creek watershed. As such the DEIR should complete a protocol-level survey of suitable habitat and include that in the DEIR. Why has this species been omitted from consideration when observations indicate a reasonable probability that the species may be present at or adjacent to the Brunswick site?

**Grp 31-43**

The Yellow-breasted Chat (Icteria virens) is also listed as a California Species of Special Concern.[40] It has been observed during breeding season along reach D (as identified in the DEIR) of the South Fork Wolf Creek. It also should be assessed for likely habitat on the proposed sites and along Reach D of South Fork Wolf Creek, an area being assessed for biological resources as part of the DEIR.

**Grp 31-44**

Willow Flycatcher (Empidonax traillii), a species the state considers critically iimperiled (S1/S2) has also been observed along Reach D.[41] Probable habitat should be identified and analysis of potential impacts to that habitat due to mine dewatering, particularly in regard to riparian willow stands, and other impacts due to proximity to mine operations.

**Grp 31-45**

The US Fish and Wildlife Service has determined that listing of the Monarch Butterfly (Danaus plexippus plexippus) as "endangered or threatened under the Endangered Species Act is warranted" and is now under yearly review as a candidate for inclusion under the Endangered Species Act.[42] This is particularly the case with the Western Monarch Population, which relies on migration and breeding habitat throughout the Sierra Nevada Foothills. In support of this, the California Department of Fish & Wildlife has included the Monarch Butterfly in its Terrestrial and Vernal Pool Invertebrates of Conservation Priority list and identified as a Species of Greatest Conservation Need in California's State Wildlife Action Plan. A Western Monarch Conservation Plan, adopted in 2019, was also created to protect and assist in the recovery of western monarch populations.[43] Essential to recovery efforts, according to the Conservation Plan,[44] is preservation of breeding habitat, primarily species of milkweed (Asclepias). The Centennial site as described in this DEIR has a population of showy milkweed (Asclepias speciosa) existing in riparian and wetland (FAC) habitats.[45] Therefore, special consideration of the existence and

[45] DEIR, Appendix F.6, Appendix A, Vascular Plants Occurring in the Centennial Industrial Site, page 1

preservation of these milkweed populations needs to be included in the DEIR. A protocol-level survey of individuals needs to be included as well as seasonally-timed surveys for monarch butterflies, in adult, larval, or pupae stages. How can we be assured that impacts of this proposed project will not include detrimental actions reducing monarch butterfly populations if a complete survey of milkweed and monarch butterfly populations on site is not included in the DEIR?

The DEIR also downplays the potential presence and need to mitigate for the following species of concern:

Stebbins morning glory (CNPS List 1B.1) — surveys were completed outside its blooming period, nor have surveys been done after the recent fire that burned portions of the Centennial site in 2021. Habitat at the Centennial site itself indicates a reasonably high probability of presence.[46]

Chaparral sedge (CNPS List 1B.2) — surveys for this species were also done outside of its blooming period and the habitat again suggests a high probability of presence.[47]

**Grp 31-46**

Finger rush (Juncus digitatus, CNPS List 1B.1) — though the species is considered to have a low probability of occurrence by the DEIR, the species is known less than one mile from the sites, and surveys for the species were not done during its blooming season.[48]

Sierra brodiaea (Brodiaea sierra, CNPS List 4.3) — As the DEIR states, "thousands of individuals covering almost a quarter of the Centennial Industrial Site"[49] were mapped in surveys. Although the DEIR obscures the potential impact to this species, by referring impacts to DTSC's proposed and not-yet-completed RAP, it is likely that a significant population of this species would be extirpated or seriously impacted.

**Grp 31-47**

Foothill Yellow-legged Frog (Rana Boylii) and Red-legged Frog (Rana aurora draytonii) — visual surveys were not done during prime breeding conditions, given the absence of recent rain. Nor is there an indication that surveys were done at night, when observation of these frogs is optimal.[50]

**Grp 31-48**

Western Pond Turtle (Emys marmorata) — though probability of presence is considered high by the DEIR, there is no adequate survey of their presence. Further, the mitigation suggested does not consider or adequately protect for loss of steam bank habitat due to higher stream levels, nor does it adequately protect turtle hatchlings who need connectivity with water.[51]

[49] DEIR 4.4-31
[50] Marion Blair, Biologist, B.S., M.S. Santa Clara Valley Water District, retired - personal communication, 2022
[51] Marion Blair, 2022

**Grp 31-49**

Hoary bat (Lasiurus cinereus) and Pallid bat (Antrozous pallidus) — the DEIR identifies "riparian and woodlands" for both species, and admit that the "disturbance" of the project could cause impacts.[52] Yet, the DEIR offers no surveys of bats, and does not consider the impacts of loss of woodland or riparian habitat in either the Brunswick or Centennial sites.

**Grp 31-50**

Raptors and Migrating birds — Numerous observations of Cooper's Hawk (Accipiter cooperii) are recorded for areas adjacent to the Brunswick site and the Bennett Street grassland potentially impacted by mine water discharge along Reach D.[53] Fledglings have also been observed locally during breeding season. Olive-sided Flycatcher (Contopos cooperi), another species of special concern, has also been observed along Reach D, in the Bennett Street grassland and riparian area.[54] Impacts to these species are not adequately considered in the DEIR.

**Grp 31-51**

Species of special concern, valuable in themselves, are also indicators of overall ecosystem health and resilience. A comprehensive, complete consideration of the presence or probable presence of special concern species, rather than one that is minimal and incomplete, is needed in order for this survey of biological resources to be complete. The DEIR itself admits that Madrone's peer review of the Biological Resources chapter of the DEIR "identified concerns with respect to the timing of the special-status plant surveys conducted for the Centennial and Brunswick botanical reports," and actually suggests that a remedy would be to conduct additional surveys AFTER the project is approved and prior to specific disturbance activities."[55] This defeats the whole purpose of an EIR, which is to clearly identify potential impacts as part of determining WHETHER the project should be approved. To do otherwise is to be negligent and to unknowingly expose biological resources to irreparable harm. Overall, this DIER fails to adequately consider both individual species of concern as well as the interconnected web of biological resources as a whole. Why hasn't the DEIR included or considered more inclusively the species of special concern listed above? How can this DEIR be considered adequate and complete if it does not adequately survey and consider these species of special concern?

### 4.4.4 Impacts and Mitigation Measures

**Grp 31-52**

Just as the delineation of environmental setting and the survey of biological resources are deficient in many regards, so also the measurement of impacts to biological resources and the mitigations proposed to reduce those impacts are inadequate in many regards. This is due to inaccurate or incomplete assessment of the environmental setting as detailed above, but also due to questionable assumptions used as the basis for impact analysis and proposed mitigation that do not sufficiently project species.

[55] DEIR, 4.4-56

**Issue 2.a - Present an inadequate Pine Hill Flannelbush Management Plan. (4.4-1)**

The DEIR is required to consider the population of the decumbant Fremontodendron on the Centennial site as an endangered species until such time as further genetic analysis comparing different decumbant Fremontodendron populations is completed. The DEIR, therefore, given that the proposed project would involve 'taking' or impacting at least 14 Fremontodendron, presents a required management plan. This plan, however, ignores some of the basic considerations pertaining to the species. At III-20, the federal Recovery Plan for Gabbro Plants of the Central Sierra Nevada, on which the management plan is based, states that:

> Fremontodendron californicum ssp. decumbens is a shrub that persists through a fire cycle and requires fire for seed germination... Fire is needed to maintain habitat for this species.

And further that:

> *Preservation of the pollinating fauna (native solitary bees) and dispersal fauna (ants) is also important to the survival and recovery of F. californicum ssp. Decumbens.*[35]

Grp 31-53

Yet, the management plan does not in any way consider the requirement of "fire for seed germination." As the federal recovery plan clearly states, "Fire is needed to maintain habitat for this species." Further, the management plan does not consider pollinators or dispersal species. How can this management plan be considered sufficient without aspects of the plan including the regular introduction and management of fire and attention to pollinator and dispersal species in areas occupied by the decubant Fremontodendron?

Equally troubling is the inattention to a sufficient "buffer" in order to protect the plants and give sufficient space for fire management. As the federal plan states, there is a requirement for

> *"Sufficient unoccupied habitat for fire management and a 150 meter (500-foot) buffer"*[51]

Finally, plans to move and transplant Fremontodendron are unjustified without further study, which the DEIR does not present. The federal plan asks for

> *"Research on seed germination and propagation techniques"*

And sets the criteria for success not at 80% as the DEIR management plan suggests, but at 100% or more:

> *"The establishment of occurrences must continue to be greater than the extirpation of occurrences"*[35]

[35] Recovery Plan for Gabbro Plants of the Central Sierra Nevada, 2002, III-20
[51] Recovery Plan for Gabbro Plants of the Central Sierra Nevada, 2002, III-31
[35] Recovery Plan for Gabbro Plants of the Central Sierra Nevada, 2002, III-31

Transplanting mature Fremondendron is known to be difficult with no certainty of success. Without detailed study of its efficacy how can transplanting be included in this management plan? In sum, the Pine Hill Flannelbush management plan presented in the DEIR cannot be considered adequate and sufficient until it includes fire management, sufficient buffers, attention to pollinator and dispersal species, research showing the efficacy of transplanting individuals, and adherence to a success rate 100% or higher. Why has this management plan been presented without these crucial considerations?

**Issue 2.b - Ignore and do not consider mitigation plans for species of special concern — Monarch Butterfly & Showy Milkweed (known to be present at the Centennial site), California Spotted Owl (reported as present in Empire Mine State Historical Park, which is adjacent to the Brunswick site), Yellow-breasted Chat (known to be present during breeding season in the meadow/grassland reach of the SFWC downstream of the Brunswick site) and Willow Flycatcher. (4.4-1) (4.4-2)**

**Grp 31-54**

As discussed above, based on their presence or highly likelihood of presence on one of the two project sites or nearby, the DEIR should include specific, measurable, and actionable mitigation plans to protect the three species of special concern listed above. Mitigation plans for Monarch Butterfly and Showy Milkweed should follow guidelines detailed in the state's Western Monarch Conservation Plan.[59] Mitigation plans for California Spotted Owl and Yellow-breasted Chat should also be prepared and include guidelines based on standard CDFW protocols. As Yellow-breasted Chat (during breeding season) and the critically imperiled Willow Flycatcher have both been observed during breeding season in Reach D of the South Fork Wolf Creek downstream of the proposed mine water discharge site, mechanisms should be in place requiring the stoppage of mine dewatering if surveys by qualified biologists deem that dewatering is impacting Yellow-breasted Chat habitat. Mitigation plans should also include the latest biological and regulatory information, for example as laid out in the USFS's *Guidance on Limited Operating Periods for the California Spotted Owl*.[60] How can this DEIR be considered adequate and complete if it does not include appropriate mitigation plans for sensitive species known to be present in areas potentially impacted by the proposal?

**Issue 2.c - Do not consider potential impacts to biological resources of the Brunswick site pond (PD1). (4.4-2) (4.4-3) (4.4-4)**

**Grp 31-55**

The pond at the Brunswick site, identified in maps and text as PD-1,[61] is an important habitat for riparian plants, aquatic species, waterfowl, and migrating birds. Impacts to these biological resources need to be assessed in the context of rebuilding any of the physical features of the pond and subsequently using the pond for water treatment. This is not addressed in the DEIR. Given the existence of biological resources associated with the pond, how can impacts to these resources not be considered?

[59] California Department of Fish and Wildlife, https://wildlife.ca.gov/Conservation/Invertebrates/Monarch-Butterfly
[60] Guidance on Limited Operating Periods for the California Spotted Owl, 2006, https://www.fs.usda.gov/Internet/FSE_DOCUMENTS/stelprd3812313.pdf
[61] DEIR, 4.4-15

**Issue 2.d - Do not consider adequate mitigation for potentially impacted aquatic species, including BMI and trout. Nor does it include analysis and mitigation for the movement of trout and other aquatic species both upstream and downstream of the industrialized portion of the Brunswick site. (4.2-2) (4.4-4)**

**Grp 31-56**

As previously pointed out in our comments on the environmental setting of the Brunswick site, the South Fork Wolf Creek has continuity as a perennial stream from a point above Brunswick Road (WCCA monitoring site 6.1) all the way to its confluence with the main stem of Wolf Creek in Grass Valley. As such, the continuity of the stream as an ecosystem needs to be addressed for potential impacts due to the proposed mine. Specifically, replacement of the 48" culvert that connects the creek's upper headwaters with its downstream reaches needs to be addressed.[52] Impacts to aquatic organisms, including BMI and trout need to be considered. As the DEIR itself states, Appendix G of the CEQA guidelines indicate that a significant impact would occur if the project would,

> *Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites*[53]

The ability of these organisms to migrate upstream or downstream needs to be analyzed, with any potential impacts clearly delineated along with any mitigations necessary to protect these biological resources. How can we be assured that impacts to aquatic species, such as trout or BMI, will not be impacted upstream or downstream of the 48" culvert scheduled to be replaced without assessing impacts of that activity? What mitigations should be in place to protect those biological resources? This should include consideration of an alternative mitigation: remove the entire length of the culvert, and restore this stretch of the creek to a more natural setting.

**Issue 2.e - Consider that habitat loss is an acceptable option if the species has not yet been observed, even if the likelihood of the species being present is high, including the destruction of nesting habitat for birds after the nesting bird has departed. (4.4-2)**

**Grp 31-57**

Throughout the discussion of mitigations necessary to reduce the impacts on species of special concern the assumption is that only if the species in question is observed to be present immediately prior to or during construction or other disruptive activities is there a need for mitigation procedures. In most cases, the solution presented is to "to move individuals out of the disturbance areas to avoid impacting this species"[54] and then proceed with the activity. How does this protect the habitat of the threatened species? In the instance quoted, the DEIR is referring to Foothill Yellow-legged Frog, but the mitigation is repeatedly suggested, for Western Pond Turtle, Coast Horned Lizard, special status bats, including Townsend's big eared bats, raptors,

[52] As summarized for example at DEIR, 4.8-73
[53] DEIR 4.4-52
[54] DEIR 4.4-76

and migratory birds.[65] Removing individuals from their habitat does not protect the species if the habitat they are removed from is then distrubed or destroyed. How does this mitigation protect the species if its habitat is eliminated or damaged? The mitigation must include consideration of avoiding habitat destruction or assuring that suitable additional habitat is available?

**Issue 2.f - Unreasonably suggest that a one-to-one replacement of wetland or monetary compensation is a preferred option for mitigating loss of wetland (4.4-3)**

**Grp 31-58**

In both the Brunswick and Centennial sites considered for this project wetlands and riparian areas are identified as needing to be destroyed. For the Centennial site, the identified acreage unreasonably excludes extensive wetland currently present at the site. As the RAP developed by DTSC is currently not finalized, AND as impacts to that site should legally be included in a consideration of the impacts of this project, the acreage identified is wholly inaccurate.[66] Even if this was correct, we question the approach of the DEIR in mitigating impacts to wetlands. Federal law requires that preservation of wetland be considered as the preferential option when there is potential impact to these habitats. This is also put forth clearly in the Nevada County General Plan. Yet the DEIR does not consider in any way this option for the wetland involved and does not discuss possible preservation of the wetland areas it targets for elimination. Instead it states that it is a simple matter of "no net-loss" and that mitigation COULD include onsite and/or offsite wetland creation and/or restoration, payment of an in-lieu fee, and/or purchase of mitigation credits"[67] This mitigation is vague, unspecified, and out of keeping with the intentions of federal law and county plans. Wetlands in the headwaters area of Wolf Creek, in which both of these projects are proposed to take place, have greatly declined due to previous mine activity and subsequent urban and residential development. Each portion of wetlands is irreplaceable and connected organically with the hydrology of the watershed. Paying money in compensation for destroying wetlands is not an acceptable option for this project. Restoring wetlands in some generic way outside the sites and outside the watershed is not an acceptable option for this project. Project design options that avoid wetland destruction must be presented and evaluated. Why has the DEIR not looked at these options? Why has it not detailed any potential creation or restoration of wetland on-site? Applying for a permit and paying money is not an adequate mitigation.

**Issue 2.g - Allow substantial impacts to riparian or wetland habitats, or disturbance within 100 foot setbacks from the South Fork Wolf Creek. (4.4-3)**

**Grp 31-59**

Finally, the DEIR in its discussion of mitigations necessary to protect wetland, watercourse, and riparian areas is negligent in a number of respects.

First, the DEIR omits and avoids full consideration of wetland and riparian habitats at the Centennial site, making it impossible to judge to what extent those habitats would be impacted and how successful mitigations to those impacts would be.

[65] DEIR 4.4-76 to 4.4-80
[66] DEIR 4.4-80-81
[67] DEIR 4.4, Mitigation 4.4-3(c), 4.4-90

Second, the mitigations proposed for wetland mitigation unreasonably leave the reader with a bare list of mitigation options, ranging from:

> onsite and/or offsite wetland creation and/or restoration, purchase or placement of conservation easements, payment of an in-lieu fee, and/or purchase of mitigation credits. DEIR 4.4-90

Yet, the Nevada County Land Use and Development Code along with other federal and state agencies assert that

**Grp 31-60**

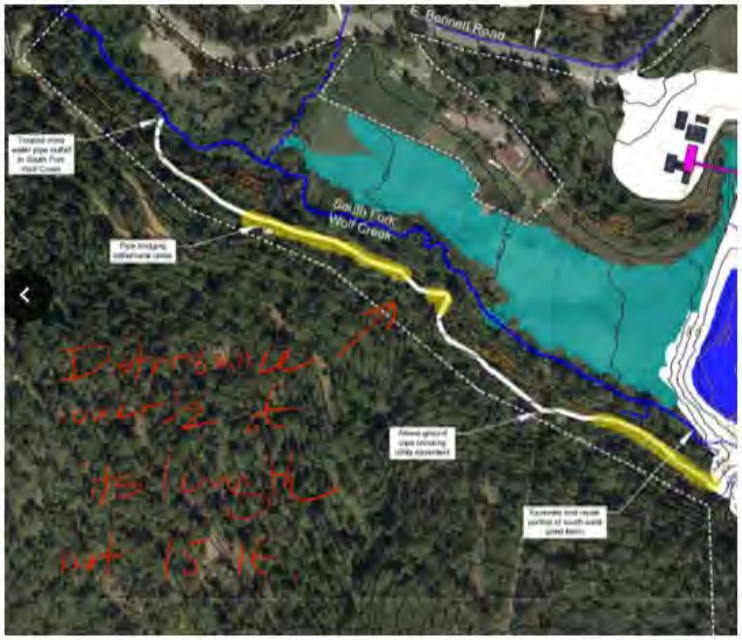
> "avoidance is the preferred standard unless the Planning Agency determines that implementation of this standard effectively removes the potential for the reasonable development of the parcel."[68]

The DEIR does not specifically consider and detail alternatives that would involve avoidance. Nor does it include any analysis of the potential for onsite or offsite wetland creation or restoration, which is preferable to fees or mitigation credits. In this sense, the DEIR is not pursuing any due diligence in considering options that would protect wetland or riparian areas. Why does the DEIR omit any consideration of specific alternatives? Could the site plans allow for avoidance of proposed disturbances to these habitats? Are there suitable on-site locations for creation or restoration? None of this is included in the DEIR.

Third, impacts due to disturbance to the section of South Fork Wolf Creek (with its unassessed BMI and trout populations) that flows through the existing culvert and the pond (PD-1) that currently contains significant (also unassessed) biological resources are not considered.[69]Why is that not the case? Surely stream connectivity suggests significant impacts to the SFWC if no mitigation is considered. In the same way, biological resources of the pond could be impaired or extirpated if no consideration is given to their existence.

**Grp 31-61**

Fourth, violations to the 100 foot setback from streams is not adequately addressed. Policy 11.7 of the Nevada County General Plan states:



> Through the development and application of Comprehensive Site Development Standards, and project environmental review, establish and enforce minimum building setback lines from perennial streams and significant wetlands that are adequate to protect stream and wetland resource values.[70]

**Grp 31-62**

Yet, when considering stream setbacks the DEIR on the Brunswick and Centennial sites, the DEIR notes a number of instances where the proposed project would indeed violate minimum

[68] As quoted in DEIR, 4.4-49
[69] DEIR, 4.4-85
[70] As quoted in DEIR 4.4-46

setbacks.[71] Again, the DEIR does not explore alternatives to the described encroachment. Further, the extent of encroachment would appear to be misconstrued in the DEIR. At 4.4-85 the text suggests no more than 15 linear feet of permanent impact, but does not describe in sufficient detail the impact of the pipe paralleling South Fork Wolf Creek to the discharge point. Close examination of the accompanying map at 4.4-84 shows that this pipe would impact the "non-disturbance buffer zone" along approximately half its length, a much greater amount of impact that is not measured or quantified. The DEIR describes the route chosen for the pipe as along "an existing dirt road". This is a mischaracterization. It is not a road, it's a path through a riparian zone inhabited by trillium, equisetum, and the rattlesnake plantain orchid. It may have been used for logging 50 years ago, but it is not a road. One has to step over fallen trees, dodge poison oak, and jump over streams in the rainy season. The DEIR must be revised to accurately describe the proposed pipeline route as it really is; it must describe how the minimum setbacks will be maintained from the perennial creek and the multiple seasonal streams in this area, and how the riparian resource value will be maintained.

In sum, the DEIR does not consider carefully enough, comprehensively enough, or with an eye to their actual potential and the manner necessary to mitigate them, the impacts to biological resources involved in this proposed project.

