to the board of supervisors of nevada county,

i am writing to urge the board that you must insist that PG&E must bury all of the power lines in nevada county. we have been without power for coming on two weeks now due to the recent storms, and the work on north bloomfield has been very slow at best. not only will that address the issues of downed trees cutting power, but also will eliminate the summertime fires that occur from any number of sources connected to PG&Es powerlines. this proposition has been in discussion for far too long with no movement on addressing the matter. it's time for you to act.

similarly, it is also time for the board of supervisors to end, once and for all, the petition to reopen the idaho-maryland mine. rise gold continues to promote disinformation about the mine with impunity. i have written numerous letters on the matter, and i urge you once again to think beyond what little tax revenue and what few jobs that enterprise will ultimately deliver, and send those bums back to canada.

yours in magnanimity,

jim haynes

DO NOT reopen the mine. My ancestors worked (including head engineer) the mines here for generations, since 1863. Preserve what little beauty is left of this county. For once DON'T let money rule the day

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Patricia Fuenzalida. I live at 14574 Sunrock Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

As a home owner residing in District 1 I must implore you all again to not approve the re-opening of the Idaho-Maryland Mine. We have read and researched so much on this very controversial proposal and could not be more appalled at the idea. There is nothing of substance to be gained and so much to lose. We can look back at history both decades ago and more recent to see the hugely detrimental impact the mine would have on our communities, quality of life, property values, health and precious environment. The track record of Rise Gold is abysmal and we fail to see how anyone could trust them. Mining should stay in our history! We need to look forward to other more productive ways to create jobs in our communities. This is not it!

Sincerely,

Patricia Fuenzalida

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Amy Phillips. I live at 404 Nimrod St, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My house is in district 1. I've lived in Nevada county since 2005, and one of the things I like the most if our natural environment. This mine will be a disaster for residents nearby, for well water consumers in the larger area, and for our limited groundwater supply in our chronic drought (which one wet winter does not resolve). Rise Gold has a track record of misinformation and environmental problems; the studies they have done to try to prove the safety of the mine are flawed. Mining companies come in, take their profit and leave their mess behind for residents to deal with for decades after. Yes we need good paying jobs but not at the price of people's health and quality of life. A few temporary jobs are not worth the damage that will be done - there is no clean way to extract gold from the ground, and we will all suffer the consequences of contaminated water. Don't let them fool you - put a stop to this money grab!

Sincerely,

Amy Phillips

Dear Nevada County Supervisors and Planning Commissioners,

My name is Anita Wald-Tuttle. I live at 6 Rockwood Drive, Grass Valley., CA 95945-5607 530-277-6195 anitaw1t3@gmail.com, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

At the present time I live in District 3, but moved to this area in 1989 and helped run our business, The Tanglewood Forest, for 26 wonderful years. This community has blossomed and draws visitors from near and far to enjoy the culture, dining, and outdoor pleasures that abound. It is too precious to lose to heavy industry and very limited benefits if any. Please say "NO" regarding the permit. The people who elected you into your offices need to know that you are listening to them and will safeguard this wonderful area for a long, long time.

Sincerely,

Anita Wald-Tuttle

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Ashley Hall. I live at 15169 Lewis Rd., Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in the Willow Valley area in District 1, about a mile from downtown Nevada City since 1978. During that time, I have witnessed many changes in our beloved Nevada County. Despite all these changes, I have noticed that some things have remained pretty constant. We live within and around functioning forest ecosystems and we have a strong sense of community. I have also witnessed how long it takes for human and ecological communities to recover from the legacy of gold mining. Now, gold mining is once again threatening to disrupt these qualities. As an industry, gold mining is one that typically takes more from local communities than it gives back. It is a well documented fact that gold mining is among the lowest job creators in U.S. industry. Independent analyses of the RDN report reveal that it projected contributions to Nevada County's economy by the proposed reopening of the Idaho Maryland Mine are based on data that is "sketchy, at best" and are grossly

exaggerated. Perhaps more important, It is also well known (particularly in a place like Nevada County) that gold mining produces a toxic legacy. Mining industry expert Dr. David Chambers questions the characterization of the geochemical composition of waste rock that will be produced as a result of the mine: the sample size was too small and the use of distilled water to the samples does not render an accurate understanding of how rainwater, which tens to be more acidic, will leach toxins from mine tailings. Along with these examples, there are many others that provide ample evidence that the environmental impacts of the mine do not justify the meager contributions to our economy. As a long time resident, college educator, and the father of two young children, I urge you respectfully and in the strongest terms to reject the proposal to reopen the Idaho Maryland Mine.

Sincerely,

Ashley Hall

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Beth Moorehead at bethpm65@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Beth Moorehead. I live at 118 Jan Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

District 3, Washington Heights.
My husband's family moved here during the Depression to work in the mines. They were not fun places to work, it was brutally hard and dangerous. If they were alive today, they'd question the motives of re opening a mine. They did what they could to get OUT of the mines. This will benefit a handful of Canadians, that's it. We will be left with the environmental damage for decades.
I cannot believe ANY of you would fall for this. I vote in every election and often help with campaigning. If any Yes votes come from this board, you can be assured I'll be vocal about my displeasure. Alternatively, a NO vote will ensure my support in future elections.
You cannot allow this mine to re-open, it's a major loss for our town.
There are alternatives to finding jobs for 100 people. My husband's company, for

instance, is hiring engineers with high levels of education to work in Grass Valley, luring them away from the Bay Area. People love living here! Be creative, don't go for the low lying, environmentally horrific fruit.
Thanks for your consideration.

Sincerely,

Beth Moorehead

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Brian Ward at gregward1@prodigy.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Brian Ward. I live at 13120 Wood Rose Way, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My name is Brian Ward. I have lived at 13120 Wood Rose Way since 20000. My property is located very close to the Brunswick entrance to the mine property. I am concerned about excessive noise, increased traffic, air quality degradation, contamination of Wolf Creek and the list goes on and on and on. I am asking that you vote NO on allowing the mine to re-open. Nevada County has allowed residential neighborhoods to be developed all around the mine and a large industrial project such as the Mine should not be allowed to open and operate in what is now a residential neighborhood.

I am also concerned about the impact the mine will have on property values. The Economic Impact Study that you commissioned is flawed in many ways. One of the flaws is in regard to property values. The mining communities chosen for the case

studies are in no way similar to Grass Valley and should not be used to determine if property values could be impacted. Further, the study discounted the opinions of hundreds of Realtors who have stated that property values would decline if the mine were to open. Who would know better about property values than Realtors..

Please vote NO and save our beautiful community from being ruined.

Sincerely,

Brian Ward

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Chris Vaughan. I live at 121 Orchard Street, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The FEIR’s conclusion that water quality impacts related to mine waste will not be significant is
unsupported. The Water Board made it clear in Draft EIR comments that more rock testing is
needed to assess the likely concentration levels of hazardous elements in the rock to be mined.
The FEIR’s plan for storing and disposing of mine waste has extensive gaps, creating a risk for
long-term mine water pollution similar to what this community has seen in the past.
● Rise Gold’s project plans to deposit 1000 tons of tailings and waste rock per day on the
Centennial and Brunswick sites for the first 11 years. After that, the plan is to

dispose of it via
off-site sales. However, only waste classified as Group C can be used for engineered fill deposits
or off-site sales. The more hazardous Groups A and B require special handling. The FEIR asserts
that “mine materials will likely be classified as Group C”, but its conclusions rely on just 11 feet of
drill core samples.

● The FEIR does not provide adequate provisions for the storage of Group A or Group B mine
waste, which will be required by the Water Board. Since any waste that is not Group C cannot be
used for engineered fill or off-site sales, viable alternative strategies must be defined. The FEIR
introduced a new suggestion that if not Group C “...the waste rock would be placed underground”,
but CEQA requires storage of Group A or B mine waste underground to be reviewed in a Draft
EIR.

● This extensive set of gaps in mine waste management also introduces uncertainties about Rise
Gold’s ability to operate by disposing of mine waste from off-site sales.

Sincerely,

Chris Vaughan

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of David Agran at dagran@sbcglobal.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is David Agran. I live at 13755 Quaker hill cross rd, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

As I said after reviewing the deir. There are a couple key reasons why just so no is the only option that is good for nevada county and especially grass valley and banner Mtn. And the watershed downstream.

1) an 85 year permit to a bankrupt company being litigated against by the Canadian govt and first peoples and I think the state for going against their word and commitments and not being safe and polluting pristine areas and then not cleaning up the mess but instead declaring bankruptcy and then fleeing the country. Since past behavior is THE best predictor of future behavior (just ask anyone who runs your credit report why they do that before they trust you) does not seem a worthy partner to jump in bed w for 85 years.

2). What if they are wrong. BP Texas offshore deep water horizon thought they were safe. They were wrong. The challenger disaster those experts thought it was safe to launch. They were wrong. Three mile island disaster those nuclear scientists thought they were right. They were wrong. What's that big dam about an hour away near yuba city that failed a few years back those experts said the spillway was safe. They were wrong. I live on banner Mtn about 3 miles from proposed mine tunnels. I have an ole mining shed and air vents on My property. I have been her 15 years I have a low producing well that's getting worse. With drought nearly universal. What if after they drain millions of gallons water from underneath me and my well goes dry. Are you gonna promise in writing that you are gonna take care of me. If my well goes dry what if they are wrong. The final EIR is already proving that their experts are already. wrong. Are they happy to buy solidly fully financed insurance policies for clean up and mitigation for harm done to the community and its members like me for the next 125 years.

3). The environmental and sustainability goals that you all set. There are bad outcomes and potential harm to each goal from the mine. Good governance has no place for "yes men and yes women"! who say yes to everyone's ask jistbto please everyone (or curry favor) . Are you really a hypocrite or do you just play on o. The commissions dias. Don't do that. Especially when the mine clearly goes against long term health and well being. We the community anre here for ever. Not just 85 years to rape and
plunder the earth and leave us holding the Messy bag to clean up, once they leave or sell to an even lessScrupulous mining company

4). Mining is our Glorious past but not our future. Back in the glory days. There were not over15,000 people living within a few miles and close to downtown.

This is pure folly. Just say no. Thank you. It's your only ethical and value driven choice if you truely support the community and our safety and security

Jist say no. Thank you.
David agran.

Sincerely,

David Agran

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is dean olson. I live at 13075 Woolman Lane, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Besides its huge impact on our local environment and community structure, it also adds insult to injury when we are presently becoming aware of what mining did in the destruction of the Nisenan Tribe in our area, the confiscation of their land, and the almost total destruction of their food sources and the ecology of our area.

There are too many precious areas of our environment that are already under severe stress, besides the water table and the grassland and forest areas. We have lived for twenty years on the Sierra Friends Campus, the Woolman Program, a 240 acre working farm and educational facility. We went through the Jones Bar Fire, had massive destruction of areas of woodland besides many of our buildings burned completely to the ground, with only the metal roofs left on the ground and stone chimneys like tombstones.

The last thing we need is another assault on this sacred land and water table and environment by a mining operation.

Sincerely,

dean olson

Environmental impacts unavoidable - The FEIR lists several significant and unavoidable
environmental impacts that endanger this community's health and quality of life. These include
aesthetics, traffic, and noise. There are also serious deficiencies in the FEIR that put the County
and its citizens at even greater risk. Key deficiencies are shown in sections 2-6 of this document. https://www.minewatchnc.org/post/the-county-should-deny-the-idaho-maryland-mine-and-should-not-certify-the-final-eir

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jade Mariconi. I live at 14689 Towle Ln, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live right across the street from the mine, off Brunswick. I am new to the area, just bought my first house and I didn’t understand that the mine could actually open again. That would put me and my family at risk for exposure to toxic heavy metals, effect our beloved land and water shed, and create 24 hr noise pollution. Please, please, please don’t do it. I am raising two young sons and we are finally living a safe and wholesome life here in Nevada County, and I really don’t want to leave.

Sincerely,

Jade Mariconi

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Janet Miller at janetsm@pacbell.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Janet Miller. I live at 10401 Jitney Lane, Grass Valley, California, US 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My husband and I have lived in Grass Valley since 1986, in District 3. We moved here because I had been hired as a computer engineer by Mitsubishi R&D Center (which left Nevada County in 1995). Our two sons grew up here and attended the local schools and graduated from NUHS.

The more I learn about Ben Mossman, the more I oppose the re-opening of the Idaho-Maryland mine. His Yellow Giant gold mine in British Columbia, from which he released mine waste and contaminated water into creeks, ponds and wetlands, was shut down after one year of operation (L.A. Times 6/24/22). His apparent disdain for the people to be affected by reopening the mine, shown by the flawed environmental and economic impact reports (YubaNet, 12/16/22 and Minewatch, 12/4/22)

reinforces my opposition.

Regards,
Janet Miller

Sincerely,

Janet Miller

Dear Nevada County Supervisors and Planning Commissioners,

My name is Larry Strauss. I live at 13084 Golden Trout Way, Penn Valley, CA 95946.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in Penn Valley and spend time in the greater Grass Valley area often. I drive by the ponds outside the old Empire mine still being used to cleanse the earth of the harmful minerals associated with mining. I also lived in the Rocky Mountains where mining remnants and clean up persists to this day. Company's provide assurances that 'this time it will be different.' I don't buy it. One accident is all it will take to destroy the environment.

Create jobs by enticing small manufacturing. Raise taxes if funds are needed to effectively operate the county. But, please, do not approve this mine.

Sincerely,

Larry Strauss

Dear Nevada County Supervisors and Planning Commissioners,

My name is Lesley Estes. I live at 10377 tillicum, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live off Old Downieville in district 1. I spent my 30 year career in water quality regulation implementation for local government. I reviewed more EIRs than i can count and have participated in the creation of many EIRs. I know how they can be misleading, inaccurate and biased despite best efforts and especially when benefits are dependent on ongoing mitigation measures. The vast majority of time mitigation measures require significant government oversight therefore government resources, always more than anticipated.
Over time these resources dwindle and violations are missed and mitigation becomes non existent within just a few years. I've seen this over and over again, despite best intentions. Time becomes the friend of the exploiter and the exploiter is fully aware of the future limitations of government oversight. Sometimes it's just best to be cynical of mitigation measures and simply weigh the possible risks vs. benefits.

The risks and impacts are possibly severe, the benefits are questionable and minimal at best. Why risk it?

Sincerely,

Lesley Estes

Dear Nevada County Supervisors and Planning Commissioners,

My name is Maciel Dotson. I live at 14941 Julia Ranch Road, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in district three off of Greenhorn road. I’m deeply concerned that reopening the mine will cause a significant threat to our local environment. We do not have the infrastructure to support heavy duty equipment running on our roads 24/7.
Along with that is the grave danger of lowering the water table. Water is precious here in California and people in the area close by the mine have already had to re-drill their wells. I urge the Supervisors and Planning Commissioners to make the right choice for our community and say no to reopening the mine.

Thank you,

Maciel Dotson

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is MaryBeth Fitzsimmons. I live at 15443 Orchard Springs Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We've lived in Chicago Park since 2006, moving here to enjoy the natural beauty and rural lifestyle of Nevada county. We rely on our groundwater. We don't have confidence in a Canadian mining company to make environmentally sound decisions over profit. There are many alternatives to job and tax growth in the county. Please show respect for the long term health and well-being of Nevada county citizens and do not approve the mine.

Sincerely,

MaryBeth Fitzsimmons

Dear Nevada County Supervisors and Planning Commissioners,

My name is Micah Panzich. I live at 17986 Wallis Drive, Grass Valley, California 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a new resident to the area. I have bought a house in Grass Valley. I understand that mining was a part of Nevada County's past but it should not be a focal point for the future. My wife did not decide to move here after 25 years in another location - because there is a past in mining. We moved here because of the beauty of the area, and the energy of the area. Although jobs and revenue are at stake - there is no telling what money will need to be spent to care for the damage this mine could cause - or the amount of money lost long term to a town that cowards behind a few dollars. Look long term. Do not let such a small benefit out weight the long term health of a vital community. How could we even consider gambling with the health risk this could cause. Green jobs - this mine is laughable and a disgrace. Say no to the mine. Do not let this happen.

Sincerely,

Micah Panzich

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Reed Hamilton. I live at 13310 Nannas Way, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 4 and have been a county resident for 40 years. I am retired now but owned businesses here from the 1980’s to my retirement a few years ago. After examining the DEIR and the FEIR and doing considerable reading, I have concluded that there are too many unanswered question and defects in those documents and the economic analysis report commissioned by the county to approve this project. The county and its citizens are assuming too much risk in regard to regulation of the mine, traffic, air pollution, water pollution and well dewatering, and real estate values to allow an underfinanced junior company with a poor track record to begin such a project without further financial and regulatory guarantees. I ask you to reject this application as it stands and require a new one with new documents to address the many question.

Sincerely,

Reed Hamilton

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Rhonda Harmon. I live at 17170 Oscar Drive, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have been a Nevada County resident for 23 years. I moved here in 2000 after college to be with my then new husband and his family. That makes our two teens—now 14 and 17–fifth generation here. Tracing their lineage back, their great grandparents helped to found the North Bloomfield area. They were the owners of the North Bloomfield Hotel in it’s golden days. I’ve even slept on a bed at my in-law’s home that came out of that Hotel. That means that my children’s heritage is not only in Nevada County, but it is also in mining.

Today is a different era. Given what we know about the impacts of reopening of a mine in our area would realistically be, I adamantly oppose the reopening. The detrimental effects on our air, water, noise pollution, and overall quality of life is just not worth it, even in the best case scenario. In the worst case scenario, it moves

from ‘not being worth it’ to being a potential catastrophe. The negative impacts that it will have on our property values and on tourism would be absolutely devastating as well. Please, for the sake our our sweet town and for the future I hope my children can enjoy, I say NO! to reopening the Idaho Maryland Mine.

Sincerely,

Rhonda Harmon

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Sam Diaz at sldiaz09@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Sam Diaz. I live at 505 Long Street, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live near Pioneer Park in District 1. I have lived here since 2010. I lived in District 3, west of Condon Park from 2007 to 2010. I moved here to start a family in a place where I could raise kids in a quiet, safe town. There's nothing about this mine that feels quiet or safe. Extra truck traffic and the pollution that comes with it is the last thing we need.

Air quality will be significantly impacted. We live in an area where smog from the valley settles already and out air quality is poor. We don't need more industrial exhaust, dust and other air pollutants this mine will create. Dust from rock crushing and transporting ore are a significant risk to air quality and human health that will add to what we've got already.

The mine will also discharge pumped groundwater into Wolf Creek, changing the base flow and flood hydrograph, increasing bank erosion, and potentially polluting it with whatever else comes out of the shaft. I can only postulate on what effect this dewatering will have on wells surrounding the mine, but I imagine dewatering the mine could only lower groundwater levels and thereby reduce residential well supplies.

There's too much risk associated with this mine for it to be worth it. It is definitely going to negatively impact quality of life for residents of western Nevada County, and environmental health. Claims by mine proponents that these effects are negligible are not substantiated. The mine company is painting a falsely positive picture so they can pursue gold. It's an old story and we already know how it goes. We will suffer the environmental degradation and industrialization of our quiet town for the profits of a company. I urge you to reject the mine proposal.

Sincerely,

Sam Diaz

Dear Nevada County Supervisors and Planning Commissioners,

My name is TJ Davis. I live at 240 Boulder Street, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1 in Nevada City. I am writing this letter as I am concerned about my friends and neighbors located in the Greenhorn & Brunswick areas. This mine will destroy the water table and pollute the environment and will never make a lot of money or create a lot of jobs.

Sincerely,

TJ Davis
greenisgreat@att.net

Dear Board Members

I am a resident of Nevada City having moved here 4 years ago. Looking for the peaceful nature filled atmosphere that resides in this lovely little town. I own my own residence at 547 W. Broad St. I have grave concerns over the proposal to reopen the Idaho-Maryland Mine. This is the worst thing that could happen to both the Grass Valley and Nevada City Communities as it will cause extreme catastrophic environmental devastation for decades to come. What or who benefits with moving forward with this decision??? Certainly not us as they destroy our air water and land quality. We have been in a drought for over 3 years! California is always talking about running out of water. How in the world can we allocate gallons and gallons of water for this endeavor? We have had numerous power outages because our electrical grid can't accommodate the every day usage of the citizens of our two towns. How do we allow this company to come in and drain/tax the electrical grid that is already struggling? We are headed into fire season. The dangerous combustibles this company will be using puts us at risk for an explosive fire risk. If that should happen and people should die in the fire who is responsible for this tragedy? The mining company or the board who ok'ld this preposterous proposal to reopen the mine. When we are left with toxic unlivable conditions for the soil with arsenic, copper, elevated concentrations of metals on these acres of land who is responsible for the failed clean up? Which will cost millions of dollars. The company who grabbed the gold and got out of town or the board members who allowed this to happen? And then it's to late! You can't go back and undo your decision. It's going to be a done deal with devastating ramifications for decades to come. The entire community is begging you not to let this happen!!! If you owned a home in this area would you allow this to happen?

There have been numerous articles daily in "The Union" with reasons to vote no on this decision. Wednesday April 7th "Building sight needs right clean up" by Paul Halstead. Regarding planned development at 10780 East Bennet Road. Please read as now this area is a toxic mess "not suitable for residential land use or other exposure scenarios" Do we want to create more acres of land where it is extremely contaminated soil prohibiting any use of the land or should we be activists protecting human health and environmental well being .

The Letter to the Editor in April 6ths Union "Mine water usage makes no sense" also a great article stating why we shouldn't reopen the mine just with the regards to our water situation.

April 7th The Union " Storms batter aging power grid as climate disaster spreads" Clearly states Californias power shut offs since 2017. We are vulnerable to this and yet we would allow a mining company to come in and "de energize the grid"????

And of course all the articles warning us of fire season, being prepared, evacuation routs etc etc.

This proposal should have never even been allowed to be brought to the table as it is obviously to destructive to our communities. Please listen to all the voices that have come forth with valid great concerns. We who reside here love this community and are compassionate for the environment it provides us in this very special place we call home. Please honor it as we do. As Robin Wall Kimmerer states in her "Braiding Sweetgrass" book "Never take more than you need and always say thank you" What a different world this would be if we followed that simple way of life. Let's live in harmony with nature and spend time and energy to heal the earth from poor decisions and ways of life that have caused such great harm. I invite you to read the book as it will alter the way you look at life-I promise for the better ... Thank you for taking the time to read my letter. Sincerely Sharon Lipski 414-477-7057

Storms batter aging power grid as climate disasters spread

By Matthew Brown, Camille Fassett, Patrick Whittle, Janet Mcconnaughey & Jasen Lo
Associated Press

Power outages from severe weather across the U.S. have doubled over the past two decades, as a warming climate stirs more destructive storms that cripple broad segments of the nation's aging electrical grid, according to an Associated Press analysis of government data.

Forty states are experiencing longer outages — and they're worst in areas where weather is getting more extreme, data shows. The blackouts can be harmful, even deadly, for the elderly, disabled and other vulnerable communities.

And power grid maintenance expenses are skyrocketing as utilities upgrade decades-old transmission lines and equipment. So customers hit with more frequent and longer weather outages also are paying more for electricity.

"The electric grid is our early warning," said University of California, Berkeley grid expert Alexandra von Meier. "Climate change is here."

The AP found:

— Outages tied to severe weather rose from about 50 annually nationwide in the early 2000s to more than 100 annually on average over the past five years.

—The frequency and length of power failures are at their highest levels since reliability tracking began in 2013 — with U.S. customers on average experiencing more than eight hours of outages in 2020.

—Maine, Louisiana and California each experienced at least a 50% increase in outage duration.

—In California alone, power loses have affected tens of thousands of people who rely on electricity for medical needs.

The AP analyzed electricity disturbance data submitted by utilities to the U.S. Department of Energy to identify weather-related outages, including how long they lasted and how often they occurred.

Driving the increasing blackouts are winter storms called nor'easters that barrel into New England and shred decrepit electrical networks. Summers bring hurricanes that pound the Gulf Coast and Eastern Seaboard, plunging communities into the dark sometimes for months. And in fall, West Coast windstorms trigger forced power shutoffs to protect against deadly wildfires.

MAINE

The grid's fragility hit home for Lynn Mason Courtney, 78, a blind cancer survivor in Bethel, Maine. When her retirement community building lost power and heat for three days following a 2020 winter storm, the temperature inside fell to 42 degrees (6 degrees Celsius). She developed hypothermia.

"Two people on oxygen had nowhere to go. They just stayed in the apartment and hoped like hell that the power would come back on," Courtney said. "If you're disabled, it's scary. You're not safe."

Maine suffered record numbers of weather-related interruptions in recent years. Storms left more than 500,000 customers without power in winter 2017 — more than a third of the state's population.

As the planet warms, extreme weather that threatens power reliability will likely hit some areas harder, said Penn State University meteorologist Colin Zarzycki.

A warmer atmosphere holds more moisture, increasing energy packed by storms. The phenomenon produces more destructive tropical hurricanes in the Southeast and storms that cause flooding on the West Coast.

"Those really high-end nor'easters, the ones that take over CNN for days, those are going to occur with the same or increased frequency," Zarzycki said.

LOUISIANA

After Hurricane Ida knocked out power in coastal Louisiana last year, heat killed or contributed to deaths of at least 21 people, local coroners reported.

David Sneed, 65, died in the 12th-floor apartment where he'd been without power for several days after the storm hit Aug. 29.

Sneed was obese and had a cognitive impairment, so he usually used a wheelchair, said Rev. Ken Taylor at New Orleans Baptist Theological Seminary, where Sneed was a doctoral student.

Taylor checked on Sneed after the storm and said his apartment felt like 100 degrees (38 degrees Celsius). Six days after the storm, the power was back but when Taylor visited he got no answer.

Sneed's body was found in his apartment, slumped in his wheelchair. He died from the heat, the coroner ruled.

"I speculate that he had rolled into his bedroom to put on some pants to go downstairs," Taylor said.

The financial toll is steep. Louisiana regulators approved $3.2 billion in charges from hurricane damages in 2020 and 2021, which utility Entergy Corp. estimates will cost the average residential customer almost $100 annually for 15 years.

Most U.S. power transmission facilities are at least 25 years old. Utilities have quadrupled spending on them since 2000 to about $40 billion annually, according to Department of Energy data.

Billions more are set to be spent, with costs borne by consumers. Yet the effort won't keep up with climate change, said U.C. Berkeley's von Meier. "Rates will go up, reliability will go down," she said.

CALIFORNIA

Almost 200 California wildfires over the past decade were traced to downed power lines. Among them, a 2018 fire that ripped through the Sierra Nevada foothills town of Paradise and killed 85 people, resulting in criminal convictions of Pacific Gas and Electric Co., the nation's largest utility.

Now when windstorms and dry conditions are forecast, utilities cut power preventively. That's potentially life-threatening for people with medical equipment that requires electricity.

An AP review of California utility filings found almost 160,000 power shutoffs to customers with medical needs since 2017.

Utilities have sought to lessen the impacts by distributing portable batteries and setting up centers where people can charge essential devices.

PG&E Vice President Sumeet Singh said shutoffs are a last resort and have been reduced in size in part through better forecasting of hazardous weather. "We know there has been a trade-off between safety and reliability," Singh said.

By year's end, PG&E expects to have spent almost $15 billion since 2020 on wildfire prevention. It's cutting back vegetation near equipment and plans to bury 10,000 miles (16,000 kilometers) of lines over 10 years so they won't be exposed to falling trees.

For now the shutoffs are set to continue.

Richard Skaff, a paraplegic and advocate for the disabled in Northern California, said he endured two forced outages each lasting five days. He had a generator to keep his electric wheelchair powered and house heated, but said others with disabilities live on minimal incomes and struggle during outages.

"If we're going to allow PG&E and others to de-energize the grid...you have to determine the effects on the most vulnerable people," Skaff said.

Building site needs right cleanup

OTHER VOICES
Pauli Halstead

In 2019, Geocon Consultants Inc. prepared a removal action work plan for the city of Grass Valley for a proposed planned development at 10780 East Bennett Road, in the city's sphere of influence.

"A portion of the site was historically used as a sulphuret works," according to the plan. "This past use has resulted in contaminant (metals) impacts to shallow soil on the site that prospective site developers will need to understand and plan for prior to development of the Site. Other small hot spots of elevated arsenic and lead concentrations exist in shallow soil on the site as well."

The purpose of the work plan was to evaluate the nature, source and extent of contaminant impacts and health risks. The plan outlines three alternatives for the removal of 8,600 cubic yards of arsenic and lead contaminated soil, mitigate risk, and prepare the site for development.

The plan states that without mitigation of health risks by minimizing exposure to arsenic and lead in the contaminated soil, baseline conditions in all assessment areas are not suitable for residential land use or other exposure scenarios, for example, industrial, commercial indoor and construction workers.

Geocon divided the site into three assessment areas. The following metals are identified as constituents of concern and are included in the risk characterization:

- Assessment Area 1: arsenic, lead, mercury.
- Assessment Area 2: arsenic, barium, copper, lead, mercury, selenium.
- Area 3: (site of sulphuret works), arsenic, cadmium, chromium, copper, lead, mercury, silver, zinc.

To begin removal of contaminated soil, there will be a 30-day public comment period to allow the public to review the draft final plan and provide comments. Fact sheets will be mailed to the community notifying them of the comment period and a display advertisement will appear in the local newspaper announcing the comment period.

Following the public comment period, the Department of Toxic Substances Control will respond to comments in a responsiveness summary. The department will then either approve the plan as final or modify it in response to comments.

"Since the primary constituents of concern are present at elevated concentrations in soil on the site and arsenic also exists naturally at elevated concentrations in underlying soil and bedrock, it is impractical both physically and financially, to remove arsenic and lead from the site."

Therefore, Geocon has proposed three alternatives for the protection of human health and the environment.

ALTERNATIVE 1

This alternative — No Action — would not provide suitable protection of human health under the current or future land use because no measures would be taken specifically to mitigate exposure to constituents of at concentrations exceeding local background levels or applicable health risk-based screening levels.

Under this alternative, trespassers could be exposed to arsenic at elevated concentrations in soil at the Site through direct contact, ingestion, and inhalation of dust.

This alternative may be suitable under the current inactive use if the Site is fenced and warning signage is posted regarding chemical hazards. No cost!

ALTERNATIVE 2

Excavation and offsite disposal of impacted soil and mine waste and replacement with clean imported soil would provide the greatest overall protection of human health and the environment.

Transportation of the impacted soil and/or mine waste would potentially increase short-term exposure to receptors along the transportation route from airborne dust generation and spillage. Cost: $946,028 (2019 estimate).