[71] DEIR, 4.4-81

## 4.4-6 Cumulative Impacts and Mitigation Measures

**Grp 31-63**

The project proposed as presented in the DEIR includes a significant range of potential impacts that could persist, occur through accident or mismanagement over time, or be exacerbated by changing factors over the proposed 80 years of the project. The DEIR in no way addresses the potential synergies of these cumulative impacts, the likelihood of mitigations NOT protecting biological resources due to various foreseeable and indeed probable circumstances, or the extent to which changing climate or other serious environmental or human factors in the future might undermine mitigations or dramatically increase risks. This negligence on the part of the DEIR can be detailed through a number of specific issues.

**Issue 3.a - Does not address the loss of forest land and associated stresses on forests as an essential factor of environmental health for the community (4.2-3)**

**Grp 31-64**

The DEIR identifies more than 33 acres of forest land that would be lost as a consequence of the project, 31 acres of forest replaced by mine waste (which the DEIR chooses to call 'engineered fill'),[72] and somewhat less than 4 acres at the Centennial Site. This of course does not include any forest land not addressed or disclosed in the DEIR at the Centennial Site due to claim of separate consideration in an as yet incomplete DTSC RAP.[73] This forest land represents much of the diversity of forest habitats in the Wolf Creek Watershed and is a significant amount of forest land lost. This impact is ignored in the DEIR in spite of the language of impact 4.2-3 specifically mentioning

> *"the loss of forest land or conversion of forest land to non-forest use."*[74]

Why is this impact not considered? Loss of forest land impacts the whole watershed and the ecological resilience of forest land that is essential for the health and well-being of our community. It impacts water retention and storage in the watershed, a crucial factor in the context of increasing periods of drought due to climate change. It reduces forest species diversity and abundance, and limits breeding habitat and connectivity for species. Loss of forest is an impact that adds to others to be a cumulative impact on biological resources. Why is the cumulative impact of loss of forest land not fully addressed?

**Grp 31-65**

**Issue 3.b - Does not address potential cumulative impacts of impaired air quality on forests, nearby meadow, or wetland and its associated species (4.3-1) (4.3-2)**

[72] DEIR 2.0, Executive Summary, 2-2, DEIR 4.4-7 through DEIR 4.4-10
[73] DEIR 2.0, Executive Summary, 2-2, DEIR 4.4-4 through 4.4-6. This is based on comparing the acreage and map of forest habitats with the project description. It appears that a small section of Montane Hardwood Conifer habitat would remain outside the area of 'engineered fill.'
[74] DEIR 2.0, Executive Summary, 2-13

Air quality impacts forest, meadow, and wetland health as well as its related species. Whether it is emissions caused by the crushing of mine rock or the fumes of diesel trucks, this air quality impacts can have a cumulative, chronic impact on biological resources. Trees and other plant species are impacted by chronic exposure to airborne toxins and pollutants.[75] Why are the impacts of air quality on biological resources not addressed or evaluated?

**Issue 3.c - Does not consider the loss of habitat an impact to special-status species, present or potentially present (4.4-1) (4.4-2) (4.4-6)**

**Grp 31-66**

In its consideration of species of special concern only a few are considered to have an essential need for habitat. For others removal and destruction or impairment of habitat is deeded acceptable. Yet habitat loss across landscapes is cumulative. Why does the DEIR not address the overall loss of habitat for species of special concern (much less the whole complex of forest species that are essential to forest health) involved in the project?

**Issue 3.d - Considers the net loss of wetland within the Wolf Creek Headwaters area in which the project is proposed to be an acceptable mitigation, significantly reducing and unduly impacting the environmental resiliency of the associated local ecosystems. (4.4-3)**

**Grp 31-67**

Loss of wetland in one part of the watershed impacts other parts of the watershed. The watershed needs to be seen as a vital network of hydrological connections, much as we view our circulatory or lymphatic system. The impacts accumulate and impact the health of biological resources. Why does the DEIR not address the cumulative loss of wetland habitat proposed in this project?

**Issue 3.e - Does not adequately consider the cumulative impact of mine water discharge or failure of water treatment or water retention at the Brunswick site. (4.6-2) (4.8-3) (4.8-7)**

**Grp 31-68**

Mining operations in the Wolf Creek Watershed have had a history of creating severe impacts due to the failure of water treatment or the persistence of unmonitored and unmitigated mine discharges into its streams. The Magenta Mine discharge required legal action and millions of dollars of mitigation. The mine discharge from North Star mine shafts owned by Newmort upstream of the City of Grass Valley's water treatment plant similarly involved years of litigation and extensive re-engineering to successfully mitigate. In the meantime, streams of the watershed suffered through years of toxic discharge that impacted biological resources. The DEIR must present data, analytical study, and assurances that similar negative impacts to streams downstream of the proposed project would not happen. The DEIR simply references adherence to pertinent law and regulation and a water treatment plan that is not presented for consideration. No calculation of the impact of foreseeable accidents is discussed. No discussion of public monitoring and rigorous oversight is included. No calculation of increased potential for

[75] EPA, Plant Response to Air Pollution, 2002, https://cfpub.epa.gov/si/si_public_record_report.cfm?Lab=NHEERL&dirEntryId=50437

failure of water retention at the Brunswick site due to the increased intensity of storm events over the 80 year lifetime of the project is considered, nor any other intensifying impacts due to climate change. Mining, historical or modern, has a track record of having impacts in real operation far beyond what is projected in project proposals.[76] Why are these exigencies not detailed, elaborated, and considered? Any heavy industrial operation has the potential to include increasingly significant impacts, to water quality and to biological resources over time. Why is this not examined, given that the project proposes 80 years of operation?

**Issue 3.f - Does not address environmental impacts of decreased groundwater in the the meadow/grassland reach of SFWC or other projected impact areas of the watershed. (4.8-2)**

**Grp 31-69**

Drawdown of the water table due to mine dewatering is largely underestimated in the DEIR as well as the degree of certainty of those predictions. Additionally, increased temperatures and decreasing soil moisture due to accelerating climate change will likely combine with a lowering water table in forest or meadow areas adjacent to the proposed mine to exacerbate "stress complexes" leading to "increasing numbers of forest dieback events."[77] Depth-to-groundwater is a crucial factor for vegetation. As Eamus (2016) states,

> *An increased depth-to-groundwater may lead to reduced plant growth, mortality and change in species compositions.*[78]

The cumulative impact of changes in groundwater as it might impact biological resources is not considered or evaluated. This project is proposed to last 80 years. Why does the DEIR ignore the potential cumulative impacts of loss of groundwater to biological resources?

**Issue 3.g - Does not consider the need to monitor existing mine seeps on the main stem of Wolf Creek in the event that mine dewatering impacts these seeps in ways that are not predicted.**

**Grp 31-70**

At DEIR 4.8-14 four drains discharging mine water are discussed - Eureka Drain, East Eureka Shaft Drain, East Eureka Shaft and 'Unknown Origin' all of which empty in Wolf Creek. Water quality testing of these drains reveals high levels of some heavy metals. The DEIR suggests that, as these drains are connected to the network of mine shafts holding ground water, mine dewatering will eliminate these seepages. Nonetheless, given the groundwater connectivity of these drains with groundwater zones impacted by the proposed project, a reasonable amount of uncertainty exists. Dewatering might not reduce the outflow from these drains, or expansion of mine workings could alter the fracture typology of underground rock so that mine water seepage from these drains actually increases. Therefore, due diligence indicates that monitoring of these

[76] James R. Kuipers, et al., Comparison of Predicted and Actual Water Quality at Hardrock Mines, 2006
[77] Glazer & Likens, The Water Table: The Shifting Foundation of Life on Land, https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3472013/
[78] Eamus, et. al., Groundwater Dependent Ecosystems: Classification, Identification Techniques and Threats, 2016, https://link.springer.com/chapter/10.1007/978-3-319-23576-9_13

existing mine seeps needs to be included. Why does the DEIR not include ongoing monitoring of these drains? In addition, the DEIR must address the fact that upon closure or decommissioning of the project (whether in 80 years or sooner), the underground workings will inevitably re-fill with water, and reemerge, with the same mix of contaminated water. Where will this water reemerge? The DEIR must also describe the treatment facility that will be necessary upon closure of the project, including funding sources for construction, maintenance, replacement after the expected life cycle of the facility, in perpetuity.

**Issue 3.h - Does not address the impact to overall development impacts for the community of changing the land use zoning designation from light industrial to heavy industrial/mining. (4.9-4)**

**Grp 31-71**

The change to county zoning that would allow a designation change from light industrial to heavy industrial has significant, cumulative impacts for the community, the county, and the watershed. Would this change allow other similarly intensive developments to take place? Or would it cause a reduction of less environmentally impactful developments due to the presence of the proposed project? How would future changes in zoning impact the watershed? These questions about the cumulative impact of land zoning changes need to be addressed. Why hasn't this been considered?

**Issue 3.i - Does not adequately address impacts of increased noise on species, habitats, and ecosystems. (4.10-1) (4.10-2) (4.10-3)**

**Grp 31-72**

Wildlife disturbance due to noise is partially addressed in the Biological Resources chapter at page 4.4-74. It included no data, and relies only on generalizations and citations from a limited selection of sources that create a one-sided picture of the impacts of noise on species, suggesting that species will become "acclimatized" to noise disturbance, that protected species have a "low potential" to be on the site, and that non-protected species can 'decline' due to noise disruption as their populations are not at risk of "declining below self-sustaining levels."[79] This callous disregard of potential impacts is negligent in that it discounts the potential impact and does not fully consider the various lines of research that do exist, and that increasingly link noise disruption with serious impacts to species. As the National Park Service states:

> In general, a growing number of studies indicate that animals, like humans, are stressed by noisy environments (Shannon et al. 2015). The endangered Sonoran pronghorn avoids noisy areas frequented by military jets; female frogs exposed to traffic noise have more difficulty locating the male's signal; gleaning bats avoid hunting in areas with road noise (Barber et al. 2009). When these effects are combined with other stressors such as winter weather, disease, and food shortages, sound impacts can have important implications for the health and vitality of wildlife populations…[80]

[79] DEIR 4.4-74
[80] NPS.gov, Effects of Noise on Wildlife, https://www.nps.gov/subjects/sound/effects_wildlife.htm

In fact, numerous studies suggest that noise disruption can negatively impact breeding success among migrating bird species, and that species leave habitat in order to be less impacted by noise.[81] The chronic impact of noise over the life of the project potentially would seriously impact species populations. Noise is a cumulative impact; along with the many other potential impacts mentioned, it works to negatively affect the biological integrity of large areas of the Wolf Creek Watershed. Why doesn't the DEIR investigate the cumulative impact of noise disturbance more completely, particularly with regard to the negative impacts already shown by research? Why doesn't it include specific data measuring potential db levels at various locations where biological resources might be impacted and correlate that data with the current range of noise research?

**Issue 3.j - Does not fully address potential increases in risk of wildfire in an 80 year period that will see increasingly large and uncontrollable fire. (4.13-2) (4.13-5)**

Catastrophic wildfire is a fast-increasing reality in our forest landscape. Yet, the DEIR barely considers its impact over the 80 year life of the proposed project. Why is this? The potential impacts, cumulatively should be obvious and therefore fully analyzed and considered.

Importantly, the DEIR needs to incorporate the science summarized in the California Department of Fish and Wildlife paper, Wildfire Impacts, 2022, where it states,

**Grp 31-73**

> Managing forests, woodlands, shrublands, and grasslands for broad ecological and societal benefits has become a challenging issue in California

And details the multiple impacts to biological resources:

> Due to increasing fire size, frequency, and susceptibility to beetle outbreaks and drought driven mortality, forest biodiversity and composition is changing rapidly. Changes in vegetation structure alter important aspects of fire regimes (e.g., magnitude, frequency, seasonality), and these changes affect the management of biodiversity, groundwater management, forestry, recreation, as well as human safety. Atypically large patches of high-severity fire can hinder the ability of an ecosystem to recover, potentially undermining conservation of native biodiversity by long-term or permanent loss of native vegetation, expansion of non-native, invasive species, and long-term or permanent loss of essential habitat for native fauna.[82]

[81] Graeme Shannon et. al., A synthesis of two decades of research documenting the effects of noise on wildlife, 2015, https://onlinelibrary.wiley.com/doi/abs/10.1111/brv.12207; see also the research of Colorado State University's Sound and Light Ecology Team, https://sites.warnercnr.colostate.edu/soundandlightecologyteam/publications/

[82] CA Department of Fish and Wildlife Science: Wildfire Impacts, 2022, https://wildlife.ca.gov/Science-Institute/Wildfire-Impacts

Wildfire, just last year, passed through portions of the Centennial site.[83] Other, larger, recent fires, such as the River Fire threatened the city of Grass Valley and the area where this project is proposed.[84] Over the projected lifetime of this project, the likelihood of wildfire or prescription burning is close to 100%. Yet, the DEIR does not incorporate any discussion of the risk, the probability, and the impact of fire to the project or to the biological impacts created by the project. Why is this? Does the DEIR assert that increasing impacts of wildlife do not interact or influence impacts required to be considered by CEQA? The governor's recently created California Wildfire and Forest Resilience Task Force in January of 2021 published its *California's Wildfire and Forest Resilience Action Plan*. In it, clear guidelines are set forth that this DEIR needs to consider, follow, and analyze:

- Does this proposed project contribute to "restoring the health of our forests?"
- Does this proposed project "protect and expand urban canopy and forests?"
- Does this proposed project "increase prescribed fire?"
- Does this proposed project increase fuel breaks, protect wildfire-prone homes and neighborhoods, improve utility-related wildfire risk, create fire-safe roadways, reduce health impacts of smoke?"
- Does this proposed project "utilize best available science…to expand and improve monitoring?"[85]

The challenges are immense, but existential for California, for its communities and for its biological resources. The DEIR needs to fully address the cumulative impacts of these challenges over the lifetime of this project. Why has the DEIR not done this? How can this DEIR be considered complete without addressing these concerns?

80 years from now is the year 2102. Given the potential acceleration of climate change just to the year 2050, much less the turn of the next century, surely it is not only reasonable but imperative that this DEIR include an extended analysis of the impacts of increasing wildfire and prescribed burning, and the ways in which the potential impacts of this project could synergize or exacerbate impacts to biological resources.

Grp 31-74

## Final Comments

Based on the failure of this section of the DEIR to identify and account for impacts to biological resources and its inadequate proposals for mitigation we identify 5 areas of impact where the impact designation should be changed.

| Impact | DEIR's Proposed level of Significance | Actual potential level of significance |
|---|---|---|
| 4.4-1 Special Status Plant Species | LS | S |
| Does not adequately address impacts to Pine Hill Flannelbush and other species of special concern | | |
| 4.4-2 Special Status Wildlife Species | LS | S |
| Does not include or adequately address impacts to Monarch Butterfly, Yellow-breasted Chat, Willow Flycatcher, California Spotted Owl, and other species of special concern | | |
| 4.4-3 Riparian habitat, wetland or other sensitive natural community | LS | S |
| Does not address impacts to Centennial wetlands, to the full length of South Fork Wolf Creek, to the Brunswick Pond, to BMI, and to aquatic ecosystems downstream impacted by mine water discharge | | |
| 4.4-4 movement of native fish or wildlife | LS | S |
| Does not address movement of native fish along the full length of South Fork Wolf Creek | | |
| 4.4-6 Cumulative Impacts | LCC | CC |
| Does not address loss of forest or wildlife habitat, or cumulative impacts due to chronic stress for species, lowering of water table, air quality, noise, risk of system failure over time, wildfire, and climate change | | |

LS = Less Than Significant LCC = Less Than Cumulatively Considerable
S = Significant CC = Cumulatively Considerable[86]

[86] See table 2-1 in DEIR, Chapter 2, Executive Summary, pages 2-30 and following

**Grp 31-75**

Overall, this DEIR fails to consider biological resources as a whole, interconnected system of living parts, each dependent on the other, as well as on the complex of abiotic factors that make the integrity and resilience of the whole possible. Our comments have highlighted the many ways in which the details of the DEIR's data and analysis are incomplete and inadequate. However, it is the lack of regard for the cumulative, interconnected impacts that most stands out. We ask that this DEIR be recirculated so that its lack of data can be addressed, its omissions of biological resources corrected, its conclusions and analysis of impacts and mitigations rewritten. Most importantly, we ask that the biologists who engage in the writing of this DEIR truly consider the biological wholeness of what they study and make judgment upon. We are all part of an interconnected system of relations. We who live in this community are all of one watershed.

Sincerely,

Gary Griffith

## GROUP LETTER 31: JONATHAN KEEHN, WOLF CREEK COMMUNITY ALLIANCE

### Response to Comment Grp 31-1

This is an introductory comment and does not provide a comment on an environmental issue associated with the project. Comment noted.

### Response to Comment Grp 31-2

The commenter generally states the DEIR biological analysis was insufficient. Specific concerns are provided by the commenter in the following comments. Please see Master Response 30 - Technical Study Adequacy, and Responses to Comments Grp 31-3 to Grp 31-7 below.

### Response to Comment Grp 31-3

The commenter states that the DEIR improperly separates the Centennial cleanup project and therefore does not consider the current existing baseline at the Centennial site. Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

### Response to Comment Grp 31-4

The commenter asserts the upstream and offsite portions South Fork Wolf Creek were not analyzed nor considered for potential impacts, including movement of trout and other species. The DEIR, including Appendix F.7, identifies the onsite portion of South Fork Wolf Creek as perennial. The upstream portion of South Fork Wolf Creek is offsite and would not be impacted by the project.

Flows from offsite upstream drainage that flows through the existing onsite culvert were analyzed as part of the site drainage analysis when sizing the onsite detention basin. Preliminary Drainage Analysis (PDA) (Nevada City Engineering, 2019) was prepared and included as DEIR Appendix K.5. As described in DEIR Section 4.8.4, the PDA was peer reviewed by the County and potential impacts were analyzed in Impact 4.8-3. As stated in the conclusion to Impact 4.8-3:

> "The drainage analyses discussed above conclude that the project would not significantly alter the drainage patterns of the sites in a manner which would result in substantial erosion or siltation on- or off-site, nor substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site, nor create or contribute to runoff water which would exceed the capacity of existing stormwater drainage systems, nor impede or redirect flood flows. West Yost's independent peer review concurs with this conclusion." (DEIR page 4.8-75)

In addition, the DEIR biology and hydrology sections included analysis of treated water discharge into South Fork Wolf Creek. DEIR Impact 4.4-2 analyzed potential impacts to special status species that may use South Fork Wolf Creek and the surrounding habitat. DEIR Impact 4.4-3 considered potential impacts to the riparian habitat surrounding South Fork Wolf Creek. DEIR Impact 4.8-1 considered whether treated water discharge would degrade water quality standards. DEIR Impact 4.8-2 analyzed potential drawdown impacts to South Fork Wolf Creek resulting from dewatering. DEIR Impact 4.8-3 considered potential erosion and sedimentation impacts resulting from treated water discharge. As demonstrated above, impacts to South Fork Wolf Creek were considered and analyzed in the DEIR.

Please also see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 34 - Resident Fish, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

## Response to Comment Grp 31-5

The DEIR, and Appendix F.7, both identify the onsite pond as a historic man-made clay-lined pond that was associated with historic saw milling operations. The pond is a non-jurisdictional "water of the United States" but may be considered a "water of the State of California." Special-status species that may use the pond and surrounding habitat were considered in Impact 4.4-2. This impact was considered potentially significant but reduced to a less than significant level with mitigation. Mitigation covered a variety of special-status species and required preconstruction surveys, potential state and federal permitting, implementation of avoidance and protection measures, and preparation of management plans. Impacts to "waters" was considered in DEIR Impact 4.4-3. This impact was considered potentially significant but reduced to a less than significant level with mitigation. Mitigation included additional state and federal permitting and preparation of management plans.

## Response to Comment Grp 31-6

Please see Response to Comment 31-4 above. In addition, please also see Master Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 34 - Resident Fish, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

## Response to Comment Grp 31-7

The commenter asserts that species were misidentified or incompletely identified, and that the DEIR downplays potential presence of special-status species. However, the commenter does not specifically state which species they believe were mistaken or excluded. Please see Master Response 30 - Technical Study Adequacy, Master Response 31 - Rare Plants, Master Response 34 - Resident Fish, and Master Response 37 - Birds and Raptors.

## Response to Comment Grp 31-8

The comment generally states the mitigation measures in the DEIR are inadequate, and provides specific concerns in the following comments. Please see Responses to Comments Grp 31-9 to Grp 31-15.

## Response to Comment Grp 31-9

The commenter raises concerns that Mitigation Measure 4.4-1(a), which requires a habitat management plan for Pine Hill flannelbush impacts, does not contain sufficient detail regarding monitoring and success criteria. As explained in Appendix F.4, a maintenance and monitoring program is identified for transplanted Pine Hill flannellbush. Monitoring will occur every six months for the first two years. If transplantation does not meet success criteria, monitoring and maintenance will continue until those success criteria are achieved (see Appendix F.4, section 6.3.2). Irrigation is not prohibited by the DEIR, and could be utilized if determined necessary to ensure the success of transplantation. The monitoring and maintenance will continue until success criteria are achieved. If those success criteria cannot be achieved, the Mitigation Measure 4.4-1(a)(5) and the draft habitat management plan provides alternative maintenance transplantation measures to help achieve success criteria.

Mitigation measure 4.4-1(a) provides the requirements the management plan must include in order to be approved by the County and some of the performance and success criteria that should be included in the habitat management plan. Mitigation measure 4.4-1(a) is not intended, nor required, to have every detail of the habitat management plan, which is a separate document that was included in Appendix F.2 to the DEIR. The mitigation measures, consistent with the requirements of CEQA, provide clear standards, timeframes, and responsibility such that

mitigation measures can be enforced by the County. Follow up special-status plant species surveys were conducted the last two weeks of June 2022 within the project area, including areas impacted by the 2021 fire that occurred within the Centennial site, and flannelbush seedlings were documented growing in a very small portion of the area impacted by fire within the Centennial site. No other special-status plant species were identified within the areas impacted by fire or within the overall project site. Given the USFWS does not consider any flannelbush species in Nevada County to be the listed variety, an ESA consultation would not be required with the agency as part of the approval and permitting of the project. However, coordination with CDFW regarding the flannelbush will occur as part of the project regarding the implementation of Mitigation Measure 4.4-1(a). Notably, CDFW had no recommendations for further mitigation for the species as part of their DEIR comment letter dated April 4, 2022, which is evidence that the expert agency, CDFW, found the mitigation to be sufficient.

## Response to Comment Grp 31-10

Please see Master Response 37 - Birds and Raptors, regarding yellow-breasted chat and Willow flycatcher. The showy milkweed was identified on the project site but is not a listed plant and therefore not analyzed in the DEIR.

The CNDDB has only historically tracked overwintering sites for monarch butterfly, not breeding locations. As such, no monarch occurrences are documented within the 9 quad CNDDB review, nor is it included as unprocessed data within the 9 quad CNDDB search. The species has not been documented within the project site during the many site visits and wildlife surveys conducted between December 2018 through June 2022. The showy milkweed is not protected (has no CNPS status), but it was identified in both the Centennial and Brunswick sites during the 2019 botanical surveys. However, given the project sites are not located along a known monarch butterfly migration corridor and the species has not been mapped within the 9 quad CNDDB search, the species is considered to have a low potential to occur on the project site. Table 4.4-6 of the DEIR (page 4.4-35), is hereby revised to discuss the monarch butterfly and identify the potential for monarch butterfly occurrence onsite as low.

| Common and Scientific Name | Legal Status | Habitat Requirements | Potential for Species/Habitat Presence |
|---|---|---|---|
| **Monarch butterfly** *Danaus plexippus* | FC/-- | Monarch butterfly has not been documented within the CNDDB within 5 miles of either the Centennial Industrial Site or Brunswick Area. Neither site contains many milkweed plants, the host plant for the species. This species is of a Federal Candidate for listing under the ESA. | **Centennial Industrial Site and Brunswick Area** **Low.** The species was not identified within either area during the surveys conducted in 2018, 2019, and 2022. Both sites contain very few and scattered milkweed plants. Anecdotal evidence shows the species to have been previously documented within the greater Grass Valley area. It is unlikely to occur in the Centennial Industrial Site or Brunswick Industrial Site. |

Page 4.4-39 of the DEIR is also hereby revised to include additional discussion of monarch butterfly as set forth below:

Monarch butterfly (*Danaus plexippus*) – Federal Candidate for ESA Listing

The monarch butterfly has not been previously identified within five miles of the Centennial Industrial Site and Brunswick Area per an updated review of the CNDDB (CNDDB 2022); however, there is some anecdotal evidence that the species has been documented within the greater Grass Valley area (per iNaturalist). Per a review of iNaturalist, the species has never been documented within the Empire Mine State Historical Park located adjacent to the Brunswick Area; however, such websites are not peer reviewed scientifically or by state or federal biologists and should be considered anecdotal until additional documentation of the species are considered validated by state and/or federal biologists, or the scientific community. The species is considered a Federal Candidate for listing under the ESA and the USFWS maps the entirety of the United States as potential habitat for the species. The Centennial Industrial Site and Brunswick Area contain a few, scattered milkweed plants (the host plant of the monarch butterfly), but given the species was never documented within either the Centennial Industrial Site or the Brunswick Area during botanical and wildlife surveys, the species is considered to have a low probability of occurring within either the Centennial Industrial Site or the Brunswick Area.

The above changes are provided for clarification purposes, and do not alter the analysis, nor conclusions of the DEIR.

With regard to California spotted owl, please see Master Response 37 - Birds and Raptors. As discussed therein, in response to several public comments and information available on the Biogeographic Information and Observation System (BIOS) managed by CDFW, the Final EIR includes specific discussion of the California spotted owl (CSO) species. The California spotted owl is not listed as threatened or endangered in the federal Endangered Species Act (ESA) or the California State Endangered Species Act (CESA) but is rather referred to as a Species of Special Concern by CDFW, which do not require take permits for incidental take, but do require analysis under CEQA. The DEIR acknowledges that raptor nests and eggs are protected by Section 3503.5 of the California FGC, which states, “It is unlawful to take, possess, or destroy any birds in the order *Falconiformes* or *Strigiformes* (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by the code or any regulation adopted pursuant thereto.” Notably, the DEIR also acknowledged that the Brunswick site has suitable habitat for raptors (owls are a type of raptor), and included mitigation specifically for raptor and nesting bird species. (See Mitigation Measure 4.4-2(g).)

As identified in the BIOS database, a CSO nest was documented within the Brunswick Area in 2011. Three additional follow up surveys in 2012, 2016 and 2018 did not document the presence of a nest but did document the presence of a pair of CSO (in 2012 and 2016) and a single male CSO in 2018. Based on the information from BIOS, and to clarify the analysis provided in the DEIR on impacts to raptors, two surveys for presence and nesting status of California spotted owl were conducted by a qualified biologist pursuant to the United States Forest Service (USFS) protocol (1992) on the Brunswick site. California spotted owl callback surveys were conducted at two locations within the Brunswick Area on August 5, 2022 and then again on August 11, 2022. No CSO responded to any of the calls from either survey station either night (Please see Appendix I to this Final EIR for the Technical Memorandum for the Idaho-Maryland Mine Project – Brunswick Area California Spotted Owl Surveys and Assessment, August 2022).

Given the information obtained via BIOS 6, identifying four previous sightings of CSO on the Brunswick Site, Table 4.4-6 in the DEIR has been updated in Section 4.4 of the FEIR to include California Spotted owl by name, and to indicate that the potential for CSO nesting onsite is

Moderate, while potential for presence of transitory CSO onsite is High, as shown on the following page.

In addition, page 4.4-39 has been revised to include a species discussion of California spotted owl, as follows:

> California Spotted Owl (*Strix occidentalis occidentalis*) – CA State Species of Concern
>
> California spotted owl have been previously identified within five miles of the Centennial Industrial Site and Brunswick Area, including a location potentially within the border area of the southwestern section of the Brunswick Area and adjacent to the Empire State Historic Park border (CDFW BIOS 2022). The Brunswick Area is generally considered wintering habitat for the California spotted owl and suitable nesting sites for the species are generally considered to be located to the east of Brunswick Road (see CDFW BIOS 2022 habitat mapping for the species). The individuals identified within the southwestern section of the Brunswick Area could be individuals that have moved in from nesting sites outside the Brunswick Area, including the Empire State Mine Historic Park where a pair of California spotted owls have previously been identified (State Parks, 2009). Surveys conducted within the Brunswick Area forested habitat for the project in December 2018, January 2019, and July 2019 did not identify the presence of the species when reconnaissance-level biological resources surveys were conducted for special-status wildlife species. In addition, on August 5, 2022, a raptor biologist with previous experience conducting USDA Forest Service protocols for surveying the California spotted owl did not identify the presence of the species when amplified calls of the California spotted owl were conducted from two (2) locations within the southwestern and western sections of the Brunswick Area (see USFWS 1992 for protocol for the presence, absence, and nest sites for the California spotted owl).
>
> California spotted owl inhabits older, closed canopy forests and forages for prey that require woody debris and understory vegetation for cover. The species nests in cavities of trees and snags. To accurately document the location of a California spotted owl nest, USDA as part of their protocol for the California spotted owl, includes both the identification of a pair of owls and documenting the female in the nest or a male bringing a prey item (usually a mouse placed by the observer) back to a female in the nest. A sighting and/or call back of an individual, pair, and/or juvenile California spotted owl does not reflect that the species is nesting at that exact location given a California spotted owl territory can be quite large (mean up to 946 to 1,520 acres in the Tahoe Nation Forest, see Roberts 2017). The USFWS (1992) protocol for determining whether nesting is confirmed at a location includes that the following conditions are observed:
>
> - Two observations, at least 1 week apart, are required to determine nesting status if the first observation occurs before 1 May. This is necessary because the owls may show signs of initiating nesting early in the season without actually laying eggs and their behavior could easily be mistaken for nesting behavior.
> - After 1 May, a single observation is sufficient. Nesting is confirmed if, on 2 visits before 1 May, or 1 visit after 1 May several additional parameters are met.

| Common and Scientific Name | Legal Status[1] | Habitat Requirements | Potential for Species/Habitat Presence |
|---|---|---|---|
| **California spotted owl** *Strix occidentalis occidentalis* | --/SSC | California spotted owl inhabits older, closed canopy forests and forages for prey that require woody debris and understory vegetation for cover. The species nests in cavities of trees and snags. | **Centennial Industrial Site** **None**. Suitable habitat for the species is absent. **Brunswick Area** **Moderate potential for CSO nesting, and High potential for transitory CSO**. Brunswick Industrial Site contains habitat within the southern section of the site. The species has been previously documented within that area along the border of the site with the neighboring parcel. Species documented in 2011, 2012, 2016, and 2018, but the species was not identified within the site during the surveys implemented in December 2018, early January 2019, July 2019, or August 2022. A nest has not been seen onsite since 2011. Further, the two protocol surveys conducted in 2022 did not identify any CSO onsite. Therefore, the potential for CSO nesting onsite is Moderate, while the potential for CSO that may be moving through the site or foraging onsite is High. |

The observer that documented the California spotted owls within the southwestern section of the Brunswick Area on April 28, 2011 stated that the sighting's highest use could be a nest and that a single young was also sighted on that day. Follow up surveys for the California spotted owl within the southwestern section of the Brunswick Area were conducted in May 2012 and in April 2016, when a pair of owls was documented within the same general location each time, but nesting was not listed as the highest level of use, just use by a pair of owls was listed. Furthermore, in 2018 (no date or month was given), a single resident California spotted owl was documented in the same general area in the southwestern section of the Brunswick Area and was considered a resident and not part of a pair.

Therefore, given there is no additional information to confirm the site was an active nest in 2011 (no confirmation of a female within the nest or confirmation of male bringing prey to an active nest with a prey item like a mouse), and given that a required follow up survey was not conducted by the observer at least 7 days after the initial documentation of the owls at this location since the initial documentation occurred in April 2011 (per the USFWS 1992 protocol), it is inaccurate to call this location a nesting site. Based on the site visits in late 2018, early 2019, and summer 2019, which did not identify the area within the southwestern section of the Brunswick Area as suitable nesting habitat for the species given a lack of required snags, etc. within that section of the Brunswick Area, it is quite likely that a single resident or pair of California spotted owl that live within the Empire State Historic Mine Park use the forested area of the southwestern section of the Brunswick Area for potential foraging and overwintering.

*Centennial Industrial Site:* No potential suitable habitat for this species occurs within the Centennial Industrial Site.

*Brunswick Area:* The potential for this species to occur within the forested areas within the southwestern and western sections of the Brunswick area is considered high. This area represents wintering and foraging habitat for the species and it is highly unlikely the species uses the area for nesting given the lack of snags and open areas within the ground that is required for foraging when nesting. Given that any vegetation to be removed within the southwestern and western forested areas of the Brunswick Area would occur between September and January, there is no likelihood for this species to be impacted, given that if present, they would fly away during the removal of such vegetation.

Chapter 7, references of the DEIR is also hereby revised to add the following citations:

U.S. Fish and Wildlife Service (USFWS). 1992. Protocol for Surveying Proposed Management Activities That May Impact Northern Spotted Owls.

State of California. 2009. Addendum and Final Initial Study and Mitigated Negative Declaration Osborne Hill Trail Network Project State Clearinghouse #2008112086 (within the Empire Mine State Historic Park). Department of Parks and Recreation, Sacramento, California (January 2009).

Roberts, S.L. 2017. Chapter 3: California Spotted Owl Habitat Characteristics and Use. In USDA Forest Service General Technical Report PSW-GTR-254: The California Spotted Owl Current State of Knowledge.

As discussed in Master Response 37, the DEIR already acknowledges that raptor nests and eggs are protected by Section 3503.5 of the California FGC, which states, "It is unlawful to take, possess, or destroy any birds in the order *Falconiformes* or *Strigiformes* (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by the code or any regulation adopted pursuant thereto." Notably, the DEIR also acknowledged that the Brunswick site has suitable habitat for raptors (owls are a type of raptor), and included mitigation

specifically for raptor and nesting bird species. For clarification purposes, Mitigation Measure 4.4-2(g) has been revised as shown in Master Response 37.

The above changes amplify the existing discussion of raptors in the DEIR, for which mitigation has already been included, and do not alter the conclusions of the DEIR, which remains less than significant with implementation of mitigation measures.

## Response to Comment Grp 31-11

Please see Response to Comment Grp 31-4 above.

## Response to Comment Grp 31-12

The commenter states that the DEIR should focus on Benthic Macroinvertebrates, but does not provide any specific comment on how the project could have an adverse impact. Please see Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 34 - Resident Fish, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependant Vegetation, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog. CDFW conducted a thorough review of the DEIR and submitted a comment letter on the DEIR (letter dated April 4, 2022). CDFW also conducted electrofishing within three stretches of the South Fork Wolf Creek to identify native fish populations downstream of the proposed discharge (Memorandum report dated March 23, 2022). CDFW did not make any comments on the project's potential impacts to BMI and they only identified two non-native fish species downstream of the proposed discharge point within the Brunswick site. CDFW is concerned with impacts to riparian vegetation and fish and amphibian populations downstream, but did not mention BMI as a concern in either their comment letter or electrofishing Memorandum.

There are no US EPA water quality criteria for the protection of aquatic life for electrical conductivity, total dissolved solids, and sulphate (See page D-34 of Order R5-2022-0006). However, the secondary MCL for Electrical conductivity of 900 umhos/com is the recommended level for the protection of agricultural supply by the Central Valley Water Board (See page D-34 and D-35 of Order R5-2022-0006). As discussed on page 4-5 of Appendix K.4, electrical conductivity (EC) is associated with Total Dissolved Solids (TDS). Appendix K.2 listed EC values for the New Brunswick Shaft water as approximately 385 µS/cm. The mobilized divalent ions from the carbonate and sulfide minerals would add to that specific conductance, although it would require significant contributions of Ca, Mg, and SO4 to surpass the NPDES CAG995002 screening level of 900 uS/cm. However, if treatment is deemed necessary for TDS mitigation at some point during mining operations through required water quality monitoring (see Mitigation Measure 4.8-1(a)), it is Linkan's opinion that mobile ion exchange water softeners should be deployed as compared to building additional permanent infrastructure that may not be needed or only needed for relatively short periods. These mobile units are readily available, and various vendors offer the service of replacing them as necessary as the resin becomes spent and in need of regeneration. Additionally, the resins used for these constituents are common throughout the industry for softening water and do not pose a health or environmental risk. Therefore, the proposed water treatment plant is capable of ensuring that conductance of discharged mine water meets water quality goals and the required Notice of Applicability would ensure compliance (see Master Response 35 – Discharge to South Fork Wolf Creek). The Project Applicant must adhere to the NPDES discharge limits within South Fork Wolf Creek, which would minimize any potential impact to downstream aquatic resources.

## Response to Comment Grp 31-13

As discussed in DEIR Impact 4.4-2, special-status species impacts, including potential loss of habitat, was already analyzed. This impact was considered potential significant, and the DEIR requires preconstruction surveys for species, even species not observed onsite during surveys, prior to surface disturbance.

DEIR Impact 4.4-2 considered impacts to birds, raptors, and migratory birds and determined this impact was potentially significant. Mitigation measures, including Mitigation Measure 4.4-2(g) (requiring pre-construction surveys for raptors and migratory birds) were required to reduce this impact to a less than significant level. The commenter asserts that it is problematic that nesting habitat may be removed after a nest is no longer occupied but does not explain how that would result in significant impacts to a special-status species. Please see Master Response 37 - Birds and Raptors.

## Response to Comment Grp 31-14

The commenter suggests that compensatory mitigation or payment of in-lieu fees is not a reasonable mitigation strategy. However, these mitigation strategies are widely used and accepted. Mitigation Measure 4.4-3(c & d) provides a series of compensatory mitigation options that will be negotiated during the section 404 and 1600 permitting process, and the Corps and CDFW will require mitigation based on its established mitigation ratios, which are usually greater than 1:1. The mitigation option identified and ratios at which mitigation is required is based on consultation and approval by state and federal agencies involved in the permitting process. For clarification, Mitigation Measures 4.4-3(c & d), on page 4.4-91 of the DEIR, shall be revised to reflect that the minimum mitigation ratio for compensatory mitigation shall be 1:1, and higher ratios may be implemented if required by the agency issuing the respective permit. The revised language of Mitigation Measures 4.3-3(c) and 4.4-3(d) is set forth below:

*4.4-3(c)* *To the extent feasible, as determined by the qualified biologist in coordination with the Corps, the project shall be designed to avoid and minimize adverse effects to waters of the U.S. or jurisdictional waters of the State of California within the project area. Prior to initiation of ground-disturbing activities, a Section 404 permit for fill of any jurisdictional wetlands within the Centennial Industrial Site and Brunswick Area shall be acquired, and mitigation for impacts to jurisdictional waters that cannot be avoided shall conform with the Corps "no-net-loss" policy, be provided at a minimum 1:1 ratio and be based on the final impact acreages verified by the Corps. Mitigation for impacts to both federal and State jurisdictional waters shall be addressed using these guidelines. Compensatory mitigation can include but is not limited to the following: onsite and/or offsite wetland creation and/or restoration, purchase or placement of conservation easements, payment of an in-lieu fee, and/or purchase of mitigation credits at an approved Corps wetland mitigation or conservation bank.*

*The applicant must also obtain a water quality certification from the RWQCB under Section 401 of the Clean Water Act (CWA). Written verification of the Section 404 permit and the Section 401 water quality certification shall be submitted to the Nevada County Planning Department.*

*4.4-3(d)* *Prior to initiating of ground disturbing activities within the non-disturbance buffers for aquatic resources on the Centennial Industrial Site and Brunswick Area, the applicant shall apply for a Section 1600*

> *Lake or Streambed Alteration Agreement from CDFW. Impacts to CDFW 1600 jurisdictional areas shall be outlined in the application and are expected to be in substantial conformance with the impacts to biological resources outlined in this EIR (see Tables 4.4-9 through 4.4-11). Impacts for each activity shall be broken down by temporary and permanent, and a description of the proposed mitigation for biological resource impacts shall be outlined per activity and then by temporary and permanent. Minimization and avoidance measures within jurisdictional areas shall be proposed as appropriate and may include: preconstruction species surveys and reporting, protective fencing around avoided biological resources, worker environmental awareness training, seeding disturbed areas immediately adjacent to riparian areas with native seed, and installation of project-specific storm water BMPs. Mitigation may include restoration or enhancement of jurisdictional resources on- or off-site, purchase of habitat credits from an agency-approved mitigation/conservation bank, off-site or on-site conservation easements, working with a local land trust to preserve aquatic or riparian areas, or any other method acceptable to CDFW. Mitigation shall be provided at a minimum 1:1 ratio.*
>
> *A site revegetation plan would be required to be developed and approved by CDFW as part of a Streambed Alteration Agreement permit condition and native trees planned for removal with a diameter at breast height of 4 inches or greater would need to be mitigated for through planting of native riparian trees within adjacent stream zones not being impacted by the Idaho-Maryland Mine Project, with clear success criteria identified, monitoring and reporting required, and corrective actions to be taken if mitigation measures do not meet the proposed success criteria.*
>
> *Written verification of the Section 1600 Lake or Streambed Alteration Agreement shall be submitted to the Nevada County Planning Department.*

The above minor changes are for clarification purposes and do not affect the adequacy of the analysis contained in the DEIR.

## Response to Comment Grp 31-15

The commenter states that the DEIR mischaracterizes the degree and extent of the disturbance to South Fork Wolf Creek setbacks. As analyzed in DEIR Impact 4.4-3, encroachment into the South Fork Wolf Creek 100-foot setback is necessary for the replacement of the deteriorated culvert currently outfalling into South Fork Wolf Creek, existing clay-lined pond repair activities, and installation of the treated water pipeline discharge. These are necessary project components, so avoidance of this setback is not feasible. As such, this encroachment was considered a potentially significant impact. Mitigation measures have been required, including additional agency permitting (Mitigation Measure 4.4-3(a, c, & d) and preparation of a management plan (Mitigation Measure 4.4-3(b), and the impact has been determined to be less than significant after mitigation. The commenter does not explain its statement that the encroachment is mischaracterized.

## Response to Comment Grp 31-16

The commenter generally states that the DEIR did not adequately analyze cumulative impacts of the project, due to the interconnected nature of the environment and the changing environment

due to climate change. With regard to climate change, there is no consensus on how climate change will affect groundwater recharge and numerous other areas of concern, so analysis based on varying climate change predictions would be speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As analysis of climate change scenarios, when there is no consensus on how climate change will affect the project site, would be speculation, this analysis is not required by CEQA. Further the DEIR already analyzes varying climate conditions such as large storm events and multiple drought year scenarios, so the analysis already is responsive to the commenter's concerns. Please see Master Response 16 – Drought and Climate Change.