ALTERNATIVE 3

Consolidation and containment by capping, Alternative 3, would provide good overall protection of human health and the environment for potential future residential use on Assessment Areas 1 and 2 and commercial/industrial uses on Assessment Area 3 through elimination of the exposure routes to arsenic and other metals at elevated concentrations on the accessible portions of site.

However, this alternative would also require administrative controls of the land use on the capped portion through a land use control plan on the title and maintenance of the cap in accordance with an operational use program. Cost: $423,083 (2019 estimate) plus $51,000 for long-term maintenance.

Capping soil creates a forever monitoring program which is more likely to be more expensive than anyone can foresee.

If we are going to build housing on the site, wouldn't we want Alternative 2, which provides "the greatest overall protection of human health and the environment"? Let's not cut corners when it comes to human health and the environment.

My question: What prevents underground water flows from creating toxic plumes of arsenic and lead under the cap on Area 3, the sulphuret works? Alternative 3 moves all the contaminants to the downhill slope across from the Empire Mine State Park's "grasslands," and the watersheds of South Fork Wolf Creek and Little Wolf Creek.

Pauli Halstead is a Nevada City resident.

Letter to the editor

Mine water usage makes no sense

My chief concern about the Idaho-Maryland Mine Proposal is the additional environmental burden it potentially puts on our community. Diverting millions of gallons of water into Little Wolf Creek while California is experiencing drought conditions statewide in a fire prone region is reckless, I think.

We are all aware of the devastation fire brings to heavily forested areas like ours. We've lived without electricity and cut back on our own personal water usage hoping to avoid the devastation that fire brings. Fire season is now year-round. Then, we turn around and allow a private company to drain our precious water away! Dewatering any region during a years long drought makes no sense to me.

We need water. We don't need an industrial mining operation in the middle of our community compromising our ability to survive.

The promises of environmental mitigation presented by Rise Gold management are not reassuring based on their track record. This mine proposal is environmental havoc we can avoid.

Supervisors, please be good stewards of our community and deny this very flawed proposal from this very flawed company. Our quality of life is at stake.

Re: Reopening of Idaho-Maryland Mine

Dear Planning Commission:

I am writing to express my strong opposition to the reopening of the Idaho Maryland Mine (IMM)! As a resident of Nevada County since 1974, Past President of the Nevada County Board of Realtors, Realtor Emeritus, founding Board Member of the Nevada County United Way, founding board member and past board president of The South Yuba River Citizens League, past Assistant Superintendent of the Nevada County Juvenile Hall, past assistant Director of the Nevada County Council on Alcoholism, and past Chairperson of the Nevada County Juvenile Justice Commission I believe I have a very clear understanding of what makes Western Nevada County the desirable community it is. Reopening of IMM will cause permanent damage not only to our local environment and unique quality of life, but also have a long term negative effect on real estate values throughout Western Nevada County.

I have spent several weeks reviewing the Draft Environmental Impact Report completed for Rise Gold. Draft EIR there are numerous findings defined as having "SIGNIFICANT AND UNAVOIDABLE IMPACTS", See pages 1006 – 1009. The final sentence of this section referring to traffic cues reads, "Thus, the EIR conservatively concludes that the impact would be significant and unavoidable." A careful reading of <u>all</u> impacts in this section are in fact significant and UNAVOIDABLE! As I understand the EIR rules, we are supposed to just accept these unmitigable impacts?? The current Draft EIR makes reference to numerous unknown, and seriously scary, potential impacts, solutions for which will need to be developed AFTER the mine is up and running. In numerous places throughout the DEIR (pgs. 577, 543, 544, 1016 to note just a few), the report refers to potential future problems which would need to be dealt with once the project is operating. I was heartened to see that Rise proposed using "sawdust and kitty litter" when petroleum products are leaked into the Wolf Creek Watershed. In the section called "Collapse" (pg.573), it is noted that significant impacts could occur for which mitigation measures would have to be developed "prior to construction". Dewatering of the mine raises many unknowns which could only be dealt with at the time of failure. (In fact this type "solution" is referenced throughout the DEIR. Rise Gold repeatedly states that they will deal with issues as they arise, we are being asked to trust that they will. (Nowhere does Rise share with us their financial capability to remediate any of the potential problems of this project.)

Please also note that within the DEIR Rise asks for the right to amend Final Parcel Map #85-7 recorded 1/87. They do not state why they want to amend this map. This subdivision map illustrates near surface workings, where a home built on one of the parcels suffered a major collapse. The map also makes reference to faults in the area. Given Rise's desire to move ahead I do not trust their motives for requesting the map change. On page 567 of the Draft EIR it states, "Therefore, a significant impact could occur with respect to being located on a geological unit of soil that is unstable, or that could become

unstable as a result of the project, and potentially result I an off-site landslide, lateral spreading, subsidence, liquification or collapse...."

Last month Ben Mossman sent a letter to Realtors throughout Nevada County touting the safety and lack of risk delineated in the DEIR. Clearly that is how he sees this project. I could enumerate many additional, questionable conclusions and assumptions in this DEIR – they run throughout the document.

In my humble opinion, the reopening of the Idaho Maryland mine will negatively impact, and irreparably harm the future Western Nevada County.

Thank you.

Re: Idaho Maryland Mine/DEIR/Rise Gold

Public Comment from Charley Brock, Real Estate Broker:

This comment is to state my concern and opposition to the reopening of the Idaho Maryland Mine. Having completed a thorough reading of the Draft Environmental Impact Report, it is my opinion that numerous impacts of this development and its 80 YEAR permit, would inflict serious, **unmitigable** impacts on the County of Nevada.

Rise Gold and their consultants will have you believe that ALL environmental impacts of this mine reopening can be mitigated. This is simply not true! The DEIR refers to impacts that are labeled "SIGNIFICANT AND UNAVOIDABLE". Rise Gold states repeatedly that they will deal with issues as they arise. Will they deal with the dangerous release of greenhouse gas and airborne asbestos? I think not. Local physicians have reviewed the DEIR and come to the same conclusion regarding the massive emission of greenhouse gasses and cancer inducing levels of asbestos.

I am resubmitting a letter previously submitted to the County that references numerous specific disastrous effects that will come with approval of this project. What can go wrong in 80 years? Don't be hood-winked into thinking that Rise Gold (a company with an abysmal environmental history), is capable of bringing Nevada County a project that will be anything other than an environmental disaster.

Note that Charley has been a Realtor in our county since 1980, knows that market values throughout the western county will be negatively affected if the mine is approved (see the MineWatch documents from County real estate agents.

Thank you.

Sincerely,

Charles Brock, Real Estate Broker

Spoken Comment for Nevada County Planning Commission

November 10, 2022

My name is Martha Turner and I live at 10860 Dolores Drive, Grass Valley, Supervisor District 3. I am a retired Nurse Practitioner and Nurse Midwife, I've lived mostly in Nevada County since 1960. I contributed a formal comment on the Idaho-Maryland Mine's DEIR regarding Wildfire at the special Planning Commission's meeting last March.

I speak today in opposition to the reopening of the Idaho-Maryland Mine which I understand you all will have influence on the Board of Supervisors decision making.

I consider why I continue to spend my time and resources working in opposition to the reopening of the mine. It is because it's abundantly clear that if this heavy industrial complex were to open, so close to our towns, life as we know it will be forever damaged.

If each of you were to look at a compilation of the dozens of articles written and published in the Union over the past couple of years, you would understand that there are many intelligent and thoughtful people in our community that speak for the vast majority of us who oppose this mine. The SCIENCE IS CLEAR. It is also clear that this is a non-partisan issue for it will have an impact on every one of us who live here and breath air. It will not only be detrimental to our lives now but the lives of our children and grandchildren, for generations to come.

The CEO of Rise Gold Grass Valley, which is a Canadian mining company wanting to open the Idaho-Maryland Mine, is Mr. Ben Mossman. Perhaps some of you have heard about his legal troubles from the last mine he was president, CEO and operations manager of?

It was the Yellow Giant mine, up near Prince Rupert Sound. It filed for bankruptcy and closed in 2015, shortly after enforcement officers from Environment and Climate Change Canada, found mining waste in the woods and wetlands surrounding the mine.

He is facing criminal charges in the British Columbia courts. I checked today and learned from news postings that Mossman's appeals have been

rejected and a new trial will go ahead. This is the same man who would be at the helm of the Idaho-Maryland Mine. His actions speak loudly.

This is my hometown and I love the quality of life we have. THIS is why I will continue to work hard to prevent this mine from ever reopening.

Thank you very much for hearing my comment.

County

Commissioners and Staff,

I am here again with a quick update on Stop the Mine activities as the return of the massive DEIR looms. For the record, I'm Jim Bair, 21-year County resident, former Planning Commissioner and business owner in Grass Valley.

In case you didn't see the front-page headline in The Union on Sept 28, it was,

*"They [our children] will be around their whole lives breathing this toxic soup' *: Mine impacts scrutinized during public forum".*

The headline was based on Dr. Jeff Kane's presentation on 80 years of air pollution after the Mine's mitigation measures. The news article went on to say that we had a standing-room only attendance at the Universalist Unitarian meeting hall. Attendees included government officials and community leaders.

Approximately 100 were in attendance and most stayed until 7:30 with lots of comments and questions. Not one was for the Mine.

We have heard some questions repeatably, for example:

> "Why is this project even being considered?
>
> "I'll certainly vote against it." (They can't).
>
> "It violates CA State code, why isn't that a show stopper? [Section 41700 of the CA Health and Safety Code presented by Dr. Chris Newsom]".

A major action item presented was a request that the County recirculate the Idaho-Maryland Mine Project DEIR because there are too many significant and unavoidable negative impacts that cannot be mitigated (for example, the air pollution as described by Drs. Kane and Newsom at the Forum)"

The success of the Forum pointed to overwhelming County opposition to the Mine.

Thank you, I sincerely appreciate this opportunity.

To attendees: "Raise your hand if a you are against the Mine.

[Thanks to our panelists: DR. Chris Newsom (MD), Dr. Jeff Kane (MD), John Vaughan (CIO), Reverend Sharon Delgado & Head of Earth Justice Ministry, and Tim Ogburn (retired CA State EPA), moderated by me, who all garnered very complimentary feedback, and the Task Force Teams.]

The **Forum slides**, the Mine Economic Impacts Study, and other important docs are on the Universalist Unitarians Web site [https://www.uugrassvalley.org/justice/stop-the-mine-task-force/]

CALIFORNIA HEALTH AND SAFETY CODE

- " Section 41700 of the CA Health and safety Code states that a person must not discharge from any source whatsoever quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public; or that endanger the comfort, repose, health or safety of any of those persons or the public; or that cause or have a natural tendency to cause, injury or damage to business or property. Section 41700 also applies to sources of objectionable odors."

Hey Anita!

I haven't got much to say right now, so let's keep it short and to the point:

Nevada County Sunrise is made up of students and youth in the community who adamantly oppose the reopening of the Idaho Maryland mine. It is in the worst interest of youth and future generations to even be considering such a destructive operation in our community. It is our goal to adopt the 2030 United Nations Goals in our community and we urge you to make it your goal as well. These goals should be reflected in your policy and processes and a mine shouldn't even be on the table. Please do better.

Nevada County Planning Commission – November 10, 2022

State opposition to reopening of I-M mine

Could speak about the many flaws of this proposal – air pollution, noise & traffic, energy drain, lowering of the water table, loss of real estate value, destruction of wildlife habitat etc.etc.

Instead – I'd like to ask a few simple questions: If this horrendous proposal ever gets approved, I'd like to know – What are the benefits? Whose lives would be improved? How would our community be strengthened?

We are no longer a gold rush town or a mining town. The Idaho-Maryland mine hasn't operated since around 1956 or 1957 … and nearly 70 years later, GV & NC thrive in different ways.

People live here and tourists come to visit because of the flavor of our community …. Music, theater, history, beauty, the feeling of small town connectedness that's so prevalent here. All of these items are invaluable assets that can't be measured on a chart or a ledger sheet. … And we certainly, under no means, want to lose these assets.

Rise Gold claims it would help us economically … but I cannot believe this is so. In fact, if a heavy industrial project such as an operating gold mine running 24/7 ever struck Grass Valley, I believe it would drive people and businesses away in droves.

Seems to me, if the county wants to grant an 80 year lease to mine gold, they full well better be certain that the company's management has a reputable track record … Yet truth be told, this company has never operated a successful gold mine. They tried it up in Banks Island B.C. a few years ago but they had to close it down when they were caught illegally dumping contaminated effluent into local waterways. The management didn't stick around too long afterwards. Instead they declared bankruptcy and left … and now … they're in Grass Valley.

Prosperity is more than numbers, more than figures on paper. It's an expansive state that ideally wraps around everyone, every being … businesses, workers, residents, wildlife, our ecosystem, the well-being of our whole community. And if we want prosperity, we cannot have a destructive gold mine operating anywhere near us.

We are living in a time of worldwide angst … with climate change, COVID recovery, loss of civility, misinformation, wars, famine etc. It's a lot to shoulder. But living in a strong community such as ours helps us to bear the load. We're fortunate to live in such a community and for that I am grateful … so please, let us preserve and enhance the treasures we already have in GV & NC … the treasures that keep us together and feed our spirits.

Thank you.

Comment to Nevada County Planning Department
~~July 12, 2022~~ November 10, 2022
Christy Hubbard
12966 Mink Court
Grass Valley, CA 95945

Good ~~morning~~ afternoon. My name is Christy Hubbard. I'm a Grass Valley homeowner, a volunteer with the CEA Foundation, and a leader in the MineWatch campaign.

Let me begin by saying thank you for the important work you are doing in evaluating both environmental and economic impacts of the Idaho-Maryland Mine. Today, I'm here to expand on the information Ralph Silberstein just shared about community opposition for this mine.

I think we're all growing deeply weary of Rise Gold's misrepresentations of the facts. Last year, there was the widely criticized, heavily manipulated poll that concluded the majority of residents support the mine. Early this year, their glossy mailer proclaimed that the mine was going to be "green" while happily ignoring the huge energy use and greenhouse gas emissions they'll be generating. Even more alarming were assertions that "The County has determined that the project is safe" – implying that a DRAFT environmental report was the final word on the subject.

Late in June, they hit a new low with their press release claiming the majority of the comments on the environmental report supported the mine. Come again? Are they serious? I distinctly remember sitting in the meeting you hosted on March 24 and being told that this was not the forum for "for" or "against" comments, but that we should focus our comments on the adequacy of the draft report itself.

But noooooo. Rise Gold needed a press soundbyte so badly, they decided to submit 1,600 reply cards and form letters that simply declared support for the mine. Hundreds of which were invalid. This is akin to stuffing a ballot box because people on the other side of the fight weren't even using the environmental report comments to cast votes.

Perhaps they can fool their investors, but they're not fooling us. Ralph just filled you in on the petition signatures and comments we're delivering today as independent evidence of community opposition.

But that's not the only proof we have.

- We counted 482 people in attendance at your DEIR comment meeting in March. Of the 101 who took tickets to speak, only one spoke in support of the mine.
- There's also 250 Nevada County businesses who have gone on record opposing the mine. Almost 150 signed a letter of opposition that was delivered to Supervisors in May. Another 100+ new names are included in the petition Ralph just delivered.
- Then there's the 168 opinion pieces published in The Union newspaper about the mine, only 8 of which were pro-mine. That's 95% opposed.

Bottom line. This community is overwhelmingly rejecting this mine. We sincerely hope you see through Rise Gold's inflated claims just as much as we do. Thank you.

Community Submits Petition Signatures Opposing Gold Mine

Over 5,500 Signatures From Nevada County Residents and Others

by **Community Environmental Advocates Foundation**
July 12, 2022

Grass Valley, CA – July 12, 2022 – Today, MineWatch Nevada County, a coalition effort spearheaded by the Community Environmental Advocates Foundation (CEA Foundation), announced that it has joined together with businesses, homeowners, conservationists, and others to obtain over 5,500 petition signatures and 1500 comments to showcase the community's opposition to reopening the Idaho-Maryland Mine. Signatures were collected in person and online through grassroots efforts such as information tables in front of local businesses and sharing via website and social media. The petitions were presented to the Nevada County Board of Supervisors during their regular board meeting on Tuesday.

RISE Gold Corp., a company headquartered in Canada, has proposed re-opening the mine in Grass Valley – an urbanized historic mining town. The long-shuttered mine sits just outside of the downtown, and a residential neighborhood has developed around the abandoned site.

"Despite Rise Gold's claims to the contrary, these petitions add to the growing mountain of evidence that the people of Nevada County are overwhelming rejecting the mine", stated Ralph Silberstein, CEA Foundation Board President. "Over a hundred volunteers helped collect these signatures. Many told me their job was easier than expected because it was extremely rare to meet anyone in favor of the mine."

Further evidence of anti-mine activism abounds. "No-mine" opinion pieces in the local Union newspaper outnumber "pro-mine" pieces 160 to 8. MineWatch social media groups are over 2,500 members strong. And almost 500 people attended the **planning commission meeting in March** to review comments on the Draft Environmental Impact Report for the mine – at 9am on a Thursday morning. Of the 101 who took tickets to speak, only one spoke in support of the mine.

Over 1500 of the people who signed online also wrote personalized messages to Nevada County Supervisors. The full collection was delivered today along with the petition signatures. Here are just a few samples.

"As a physician and Nevada County resident for 10 years, I am opposed to this mine [and] I urge you to oppose the mine. Please don't vote to destroy the peace, quiet, and beauty of our delightful town. This is the best place I have ever lived and worked. If this mine opens, I will move, and you'll have one less doctor here."

"A hundred years ago a mine was appropriate. Now we are dependent on tourism and attracting people to a clean and quiet place. The mine site is surrounded by 1-5 acre parcels, [with hundreds of them] on a well. Approval of a mine in this situation opens the county up to a financial disaster."

"As a water policy specialist, I know the impacts of mining and the value of water in this climate change vulnerable region. Water is more precious than gold, and with its terrible track record Rise Gold should not be allowed to come anywhere near our watersheds which could easily be further degraded and depleted by this mine."

"As a renter, property owner, and leader of a soil health/agriculture non-profit, all in Nevada County, I strongly object to the proposal to reopen the Idaho-Maryland Mine. I'm very concerned about the impacts on water quality and underground water sources, including the impacts that polluted wells would have on our surrounding farms and food supply. I urge the Board of Supervisors to protect our community, our environment, and our economy and reject the proposed mine."

Of the over 5500 people who signed the petition, over 85% were Nevada County residents. Another 5% were from neighboring counties such as Placer, Yuba, and Sacramento. 6% were tourists or visitors.

For more information about the potential re-opening of the Idaho-Maryland Mine visit: www.MineWatchNC.org

advocacy to promote responsible land use and environmental protection policies in Nevada County. CEA Foundation is the sponsor of MineWatch, a campaign that brings together a coalition of nonprofit organizations, residents, and businesses opposed to the mine.

CEA: Businesses urge County Supervisors to reject Mine proposal

150 local business leaders sign on to letter

by **Community Environmental Advocates Foundation**
August 19, 2022

Grass Valley, CA – 150 business leaders from Nevada County submitted a letter to the Nevada County Board of Supervisors. The letter includes businesses located in downtown Grass Valley and from diverse sectors in the County including tourism, agriculture, and real estate. In addition, nearly 100 business owners also signed a petition to the Board of Supervisors, for a total of 250 businesses opposed to re-opening the mine.

The long-shuttered Idaho Maryland Mine is proposed to be re-opened by Rise Gold Corp – a company headquartered in Canada. A Draft Environmental Impact Report (DEIR) was released in January. In response, many hundreds of comments were submitted by citizens to the County expressing serious concerns about the risks of the mine and the inadequacy of the report. The County Board of Supervisors could consider this issue as early as 2023 after a Final Environmental Impact Report (FEIR) is issued.

The letter states:

"Mining is our past, not our future. During the past 50 years, Nevada County has worked diligently to attract people and investments that contribute to and renew its economic vitality through promising and sustainable enterprises which align with the aspirations of its residents. That is what continues to make this County an attractive place to live, to make a living, and to start new business ventures."

Residents and businesses have expressed concerns about the potential economic impacts of the mine, including impact on tourism, property values, and tax revenue, and high-tech companies.

Many businesses offered quotes expressing their opposition to the Mine. "This mine is on track to have a potentially significant impact on our regional flora and fauna, water quality, and even local culture," stated Fable Coffee. "Rise Gold's ethical practices are questionable; we simply do not know enough to say this is safe – but we know enough to say that this community is not ready to open Idaho-Maryland Mine. There are better, more innovative, and more regionally respectful ways to enhance our economy."

Nevada County's agricultural sector is growing. With over 350 farms, tourists flock to farmers markets, and local farm-to-fork restaurants to experience fresh food grown by local farmers and prepared by local chefs.

"Grass Valley and Nevada County are known for our local farms and businesses," said Mike Pasner, Owner of Indian Springs Organic Farms. "We need to invest in our already existing sustainable businesses."

Nevada County was once the epicenter for gold mining. The big mines shut down in the 1950s, and mining is now less than ½% of the local economy. The County, particularly Grass Valley, is now considered a scenic and cultural destination.

Residents contend that the few jobs that might be gained are offset by big risks to tourism, high tech businesses, private wells, and 10's of millions lost in property values.

"Real estate values and the quality of life in Nevada County will suffer permanent and irreparable harm if the mine is allowed to operate," stated Charles Brock, Real Estate Broker. "I have read the Draft EIR for this proposed project, and there are many unanswered and unmitigable issues which, in my opinion, will destroy the fabric of life as we know it in Nevada County."

The letter outlined key economic points and concerns, including:

The County could do better by continuing to invest in existing industries and new enterprises that address current priorities in the Sierra, like watershed and forest management.

Other industries can produce far better economic growth numbers than mining, including eight industries Nevada County already has today.

An economic study commissioned by the City of Grass Valley during Emgold's attempt to re-open the Idaho-Maryland Mine in 2008 concluded that Nevada County would be better off economically if it pursued other opportunities than mining.

The Draft Environmental Impact Report (DEIR) was released in January and while it is not required to include an analysis of the economic impacts, Nevada County has commissioned an independent economic impact report. The letter also urged the County to include consideration of a non-Mine alternative in their Economic Study. Because the DEIR will most likely have to be recirculated, the study is expected to be released after potential changes in the project description have been assessed.

The public can view pictures of several businesses opposed to the Mine on the website **www.MineWatchNC.org** or on the MineWatchNC Instagram account at **minewatchnc**

Re: Idaho-Maryland Mine

Dear Mr. Kelley:

Mine Watch brought to my attention that Rise Gold used my email address fraudulently. In their June 29th press release: *Rise Gold Reports Majority of Comments on Draft EIR Support Idaho-Maryland Mine.* It states: "The County received approximately 2,850 comment letters during the comment period of which the majority (~1600 comment letters) expressed support for the Project." Five of those comments supporting the mine (attached) appear to be from me. I did not send them. I do not support the reopening of the mine.

It's called "spoofing" and maybe Rise thought: "No one will find out so what harm can it do?" They aren't very good at it because in the email sent to "Planning" they neglected to delete a Mr. **Elijah Bloom's** name on the header and also "**myvoice@oneclickpolitics.com**" in the *From* field. There are two to the BOS (sent at the exact same time, so one is a duplicate) and two to you, Mr. Kelley. I realize the comment period is closed but since three went to your department I felt I should notify you that these emails were not legitimate. Apparently, there were other fictitious emails sent using other mine opponents' emails, not just mine.

I have not been able to get any answers from Rise or One Click Politics so I had no choice but to close my email account that I had for over 25 years.

This does not involve the actual operation of the mine but it does show that Rise Gold is not acting in good faith.

Sincerely,

Holly Rose

OTHER VOICES
Holly Rose

Alan Riquelmy has a clever headline for his July 12 article: "Panning for support for the mine; Rise Gold and advocates spar over level of opposition to plans to reopen Idaho-Maryland."

But there are errors and omissions.

"Other mine opponents claimed their email addresses had been used to submit comments in favor of the mine."

"'Not just once,' said Sharon Delgado, 'but three times.'"

I'm not "claiming" they used my information. They did. I presented five actual emails to each supervisor at the meeting. I believe they were also provided to Alan prior to the meeting.

There are many people that Rise is claiming supports them, not just Sharon Delgado and myself, that are documented signers of the no mine petitions. MineWatch has the exact number — nine, I believe they said, each probably having more than one entry. I would think mine supporters would want to follow up that they don't have fraudulent support letters/comments. They can check with MineWatchNC.

Jarryd Gonzales, spokesman for the Idaho-Maryland Mine project, said duplicate comments exist on both sides of the mine issue.

Those numbers were taken from the county," he added, noting that 56% of the comments favored the mine. "What you'll find is there are more duplicates on the side of CEA or MineWatch."

Concerning opponents' emails being used in support of the mine, Gonzales said an email was sent to the county whenever someone visited the project website and completed a support form.

Documentation shows Rise's numbers should be the only ones in question. I guarantee I never completed a support form and Rise's numbers still include their duplicates and fictitious emails, not MineWatch's. With everything presented at the meeting, how did Alan get it so backwards?

MineWatch has meticulously gone through and deleted all duplicates so their numbers are accurate.

That was stated at the meeting and specifically told to Alan, I believe.

Rise's July 29 press release says it has 59% support. The article states Mr. Gonzales is now claiming 56%. Is Rise actually changing their numbers or was that a typo?

I was relieved to let the Board of Supervisors know what Rise is up to and was told The Union reporter was going to cover it.

People need to know that our email information and addresses are being fraudulently used in Rise's numbers and we have no idea how many are fake.

They somehow have my residence address, which I don't give out, except for voter registration. It's not rocket science to figure out that support numbers Rise claims are incorrect.

Holly Rose lives in Grass Valley.

OUR POLICIES

LETTERS TO THE EDITOR

Letters are limited to 200 words. Kudos must be 100 words or less. Please include your name, address and phone number.

OTHER VOICES

"Other Voices" may be 500 to 750 words in length. Please include your name, address, daytime phone number and a paragraph at the end describing yourself.

EMAIL TO

letters@theunion.com

The Union accepts one submission per author, per 30-day period, although an opportunity for rebuttal will be granted on a case-by-case basis. Due to length, letters to the editor are often able to be published sooner than Other Voices submissions. In the interest of clarity, The Union only accepts electronic submissions. Selection of letters and Other Voices for publication is at the discretion of the editor. The Union reserves the right to edit for length, clarity and content on all submissions. All submissions become the property of The Union.

DO NOT !!!

I support re-opening the Idaho-Maryland Mine.

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

RECEIVED
NEVADA COUNTY
2022 APR 12 PM 1:30
PLANNING DEPARTMENT

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual earnings of more than $122,000 including benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jumpstart our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Re: Use of my name, without my permission by Rise Gold in comments on the DEIR

Dear Mr. Kelley,

Thank you for talking with me last week regarding the use of my name (and others), in support of Rise Gold, without my consent. My name appears three times as comments in county documents related to the Idaho-Maryland Mine DEIR as emails saying that I am in support of re-opening the Idaho-Maryland Mine. Nothing could be further from the truth!

I am asking the county, if possible, to retract the fallacious comments which have my name on them. I am asking that this letter be included in the comments if retracting them is not possible. I am asking that the planning commissioners and Board of Supervisors be informed that Rise Gold used my name, and many others, multiple times and are now using these falsified numbers to unethically boost their claims that there is huge support for the mine by Nevada County residents.

I will continue to pursue the matter with Rise Gold and work with other community organizations to fight this unethical company from reopening the mine and damaging our community.

Respectfully,

Martha Turner.

Dear Matt Kelley,

The opening of the mine is a scary topic to think about. Will I be safe when I go outside? Can I drink my own water? There's an endless amount of questions that everyone is all wondering. I believe that Grass Valley should not open up the mine because it will pollute our county. I have lived here my whole life and I do not want to get sick or move out because of the mine.

Water is one of the most important things for the human body. That is not something to mess around with. Mines can ruin our drinking water and can make everything around it unhealthy. According to WMAN, "More than 40 percent of stream reaches in western watersheds are contaminated by acid mine drainage and heavy metals." Do you want to be part of that number? Mining is proven to make the water harmful. Almost everything in the world relies on water. And we're just going to ruin it all. "Cyanide used at these mines to leach gold from ore resulted in such high levels of pollution that people can not use nearby water resources until they have been subjected to extensive and expensive treatment." (Sciencing) If the mine does open, they have a lot of water to take care of. According to Mine Watch, "3.6 million gallons of treated water will be released every day into South Fork Wolf Creek for 6 months, then 1.2 million gallons a day after that." That is a lot of water being dumped into the river, but the real question is: Is it really treated enough? Going through millions and millions of gallons throughout the years, they would start to slack off about the water. Our county loves our salmon and our environment. According to WMAN, "Mining also can cause erosion, and sedimentation, burying gravel beds important for salmon spawning and damaging habitat for trout and other species that depend on clear, cold, oxygen-rich water." We can not afford to impact the Earth anymore. Humans already have caused overpopulation, deforestation, glacial melting, and so many other things that are not fair to our Earth. "The mine would result in staggering increases in greenhouse gas emissions: 9000 metric tons annually." (Mine Watch) One one hand, mining will provide more jobs for people, but, after a storm we always have to cut down huge trees. And we will just leave the remains at times. Instead, you provide jobs to cut down or clean up trees after a storm or fire. It will help the environment, and California is known for its fires. We can't be

doing whatever we want anymore. We have to stand up for our planet. I want to drink out of my faucet, without hesitating to take a sip.

I do not want to go outside and wonder how many years will be taken off my life by breathing. The air is already unhealthy here, and we can't afford anything worse. According to Mine Watch, "Grass Valley already gets an "F" for air quality today. The mine will make it worse with escaped dust from continuous rock crushing, loading, hauling, unloading, spreading, and compacting." We're just throwing dust around everywhere. Maybe one day, it will be unsafe to go outside. According to WMAN, "Hundreds of thousands of rock are unearthed, moved, and crushed in mining operations, significantly increasing the amount of dust and particles in the air. In addition, mine tailings, which may contain finely ground and even toxic waste, can become airborne." You could be killing your town, and slowly, the world. Fossil fuels help with global warming, air pollution, and much more. "The machines used to mine the Earth for gold are often powered by fossil fuels, adding to the air pollution produced by the gold mining agency." (Sciencing) Some people say that mining promotes a more efficient use of energy, which would save people money. But, instead we could stop spending money on useless things, or we could use the washer and dryer less, or turn off the air conditioner and heat when you don't need it. According to Spark Energy, "If you have a heat pump and use it a lot, you may run it somewhere between 10 and 15 hours a day. If your electricity costs 10 cents an hour, that could cost you $15 to $22 a day." If you take a step back, it would save you lots of money. When people find out what you are doing to us, they won't want the mine either. It's not safe to be ruining our town, and our people. "Nevada County's death rate from chronic lung disease is already twice the state average." (Mine Watch) It's not fair to open up the mine and destroy everything for some money.