## Response to Comment Grp 31-17

The commenter states that the DEIR does not address the loss of forest land and stresses on forests. As discussed in Section 4.2.1, Existing Environmental Setting (subsection Forest Resources), the project site is not zoned for forest land or timberland uses. The project site does have lands meeting the definition of forested land (10 percent or more of native tree cover) and timberland (available for, or capable of, growing a crop of trees). (See DEIR, p. 4.2-9.) As noted in Impact 4.2-3, the amount of forest and timberland converted by this project is insignificant compared to the available forest and timberland resources in the County and Statewide. For example, the conversion of 25 acres within the project site is approximately 35% of the resources within the project site, and less than 1/10 of 1 percent of the County forestlands per the General Plan. The DEIR correctly concluded this impact is less than significant. (See DEIR Impact 4.2-3.)

## Response to Comment Grp 31-18

The commenter asserts that the DEIR does not address potential cumulative impacts of impaired air quality on forests, meadows, wetlands and associated species. The DEIR analyzed cumulative air quality impacts on pages 4.3-91 to 4.3-92 and determined that impacts would be less than cumulatively considerable. Please see Master Response 18 – Air Quality Thresholds and Master Response 27 – Greenhouse Gas Thresholds.

## Response to Comment Grp 31-19

The commenter asserts that the DEIR does not consider the loss of habitat for special-status species, present or potentially present, to be an impact. However, as discussed in DEIR Impact 4.4-2, special- status species impacts, including potential loss of habitat, was already analyzed. This impact was considered potentially significant and required preconstruction surveys for species, even species not observed onsite during surveys, prior to surface disturbance. (See Mitigation Measures 4.4-1(a-b), 4.4-2 (a-g), and 4.4-3(a-d).)

## Response to Comment Grp 31-20

The commenter states that the DEIR incorrectly considers the net loss of wetland within the Wolf Creek headwaters as acceptable mitigation. However, as discussed on page 4.4-95 of the DEIR, Mitigation Measure 4.4-3(c) would require that the proposed project conform with the Corp's "no-net-loss" policy for wetland mitigation. Thus, any wetlands lost within the project area must be compensated through the protection of existing wetlands, avoidance of wetland impacts, or creation of new wetland habitat elsewhere. Please see Response to Comment Grp 31-4.

## Response to Comment Grp 31-21

The commenter states that the DEIR does not adequately consider cumulative impact of mine water discharge or failure of water treatment or water retention at the Brunswick site. Cumulative water quality impacts were already analyzed in Impact 4.8-7 of the DEIR. Please see Master

Response 36 - Flows in South Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts.

The water treatment facility will be subject to multiple permits regulating discharge of treated water into South Fork Wolf Creek, including monitoring of water quality. (See Mitigation Measure 4.8-1(a).) In the event of accident or unforeseen conditions, the operator would be subject to enforcement actions, and potential agency fines and penalties.

The water treatment pond is an existing site feature with a 40-acre foot capacity. See DEIR Impact 4.8-3 which analyzes the capacity of the water treatment pond and determines that sufficient capacity exists based on the storm events modelled. See also Appendix K.5 detailing Brunswick Industrial Site drainage and stormwater facility sizing. The clay-lined pond does not discharge and is designed to retain sufficient freeboard not to overtop (see page 4.8-73 of the DEIR).

## Response to Comment Grp 31-22

The commenter asserts that the DEIR does not analyze the impact of decreased groundwater in the meadow/grassland reach of SFWC or other projected impact areas of the watershed. Please see Master Response 33 - Groundwater Dependent Vegetation; and see Itasca Memo – Simulated Drawdown of Selected Meadows attached to the Final EIR as Appendix H.

## Response to Comment Grp 31-23

The commenter asserts that the DEIR does not consider the need to monitor the existing mine seeps on the main stem of Wolf Creek for dewatering impacts. However, the DEIR analyzed dewatering impacts and these impacts were determined to be less than significant after mitigation. Once mine dewatering commences, flow from the mines drains along Idaho-Maryland Road would cease and no monitoring of the existing mine seeps would be possible. (See DEIR, p. 4.8-66.)

## Response to Comment Grp 31-24

The commenter asserts that the DEIR does not address the impact to overall development impacts from changing the land use zoning designation. DEIR Chapter 4.9, Land Use and Population and Housing, addresses potential project conflicts with applicable County General Plan land use goals and policies and zoning code requirements. DEIR Section 4.9.2 identified the applicability of Nevada County Ordinance No. 1853 creating the SP zoning district and that the Brunswick Industrial Site was designated M1-SP (see Table 4.9-2 and Figure 4.9-2). As discussed in DEIR Project Description, section 3.8, the applicant has requested a rezone to the parcels located at the Brunswick Industrial Site from M1-SP to Light Industrial with Mineral Extraction Combining District (M1-ME). The project does not propose to rezone the land to M2 (heavy industrial) and such a rezone is not required for the land use proposed for the project.

As such, land use impacts were analyzed in Chapter 4.9 of the DEIR, and the DEIR specifically analyzed the requested rezone from M1-SP to Light Industrial with Mineral Extraction Combining District. The DEIR concluded that land use impacts would be less than significant. Please see Master Response 1 - Non-EIR/ Administrative Issues regarding quality-of-life concerns.

## Response to Comment Grp 31-25

DEIR impact 4.4-2, subsection Wildlife Disturbance, addressed potential noise and nighttime lighting impacts on wildlife populations and found the potential impact less than significant.

## Response to Comment Grp 31-26

DEIR Chapter 4.13 addressed the potential for wildfire. DEIR impact 4.13-2 (wildfire) was identified as potentially significant given vegetation that would not be removed surrounding both sites and the use of hydrocarbon-powered equipment. Mitigation Measure 4.13-2 requires the preparation of a vegetation management plan for review and approval by the County Fire Marshall reducing this impact to a less than significant level.

## Response to Comment Grp 31-27

The commenter summarizes the comments Grp 31-16 to Grp 31-26 and states that a new DEIR must be prepared and recirculated. The commenter's specific comments are addressed in Responses to Comments Grp 31-16 to Grp 31-26 above. The commenter has not identified a new significant impact that was not addressed in the DEIR; therefore, recirculation is not required. Comment noted.

## Response to Comment Grp 31-28

The commenter asserts that the DTSC cleanup project should be analyzed as part of the DEIR so that the existing baseline of the Centennial Site can be analyzed with respect to project impacts. Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

## Response to Comment Grp 31-29

DEIR Chapter 4.4, subsection 4.4.2, provides a detailed characterization of the vegetation communities within the Centennial Industrial Site based on extensive technical studies. Please see Master Response 30 - Technical Study Adequacy. As outlined in DEIR subsection 4.4.2, eight different vegetation communities were identified onsite based on site surveys. These individual vegetation communities were described in the DEIR, including fresh emergent marsh wetland and wet meadow, and the DEIR included descriptions of the special-status species that may occupy these communities. The intent of these descriptions was to provide a general overview of the vegetative community and the special-status species that may utilize this vegetative community and potential impacts that may occur as a result of surface disturbance to this community. Note that white brodiaea and showy milkweed mentioned by commenter are not special-status species.

## Response to Comment Grp 31-30

The commenter states that the DEIR provides an inaccurate hydrological assessment of the Brunswick site, ignoring the connectivity of the South Fork Wolf Creek upstream and downstream of the culvert on the Brunswick property, along with the movement of trout and other species. Please see Response to Comment Grp 31-4 and Master Response 34 - Resident Fish.

Previous permitting of the culvert installation and NID spill easement are not environmental issues required to be analyzed in the DEIR for this project.

## Response to Comment Grp 31-31

The commenter asserts that the DEIR considers the clay-lined pond to not be an aquatic resource, disregarding impacts on its biological resources. Biological impacts relating to the project's use of the clay-lined pond were addressed in DEIR Section Impact 4.4-3. Please see Response to Comment Grp 31-5.

As stated on page 4-2 of Appendix F.7 of the DEIR, a historic man-made clay lined pond (PD-1) associated with historic saw milling operations does not have a direct outlet or connection to the South Fork Wolf Creek. PD-1 contains a 2-foot clay liner to limit any potential infiltration and receives its water mainly from surface runoff and precipitation. PD-1 is a man-made pond used historically as a recycling pond for site runoff containment and log watering during mill operations.

As stated on page 4.8-30 of the DEIR, the clay-lined pond, constructed in the 1980s, for the former Bohemia Lumbermill, was permitted by the RWQCB through WDRs as a Class II Designated Waste Management Unit, under former Title 23 of the CCR, Subchapter 15, Section 2532. According to the WDRs (Order No. 88-185 for Bohemia Incorporated Grass Valley Mill), the pond was to be lined with a two-foot-thick clay layer having a permeability not to exceed 1x 10-6 cm/s. Vector Engineering found that the "clay liner system was constructed in substantial accordance with the SWRCB Title 23, Subchapter 15, Section 2532 regarding construction of the natural liner system for Class II Designated Waste Management Units." Due to the very low permeability of the existing liner, water contained in the pond does not infiltrate into and support the adjacent wetland meadow.

## Response to Comment Grp 31-32

The commenter asserts that the clay-lined pond is a jurisdictional water of the U.S. and must be protected. However, the clay-lined pond is a man-made industrial pond that was created for industrial use and is not connected to South Fork Wolf Creek. Biological impacts relating to the project's use of the clay-lined pond were addressed in DEIR Section Impact 4.4. Please see Response to Comment Grp 31-5.

## Response to Comment Grp 31-33

The offsite stream reach (Reach C) referenced by the commenter is outside the project site and will not be subject to project-related surface disturbance. However, potential downstream effects of the project were evaluated in the DEIR. Please see Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 34 - Resident Fish, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependant Vegetation, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

## Response to Comment Grp 31-34

See Response to Comment Grp 31-33 above.

## Response to Comment Grp 31-35

The commenter states that the DEIR contains insufficient observation over time of stream flow. However, the DEIR contains voluminous baseline surface water quality data, including flow of relevant streams. The baseline surface water quality data are described within DEIR Section 3.4.1.2 and presented in Tables 3.5 through 3.10 of Appendix K.2 of the DEIR. The baseline data include results from samples collected from the underground workings, from drains that discharge water from the underground workings, from Wolf Creek, and from South Fork Wolf Creek. The results include field parameters, general water chemistry parameters, and metals. In particular, Table 3-8 of Appendix K.2 contains pH, temperature, dissolved oxygen (DO), electrical conductivity, and oxidation-reduction potential (ORP) measurements from three locations along South Fork Wolf Creek and two locations on the former SPI site that discharge to South Fork Wolf Creek. Table 3-8 of Appendix K.2 presents laboratory analytical results for 18 general water chemistry parameters and 19 different metals from two samples collected along South Fork Wolf Creek at locations that will be upstream and downstream of the proposed treated water discharge location.

Table 3-10 of Appendix K.2 provides field measurements of flow, temperature, specific conductance, pH, and turbidity for two locations (upstream and downstream) along South Fork Wolf Creek measured during five different storm flow conditions, including summer baseflow, early-season post-storm (comparable to first-flush) flows, winter baseflow, rising flows during a

"qualifying rain event" of 1.25 inches, and peak flows during the same "qualifying rain event". Additional details regarding flow conditions and baseline water quality conditions in South Fork Wolf Creek are also provided in Appendix K.1 of the DEIR.

Further analysis of the baseline water quality data is provided in Section 3.4.2 of Appendix K.2 of the DEIR. In particular, data from South Fork Wolf Creek are presented on Figures 3-12 and 3-19 of Appendix K.2 of the DEIR, while the baseline data from the underground workings, drains, and Wolf Creek are presented on Figures 3-12 through 3-18 of Appendix K.2 of the DEIR.

## Response to Comment Grp 31-36

The commenter asserts that stream data for South Fork Wolf Creek presented in the DEIR is insufficient. Please see Response to Comment Grp 31-35 above.

## Response to Comment Grp 31-37

The commenter asserts that the DEIR contains inadequate study and characterization of mine water discharge, stream flow, sedimentation, stream velocity profiles, loss of seasonality and loss of streambed or bank habitat. Please see Response to Comment Grp 31-35 above and Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, and Master Response 32 - Temperature of Mine Water Discharge.

## Response to Comment Grp 31-38

The commenter asserts that the DEIR failed to address impacts to the SFWC and associated species in stream reach D that runs through Empire Mine State Park. Please see Response to Comment Grp 31-4, Responses to Comment Letter Agcy 1, Master Response 30 - Technical Study Adequacy, Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 34 - Resident Fish, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependant Vegetation, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

It is acknowledged and analyzed in the DEIR impact analysis (see Section 4.4.4) that species exist within the project site that are common to the area. Potential impacts to these species were analyzed and mitigation measures have been provided where it was determined impacts to species could occur as a result of project activities, including the implementation of preconstruction surveys and agency permitting requirements. The only migratory species acknowledged by the County General Plan is deer migration corridors. Per the Migratory Deer Ranges Nevada County General Plan map, the project site is located in an area of potential Deer Winter Range. Although this map dates from 1991, that is the most recent map for the local deer range that CDFW has published. The project site does not contain any known major deer migration corridors, known deer holding areas, nor critical deer fawning areas. Any deer within or adjacent to the project site would move outside the project site to the remaining forest surrounding the site and would be uninhibited to move into and out of the project site and the areas outside the project site. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded it less than significant.

## Response to Comment Grp 31-39

The commenter states that the DEIR should focus on Benthic Macroinvertebrates, but does not provide any specific comment on how the project could have an adverse impact. Please see Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 34 - Resident Fish, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependant Vegetation, and Master

Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog. CDFW conducted a thorough review of the DEIR and submitted a comment letter on the DEIR (letter dated April 4, 2022). CDFW also conducted electrofishing within three stretches of the South Fork Wolf Creek to identify native fish populations downstream of the proposed discharge (Memorandum report dated March 23, 2022). CDFW did not make any comments on the project's potential impacts to BMI and they only identified two non-native fish species downstream of the proposed discharge point within the Brunswick site. CDFW is concerned with impacts to riparian vegetation and fish and amphibian populations downstream, but did not mention BMI as a concern in either their comment letter or electrofishing Memorandum. The Project Applicant must adhere to the NPDES discharge limits within South Fork Wolf Creek, which would minimize any potential impact to downstream aquatic resources.

## Response to Comment Grp 31-40

Please see Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 34 - Resident Fish, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependant Vegetation, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog, regarding the impacts to fish, discharge flow volumes, temperature, and quality, potential for erosion, and species impacts. There are no US EPA water quality criteria for the protection of aquatic life for electrical conductivity, total dissolved solids, and sulphate (See page D-34 of Order R5-2022-0006). However, the secondary MCL for Electrical conductivity of 900 umhos/com is the recommended level for the protection of agricultural supply by the Central Valley Water Board (See page D-34 and D-35 of Order R5-2022-0006). As discussed on page 4-5 of Appendix K.4, electrical conductivity (EC) is associated with Total Dissolved Solids (TDS). Appendix K.2 listed EC values for the New Brunswick Shaft water as approximately 385 µS/cm. The mobilized divalent ions from the carbonate and sulfide minerals would add to that specific conductance, although it would require significant contributions of Ca, Mg, and SO4 to surpass the NPDES CAG995002 screening level of 900 uS/cm. However, if treatment is deemed necessary for TDS mitigation at some point during mining operations through required water quality monitoring (see Mitigation Measure 4.8-1(a)), it is Linkan's opinion that mobile ion exchange water softeners should be deployed as compared to building additional permanent infrastructure that may not be needed or only needed for relatively short periods. These mobile units are readily available, and various vendors offer the service of replacing them as necessary as the resin becomes spent and in need of regeneration. Additionally, the resins used for these constituents are common throughout the industry for softening water and do not pose a health or environmental risk. Therefore, the proposed water treatment plant is capable of ensuring that conductance of discharged mine water meets water quality goals and the required Notice of Applicability would ensure compliance (see Master Response 35 – Discharge to South Fork Wolf Creek).

## Response to Comment Grp 31-41

The commenter asserts that the DEIR contains errors in identification of species, typographical errors and incomplete identifications. As the DEIR contains thousands of pages of information, a small number of typographical errors can be expected, and as stated by California Courts, "[t]he need for thorough discussion and analysis is not to be construed unreasonably… to serve as an easy way of defeating projects. Absolute perfection is not required." (Laurel Heights Improvement Assn., supra, 47 Cal.3d at p. 406.). The project sites have been field checked many times by qualified biologists and botanists and a complete plant species list, including native plants, is included in the appendices of the DEIR. Please see Appendix F.2, F.6, F.9, F.11 of the DEIR and Master Response 30 - Technical Study Adequacy. The reference to Populus tremuloides is an

error in the report. Page 4.4-9 of the DEIR has been corrected in the FEIR as set forth below (additions in underline, deletions in ~~strikeout~~):

> The montane riparian in the placer diggings and areas created from earth movement are characterized by ~~black~~Fremont cottonwood (Populus ~~tremuloides~~ fremontii ssp. fremontii), red willow (Salix laevigata), arroyo willow (Salix lasiolepis), and occasionally ponderosa pine in the overstory.

The species of pine referred to on page 4-4-10 of the DEIR is Ponderosa Pine. Page 4.4-10 of the DEIR has been corrected in the FEIR as set forth below (additions in underline, deletions in ~~strikeout~~):

> The montane riparian vegetation along both sides of the South Fork Wolf Creek is dominated by white alder (Alnus rhombifolia), red willow (Salix laevigata), and arroyo willow (Salix lasiolepis), with other overstory species from adjacent vegetation types, including California black oak, Ponderosa pine and Douglas fir.

This minor error and clarification in species name in the DEIR and appendices does not affect the impact determination included in the EIR.

## Response to Comment Grp 31-42

The commenter notes that the California spotted owl is under review as an endangered species by the USFWS; however, the USFWS determined that listing was not warranted on 11/8/2019, and there are no pending listing petitions for the species. Please see Master Response 37 - Birds and Raptors.

## Response to Comment Grp 31-43

Please see Master Response 37 - Birds and Raptors, regarding the Yellow-breasted chat.

## Response to Comment Grp 31-44

Please see Master Response 37 - Birds and Raptors, regarding the Willow flycatcher.

## Response to Comment Grp 31-45

Please see Response to Comment Grp 31-10.

## Response to Comment Grp 31-46

Please see Master Response 30 - Technical Study Adequacy and Master Response 31 - Rare Plants.

## Response to Comment Grp 31-47

Please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog, regarding impacts to amphibian species.

## Response to Comment Grp 31-48

The commenter asserts that the DEIR did not adequately survey for presence of Western Pond Turtle, and does not consider loss of stream bank habitat due to higher stream levels, or properly protect turtle hatchlings. DEIR Impact 4.4-2 analyzed potential impacts to Western Pond Turtle and concluded a potentially significant impact may occur. Mitigation Measure 4.4-2(b) requires a preconstruction survey by a qualified biologist no more than seven days prior to proposed disturbance of perennial waters on the project site. While the project would discharge up to 5.6

cfs into South Fork Wolf Creek, peak flows from the site during storm events are expected to be lower than under baseline conditions due to the construction of a stormwater detention pond on the Brunswick site. As such, the peak flows are expected to be within or less than the same range as currently exist, resulting in a less than significant impact related to Western Pond Turtle habitat due to stream level (see DEIR Impact 4.8-3). Potential downstream impacts to the stream channel and associated riparian zone along both sides of South Fork Wolf Creek from the additional discharge of 5.6 cfs would be minimal on such sensitive biological resources and do not represent a potential significant impact to the stream channel or associated riparian zone within South Fork Wolf Creek (See page 9 of Appendix F.10 and Master Response 36 - Flows in South Fork Wolf Creek).

Please see Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, and Master Response 32 - Temperature of Mine Water Discharge regarding treated water discharge to South Fork Wolf Creek and the limited potential for impacts to the stream bank.

## Response to Comment Grp 31-49

The commenter asserts that the DEIR did not include bat surveys and did not consider the impacts of bat habitat loss. However, the DEIR (see Impact 3.4-4) conservatively concludes a potential impact to bat species despite determining bat species have a low likelihood of occurring onsite. Mitigation Measure 4.4-2(f) provides extensive detail regarding a required survey for bats that must occur prior to site disturbance, and specifically requires that surveys shall occur no more than seven days prior to surface disturbance. Mitigation Measure 4.4-2(f) also specifies reporting requirements if bats are not found, passive removal if bats are identified, and avoidance until breeding roots have dispersed. This mitigation measure allows for potential bats to be identified, prevented from returning to disturbance areas, and/or avoidance of bats to limit the potential for impact. As a result, this impact was considered less than significant following mitigation. The commenter also asserts that the DEIR does not analyze loss of woodland and riparian habitat; however, the DEIR acknowledges that "On the Brunswick Industrial Site, approximately 18.7 acres of forested areas (Montane Hardwood-Conifer, Montane Hardwood, Ponderosa Pine, and Sierran Mixed Conifer vegetation communities) would be disturbed and trees would require Removal … [and] [o]n the Centennial Industrial Site, up to approximately 5.3 acres of forested areas (Montane Hardwood-Conifer and Montane Hardwood vegetation communities) would be disturbed and trees would require removal." (DEIR p. 4.3-59.) Further, the DEIR acknowledges that the project could have significant impacts on riparian habitat and provides mitigation to reduce those potential impacts. (See DEIR, p. 4.4-87.) The project does not have a significant permanent impact on Riparian habitat, and the loss of approximately 24 acres of forested areas is insignificant compared to the acreage of forested lands within Nevada County. Accordingly, the project's impacts to forested lands and riparian habitats would not cause significant impacts to bats or bat habitat.