The calmness of our town is what attracted new people over, but with the mine, all of that would go away. You may think that the mine will be a benefit, but really, it comes with major losses. "The peace and quiet that brought homeowners to this beautiful area will be shattered. Constant truck traffic, vibration, and noise from blasting and heavy equipment will become the new normal." (Mine Watch) These are your people. And mining could quite literally kill them. According to WMAN, "National cancer statistics also have been shown elevated death rates from cancer--particularly lung, bronchial, and trachea cancer--in areas of the Clark Fork Basin where mining has occurred." We're a small county, a death from mining would not be forgotten. Not to mention that homeowners also pay taxes to the county. If the mine opens up, your taxes will go down. According to Mine Watch, "Real estate professionals and appraisers tell us that property values will drop in the surrounding community by 5-20%, resulting in 10's of thousands of dollars lost in home equity for each home and adding up to 10's of millions of dollars lost across the total number of homes impacted." While some people might argue that it will boost the economy, however, you could just have more tourists or new homeowners instead. But for this, it's one or the other. Nobody will want to visit or buy a house if all they hear is heavy equipment/the mine. According to CDC, "Noise above 70 dB over a prolonged period of time may start to damage your hearing." Not only that, but the CDC also shows " The biggest

offenders in underground mines are typically drills, especially the percussive pneumatic variety which can produce noise levels of up to 115 dB." That is way over the amount someone should be hearing. You're just drawing your town away. If the mine does open, I might move away.

I am just a 12-year-old girl, I should not be worrying about the future of myself, my friends, and my town. I care about the Earth a lot, and I don't want to see pollution of air, water, dirt, life, anymore. If you do open up the mine, you are letting people of all ages suffer, of fear, and sickness. It's not fair that I would be in danger at all times, because of something that I couldn't control. So that's why you should not open up the mine.

Sincerely,

Laima Ositis

Nevada City, CA 95959

Dear Matt Kelley,

Have you ever thought how many chemicals and different substances go into the ground for mining? There's mercury, lead, cyanide, nitric acid, sulfuric acid and arsenic. All of those substances are bad for us and the environment. Breathing in the dust particulars produced by the mining can which can lead to lung cancer. The most common form is black lung disease, which is caused by the miners because they breathe in the coal dust. You can also get respiratory disease. We need to stop the mining industries from opening in Grass Valley CA.,

Rise Gold Corp needs to be stopped because 15,000 people are dying each year from mining! Mining is increasing the level of volume and rate of exposure of sulfur containing rocks to air and water, creating sulfuric acid and dissolved iron. The acids are running off of heavy metals such as copper, leading to mercury which leach into groundwater aquifers. Mining can also lead to soil pollution, deforestation, groundwater pollution, loss of biodiversity, and landslides will become more likely to occur. The average amount of money a miner gets an hour is $23.92. Glencore had made $203.75 billion US dollars in 2021 for polluting the earth! According to Minerals Make Life it states that with an annual salary of $96,000. Miners do not make any money unless they find a bloc of gold! This needs to be stopped because they work their butts off trying to find gold and don't get anything.

The five steps to mining are exploration, mine-site design and planning, construction, production, and closure and reclamation ,crushing and grinding, flotation and oxidation, leaching and adsorption. There is underground mining, open surface (pit) mining, placer, and in-situ mining. I think that mining should be stopped entirely because it is polluting the earth. Mining is not good because it can contaminate the surface water, soil erosion, and loss of biodiversity according to World Atlas.

There are a lot of health risks due to mining industries and the workers.Miners are likely to end up with pneumoconiosis which is a type of lung disease because of the exposure to airborne respirable dust The average amount of money a miner gets an hour is $23.92.

It can also damage the environment around it just to get this tiny tiny bit of gold. We need to stop hurting ourselves, the water we drink, the habitat, and permanently scarring up the land. The downside to this argument is we would not be able to use automobiles to drive us to school, grocery stores, gas stations etc…, both gas and electric would disappear coming from johnsons service group. 27 states would lose 25% of their electricity just from stopping mining.

Here are some ways you can help stop mining by yourself: reuse mining waste, Lower-impact mining techniques, Eco-friendly equipment, shutting down illegal mining. You should think about how you can stop mining and what the benefits and the downside of mining is because there are good benefits of stopping mining and bad benefits of stopping mining. I hope you enjoyed reading this and learning about the good and the bad of mining. Maybe you put no mining sign in front of your yard or maybe you just started to think maybe we should stop mining.

Sincerely,

Izabella Hioki

Dear Commissioners Danny Milman, Laura Duncan, Robert Ingram, Mike Mastrodonato and William Greeno,

I, the undersigned, am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corporation. I understand that you will be reviewing the Draft Environmental Impact Report and advising Nevada County's Board of Supervisors before they vote on the matter. I have listened to both sides of the argument and find Rise Gold Mine to be inconsistent, misleading and manipulative. They fail to adequately mitigate many significant negative impacts of this large industrial project on my family, friends, neighbors, and businesses.

There are many reasons this mine should NOT be reopened. My personal reasons are:

I am a Nevada County resident and see that Rise Gold Corporation lacks concern for our environment and the people who live here. I'm confident that you will value my input and comments from thousands of other residents. I hope you will be among those who will be known to have stood against the well-funded deception that Rise Gold Mine has developed.

Re: Idaho-Maryland Mine DEIR Comment

January 18, 2023

The DEIR is incomplete, particularly in regard to its air quality section.

The DEIR Table 4.3-19 (p. 366) lists estimates of mitigated toxic emissions. That is, this is the best case scenario. The Report states that total mitigated emissions of airborne poisons will total 153 lbs daily during the first year of operation. It concludes, based on established standards, that this amount isn't significant. Maybe that is acceptable for a single day, but the Report fails to calculate cumulative emissions.

Grass Valley has long served as "Sacramento's tailpipe," as ozone-rich pollutants accumulate here daily as a result of topography and airflow. Pollutants ebb and flow like a tide, but we don't know how much of the mine's emissions will gradually accumulate over eighty years. It's irresponsible to dismiss this issue, and the DEIR is crucially incomplete in not addressing it. Simple mathematics (see attached page) shows that during the mine's operation its daily emission of known respiratory poisons will total 3,600 tons.

I included this fact in my comment to the DEIR. The Final EIR responded that there are no standards for the sum of all emissions. So the consultant explored no further. We don't know, then, how eighty years of daily exposure to an ultimate 3,600 tons of airborne poisons and carcinogens will affect our community. We'll thus be involuntary subjects in a long experiment. All we can confidently predict is that it will affect the health of Nevada County residents. The mine's poisonous airborne emissions will especially impair children's health. Current and future Nevada County children will absorb more of the mine's poisons than adults do, because of both their more rapid respiratory rate and longer exposure.

Seriously compromising the DEIR, this omission justifies the Planning Commission declining to certify it.

Dear Sirs,

I can not speak of the dangers and damage that will be done to Nevada County if the mine project is allowed to proceed.

The EIR report is full of holes that seem to be accepted on face value.The destruction to our lovely town and county will be irreparable.

They talk of mitigation as if those problems can be mitigated because they say "We will mitigate them." Take a look at history. The first problem will be water. All clean except for number 2 water? And if a person looses their well, let NID fix it.

My name is Joanne H. Harris and I have been a resident of Nevada County for 42 year.

My address is:

Dear Nevada County Supervisors and Planning Commissioners,

My name is Melanie Dixon. I live at 610 Brighton Street in Grass Valley.

As a conscientious citizen, **I am asking you to say no to re-opening the Idaho-Maryland Mine.** As you know, it has **significant and unavoidable environmental impacts that endanger this community's health and quality of life**. The risks are higher than any foreseeable benefits.

Thank you for choosing to work as a Nevada County Supervisor or Planning Commissioner. It takes a lot of grit to meet the changing needs and challenges of our community. Thank you for devoting your energy and your wisdom to this task.

I am a homeowner here in District 3. My husband and I own and operate a land maintenance and brush clearing business in Grass Valley. I have a child at Yuba River Charter School, and one who is a graduate of Ghidotti High School. I volunteer time and money to raise awareness of the local Nisenan Tribe, protect the Yuba River watershed and make our community a safer environment for LGBTQIA+ community members. I have lived here 10 years, and value it every day.

The mining history in Grass Valley is one of the most sordid aspects of our past. As you may or may not know, there were 7-9,000 Nisenan people living in the Grass Valley/Nevada City area in 1849, before the gold rush. 18 years later, in 1867, there were 500 Nisenan people remaining *(History of Us*, Richard Johnson, p. 6). That's a minimum of **6500 people murdered in 18 years, and a whole culture destroyed, so that gold could be mined out of this ground.** There are now about 150 living members of the Nisenan tribe, who are working to re-establish their identity, their land rights and their internal well being after such a massacre. That state sanctioned massacre was encouraged so that gold could be mined.

Now, there is a launch again to dig into the ground, to get this gold, and to do it whatever the cost. I'm not interested in supporting this kind of thinking. You've attended meetings with Rise Gold representatives. You've read the unsubstantiated EIR reports, claiming minimal environmental impact. It doesn't take deep assessment to see that the results from this company's previous mining extractions resulted in massive environmental devastation, followed by a declaration of bankruptcy and a failure to clean up the land. **Mining of this nature requires explosives, loud and toxic ore processing, heavy, loud trucks on our roads, toxic particulates in our air and sadness in our hearts at having lost sight of how to be real stewards of this community and this land.** It is our job as mindful recipients of information to research the claims of "non-harm" to the environment from such a company as Rise Gold and to see that the results in their track record indicate that our environment and quality of life would be devastatingly negatively impacted.

Have you ever lived in an active mining town? I have. In Utah. It's smelly, sad, unkind and not proud of itself. It's difficult to encourage generous behavior between people in a community where the economy is based on getting something from the earth that benefits the people but in turn, hurts the health of the land. **It creates unkind people.**

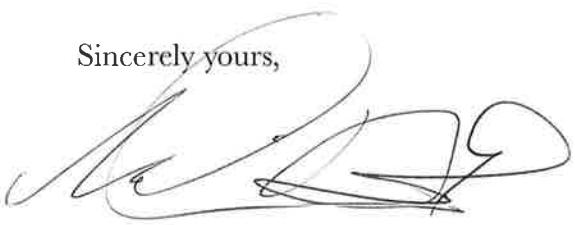
We live in what was previously a mining town. I tell you, I wouldn't have wanted to be here when extracting gold was the economic base. Everything I've read says it was a dangerous, mean-spirited experience that destroyed old growth forests, the indigenous people, the face of the river and the downstream farmland. Those aren't the legacies I'm committed to creating.

This mine would do different harmful things than hydraulic mining of the past. The results though, in the end, would be harmful.

There's not a lack of jobs in our community. **There's plenty of work here** for skilled labor, retail, tech and services. Let's keep creating work and community projects that have us feel proud to be citizens of Grass Valley, the way we steward our groundwater, river, clean air, calm environment, and our just and kind treatment of each other and our land.

Thank you for considering the voices of your constituents.
All blessings to your work and your role as our representatives.

Sincerely yours,



Melanie Dixon

This concerns the Final Environmental Impact Report (FEIR) for the Idaho-Maryland Mine Project. I have reviewed the responses contained in FEIR to see if the comments I made on the Draft Environmental Impact Report (DEIR) had been adequately addressed. They were not. Rather than repeat the entire content of my March 23, 2022 comment letter (designated #585), I will just address the major points.

Noise Response 585-3 and 4

My comment was on the DEIR's claim that the noise from the **engineered fill operation** 500' behind my house would be **less than** current ambient noise levels. I pointed out that currently there is just a forest behind my house with no mechanical or other human noise-producing activity of any kind.

Although my question is shown in the FEIR as being 585-3, the answer given was in Response to Comment Ind 585-2: "The noise analysis was not intended to imply that the project would result in an overall decrease in existing ambient noise levels at any sensitive receptors in the project vicinity. Rather, it was intended to imply that the noise generation of the project by itself would be below existing ambient noise levels experienced at the nearest residences."

How does that response answer my question? I did not say or imply that the project would result in an overall decrease in ambient noise. I asked how it was possible that 50-100 runs by diesel haul trucks dumping rock out of steel bed trailers, with the rock then being graded and compacted by heavy earthmoving equipment, 500 feet behind my house would be quieter than no activity at all?

Since there is no noise producing activity in the forest behind my house, the only possible noise source is traffic noise from Brunswick Drive, which is more than three times the distance from the proposed engineered fill operation and typically only used by passenger cars and pickup trucks. I wanted an explanation **on how it was possible** the fill operation will be quieter. It was not forthcoming.

Comment 585-4

According to the Noise and Vibration Study, mineral processing will take place 2,000' from my house. Table 22 has the predicted cumulative noise from all nighttime mine operations as being 26 db at my location. This means the study predicts that hoisting over 1,000 tons of soil and rock 85' above the surface and dropping it into a steel chute, then transporting it 335' on a

conveyor and grinding it down, will be quieter than an occasional car driving on Brunswick Road, which except for maybe crickets, is the only current nighttime noise source. I fail to see how any person or study could have come to this conclusion and wanted an explanation.

I have pointed these ridiculous claims and have asked these question four times now - in my scoping comments letter of August 11, 2020, in my March 23, 2022 comments on the DEIR, and in my verbal comments to the Planning Commission on March 24, 2022. **I have not yet received an answer.** All Raney Planning and Management had to do was ask Bollard Acoustical Consultants to explain how their claims are possible. But apparently they couldn't be bothered.

I made these points to prove the inadequacy of the sound study. **Maybe a judge will understand that a mine operating 24 hours a day cannot possibly be quieter than having no mine at all.**

Air Quality Ind 585-6 and 585-7

In my August 11, 2020, scoping letter I asked "What contaminants will be in the air exhausted from the mine shaft; where will the wind carry them; and where will the contaminants come down? What impact on the environment will these contaminants have during the 80 years the mine is expected to be open?" I further pointed out, "Although health impacts are discussed in Appendix E.1, after checking the draft EIR, Appendix E.1, and the Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan, I can find no mention or discussion of the effects of the exhausted contaminants over the 80-year life the mine is expected to be open."

The answer was, "A detailed analysis of airborne contaminants, modelled concentrations at receptor locations, and resulting health risk is provided in Chapter 4.3 and Appendix E.2 of the DEIR. The analysis in the DEIR concluded that air quality impacts from the project would be less than significant after implementation of required mitigation measures. (see DEIR Chapter 4.3.)"

and

"Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval."

Again, my question was not answered. The draft EIR did not contain the information I asked about which is why I asked the question in the first place. This is another example of the draft EIR and now final EIR being inadequate. 288,000,000 cubic feet of mine exhaust will enter the air we breathe each day, however we have been given no information on what happens to this possibly toxic exhaust, where it ends up, or what the long term effects are. Since the EIR did not provide the information I requested, I don't see how Raney Planning and Management can make the claim that "air quality impacts from the project would be less than significant after implementation of required mitigation measures."

Furthermore the meteorological data used was from locations between 17 and 22 miles away. Apparently the actual impacts of the mine and the health of local residents are not important

enough to warrant getting meteorological data from the actual mine site. Yet another flaw in the EIR.

Emergency Evacuations Ind 585-9

DEIR Section 4.7-4 states that the mine's impact would be less than significant with an adopted emergency response plan or emergency evacuation plan.

Raney's response in Master Response 5 – Evacuation Zones, includes "It would be highly unlikely that the mine site and Greenhorn area were subject to a mandatory evacuation order at the same time and the Greenhorn area could not use Ridge Road as an evacuation route." What are they talking about? Ridge Road is nowhere near the mine site.

Explosives Ind 585-11 and 585-12

In my comments I pointed out that the frequency given in the DEIR on delivery of explosives was in error and would be greater than shown. The answer I received was, "the transportation of explosives in the United States is highly regulated and has an excellent safety record. The analysis of explosives transport in Chapter 4.7 of the DEIR does not depend on the precise frequency of explosives delivery to determine the significance of hazards. Therefore, an increase in frequency would have no effect on the DEIR's conclusion that a less than significant impact would result from explosives transport, storage, and use, after implementation of mitigation."

The response is saying the danger to us residents doesn't change whether there is one truck load of explosives a day or one hundred truckloads. Tell that to the residents of East Palestine in Ohio where a train derailed. Accidents happen and it is not logical to conclude that the risk of an accident does not increase with the number of trucks carrying explosives that use our roadways.

I pointed out that the Hazardous Materials Inventory Statement did not list any detonators. This was not addressed.

Asbestos Ind 585-16

In response to my comments concerning wetting and covering working piles of engineered fill, Raney conveniently claims that engineered fill piles are not considered active storage piles and thus do not have to be wetted or covered with plastic:

"However, the engineered fill piles are not considered active storage piles for the purposes of Mitigation Measure 4.3-2, because the compacted surface of the engineered fill is much more resistant to wind erosion than a loose storage pile from typical construction."

I disagree. The piles are active as long as material is being dumped on them and vehicles are driving over them and compacting them. All those activities generate dust. Once they are finished they are not active. So my comments in Ind 585-16 have not been adequately answered.

Brunswick Site Native Resident Wildlife Ind 585-18

As I said in my comments on the draft EIR, the biologists made his conclusion based on a 1991 California Department of Fish and Game study. A lot has changed at the Brunswick site since 1991 including the shutting down and removal of the Bohemia Sawmill which ran 24 hours a day. I provided visual evidence based on a year of game camera placements, which proved that the Brunswick site holds a year-round native deer population where doe give birth to their fawns as well as numerous other species of wildlife.

The response to my comments just reiterated what was in the draft EIR and concluded with, "Any deer within or adjacent to the project site would move outside the project site and would be uninhibited to move into and out of the project site and the areas outside the project site. Thus, substantial interference, which is the operative language in Appendix G of the CEQA Guidelines, would not occur to deer movement. Impact 4.4-4 addressed the project's impact to this potential migratory corridor and concluded it would be less than significant."

As I previously pointed out, thirty-one acres of the 119-acre Brunswick site will be covered with engineered fill. To accommodate the fill, 18.7 acres of forested area will be clear cut. **This area is covered with game trails that the biologist chose not to investigate further or mention in his report.** Raney Planning and Management doesn't perform biological surveys, and no further surveys were performed. Raney relied on the prior biological study which was totally inadequate.

I believe the evidence I provided in my draft EIR comments proved the operation of a mine and clear-cutting the forest would have a **significant effect** on established native resident wildlife.

In closing it appears to me that no further studies were done and Raney Planning and Management did nothing other than to base its responses on prior inadequate information. That the County chose to approve a poorly prepared and inadequate EIR will be tested in a court of law. I am sick of dealing with this mine and the **significant negative impacts** it has had on my life without it even being open.

RE: Rise Gold proposal to re-open the Idaho-Maryland Mine

Dear Danny Milman,

Attached are 3 one-page summaries of information I hope you will find useful in your analysis of the Final EIR re: the Rise Gold proposal to re-open the Idaho-Maryland Mine.

The attachments are:

1) The FEIR and Economic Viability for "only a few decades"
2) The FEIR and the "normal" Mine approval process
3) Economics 101 and the RDN Rise Gold Economic Report

Although the Final EIR (FEIR) and the County's Economic Impact Report are two completely separate analyses, the FEIR made a number of economic assumptions that deserve your close attention. I believe the examples in these documents demonstrate a bias towards the applicant in the FEIR responses. My examples focus on FEIR responses regarding economics, but the apparent bias can be found throughout the FEIR responses, not just economics.

<u>The FEIR is inadequate and should be rejected.</u>

I would be happy to meet in person to review the contents if needed.

I respectfully request you **JUST SAY NO** to the Final EIR.

Thank you for your consideration.

Sincerely,

John Vaughan
District 3
55 year Nevada County resident

The FEIR and Economic Viability for "only a few decades"

The FEIR responses repeatedly say some form of: "The economic viability of the mine is outside the scope of CEQA" yet the FEIR responses routinely then attempt to provide an economic justification for the project based on speculation and without any data to support their conclusions. The FEIR authors should not attempt to provide editorial comments on a topic outside the scope of their expertise.

For example, the FEIR "Response to Agcy 8-42", which is from the City of Grass Valley, states in part "Long permit terms are commonly requested for large mining operations because they are capital intensive, and it is not economically feasible to invest tens or even hundreds of millions of dollars on a project, when the number of years in which to obtain return on that investment are limited to only a few decades."

First, where is the definition of "large mining operations"? What data is provided to support the FEIR speculation that the Rise "inferred resource"[1] of 108,400 oz/year is large relative to other mining operations? For example, look at Nevada Gold Mines, a merger of Barrick and Newmont which includes 6 mines in the State of Nevada creating "the world's single-largest gold producer", producing ~3.3million oz/year. The smallest of the 6 is Long Canyon with annual production at ~136,000 oz/year is being considered for sale as it is too small. The remaining 5 sites each average over 6 times the production of Rise's "inferred resource". In addition, the smallest of the top 10 gold producing companies world-wide also produces over 6 times the production of Rise's "inferred resource". Defining Rise as a "large mining operation" is speculation at best and pure guesswork at worst.

Second, "not economically feasible" is more speculation not supported by any research or facts. The data *provided by Rise Gold* in support of the recently published "ECONOMIC IMPACT OF THE PROPOSED IDAHO-MARYLAND MINE", prepared by Robert D. Niehaus (RDN) in Table 5-4 is summarized on the right:

Annual Revenue (based on 108,400 oz/year at $1,659/oz)	$179,800,000
Annual Expenses	$68,300,000
Net Income	**$111,500,000**

Now let's look at Net Income when, as noted above, the FEIR speculates "...it is not economically feasible to invest tens or even hundreds of millions of dollars on a project, when the number of years in which to obtain return on that investment are limited to only a few decades."

In fact, according to Rise's own data, they will have $1.15 BILLION in profit every decade for 80 years.

BILLIONS of Net Income	
10 years	$ 1,115,000,000
20 years	$ 2,230,000,000
30 years	$ 3,345,000,000
80 years	$ 8,920,000,000

Finally, the Startup & Construction costs of **$36.1M**, again using data provided by Rise, could easily be **paid off from Net Income of $111.5M in the first year of operation, not decades** as speculated by the FEIR.

Rise Gold Startup & Construction
(see RDN Report: Pg 51 commentary, Table 3-3 and Webinar Q&A #3)

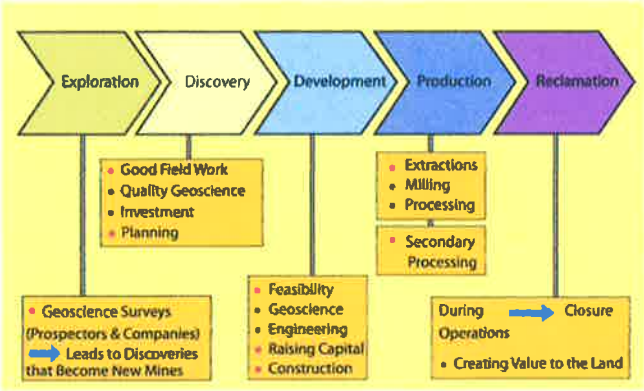
Assessed Value of Site Improvements	Pg 51		$12,500,000
Construction Direct Costs (Labor/Subcontractor)	Table 3-3, QA#3	Year 1	$10,100,000
		Year 2	$13,500,000
Total Assessed Value of Site Improvements + Construction Direct Costs			**$36,100,000**

Unless the FEIR is speculating it will cost BILLIONS to start up the project, which is inconsistent with the data provided by Rise for the RDN report, **the FEIR response does not match the facts** and makes no sense.

[1] See SEC Industry Guide 7 and https://www.crirsco.com/docs/rendu_paper_darwin2006.pdf Reporting Mineral Resources and Mineral Reserves in the United States of America

The FEIR and the "normal" Mine approval process

As shown in the picture (one of many available on the internet, re: the steps required to open a hard rock mine), the normal process for opening a mine includes (at least) the following steps: Feasibility Study, Exploration (which requires an EIR and permitting) and Production (which requires an EIR and permitting). Also see the Nevada County "USE PERMIT PACKET EXPLORATION / MINING / RECLAMATION AND ENVIRONMENTAL ASSESSMENT" form which clearly includes the option to request an exploration permit.



David Chambers, Ph.D., P. Geop., #GP972 (a recognized expert in the mineral exploration industry), one of the many DEIR commenters notes the following: "The mining project as proposed in this [Draft]EIR has a **fundamental lack of information** on the economic viability of the mine, and potential environmental impacts related to geochemistry and water quality. **The data submitted in support of this [Draft]EIR is only sufficient to support an application for dewatering the mine, and for underground exploration drilling.** This would provide not only the information that will be required to perform a preliminary economic analysis of the orebody, but also supply the samples needed for geotechnical and geochemical testing, and for water quality modeling. The [Draft]EIR should analyze an **Alternative that provides for dewatering and underground exploration. That is the only Alternative that the information provided in this [Draft]EIR will support.**" [emphasis added]

In this example, the FEIR does not bother with "...economic viability of the mine is outside the scope of CEQA" but jumps straight to (again) speculating "...not economically feasible..." followed by an attempt to defend the applicant by noting a list of "significant cost[s]" without any actual data to support their conclusions.

The FEIR response states: "This proposed alternative (exploration only) is not economically feasible because there is significant cost with dewatering the mine, including construction of a water treatment plant, installation of a potable water pipeline [for] affected well owners...underground access and safety improvements...to complete the...exploration phase. The proposed alternative would be economically infeasible because all the above costs would be incurred without the ability to produce any valuable minerals to offset that cost."

Dr. Chambers response (via email) to this FEIR comment: "**If you follow this simplistic logic**, mining companies would never ask for an exploration permit, they would just ask for a permit to mine, and then go start drilling to see if anything is really there. **This approach**, which is what is being proposed by the Idaho-Maryland proposal, **gives the mining company an enormous amount of flexibility, with minimum regulatory oversight**. Mining companies complain a lot about regulatory oversight, as well as having to communicate with the public. However, those regulatory requirements are there for a reason – mistakes have been made by mining companies that have led to financial and environmental losses to individuals and public agencies..." [emphasis added]

Independent of the fact that Rise is not following normal approval processes, the FEIR response is stunning, basically saying "we can't afford to follow the normal steps so give us a permit to open the mine...for 80 years".

As noted on page 3 of this packet (The FEIR and Economic Viability for "only a few decades") based on data provided by Rise Gold, the **startup costs of $36.1M can be offset over 3 times in the first year of operation.** In addition, the same Rise data forecasts a **$1.15 BILLION profit every 10 years.** With profits as high as claimed by Rise, attracting investors to cover startup costs would be easy. **If you believe the Rise data, *which is suspect at best*, claims of economic infeasibility do not stand up.**

Economics 101 and the RDN Rise Gold Economic Report

Commentary below is a high-level summary of the key issues with RDN's recently published "ECONOMIC IMPACT OF THE PROPOSED IDAHO-MARYLAND MINE". Table 5-4 is from page 52 of the report.

Table 5-4. Base Year Mineral Property Value Assessment – High-end Scenario (In millions of 2022 dollars)

Year[1]	Yearly Production	Revenue	Expenses[2]	Net Income	Present Value[3]
4	C 108,400	D $179.8	E $68.3	F $111.5	A $111.5
5	108,400	$179.8	$68.3	$111.5	$94.5
6	108,400	$179.8	$68.3	$111.5	$80.1
7	108,400	$179.8	$68.3	$111.5	$67.9
8	108,400	$179.8	$68.3	$111.5	$57.5
9	108,400	$179.8	$68.3	$111.5	$48.8
10	108,400	$179.8	$68.3	$111.5	$41.3
11	108,400	$179.8	$68.3	$111.5	$35.0
Total[4]	**867,200**	**$1,438.4**	**$546.1**	G **$892.3**	B_1 **$536.7**

[1] *Analysis uses Year 4 of the proposed project (i.e., first year of full production) as the base year*

[2] *Annual expenses during full operation were provided by RGV* — B_2

[3] *Applies a discount rote of 17% to account for the high risk associated with the mining industry*

[4] *Numbers may not sum due to rounding*

A	Table 5-4 shows the "Present Value" of the "Mineral Property" (also known as Mineral Reserves) over 8 years.
B_1	The total "Mineral Property Value Assessment" is stated as $536.7M in the "Present Value" column, which is used as the basis for calculations related to County Property Tax and General Fund revenue.
C	The Mineral Reserve calculation begins with the assumption that "Yearly Production" will produce 108,400 oz of gold every year based on the mine's history from the 1940's and 1950's. **It is not based on any current exploration data.**
D	"Revenue" is then calculated from 108,400 oz/year times $1,659 (which is the 2022 three-year average price of gold), resulting in total Annual Revenue of $179.8M.
E	"Expenses" of $68.3M (provided by Rise-see footnote 2) includes only Rise Payroll of $38.1M/yr (see RDN Report Table 3-1) and Supplier Expenses of ~$30M/yr (see Figure 4, of March 2021 Rise Economic Plan) and do not include depreciation of startup/shutdown costs, purchased equipment, mitigation costs, leases, or any other items normally found in an Income Statement. Page 51 of the Economic Report references the "CA Assessors Handbook Section 560" and notes "...the County uses an income approach to assess mineral property values." [emphasis added] The "income approach" as described in Section 560 requires all expenses, not just Payroll and Supplier costs. Therefore, the $68.3M Expenses provided by Rise are too low.
F	"Net Income" of $111.5M/year is the result of Revenue at $179.8M minus Expenses at $68.3M. Net Income is the basis for Mineral Reserve calculations. As noted, with Expenses too low, projected Net Income is high, leading to inflated County Property Tax and General Fund projections.
G	"Net Income" over 8 years is stated as $892.3M, just under $1 BILLION. Note: Based on Rise projected Net Income of $111.5M/year, Return on Investment = 63% which is unrealistic at best.
B_2	Annual Expenses of $68.3M divided by 108,400oz/yr = $630/oz to produce gold. As noted above, expenses are low based on the CA Assessors Handbook. They are also low compared to industry averages. The Industry Average to produce an ounce of gold is about $1,200/oz. **Using the Industry Average of $1,200/oz for Expenses reduces the Mineral Reserves to $297M, which then also reduces County Tax Revenue by 45%.**

In summary, the numbers provided by Rise are inflated at best and irresponsible at worst.

Sierra Foothills Audubon

RECEIVED
MAR 06 2023
NEVADA COUNTY
PLANNING DEPT.

February 24, 2023

To: Matt Kelley, Senior Planner
Nevada County Planning Department Staff
950 Maidu Ave, Suite 170
Nevada City, CA 95959
Ph: 530 265-1423
Email: matt.kelley@co.nevada.ca.us

The Sierra Foothills Audubon Society's mission is to educate ourselves and others to the variety and beauty of our natural environment and protect our wildlife and natural places. We have over 500 members in Nevada County.

We are writing in response to the Final Environmental Impact Report for the Idaho-Maryland Mine Project.

In March 2022 SFAS submitted comments on the Draft Environmental Impact Report for the proposed Idaho-Maryland mine. We stated that Gold Country Avian Studies had submitted to the county, California Natural Diversity Database (CNDDB) detections of over 15 special status Special Status bird species (of one or more individuals). The data indicated that the SF Wolf Creek may be used regularly during migration season by the endangered Willow Flycatcher, and species of special concern – Olive Flycatcher, Yellow-breasted Chat and Yellow Warbler.

The only species documented in the mine survey were the possibilities of California Black Rails and Cooper's Hawk.

FEIR response to Comment Grp 22-3

FEIR added mitigation measures describing these species of special concern, and where they would likely to be found. They also added a description of California spotted owl and documented past occurrences within the area.

"As such, potential for presence was already acknowledged by the DEIR, and the DEIR then concluded that "on-site removal of vegetation could result in adverse effects to nesting raptors and other birds protected under the MBTA should they be nesting on-site prior to commencement of construction." (Id.) As such, a potential impact to this species was already assumed by the DEIR. Mitigation Measure 4.4-2(g) was therefore

included requiring preconstruction surveys and buffers from nests if the species is present."

SFAS response

The statement that "potential for presence was already acknowledged by the DEIR" is false. The only species documented in the mine survey were the possibilities of California Black Rails and Cooper's Hawk.

FEIR Response to Comment Grp 22-3

THE FEIR response to explain why they hadn't located these species that Gold County Avian found.:

"While the reconnaissance level surveys conducted on July 10th and 14th 2019 for the Centennial Site and July 14th and 16th for the Brunswick Site may not fall within the survey protocol recommended windows for all species, protocol-level surveys are not required for CEQA analysis. Rather, the survey results along with review of CNDDB records and appropriate mitigation measures including pre-construction surveys was relied on to appropriately reach the conclusion that impacts to wildlife species is less than significant after mitigation."

SFAS response

We ask that Rise Gold perform studies in all seasons to verify species that could be impacted by the mine both at Centennial and east Brunswick. There may be more Species of Special Concern at the Brunswick site where extensive monitoring has not taken place.

FEIR Response as a mitigation

Mitigation: "Prior to initiation of ground-disturbing activities for any phase of project construction, if construction is expected to occur during the raptor nesting season (February 1 to August 31), a qualified biologist shall conduct a preconstruction survey prior to vegetation removal, including one daytime survey and one nighttime survey targeted at California spotted owl, consistent with the USFWS (1992) California spotted owl survey protocol.

SFAS Response

This only refers to California Spotted Owl and not other species such as Cooper's hawk and other Species of Special Concern.

FEIR Response to Comment Grp 22-4

Further mitigation was: "Removal of any trees within the Brunswick Area would occur between September 1st and January 31st to ensure that no nesting birds, raptors, or owls would be impacted by the proposed IMM project. If any active nests are located within the proposed disturbance area, including active nests within riparian habitat for the Yellow-breasted Chat, Willow Flycatcher, Yellow Warbler, and Olive-sided Flycatcher, an appropriate buffer zone shall be established around the nests, as determined by the project biologist."

SFAS response

These additional mitigations are necessary, but the fact that Gold County Avian and Audubon had to point out the missing species suggests a inadequate DEIR preparation and concern over what else is missing. In addition, the removal of a large number of trees where California Spotted Owl have nested in the past shows the lack of concern for existing bird habitat.

FEIR Response to Comment Grp 22-6

Noise impacts to wildlife and bird species was analyzed in Impact 4.4-2 and determined to be less than significant. Air Quality impacts were assessed in Chapter 4.3 of the DEIR and were found to be less than significant. The commenter provides no evidence that the project's incremental increase in regional emissions would cause significant impacts to bird species.

SFAS response

In our original letter we commented: "Table 4.3-11 indicate 36,500 Engineered fill trucks trip per year plus 120,788 employee trips per year. This additional traffic on Centennial Drive and East Bennett Roads will cause excessive noise and air quality impacts that would affect nesting birds in the area. In a study published in the January 2016 Proceedings of the National Academy of Sciences, researchers found that adults and nestlings of three bird species including the Western Bluebird showed multiple signs of chronic stress caused by noise pollution, including skewed stress hormone levels, due to increased anxiety, distraction, and hypervigilance."

The FEIR response ignored the Study we cited saying we had provided no evidence.

Furthermore, the mine is proposed to operate for 80 years with the excess noise, air quality impacts and stream pollution. To respond that they will stop activity during construction if nests are found ignores the long-term impacts of the mine that will make this a wasteland for raptors and other bird species of special concern.

Conclusion

SFAS and most of the community have concluded that the FEIR proposed mitigations are inadequate allowing the mine to destroy bird habitat, and impact air and water

quality, and the health of the community not only during construction but during 80 years of operation.

SFAS is recommending the Planning Commission not certify the FEIR and that the project be rejected.

Re: Idaho-Maryland Mine Project Final Environmental Impact Report

My name is Don Rivenes. I lived in Nevada County for 13 years and have now lived in Grass Valley for the last 8 years. I am a member of the Nevada County and Grass Valley Energy Action Plan working groups and Coordinating Chair of Nevada County Climate Action Now.

I appreciate the opportunity to answer the FEIR responses to my letter on behalf of Nevada County Climate Action Now on the DEIR for the proposed Idaho-Maryland mine. I find the FEIR responses inadequate and do nothing to support approval of the DEIR. I concentrated my comments on the impact the mine would have on greenhouse gas emissions and on the Energy Action Plan goals of Nevada County. Below are the FEIR responses and rebuttal to the responses.

Comments on the FEIR response.

Grp 17.1

FEIR response

The Response states: "Given that it is unknown if/ when a PSPS would occur, it is considered a speculative event, and per the CEQA Guidelines, if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145)."

My rebuttal

Though it is not known when a PSPS event will occur, the events are occurring with a regularity and can be estimated as to how many would occur in a particular year. The amount of gold dug up in a particular year is also speculative, yet the FEIR relies on this speculation. The FEIR should provide the total MT CO2e from Emergency uses and add them to the operational MT CO2e figures.

Grp 17.2

FEIR response

The Response states: "Numerous revisions were made to the Air Quality Report during the preparation of the DEIR. The report presented in Appendix E.1 of the DEIR is the final version of this report."

My rebuttal

My comment was that the total hours for this electric equipment in 2022-2032 are just a small part of the off-road equipment and shouldn't account for the difference going from 2130 metric tons in the February 2020 report to 755 metric tons in the DEIR. The FEIR must account for this difference. How can you expect the public to believe such as gross difference between the original figure and the new Appendix E figure without an explanation to account for the change. It brings in to question the reliability of any of the data in the DEIR.

Grp 17.3

FEIR response

The Response states: "The commenter identifies differences between the analysis in the DEIR and a draft version of the Air Quality and GHG Report. Please see response to comment Grp 17-2 regarding draft versions of the air quality report. Emission factors for conversion of miles driven to carbon dioxide (CO2) and other emissions are already included in Appendix E.1 of the DEIR."

My rebuttal

My comment was that the DEIR must show the factors used when converting miles driven to CO2 emissions for each of the vehicles. I also asked what factors were used to relate miles travelled with emissions generated. This must be provided. I have scanned Appendix E-1 and found table entries that show miles driven and CO2 emissions, but the actual factors used are not stated anywhere. There is no reference to the scientific source of any conversion factors.

Grp 17.4

FEIR response

The FEIR response states "The commentator suggests that GHGs associated with the transport of cement by third parties should have been included in the DEIR. This comment pertains to a "lifecycle" analysis, which is not required under CEQA. Please see Master Response 26 – Life Cycle GHG emissions."
Master response 26: "The Project will use materials including cement, steel, and various products and materials. The manufacture of many of the materials that are used by the proposed project occurs outside of Nevada County boundaries, outside of the local agencies' jurisdictional control or substantial jurisdictional influence. The project GHG emissions estimate includes the shipping of these materials to the site from an origin of 60 miles. "

My rebuttal

My contention is that the cement is not transported only 60 miles. Table 4.3-11 figures do not include the CO2 emissions from transporting the cement from production point to Sacramento (for example from Oro Grande in the desert to Stockton and from Stockton to a pickup point for the truck). If you include transport from Sacramento, you must include the transport from place of manufacture.

Grp 17.5

FEIR response

When discussing project-level GHG emissions reduction actions and thresholds in the context of CEQA, the CARB 2017 Scoping Plan states that "achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development" for project-level CEQA analysis. Master Response 27 states: "As discussed above, the CEQA Guidelines allow a CEQA lead agency to determine its own thresholds for environmental impacts (including GHG emissions), and explicitly provides that an agency may consider thresholds adopted by other agencies provided that such decision is supported by substantial evidence."

My rebuttal

I see no evidence from other districts that the level used is an appropriate level. At minimum, it needed to explain why it was standing by the 10,000 MT CO2e threshold at the same time that other agencies are concluding that a much more stringent standard is necessary. Because it did neither, the EIR's significance threshold for operational GHG emissions is unsupported and legally deficient. There is no legitimate reason that the County should adopt a standard for an 80-year project that is not consistent with the S.B. 32's statewide GHG reductions goals for 2030 and beyond. The thresholds adopted by the other air districts (1) relied on detailed and region-specific justifications, and (2) are

now obsolete, because they all predated the new and much more stringent GHG reduction targets set in 2016 by S.B. 32. Thus, the EIR erred by simply copying other existing thresholds without providing its own project-specific rationale.

Grp 17.6

FEIR response

Master Response 26 says: "In some instances, materials may be manufactured for many different projects as a result of general market demand, regardless of whether one particular project proceeds. Thus, such emissions may not be "caused by" the project under consideration. Similarly, in this scenario, a lead agency may not be able to require mitigation for emissions that result from the manufacturing process. Mitigation can only be required for emissions that are actually caused by the project. (State CEQA Guidelines, § 15126.4(a)(4).)"

My rebuttal

My contention is that a bag of Portland Cement is made the same way for each project. If this project was not done, the bag would not have been manufactured. Whether CEQA thinks it is too difficult to follow a "lifecycle" process or not, the fact is that the Mine project is responsible for the cement emissions and the County should consider these emissions from a project consideration, beyond what CEQ calls for.

Grp 17-7

FEIR response

The response states: The commenter suggests that GHGs associated with the manufacture and transport of cement by third parties should have been included in the DEIR. This comment pertains to a "lifecycle" analysis, which is not required under CEQA.

My rebuttal

Cement emissions may already have been counted at the plant level and for state goals, but we are including them for this project as avoidable emissions in that the emissions would not have occurred if this project were not done.

Therefore, to calculate the GHG impact from the Idaho-Maryland mine, one must include the embedded impact from the manufacture of the Portland cement. Embedded cost, in the context of energy costing, refers to the full amount required for a certain amount of energy to be provided.
By including them, the project will be exceeding the arbitrary level of 10,000 MT CO2e each year for 80 years, and thus require mitigation.

Grp 17.8

FEIR response

The response states: "With regard to the validity of Mitigation Measure 4.3-7(b), which requires carbon offsets to reduce the project's construction emissions of GHG below the applicable threshold, please see Master Response 28 - Greenhouse Gas Credits.'

My rebuttal

The proposed mitigation for construction emissions beyond the chosen 1,100 MT CO2e leaves 1,000 MT CO2e still being emitted. The emissions are a calculation that could vary either direction from the limit. I ask that the mitigation cover the probability that they will be exceeded by a certain percentage. As opposed to a mitigation, I suggest that the emissions be cut back onsite to below the threshold. The emissions from the purchased mitigation will already have taken place regardless of this project.

Grp 17.9

FEIR response

The Response states: However, as demonstrated in the DEIR, estimated operational GHG emissions are below the applied numeric threshold of 10,000 MT CO2e per year. The DEIR determined that project-generated construction GHG emissions would exceed the applied GHG threshold of 1,100 MT CO2e per year, as addressed above".

My rebuttal

I appreciate the changes made to the mitigation measure 4.3-7(b), but it doesn't change the fact that the mitigation can occur anywhere in California, while Nevada County still will exceed the suggested level. The offset mitigation should be confined to Nevada County.

GRP 17.10

FEIR response

The Response states: "Of note, projects that consume electricity do not necessarily conflict with the County energy reduction goals. Additionally, although the EAP is not a Qualified GHG Emissions Reduction Plan under CEQA pursuant to the requirements outlined in the CEQA Guidelines, Section 15183.5(D), the project was nevertheless determined to be consistent with the EAP (see Table 4.3-22 of the DEIR)".

My rebuttal

Though it is true that the Energy Action Plan refers to all of its savings in kilowatt hours and thus is not qualified under CEQA, the Energy Action Plan cites California laws and executive orders for reduction of GHG emissions. Also, "In April, 2009, the County adopted the "Nevada County Energy Plan" to support the reduction of energy use throughout the County facilities and operations. The Plan sets energy reduction goals and targets and correlates to the County's 2011 GHG study. Numerous County energy projects have been completed to date." [1]

In addition, this statement is essentially false for the following reasons.

This mine project will consume 49,000,000 kilowatts of electricity annually, in direct conflict with the County's energy reduction goals.[2] The mine operation may be energy efficient and still use vast amounts of electricity and natural gas additional to other County uses. In 2021, the average annual electricity consumption for a U.S. residential utility customer was 8,616 kilowatt hours (kWh). [3] The mine usage equates to the energy use of 5,575 homes in Nevada County.

There are 1,774 businesses in Nevada County.[4] In 2017 they used 53,393,272 kwh.[5] The forecasted 2035 efficiency savings for businesses is 8,905,888.[6] That leaves 44,487,384 kwh usage. The annual usage of the mine of 49,000,000 kwh is more than the usage of all businesses in the County, even after the EAP savings.

The proposed Idaho-Maryland Mine is not only not consistent with the EAP, but is opposite to the goals of the Nevada County Energy Action Plan.

Conclusion

The Nevada County Planning Commission and the Board of Supervisors must consider what direction the approval of the mine takes us. Do we want to do our part in combatting the impacts of climate change on our rural community as called for in the Energy Action Plans and the new California guidelines on emission standards, or are we willing to contribute to the impacts?

Re: Idaho-Maryland Mine Project Final EIR comments

RECEIVED
MAR 08 2023
NEVADA COUNTY
PLANNING

The Sierra Nevada Group of the Sierra Club continues to have concerns about the Idaho-Maryland Mine re-opening in Nevada County. The following are our responses to the Final Environmental Impact Report (FEIR). As with the earlier EIR we support the submitted FEIR comments/responses of the Community Environmental Advocates Foundation.

As part of the Sierra Club which is our nation's largest and most influential grassroots organization with millions of members and supporters, the Sierra Nevada Group serves approximately 1000 members in Nevada, Yuba and Sierra counties. Our mission includes working to promote clean energy, safeguard the health of our communities and protect wildlife through activism, public education, lobbying and legal action.

The California Environmental Quality Act (CEQA) is an important tool to help communities understand the scope and impact of a project being proposed. As such, it requires that all the information regarding the proposed Project be examined and found to be complete and answer all the questions that could arise should the Project be approved. In the case of the Idaho-Maryland Mine re-opening, clearly a large industrial venture will pose a considerable impact on its rural residential neighbors and the nearby city.

The release of the Idaho-Maryland Mine EIR enumerated the number of impacts the re-opening would have. That number was a staggering 83 potential impacts with 3 that would not be able to be mitigated and the other 80 were considered to be significant or less than

significant and could be successfully mitigated below that level. The following are a few of the incomplete and inadequate responses to the EIR's treatment of impacts that continue to raise serious concerns.

CEQA issues: CEQA requires the EIR to identify the whole of the Project's activities as a single and complete Project to analyze its potential impacts. The full project includes the use of the currently toxic laden Centennial property as a repository for "engineered fill" from the mine. It assumes that the property will have been cleaned up in advance of the production and transport of mine material but does not discuss this clean-up and its impacts as part of the Project. The environmental impacts rightfully need to be described, enumerated, and counted as part of the entire Project. A CEQA requirement is to identify the "whole" of the Project as a single and complete Project and should not have parts excluded. It could lead to an underestimation of impacts and not inform the public of the actual harm this project in its entirety could cause.

The Centennial cleanup is not a stand-alone project and the considerable impacts of grading, traffic, air quality and wetland disturbance associated with it should be added to the entire Project. It is a serious failure of the EIR not to have incorporated the impacts of the Centennial Site cleanup as part of the project.

We dispute the argument made under Master Response 4 that Centennial Site cleanup is a separate project for the following reasons:

1) The FEIR Does Not Use the Correct Baseline of Existing Conditions at the Centennial Site. The EIR does not consistently use existing conditions as the baseline for the Centennial Site and cannot merely assume that the proposed Centennial cleanup will be approved or completed. The document's analysis of aesthetic impacts, agriculture and forestry resources, biological resources, hazards and hazardous materials, and wildfire risk (which all use the assumed post-remediation baseline) do not evaluate those impacts with reference to existing contaminated conditions on the Centennial Site and must consider the possibility that the cleanup may not occur before mine operations begin, or at all.
2) The FEIR's Project Description Improperly Excludes the Cleanup of the Centennial Site from the Project Scope. Rise Gold would not have entered the Voluntary Agreement to undertake the Centennial cleanup and its associated costs if it did not serve the Applicant's goal of dumping fill on the site as part of the IMM Project. If the IMM Project does not go forward, the Applicant could withdraw from its commitment to the Centennial cleanup.
3) The Nevada County Idaho-Maryland Project Description dated November 2019 contains a request for a Use Permit and Reclamation Plan to allow transport of engineered fill from the Brunswick Industrial site and placement at the Centennial Industrial Site. Clearly this Project Description considers the use of the Centennial Industrial Site as part of the Project and should not be separated.

The Centennial cleanup is not a stand-alone project and the considerable impacts of grading, traffic, air quality and wetland disturbance associated with it should be added to

the entire Project. It is a serious failure of the EIR not to have incorporated the impacts of the Centennial Site cleanup as part of the project.

Noise: Calculations regarding the changes in noise levels in the Brunswick Industrial Site where the actual mine entrance is located along with various mine and waste processing, two silos, mine dewatering and filtration pond, truck loading and unloading and most of the employees was found in the EIR calculations not to exceed normal decibels. The project location is surrounded by a rural residential neighborhood with generally low ambient noise thresholds.

An expert in noise and vibration analysis noted that the Project includes many operations that will occur at nighttime hours. In addition, many of the nearby sensitive receptors are located away from notable sources of ambient noise and therefore receive very low nighttime background noise. The Project's noise levels could be 20 to 35 decibels louder than the current median/background ambient noise levels, causing a severe impact. The EIR fails to address sensitive receptors located farther away.

The proper question is not the relative amount of noise resulting from the Project, but "whether any additional amount of noise should be considered significant" in light of existing conditions. Conformity with the absolute or maximum noise level specified in a general plan does not prevent a fair argument from being made that the proposed project will generate environmentally significant noise impacts. Considering this very quiet ambient environment, the FEIR should have thoroughly examined the Project's potential to generate nighttime noise. Unfortunately, it does no such thing.

The FEIR asserts that because the Project's on-site noise sources must comply with the County's nighttime noise level standards, an evaluation of sleep disturbance is not warranted. EIR at 4.10-23. This assertion is absurd. The Project includes many operations that will occur during early morning or nighttime hours, including dewatering, indoor facility construction, truck loading/unloading and off-site hauling mineralization processing, and water treatment. DEIR at 3-37. The combination of morning and nighttime industrial activities and low background/ambient noise levels represent a significant risk for Project-related noise to impact the community, annoy residents, and cause sleep disturbance.
The FEIR further omits an analysis of the noise impacts resulting from remediation of the Centennial site, which we contend is part of this Project.

Wells and Groundwater: Groundwater resources are of extreme concern. The proposed Project would significantly affect local groundwater resources by dewatering the mine thereby lowering groundwater levels. The EIR recognizes that 242 well owners will be affected but assumes others in the vicinity will not be dramatically affected, but merely have their wells lowered a couple of feet. Looking forward to positive indications of drought and future climate change, this arbitrarily low impact threshold is invalid. The mitigations proposed are inadequate with respect to the number of affected well-owners in the large area of uncertainty. Monitoring should be required for at least three years.

There are over 300 properties with wells within 1000 feet of the Project's mineral rights area. The EIR did not provide current monitoring data from these domestic wells and relied only on sparse patches of data from over 15 years ago. Further, the groundwater modeling done for the EIR is limited to a very narrow region. More basic data needs to be gathered and a valid groundwater hydrological model must be built. These and other pressing groundwater issues need to be rectified.

The EIR explains that to implement a Ground Watering Plan, the Applicant must collect additional groundwater level data and then perform a water-level assessment for individual wells. These steps are necessary to evaluate *baseline* groundwater level conditions and to determine the Project's impacts on individual domestic wells. EIR at 4.8-67. This post approval data collection and impact analysis constitutes an inappropriate deferral of mitigation. **"Formulation of mitigation measures should not be deferred until some future time." CEQA Guidelines § 15126.4(a)(1)(B).**

The model does not describe how drawdown would be determined relative to baseline conditions. Private domestic wells in the Project vicinity have seasonal fluctuations that may vary from 10 to 50 feet between wet and dry seasons. Exhibit A (Baseline Report) at 11 (citing EIR Appendix K.3 at 7). The EIR provides no explanation as to how these seasonal water fluctuations would be distinguished from Project-related drawdown. Nor does the groundwater model accurately account for the groundwater depression that will be created by the constant drainage from the existing mine workings. As Baseline explains, calibrating the groundwater model without incorporating the proper mechanisms to simulate the drainage of groundwater from existing mine workings could introduce substantial error to the overall modeling results. Exhibit A (Baseline Report) at 8.

Conclusion: Machines rumbling around beneath homes, blasting, trucks laden with toxic dust particles (impossible to contain), nighttime noise/glare, 7 stories of "engineered fill" on two properties within ¼ mile of a city of 36,000 people need adequate mitigation. Two creeks, Wolf Creek and South Fork Wolf Creek, border each of these mine properties and will be impacted by dewatering and being used as a conduit for used Mine water.

The overall environmental damage is significant and cannot be adequately mitigated. The above are just a few of the 80 impacts which have not been adequately addressed by the proponents.

The Planning Commission meeting in April 2022 on the Idaho-Maryland EIR and about 100 people spoke. Each shared their legitimate concerns about either the inadequacies of the report or of the outsized impact that a large industrial project will have on some neighborhoods and/or the ambience of the area in general. Since the beginning of the EIR process in 2021, large numbers of residents have written personal letters, signed petitions and campaigns against the re-opening of the IMMine.

On behalf of the Sierra Nevada Group, we conclude that the IMM FEIR does not meet the standards of adequacy in mitigating the impacts discussed in this response. We urge a No vote on recommendation to the Nevada County Board of Supervisors for approval.

Sincerely,

Barbara L. Rivenes

Barbara Rivenes, Vice-chair
Sierra Nevada Group/Sierra Club

Good morning

I would like to clarify the role of public comments in the DEIR, as I have concerns about the legitimacy of many of the hundreds of letters and postcards attached to it.

From 2019 CEQA Statutes and Guidelines

Article 7. EIR Process

15088. EVALUATION OF AND RESPONSE TO COMMENTS

The lead agency shall evaluate comments on environmental issues received from persons who reviewed the draft EIR and shall prepare a written response. **The Lead Agency shall respond to comments raising significant environmental issues received during the noticed comment period and any extensions and may respond to late comments.**

I submitted two separate comments directly questioning different sections of the DEIR, which I referred to by number and page. This is legitimate comment on DEIR

Statements against the mine that do not reference the DEIR are not legitimate additions to the DEIR. Statements like those from hundreds of people stating why they oppose the mine were to alert you and the Board that we average citizens are opposed to this insane proposal to reopen this toxic mine.

Article 2. General Responsibilities
SECTIONS 15020 TO 15025
15020. GENERAL

Each public agency is responsible for complying with CEQA and these Guidelines. A public agency must meet its own responsibilities under CEQA and shall not rely on comments from other public agencies or private citizens as a substitute for work CEQA requires the Lead Agency to accomplish. For example, a Lead Agency is responsible for the adequacy of its environmental documents. The Lead Agency shall not knowingly release a deficient document hoping that public comments will correct defects in the document.
Note: Authority cited: Section 21083, Public Resources Code; Reference: Sections 21082 and 21082.1, Public Resources Code; Russian Hill Improvement Association v. Board of Permit Appeals, 44 Cal. App. 3d 158 (1975).

Jim Bair, 128 Sierra Blanca Ct, Grass Valley, CA 95945

Public Comment to the Board of Supervisors, August 9 2022 on Idaho-Maryland Mine reopening by Jim Bair[1]

Good morning. I'm Jim Bair, business owner and resident of Nevada County for over 20 years. In my previous comments to you [much appreciation for the opportunities], my objective was to help the Idaho-Maryland Mine decision making process. Today I've expanded my documentation review from the several thousand pages of Rise Mine documents to the County database of "all Draft EIR Comment Letters" up to April 5. This includes a spreadsheet of 2873 commenters often with additional content from the same organization/contact.

Having been an expert witness in software corporation's law suits, I believe this might be evidentiary.

There are 10 categories in the DEIR comments database which contains 2,842 Files [email, letters, and unknown contents]. While reviewing the contents of each of the 10 categories, I have found that many entries are questionable.

Many of the so-called comments are not comments at all -- many are form letters with the same exact content. The most common entry, "Project Support Card" argues "Nevada *County is in tremendous need of new, well-paying jobs …Rise Grass Valley … [is] creating over 600 new jobs…".* Is this even a fact?

The 1132 "Project Support Cards" were created by Rise Mine. They are from a bulk mailer to thousands of County voters, and a subset were mailed prepaid to the County. They show support for the Mine and have no reference to the DEIR (see Exhibit 1).

Other "comment letters" are called "Form Letters", some with no content and others actually contain unique individual commentary on the DEIR. Form Letters A and B (see my attached exhibits) were not intended to be Comments on the DEIR [as defined by the CA Environmental Quality Act (CEQA]).

A second questionable set of "Form Letters [C]" is labeled "Subject Line Only". Entries contain automatic emails faked to be **for** the Mine from individuals **against** the Mine [reported in *The Union* op ed], automatically reused content, duplicates, and emails from an out-of-town contractor "*oneclickpolitics.com*" (Wash. D.C.).

I anticipate I'll find more questionable comments as we continue to review the database [of "all Draft EIR Comment Letters"]. In the meantime, I urge the County to re-organize the database, especially separating DEIR Comments per CEQU from opinion pieces. It might also be prudent to separate legitimate comments from fake, machine generated and content free entries – which Rise Mine is using for PR and investor appeals [available upon request.]

I've given these comments, data, and examples to the County Clerk.

Thanks so much for your attention.

(See Exhibit 4, **example of actual business opposition related to the DEIR,** that might not be counted by the Mine.)

---

I support re-opening the Idaho-Maryland Mine

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once-in-a-generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual salary of more than $90,000 plus benefits. The mine will also spur an additional 300 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Re: I support the re-opening of the Idaho-Maryland Mine

Dear Planning Commissioners County,

Nevada County is in tremendous need of new, well-paying jobs that can help provide a strong economic future for today and for decades to come. Rise Grass Valley's plan to build a modern and environmentally sensitive mine that respects neighbors and our natural environment while creating over 600 new local jobs is a once in a generation opportunity to revitalize our local economy.

Re-opening the mine means over 300 new employees in safe and satisfying careers with an average expected annual salary of more than $90,000 plus benefits. The Mine will also spur an additional 600 jobs through related new business in the area. This project will enhance the pride and confidence of Nevada County workers and their families and help build stable and prosperous lives.

Opportunities like this come along rarely. Rise Grass Valley has a responsible, innovative project for Nevada County. I urge the Board of Supervisors and other county officials to jump start our local economy by strongly supporting the re-opening of the Idaho-Maryland Mine.

Sincerely,
Chris Frank

Dear Matt Kelley,

As business owners, we are very much in favor of free enterprise. We have lived in the county since 1981 and love the rich history.

We also are realistic and recognize that we are in an historic drought. Depleting our ground water seems to be an illogical step to take if we are looking to improve our county's health.

We are very much opposed to the reopening of the mine. This property could have a use that is not harmful to our quality of life.

Respectfully,

Christopher and Susan Claydon

Jim Bair, 128 Sierra Blanca Ct, Grass Valley, CA 95945

Public Comment to the Nevada County Planning Commission, August 25, 2022 on Idaho-Maryland Mine reopening by Jim Bair[1]

Hi. I'm Jim Bair, business owner, resident of Nevada County for over 20 years, and former Grass Valley Planning Commissioner. I am sharing with you a presentation I made to the Supervisors (Aug. 9). It includes surprising findings in the County database called, *"All Draft EIR Comment Letters"* with over 28 hundred [2873] entries related to the proposed Rise Gold Mine.

There are 10 categories in the DEIR Comments database – see my included table. While reviewing the contents of each of the 10 categories, I have found that many entries are questionable.

Many of the so-called Comments are not Comments at all -- many are form letters with the same exact content. The most common entry, *"Project Support Cards"* were created by Rise Mine. They are from a bulk mailer to thousands of County voters, and 1132 were mailed prepaid to the County. They state support for the Mine and have **no** reference to the DEIR (see Supervisors Exhibit 1).

Other "Comment letters" are "Form Letters", some with no content and others actually contain unique individual commentary. Form Letters A and B (see attached exhibits) were not intended to be Comments on the DEIR – most were generated by my *Stop the Mine Task Force*, signed and delivered by concerned citizens!

A third questionable category of "Form Letters [C]" is labeled *"Subject Line Only"*. Entries contain automatic emails faked to be **for** the Mine from individuals **against** the Mine (e.g., see Exhibit 5)--7 duplicates) (reported in *The Union* op eds), automatically reused content, duplicates, and emails from an out-of-town contractor "*oneclickpolitics.com*" (in Wash. D.C.).