## Response to Comment Grp 31-50

The commenter asserts that Cooper's Hawk and Olive-sided Flycatcher could be impacted by the project and were not properly considered in the DEIR. Please see Master Response 37 - Birds and Raptors.

## Response to Comment Grp 31-51

The commenter asserts that more biological surveys need to be completed in order to identify every species that could potentially be on site. Identification of potential special-status species was based on a 5-mile radius search of the CNDDB database, site surveys by qualified local

biologists, and local knowledge of habitats and species that may occupy those habitats. Also, consistent with the County's independent biology expert's comments, the DEIR requires preconstruction surveys to identify species that may not have been identified on the project site as part of the DEIR process. Accordingly, the biology analysis was prepared by local experts, was peer reviewed by the County's independent expert, who found the analysis to be adequate after incorporation of that expert's revisions. Please see Master Response 30 - Technical Study Adequacy and Master Response 31 - Rare Plants.

## Response to Comment Grp 31-52

The commenter generally asserts that the biological resources analysis and mitigation is inadequate. The commenter's specific assertions are addressed below in Responses to Comments Grp 31-53 through Grp 31-62.

## Response to Comment Grp 31-53

The commenter raises concerns that Mitigation Measure 4.4-1(a), which requires a habitat management plan for Pine Hill flannelbush impacts, does not contain sufficient detail. Mitigation measure 4.4-1(a) provides the requirements the management plan must include in order to be approved by the County and some of the performance and success criteria that should be included in the management plan. Mitigation measure 4.4-1(a) is not intended, nor required, to have every detail of the management plan, which is a separate document. The mitigation measures, consistent with the requirements of CEQA, provides clear standards, timeframes, and responsibility such that mitigation measure can be enforced by the County. Follow up special-status plant species surveys were conducted the last two weeks of June 2022 within the project area, including areas impacted by the 2021 fire that occurred within the Centennial site, and flannelbush seedlings were documented growing in a very small portion of the area impacted by fire within the Centennial site. No other special-status plant species were identified within the areas impacted by fire or within the overall project site. Given the USFWS does not consider any flannelbush species in Nevada County to be the listed variety (as stated in their 2019 5-year review of the species), an ESA consultation would not be required with the agency as part of the approval and permitting of the project. However, coordination with CDFW regarding the flannelbush will occur as part of the project and the implementation of Mitigation Measure 4.4-1(a) should be adequate with the agency given they had no recommendations for further mitigation for the species as part of their DEIR comment letter dated April 4, 2022.

## Response to Comment Grp 31-54

Please see Response to Comment Grp 31-10. Please see Master Response 37 - Birds and Raptors, regarding Yellow-breasted Chat and Willow Flycatcher.

## Response to Comment Grp 31-55

Please see Response to Comment Grp 31-5.

## Response to Comment Grp 31-56

Please see Master Response 34 - Resident Fish. Please see Response to Comment Grp 31-12 regarding Benthic Macroinvertebrates. Please also see Master Response 36 - Flows in South Fork Wolf Creek, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 33 - Groundwater Dependant Vegetation, and Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog.

The proposed project will have no impact on migratory fish. As stated in the CDFW's Memorandum (dated March 23, 2022), which details electrofishing at three locations downstream of the Brunswick site, the areas upstream closest to the Brunswick site were found to have brown trout with poor body conditions. CDFW stated that ideal spawning and rearing habitats for brown trout, a non-native fish species in California, are located further downstream and that some fish may migrate up into the areas closer to the Brunswick site. The Brunswick site will not inhibit any movement of fish from below the project site to upstream of the project site given the stream will continue to flow from upstream, through the Brunswick site, and then downstream of the Brunswick site as it currently functions. As stated on page iii of Appendix H.1 of the DEIR, the existing culvert that conveys water through the Brunswick site appears to be approaching the end of its lifespan and is recommended for replacement. The replacement of this culvert by the proposed project will therefore improve fish passage, as the existing culvert is degraded, and could fail without replacement, which would sever connectivity and likely result in subsequent substantial erosion as the flow sought another path.

## Response to Comment Grp 31-57

The commenter asserts that the mitigation provided in the DEIR for special-status species is insufficient because it allows disturbance once the habitat is no longer occupied and does not consider avoidance. However, habitat for the special status species with a potential to occur onsite is not by itself protected by the California Endangered Species Act or Federal Endangered Species Act. Rather, the species themselves are protected and habitat for those species require protections only when occupied. However, Mitigation Measures 4.4-2(a), through 4.4-2(f) require consultation with the respective state or federal agencies for determination of appropriate avoidance and minimization measures. As discussed in DEIR Impact 4.4-2, special-status species impacts, including potential loss of habitat, was analyzed. This impact was considered potentially significant and the DEIR required preconstruction surveys for species, even species not observed onsite during surveys, prior to surface disturbance. In the event a special-status species is identified during preconstruction surveys, the mine operator is required to consult with state and/or federal agencies regarding how, where, when, and by whom those species can be relocated. Moreover, the County's independent biology expert reviewed the proposed mitigation measures and found the measures to be adequate to reduce impacts to a less than significant level.

## Response to Comment Grp 31-58

The Centennial site cleanup project is a separate project. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

The commenter suggests that compensatory mitigation or payment of in-lieu fees is not a reasonable mitigation strategy. However, these mitigation strategies are widely used and accepted. Avoidance of the onsite wetlands that are proposed to be removed is not feasible due to project design constraints and the need to use the clay-lined pond for water treatment purposes. As shown on Figure 4.4-4 of the DEIR, the Brunswick site has small artificial wetlands dispersed throughout the project area which have formed in depressions created by previous disturbance on the site. The retention of these wetlands (MA-1, MA-2, MA-3, MA-4, MA-5, MA-6, WM-A, WM-2, WM-3, RI-4) would prevent the construction of most of the proposed buildings, the storm water detention pond, and the engineered fill pile and therefore would be infeasible. Large natural wetlands (WM-3, RI-2, and RI-3) are preserved by the project design. Mitigation Measure 4.4-3(c & d) provides a series of compensatory mitigation options that will be negotiated during the section 404 and 1600 permitting process. The mitigation option identified and ratios at which mitigation is required is based on consultation and approval by state and federal agencies involved in the

permitting process. For clarification, Mitigation Measures 4.4-3(c & d) shall be revised to reflect that the minimum mitigation ratio for compensatory mitigation shall be 1:1, and higher ratios may be implemented if required by the agency issuing the respective permit. Please see Response to Comment Grp 31-14.

## Response to Comment Grp 31-59

The commenter asserts that the DEIR omits discussion of wetland and riparian habitats on the Centennial Site in their existing condition. Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA.

## Response to Comment Grp 31-60

The commenter cites language from Mitigation Measure 4.4-3(c) for the proposition that the DEIR did not consider avoidance of wetlands. However, the commenter omits language in that mitigation measure that specifically calls for consideration of avoidance if feasible, as follows "To the extent feasible, as determined by the qualified biologist in coordination with the Corps, the project shall be designed to avoid and minimize adverse effects to waters of the U.S. or jurisdictional waters of the State of California within the project area. As such, the mitigation provided already calls for avoidance where feasible. The commenter asks that the County consider an alternative that avoids wetlands. As shown on Figure 4.4-4 of the DEIR, the Brunswick site has small artificial wetlands dispersed throughout the project area which have formed in depressions created by previous disturbance on the site. The retention of these wetlands (MA-1, MA-2, MA-3, MA-4, MA-5, MA-6, WM-A, WM-2, WM-3, RI-4) would prevent the construction of most of the proposed buildings, the storm water detention pond, and the engineered fill pile and therefore would be infeasible. Large natural wetlands (WM-3, RI-2, and RI-3) are preserved by the project design. Additionally, the commenter asks whether onsite or offsite wetland creation could be considered. The Project Proponent could consider offsite creation of wetlands as part of specific wetlands mitigation in consultation with the Corps or CDFW, but no specific offsite mitigation site is currently under consideration. For example, the large natural wetlands on the property discussed above could be enhanced and/or permanently protected  Please see Responses to Comments Grp 31-57 and -58 above.

## Response to Comment Grp 31-61

The commenter asserts that impacts to South Fork Wolf Creek have not been assessed. Please see Response to Comment Grp 31-4, Master Response 36 - Flows in South Wolf Creek and Wolf Creek, Master Response 32 - Temperature of Mine Water Discharge, Master Response 34 - Resident Fish, and Master Response 35 - Discharge to South Wolf Creek, regarding the discharge flow volumes, temperature, and quality, potential for erosion, and species impacts. Additionally, the commenter asserts that the clay-lined pond (PD-1) is connected to South Fork Wolf Creek; however, this is not correct. The clay-lined pond is a man-made industrial pond that was created for industrial use and is not connected to South Fork Wolf Creek. Please see Response to Comment Grp 31-31. Biological impacts relating to the project's use of the clay-lined pond were addressed in DEIR Section Impact 4.4. Please also see Response to Comment Grp 31-5.

## Response to Comment Grp 31-62

The commenter asserts that encroachments into the 100-foot setback from streams has not been addressed in the DEIR. However, the encroachment was specifically addressed in the DEIR. Please see Response to Comment Grp 31-15 regarding the necessary encroachment and analysis. As stated on page 4.4-86 of the DEIR, the proposed treated mine water discharge pipe is an aboveground pipe that would be located along an existing access road on the south side of

South Fork Wolf Creek. The existing access road crosses the ephemeral stream feature E-1. A support structure would be constructed across the ephemeral stream (E-1) so that the pipe crosses over the two-foot-wide stream instead of through the stream, which may cause a temporary impact to approximately 16 linear feet of the stream. Riparian vegetation, if present along the existing access road, may be impacted from placement of the discharge pipe. The pipeline has been routed along an existing access road to minimize the potential impacts to riparian environments, as well as the 50-foot non-disturbance buffer of the ephemeral stream (pursuant to Nevada County LUDC Section L-II 4.3.17).

The commenter suggests that the existing road where the discharge pipe will be placed is inhabited by trillium, equisetum, and rattlesnake plantain orchid. However, none of these plants are special-status plants. Therefore, any disturbance, assuming they were located on parts of the existing road where the proposed treated mine water discharge pipe would be placed, would not be a significant impact under CEQA.

Please see Response to Comment Grp 31-17.

## Response to Comment Grp 31-65
Please see Response to Comment Grp 31-18.

## Response to Comment Grp 31-66
Please see Response to Comment Grp 31-57.

## Response to Comment Grp 31-67
DEIR Impact 4.4-3 analyzed the projects potential to impact state or federally protected waters and wetlands and determined this impact was potentially significant. Surface disturbance on the Centennial Industrial Site has the potential to impact approximately 0.033-acre of ephemeral streams. Mitigation measures 4.4-3(a-d) were identified that reduce this impact to a less than significant level. Surface disturbance on the Brunswick Industrial Site has the potential to impact approximately 0.57-acre of wetlands and 293 linear feet (0.103-acre) of mapped streams. This insignificant reduction in wetlands would not result in cumulatively considerable impacts to wetland and associated species viability in the region, as discussed in Impact 4.4-6 of the DEIR.

## Response to Comment Grp 31-68
Please see Response to Comment Grp 31-21.

## Response to Comment Grp 31-69
Please see Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Grp 31-70
Please see Response to Comment Grp 31-23. Once mine dewatering commences flow from the mines drains along Idaho-Maryland Road will cease and no monitoring of the existing mine seeps would be possible. It is not possible for groundwater seeping into dewatered mine workings to flow out of the existing mine drains.

As discussed on page of Appendix K.2 of the DEIR, the restoration of the post-mining discharge through the drains would be comparable to existing conditions and, thus, not an impact under CEQA. However, once the mine discharge from the drains resumed, compliance measures may

be required by RWQCB to address the Basin Plan, antidegradation, and other water quality standards. These measures might include sealing off areas of the underground workings that are the primary source of arsenic in the existing drain water, sealing the underground workings sufficiently to prevent seepage of water from the connected mine workings, obtaining an Individual NPDES permit upon closure, or treating of the mine water seeps after closure.

## Response to Comment Grp 31-71

The commenter alleges that the DEIR does not address the impact of changing the land use zoning designation from light industrial to heavy industrial/mining. The commenter mischaracterizes the rezone application, however, as the existing zoning for the Brunswick site is Light Industrial, Site Performance Combining District, and would be rezoned to Light Industrial with Mineral Extraction Combining District to allow for surface mining facilities. The commenter's statement that the rezone changes the zoning to heavy industrial is incorrect. Moreover, the existing zoning already allows for industrial-type uses such as lumber yards, auto dismantling yards, large wholesaling and distribution facilities, and other industrial uses. The primary change in the zoning categories is that the new zoning allows surface mining uses in connection with underground mining, for which the impacts are specifically addressed in the DEIR. The commenter does not identify any specific impacts that would occur due to the change in zoning, but merely speculates that such impacts may occur. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." The rezone would allow light industrial uses similar to those already allowed under the existing light industrial zoning, and the additional permitted uses associated with the mineral extraction zone combining district have already been analyzed in the DEIR. Accordingly, no further analysis is required. Please see Response to Comment Grp 31-24.

## Response to Comment Grp 31-72

Please see Response to Comment Grp 31-25.

## Response to Comment Grp 31-73

Please see Response to Comment Grp 31-26 and Master Response 6 - Wildfire. The commenter alleges that the project may be inconsistent with the California Wildfire and Forest Resilience Action Plan, but does not provide any specific examples. The California Wildfire and Forest Resilience Action Plan does not have any specific mandates that apply to the project, and moreover, the DEIR concluded that the project's wildfire impact was less than significant after mitigation.

With respect to climate change, there is no uniform consensus on how climate change will affect wildfire patterns, so analysis based on varying climate change predictions would be speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As analysis of climate change scenarios, when there is no consensus on how climate change will affect the project site, would be speculation, this analysis is not required by CEQA. Please see Master Response 16 – Drought and Climate Change.

**Group Letter 32**

To: Members of the Nevada County Planning Commission,
Nevada County Board of Supervisors,
and Nevada County Planning Department Staff
Attn: Matt Kelley, Senior Planner
950 Maidu Ave, Suite 170
Nevada City, CA 95959
Ph: 530 265-1423
matt.kelley@co.nevada.ca.us
To All Concerned:

Summary Comments on the Draft Environmental Impact Report (DEIR) for the proposed Idaho Maryland Mine project[1]

32-1 As a community-based environmental organization Wolf Creek Community Alliance (WCCA) has worked to monitor, protect and restore the Wolf Creek Watershed since 2004. The Wolf Creek headwaters in which this proposed project would take place is a crucial component of our watershed. We at Wolf Creek Community Alliance are concerned that the DEIR is deficient in a number of ways.

Two general comments -

**Chapter 4.5 Cultural & Tribal Resources**

32-2 We are surprised that the cultural resources identified in the draft are all mining sites. Not a single pre-mining site is identified, in spite of archeological sites well-known to the State Park existing in the Area of Potential Impacts, and public maps showing the existence of Nisenan village sites on both the South Fork Wolf Creek and Wolf Creek itself. That the report simply records outreach to tribes without succeeding in actually consulting with them speaks more to the failure of the draft than to the absence of knowledge of important sites on the part of tribal communities. The draft needs to more adequately survey for archeological and traditional tribal sites and fully consult with local tribes.

**Biological Resources - Section 4.4.2 Environmental Setting**

32-3 Second, the environmental setting should be framed more accurately. The proposed project sits within areas with some of the highest biological diversity in the county. A network of undeveloped land provides heavily used wildlife corridors and rare refugia for significant species. Aquatic resources continue to provide crucial ecological function to the watershed downstream. Instead of being characterized primarily as 'disturbed industrial zones' suitable only for further development, they more accurately should be seen as biological resources that, though damaged by a long history of mining, continue to be resilient and over time have shown a remarkable ability to recover. SFWC is a perennial stream starting above Brunswick Road not out of a metal culvert. The pond there is not a mere collector of storm water, but a consequence of the natural hydrology of the valley, and currently a productive biological resource. The wetland habitats at the Centennial site that the draft seeks to ignore by setting a poorly defined future baseline are important hydrologically for the headwaters and contain species of special concern.

[1] More detailed comments with citations to follow.

32-4 Further, as the proposed permit is for 80 years, into the 22nd century, considerations of impacts should be fully analyzed for predicted and probable changes we will see due to drought, wildfire and climate change in those 80 years. Given the severity of that future, the criteria should be not just to minimize the negative impacts, but to ensure the continued recovery and resilience of biological functions crucial to our future. The draft does none of this and ignores future considerations as if we live in a static universe.

32-5 Regarding the details in **Biological Resources,** chapter 4.4, we see 5 areas where the impact designation should be changed from **less than significant (LS)** to **significant (S)**, or from **less than cumulatively considerable (LCC)** to **cumulatively considerable (CC)**.

32-6 **Mitigation 4.4-1 - Special Status Plant Species**. The draft does not adequately address potential impacts to stebbins morning glory, chaparral sedge, finger rush, and sierra brodiaea. The management plan to protect the endangered Pine Hill flannelbush also fails to protect that species. Botanical surveys did not take place during blooming seasons and dismissed probable occurrence in spite of suitable habitat. Pine Hill flannelbush management does not incorporate sufficient buffers, plans for treatment with prescribed burning, or study to show that transplanting would be successful, all details that the Recovery Plan for Gabbro Plants of the Central Sierra Nevada require. **The level of impact should be changed to significant.**

32-7 **Mitigation 4.4-2 - Special Status Wildlife Species.** The draft does not consider impacts to Monarch Butterfly and showy milkweed, present at the Centennial site, or Yellow-breasted Chat and California Spotted Owl, present close to the Brunswick site. It also fails to adequately consider impacts to Foothill Yellow-legged and Red-legged Frog, Western Pond Turtle, Cooper's Hawk, Willow Flycatcher, and Olive-sided Flycatcher. Surveys are inadequate and mitigations for impacts to Western Pond Turtle and raptors do not adequately protect breeding habitat. **The level of impact should be changed to significant.**

32-8 **Mitigation 4.4-3 Riparian Habitat, Wetland, and other Sensitive Communities.** The draft does not include the full length of South Fork Wolf Creek or the Pond at the Brunswick site for its aquatic or biological resources. It also excludes impacts to wetlands as they currently exist at the Centennial site. It does not adequately address impacts downstream to South Fork Fork Creek due to dewatering. Whole reaches of South Fork Wolf Creek are not studied for basic hydrology or biological resources. Benthic Macroinvertebrates (BMI) are not collected for study. Changes to seasonality of stream flow, water temperature, and habitat for BMI are not considered. Conclusions about the potential for increased sedimentation are questionable and not supported with sufficient data. The drawdown of the water table due to dewatering is underestimated and its impacts to meadow, wetland, and forest habitats not considered. **The level of impact should be changed to significant.**

32-9 **Mitigation 4.4-4 Movement of Native Fish or Wildlife.** By not characterizing perennial reaches of South Fork Wolf Creek as being aquatic resources, the DEIR neglects to consider the movement of fish and other aquatic species within the full length of the stream. **The level of impact should be changed to significant.**

32-10 **Mitigation 4.4-6 Cumulative Impacts.** The DEIR does not address loss of forest or wildlife habitat, or cumulative impacts due to chronic stress for species, air quality, noise, risk of system failure over time,

wildfire, and climate change. **The level of impact should be changed to cumulatively considerable.**

Finally we are concerned how the DEIR deals with the long-term impacts of the project.

**APPENDIX C Reclamation Plan 5.12.** Removal and Closure Activities fail to address how Rise Gold will protect the community from heavy metal contamination once the mining company has ceased operations, which could happen in 6 months or 80 years. There is no plan and no way to mitigate for the leaking effluent that inevitably leaks from the underground tunnels into the creeks.

When sulfides, which co-occur with gold, contact water and air, they form sulfuric acid which leaches heavy metals from the rocks: arsenic, manganese, iron, cadmium, and lead are the leading toxins. When the mines close, tunnels fill with water, eventually bust loose somewhere, and begin draining into the creeks, in difficult to predict places. Acid mine drainage is considered the most serious threat to streams. It doesn't matter how "green" the mining process is, as long as the tunnels fill with water, they will leach toxic metals.

**32-11**

The Idaho Maryland Mine, Empire Mine, and North Star mines operated for about 100 years. Today, sixty-eight years after the mines closed in Grass Valley, the community and environment are still paying for what happens after the mines closed. There are brownfields sites all over the County from hard rock mines. Magenta Drain, the Drew tunnel, Little Wolf Creek are 3 examples that have been toxic to the soil and water and very expensive to clean up and treat.

The Idaho Maryland mine is currently draining water into Wolf Creek, out of four sites on Idaho Maryland Rd, with arsenic and manganese levels above the acceptable range for recreational waters according to State standards.

This water will need to be treated forever. Mine tunnels will fill, rupture, leak, and leach heavy metals forever. We can't predict when or where. There is no plan in place to address this issue in the DEIR. We think it is an unavoidable significant impact. This expensive problem and the reasons above and from my colleagues should be enough reason not to grant a permit to Rise Gold.

**32-12**

Based on these concerns, both general and specific, we feel that the DEIR is inadequate and does not address the real impacts of the proposed project.

Thank you,

Jonathan Keehn, President  Josie Crawford, Executive Director

## GROUP LETTER 32: JONATHAN KEEHN, WOLF CREEK COMMUNITY ALLIANCE

### Response to Comment Grp 32-1

This is an introductory comment. The commenter generally states the DEIR is deficient. Responses to specific comments are provided below.