We are continuing to find questionable entries in the database [of "all Draft EIR Comment Letters"]. I urge you to request the Planning Dept. to separate legal DEIR Comments per CEQU from fake and opinion pieces. This is critical because Rise Mine is counting all entries -- the fake, machine generated and empty entries -- for PR and investor appeals, and saying Nevada County is for the Mine.

Having been an expert witness in software corporation's law suits, I believe this might be evidentiary.

I've given this comment and the Supervisors package to the County Clerk.

Thanks so much for your attention.

(Attached: **Exhibit 5, Seven Duplicate Form Letters—slight differences, same signatory and: Jim Bair's *Public Comment to the Nevada County Board of Supervisors,*** *9 pages)*

TO: Nevada County Planning Commissioners,

Danny Milman, Laura Duncan, Terry McAteer, Mike Mastrodonato, and William Greeno

Subject: Final Environmental Impact report (EIR) re: reopening the Idaho-Maryland Mine

From: Jim Bair[i], Scientist at Stanford, Bell-Northern Research, and Rome Research Center (USAF)

This comment is in response to the Final EIR Idaho-Maryland Mine Project, December 2022. The FEIR fails to deliver the required responses to public comments on the Draft EIR. While some responses are contained in the FEIR, they are often combined into Master Reponses, and they do not provide adequate mitigation measures. When a comment from an agency or individual is referenced, the FEIR does not contain new information that addresses the specific requests in the DEIR Comments.

For example, my DEIR comment described inadequate, misleading and incorrect statements about asbestos, one of the most dangerous pollutants[ii] [Comment Ind 353-19]

The FEIR does not adequately address my Comment on the DEIR:

1. The inadequate FEIR asbestos mitigations are unchanged from the DEIR. The required *Asbestos Dust Mitigation Plan*, page 3-3, (4.3-2) is only a "summary" and does not address asbestos fibers which are too small to be treated as dust. [iii] To quote the FEIR Group Response, "the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD, would be detailed in the ADMP" (FEIR Comment Grp 7-143 Mitigation Measure 4.3-2). The required Asbestos Dust Mitigation Plan is not done. See Note 4 below.

2. There is inadequate sampling of the mineral rights area. Conclusions based on 19 bore holes are not valid to generalize to 2,500 acres. Some samples did contain asbestos indicating far more bore holes are needed to get valid sampling. There should be at least one bore hole per acre. (See Master Response 23).

3. The use of asbestos detection technology incorrect. The measurements and the mitigations failed to address the size of asbestos fibers. Asbestos fibers are often less than one micron in size and cannot be detected by Polarized Light Microscopy (PLM asbestos testing). [Microscopes using light are not sensitive enough.] TEM (Transmission Electron Microscopy) must be used to detect sub-micron fibers and to distinguish between asbestos fibers and non-asbestos fibers.
   TEM asbestos testing requires shipping samples to San Leandro, CA, with a turn-around of days. Thus, the real-time monitoring restated in the FEIR is

impossible. Quantities that are hazardous to public health would be widely airborne before tests results would be available.

4. The FEIR mitigation of airborne asbestos is inadequate because it is treated as "dust" in the DEIR and cannot be measured (see Note 4). The comment that mitigation cannot be done to state standards of air quality (Northern Sierra Air Quality Management District (NSAQMD)) is proof of inadequacy. Asbestos fibers are too often smaller than dust (PM2). The FEIR must describe mitigation measures for sub-micron fibers in addition to washing and spraying in open tailings areas, and especially the trucking lanes to and from the tailings dump site (Centennial).[iv]

5. Even though the FEIR declares that asbestos pollution is a serious negative impact, it does not contain the plan for mitigation. Quote, "the DEIR concludes that the Project **could** result in a significant impact with respect to exposing receptors [people] to **substantial concentrations of asbestos** and requires mitigation to reduce the impact to a less than significant level." Page 183.[v]

Conclusion

The lack of feasible mitigation of asbestos is an example of significant and unavoidable negative environmental impacts. The FEIR (page 256) states that if certain levels of asbestos emissions are exceeded, then there is a potentially significant impact and mitigation is required. If after implementation of mitigation, levels are exceeded, then a significant and unavoidable impact would occur." **There is no evidence to predict less than the unacceptable Level C of asbestos pollution from processing 1,500 tons of mine waste per day**. [vi]

The FEIR continues to cite Federal and State rules, regulations and guidelines in inaccurate ways to insinuate that future impacts will be less than significant, e.g., NSAQMD and OEHAA (CA Office of Environmental Health Hazard Assessment). The FEIR states, **if and when** pollution mitigations are implemented and followed by measurement, they will be less than significant, but there is no airborne measurement methodology according to NSAQMD. [vii]

NOTES re: Asbestos in the FEIR:

Note 1: Unsupported claims (page 180):

"This master response confirms that the proposed project will use chemical dust stabilizers that are not considered toxic air contaminants, nor do they have adverse effects on water quality or aquatic life. [**There is no evidence that dust stabilizers will control asbestos**]. This response also demonstrates that, after implementation of mitigation, the project's construction and operations would not expose sensitive receptors to substantial concentrations of fugitive dust such that a human health effect would occur (Appendix G, III(c))." **This statement cannot**

be supported. Asbestos is not limited to "dust" – the particles are too small – **the response doesn't demonstrate anything**.

The FEIR does not address the predicted amount of asbestos (page 180), it merely references the DEIR as evidence!

"Several commenters asserted that the assumptions used in the Health Risk Assessment (HRA) understated the amount of asbestos that will be found in the rock mined at the project, and likewise the level of respirable asbestos that will be emitted into the air. Conversely, the assumptions used for the HRA were based on conservative assumptions that overstate the amount of asbestos in Final EIR". Responses to Comments Page 2-108: "...the rock and tailings and overstate the amount of asbestos that will become airborne. As such, the HRA provides a conservative analysis of asbestos impacts, and thus, adequately evaluates the potential health effects from asbestos attributable to the proposed project."

There's no proof to support the claim of an adequate evaluation primarily because the amount of airborne asbestos cannot be predicted (see invalid sampling and particle size).

Note 2: FEIR Chapter 3 – Revisions to the Draft EIR Text

The FEIR claims are assertions without evidence. The referenced Asbestos Dust Mitigation Plan (ADMP) is not done. I noted that it should before DEIR acceptance. The required ADMP plan still is not submitted to the Northern Sierra Air Quality Management District (NSAQMD) or any other recipient.

Note 3: Master Response 23 - Inadequacy of Sampling - Asbestos

P 182 Conclusion quote: "Based on these conservative assumptions, **the DEIR concludes that the Project could result in a significant impact with respect to exposing receptors [people] to substantial concentrations of asbestos and requires mitigation to reduce the impact to a less than significant level**. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Final EIR Idaho-Maryland Mine Project December 2022 Chapter 2 – Responses to Comments Page 2-111 Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in Mitigation Measure 4.3-2. Additional measures, such as air monitoring, if required by the NSAQMD, would be detailed in the ADMP.

P253 quote: "Rather, the concentrations of asbestos at receptor [people] locations are modelled and the health risk is calculated in accordance with OEHAA guidelines. OEHHA is the lead state agency for the assessment of health risks posed by environmental contaminants in California." **Modeling to forecast asbestos concentrations is delegated to the State which is too general to apply to this unique project. (**Appendix report: Health Risk Assessment Memorandum for the Idaho-Maryland Mine Project Date: July 11, 2022).

Note 4: This is proof of inadequacy: **"The Northern Sierra Air Quality Management District (NSAQMD) has indicated that there is no approved method, and thus some uncertainty, regarding the estimation of asbestos risk based on rock samples."** FEIR page 416, Agency response 11-2.

Use 'control f' to search online:

https://www.nevadacountyca.gov/DocumentCenter/View/46398/IMM-FEIR_Volume-VII---Volume-IX-Appendices-A---R.

ENDNOTES:

[i] Jim Bair, aristotle2001@gmail.com, is Leader of the Stop the Mine Task Force, Unitarian Universalist Community of the Mountains https://www.uugrassvalley.org/justice/stop-the-mine-task-force/

[ii] See references in my DEIR Comment; this observation is corroborated by three MDs and a Professor of Medicine. Note that Endnotes and NOTES are important because the FEIR is inconsistent and extremely challenging to process at over 10,000 pages.

[iii] Dust is regulated, sub-micron particles are not. In addition, FEIR page 181 states that the plan to monitor for airborne asbestos is not done: "Air monitoring requirements will be specified in the approved Asbestos Dust Mitigation Plan (ADMP), which must be approved by the Northern Sierra Air Quality Management District **prior to Project operations**. The ADMP is required under the Asbestos Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mine Operations. Section (h)(3) of the ATCM specifies the requirement for analysis of air samples. Analysis of all air samples shall follow the analytical method specified by the United States Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) criteria for asbestos (40 CFR, Part 763 Subpart E, Appendix A, adopted October 30, 1987). The ATCM modifies the AHERA criteria for asbestos and requires a lower detection limit and the counting of all asbestos structures irrespective of length…".
[EPA regulations are at https://www.ecfr.gov/current/title-40/chapter-I/subchapter-J/part-302]`
EPA Regulations are limited and cannot be relied upon: "13. Observe the following counting rules: Count only fibers equal to or longer than 5 micrometers [microns]." Occupational Safety and Health Admin., https://www.govinfo.gov/content/pkg/CFR-2011-title29-vol6/pdf/CFR-2011-title29-vol6-sec1910-1001.pdf
Asbestos fibers are **typically less than 5 micrometers [microns] and frequently measure .5 micron.**

[iv] FEIR page 136 **falsely** states that, "From a health perspective, the Health Risk Assessment (HRA) prepared for the proposed project (included in Appendix B of Appendix E.1 of the EIR) evaluated fugitive dust as PM10. The HRA concluded that a significant health hazard to the public would not occur as a result of fugitive dust [dust that escapes containment] after implementation of mitigation (see DEIR, p. 4.3-82). For more detail, please refer to Master Response 20 – Conservatism Used for Metals in Dust, Master Response 21 – Silica Health Risk, and Master Response 22 – Conservatism Used for Asbestos.

[v] Page 183 (2-110) states that," the DEIR concludes that the Project **could result in a significant impact with respect to exposing receptors to substantial concentrations of asbestos** and requires mitigation to reduce the impact to a less than significant level. Mitigation Measure 4.3-2 of the DEIR requires the submission of an *Asbestos Dust Mitigation Plan* (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in Mitigation Measure 4.3-2. Additional measures, such as air monitoring, if required by the NSAQMD, would be detailed in the ADMP. **The ADMP cannot be found in the FEIR.**

[vi] FEIR page 256 states that, "If unmitigated emissions of ROG, NOx, and/or PM10 exceed 136 pounds per day (Level C), then there is a potentially significant impact and mitigation is required; if mitigated emissions of ROG, NOx, and/or PM10 still exceed 136 pounds per day (Level C) after implementation of mitigation, then a significant and unavoidable impact would occur."

[vii] **The FEIR contains broad brush statements that future measures prove that mitigations will be made, quote:** "Response to Comment Agcy 1-17 The commenter asserts that the project's ROG, NOx, and PM10 emissions should be considered "potentially significant" after mitigation; however. the commenter misunderstands the NSAQMD guidelines. The NSAQMD requires implementation of certain mitigation measures for each defined level of emissions volumes (A, B, C) to achieve an impact determination of less-than significant impact. As stated on page 4.3-41 of the DEIR, the NSAQMD has developed a tiered approach to significance levels. The tiered thresholds for Levels A, B, and C are given in Table 4.3-5 for a project's estimated emissions of criteria pollutants in pounds per day. A project with emissions qualifying it for Level A thresholds (i.e., all projects with emissions greater than zero) requires the most basic mitigation. Projects that qualify for Level B require more extensive mitigation, and projects that qualify for Level C require the most extensive application of mitigation. If unmitigated emissions of ROG, NOx, and/or PM10 exceed 136 pounds per day (Level C), then there is a potentially significant impact and mitigation is required; if mitigated emissions of ROG, NOx, and/or PM10 still exceed 136 pounds per day (Level C) after implementation of mitigation, **then a significant and unavoidable impact would occur.**

Quote [NSAQMD states they do not have a measurement methodology]: **"Unmitigated emissions below Level C would result in an impact that is potentially significant, and mitigation is required;** following implementation of mitigation (as specified separately for Level A and Level B by NSAQMD), emissions would be less than significant. The DEIR imposes the NSAQMD recommended mitigation measures for the project's ROG, NOx, and PM10 emissions, and therefore achieves a less than significant impact, per NSAQMD guidance. (DEIR, p. 4.3-73.) Notably, the NSAQMD thresholds used for criteria air pollutants for the project are the same thresholds used by the commenter in the Empire Mine State Historic Park Site Characterization and Remediation Draft Program EIR in 2009.3 While the commenter asserts that emissions meeting NSAQMD level B thresholds should be considered "potentially significant" after mitigation, the commenter's 2009 EIR stated that the park project's NOx emissions, which were shown to meet NSAQMD level B thresholds, were "less than significant" after implementation of standard dust control mitigation, **similar to the standard mitigation used in the project's DEIR**. (See Empire Mine State Historic Park Site Characterization and Remediation Draft Program EIR, pp. 4.2-31 to 4.2-35.)

WELLS COALITION

wells@cea-nc.org

January 12, 2022

Nevada County Planning Commission
950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902
Idaho.MMEIR@co.nevada.ca.us
planning@nevadacountyca.gov

Subject: Protection for Wells Near Idaho-Maryland Mine Still Not Adequate

The Wells Coalition is a group of well owners near the Idaho-Maryland Mine. Our purpose is to protect our only source of water, our wells.

We are astounded that a comprehensive domestic well monitoring program was not established *before* the Draft EIR was published last year. Such a program is a necessary step to establishing the baseline data required by CEQA. It's clear that this omission was recognized in the Final EIR, but the proposed solution is little more than a band-aid that doesn't actually address the serious, underlying problem.

Even though there are over 300 properties with wells within 1000 feet of the Mine's mineral rights area, neither the draft nor final EIRs provided current monitoring data from these domestic wells. They relied only on *sparse patches of data from over 15 years ago*. The quality of this input data is one of many concerns identified by numerous experts who contradicted the findings of the Draft EIR's groundwater study in their written comments.

The EIR's primary approach is to install fifteen non-domestic *monitoring wells over a limited area* to do the job of predicting impacts for all water supply wells. With our complex fractured bedrock spread over thousands of acres, this approach is inadequate. This is further complicated by the fact that the estimated area of potential impact is based on the findings of a questionable study. In addition, the 378 properties identified in the Final EIR's *supplemental domestic well monitoring program* only capture about 150 of the 300 plus wells in the mineral rights area.

Timing of baseline data collection, however, is really the central issue. CEQA requires that a baseline be established prior to the evaluation of potential impacts. This was not done. With mine dewatering, previous dry years, and drought still predicted for the future, it is imperative that we get this right. Adding a well monitoring program *after* the project is approved and just one year before the mine is dewatered - as the Final EIR

proposes - is not only out of compliance with CEQA, but is also extremely shortsighted and risky. Multiple experts provided comments telling us that it takes a minimum of 3 years to establish a reliable baseline in order to account for year-over-year variations.

Also, under CEQA a mitigation measure must be achievable, enforceable, and must be capable of actually reducing the Project's impacts. The Final EIR's supplemental domestic well monitoring program is not even defined as a mitigation.

Not having a baseline established by a properly constructed *domestic* well monitoring program before publishing a Final EIR is unacceptable. Our wells are not currently being monitored. Since it will take several years for Rise Gold to establish a reliable baseline, we request the current EIR be rejected and that any future EIRs include at least 3 years of comprehensive well monitoring data.

Sincerely,

Christy Hubbard
The Wells Coalition

info@sjrtaxpayers.org www.sjrtaxpayers.org

January 12, 2023

Nevada County Planning Commissioners
950 Maidu Avenue
Nevada City, Ca. 95959

Dear Commissioners,

My name is Sol Henson, I grew up on the San Juan Ridge and hold a master's degree in hydrology. I am the president of the San Juan Ridge Taxpayers Association and speak for the Association today. I'm here to talk about the importance of baseline monitoring for wells to protect our community from industrial mining impacts.

In 1995 Siskon Gold operated a gold mine in the North Columbia Diggings on the San Juan Ridge. During mining operations, they breached a water bearing fault-line 300 feet underground. This breach led to the loss of nearly a dozen wells including the well for our middle school and the community Cultural Center. This was a disaster for those who lost their wells, but we still do not know the extent of well impacts. Some wells may have lost 50% or even 75% capacity but without baseline data, owners could not prove that the mine had impacted their wells.

This was a single catastrophic event. Wells are more commonly impacted by the extraordinary amount of water pumped out of mine tunnels just to maintain daily industrial mining operations. Over time, millions of gallons of water a day must be removed from the surrounding fractured bedrock aquifer. In such cases, well impacts can be slow to develop and can be hidden within seasonal cycles.

In 2012, the San Juan Ridge Mine Corporation submitted a new permit application to mine the North Columbia Diggings. Exhibiting due diligence, and with community input, the County helped to create a baseline monitoring program for domestic wells. This program established a baseline through monthly collection of water quantity and quality data. This information would have been invaluable for the environmental review process. Should the mine have been permitted, well owners would have had recourse to say with some confidence if their well had been impacted.

We firmly support the precedent of baseline monitoring for projects of such scale and impact as the Idaho Maryland Mine. Significant monitoring programs have been developed in the past for the IMM site, including for the 1996 permit to dewater the mine for exploration and the 2008 Emgold Mine environmental review process. It is unclear why the current Rise Gold effort to permit the IMM lacks a monitoring plan that would form a baseline for water quantity and quality of domestic wells in the surrounding area. We believe that the community is owed these safeguards and that CEQA requires it. Thank you very much.

Sincerely,

Sol Henson

Subject: the Idaho-Maryland Mine Final EIR groundwater hydrological model predictions and risk to domestic wells in the area of the Project.

The proposed well mitigations in the Final EIR for Rise Gold fail to acknowledge that there are significant risks posed to domestic wells in the surrounding area of the Idaho-Maryland Mine project, and it does not comply with CEQA.

The Final EIR for Rise Gold states:

" All potentially impacted wells are located in the E. Bennett Road area. Domestic water wells outside this area will not be impacted." [1]

But expert opinions contradict the certainty of these statements, citing repeatedly the uncertainties in hydrologic predictions and impacts to wells:

Emgold's 2008 DEIR for the Idaho-Maryland Mine states

"Due to the uncertainties regarding the complex geology and groundwater flow, dewatering ***impacts to domestic water supply wells cannot be accurately predicted."*** [2]

Also, Emgold's project description states

"The geologic formation in which the mine is located is fractured bedrock whose hydrogeology is difficult to predict. *Therefore, reliance on Domestic Well Level Monitoring Program data will be required to assess impacts and discern appropriate* ***mitigation measures for each domestic well*** *owner."* [3]

After reviewing the hydrology computer model from the EIR for Rise Gold an expert hydrogeologist in groundwater modeling stated

"Even a well calibrated model has a large uncertainty to it, in its predictions.

It turns out that this model is not well calibrated, so the uncertainties are almost certainly larger."[4]

The hydrology report for the Idaho-Maryland Mine's 2008 EIR affirms the uncertainty in predicting whether ground water from near surface well waters may drain down into the deeper mine workings.

"The groundwater in this particular area is contained in and flows through fractures in near surface bedrock and because of this fracture flow regime, the groundwater flow in quantity varies considerably with location and ***cannot be predicted with certainty. Furthermore, complete hydraulic separation between the deeper groundwater within the underground mine workings and the shallow groundwater within fractures and supplying the domestic wells cannot be assumed."***[9]

Even the hydrologist who prepared the hydrology computer model for the EIR, told the NID board of directors.

"With fractured rock there will always be uncertainty and during my career there won't be any 100% confidence in predictions."[5]

It is because of these uncertainties that we are appealing to you to require protection for all wells with a comprehensive well monitoring plan for at least 3 years to gather baseline data to be used in a revised EIR.

Thank You,

Gary Pierazzi
The Wells Coalition
wells@cea-nc.org

Additional expert opinion quotes regarding uncertainties in groundwater modeling and fractured rock.

"The EMKO Report describes a three-step procedure used to assess potential drawdown effects in perimeter areas. A major assumption underlying the procedure is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth. ***However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of this uncertainty and the overall uncertainty of the analytical and numerical model predictions with respect to groundwater level impacts on individual wells should be provided. expanded to include an assessment of the uncertainty in the conclusions developed by Todd Engineers."****[6]*

"Although the analysis is considered conservative in methodology, ***several complexities in the groundwater system could potentially result in a larger or smaller radius of influence. Although larger impacts seem unlikely, it is difficult to prove that aberrations in the system do not exist."*** *[9]*

"Uncertainties in the analysis indicate that monitoring should occur over a slightly larger area than where impacts are predicted. In addition, the monitoring program should consider adjustments specifically for geologic faulting." *[7]*

"Monitoring locations should also include areas outside of the predicted impact zone to account for uncertainties in the analysis," *[7]*

"The fracture systems existing in buried bedrock beneath Grass Valley are not mappable within the resolution needed to predict specific dewatering effects. Technology and state-of-the-art hydrogeology have not developed to a level that fracture mapping is possible. Due to this limitation, hydrogeologic modeling is attempted by making an assumption on fracture connectivity." *[8]*

"Based upon the significance criteria established on page 4.3-4, ***the risk to all wells within the study area, regardless of risk category, represent a potentially significant impact."*** *[10]*

"The study area has not been monitored by an approved groundwater monitoring system designed to observe the dynamics associated with subsurface hydrology. Therefore, ***many of the initial unknown hydrogeologic and geologic parameters located within the earth between well and mine elevations still exist."***

Nevada City, CA 95959-7902
Idaho.MMEIR@co.nevada.ca.us
planning@nevadacountyca.gov

I'm a resident & well owner in district 1.

I can appreciate the inclusion of a well monitoring program in the FEIR, but it falls significantly short of what we really need. I should not have to beg for protection from the county to keep our sacred resource safe. Our well is amazing! It provides safety from wildfires by allowing us to maintain green space. It keeps my family and pets healthy and happy. Just imagine what you would do if the water in your own home suddenly vanished. Your spouse and kids, asking what's wrong with the water? Oh my god! Without water my property is worthless! How could this have happened? Where is the protection from my county?

Experts have weighed in on the amount of monitoring time necessary to obtain a dependable baseline. In some cases, 3 years is not even enough. It's also a stretch to accept a program that is deficient in infrastructure to replace my water resource if it becomes damaged? As I read the details, I would be subject to some sort of nebulous negotiations with Rise Gold to get my water connected to NID. Would this make you feel protected? To be forced to deal with a CEO that has demonstrated severe environmental failures in Canada, and spreads contrary information through press releases and interviews, stating, "there will be no impacts", or, "the community overwhelmingly supports the project"?

I should not be required to compromise or negotiate when it comes to an intruder causing harm to my family and home. None of the hundreds of well owners asked for this. None of us would be the recipient of any benefit whatsoever. We need complete protection from this potential catastrophe, with a comprehensive well monitoring program that is designed around the adequate years necessary to produce dependable data. This data should have been obtained before the DEIR, according to CEQA. This program must also lay out, in specific details, the transfer to an equal replacement water source, with all necessary infrastructure in place, and independent from Rise Gold for immediate implementation when a well fails.

Our stress levels are off the charts dealing with these potential consequences, including financial ruin and loss of our nest egg. The fact that I must beg for protection in 3 minutes here

is just as stressful. No one here today would accept even the tiniest risk that they could lose their water in exchange for gold in the pockets of strangers. I implore the board reject this FEIR and take
everything back to the drawing board with our protection as top priority.

Groundwater Baseline Requirements and the Idaho-Maryland Mine EIR

Presented as Public Comment to the Planning Commission Jan 12, 2023

The California Environmental Quality Act (CEQA) does not allow the deferral of important studies necessary to characterize a project's impacts.

According to CEQA Guidelines § 15125(a), an Environmental Impact Report (EIR) must include an accurate description of a project's environmental setting, which provides "the baseline physical conditions by which a lead agency determines whether an impact is significant."[1] It goes on to state: this baseline "should describe **physical environmental conditions as they exist at the time the notice of preparation** is published."[2] (i.e. before the Draft EIR is prepared.) The purpose of this requirement is, per CEQA Guidelines, "to give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts."[3] And the court case of *Save Our Peninsula Com. v. Monterey County Bd. of Supervisors (2001)* affirmed that point: "Without a determination and description of the existing physical conditions on the property at the **start** of the environmental review process, the EIR cannot provide a meaningful assessment of the environmental impacts of the proposed project."[4]

Note that the Rise Gold project Final EIR clearly acknowledges that this baseline is needed. It states that for each domestic well, a projected and seasonally averaged water level shall be estimated **"...which will serve as a baseline groundwater level."**[5] But this **incorrectly defers** the collection of the needed additional groundwater data to after the EIR process is over.

Let's look at it using common sense. Unless the EIR identifies current well levels and related data, it cannot establish performance criteria and evaluate how dewatering may impact wells, and it's not possible to define appropriate mitigations. For example, Rise Gold's hydrology model estimates that water levels will drop between 1-10 feet for over 150 wells. But there is no current data that could tell what the impact would be to well owners. A two foot drop could be critical. How would that be determined? Are some wells near failure? We don't know.

CEQA law, County precedents, and common sense all say the same thing: Collection of the well data should have been included in the Draft EIR, not deferred until after the CEQA decision has been made.

Current domestic well monitoring data should have been collected and included in the EIR to establish a baseline so that it can be reviewed and then used in the decision making process.
The County has ignored this critical step and released an inadequate Final EIR.

Thank you.

Nevada County, CA 95959-1423

As a wetland ecologist, I have a number of concerns about the minimization of environmental impacts to wildlife, plant communities, and aquatic resources in the proposed project, so I made several comments Deir. The two I am discussing now areNos. 523-2 & 523-3, located on p 804-806 of Volume V of the DEIR of the IMM project.

My comment 523-2 of the DEIR:
" The mitigation caveat presented in the DEIR of wetland impact is: "however, in the event that the currently proposed remediation boundary limits are modified by DTSC prior to commencement of remediation, this EIR address the possibility that some amount of freshwater emergent marsh wetland habitat may remain on the Centennial Industrial Site post remediation"

What is the specific quantity of "some amount"? These delineated wetlands are too important ecologically to pave over, even partially, regardless of the ability to obtain Federal permits. How do the biologists justify minimizing the environmental impacts of this mine project on the delineated wetlands of both the Centennial and the Brunswick Sites that occurs throughout the DEIR? Even drainage in ditches on the Brunswick and East Bennet ROW has potential to be amphibian habitat, as I have personally observed

Response to Comment Ind 523-3

A majority of the wetlands on the Centennial Industrial Site will be removed as a resulted of the Centennial M-1 Remedial Action Plan project. Please see Master Response 4 - Clean-Up Project is a Separate Project Under CEQA. The additional wetland impacts associated with engineered fill placement at the Centennial Industrial Site were analyzed in DEIR Impact 4.4-3 and mandatory mitigation reducing the impact to a less than significant level is provided in Mitigation Measure

Also, Master Response 4, which merely states they are mitigated to less than significant based on the Aquatic Resources Management plan. I have reviewed this thoroughly, and found it inadequate, mainly in terms of compensatory mitigation.

The FEIR Responses to my comment #523-3 regarding fill of wetlands on both the Brunswick and Centennial sites

The FEIR Response on p 812 of Volume 5 states
"Compensatory mitigation can include but is not limited to the following: onsite and/or offsite wetland creation and/or restoration, purchase or placement of conservation easements, payment of an in-lieu fee, and/or purchase of mitigation credits at an approved Corps wetland mitigation or conservation bank."

There is not attempt at describing what compensatory mitigation would go into effect.
At a minimum, this should be in - kind mitigation on a 1:2 ratio, meaning for every wetland plant species removed or filled, two more shall be planted, maintained, and monitored with specific end point success criteria in an in-kind wetland.
Of the 14 acres of delineated wetlands mapped on the two sites, some percentage of these will be filled. The mitigation measures stated in the FEIR do not compensate for that, as required under various regional, State and Federal laws per CEQA.

(IF TIME ALLOWS)

Also, there are many references to "reasonably anticipated conditions of the site following remediation" of the Centennial Site specifically

HOWEVER, THERE IS STILLL NO REMEDIAL ACTION PLAN
My comment regarding this is # 522-1 on p 804:

.."This is but one of many such references to remediation activities in the DEIR. What are those remediation activities? How can analysis of impacts to these biological resources be complete? Without complete analysis how can conclusions be justified without this information?"

The FEIR also states the following in response to many comments about this, including mine:

As the Centennial Industrial Site has been targeted by the U.S. EPA for cleanup since 2002, and discussions regarding cleanup of the Project site were well underway before the IMM Project application was submitted, statements from commenters that the Project is merely a component of a larger plan to develop an underground gold mine (the IMM Project), is factually incorrect. Third, the Clean-Up Project is under the authority of the California Department of Toxic Substances Control.

This is very faulty logic. Rise Gold made a deal to clean up the Centennial site in order to proceed with their proposed project to reopen the mine.

Public Comment to the Nevada County Planning Commission, Mar. 9, 2023: Example of Inadequate Mitigation in Rise Gold Mine Inc. (IMM reopening) Final Environmental Impact report (FEIR), Asbestos Pollution Jim Bair [1]

Hi, I'm Jim Bair, Leader of the Stop the Mine Task Force in Grass Valley. I have been asked to provide specific references to the 'Rise Gold' FEIR. So, I include notes and references here and in a detailed report with this comment. [i] [Blue type not read publicly].

The FEIR states that the project could result in a significant impact (health and mortality) by exposing receptors [people] to substantial concentrations of asbestos, and requires mitigation to reduce the impact to a less than significant level. The proposed asbestos Mitigation Measure 4.3-2 is inadequate for dozens of technical reasons.[ii] Here are a few key points.

First, the required the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval is not to be done until after project approval. [iii]

There's no question asbestos is present in the mineral rights area. [iv] The quantity cannot be predicted because the rock sampling using 19 bore holes to generalize to 2500 acres is invalid. Even so, asbestos was found in a significant proportion of samples (FEIR p. 123, parag. 5, and p. 416.) (Section 4.4 of Appendix K.2 of the DEIR)

Given asbestos will become airborne, there is no adequate measurement once it's in the air.

The State and Federal (EPA) authorities state they do not have an airborne asbestos measurement methodology.

Measurement technology is limited by the extremely small size of asbestos fibers. [v]

The proposed mitigation is for **dust** which is larger particles (PM 10) while asbestos fibers are often 10 to 20 times smaller than dust -- .5 microns (<PM2). Asbestos is more like smoke and can toxify air miles from its source.

The asbestos mitigation measure is only for dust using water spraying, washing truck tires, sealing the hauling trucks, paving the rock processing area. Even then the FEIR states some dust will escape (become fugitive).

Chemical stabilizers to reduce hauling dust have minimal impact on asbestos particles.

Extremely small numbers of asbestos fibers can cause cancer, asbestosis, and death....[vi]

Finally, the FEIR makes the following questionable judgement in at least 7 places:

Quote: "*The engineering details and intensive sampling described by many commenters* ***would be*** *developed and completed through the implementation of mitigation measures, and is not required to be completed as part of the CEQA process*"—I provide legal citations [vii] – **this is subject to interpretation, and I think you can decide.**

Public Comment to the Nevada County Planning Commission, Mar. 9, 2023: Example of Inadequate Mitigation in Rise Gold Mine Inc. (IMM reopening) Final Environmental Impact report (FEIR), Asbestos Pollution Jim Bair [1]

---

[i] Title: Example of inadequate mitigation in Rise Gold Mine Inc. Final Environmental Impact report (FEIR), Asbestos Comment (amended), March 5, 2023.

[ii] The report submitted with this comment on the Final Environmental Impact Report (FEIR) for Rise Gold Mine Inc. explains how the FEIR does not adequately address Public Comments on the Draft Environmental Impact Report (DEIR). It describes an example of inadequate, misleading and incorrect statements about asbestos, one of the most dangerous pollutants in the world that will be released from the Mine's operation. It is highly likely there will be significant and unavoidable negative environmental impacts from the Mine's asbestos emissions resulting from the processing of 1,500 tons of mine rock per day.

[iii] The FEIR continues to reference itself (DEIR) as evidence; for example, *"the health risk assessments are conservative and therefore…the DEIR adequately evaluates the potential health effects from asbestos."* It does not.

[iv] See J. Bair, **Idaho-Maryland Gold Mine Project, DEIR Comment on *Appendix E2: Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan*** for a description of the statistically invalid measurement of in-ground asbestos.

[v] (see EPA ref., p.8 of my report [v]).

[vi] NOTE that TACs (toxic air) in the EIR include gases as well as particulates. The Northern Sierra Air Quality Management District's (NSAQMD) cancer and noncancer thresholds to assess health risk significance for CEQA is consistent with AB 2588 risk assessment procedures, **but** are not adequate for asbestos fibers > 3 microns [length]. CEQA may not be current enough to cover all airborne pollutants even though it does apply to worksite toxins related to dust.
Further, Airborne dispersion models (Dudeck Appendix K) are also for larger particles as well as gases.

Notes:

1. The FEIR (p. 7456) continues delegate asbestos pollution to the State: "As stated on page 4.3-42 of the DEIR, use of the NSAQMD's cancer and noncancer thresholds to assess health risk significance for CEQA is consistent with AB 2588 [California Air Toxics "Hot Spots" Information and Assessment Act] risk assessment procedures. The threshold of significance for health risk is an increased cancer risk of >10 cases per million persons. The Health Risk Assessment prepared for the project concludes that the health risk to the most sensitive receptor will be below this threshold."
    a. The referenced AB2588 depends upon The California Air Resources Board *Implementation Guidance Document for Test Method 435 Field Sampling and Laboratory Practices.* **This test method is for naturally occurring asbestos (NOA) by limiting the asbestos content of surfacing materials. It does address airborne asbestos.** https://ww2.arb.ca.gov/resources/documents/test-method-435
    b. **Further, even rock aggregate measurement is difficult: "***ARB staff conducted a M435 Interlaboratory Study (ILS). The ILS identified variability in laboratory equipment and procedures that can significantly affect the reported asbestos content of M435 rock and soil samples."*
2. **The law depends upon Rise Gold Inc. to inform the agencies & public:** While AB 2588 is relevant, ***the law depends upon the* facilities emitting toxic substances** to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over five years. DEIR p.300.

[vii] **FEIR Legal Claims**: pp. 119, 411 (*details to be from the County*), 638, 6835, 7590, 7797, 8187. FEIR states *Engineering level detail is not required in an EIR.* (Dry Creek Citizens Coalition v. County of Tulare (1999) 70 Cal.App.4th 20, 26.) Which cites Sacramento Old City Assn. v. City Council, Court of Appeal Third District Apr 30, 1991, **are not comparable – irrelevant precedent**.

Subject: Example of inadequate mitigation in Rise Gold Mine Inc. Final Environmental Impact report (FEIR), Asbestos Comment (amended)

Copy: County Staff

From: Jim Bair [i]

Executive Summary

This comment on the Final Environmental Impact Report (FEIR) for Rise Gold Mine Inc. explains how the FEIR does not adequately address Public Comments on the Draft Environmental Impact Report (DEIR). My comment describes an example of inadequate, misleading and incorrect statements about asbestos, one of the most dangerous pollutants in the world that will be released from the Mine's operation. It is highly likely there will be significant and unavoidable negative environmental impacts from the Mine's asbestos emissions resulting from the processing of 1,500 tons of mine rock per day.

The proposed FEIR asbestos mitigations are essentially unchanged from the DEIR. The proposed mitigation and management plan for asbestos is still inadequate, and consequently there is high probability for significant long-term negative environmental and health impacts to our community. The FEIR fails to address Rise Gold Mine's Technical Reports and Appendices that discuss the Mine proposal's difficulties especially the invalid asbestos measurement in rock and predicted air sampling. [ii]

Numerous scientific studies have shown that asbestos is extremely toxic and can have long-term, serious health impacts to those exposed. If it escapes into our air, it is likely to cause cancer. Airbourne asbestos is often lighter than dust and, like smoke, can pollute the air over an extended area, miles from its point of release.

As is the case throughout the FEIR, the operational testing proposed in the FEIR is assigned to government agencies that do NOT have the equipment, staffing nor regulations to measure airborne asbestos. The FEIR delegates the Asbestos and Dust Mitigation Plan to the Northern Sierra Air Quality Management District **after Mine project approval.**

The FEIR continues to reference itself (DEIR) as evidence; for example, *"the health risk assessments are conservative and therefore…the DEIR adequately evaluates the potential health effects from asbestos."* It does not.

Report and References

This comment is in response to the Final EIR Idaho-Maryland Mine Project, December 2022. The FEIR fails to adequately address the public comments on the Draft EIR. While some responses are contained in the FEIR, they may be combined into Master Reponses, and they often do not provide adequate mitigation measures. When a comment from an agency or individual is referenced, the FEIR usually does not contain new information that addresses the specific requests in the DEIR Comments.

For example, my DEIR comment [Comment Ind 353-19] described inadequate, misleading and incorrect statements about asbestos, one of the most dangerous pollutants[iii]

The FEIR does not adequately address my Comment on the DEIR:

1. The inadequate FEIR asbestos mitigations are unchanged from the DEIR. The required *Asbestos Dust Mitigation Plan*, page 3-3, (4.3-2) is only a "summary" and does not address asbestos fibers which are too small to be treated as dust. [iv] To quote the FEIR Group Response, "*the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in the mitigation measure. Additional measures, such as air monitoring if required by the NSAQMD,* ***would be*** *detailed in the ADMP*" (FEIR Comment Grp 7-143 Mitigation Measure 4.3-2). **The required Asbestos Dust Mitigation Plan is not done.** See Note 4 below.

2. There is inadequate sampling of the mineral rights area. Conclusions based on 19 bore holes are not valid to generalize to 2,500 acres. Some samples did contain asbestos indicating far more bore holes are needed for valid sampling. There should be at least one bore hole for each unique geologic structure. (See Master Response 23).

3. The use of asbestos detection technology is incorrect. The measurements and the mitigations failed to address the size of asbestos fibers. Asbestos fibers are often less than one micron in size which cannot be detected by Polarized Light Microscopy (PLM asbestos testing). [Microscopes using light are not sensitive enough.] TEM (Transmission Electron Microscopy) must be used to detect sub-micron fibers and to distinguish between asbestos fibers and non-asbestos fibers.[v] (c.f. **Appendix 1**)
   TEM asbestos testing requires shipping samples to San Leandro, CA, with a turn-around of days. Thus, the real-time monitoring restated in the FEIR is impossible. Quantities that are hazardous to public health would probably be widely airborne before tests results would be available. [vi]

4. The FEIR mitigation of airborne asbestos is inadequate because it is treated as "dust" in the DEIR and cannot be measured (see Note 4). The comment that mitigation cannot be done to CA standards of air quality (Northern Sierra Air Quality Management District (NSAQMD)) is proof of inadequacy. Asbestos fibers are too often smaller than dust (PM2). The FEIR must describe mitigation measures for sub-micron fibers in addition to washing and spraying in open tailings areas, and especially the trucking lanes to and from the tailings dump site (Centennial).[vii]

5. Even though the FEIR declares that asbestos pollution is a serious negative impact, it does not contain the plan for mitigation. Quote, "*the DEIR concludes that the Project **could** result in a significant impact with respect to exposing receptors [people] to **substantial concentrations of asbestos** and requires mitigation to reduce the impact to a less than significant level.*" Page 183.[viii]

Conclusion

The lack of feasible mitigation of asbestos is an example of significant and unavoidable negative environmental impacts. The FEIR (page 256) states that if certain levels of asbestos emissions are exceeded, then there is a potentially significant negative impact and mitigation is required. "If after implementation of mitigation, levels are exceeded, then a significant and unavoidable impact would occur." **There is no evidence to predict an acceptable level of asbestos pollution from processing 1,500 tons of mine waste per day**. [ix]

The FEIR continues to cite Federal and State rules, regulations and guidelines in misleading ways to insinuate that future impacts will be less than significant, e.g., NSAQMD and OEHAA (CA Office of Environmental Health Hazard Assessment). [x] For example, only larger particles are proposed to be mitigated (PM10) while asbestos is usually smaller than PM2. The FEIR states, **if and when** pollution mitigations are implemented and followed by measurement, they will be less than significant but **there is no airborne measurement methodology according to NSAQMD** – see Note 4.

NOTES re: Asbestos in the FEIR

Note 1: Unsupported claims (page 180):

To quote, "*This master response confirms that the proposed project will use chemical dust stabilizers that are not considered toxic air contaminants, nor do they have adverse effects on water quality or aquatic life.* [**There is no evidence that dust stabilizers will control asbestos**]. *This response also demonstrates that, after implementation of mitigation, the project's construction and operations would not expose sensitive receptors to substantial concentrations of fugitive dust such that a human health effect would occur* (Appendix G, III(c))." **This statement cannot be supported.** Asbestos is not limited to "dust" – the particles are too small – **the response doesn't demonstrate anything.**

The FEIR does not address the predicted amount of asbestos (page 180), it merely references the DEIR as evidence!

FEIR quote, *"Several commenters asserted that the assumptions used in the Health Risk Assessment (HRA) understated the amount of asbestos that will be found in the rock mined at the project, and likewise the level of respirable asbestos that will be emitted into the air. Conversely, the assumptions used for the HRA were based on conservative assumptions that overstate the amount of asbestos in Final EIR".* Responses to Comments Page 2-108: "...the rock and tailings and overstate the amount of asbestos that will become airborne. As such, the HRA provides a conservative analysis of asbestos impacts, and thus, adequately evaluates the potential health effects from asbestos attributable to the proposed project."

There's no proof to support the claim of an adequate evaluation primarily because the amount of airborne asbestos cannot be predicted (see invalid sampling and particle size in this comment).

Note 2: FEIR Chapter 3 – Revisions to the Draft EIR Text

The FEIR claims are without evidence. The referenced Asbestos Dust Mitigation Plan (ADMP) is not done. I noted that it should be done before DEIR acceptance. The required ADMP plan doe not appear to have been submitted to the Northern Sierra Air Quality Management District (NSAQMD).

Note 3: Master Response 23 - Inadequacy of Sampling - Asbestos

P 182 Conclusion quote: "Based on these conservative assumptions, **the DEIR concludes that the Project could result in a significant impact with respect to exposing receptors [people] to substantial concentrations of asbestos and requires mitigation to reduce the impact to a less than significant level**. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Final EIR Idaho-Maryland Mine Project December 2022 Chapter 2 – Responses to Comments Page 2-111 Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in Mitigation Measure 4.3-2. Additional measures, such as air monitoring, if required by the NSAQMD, would be detailed in the ADMP.

P 253 quote: "Rather, the concentrations of asbestos at receptor [people] locations are modelled and the health risk is calculated in accordance with OEHAA guidelines. OEHHA is the lead state agency for the assessment of health risks posed by environmental contaminants in California." **Modeling to forecast asbestos concentrations is delegated to the State which is too general to apply to this unique project.** (Appendix report: Health Risk Assessment Memorandum for the Idaho-Maryland Mine Project Date: July 11, 2022).

Note 4: This is proof of inadequacy: **"The Northern Sierra Air Quality Management District (NSAQMD) has indicated that there is no approved method, and thus some uncertainty, regarding the estimation of asbestos risk based on rock samples."** FEIR page 416, Agency response 11-2.

https://www.nevadacountyca.gov/DocumentCenter/View/46398/IMM-FEIR_Volume-VII---Volume-IX-Appendices-A---R. (Use 'control f' to search FEIR online.)

Note 5: **Health Impacts are Unavoidable by State standards.**

Naturally occurring asbestos is found in some areas throughout California, most commonly where ultramafic rock or serpentinite rock is present. Draft EIR Idaho-Maryland Mine Project December 2021 Chapter 4.3 – Air Quality, Greenhouse Gas Emissions, and Energy Page 4.3-9.

Ultramafic rock or serpentinite rock is typical in the mineral rights area as reported in the DEIR. **With 100,000 persons in Nevada County, it takes only ONE PERSON to get cancer to exceed the State threshold (see FEIR table below).**

Table 4.3-6
NSAQMD Thresholds of Significance for Health Risks

Risk Factor	Threshold
Cancer	Increased cancer risk of >10.0 cases per million persons
Non-Cancer	Increased non-cancer risk of >1.0 Hazard Index (Chronic or Acute)

Source: Longmire, S. NSAQMD. Personal communication [email] with M. Morales, Dudek. February 19, 2021.

The DEIR description of *Asbestos, Serpentinite, and Ultramafic Rock Management*, does not measure smaller asbestos fibers in the rock (PCM microscopy cannot – see Appendix 1) **and does not address airborne asbestos. (see** Chapter 3.0 – Project Description Page 3-20).

"The TAC [toxic air contaminants] emissions associated with blasting and crushing, ore processing, and earthwork and material handling **would include asbestos and silica emitted from the fugitive dust produced.**" DEIR Chapter 4.3 – *Air Quality, Greenhouse Gas Emissions, and Energy* Page 4.3-61.

[iii] See references in my DEIR Comment; this observation is corroborated by three MDs and a Professor of Medicine. Note that my Endnotes and NOTES are important because the FEIR is inconsistent and extremely challenging to process at over 10,000 pages.

[iv] **Dust is regulated when the particles are larger than PM2 (2 microns) -- smaller particles (below PM2) may not be measured let alone regulated. But asbestos fibers are typically less than 5 micrometers [microns] and frequently measure a half (.5) micron.** In addition, FEIR page 181 states that the plan to monitor for airborne asbestos will be done in the future: "*Air monitoring requirements will be specified in the approved Asbestos Dust Mitigation Plan (ADMP), which must be approved by the Northern Sierra Air Quality Management District* ***prior to Project operations [not approval]****. The ADMP is required under the* ***[State]*** *Asbestos*

Airborne Toxic Control Measure (ATCM) for Construction, Grading, Quarrying, and Surface Mine Operations. Section (h)(3) of the ATCM specifies the requirement for analysis of air samples. Analysis of all air samples shall follow the analytical method specified by the ***United States*** *Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) criteria for asbestos (40 CFR, Part 763 Subpart E, Appendix A, adopted October 30, 1987). The* ***State*** *ATCM modifies the AHERA [Federal] criteria for asbestos and* ***requires a lower detection limit and the counting of all asbestos structures irrespective of length…".*** **[When the FEIR depends upon EPA regulation of asbestos, it is inadequate;** [see https://www.ecfr.gov/current/title-40/chapter-I/subchapter-J/part-302].` EPA Regulations are limited and cannot adequately measure asbestos: *"Observe the following* ***counting rules: Count only fibers equal to or longer than 5 micrometers [microns].***" Occupational Safety and Health Admin., https://www.govinfo.gov/content/pkg/CFR-2011-title29-vol6/pdf/CFR-2011-title29-vol6-sec1910-1001.pdf

[v] Pamela Heard, Licensed Respiratory Specialist, AIR Impacts Dec 23, 2021; Transcript by MineWatchAdmin https://www.minewatchnc.org/post/air-impacts-pam-heard-respiratory-therapist
EIR quote: *"TEM is the preferred analytical method for outdoor asbestos samples because of its ability to detect small fibers (greater than or equal to 0.0002 microns in diameter) and to distinguish between asbestos fibers and non-asbestos fibers. The term "TEM structures" is often used to describe asbestos fibers detected by this method. TEM is the method recommended by the California Office of Environmental Health Hazard Assessment (OEHHA). However, TEM measurements cannot be directly related to the cancer potency factors because the studies upon which OEHHA's risk assessment was based used PCM analysis. Thus, the TEM measurements must be converted to PCM equivalent units (OEHHA 2015.)"* (ASUR Plan, document pp 7 or pp 9 of 131).

[vi] *Ibib*

[vii] FEIR page 136 **inaccurately** states that, *"From a health perspective, the Health Risk Assessment (HRA) prepared for the proposed project (included in Appendix B of Appendix E.1 of the EIR) evaluated fugitive dust as PM10. The HRA concluded that a significant health hazard to the public would not occur as a result of fugitive dust [dust that escapes containment] after implementation of mitigation (see DEIR, p. 4.3-82). For more detail, please refer to Master Response 20 – Conservatism Used for Metals in Dust, Master Response 21 – Silica Health Risk, and Master Response 22 – Conservatism Used for Asbestos.*

[viii] Page 183 (2-110) states that, "*the DEIR concludes that the Project* ***could result in a significant impact with respect to exposing receptors [people] to substantial concentrations of asbestos*** *and requires mitigation to reduce the impact to a less than significant level. Mitigation Measure 4.3-2 of the DEIR requires the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review and approval. The ADMP has minimum requirements as described in Mitigation Measure 4.3-2. Additional measures, such as air monitoring, if required by the NSAQMD,* ***would be*** *detailed in the ADMP.* **The ADMP cannot be found in the FEIR.**

[ix] The FEIR p. 256 states that, *"If unmitigated emissions of ROG, NOx, and/or PM10* [10 microns] *exceed 136 pounds per day (Level C), then there is a potentially significant impact and mitigation is required; if mitigated emissions of ROG, NOx, and/or PM10 still exceed 136*

pounds per day (Level C) after implementation of mitigation, then a significant and unavoidable impact would occur." **When the measured emissions are larger than PM10, much of the asbestos and other small particles are not counted!**

[x] **The FEIR contains broad brush statements that future measures prove that mitigations will be made, quote:** "*Response to Comment Agcy 1-17 The commenter asserts that the project's ROG, NOX, and PM10 emissions should be considered "potentially significant" after mitigation; however, the commenter misunderstands the NSAQMD guidelines. The NSAQMD requires implementation of certain mitigation measures for each defined level of emissions volumes (A, B, C) to achieve an impact determination of less-than significant impact. As stated on page 4.3-41 of the DEIR, the NSAQMD has developed a tiered approach to significance levels. The tiered thresholds for Levels A, B, and C are given in Table 4.3-5 for a project's estimated emissions of criteria pollutants in pounds per day. A project with emissions qualifying it for Level A thresholds (i.e., all projects with emissions greater than zero) requires the most basic mitigation. Projects that qualify for Level B require more extensive mitigation, and projects that qualify for Level C require the most extensive application of mitigation. If unmitigated emissions of ROG, NOx, and/or PM10 exceed 136 pounds per day (Level C), then there is a potentially significant impact and mitigation is required; if mitigated emissions of ROG, NOx, and/or PM10 still exceed 136 pounds per day (Level C) after implementation of mitigation,* ***then a significant and unavoidable impact would occur".*** [c.f. APPENDIX 1 OF 1: Asbestos Measurement, EPA Analytical Methods

http://www.epa.gov/region8/superfund/libby/sampling.html

[Quote:] "Methods for asbestos analysis vary in complexity and are selected based on data needs. Simplistically, samples are visually identified under a microscope by a trained technician. Observed fibers are viewed at various magnifications and counted according to the rules and capabilities of each method. Depending on the method, results can indicate the type and amount of asbestos present, and also the dimensions of each counted fiber. Analytical techniques currently in use or proposed for use in Libby [MT] are:

- **Phase contrast microscopy (PCM)** - The traditional technique for measurement of asbestos fibers in air and upon what many regulations are based (e.g., occupational exposure). Results are often used to estimate health risk from asbestos in air. PCM has limited utility because it cannot differentiate between asbestos and non-asbestos fibers. Thus, PCM use in Libby [MT town EPA investigated] has been limited to specific purposes, often in conjunction with another analytical technique such as TEM.
- **Polarized light microscopy (PLM)** - Used to visually estimate the percent of asbestos in bulk samples, such as soil and insulation materials. It can differentiate between asbestos types, but cannot reliably detect asbestos in low concentrations (below 1%). Thus, PLM is being used in Libby as a screening method.
- **Transmission electron microscopy (TEM)** - TEM is more complex than PCM or PLM, and it uses a more sophisticated analytical instrument. TEM can distinguish between asbestos and non-asbestos fibers and asbestos types. It can be used at higher magnifications, enabling identification of smaller asbestos fibers than can be seen by other techniques. In Libby, two TEM methods (AHERA and the more complex ISO 10312) are used, depending on the data need.
- **Infrared spectroscopy (IR)** - This is a developmental, rapid-screening method, for use in determining the presence of Libby amphibole asbestos in soil at low concentrations. It is needed because PLM is not reliable for screening concentrations less than 1%.
- **Scanning electron microscopy (SEM)** - SEM is similar to TEM. It is capable of distinguishing asbestos fibers from non-asbestos fibers and is capable of higher magnifications than PCM. Its range of visibility is more limited than TEM. SEM is also limited in its ability for mineral identification.

In Libby, air samples are analyzed by PCM and TEM methods. Indoor dust samples are analyzed by TEM and, on occasion, PLM. Water samples are analyzed by TEM. Solid bulk samples (soil, mine waste, and bulk insulation) are analyzed by PLM, and a respirable fraction is sometimes and analyzed by TEM. SEM and IR may be used to analyze bulk samples for low levels of asbestos (concentration estimates below 1%). Method applications are regularly reviewed along with the advancement of new test methods.

Fiber Size

EPA is very interested in the size of the asbestos fiber, particularly those longer than 5 microns and thinner than 0.5 microns. These fibers are thought to be more dangerous, because they are more difficult for the body to expel.

Size classes used in the analysis are:

- Less than 5 microns
- Between 5 to 10 microns
- Greater than 10 microns

A micron is too small to see with the naked eye. There are 25,400 microns in an inch!"

Mine Waste and the Water Pollution Problem
Jan 10, 2023

The Final EIR for Rise Gold's Idaho-Maryland Mine is inadequate because it fails to address the potentially significant impact of mine waste disposal.

The Mine project plans to export 1000 tons of tailings and waste rock per day. This mine waste will be dumped into 2 Engineered fill piles over the course of the first 11 years. After that, the mine waste will be disposed of through off-site sales.

There are significant issues with the disposal of mine waste due to the potential to pollute ground water and surface waters by leaching hazardous chemicals. This falls under the jurisdiction of the Regional Water Quality Control Board.

The Water Board classifies mine waste by Groups A, B, and C. Only Group C, which has relatively low levels of contaminants, is clean enough to be used for off-site sales. Groups A and B require more stringent controls. The Water board requires mine waste testing to determine classification. In response to the Draft EIR, the Water Board stated: "The applicant shall not sell or utilize waste rock and tailings from the Project for construction aggregate or fill purposes offsite unless such material has been tested and confirmed to qualify as Group C mining waste..." [1]

In the EIR, the Water Board and numerous other parties identified that there was insufficient testing to determine whether the mine waste would be Group C, suitable for off-site sales.
Per the Water Board comments:
"...the alternative scenario that the mining waste is not suitable for off-site use should be examined."
The Water Board goes on to state that Rise should assess any constraints or challenges associated with waste disposal in case they can't do off-site sales for construction aggregate. They conclude with:
"The Draft EIR should be revised to address this comment."[3]

Rise Gold acquired a collection of drill cores and samples from Emgold Mining when they purchased the mine. In addition, they did over 67,500 linear feet of exploratory drilling. . Yet, from all those samples, they chose to test only 11 feet to characterize what will be over 25 million tons of waste rock that will be produced over the life of the mine. [2]

Disposal of mine waste is a critical element of the project with the potential for causing significant long term impacts. Yet no further testing was produced for the Final EIR. This is inexplicable.

CEQA requires that the EIR "...give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." [4] This Final EIR fails to do that.

You are being asked to approve a project without knowing if any portion of the mine waste will qualify as Group C. Currently, there is no realistic plan for continued mine operations if you can't sell the mine waste.

The Final EIR response uses speculative, unproven assumptions stating that the mine rock "...would not be mined until mine waste characterization has been performed to ensure the rock will be suitable for off-site sale. Rock types that are not suitable for off-site sale would likely not be mined, and if mined, the waste rock would be placed underground" [5].

Mine waste classified as Group A and B requires specific management that must be determined by the Water Board, and cannot automatically be placed underground.

Backfilling with waste rock and tailings is the exact scenario which has led to polluted ground water discharges in so many mines in our area. This new element, the placement of Group A or B mine waste underground, was not included in the Draft EIR.

Even disposal of mine waste on the project sites for Engineered fill (Centennial for 5 years, Brunswick for 6 years) requires testing and will have to meet the Water Board's approval. Quoting the Final EIR:

"The barren rock and sand tailings would undergo testing as part of obtaining [Water Discharge Requirements] WDRs for use in the Engineered fill pads, and compliance with water quality objectives will need to be demonstrated to the [Water Board] prior to that placement ." [6]

The project description fails to provide an adequate means of interim storage for mine waste.

The viability of the entire project is dependent upon the safe disposal of mine waste under Group C. There were numerous core samples available that could have undergone static and long-term dynamic testing, yet, subsequent to the release of the Draft EIR, no additional testing was done.

Even if the mine waste is all Group C, it is hard to believe there will be no need to stockpile any of it for shipping off site. 1,000 tons/day will be coming out of the shaft. That's about 50 truck loads/day. Construction aggregate is seasonal. Most construction shuts down in the winter.

The Final EIR is inadequate because if fails to address the potentially significant impact of mine waste disposal. Again, critical testing after project approval does not provide an "…accurate and understandable picture…of the projects likely…impacts".

Thank you.

Just received your fancy brochure announcing Rise Grass Valley "Career Day." What a farce. This event, a naked publicity stunt, will raise hopes that you will never fulfill, with most of the good jobs going to people from elsewhere. This is just cruel.

But these are not the kind of jobs this region needs anyway. Given the inherent toxic nature of gold mining, combined with Rise Corporation's terrible track record of environmental abuse and community disrespect, there is no way on earth I would support your effort to re-open this mine. This region of California is already still dealing with pollution from the initial gold rush over a century-and-a-half ago and into fairly recent history. We don't need you adding more pollution and community upheaval, regardless of the happy-talk lies you have been peddling. For that matter, we don't "need" the gold.

Go away, thank you.

To: Nevada County Board of Supervisors

Suppose I wanted to buy a house in Nevada County and spoke to a lender to get pre-approved for a home loan. My credit history and employment history would be reviewed. I would need to list past residences, disclose any legal actions against me and provide proof of current income. Basically, the lender must determine if I am able to "make good" on the loan or if the risk is too high.

Unless I am paying cash for a home, I understand this process. I accept that there are price range limits that I should consider based on my approval and a realtor would not waste their time showing me a $5 Million home that I could not afford.

I'm confused why we are wasting time entertaining the 80-year permit request by Rise Gold to re-open the Idaho-Maryland mine. As a company, they look terrible on paper. Is there any reason to believe they would "make good" on their stewardship of Nevada County resources like air quality or water supply? Will the rumble of large work trucks increase or decrease neighborhood quality of life? Property values? Rise Gold promises jobs. That's an appealing promise with little to no credibility.

I hesitate to even claim that they have any intention of opening a mine. I believe their main objective is investor dollars. Period.

It's time for the Nevada County Board of Supervisors to stand up to Rise Gold's risky Ponzi scheme and stop wasting concerned residents' and business owners' time and resources. Nevada County has other issues to resolve. Enough.

Kim James

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kathy Ellis. I live at 12085 Logans Run Ct, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Dear Sir, I would like to express my concerns about Re-opening this gold mine here in town. First of all we have been in a draught for years now and it just doesn’t make sense to open this mine back up again. The amount of water that will be used is not making any sense to me. People can’t afford there water bills as it is. And our water is so precious and such a premium to be wasting on this mine.

I don’t think it will be adding enough jobs for local people to make much of a financial difference. The people that live here now have no experience in mining. So there fore what’s the point of bringing in several hundred new people to the community? Besides we already have a huge shortage of housing as it is, this just makes it all the more difficult for the people who live here now and can’t find affordable housing.

But my main concern is our precious water! We can't afford to be dumping millions of gallons of water for this project which will never last or be successful.

Please don't vote for this project. We don't need it.

Sincerely,

Kathy Ellis

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Dr. Christopher and Susan Claydon. I live at 12353 Beaver Dr, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We live adjacent to the mine property and are gravely concerned about the potential adverse effects on the underground water supply and above ground pollution and traffic.

We have already had two home sales in our neighborhood pull out when they learned of the potential for the mine to reopen.

We are business owners, and very much in favor of new business and new property tax payers, but do not feel that this is the right business for our area.

Sincerely,

Dr. Christopher and Susan Claydon

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Eli Duber at eli.duber@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Eli Duber. I live at 11459 Ball Rd, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The mine would be a nusance to the people of Grass Valley. The mine would be detrimental and provide zero potential benefits. The mine would degrade the quality and quantity of our surface and groundwater, increase risk of contamination, lower the water table, increase air pollution, dramatically increase traffic, noise, risks to wildlife, human health and personal property and would ruin people's livelihoods. A primary reason the people of Grass Valley love it here because of its natural beauty and we wish to protect it for generations to come. Please don't let this mine happen as it would only benefit a handful of wealthy investors who have zero interest in our community.