### Response to Comment Grp 32-2

The commenter is surprised no pre-mining cultural sites are identified in the DEIR on the project sites. As explained in Impact 4.5-2 of the DEIR, a site-specific cultural resources survey was conducted by a qualified archeologist meeting the Secretary of the Interior's Professional Qualification Standards. This included outreach to the Native American Heritage Commission, surrounding Native American tribes and historical entities, and the Nevada County Landmark Commission, as well as a pedestrian survey on May 9 and 10, 2019, using 20 meter transects (see DEIR pages 4.5-19 – 21). The analysis, conclusion, and mitigation measure in Impact 4.5-2 was based on this extensive site-specific analysis and broad outreach and reflects the judgment of professional experts in the field and the best available information.

### Response to Comment Grp 32-3

The commenter states the proposed project sits within areas with some of the highest biological diversity in the county with wildlife corridors and rare refugia for significant species and aquatic resources provide crucial ecological function to the watershed downstream. The commenter is referred to sections 4.4 and 4.8 of the DEIR which describes the environmental setting and analyzes project impacts to biological and aquatic resources.

The commenter states that South Fork Wolf Creek is a perennial steam starting above Brunswick Road. The DEIR, including Appendix F.7, identifies the onsite portion of South Fork Wolf Creek as perennial. The upstream portion of South Fork Wolf Creek is offsite and would not be impacted by the project.

The commenter states that the pond is the consequence of the natural hydrology of the valley and is a productive biological resource. The DEIR, and Appendix F.7, both identify the onsite pond as a man-made clay-lined pond that was associated with historic saw milling operations. The pond is a non-jurisdictional "water of the United States" but may be considered a "water of the State of California." Special-status species that may use the pond and surrounding habitat were considered in Impact 4.4-2. This impact was considered potentially significant but reduced to a less than significant level with mitigation. Mitigation covered a variety of special-status species and requires preconstruction surveys, potential state and federal permitting, implementation of avoidance and protection measures, and preparation of management plans. Impacts to "waters" was considered in DEIR Impact 4.4-3. This impact was considered potentially significant but reduced to a less than significant level with mitigation. Mitigation included additional state and federal permitting and preparation of management plans.

The commenter states that wetland habitats at the Centennial site are ignored by setting a poorly defined future baseline. Please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

### Response to Comment Grp 32-4

Please see Response to Comment Grp 31-16.

## Response to Comment Grp 32-5

The commenter states that 5 areas in Chapter 4.4 of the DEIR should be changed to significant impacts. Responses are provided to specific comments below.

## Response to Comment Grp 32-6

This comment summarizes comments made by this commenter in other letters.

Regarding Stebbins morning glory, chaparral sedge, finger rush, and sierra brodiaea. Please see Response to Comment Grp 31-46.

Regarding Pine Hill Flannel bush, please see Response to Comment Grp 30-40, 31-9, and 31-53.

## Response to Comment Grp 32-7

This comment summarizes comments made by this commenter in other letters.

Please see Master Response 37 - Birds and Raptors, regarding yellow-breasted chat, copper hawk, Olive-sided flycatcher and Willow flycatcher and protection of breeding habitat for raptors.

Regarding showy milkweed and the monarch butterfly, please see Response to Comment Grp 31-45 and 31-10.

Regarding the California spotted owl, please see Response to Comment Grp 31-42 and 31-10.

Please see Master Response 38 - Foothill Yellow Legged Frog and California Red Legged Frog, regarding impacts to amphibian species.

Regarding Western Pond Turtle, please see Response to Comment Grp 31-48.

## Response to Comment Grp 32-8

This comment summarizes comments made by this commenter in other letters.

Regarding study of the full length of South Fork Wolf Creek, please see Responses to Comments Grp 31-33 and Grp 31-34.

Regarding the aquatic and biological resources of the pond at the Brunswick site, please see Response to Comment Grp 31-5.

Regarding wetlands at Centennial site and project baseline, please see Master Response 4 - Cleanup Project is a Separate Project Under CEQA.

Regarding benthic invertebrates, please see Responses to Comments Grp 31-12, Grp 31-39, and Grp 31-40.

Regarding increased sedimentation, please see Master Response 36 - Flows in South Fork Wolf Creek.

Regarding impacts to meadows, wetland, and forests from mine dewatering, please see Master Response 33 - Groundwater Dependent Vegetation.

## Response to Comment Grp 32-9

This comment summarizes comments made by this commenter in a separate letter. Please see Response to Comment Grp 31-56.

## Response to Comment Grp 32-10

This comment summarizes comments made by this commenter in other letters. Please see Responses to Comments Grp 31-63 through Grp 31-66.

## Response to Comment Grp 32-11

The commenter states that heavy metal contamination would occur once mining has ceased, the mine is flooded and drainage from the mine recommences. As stated on page 4.8-51 of the DEIR, after mining is completed, and as underground mine workings fill with groundwater, water from the underground mine workings would begin to seep from the existing drains. The water that would seep from the underground workings is anticipated to have similar water quality to the water that currently discharges from the existing drains. Specifically, it may contain elevated levels of iron and manganese. Therefore, the conditions after mining is completed would be similar to existing, or baseline, conditions, such that re-activation of the seeps would not represent a potentially significant impact under CEQA. Although part of the existing environmental setting, some of the seeps have elevated arsenic levels that could pose a threat to human health or the environment. However, despite these existing discharges from the drains, the reported concentrations of all metals and other constituents in the Wolf Creek samples are well below the NPDES water quality standards. Please also see Master Response 8 - Mine Waste Characterization.

## Response to Comment Grp 32-12

The commenter states the DEIR is inadequate. Responses to specific comments are provided above.

**Form Letter A 1**

Nevada County Planning Commission

Nevada City, CA, 95959

Date: 2/16/2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

Gold mines creates a lot of waste that can contain toxic substances that threaten to pollute groundwater and surface waters. My personal reasons to oppose the Gold Mining is my and my family health, my property value decrease.

**A 1-1** I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. Rise Gold has demonstrated disrespect for the environment and the people of Grass Valley, for example, their unrepresentative survey. Stopping Rise Gold would make a huge difference for all of us. I hope you will be among those who will be known to have stood against the well-funded deception Rise Gold Mine has developed.

Sincerely,

Name: ANASTASIA OSLING

Address: 155 Success Mine Loop

## FORM LETTER A 1: ANASTASIA OSLING

### Response to Comment A 1-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1. Property values and quality of life concerns are outside the scope of CEQA – Please see Master Response 2. With regard to concerns about the Project Applicant, the commenter is referred to Master Response 3 - Operator Responsibility.

With regard to the pollution of groundwater and surface water, please refer to Impact 4.8-1 in Chapter 4.8, Hydrology and Water Quality, of the DEIR, which provides a detailed analysis of whether the project would violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality. Please also see Master Response 35 - Discharge to South Fork Wolf Creek.

I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

A 3-1

If opening a mine here is a good idea, someone locally or within CA or USA would have done this long ago. So I object to it happening at all and certainly not by a company from outside the U.S. Rise Gold also has litigation against them which doesn't make them sound like a company to be trusted with our local, valuable assets.

I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

A 9-1

My cardio-respiratory system is already sensitized (allergic) to diesel exhaust, which contains hundreds of toxic chemicals, as well as particulates fine enough to get into one's blood with adsorbed chemicals. The mine anticipates continuous diesels (hauling explosives + rock — 100 trips a day. NO!

I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our mission calls us "to use our human, spiritual and financial resources to make a difference in our local community and the world." Rise Gold has demonstrated disrespect for the environment and the people of Grass Valley, for example, their unrepresentative survey. Stopping Rise Gold would make a huge difference for all of us. I hope you will be among those who will be known to have stood against the well-funded deception Rise Gold Mine has developed.

Sincerely,

Carol Kuczora

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

1) Rise Gold has never opened a hard rock mine & has never made a profit on previous ventures. He has been charged with environmental violations in BC.
2) Removal of precious water (which is more precious than gold) 1-3 MILLION GALLONS of contaminated water, to our streams and emptying our wells as good water flows into mine shafts

A 11-1 I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. Rise Gold has demonstrated disrespect for the environment and the people of Grass Valley, for example, their unrepresentative survey. Stopping Rise Gold would make a huge difference for all of us. I hope you will be among those who will be known to have stood against the well-funded deception Rise Gold Mine has developed.

Sincerely,

Date:

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

THE REMOVAL OF AT LEAST 1 MILLION GALLONS OF WATER EVERY DAY DEWATERING HUNDREDS OF WELLS

**A 23-1** I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

air pollution - I recently read a presentation by Pam Heard, a respitory therapist given on Dec 16, 2021 she detailed toxic air pollutants that would be released by the mine operations — diesel ex haust, radon silica & asbestos. I moved here in 2019 with my daughter, son-in-law & grand-children. The mine would dash our hopes for a safe, beautiful environment

A 24-1 I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- The mine would significantly change the cultural/social environment, away from the current focus on culture, art, crafts, writing and healthy retirement.
- Traffic issues in the 174/Brunswick corridor, already difficult, would decline
- N County taxpayers should not be asked to risk/trust Rise Gold + Mossman, based on the sad history of both.
- Mossmans legal/environmental issues with indigenous BC does not bode well in our area.
- The energy demands of a functional I/M would require downgrading of our ambitions and progressive county plan to reduce fossil fuel dependency.
- Published health risks of mine communities are a big negative for some vulnerable seniors in our large retirement communities

A 31-1

I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

A 35-1

Rise Gold is in litigation on their last project for failing to adhere to environmental infractions and clean it up. There is not a single reason for this mine reopening that is beneficial to our community or environment. The only benefit goes to share holders & politicians who are in their pocket. Wake up and do what is right!

I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. Rise Gold has demonstrated disrespect for the environment and the people of Grass Valley, for example, their unrepresentative survey. Stopping Rise Gold would make a huge difference for all of us.

I hope you will be among those who will be known to have stood against the well-funded deception Rise Gold Mine has developed.

Sincerely Teresa Freeman

COUNTY PLANNING DEPARTMENT

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

Hard rock mining is the largest source of toxic waste in the U.S. Trucks will haul mine waste rock, 100 trips every day down Brunswick road, making a pile higher than 6 stories at the Centennial site. Not only that, but Rise Gold already has numerous violations of mining & environmental laws.

**A 36-1** I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. Rise Gold has demonstrated disrespect for the environment and the people of Grass Valley, for example, their unrepresentative survey. Stopping Rise Gold would make a huge difference for all of us. I hope you will be among those who will be known to have stood against the well-funded deception Rise Gold Mine has developed.

Sincerely,

Theresa Houtman

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses. Their untruthful "poll" of our sample citizenry, complete with prevarications of support for the mine, have been an affront, plastered on the back page of the Union.

There are many reasons this mine should NOT be reopened. My personal reasons are:

1. Concern for the wellbeing and safety of the thousands of residents surrounding the mine and waste sites.
2. Water contamination or dewatering of the wells of the surrounding properties.
3. Air pollution; toxic asbestos dust, diesel exhaust.
4. Underground tremors from blasting.
5. Noise of crushers running 24/7.
6. Previous and continuing violations of mining and environmental laws by Rise Gold.
7. Bankruptcy of Rise Gold.
8. Lowering of property values.
9. The disruption of our quiet, rural way of life, the very thing that brought us to this idyllic area from the noisy, contaminated, exceptionally crowded Los Angeles megalopolis.

B 2-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has put forth to weaken and override opposition from the local population.

**This is a bad company, out to extract money from our land at any price, regardless of the welfare of our citizens, our water, our state, our environment. Please vote NO.**

PLANNING DEPARTMENT

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

I have concerns about the energy and water consumption of this enterprise, in particular the potential to drive up prices for these commodities in the area, potential to drain wells of people who are currently self-sufficient in water. Also, I have concerns about the noise and pollution of the mine and the potential for sinkholes and other problems, environmental in nature, that will be created in Wolf Creek. This is an area where a major sinkhole had already opened up in 2017 (across Banner Lava Cap Rd, Nevada City, CA 95959) considered to be a "critical drain" for the city of Grass Valley. Wolf Creek goes right through downtown, so massive increased water flow could have enormous impact if it floods, causes excess debris, or more sinkholes as a result of high flow.

B 7-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Nevada City, CA, 95959

Date: 2/16/2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

I have concerns about the energy and water consumption of this enterprise, in particular the potential to drive up prices for these commodities in the area, and the potential to drain wells of people who are currently self-sufficient in water. Also, I have concerns about the noise and pollution of the mine and the potential for sink holes and other problems, environmental in nature, that will be created in Wolf Creek. This is an area that is considered a "central drain" for the city of Grass Valley, and a place where a sink hole had already opened up in 2017. Wolf creek flows right through downtown with some underground culverts, so a massive increase in waterflow as predicted by the large amounts of water the mine anticipates in pumping — could have devastating consequences if it floods or clogs with debris.

B 8-1

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Name: Amanda Gaunary

Address: 10626 Banner Lava Cap RD, Nevada City, CA 95959

## FORM LETTER B 8: AMANDA GAHONG

### Response to Comment B 8-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Responses 1 and 3.

Regarding concerns over energy consumption, please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. With respect to concerns regarding effects on nearby wells, please see Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells. With regard to concerns about noise pollution, please refer to Chapter 4.10, Noise and Vibration, of the DEIR. Regarding effects to Wolf Creek, please see Master Response 35 - Discharge to South Fork Wolf Creek and Master Response 36 – Flows in South Fork Wolf Creek. Please see Master Response 29 – Near Surface Workings, regarding sink hole concerns.

Date: Feb 1, 2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- Nevada County currently has a surplus of unfilled job positions.
- Where will the imported workers live when housing is so limited in our area.

**B 9-1**

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely, Amanda Kenney

BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

January 17, 2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, Amy R Patterson, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- The mine will pollute our air and increase lung disease.
- Clouds of airborne toxic mining dust, including asbestos, will drift downwind into Grass Valley.
- If approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.
- There is serious risk to our health, our environment, our property value, and our peace and quiet.
- Hard rock mining is the single largest source of toxic waste in the United States.
- Vast amounts of diesel exhaust will be produced from continuous operation, including the trucking in of explosives.
- A large factory on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential).
- Crushing of 1,500 tons of mine waste rock every day, all day, using massive machines.
- Trucks hauling 1,000 tons of waste rock, 100 trips every day, down Brunswick Road, piling it higher than a 6-story building at the Centennial site.
- Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area (see map).
- Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells.
- Waste water will be dumped into South Fork Wolf Creek, destroy habitats and stir up existing toxic residues like mercury, cyanide and lead with disastrous effects for downstream ecosystems.
- Use of over 12% of Nevada County's electricity, more than all the County businesses combined
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- Claims that a few hundred jobs cannot justify the likelihood of increased lung cancer in Nevada County.
- Nevada County currently has a surplus of unfilled job positions.
- Business that depends on tourism will be hurt.
- Homeowners can lose an estimated 20% in their property values and more if the wells are dry.
- A working mine will shatter the peace and quiet of many neighborhoods.

B 13-1

- Underground blasting is planned for 7 days a week and will be felt by those living above the
2,585 acres of mine underground mineral rights -- see map!
- While Rise Gold shareholders profit, the local community gets little revenue.
- The relatively few theoretical jobs gained will not offset the harm done.
- Where will the imported workers live when housing is so limited in our area?
- An estimated 85% of vendor spending will not be local (explosives, chemicals, concrete, steel...).

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Amy R Patterson

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: March 20, 2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 17-1

The "significant and unavoidable" impacts of noise and vibration! Though the EIR determined that this would only happen during the initial construction activities my feeling and experience with noise is that it can be omnipresent when dealing with a VALLEY which "We are in"! Even minor noises tend to be compounded in hather usual situations (accidents, fire engines, even minor (so called) explosions. Vibration also has significant impacts in an area like ours which has tourist traffic as its major industry. A visit to downtown Grass Valley reveals many businesses use hanging and wall displays to promote their merchandise. Vibration travelling up from under-ground blasting would create havoc with glass, ceramic, and other breakable products. It might be severe enough to put small business "out of business" because of breakage & disarray. We need our tourists to keep the ambiance we have worked so hard to create over the years

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

NEVADA COUNTY
PLANNING DEPARTMENT

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 20-1

When I first heard reports questioning the long-term viability of our Cal Fire air attack base because of encroaching housing developments, I was at a loss for words. Why would we ever jeopardize the safety of existing development to make room for just a little more. And now we think it's a good idea to approve a plan that puts 100 trucks hauling toxic waste on the road connecting that airport & new housing development? I hope my use of "we" doesn't include you. It sounds like a threat to that airport that is our lifeline.

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,

Name:
Anna Frizzell

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 21-1 I am again shocked that we are considering anything that could be cited as threatening our lifeline. I'm referring to our Cal Fire Air Attack base located just down the road from the proposed mine site. I was shocked to hear rumors questioning the long-term viability of the air attack base reported on by the Union in 2021, cited as due to the new housing developments ~~just~~ (Loma Rica). And now we're considering a plan that puts 100 trucks hauling toxic waste on that road connecting the airport & new housing development to town? It sounds like a recipe for disaster to me. + all of the environmental risks to our precious water resources.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 23-1

Mining does not belongs so close to our cities and residences. Noise, truck traffic, air quality, and water quality/availability are major concerns. The questionable prior practices of Rise Gold (or it's owner) and Rise Gold's "to good to be true" promises are also major concerns.
We do not need another reason for people to move from the area.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Please NO MINE!

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 24-1

3,6 million gallons of treated wastewata would be released everyday ento the South Fork Wolf Creek for 6 monchs, then 1.2 million gallons a day there after.

Depletion of our region groundwata and impacts to private wells.

Rise Gold claims "zero risk to wells" is a flawed privately funded hydrology study.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Date: 1/22/22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

This will impact my property value. Poison the animals I so enjoy sharing land w/.

**B 35-1**

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,

FEB 23 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: February 21, 2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- The mine will pollute our air and increase lung disease.
- Clouds of airborne toxic mining dust, including asbestos, will drift downwind into Grass Valley.
- If approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.
- There is serious risk to our health, our environment, our property value, and our peace and quiet.

B 37-1

- Hard rock mining is the single largest source of toxic waste in the United States.
- Vast amounts of diesel exhaust will be produce from continuous operation, including the trucking in of explosives.
- A large factory on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential).
- Crushing of 1,500 tons of mine waste rock every day, all day, using massive machines.
- Trucks hauling 1,000 tons of waste rock, 100 trips every day, down Brunswick Road, piling it higher than a 6-story building at the Centennial site.
- Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area (see map).
- Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells.
- Waste water will be dumped into South Fork Wolf Creek, destroy habitats and stir up existing toxic residues like mercury, cyanide and lead with disastrous effects for downstream ecosystems.

- Use of over 12% of Nevada County's electricity, more than all the County businesses combined
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- Claims that a few hundred jobs cannot justify the likelihood of increased lung cancer in Nevada County.
- Nevada County currently has a surplus of unfilled job positions.
- Business that depends on tourism will be hurt.
- Homeowners can lose an estimated 20% in their property values and more if the wells are dry.
- A working mine will shatter the peace and quiet of many neighborhoods.
- Underground blasting is planned for 7 days a week and will be felt by those living above the 2,585 acres of mine underground mineral rights -- see map!
- While Rise Gold shareholders profit, the local community gets little revenue.
- The relatively few theoretical jobs gained will not offset the harm done.
- Where will the imported workers live when housing is so limited in our area?
- An estimated 85% of vendor spending will not be local (explosives, chemicals, concrete, steel...).
- Nevada County revenue will be from ordinary property taxes, not from gold.
- The history and business practices of Rise Gold Corp. do not inspire trust.
- Rise Gold Corp. has never opened a hard rock mine and has never made a profit on its business ventures.
- Rise Gold CEO, Ben Mossman, has been charged with environmental violations in B.C. Canada.
- There are many questions about the financial stability of Rise Gold Inc.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 41-1

I'm a Native to Nevada City, born in Mercy Hospital in 1956. I oppose the reopening of the mine because of it's threat to the quality of life in Nevada County. There will be an increase in traffic which will decrease air quality and the mining will threaten ground water. Property values will decrease with the quality of life.

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

NEVADA COUNTY
BOARD OF SUPERVISORS

February 14, 2022

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA 95959

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I oppose to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Raise Gold Corporation to be inconsistent, misleading, and manipulative. They fail to mitigate significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are multiple reasons this mine should NOT reopen. My personal reasons are:

**B 47-1**

1- The mine will pollute our air and increase lung disease.
2- Clouds of airborne toxic mining dust, including asbestos, will drift downwards into Grass Valley.
3- Hard rock mining is the single largest source of toxic waste in the United States.
4- Trucks hauling 1,000 tons of waste rock, making one hundred trips every day down Brunswick Road, piling it higher that a 6-story building at the Centennial site.
5- Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area.
6- Crushing of 1,500 tons of waste rock every day, all day, and using massive machines.

I am a resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Raise Gold Corporation has developed.

Sincerely,

Carolee Weisberg

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: 3.24.22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 48-1

Enviromental, property value, our health, water concerns. Rise Gold does not appear to be a company that has the locals best interest in mind.

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely, CKmcknight.

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

All the usual reasons: pollution of many kinds - air, water, noise. Negative impacts on quality of life. But mostly, for me, larger water stewardship issues.

B 50-1

WATER - Since it is impossible to know how wells and other groundwater and surface water resources will be affected, piped, treated NID water should be provided to everyone in Western Nevada County before remotely considering any subsurface activity. Last time I checked, it was going to cost me $30,000 just to apply to NID for consideration of providing service.