Sincerely,

Eli Duber

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kate Gazzo. I live at 17490 Lazy Dog Rd, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1 off of North Bloomfield Road. My professional experience includes environmental impact assessment and mitigation. I currently work as a conservation planner for Bear Yuba Land Trust. I am strongly opposed to the mine because of the environemntal risks it poses to our community and due to Rise Gold (Mossman's) business history and track record.

Sincerely,

Kate Gazzo

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Grace Farag. I live at 172 Mcnab Circle, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

This is my second letter, because I'm very concerned about this issue — I'm concerned that you are going to ignore all the people who are begging you to say NO to opening this mine.

I have to say, I don't even understand why we need an EIR to tell us what we can know just by using our common sense. A mine will require the operation of heavy machinery. Heavy machinery is loud and will thus add noise to the community. The trucks that will necessarily be employed to go in and out will add traffic AND noise. There is also no way to get gold out of the earth without doing damage to the earth. I don't need to be a geologist to know this, and neither does anyone else.

The truth is we all know that this mine is going to cause damage to the land. It is

going to hurt our water supply, both in terms of quality and quantity — our most precious resource. I simply cannot comprehend any reason why this mine (run by a man of questionable character, to put it kindly) should be allowed to open in our community. If tax revenue is the only reason you've got for saying yes, it's not a good enough reason. Please do not make money more important than quality of life. Don't enough of our politicians and civic leaders do this already? Please, be a different kind of leader. The kind we really need.

Say NO to Rise Gold.

Thank you.

Sincerely,

Grace Farag

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Alan Emerson. I live at 11402 Hidden Mine Ln, Nevada City, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1 and I have lived in Nevada County for over 25 years. The quality of life here has been amazing compared to my previous experience of living in Sacramento County for 16 years. However, this proposed mine will change the entire scene here dramatically for the worse. This isn't just wild speculation, it's my considered assessment - it will RUIN this area in many ways, and if approved, it will lead to me moving out of state...and this once beautiful place to live and work will become untenable for so many. I honestly can't understand why this extremely risky proposition is even being considered by this board. I am active on social media apps that are devoted to the members of this community and I KNOW for a fact that there is overwhelming opposition to this proposed mine despite the massive PR campaign waged by Rise Gold in recent years. My assessment of the opposition compared with the support is around 80% opposed to 20% support. You've seen even greater

numbers in all public forums discussing this matter, so a NO vote should be a no-brainer. The Environmental Impact Report was a JOKE! The Economic Impact Report was also a JOKE! Both hugely underestimated the negative impacts to the point where I wouldn't be surprised if Rise Gold had a hand in drafting both of them.

Do the right thing and preserve what is left of this great community. Vote NO. If you are foolish enough to vote YES, may God have mercy on you.

Sincerely,

Alan Emerson

Dear Nevada County Supervisors and Planning Commissioners,

My name is Ronja Giesser. I live at 14618 Tyler Foote Rd, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live on the San Juan Ridge within Nevada City. My main concern about the mine being reopened is that it will drain our water and pollute it. As I'm sure you are aware, we have been in a severe drought for years and protecting our watersheds is of utmost importance. No amount of potential jobs or revenue can justify jeopardizing our water supply. I frankly think, reopening this mine would be dangerously irresponsible.
Sincerely,
Ronja Giesser

Dear Nevada County Supervisors and Planning Commissioners,

My name is Victoria Adams. I live at 15443 Cascade Drive, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hello there,

My name is Victoria Adams and I’m a resident of Cascade Shores in Nevada City. I would like to express my opposition for the Idaho-Maryland mine. It’s become apparent how detrimental this would be for the land as well as the residents. Corporate greed is rapidly destroying our planet as we all are very aware. Allowing something like this to happen here sends a strong message that the people and the land here are not considered or prioritized and yet again greed is the motive. Please do what is ethically and morally right here. The people have clearly spoken.

Sincerely,

Victoria Adams

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Rhonda Roberts Gaffney. I live at 13144 Idaho Maryland Rd, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

To Whom it may concern,
I strongly oppose the opening of the Idaho Maryland mine.
I live in Nevada City, in district 1. My family has lived here since 1966.
The opening of the mine is ludicrous! The harm that will done to our lives will be substantial.
My life and the lives of those in our community are worth more than money or gold.
Please be sure the mine owners are stopped from opening the mine.
Thank you,
Rhonda Roberts Gaffney

Sincerely,

Rhonda Roberts Gaffney

Dear Nevada County Supervisors and Planning Commissioners,

My name is D Sekerak. I live at P O Box 435, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Live in rural Nevada City. Have read the reports. Extremely concerned about Rise’s lack of a proven track record and the skewed economic #’s being presented. The lawsuits NevCo will shoulder due to “accidents” are not an if they are a when. Rise folds and NevCo tax payers foot the bill. Are board members prepared to be named in the many lawsuits?
The de-watering alone should be a hard NO!

Sincerely,

D Sekerak

Dear Nevada County Supervisors and Planning Commissioners,

My name is Janet Cinquegrana. I live at 140 Buckingham Ct, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a home owner living in district 3 in Grass City. Wolf Creek runs through my property. Reopening the mine would pollute our air, water and land. Our property values would go down. We would lose tourist revenue. In short it would ruin our community.

Sincerely,

Janet Cinquegrana

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Patricia Fuenzalida. I live at 14574 Sunrock Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

As a home owner residing in District 1 I must implore you all again to not approve the re-opening of the Idaho-Maryland Mine. We have read and researched so much on this very controversial proposal and could not be more appalled at the idea. There is nothing of substance to be gained and so much to lose. We can look back at history both decades ago and more recent to see the hugely detrimental impact the mine would have on our communities, quality of life, property values, health and precious environment. The track record of Rise Gold is abysmal and we fail to see how anyone could trust them. Mining should stay in our history! We need to look forward to other more productive ways to create jobs in our communities. This is not it!

Sincerely,

Patricia Fuenzalida

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jacqueline Frost. I live at 801 West Main Street, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I moved to Grass Valley last year and love the community. Gold mining was our PAST - not our future. A few extra jobs are not worth the risk to our environment and the degradation of our infrastructure. This company has a shaky reputation at best and cannot be trusted to run the mine safely.
Please say NO to the mine. Our future is not our past.
Thank you.

Dear Nevada County Supervisors and Planning Commissioners,

My name is Alana Flores. I live at 10961 Skyranch Place, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a mother of two young school aged children who has lived in Nevada County for 10 years. My husbands works as a teacher and I work in the service industry along with having been brick and mortar business owners in Grass Valley for 5years. It is my responsibility as a community member to stand against the reopening of the Mine. For my children for the land and for the well being of our community. I vehemently disagree with the opening of mining here in our beloved foothills. The havoc it would reek on our watershed and in our fragile ecosystem would far outweigh the small benefits that would like the pockets of the already wealthy removed from those impacts. I SAY NO MINE. Count my voice and vote to protect us all.

Sincerely,

Alana Flores

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Maria Benner. I live at 17071 Pine Peak Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hi, I leave in Grass Valley and part of District 1. I have been a resident of Nevada County for 13 years. Homeowner on Greenhorn area. Just about 4 miles from the Idaho- Maryland mine project. I am really concern about the pollution and degradation and pollution to the land and the quality of our water and air. We have already been having problems with not having enough water in our wells to get us through the summer. I have a daughter born in Nevada County and feel the responsibility to stand with her and against this project, since it will mean irreversible damage to the community and environment she will inhabit and her future generations.
I ask you to please say No this project. I understand that the economical value of this is very significant, specially right now that we don’t necessarily have a strong industry supporting our local economy. But I seriously think that this project set us

back many years and causes irreversible damage.
Quoting the Native American proverb we need to remember and live by.

“ When the last tree has been cut down, the last fish caught, the last river poisoned, only then will we realize that one cannot eat money.”

Please, say No.

Sincerely,

Maria Benner

Dear Nevada County Supervisors and Planning Commissioners,

My name is Mike Frasu. I live at 18497 Easy street, Penn valley, CA 95946.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

As a construction worker my entire life, I’m (74) I have been around mines as a boots on the ground worker and know they are a polluting environment regardless of what study, test or promise you’re told is to be fact.

The dewatering process in the time of a drought is absolute insanity. You can write anything you want on a one Dimensional piece of paper. It will affect the water table. It’s that simple.

Air, noise, and ground pollution, are how mines operate., regardless of what you have been told.

The traffic congestion in the Brunswick basin is already crazy. The integrity of our

roads and the traffic congestion We'll be over the top for a little town like Grass valley

This is all for a foreign entity to make money and already have a black mark against them in Canada. I find it hard to believe it's even a consideration.

Sincerely,

Mike Frasu

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Karey Nickerson. I live at 12251 Tomales Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Sincerely,

Karey Nickerson

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Katherine Honegger. I live at 13157 Tranquility Ln, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada County as long as I can remember. We moved here just before I started kindergarten and I am now 23. I feel lucky to have been raised in such incredibly beautiful place. From our forests to the Yuba River, the nature here has helped shape who I am today. The possible effects of the mine are extremely upsetting and scary, it puts all of the things I love most about Nevada county at risk. I urge and plead with you to not let this mine happen here. Please don't let it permanently destroy everything I call home, the trees, the animals, the river. As of now, I would love to live here the rest of my life, support and be apart of our wonderful community. However if this mine were to go through, I could no longer live in a place being destroyed and polluted like that, especially a place so much apart of

my heart. Just the thought of this mine being possible makes my heart ache for our wildlife, for our beautiful old trees, for our incredible water sources like Bitney Springs and the Yuba. No amount of money will EVER be worth destroying all of that. And if this passes, we will lose all of the things that make Nevada county so special. Please, protect my childhood home from this mine and all of the horrible things that will come from it.

Sincerely,

Katherine Honegger

Dear Nevada County Supervisors and Planning Commissioners,

My name is Deva Hauber. I live at 11951 BANNER LAVA CAP RD, NEVADA CITY, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

When I moved to Nevada county in 2018. It was the beauty and sense of community that drew me to the area. I was looking for a place to raise my child where he could grow a connection with the land and understand the importance of the environment around us. I have since opened a preschool in our home and work with children every day. I am asking you to protect this place for them. Don't be drawn in by the short-term benefits that the mine is promising. Look at what occurs historically when mining corporations come into a community and what they leave behind. We need to maintain our resources within the community rather than exporting them for someone else's profit. There is more benefit for the community long-term in protecting this land.

Sincerely,

Deva Hauber

My name is Ross Adam. I live at 12737 Rattlesnake Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I was born and raised in Grass Valley (near Peardale) and care deeply about this small town. I love how quiet, peaceful and beautiful this area is. I want my future children to enjoy this lovely place just like I have since I was born here 37 years ago. The mine would be nothing but a disgrace to the area, and would hate to see it degraded and polluted by the Idaho-Maryland Mine. Please don’t allow this wonderful town to be impacted in such a negative way.

Sincerely,

Ross Adam

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am relatively new to Grass Valley but in my many years of life I have repeatedly seen something wonderful (and taken for granted) loose everything that made it wonderful. This can happen when people do not recognize what a truly valuable resource they are holding. Let’s not do that here. Grass Valley and Nevada County is already so very fortunate. We don’t need to gamble away our good fortune in exchange for unfounded and unsubstantiated promises. We are looking to your wisdom to protect our home. Thank you

Sincerely,

Katharine Popenuk

Dear Nevada County Supervisors and Planning Commissioners,

My name is Shannon Ross Winters. I live at 12202 Nuthatch Ct., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

if you approve RISE GOLD'S application to mine here, it will destroy our homes, destroy our wells, tourists will not come to this town. It will destroy our creeks and the population of NC their serenity. You all are intelligent to read the about the damage this company, Rise Gold, has created in other places. Can we not learn from Canada's problems with Rise Gold to know this is a losing proposition here in Nevada County. It will destroy the health of our citizens. This is CALIFORNIA. We are leaders in prosperity, creativity, clean air, solutions to GHG, we lead the way in slowing down global warming and to allow this rotten company RISE GOLD to come here and destroy a pristine beautiful community would be on your heads and hands for ever more. The supervisors should be taking the long look into the future with this

disreputable company, RISE GOLD. Consider how people will literally lose their life savings in their homes and properties that will be affected by this backwards choice. We cannot go back to the health standards of the 1850s. We need to face the future creatively and with long-term solutions for the health of our citizens, the natural world, for our waterways, and air quality.

Sincerely,

Hello. I live in downtown Grass Valley and have been here for 3 years. I love being here because of the natural beauty and recreational opportunities that abound. As an avid hiker and fisherman, I am extremely concerned about this project. As a long-time resident of Northern California (specifically Foresthill and Auburn), I have seen what the mining industry can do to local waterways and fisheries first hand. Please do not approve this project. I believe it is NOT in the best interest of the local community to reopen this mine.

Sincerely,

Daniel Prawalsky

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Susan Perko. I live at 528 Main Street, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in downtown Nevada City. I moved here nearly 12 years ago with my husband and my two children. I have no plans of living anywhere else. I love this community. The quality of life here is unmatched. The river, the forest, the people, the creative energy- it's like no where else. I work in downtown Nevada city and I love it. I just never know who I'm going to meet. People come from all over the surrounding area to shop in our downtown and hear music and see plays and go walk in the forest. If there is even the most minuscule chance that the environment could be harmed on any level, there is absolutely no reason that this should be allowed . We do not need a Mine and we do not want it. A mine would negatively impact this area. Recently, I opened a business that will depend on the people who come to visit this place. I know many people from here who rely on the tourists. If the air quality is poor, and the water is poison, we are going to lose tourism. There are so many people who

rely on tourism for their livelihood. Please vote AGAINST the opening of the Idaho Maryland mine.

Sincerely,

Susan Perko

heather.mulligan@protonmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Heather Mulligan. I live at 15912 clover valley rd, Grass valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We live in District 2. After reviewing as many documents as I was able to find on this subject it seems the risks far out weigh the benefits. Specifically, my main concerns are the following:

1. Asbestos disturbance in air and water as the Environmental Impact Report has shown asbestos in several of the samples such that the Idaho-Maryland mined material is considered “restricted material. As such, certainty on safety from air and water poisoning via the disturbance of asbestos cannot be guaranteed for the surrounding people

2.It appears from the planning documents that there is an expectation of destroying peoples' well and that the solution proposed is to pipe substandard NID water to these people. This is unacceptable.

3. Previous mining experience in Nevada County (San Juan ridge) has shown that often the wells of people are poisoned with substandard levels of contaminants. How are you measuring the cost and consequences for human life over the next 80 years for which the mining permit is requested for? What are your plans for compensation for those negatively affected?

4.where are the details on the planned "treatment" of water that will be reinserted into Wolf Creek? Who will monitor and how and if it is found that the creek is poisoned by substandard cleaning and monitoring then what is the contingency plan if the results poison many others along the watershed?

As a resident who calls this place home - what can I do to stop this mine from irresponsibly affecting ours and our neighbors' land? If you approve this mine - it appears to be a very short-sighted decision which will benefit some at the cost of many.

Please stand up for our people, our water, and our land and say no to this mine or let us know what we can do to stop I from happening.

Sincerely,
Heather

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Simone Leask at sgleask@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Simone Leask. I live at 11407 Cedar Ridge Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in Cedar Ridge very near the mine site. My partner and I were able to fulfill our dream of buying a home here in 2020. We chose this area because of it's natural beauty, closeness to nature, and the quiet neighborhood. All of those things will be negatively impacted if you allow the mine to reopen.

Sincerely,

Simone Leask

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Patricia Sharp at patsharpdesigns@hotmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Patricia Sharp. I live at 312 Marshall St, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in town, not far from Empire Mine State Park. For the 20 years I've lived in this house, I've walked there 4 days a week. Anyone who uses the park is familiar with the magenta drain. It serves to filter out the heavy metals that accumulated in the mine water. An expenditure of over $2 million dollars created a natural filtration system that removes 60-70 % of the metals out of the water.

The process to clean up that site has been a long and winding one. Newmont, the previous mine owners didn't want to pay for the underground cleanup.. A lawsuit ensued in July of 2012, the State of CA sued Newmont Mining to reimburse the State for the $36 million dollars it already spent remediating the toxic waste. The suit included all future responsibility for the cleanup. Newmont ended up settling with CA State Parks for $15 million and the cost of ongoing and future costs for cleanup. The

ordeal and expense of toxic mine waste cleanup prompted talk from State legislators to suggest selling the 850 State Historic Park.

The point I want to make is that industrial hardrock mining is a dirty, toxic business. So dirty and toxic that no one wants to foot the cleanup bill. It is most certainly not something that should be done in a populated area. There will be tons and tons of toxic soils trucked out, through town, spewing diesel exhaust, toxic dust floating around, impeding traffic, not to mention all the homes nearby that might lose their well water.

Right out front, the owners of Rise Gold are not trustworthy. Quoting from Bob and Christy Hubbard, in The Union Newspaper, Oct 17, 2022, " CEO Ben Mossman's last venture before joining Rise Gold was a profound failure, and disregard for regulations and poor management practices appear to have played a significant role in that. His company, Banks Island Gold Ltd., owned the Yellow Giant Mine in British Columbia, Canada, which polluted tribal waters, went bankrupt and left Canadians with a mess to clean up".

An industrial mining operation has no business being in the middle our beloved Grass Valley. The potential degradation to our town combined with the management record of Rise Gold should lead you, our Nevada County Supervisors, to vote NO on re-opening the Idaho-Maryland Mine. Lets not foul our nest anymore.

Sincerely,

Patricia Sharp

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Harry Winters at harry.mc.winters@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Harry Winters. I live at 148 Conaway Ave, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am writing to strongly oppose the proposed opening of a gold mine in Grass Valley, California. As a long-time NATIVE of this small town, I am deeply concerned about the potential environmental and economic consequences of such an industrial development.

The proposed gold mine could have a devastating impact on our region's natural resources, particularly our precious groundwater. The mining process often requires large amounts of water, and the potential for water pollution is a significant concern. Groundwater depletion, contamination, and loss of water supply to the community are all potential negative outcomes of such a project.

In addition to the potential environmental impact, the proposed gold mine could have

significant negative economic effects on our community. Grass Valley has become a destination for outdoor enthusiasts and nature lovers, attracting visitors from all over the world. This has led to a growing community of high-paid knowledge workers, small business owners, and entrepreneurs who have invested in the area, creating new jobs and contributing to our local economy.

The proposed gold mine would pose a serious threat to our region's unique natural beauty and the economic benefits it brings. The presence of an industrial mine would likely discourage many visitors from coming to the area and discourage high-paid knowledge workers from remaining in the area or from moving here in the first place. This could have significant negative impacts on the community's long-term economic prospects and cultural vitality.

Given these concerns, I strongly urge you to vote no on opening a gold mine in Grass Valley. Instead, I urge you to explore alternative, more sustainable forms of economic development that will build upon the unique strengths of our community, rather than compromising them.

Thank you for your attention to this important matter.

Sincerely,

Sincerely,

Harry Winters

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Judy Silberman. I live at 303 Washington St, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived downtown Grass Valley for 24 years and love Nevada County. I have visited the Empire Mine State Park many times over the years, learning about it's wealth and toxic legacy. When I first moved here in 1997, there were many trails through the interior that are now off limits because the soil was deemed unsafe. I am also a docent at the North Star House. I am well versed in our gold mining legacy.

There are many reasons I oppose the reopening of the Idaho Maryland Mine. The company behind it has a terrible financial and environmental reputation. It is hard for me to believe any of their rosy promises (or anything) they say. Whatever short term financial benefits that may occur, they are far outweighed by the fire danger, traffic, noise, and water issues. Please vote no on their proposal. I have yet to meet anyone in my neighborhood who supports reopening this mine.

Sincerely,

Judy Silberman

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Laura Harter at lauraharter117@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Laura Harter. I live at 15801 Shannon Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have been a resident and a home owner in Nevada County, in District One. I have raised my children here. I am very concerned about the possibility of the mine reopening and creating unnecessary and negative impacts on real estate values, air and water quality, and overall quality of life in our area. I question whether the jobs created would be given to local residents and would be in our interest. Developing and preserving our area's strengths (tourism, artistic events, and video and tech business) should be the BOS priority instead of returning to the environmental degradation and exploitation that launched the settling of this area.

I question whether the Environmental Impact Report fully assessed the risks. Specifically, I am concerned that the FEIR excludes the Centennial Site from the full analysis of the impacts of the mine project which would prevent understanding of the

full environmental impacts and is a clear violation of CEQA, which requires that impact assessments be based on current conditions, not a speculative future condition.

● The 56-acre Centennial site is the location of hazardous waste left over from past Idaho-Maryland Mine operations. The California Department of Toxic Substances Control (DTSC) is managing the cleanup, but their Remedial Action Plan (RAP) is only in draft form. It is unclear when the plan will be finalized or when DTSC might approve the clean up.

● Per CEQA, the EIR must provide an environmental assessment of the current conditions of a project site to establish a baseline in order to determine impacts. My understanding is that this was not done. The FEIR assumes the site will be cleaned up before it is used to deposit new mine waste. The plan calls for placing 1.6 million tons of mine waste (assuming it qualifies as Group C) over the course of 5 years, covering about 44 acres to a height of up to 55 feet. And yet, the significant work needed to accomplish this clean-up is not disclosed or evaluated in the FEIR. Numerous aspects of this RAP draft have been questioned in public comments and the final project details are unknown.

This project does not benefit our community and is being proposed by outsiders that have no interest in our welfare. Returning to mining as a nostalgic nod to a gold rush past is not rational, we should do better, expect better, and protect our water, air, and community for generations to come.

Thank you for your careful consideration of this matter.

Sincerely,

Laura Harter

Dear Nevada County Supervisors and Planning Commissioners,

My name is Helen Martini. I live at 11613 Lower Pine Hill Drive Extension, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1 and have lived my whole life in the Grass Valley area as did my mother and grandparents. If it were not for mining I would not be here but times have changed. I want this land to be beautiful for my children and grandchildren and this mine is not the way to do that. Yes, Nevada County needs many more good jobs, jobs that will support a family. We don't need more pollution, noise, and poorly paid jobs. Please vote no on the mine. There are other ways to create jobs that will promote a good living here in Nevada County. Again, please vote no on the mine.

Thank you,
Helen Martini

Dear Nevada County Supervisors and Planning Commissioners,

My name is Geri Stout. I live at 101 Bawden Ave, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District three and have since 1987 although I have been a resident of Nevada County since 1976. I have an MS in Renewable Resources and many years of teaching experience concerning environmental issues. The Idaho Maryland Mine must not be reopened under any conditions. This land and water has been damaged enough! We must protect all our natural resources including our air quality, water, the list goes on and on! Our children and grandchildren deserve a clean and healthy environment.

The impact report has so many flaws and omissions that it must not be accepted! The many letters opposing the mine that have been submitted directly to you and the articles and letters that have been printed in our local paper stress so many reasons why you must not endorse the mine. Please use your good judgement not to

endorse the mine and also its impact report!

Sincerely,

Geri Stout

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Peter Willcox. I live at 13031 Cedar Crest Ln, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1 and have for 16 years. I drive by the mine site nearly every day. I am retired and love the area for its natural setting, many opportunities for retired folks, and country life. I have a well but am just outside the Well Monitoring Program.

Please consider the following;

1. Rise mine has no credibility, and even if it did, a large performance bond must be part of the arrangement.
2. All that truck traffic? Really? What of traffic control? A new signal on Brunswick? I can’t wait.
3. When they fill up their existing sites with waste rock, then what? They will have to haul all their waste rock to a processing site to turn it into sized rock, gravel, and

sand. So called “engineered fill” is neither a product nor viable. Where will the rock be processed? And what of the environmental concerns of that processing? And truck traffic to get it there?
4. You can’t move rock quietly. What of noise from bulldozers, large trucks, equipment?
5. Traffic again, the Loma Rico Ranch project will add 235 homes, many of which will be using Brunswick Road. It’s less than a mile to the mine, also on Brunswick! Not to mention the desirability of having a housing development next to an industrial operation.
6. The folks that may lose their well will suffer economically, considering that NID water is much more expensive than well water. It’s unlikely that will change. Shouldn’t the mine be responsible? For the entire 80 years?

Sincerely,

Peter Willcox

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kathy Jablonski. I live at 123 Boulder St, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The cost/benefit analysis on the mine seems quite factually clear that the costs of longstanding health risks, longterm toxic pollution to natural and inhabited areas, noise and trucking impacts, quality of life impacts far outweigh proposed and unguaranteed benefits. In any circumstance where mines are reopened in Nevada County, it not a sound decision to hire a corporation with such an unsuccessful track record, where the community pays the price for decades. Nevada County is Better than giving property over to such an operation. I urge you to represent your constituency and decide based on the clear facts

Sincerely,

Kathy Jablonski

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of David Kimmel at 3jewels3@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is David Kimmel. I live at 18163 Lake Forest Dr, Penn Valley, CA 95946.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

How valuable is our land and community? I say too valuable to trust the Rise Mine run by someone who has a track record of leaving an environmental mess behind. Why would you take that risk? I used to be in business. You didn't hire someone who was a convicted embezzler to run your books. They might have reformed but your business was too valuable to take that risk. Why would you Supervisors take this risk with our community?

Don't take the risk? Why do you have to? Please say no to this mine. If you want more jobs, work on recruiting a clean business. Don't sell us out.

Sincerely,

David Kimmel

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Ashton Simpson. I live at 364 Sutton Way Apt 6, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am writing to express my deep concern and opposition to the proposed reopening of the Idaho Maryland mine by the company Rise. It has come to my attention that Rise has a history of ruining communities where they have operated up and has declared bankruptcy multiple times. These are serious concerns that must be taken into consideration When deciding whether or not to trust these people.

The consequences of the reopening of this mine would be disastrous for our community. The negative impact on our air, water, and land would be severe, and the health and wellbeing of our community would be put at risk. Furthermore, our already congested public infrastructure would be further strained, causing more chaos and disruptions in our daily lives. This is not worth creating a few jobs, most of

which will be taken by non locals and the baseless promises of millions in tax revenue which are not guaranteed(especially given their history of bankruptcy)

I implore you to take action and prevent the reopening of the Idaho Maryland mine by Rise. The welfare of our community must be given top priority, and we cannot allow our town to be ruined by a company with such a questionable history. It is our responsibility to protect our environment and the health of our citizens.

I call upon you to work with other community leaders and local authorities to prevent the proposed reopening of the mine. We must make our voices heard and stand up against this potential threat to our community. I am confident that we can work together to avoid putting our community at risk.

Thank you for your attention to this important matter.

Sincerely,
Ashton Simpson

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jan Rubin. I live at 529 East Broad Street, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live two block from downtown Nevada City. I moved here 4 years ago to enjoy the vital downtown music, restaurants and music scene as well as the beautiful biking, hiking and swimming.
I believe the risk to our environment is not worth the few additional jobs that might be created by the mine, and in fact many more jobs may be put at risk.
Please say no to re-opening the mine.
Thanks,
Jan Rubin

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Steve Danner at danner.steve@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Steve Danner. I live at 10517 Indian Trail, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

There are many reasons why the mine should not reopen here are a few:

Environmental Concerns: Reopening the mine would have significant environmental impacts on the surrounding area. Mining operations can cause significant damage to ecosystems, including the destruction of wildlife habitats, the contamination of water sources, and the release of toxic chemicals into the air.

Community Opposition: the surrounding community is opposed to the mine reopening, citing concerns about the environmental impact, noise pollution, increased traffic, and decreased property values. In addition, the local tourism industry, which relies on the natural beauty of the area, could be negatively affected by mining operations.

Economic Viability: Despite claims by mining companies that reopening the mine could bring jobs and economic growth to the area, there are serious doubts about the long-term economic viability of the mine.

For these reasons, many environmentalists, community members, and safety advocates are opposed to the reopening of the Idaho-Maryland Mine. Instead, efforts should be focused on developing sustainable and environmentally friendly industries in the area that can provide long-term economic benefits without putting people and the environment at risk.

Regenerate response

Sincerely,

Steve Danner

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Susan McKinney. I live at 815 Zion St, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada County for 40 years and have a vested interest in the health of our ecosystem.
I currently live in the business district of Nevada City, but have resided on Banner Mountain for several years, as well as Greenhorn Road.
Both of my former neighborhoods are home to friends and neighbors who will be directly impacted by the truck traffic, water pollution, and noise pollution the proposed mine will impose.
To ruin the quality of life people have worked all their lives to enjoy, as well as cause their property values to plummet in order to reap tax money from an ill-placed mine, would be a tragic mistake on the part of Nevada County Supervisors and Planning Commisioners.
It will also create an immense amount of conflict within our county, including protests

and demonstrations.
Please seriously consider the risks versus the tax benefits as though you live nextdoor to the proposed mine.
That is the only way you will do the people of Nevada County justice.

Sincerely,

Susan McKinney

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Jim Pappas at jim@orionsgate.org

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jim Pappas. I live at 15700 Turquoise Place, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We live about 5 miles from the proposed mine site and, in addition to all of the reasons commonly referred to by opposers off the mine, let me add the problem in increased traffic. This due to not only the vehicles associated with the mine but all of the cars associated with mine employees. The relatively relaxed traffic patterns of Grass Valley would become like those of Auburn and Saint Helena, - semi rush hour traffic all day long. Not to mention the increased pressures upon schools, hospitals and housing. caused by the increased population.

In addition to money, and power, quality of life needs to be considered in all decisions that affect the life of thousands. What a painful thing it would be to have left the many disadvantages of the city only to have our board of supervisors recreate them here is peaceful Grass Valley.

Please, vote your conscience and truly represent your constituency as you have pledged to do.

Thank you,

Jim Pappas

Sincerely,

Jim Pappas

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Dee Smith. I live at 582 Morgan Ranch Dr, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have beed fortunate to call Nevada County my home since 1971. I left Los Angeles with bad air, water and over development, to live in this beautiful, clean area to live and raise a family. I watched LA destroy a once beautiful area for the sake of benefiting someone's pocket and without regard to the consequences of irrvirsably ruining the air, drinking water and land.
I beg you, please do not allow the mine to be reopened and actively operated in out town just for the sake of supposed temporary income at the cost of permanent damage to our beautiful town. Poor air quality, water loss for the wells in the area with a drought no less, increased heavy traffic in our already congested areas. Once the damage is done, it cannot be undone.
Again, please deny the opening of the mine for the sake of temporary income. Think of the well-being of the residents and quility of life we have. The people who voted

you to protect us.