Unkown beyond this is the actual cost of trenching, installing pipelines and meters.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Nevada Canty Supervisors and Commissioners,

I am writing to you with my concerns about the Idaho-Maryland Mine.
First, the amount of water which Will be used.
We are in a state wide drought and at times are told we cannot water our own yards. So pumping Millions of gallons of water from under Nevada Canty is not smart at all, and in NO way can it be a benifit to our County.
Another reason for high concern is, this county has had several sink holes over the years, some very large and very recent. If people start digging, drilling, and removing the ground out from underneith our Canty, which is now populated with Many people and Many types of buildings we will be in danger and at Risk of becoming a sink hole. Other Concerns I have about this mine opening, Without going into detail are, The increased fire danger to our County, the

p.2 17 feb 2022

impact on the Wildlife in our County which are already being Negatively impacted by all the Construction going on in our County, the waste the Mine will produce, the toxic harmful Waste, the list goes on.

Ive read the information from Rise GrassValley, which tells how they will open the mine with No Noticable impact on our County, or its residence, and that is just not true.

If you approve the re-opening of the Idaho-Maryland Mine it will devastate our County, and destroy our local much loved community as Well will have a direct Negative result on many of our Countys residence, their homes, properties, and their lives.

Thank you in advance for protecting Nevada County, and the decision to Not re-open the Idaho-Maryland Mine.

Sincerely, Christie R. Harris.

Date: 2-14-22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 59-1 I am quite concerned about the impacts This mine will have on local noise pollution, traffic, ground water levels and air pollution. I'm also not impressed with the way Rise Gold Corps has handled previous projects.

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely, Christina Sabin

### Response to Comment B 59-1

The commenter expresses general concerns regarding the noise and vibration impacts of the project, but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Responses 1 and 3.

Impacts related to noise are addressed in Chapter 4.10, Noise and Vibration, of the DEIR. Impacts related to traffic are addressed in Chapter 4.12, Transportation, of the DEIR. With respect to concerns regarding groundwater, please see Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells. Impacts related to air pollution are addressed within Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR.

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 61-1

I recently moved here from Los Angeles to be in a quiet area, in nature, away from noise pollution - and away from traffic. Also I suffer from chronic bronchitis and adding more air pollution is a big concern.

I'm also concerned about the economic impact, the value of my home and the loss of tourism.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: 2/26/22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- I have a thyroid disease, and environmental pollutants and heavy metals that result from mining operations greatly worsen my condition and symptoms. Many autoimmune diseases can be triggered by pollutants as well, and I believe the proposed mitigating actions are not sufficient to prevent damage to the wellbeing of the citizens of Grass Valley.
- The mine will pollute our air and increase lung disease. Clouds of airborne toxic mining dust including asbestos will drift downwind into Grass Valley. Vast amounts diesel exhaust from continuous operation, including the trucking in of explosives. As someone who has struggled with health problems, I do not want to see an epidemic of new medical conditions in the county, especially for my family and friends.
- We have seen long lasting and devastating effects of mining in this town over the decades. One event that sticks in my mind is the sinkholes that collapsed all over the county, including at my old middle school, Union Hill, whose field had a sinkhole for months and they could not use the area. A mining operation would only contribute to more potential calamities such as this in the future. Operations will include blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area.
- The water in the Grass Valley is one of its most precious and greatest commodities for the citizens who live here. Not only is it important to preserve the water table, but preventing contamination of that water is imperative to those who use well water. The mining operations would require removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells. Waste water will be dumped into South Fork Wolf Creek and destroy habitats and stir up existing toxic residues like mercury, cyanide, and lead with disastrous effects for downstream ecosystems - proving that even from decades and decades of time, past mining destruction is still visible today.

B 64-1

- This would be on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential). Operations will include crushing 1,500 tons of mine waste every day, all day, using massive machines. Trucks will be hauling 1,000 tons of waste rock, 100 trips every day, down Brunswick Road, piling it higher than a 6-story building at the Centennial site. Homeowners stand to lose an estimated 20% in property values (and more if the well is dry)
- The history and business practices of Rise Gold do not inspire trust. Rise Gold CEO, Ben Mossman has been charged with environmental offenses in B.C. Canada courts. Rise Gold has never opened a hard rock mine and has never made a profit on their business ventures to date. There are many questions as to the financial stability of this company. The costs of allowing this mining operation do not outweigh the minor benefits claimed by the advertising campaign of the company.

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. There are many reasons this mine should NOT be reopened. My personal reasons are:

B 71-1

our waterways & watershed are already in severe distress, in great part because of mining, even though it was long ago.

Opening this mine will not bring an enhanced way of life to Nevada County residents

DO NOT allow this travesty to continue to degrade our natural resources any further.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

# Thar's gold in promises?

**OTHER VOICES**
*Randall J. Newsome*

Of all the lofty promises Rise Gold has churned out over the preceding months, none has been more ballyhooed than the number of jobs the mine would create, and the $94,000 average annual wage they'll pay. Before anyone runs to get in line for one of these dream jobs, let's take a closer look.

First, it appears to require a considerable amount of magical thinking to believe the company will ever create a single job. According to its most recent SEC 10-Q report, Rise had less than $400,000 in the bank as of Oct. 31, 2021. By its own reckoning, it needs to plow $100 million into the facility before it can mine its first ounce of gold. It is grossly undercapitalized, to put it mildly, and teetering on the brink of insolvency.

Second, the $94,000 number is totally misleading. According to its March 2021 economic impact report, Rise estimates that it will employ "312 people in Nevada County at full operating levels." Note that it may take years before "full operating levels" are reached.

Putting that aside, the company says that its annual payroll (not including benefits) for these 312 employees will be $29,220,000. It provides no explanation for how it arrived at this number. Rise then provides a list of job categories and an estimate of employees per category.

What it doesn't provide is detail as to the average pay for each employee in each category. Only 213 of the potential 312 employees would be local hires, and of that 213, 162 of them would be "local trainees." Does anyone really think that Rise is going to pay a trainee $94,000 a year?

According to Comparably.com and other sources, the average wage for underground gold miners in the United States is less than $50,000. Even after these 213 local hires are fully trained, does anyone really think Rise will pay almost twice that national average?

So how did they arrive at the $94,000 number? Simple — if you take 312 and divide it into their made-up annual payroll of $29,220,000, you'll come up with just under $94,000.

By lumping together the salaries of managers (all of which are listed as "non-local hires"), engineers, geologists and other highly paid jobs with the lower-paid miners and mineral processors, the company has provided what I consider a false representation of what someone who lives in our community might actually expect to earn at Rise.

There is a great deal more in the Rise economic impact report that is of questionable validity. That's why the Board of Supervisors was right to commission its own economic impact report. But all the board or anyone else needs to know about the Rise report is found in italics on the second page:

Mineral resources that are not mineral reserves do not have demonstrated economic viability. Rise Grass Valley has not established mineral reserves supported by a feasibility study.

Rise Grass Valley has not completed a feasibility study to establish mineral reserves, and therefore has not demonstrated economic viability of the Idaho-Maryland Mine.

In other words, the Rise business model appears to be built on sheer speculation, which begs the following question: Why is the county continuing to spend valuable time and money on this project?

The only explanation I've heard is that the board has to follow the legal process. Does that mean that every time a carload of people comes to town with an undercapitalized, half-baked, potentially dangerous business scheme and starts throwing around empty promises, the board is required to take it all seriously?

Due process only requires whatever process that's due under the circumstances, not a seemingly endless process in pursuit of a fantasy. Isn't it time for this particular fantasy to end?

# Letters to the editor

**Goodwill amid the storm**

We live on Ball Road in Alta Sierra in the region hit with the worst of the worst storm devastation. From Highway 49 the corridor, Alta Sierra Drive, Ball Road, Francis to Dog Bar Road, roughly 75% of the power poles and power lines were downed by falling trees.

We want to express our thanks to the tree cutters who allowed us to drive to town, to PG&E who called in all the troops to get lines and power poles replaced, and especial-

vaccine exemption offered, in addition to 15% of staff.

My question: Where is the survey of how many parents and staff would pull their students or refuse to work, for their own safety, if a vaccine exemption is offered?

Let's look at both sides before coming to a decision on this thorny issue.

**Charles Lanau**
Nevada City

**A time of introspection**

This is a note of gratitude for PG&E, which

I can fully wonder how our forebears met these conditions.

**Marsha Ostrom**
Nevada City

**Single-payer better for business**

If Fran Freedle's letter to the editor in Saturday's Union frightened you about new taxes proposed to fund single-payer health care, please read this perspective on those numbers. How much are you paying in health insurance now?

Consider premiums,

proposed new excise tax of 2.3% of gross receipts only applies to the amount over $2 million, most of our local businesses would be exempt.

In the proposed payroll tax, the employer share is 1.25% on employers with more than 50 employees. Most Californians get their health coverage through their jobs, so those employers are providing health insurance.

A 1.25% tax should be a bargain compared to paying for their employees' insurance. Employees making over $49,900

Dist 3

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am fervently opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation.

I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons I believe this mine should NOT be reopened. My foremost personal reasons are:

Based on past behavior, I believe we can very confidently predict that this company will not keep its promises. That is the overriding consideration, it seems to me, and I don't think anything else needs to be discussed. This is a company whose CEO was the CEO of another company that went bankrupt rather than keep its promises. This is a deal-breaker. This is what indicates to me whether a contract or a promise from this company is worth anything at all. I cannot imagine how we could agree to entrust our environment to this company.

If, in light of the CEO's track record, other reasons are needed, it is my personal feeling that cleanup or restoration, under the best circumstances, can never restore our beautiful and complex living web of land, trees, streams, and all the creatures and organisms that live in and on it to anywhere near their original wholeness.

B 87-1

And, for one more in a myriad of objections, I cannot imagine how the dewatering of the mine would not lower the water table. Water flows downward; when space is made for it, by dewatering the mine, more will flow downward, draining groundwater. Besides the drying up of wells – which, to my mind, would not be adequately compensated for by supplying bottled water or treated water – it seems to me that it could cause further stress to our trees, and thus worsen the danger of fire. Stressed trees and fire danger are already big problems – we don't need more of this.

I am a resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Eileen Adele Hale

### Response to Comment B 87-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1. With regard to concerns about the Project Applicant, the commenter is referred to Master Response 3 - Operator Responsibility.

With respect to concerns regarding groundwater, please see Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells. Impacts related to fire risks are addressed in Chapter 4.13, Wildfire, of the DEIR.

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

I live on Marion Canyon Rd, off of Greenhorn. 2 neighbors and myself felt the vibrations when Rise Gold Corp. were doing demolitions last year. At first none of us knew what it was and "assumed" it was earthquake tremors, until we found out what it was. If we can feel what they were doing underground, how many more residents felt it also. I'm planning to sell my home this year and am wondering if I should disclose this info to my estate agent?

B 88-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,
Elizabeth McGuire

February 28, 2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato, and William Greeno

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have read the Rise Gold Mine postcards they sent recently. The information is misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project at the detriment of our community.

**B 92-1**

Gold mining is the world's worst business. It's capital-intensive. It's labor-intensive. Gold miners are ultra-sensitive to movements in the price of gold. When gold moves higher a gold mining company can get capital. When it moves lower, and the investors had enough with the industry they leave and find another opportunity. The 2013-2019 downturn in gold prices was the final straw for many investors. And companies like Rise Gold had little ability to raise money to run the business. Rise Gold is a bit player in the industry. They won't be around when gold plunges. They won't be around to clean up the toxic waste. They will go bankrupt and leave California and go back to Canada where they are well protected.

I have been a Nevada County resident since 2005 and see that Rise Gold wants to risk our environment and the people who live here for their profit. I am confident that you will value my input and comments and the comments from thousands of other residents. I hope all of you will be on the right side of history and protect our community from fraudsters like Rise Gold Mine.

Thank you,
Francis Murphy

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: February 11, 2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- A large factory on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential).
- Use of over 12% of Nevada County's electricity, more than all the County businesses combined
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- Where will the imported workers live when housing is so limited in our area?
- An estimated 85% of vendor spending will not be local (explosives, chemicals, concrete, steel...).
- The history and business practices of Rise Gold Corp. do not inspire trust.
- Rise Gold Corp. has never opened a hard rock mine and has never made a profit on its business ventures.

B 100-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has put forth to weaken and override opposition from the local population.

Date: February 11, 2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- A large factory on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential).
- Use of over 12% of Nevada County's electricity, more than all the County businesses combined
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- Where will the imported workers live when housing is so limited in our area?
- An estimated 85% of vendor spending will not be local (explosives, chemicals, concrete, steel...).
- The history and business practices of Rise Gold Corp. do not inspire trust.
- Rise Gold Corp. has never opened a hard rock mine and has never made a profit on its business ventures.

**B 101-1**

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Name: George Dunstan

950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: 1-19-22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 114-1 Please do not vote in favor of this mine. Mines have been proposed for Grass Valley for decades, and former government officials have seen the wisdom of barring this toxic, polluting, noisy action from our area. Don't be the officials who close your eyes and minds and allow the destruction of our community.

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,

Name: Diana Abrell

I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

It negatively affects all areas of this community from air quality to noise and dust and water and traffic.
And it's not a financially responsible company that's leading this re-opening.

**B 115-1**

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

anything good to Grass Valley!
If Rise Gold does mark this mine,
they will destroy the beauty and
tranquility of our community with
blasting of the mine tunnels and
hauling away the waste rock.

Further, the waste water dumped
into the South Fork Wolf Creek will
continue through the section of
Wolf Creek on our property. This section
of the Creek was recently restored
by the efforts of Newmont Mining. The
dumping of this mining water will
take us back many years to the
contaminants previously seen in our
Creek.

Please do not allow this project
to move forward!!

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 128-1

A Company called Fox Com moved into my family city of Racine, WI. They promised the state jobs, growth, revenue etc. They were permitted to take farms and homes that had been in families for generations. After leveling all of this property and creating a small development they have failed to deliver on their promises. Rise Gold has a reputation for being this same kind of company and will not bring any-thing good to Grass Valley!
If Rise Gold does work this mine, they →

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,
Janet Ackland 2/6/22

will destroy the beauty and tranquility of our Community with blasting of the nine tunnels and hauling away the waste rock.

Further, the waste water dumped into the South Fork Wolf Creek will Continue through the section of Wolf Creek on our property. This section of the Creek was recently recovered by the efforts of Newmont Mining. The dumping of this mining water will take us back many years to the Contaminants previously seen in our Creek.

Please do not allow this Project to move forward!!

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- I see no redeeming value in opening this mine.
- I see $$ in the eyes of those who think this is a good idea. Opening this mine disrespects the homeowners, family + businesses that will be affected from the noise + pollution
- Who is being paid to say there will be no environmental impact?
- The risk is too big for a few jobs.

**B 129-1**

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,

Phone number: 530 477-5521

Email: jm.mp31@hotmail.com

Janet Weaver

Addendum: County Board of Supervisors:

I have several concerns regarding the Rise Gold Mine.

1. **Well Water:** Although we are 3.5 miles down Greenhorn, we may also be impacted by the voluminous amount of (possible contaminated) water that will be extracted from the mine. We are still in a drought and the snow disaster we had in December, reflects that. Trees had shallow roots because of the lack of water The enormous amount of water that will be then sent down the South Folk Wolf Creek, perhaps overflowing its banks.

2. **Traffic:** As I left this morning at 8:45 a.m. to make my right onto Brunswick from Greenhorn I noted that there had to be a least 30 cars lined up at the flashing red light to enter the city or freeway. They were as far back as the exit from the mine on Brunswick. To add 100 trucks coming up from Bennett will probably put this line as far back as the "Y". Many people from outside of GV area, are probably unaware of the extra time it will take them each day to get either into our city or out of it.

3. **Toxicity:** Hard rock mining is extremely toxic. Our property was deemed an EPA Superfund in 1998 because of the tailing overflow from the 1997 storms. Because the County could not afford the clean-up, the federal agency stepped in and spent thousands of dollars to correct the toxic waste flowing down the Little Clipper Creek. Taxpayers from all over the country fund EPA. EPA continues to monitor this site and I understand it will always be deemed a Superfund site.

There are so many other reasons NOT to have this mine. Perhaps consider having it a permanent green waste space and build a cogeneration (cogen) plant, creating our own clean energy.

We are no longer a Mining Town and anything built in that area should reflect 2022 ideas and not 1849 ideas.

February 17, 2022

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corpoeration. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Suprvisors before they vote on the matter.

I have read both sides of the argument and I must say that my biggest concern is that Rise Gold is not trustworthy. They have lied and been manipulative. They have a history of suspect business practices. The positives for our community are few, if any. The list of possible negative impacts on our community is long, including changes in the character of our foothill community, and an increase in greenhouse gases adding to the problem of climate change instead of helping to solve it. We have suffered from damage from the mining industry before and are still living with the consequences. Rise Gold's history has shown that it does not care about the environment.

**B 136-1**

I am a Nevada County resident and see that the Rise Gold Corporation lacks concern for our environment and the people who live here. Despite what Rise Gold says or how it reports on its manipulated polls, this community does NOT support their project. Our community leaders will be taking an enormous risk if we approve this mine. Please do the right thing and advise the supervisors to deny permission to reopen.

Sincerely,

Jeanne Palmer

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

1. If approved, this mine would operate 24 hours a day, 7 days a week, for up to 30 years near residential areas (undercutting property values).

**B 138-1**

2. The dewatering requirements while we endure a drought are reckless and a waste of this vital resource.
3. The value of gold as a store of value is volatile, antiquated and may lead to a sudden shutdown of mining operations with no accountability long term.

I am resident of Nevada County and observe that Rise Gold corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

### Response to Comment B 143-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Responses 1 and 3.

**Form Letter B 144**

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: 2-19-22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

**B 144-1** Water

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,

Name: JESPER

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Responses 1 and 3.

With regard to concerns related to water resources, please see Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 35 - Discharge to South Fork Wolf Creek, and Master Response 36 – Flows in South Fork Wolf Creek. Noise impacts related to the proposed project operations, including blasting and truck traffic, is addressed in Chapter 4.10, Noise and Vibration, of the DEIR.

**Form Letter B 159**

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: MARCH 9, 2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- THE EFFECTS ON OUR WATER RESOURCES CANNOT BE PREDICTED DUE TO THE MINES CRACKS & FISSURES THAT ARE INTERCONNECTED.
- MOSSMAN HAS A VERY POOR FINANCIAL REPUTATION AND A VERY BAD ENVIRONMENTAL RECORD. WE'LL BE CLEANING UP HIS MESSES FOR DECADES.
- EFFECTS ON THE ENVIRONMENT OF HUGE TAILINGS PILES IS WILDLY UNDERESTIMATED IN THE DEIS.

B 159-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely, Judie L Tartaglia

FEB 23 2022

NEVADA COUNTY
BOARD OF SUPERVISORS

Dist 2

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: February 21, 2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- The mine will pollute our air and increase lung disease.
- Clouds of airborne toxic mining dust, including asbestos, will drift downwind into Grass Valley.
- If approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.
- There is serious risk to our health, our environment, our property value, and our peace and quiet.
- Hard rock mining is the single largest source of toxic waste in the United States.
- Vast amounts of diesel exhaust will be produced from continuous operation, including the trucking in of explosives.
- A large factory on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential).
- Crushing of 1,500 tons of mine waste rock every day, all day, using massive machines that pollute!
- Trucks hauling 1,000 tons of waste rock, 100 trips every day, down Brunswick Road, piling it higher than a 6-story building at the Centennial site.
- Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area (see map).
- Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells.
- Waste water will be dumped into South Fork Wolf Creek, destroy habitats and stir up existing toxic residues like mercury, cyanide and lead with disastrous effects for downstream ecosystems.

B 160-1

- Use of over 12% of Nevada County's electricity, more than all the County businesses combined
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- Claims that a few hundred jobs cannot justify the likelihood of increased lung cancer in Nevada County.
- Nevada County currently has a surplus of unfilled job positions.
- Business that depends on tourism will be hurt.
- Homeowners can lose an estimated 20% in their property values and more if the wells are dry.
- A working mine will shatter the peace and quiet of many neighborhoods. Noise affects mental health.
- Underground blasting is planned for 7 days a week and will be felt by those living above the 2,585 acres of mine underground mineral rights – see map!
- While Rise Gold shareholders profit, the local community gets little revenue.
- The relatively few theoretical jobs gained will not offset the harm done.
- Where will the imported workers live when housing is so limited in our area?
- An estimated 85% of vendor spending will not be local (explosives, chemicals, concrete, steel...).
- Nevada County revenue will be from ordinary property taxes, not from gold.
- The history and business practices of Rise Gold Corp. do not inspire trust.
- Rise Gold Corp. has never opened a hard rock mine and has never made a profit on its business ventures.
- Rise Gold CEO, Ben Mossman, has been charged with environmental violations in B.C. Canada.
- There are many questions about the financial stability of Rise Gold Inc.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Judy McVicker

## FORM LETTER B 160: JUDY MCVICKER

### Response to Comment B 160-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1. Property values and quality of life concerns are outside the scope of CEQA – Please see Master Response 2. With regard to concerns about the Project Applicant, the commenter is referred to Master Response 3 - Operator Responsibility.

Regarding air pollution, including toxic air contaminants such as asbestos and diesel exhaust, as well as electricity consumption, please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. Regarding toxic waste, please see Master Response 8 - Mine Waste Characterization. With respect to concerns regarding effects on nearby wells, please see Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells. Regarding effects to Wolf Creek, please see Master Response 35 - Discharge to South Fork Wolf Creek and Master Response 36 – Flows in South Fork Wolf Creek. Vibration associated with blasting is addressed in Chapter 4.10, Noise and Vibration, of the DEIR. Finally, regarding concerns about underground blasting effects throughout the mineral rights area, please see Master Response 7.

950 Maidu Avenue, Suite 170
Nevada City, CA, 95959

Date: 2/9/22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

I am very concerned about water quality in our watershed. This mine's wastewater would be deposited into the South Fork of Wolf Creek. It's 2022, we have learned by now that waste into our precious waterways is extremely detrimental to our ecosystem and the creatures living within it. Also the health impacts to our beloved community – airborne toxic dust drifting into nearby communities/neighborhoods, and increased risk of cancers, increased dangers due to increased truck hauling on Brunswick Rd.

B 168-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

February 15, 2022

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastodonato and William Greeno.

Cc Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock

I the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Ross Gold Corporation. I understand that you will be reviewing he Draft Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find that Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors and businesses.

I have been to the gold mines in Elko Nevada and I have personally seen what is involved with a mining venture. It is totally disruptive to the area. To state some reasons:

- The mine will pollute our air and increase lung disease
- Clouds of airborne toxic mining dust, including asbestos, will drift downwind into Grass Valley
- if approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.
- There is serious risk to our health, our environment, our property value, and our peace and quiet. Even is kept "below legal noise level" it would still be heard all over the valley.
- Hard rock mining is the single largest source of toxic waste in the United States;
- Vast amounts of diesel exhaust will be produced from continuous operation, including the trucking in of explosives.
- A large factory on Brunswick Road is in the middle of hundreds of family homes and it is zoned "residential".
- Crushing of 1,500 tons of mine waste rock every day, all day, using massive machines.
- Trucks hauling 1,000 tons of mine waste rock, 100 trips every day, down Brunswick Road poling higher than a 6-story building at the Centennial site.
- Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area.
- Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years de-watering hundreds of wells.
- Waste water will be dumped into South Fork Wolf Creek, destroying habitats and stir up existing toxic residues like mercury, cyanide and lead with disastrous effects for downstream ecosystems.
- Use of over 12% of Nevada County's electricity, more than all the County businesses combined.
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- Claims that a few hundred jobs cannot justify the likelihood of increased cancer in Nevada County. (The jobs made available to Nevada County residents would be for those of driving the waste rock trucks.)
- Nevada County currently has a surplus of unfilled job positions
- Business that depends on tourism will be hurt.
- Homeowners can lose an estimated 20% on their property values and more if the wells are dry.
- A working mine will shatter the peace and quiet of the Grass Valley area.
- Underground blasting is planned for 7 days a week and will be felt by those living above the 2,585 acres of mine underground rights.
- While Rise Gold shareholders profit, the local community gets little revenue.
- The relatively few theoretical jobs gained will not offset the harm done.
- Where will the imported workers live when housing is so limited in our area?
- An estimated 85% of vendor spending will not be local (explosives, chemicals, concrete, steel,. . .
- Neighbors of the mine not even open yet, have complained of sink holes on their property due to exploratory blasting, that will only get worse. As Nevada County is covered in old mine shafts that would collapse with the planned blasting.

I have personally witnessed a Gold Mining operation. I have seen the water filled with the cyanide and or arsenic, that was used to extricate the gold from the rock, flowing down to the holding ponds to be "removed"

B 171-1

1

and then have that water released into the creeks and rivers. I have seen the trucks used in a mining operation. I have witnessed the hills of rock from the mine deposited away from the mine.

I have seen the devastation caused by Gold Mines in production. The Nevada County will not longer be the destination for a peaceful, beautiful lifestyle. These are many reasons this mine should NOT be reopened.

If you have any doubt of the reasons stated, visit the Elko Nevada area's mines. Elko is not in a foothill forested area, full of residences all over the county, but you can see the impact a mine has on a desert area. Imagine what it would do to an area as Nevada County and our residences.

I am a resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley, in Nevada County. I truly hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Ms Kathryn Gerwig

## FORM LETTER B 171: KATHRYN GERWIG

### Response to Comment B 171-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1. Property values and quality of life concerns are outside the scope of CEQA – Please see Master Response 2. With regard to concerns about the Project Applicant, the commenter is referred to Master Response 3 - Operator Responsibility.

Regarding air pollution, including toxic air contaminants such as asbestos and diesel exhaust, as well as electricity consumption, please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. Regarding toxic waste, please see Master Response 8 - Mine Waste Characterization. With respect to concerns regarding effects on nearby wells, please see Master Response 14 - Adequacy of Groundwater Model and Master Response 15 - Adequacy of Groundwater Monitoring Wells. Regarding effects to Wolf Creek, please see Master Response 35 - Discharge to South Fork Wolf Creek and Master Response 36 – Flows in South Fork Wolf Creek. Vibration associated with blasting is addressed in Chapter 4.10, Noise and Vibration, of the DEIR. Finally, regarding concerns about underground blasting effects throughout the mineral rights area, please see Master Response 7.

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

February 15, 2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock

Cc Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastodonato and William Greeno.

I the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Ross Gold Corporation. I understand that you will be reviewing he Draft Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find that Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors and businesses.

I have been to the gold mines in Elko Nevada and I have personally seen what is involved with a mining venture. It is totally disruptive to the area. To state some reasons:

- The mine will pollute our air and increase lung disease
- Clouds of airborne toxic mining dust, including asbestos, will drift downwind into Grass Valley
- if approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.
- There is serious risk to our health, our environment, our property value, and our peace and quiet. Even is kept "below legal noise level" it would still be heard all over the valley.
- Hard rock mining is the single largest source of toxic waste in the United States;
- Vast amounts of diesel exhaust will be produced from continuous operation, including the trucking in of explosives.
- A large factory on Brunswick Road is in the middle of hundreds of family homes and it is zoned "residential".
- Crushing of 1,500 tons of mine waste rock every day, all day, using massive machines.
- Trucks hauling 1,000 tons of mine waste rock, 100 trips every day, down Brunswick Road poling higher than a 6-story building at the Centennial site.
- Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area.
- Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years de-watering hundreds of wells.
- Waste water will be dumped into South Fork Wolf Creek, destroying habitats and stir up existing toxic residues like mercury, cyanide and lead with disastrous effects for downstream ecosystems.
- Use of over 12% of Nevada County's electricity, more than all the County businesses combined.
- The Rise Gold CEO already has numerous violations of mining and environmental laws.
- Claims that a few hundred jobs cannot justify the likelihood of increased cancer in Nevada County. (The jobs made available to Nevada County residents would be for those of driving the waste rock trucks.)
- Nevada County currently has a surplus of unfilled job positions
- Business that depends on tourism will be hurt.
- Homeowners can lose an estimated 20% on their property values and more if the wells are dry.
- A working mine will shatter the peace and quiet of the Grass Valley area.
- Underground blasting is planned for 7 days a week and will be felt by those living above the 2,585 acres of mine underground rights.
- While Rise Gold shareholders profit, the local community gets little revenue.
- The relatively few theoretical jobs gained will not offset the harm done.
- Where will the imported workers live when housing is so limited in our area?
- An estimated 85% of vendor spending will not be local (explosives, chemicals, concrete, steel,. . .
- Neighbors of the mine not even open yet, have complained of sink holes on their property due to exploratory blasting, that will only get worse. As Nevada County is covered in old mine shafts that would collapse with the planned blasting.

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

Water supply in drought years
Water pollution
Dust pollution
We are still mitigating poison from past mining operations
Underground mining noise pollution

**B 173-1**

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 175-1

Rise gold has a horrid track record, still going to court for the toxic mess they left in Bristish Columbia! Aside from polluting our creek (wolfe) with their waste water, greenhouse gas pollution, 80 year lease of truck traffic clogging our roadways, ruining many more wells than is stated, causing home prices to plumet, I can't belive our community, B.O.S, would even consider this! We will get no tax revenue, only a toxic mess!!!

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 180-1

Why are we going backward instead of forward? The future of this community lies in residential growth from other areas and from tourism. Mining will not only eliminate that but also irreparably harm the lives of those of us already living here. We do not need more toxic water, and dust or heavy truck traffic or noise or toxic waste. We do not need to— can't afford to lose what little water we have to mine operations. We will lose property value and the potential for other, higher paying, clean jobs. The Canadians or chineese may get rich for awhile, but we will lose everthing and have to start over, cleaning up another mess.

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

This is our water
I need it as well!

B 183-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- There is serious risk to our environment, specifically the amount of waste water to be discharged & treated, threatening wells and watershed.
- Continual blasting and transport of rock material.
- The benefits of this project seem to be one-sided, Rise Gold Corporation does not seem to have a responsible or profitable record. Why would we allow this?

B 185-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

Pumping millions of cubic feet of ground water endangers all wells - Especially in drought situations

The mine will pollute our air and increase lung disease. Create toxic mining dust, including asbestos into our community
Cause serious issues to our health, environment, and property values.
Hard rock mining is the single largest source of toxic waste in the U.S. Trucking dangerous explosives.
The Brunswick location is in the middle of family homes zoned residential.
Tons of waste rock, down Brunswick Road, with it going to the Centennial site.
Blasting full time in tunnel under over 2,500 acres of Grass Valley area.
Removal of millions of gallons of contaminated water every day, dewatering hundreds of local citizens wells.
Waste water dumped into Wolf Creek, destroying habitats. Toxic residues like mercury, cyanide, and lead with disastrous effects.
The Rise CEO has history of violations of mining and environmental laws.
Number of possible jobs added, does not justify the potential damage noted above.
Tourism will be hurt, based on the potential damage noted above. If citizens' wells dry up, property value is gone.
The local community get minimal benefit, rather only the Rise Gold shareholder benefit.
History of Rise Gold, and its CEO show environmental violations, no trust for the company, has no history of profits in its prior ventures.

B 187-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. Date: 3/21/22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- The potential negative health effects
- Waste water with toxins being dumped into Wolf Creek
- Pollution of our air & water
- Likely traffic & congestion associated with the mine operation

**B 196-1**

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Sincerely,
Linda Ewald

Date: 3/29/22

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- Concern about what de-watering the mine will do to the water table
- Concern about increased truck traffic
- Concern that hard rock mining is the single largest source of toxic waste in the US, and we are still dealing with the impacts of toxic waste from historical gold mining

**B 197-1** I am a member of the local faith-based organization, the Unitarian Universalist Community of the Mountains. Our values call us to use our human, spiritual and financial resources to make a difference in our local community and the world. Rise Gold has demonstrated disrespect for the environment and the people of Grass Valley, for example, their unrepresentative survey. Stopping Rise Gold would make a huge difference for all of us. I hope you will be among those who will be known to have stood against the well-funded deception Rise Gold Mine has developed.

Sincerely,

Lindsay Dunckel

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

B 198-1

This company has already been fined in Canada for breaking environmental laws. The traffic generated by this proposal is prohibitive; with all of the building already going on in the basin, the roads are currently stressed as is, let alone with numerous big rigs. Additionally, the water treatment scenario is an unknown and many nearby residents stand to possibly lose their wells. The sound pollution will be atrocious. Although Rise Gold currently owns the land, the tax base would be better served by their selling the land to the city and employing many with the land used for a green waste reclamation site.

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

1. The mine will pollute our air and increase lung disease.
2. A working mine will damage Neighborhoods with shattered peace and quiet.
3. Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells.
4. Waste Water will be dumped into South Fork Wolf Creek and destroy habitats and stir up existing Toxic residues like Mercury Cyanide and lead with disastrous effects for down stream ecosystem
5. The history and Business practice of Rise Gold do not inspire Trust.

B 202-1

I am resident of Nevada County and observe that Rise Gold corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses. Their untruthful "poll" of our sample citizenry, complete with prevarications of support for the mine, have been an affront, plastered on the back page of the Union.

There are many reasons this mine should NOT be reopened. My personal reasons are:

1. Concern for the wellbeing and safety of the thousands of residents surrounding the mine and waste sites.
2. Water contamination or dewatering of the wells of the surrounding properties.
3. Air pollution; toxic asbestos dust, diesel exhaust.
4. Underground tremors from blasting.
5. Noise of crushers running 24/7.
6. Previous and continuing violations of mining and environmental laws by Rise Gold.
7. Bankruptcy of Rise Gold.
8. Lowering of property values.
9. The disruption of our quiet, rural way of life, the very thing that brought us to this idyllic area from the noisy, contaminated, exceptionally crowded Los Angeles megalopolis.

B 208-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has put forth to weaken and override opposition from the local population.

**This is a bad company, out to extract money from our land at any price, regardless of the welfare of our citizens, our water, our state, our environment. Please vote NO.**

Sincerely,

Lynette Smith-James

## FORM LETTER B 208: LYNETTE SMITH-JAMES

### Response to Comment B 208-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1. Property values and quality of life concerns are outside the scope of CEQA – Please see Master Response 2. With regard to concerns about the Project Applicant, the commenter is referred to Master Response 3 - Operator Responsibility.

With respect to concerns regarding water contamination and effects on nearby wells, please see Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 35 - Discharge to South Fork Wolf Creek. Regarding air pollution, including toxic air contaminants such as asbestos and diesel exhaust, as well as electricity consumption, please refer to Chapter 4.3, Air Quality, Greenhouse Gas Emissions, and Energy, of the DEIR. Vibration associated with blasting, as well as noise impacts related to the proposed project operations, is addressed in Chapter 4.10, Noise and Vibration, of the DEIR.

NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 2/9/22

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses. Their untruthful "poll" of our sample citizenry, complete with prevarications of support for the mine, have been an affront, plastered on the back page of the Union.

There are many reasons this mine should NOT be reopened. My personal reasons are:

1. Concern for the wellbeing and safety of the thousands of residents surrounding the mine and waste sites.
2. Water contamination or dewatering of the wells of the surrounding properties.
3. Air pollution; toxic asbestos dust, diesel exhaust.
4. Underground tremors from blasting.
5. Noise of crushers running 24/7.
6. Previous and continuing violations of mining and environmental laws by Rise Gold.
7. Bankruptcy of Rise Gold.
8. Lowering of property values.
9. The disruption of our quiet, rural way of life, the very thing that brought us to this idyllic area from the noisy, contaminated, exceptionally crowded Los Angeles megalopolis.

B 209-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has put forth to weaken and override opposition from the local population.

**This is a bad company, out to extract money from our land at any price, regardless of the welfare of our citizens, our water, our state, our environment. Please vote NO.**

Sincerely,

Lynette Smith-James

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

1) It will negatively impact my rights to peaceful residential living by 24/7 sound pollution.
2) Traffic under current infrastructure will be negatively impacted and unable to support the mine operations
3) Water table for well water will be negatively impacted during a mega-drought!

B 210-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Date: February 22, 2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

I do not trust them. Look at their history, which I believe you must have done yourselves. They pollute and leave a disaster. Let's find other industries to boost our economy. We've already driven out prior businesses, and we've done little to entice anyone to replace them.

There are many reasons this mine should NOT be reopened. My personal reasons are:

**B 212-1**

· The mine will pollute our air and increase lung disease.

· Clouds of airborne toxic mining dust including asbestos will drift downwind into Grass Valley

· If approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.

· There is serious risk to our health, our environment, our property value, and our peace and quiet.

· Hard rock mining is the single largest source of toxic waste in the United States.

· Vast amounts diesel exhaust from continuous operation, including the trucking in of explosives

· A large factory on Brunswick Rd. is in the middle of hundreds of family homes (zoned residential)

· Crushing of 1,500 tons of mine waste every day, all day, using massive machines

· Trucks hauling 1,000 tons of waste rock, 100 trips every day, down Brunswick Road, piling it higher than a 6-story building at the Centennial site.

· Blasting 7 days a week in the tunnels under 2,585 acres of the Grass Valley area

· Removal of 1 million to 3 million gallons of contaminated water per day for the next 80 years, dewatering hundreds of wells

· Waste water will be dumped into South Fork Wolf Creek and destroy habitats and stir up existing toxic residues like mercury, cyanide and lead with disastrous effects for downstream ecosystems from the past mining operations.

· Use of over 12% of Nevada County's electricity, more than all the County businesses combined

· Numerous Rise Gold violations of mining and environmental laws in Canada and here – already

· Claims that a few hundred jobs could justify the likelihood of increased lung cancer (Nevada County currently has a surplus of unfilled job positions)

· Business life that depends on tourism will be hurt

· Homeowners stand to lose an estimated 20% in property values (and more if the well is dry)

· A working mine will damage neighborhoods with shattered peace and quiet

· Underground blasting is planned for seven days a week and will be felt by those living within the 2,585 acres of underground mineral rights the mine owns. See map!

· While Rise Gold shareholders (largely Canadian) profit, the local community gets little.

· The few theoretical jobs gained are hugely offset by the harm done. And there are several excellent suggestions in the Union to promote good jobs locally.

· Where will the imported workers live when housing is already so limited in our area? ?

· 85% of vendor spending will not be local

· Nevada County revenue will be only from property taxes, all other taxes will go to the state

· The history and business practices of Rise Gold do not inspire trust

· Rise Gold has never opened a hard rock mine and has never made a profit on their business ventures to date

· Rise Gold CEO, Ben Mossman has been charged with environmental offenses in B.C. Canada courts

· There are many questions as to the financial stability of this company.

· The potential "breakout" from the mine's contaminated settling pond during one of our "atmospheric river" storms is enormous.

I am resident of Nevada County and observe that Rise Gold corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

Sincerely,

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

Our highways are already impacted by additional trucks and construction. Rise's history is one that we can learn from. Why invite that unethical business into our community? There are better options, as long as we make our county business friendly.

There are many reasons this mine should NOT be reopened. My personal reasons are:

· The mine will pollute our air and increase lung disease.

**B 213-1**

· Clouds of airborne toxic mining dust including asbestos will drift downwind into Grass Valley

· If approved, this mine would operate 24 hours a day, 7 days a week, for up to 80 years.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- WITH CALIFORNIA IN A STATE OF DROUGHT & WATER RESOURCES LIMITED, WHERE WILL WATER ~~FROM~~ NEEDED FOR THE MINE COME FROM WITHOUT IMPACTING THE EXISTING ENVIRONMENT & RESIDENTS OF OUR COMMUNITY?
- THE C.E.O. OF RISE GOLD HAS BEEN CHARGED WITH ENVIRONMENTAL VIOLATIONS IN CANADA. WHAT'S TO STOP HIM FROM DOING THE SAME HERE?
- OUR COMMUNITY IS NO LONGER A GOLD MINING COMMUNITY LOCAL RESIDENTS AREN'T ~~TRAD~~ EXPERIENCED IN MINING JOBS & THE MINE WILL DISRUPT IT WITH NOISE, TRAFFIC, & TOXIC WASTE.

**B 218-1**

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.

- PROFITS WILL GO OUTSIDE GRASS VALLEY WHILE DISRUPTION & DESTRUCTION WILL REMAIN IN GRASS VALLEY.

Sincerely, Mark Mj

### Response to Comment B 218-1

The commenter expresses general concerns regarding the project but does not specifically address the adequacy of the DEIR. Thus, a detailed response is neither possible nor required. Please see Master Response 1. With regard to concerns about the Project Applicant, the commenter is referred to Master Response 3 - Operator Responsibility.

With regard to concerns related to water resources and drought, please see Chapter 4.8 of the DEIR, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, Master Response 35 - Discharge to South Fork Wolf Creek, Master Response 36 – Flows in South Fork Wolf Creek, and Master Response 16 – Drought and Climate Change.

NEVADA COUNTY
PLANNING DEPARTMENT

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- WATER IS A LIMITED RESOURCE IN DROUGHT RIDDEN CALIFORNIA. RISE WILL BE TAKING WATER AWAY FROM OUR EXISTING RESIDENTS & NATURAL LANDSCAPE IN ORDER TO MINE & PROFIT FROM THEIR GOLD.
- THE C.E.O OF RISE GOLD WAS CHARGED WITH ENVIRONMENTAL VIOLATIONS IN CANADA. WHAT'S TO STOP HIM FROM DOING IT HERE?
- OUR RESIDENTS & COMMUNITY HAVE MOVED ON FROM BEING A GOLD RUSH TOWN. SKILLED WORKERS WILL HAVE TO COME FROM OUTSIDE THE COMMUNITY. THE MINE WILL CAUSE TRAFFIC, NOISE, & TOXIC POLLUTION.

B 219-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed. PROFITS WILL GO TO INVESTORS NOT GRASS VALLEY.

Sincerely,

Mark Reilly

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- BAD TRACK RECORD OF RISE GOLD
- NEGATIVE EFFECTS OUTWEIGH THE JOBS TO BE GAINED. WE CAN GROW JOBS IN WAYS THAT DON'T DAMAGE OUR COMMUNITY

B 220-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- LOSS OF GROUNDWATER DURING A HISTORIC DROUGHT
- DEGRADATION OF LOCAL ENVIRONMENT
- POTENTIAL CONTAMINATION WHICH ALWAYS HAPPENS AND IS NEVER REMEDIATED.
- LACK OF LOCAL INTEREST & CONTROL IN CORPORATE GOVERNANCE.

B 221-1

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 1/23/2022

Dear Supervisors Heidi Hall, Ed Scofield, Dan Miller, Susan Hoek, and Hardy Bullock,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Environmental Impact Report and subsequently voting to approve or not approve the project. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

- AIR POLLUTION
- TOO MANY TRUCKS
- WASTE WATER ISSUES
- TOO MANY HEALTH ISSUES,
- DON'T THINK THE WORLD NEEDS MORE GOLD.

**B 222-1**

I am resident of Nevada County and observe that Rise Gold Corporation lacks respect for the impact of their mine project on the environment and the people of Grass Valley. I hope you will be among those who will be known to have opposed the well-funded deception Rise Gold Mine has developed.