Sincerely,

Dee Smith

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Chris Pappas. I live at 14232 Anchor Lane, Grass Valley, CA 94945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a small business owner, who lives in district 3 and our house is located approximately 1/2 mile from the site of the proposed mine. My family and I have lived in Grass Valley for over a year now, and we have always enjoyed the peace, quiet, rural feeling that the county offers. I am deeply saddened, and concerned that a company with somewhat of a questionable history may be allowed to re-open mine in the heart of our county. The reopening of this mine raises, serious concerns regarding the negative impacts to water quality, air quality, traffic, road conditions, wildlife in the area, and the quality of life for the citizens, who live here. As a concerned citizen I am begging the County Supervisors and Planning Department to say no to any further plans for re-opening this mine in Nevada county. The risk to the county, environment, and people, is simply not worth it.

Thank you for your time and consideration to my concerns.

Best regards, Chris

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We have lived in the Lake of the Pines Ranchos for over 20 years. Our home remains on well water at our property and we are very concerned about water quality and other environmental issues in our area. We moved to Nevada County from the Bay Area because we desired a peaceful, rural community and see the reopening of the mine as a threat to our neighborhood, even though our property is not located adjacent to the mine.

Sincerely,

Linda Adam

Dear Nevada County Supervisors and Planning Commissioners,

My name is Marika McGraw. I live at 14414 Tim burr lane, Grass valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I’ve recently purchased a home in Grass Valley. Unbeknownst to us the house is adjacent to the proposed mine and to the creek that would affected by waste from the mine. We are not intended to live there if the project moves forward. We would have to sell the property for the fraction of the price we purchased it for. We are not willing to endanger our health and serenity for corporate greed that not only ruins our daily life and health but also the desirability of the beautiful city of Grass Valley. This house was supposed to be for our retirement and that’s clearly would defy all requirements. We are also business owners and we were planning to continue our business in Grass Valley, but that’s clearly would not be on the table anymore.

Sincerely,

Marika McGraw

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Judy and Brian Miner at judyminer1@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Judy and Brian Miner. I live at 13024 Colfax Hwy, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My husband and I (Brian and Judy Miner) strongly object to the opening of the Idaho Maryland Mine and the Canadian company proposing this endeavor. Rise Gold’s past projects produced failures that compromised the surrounding land and nature while providing zero resources for recouping the damages they created. More importantly, we believe that opening the mine would be detrimental to our community, environment, water supply, wildlife, real estate values, and most importantly our quality of life in this beautiful community we’ve called home for the last 6 years.

Reasons for objecting to the opening the Idaho-Maryland Mine are as follows:

Rise Gold's plans to dewater the mine puts wells, creeks, and aquifers at risk, which is made worse with the drought.

Our air quality is already poor in our community, with an F rating. This will make a bad situation truly terrible with Fugitive dust from rock crushing, transporting, and diesel exhaust from constant truck traffic.

Gold mining is a power-hungry business, which will require significant use of fossil fuels. The mine's estimated power usage will be 12% of what the whole of Nevada County uses in a year, raising questions about further straining our power grid and effectively erasing the gains our County was planning to make in reducing power consumption to curb climate change. A YES vote for the mine is a NO vote for climate change.

Increased truck traffic, higher noise levels, and vibration from blasting will ruin our neighborhood quality of life. Our natural settings will be compromised and get buried beneath mountains of mine waste and a paved industrial area.

The enormous unimaginable environmental risks far out way the few jobs gained, (false claims of bringing jobs to the community are misleading and statistically and feasibly false), which includes tourism, high tech businesses, private wells, and 10's of millions lost in property values.

Rise Gold is untrustworthy given their 14 year old company history, have never opened a mine and never made a profit. Their current financials are weak. And most importantly, their CEO's prior venture polluted tribal waters, went bankrupt, and left Canadians with a bill to pay for cleanup.

It is no longer the 1940s when this area was a small little mountain town. It is a sprawling beautiful community. The impact of this reopening would be devastating to our community and adversely affect all those that call it home, including our Cedar Ridge home, which would be directly affected due to its proximity to the mine.

The cost to the community and the surrounding areas is too great and MUST NOT HAPPEN! For the reasons outlined, coupled with Rise Golds dubious and untrustworthy record, we vehemently object to the reopening of The Idaho-Maryland Mine.

Thank you for your time. We hope you will do the right thing for our community and it's citizens and object to the opening and VOTE NO.

Sincerely,

Brian and Judy Miner

Sincerely,

Judy and Brian Miner

Dear Nevada County Supervisors and Planning Commissioners,

My name is Robert Lowe. I live at 14159 Idaho-Maryland Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in the Banner Mountain neighborhood in Nevada City since 1980. I have seen previous attempts to revive the old gold mines in our neighborhood, and nothing has changed my mind from then that an active gold mine will not be an asset to our community, and the potential and likely hazards of mining far outweigh the benefits.

Sincerely,

Robert Lowe

TO:
Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959
bdofsupervisors@nevadacountyca.gov
Idaho.MMEIR@nevadacountyca.gov
Idaho.MMEIR@co.nevada.ca.us

Dear Nevada County Supervisors and Planning Commissioners and Senior Planner Matt Kelley,

My name is Allison Roush. I live at 275 Vistamont Dr., Grass Valley, CA 95945 (District 3 – City of Grass Valley).

I am asking you to say “No” to re-opening the Idaho-Maryland Mine. The mine will have significant and unavoidable environmental impacts that endanger this community's health and quality of life for decades and generations. Re-opening the mine will have a significant impact on the aesthetics, traffic, and noise in the area and since the mine is situated within the city limits, the local citizens will be the ones to feel this impact. Residents that live near the mine will have to deal with the increased truck traffic for decades to come, and that is not something that they had to take into account when purchasing or renting their properties. Re-opening the mine will decrease the enjoyment of their own property. Additionally, reopening the mine will increase the risk of air and water pollution, even with the safety controls the mine will put in place. If there is one disaster that occurs at the mine, the local residents will be dealing with the ramifications for centuries (not just decades). The blow back of potential environmental incidents will be felt by the local residents long after the mining company packs up and leave town. A strong and current example of this is the hazardous waste disaster currently being dealt with in East Palestine, Ohio. The residents of the City of Grass Valley could also end up in this situation with the mine being so close.

With climate change currently occurring and being felt in full force in California, the potential use of local water resources by the mining company is irresponsible. Dewatering the mine has the potential of risking depletion of our region’s

groundwater. Further, our local groundwater impacts the water resources of residents in the San Francisco Bay Area and Central Valley. Further contamination of the groundwater and possible depletion extends further than the residents of the City of Grass Valley.

The mine will also produce an increase in greenhouse gases. For the future generations of the City of Grass Valley and the State of California, it is irresponsible to threaten their future in that way. Nevada County and the State of California should be doing everything in their power to ensure a livable environment for residents, especially since gold is not considered a high priority mineral.

The low number of jobs that are slated for running the mine and uncertain tax revenues just aren't worth the risk. The revenues outcomes from the mine are uncertain, and the low-end monetary outcomes were reviewed by experts and considered to be overly optimistic. Rise Gold is a young company that has a bad track record of polluting waters in the area they have worked and leaving local residents and cities to pay for the cleanup. Are the City and State willing to take on that risk? From driving around the place I live (i.e. the City of Grass Valley), a vocal majority group of residents are not willing to take the risk.

Lastly, re-opening the mine is inconsistent with numerous Nevada County General Plan goals and policies, including: Goal 1.5, 1.6, 1.8, 2.1, 10.13, 10.5, 9.1, 18.1, 11.1, 17.1; and Policies 1.8.3, 1.7.10, 2.9, 10.13.4, 10.5.5, 9.1.10, 11.2, 11.4, 17.6, , 17.11, and 17.14. The residents of the City plan for their futures based on these goals and policies.

Please listen to me and all the other residents and businesses of the City of Grass Valley that are opposing the re-opening of the mine and say "No".

Thank you,
Allison Roush

Dear Members of the Nevada County Board of Supervisors:

I urge you to take a deep dive into the FEIR to see that there is little significance given to the fact that this project will destroy a huge percentage of the area's wetlands and harm protected plant species. This will have a negative impact on both Grass Valley and Nevada County. As a homeowner at Lake Wildwood, near Grass Valley, and a partaker of recreational use of the wider area, I wish to go on record opposing the FEIR as it stands and urge a deeper understanding of the far-reaching enviromental effects this project will have. If the project moves forward, it should be done more responsibly. Mother Nature needs to be included as an important member of the community too!

Sincerely,
Freda Hofland

Dear Nevada County Supervisors and Planning Commissioners,

My name is Pamela Posey. I live at 2024 W. Sacramento Ave., Chico, CA 95973.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Gold mining is outdated, unneeded, destructive, and a toxic polluting danger. As a resident of Chico, an organic farmer, fish and creek activist, and a long time visitor to Nevada County, I can only add my voice to the pleas to stop this proposed mining activity. We need to protect and preserve our land air and water, and the health of our creatures and citizens. This area is too precious to despoil by greedy activities fir a small profit of a few.

Sincerely,

Pamela Posey

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Jerry Grant at jerrygrant101@gmIL.COM

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jerry Grant. I live at 13105 Alderpoint, Grass Valley, CA 94945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I moved to Grass Valley in 2003 from Los Angeles where my career was and is a Musician/ composer/conductor/performer I composed music scores for Television and feature films. I continue to work here and my music, film, concert and classical jazz/rock fusion is heard on Spotify, Amazon, Apple and around the world. I live on Lost Lake off Lost Lake Rd & Greenhorn Rd., Lost Lake was created to hold mine tailings and is now a superfund site that will never be fully decontaminated since the fund went broke about 2007. This site was left over from gold mining that ended in 1945.

The first well on this property, was producing only 1.5 GPM(gallon per minute) but went dry in 2011. PETERS DRILLING drilled 2 holes over 500 ft deep and came up dry. A third hole found 1 GPM and Peters said,” I’d go with it since there are too

many straws in the ground” So you see, we are on the edge and cannot afford any disruption to the ground water table, even without the insane proposal by Rise Gold of pumping thousands of gallons per day from the ground and dumping it into Wolf Creek. You really don’t need a DEIR to determine a logical answer to whether the old gold mine should reopen.
I HAVE A PROPOSAL FOR EVERYONE ON THE BOARD. I will give each one of you 1 oz of gold each day. The only restriction is that cannot drink any water or other liquid. I will count the days to when you will be begging me to take the gold back. So, what is more important here,
GOLD or WATER.

I love that word mitigation. It is thrown around freely in DEIR report. I see in the proposal that several monitoring wells would be drilled to show any change in ground water levels. Fisrt of all, this is insanity because if levels drop are they going to close the mine and go home ? Believe me, by that time it is way too late and the damage will have been done.
My property is worth about $1,000,000. What would you pay for it with no water ? Would Rise Gold pay me for it ? They currently exist on a shoestring as it is with a record of bankruptcy and walking away from the last disaster they created.

Some 14 years ago I argued against the other fly by night co. with a miserable business plan who wanted to open another gold mine. You may recall; they planned to make ugly gray tile out of the mine tailings and capture 10% of the world tile market. Now if they captured 1/10 of 1% , I’d be amazed. Well, they quickly split the tile co. from the mine so that when the tile co. went bankrupt, they would conveniently cut it loose and pile up up mountains of tailings with arsenic and asbestos along with other poisons. Now we have a similar group of snake oil salesmen doing the same.
This is a no brainer. Please shut this charade down. That time is well in the past for this area.
Thank You !
Personally, Jerry Grant

Sincerely,

Jerry Grant

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Selene Mitlyng. I live at 16346 Red Dog Rd, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Sincerely,

Selene Mitlyng

Dear Nevada County Supervisors and Planning Commissioners,

My name is Andrew Kastner. I live at 13408 Capitol Drive, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I just dont see the benefit tot he community. The new housing development is going to v=create a huge impact on density and traffic for Brunswick and to add the Mine on top of that is not going to be good for those of us who have to use Brunswick to get to The shops off of Brunswick not to mention it is our route to Nevada City.. I guess the best way to look at it, is to ask yourselves, how many people will benefit from the mine and how many will be impacted detrimentally. I am saying NO to the mine.

Sincerely,

Andrew Kastner

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Ann Hinshelwood. I live at 19722 Buck Ridge Road, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

As a property owner in Alta Sierra Ranchos, I understand the challenges of maintaining a healthy well. The loss of water removed from the mine shafts can dramatically impact the wells in the surrounding communities. In addition, chemicals may also be leached into wells on properties throughout the shaft system. I sincerely hope that you vote against opening this mine.

Sincerely,

Ann Hinshelwood

Dear Nevada County Supervisors and Planning Commissioners,

My name is Laurel Marks. I live at 13974 Glenn Pines Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hello, I grew up next to the site of the proposed mine and am gravely concerned by this proposal. I showed the mine information to my good friend who is a professional botanist and he shared my concerns and asked me to include his letter below. Thank you.

Letter:

Hello,

I'm not sure what the status of the Idaho Maryland mine project is, but I am a professional botanist and I found some large discrepancies in the rare plant reports in the EIR (appendices F.4 and F.11). These are:

- Timing: the rare plant surveys were conducted in December and July, outside the blooming period of most rare and endangered plants. The surveys therefore did not meet the standard protocols outlined by the California Department of Fish and Wildlife and California Native Plant Society.
- Age of surveys: the rare plant surveys were conducted in 2019. Unless more were conducted this year, they over 3 years old and are out of date and no longer applicable. New surveys would need to be conducted for the EIR to be valid.
- Pine Hill flanelbush: the Pine Hill flannelbush habitat management plan (appendix F.4) found about 60 of these endangered plants in the project area. However, a recent fire may have burned in or near the project area. Since this is a fire adapted species, this may have produced thousands of new seedlings, making this plan obsolete. Also the surveys on which this plan is based are also over 3 years old and obsolete.
- Reference populations: the rare plant survey report states that "a nearby reference population of finger rush was visited on June 24th, prior to commencing field surveys to ensure this species was still detectable, which was confirmed. No other reference sites were required to be visited given the botanists local knowledge of the other target species as part of the survey effort". This does not adhere to rare plant survey protocols since the purpose of reference populations is primarily to confirm that surveys were conducted at the appropriate blooming time for species potentially present in the survey area. Learning what the plants look like is a secondary purpose.

I would be happy to discuss these points more if that would be helpful!

Thank you,
Joe Broberg

Sincerely,

Laurel Marks

Dear Nevada County Supervisors and Planning Commissioners,

My name is Sands Hall. I live at 10160 Cedro Rd, Nevada City, California 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

While I live some distance from the proposed mine, I pass through the area for work several times a week. I can well imagine the degree of disruption—noise, trucks, traffic — the mine will bring. Further, the destruction the mine itself will bring to our environment cannot and should not be dismissed. The beauty of our county will be profoundly affected. And by extension—tourism being as important as it is—so will our economy. The idea that it will bring money to the county is extremely short-sighted and limited. I strongly oppose the reopening of this mine.

Sincerely,

Sands Hall

My name is Patricia Wolfe. I live at 11747 Lowhills Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 4 and have lived at this address for 15 years. I am very concerned and actually can't believe the Board would even consider such an egregious project for our wonderful community from a company that is in litigation at this moment, walked away from all the costs and cleanup necessary after they polluted the surrounding area. The health risks are far too great to even consider it. Please vote NO on allowing this mine to reopen. I personally have talked to many people about the mine, and there is not one of them that support this project. Thanks for reading this letter.

Sincerely,

Patricia Wolfe

Dear Nevada County Supervisors and Planning Commissioners,

My name is James Conrad. I live at 14843 Chisum Trail, Penn Valley, CA 95946.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a recent transplant to Nevada County-7+ years and counting- having lived in a remote area of Trinity County for 9 years. I lived in western SonomaCounty for 22 years before moving to Trinity for the peace and quiet of our ranch to farm. We moved to the Grass Valley area to be closer to our grandkids and immediately fell in love with the community and people who weren't in too much of a hurry to be helpful and kind. Sonoma county was like that in the 70s and 80s before the area turned to monoculture. I realize that the area has a rich history of mining- for better or worse but I can't imagine the few jobs promised could ever compensate the area for the noise, traffic and inevitable damage to beauty of the county and what precious water we have here in times of long lasting drought. I urgently request that you reject this course of action by the Rise Corporation- Please.

Sincerely,

James Conrad

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Grace Farag. I live at 172 Mcnab Circle, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a relative newcomer who recently bought a home not far from where the mine will be if it opens. As such, I would be directly affected by the noise and traffic that is bound to result if operations are allowed to resume—and of course, any environmental impact as well.

In the history of mining—a history this region is certainly better acquainted with than most—there has never yet been a mine that did not deeply damage the land and water on which it was located, to say nothing of the impact to human life. There is absolutely no reason to believe that this one would be any different. I am against re-opening the Idaho-Maryland Mine, and I ask you to say NO as well.

Thank you.

Sincerely,

Grace Farag

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Joanne Evers. I live at 19111 Louis Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We live near Rollins Lake off of 174. We have lived in Nevada County for 15 years. We understand that NC is growing and responsible decisions must be made for our future. To allow RISE to establish business here, is not a responsible decision. Each of you will forever have your names attached to this short sighted, destructive, thievery.

RISE Canada will take no responsibility for any damage caused by the RISE Company Grass Valley. When our wells run dry, our water tables are gone, the Yuba becomes clogged with silt and when central Grass Valley floods, WE the people will be paying for all the above repercussions or will lose our homes and our life’s worth.

The handful of menial jobs that RISE will offer our community will not balance what

we will lose.* The money RISE is offering the county will not be sufficient to pay for infrastructure improvements for flooding and dredging the Yuba. There is no price you can put on the water we lose from draining water tables and using gallons of municipal water for daily production of the mine.

Please listen to your constituents!

*Living off of 174 at Greenhorn access to Rollins Lake, we have sat in our cars for hours while construction on the road (174) went on for two years. In that time while talking with various road workers, we learned that the company that received the contract was from Sacramento, and so too were all the workers.

Sincerely,

Joanne Evers

Dear Nevada County Supervisors and Planning Commissioners,

My name is Anya Tuton. I live at 19329 Tall Timbers Lane, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have been a working, taxpaying, voting citizen of Grass Valley for 15 years. I am raising my children here. I am strongly opposed to re-opening the Idaho- Maryland Mine. I am thinking of the future. I want beautiful Nevada County to be a safe place to live for future generations. I vote for representatives who care for the environment over profit. We have seen the havoc that mining creates on the land. I ask that you say NO to reopening the Idaho- Maryland Mine.

Sincerely,

Anya Tuton

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Janet Sanderson. I live at 13024 WOODSTOCK DR, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My husband and I moved here about 4 years ago and reside on Banner Mountain in the Banner Mountain Woodlands community. It is inconceivable that the Nevada City community would want to return to the mining days that resulted in poverty, environmental ruin and disease. People move here for the arts and culture, outdoor recreation and forward looking attitudes. The mine will result in tax payers leaving the community and a freeze in economic growth.

Sincerely,

Janet Sanderson

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kathleen Fenton. I live at 14511 Clear Creek Pl, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The Idaho-Maryland Mine poses an obvious and highly toxic threat to our community. In addition, its developers are being sued for egregious irresponsibility elsewhere. We are counting on the BoS to do its job by voting this project down. The idea that short-term jobs would compensate the community for irreversible environmental damage and the serious erosion of our quality of life is appallingly short sighted. Our economy is largely based on tourism and the Mine would jeopardize everything that makes us a desirable destination. Please show the courage and vision we elected you for and vote NO WAY -- or take upon yourselves an odious legacy.

Sincerely,

Kathleen Fenton

Dear Nevada County Supervisors and Planning Commissioners,

My name is Emma Cervantes. I live at 148 Conaway Avenue, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

While I just moved to town a few months ago, my partner was born and raised in Grass Valley. We moved here to establish ourselves in a community surrounded by nature and a healthy ecosystem — the fresh air and natural beauty are what have always drawn me here. If the Idaho-Maryland Mine is to open up down the road from our home, it will call into serious question whether we stay in this community. We want to keep Grass Valley our home, where we can raise a family, but this mine will have a major and likely detrimental impact on that decision. Please say NO to the Mine to encourage community growth and health for all!

Sincerely,

Emma Cervantes

Please provide a copy of my attached letter to each of the Nevada County Board of Supervisors.
I've worked hard on both my original comment on Chapter 4.13 Wildfire in the DEIR and on this letter commenting on the response to that first letter by the FEIR. I appreciate the attention and concern the county is showing upcoming vote on the proposal to reopen the Idaho-Maryland Mine.

Thank you!

Nevada County Planning Commissioners

- Supervisorial District I: Danny Milman
- Supervisorial District II: Laura Duncan
- Supervisorial District III: Terence McAteer
- Supervisorial District IV: Mike Mastrodonato
- Supervisorial District V: William Greeno

Thank you for taking the time to read my letter in its entirety and for your leadership on this complex matter of analyzing the Final Environmental Impact Report (FEIR) for the Idaho-Maryland Mine (IMM) project. I hope my letter will shed light on FEIR's Chapter 4.13 – **Wildfire**.

For clarity I have divided this letter into three parts:

1. A bit of information of who I am and the history of my concerns over the reopening of the Idaho-Maryland Mine by Rise Gold Grass Valley.

2. My reflections on the FEIR's response to my comments submitted on the Draft Environmental Impact Report (DEIR).
3. My closing comments

Part 1.

Over the past two years I've written numerous letters to members of the Nevada County Board of Supervisors (BOS), the Planning Commissioners, the Planning Department, Ben Mossman, (President of Rise Gold Grass Valley), each of the five members of Rise Gold's Board of Directors in Vancouver British Columbia, letters to the Editor of The Union paper, and an opinion piece with Yuba Net.

I spoke at the Special Meeting before the Planning Commission on March 24th, 2022 and again to the Planning Commission on November 10th, 2022.

With my deep concerns about what the reopening of the Idaho-Maryland Mine would do to the quality of life for our community, I committed to study the DEIR when it came out last year. Because of my experience as a firefight as a young adult and having lost everything to a wildfire in 2015, I decided to focus my effort on Chapter 4.13 regarding Wildfire. I was NOT reassured. I wrote 10 pages of comments, voicing my concerns about what the DEIR said about Wildfire should the Idaho-Maryland Mine be in operation.

When the FEIR was published in December 2022, I was hopeful I would find that my concerns and questions would be recognized as valid. In fact, each concern I raised was referenced to other sections of the DEIR and many specific issues were not addressed. I am not alone in this caviler treatment of my comments. In talking with others, many other authors of submitted comments were often treated in a similar manner.

I find there is a lot of conflicting information in the FEIR regarding Wildfire and other matters as well. I hope that this letter, along with many other letters, written by intelligent and knowledgeable people in our community, will help the readers, each of Nevada County BOS and each member of the Planning Commission, recognize that there are serious flaws in the 8661 pages of the FEIR. I want to support the individuals who must sort this matter out and make the decision that impacts all citizens in our county.

I ask that the readers be decerning about the inadequacies of the FEIR. I submit this letter to each of the members of the Planning Commission, the BOS, and the Planning Department to provide an alternative perspective on what the FEIR says on Wildfire.

I had hoped Raney Planning and Management Inc. (Raney) the environmental consultant who wrote the DEIR and the FEIR, would have taken the vast amount of input from the community and found their report to be inadequate instead of defending it. Now I must hope that the Planning Commission and the Board of Supervisors will have the clarity of mind needed to see the far-reaching detrimental impacts this mine

will have on the health and vitality of our community and the environment where we live. My intention is to support you all in this important decision making. So I write yet another letter expressing my concerns, now about the FEIR and shining the light on the inadequacies.

Part 2. The FEIR (Raney's) response to my comments on the DEIR

The FEIR is laid out in Chapters. Chapter 2 contains the Individual comment letters written by 845 members of our community and Raney's responses. My letter is #548 of the 845 individual letters submitted. Raney responded to each paragraph I wrote on Chapter 4.13 Wildfire comments assessing the DEIR. I share my perspective with the readers, my assessment of Raney's responses in the FEIR, why I disagree with their responses, and where Raney did not actually answer my questions.

INDIVIDUAL LETTER #548: MARTHA TURNER (found in the FEIR Pages 6698-7007)

FEIR Chapter 2 – Responses to Comments (found in the FEIR Pages 7008-7012)

- The major red flag in my reading the DEIR, which was NOT addressed in the FEIR in response to my comments, is the matter of <u>what would be required of the mine in the event of a wildfire in the vicinity and an evacuation is ordered for the citizens</u> (see Response to Comment Ind 548-8).

  The wording of the document (4.13.4 IMPACTS AND MITIGATION MEASURES) states that the mine would be contacted and "**asked** to temporarily shut down the mine and cease all truck hauling operations". Then states this "…would ensure that the Project would not have the potential to physically interfere with an emergency evacuation plan".

  My concern is that there is no authority in the word **"asked".** Evacuations for the public are **orders** and are enforceable. We are not <u>asked</u> to evacuate and we are not allowed to return until the order is lifted. What will happen if the mine operators were to decline? What if they were to respond with "NO, we will not shut down our mine. It would cost us too much in production"? Many large companies are more than willing to pay any fines for infractions as part of the cost of doing business but **at what cost to our community**? This would, in fact, impair the emergency response plan and become SIGNIFICANT if they were to not shut down the mine, keep their workers on site working, and continue to have their trucks hauling 112 loads/day of mine waste.

  Consider this second scenario: A wildfire has started near the Y at Brunswick Road and Hwy. 174 and is headed up Brunswick toward Bennett Street and

Greenhorn Road. Perhaps it is the time of day when the school buses are taking kids to or from school. Perhaps it is when there are 300 workers (according to Rise Golds numbers) on site at the mine. If the mine operator were asked to shut down and did so, consider the addition of 300 workers also evacuating along with residents of the area. The vehicles would be funneled into the Glenbrook Basin via Brunswick Road at the Hwy 49/20 junction. Again, how could this not have a significant impact?

The response by Raney to my concerns about the impact of the project on evacuation of the populace was dismissed. I was to referred to the Master Response 5 – Evacuation Zones. I was told "Project traffic would not substantially interfere with an evacuation plan", that "the Significance Threshold (Threshold WT-1)" was not met, and therefore NO mitigation is required. There are detailed evacuation maps in Master Response 5 but remember the evacuation mayhem of the Bennett Fire last year? My question regarding enforceable authority to shut down the mine was ignored.

I read that according to Raney, CEQA does not require analysis of speculative impacts. Perhaps my concerns are speculative. Yet it is also speculative to assume Rise Gold will follow the unenforceable request that they stop operations if asked. This is especially dubious when considering the history of Rise Gold. The unethical and illegal practices of the company at the last mine opened in BC are well documented.

The report states the "impacts will be less than significant" even though elsewhere in the FEIR it says the traffic impacts in the basin are unmitigable even when there is not a wildfire happening. These are contradictory statements and both cannot accurate.

- Another matter I addressed was that the property of both the Brunswick site and the Centennial site are classified by CAL Fire as Very High Fire Hazard Severity Zones. Rise Gold's mitigation for fuel management on the sites is to clear cut 18.5 acres of the 58 acres of forested land on the Brunswick site and clear cut 6.5 acres of the 10 forested acres on the Centennial site. The environmental impact of clearcutting is destruction of ecosystems, natural habitats, soil erosion, diminished carbon sequestration contributing to climate change, and more. Yet this is the mitigation proposed. If there is no forest to burn because they have been cut down, the fire risk is certainly reduced. But the use of clear cutting as mitigation for fuel management will have serious impacts on other aspects of the environment that will NOT be mitigated.

- I considered the risk of the mining operations actually being the cause of a wildfire in our community. How can the presence of an operating mine, with the

onsite above-ground fuel tanks totaling 24,000 gallons of diesel on the Brunswick site, plus another 1200 gallons at the Centennial site, the transport of the diesel to the site to fill these tanks, transporting explosives to the site, the moving of explosives around the site before being stored underground and the many hydrocarbon fueled vehicles and machinery, not be a recognized fire hazard? My concern was not addressed and I was referred (Response to Comment Ind 548-12) to look at landscaping in Figure 4.13-3.

- I found the DEIR's use of a questionably functioning "fire flow system" from when the site was a functioning lumber mill as support of there being a "less than significant" impact (page 4.13-20) dubious. The report also states it is NOT known if the old system meets California Fire Code (CFC) requirements. The response to my concerns was to state it would be built "to meet CFC requirements". The inclusion of a questionably functioning "fire flow system" to support the conclusion that it will make the project have NO significant impact certainly sounds more than speculative. It sounds misleading.

- There is much discussion in the DEIR on topography and prevailing winds and wildfire. While fire sciences continue to improve in their efforts anticipating how a fire is likely to behave in theoretical conditions, we also know that wildfires are erratic, unpredictable and will create their own weather and wind, which can NOT be mitigated just by saying "there is no significant impact".

  Because the Project sites do not have steep walled canyons, it is concluded that there will be no significant impact on wildfire risk. Yet there are "on-site slopes over 30%" but not enough to "influence on-site fire behavior" (Response to Comment 548-10). Sounds like more speculation to me.

- In response to my questioning the statement in the report that says "relatively few larger wildfires have occurred withing the region over the past three years", Raney said this was the statement was "according to CAL FIRE". While our fires were not the conflagrations on the scale of the Caldor fire or the Mendocino Complex, there have been 16 wildfires in Nevada County since 2015 with three in the last two years. The River Fire and the Jones Fire were devastating for many in our community. The Bennett Fire burned a portion of the Centennial site just last summer and could easily have burned down our entire town like the Paradise fire did on December 17, 2021.

  CAL FIRE has primary responsibility for a fire at the mine properties. Yet, in recent years we have seen how overwhelmed our fire agencies, local, state and federal, have been with the ever-increasing numbers of wildfires. Why would our community want to add to the risk?

- I questioned the inclusion of the Nevada County Emergency Operations Plan (EOP) which includes a “Mass Evacuation Annex (Annex B)” which has not even been approved and adopted by Nevada County. Annex B addresses disasters or incidents occurring outside of Nevada County though may result in a mass vehicular evacuation through our county”. There is no mention of the mine impact to the EOP’s plan because the “EOP does not address specific projects”. Why then include such information on something that does not exist, does not address the mine and yet is used to support the assertation that “Project traffic would not substantially interfere with an evacuation plan”. While the EOP is crucial, the FEIR does not address my question on how is this information is relevant to their claims.

- Several sections of Chapter 4.13 addresses fuel treatment projects. Most of these projects are in locations quite far from the mine site. If the reader were to look at the map (Figure 4.13-2 of the DEIR) you will see that it was poorly reproduced. It is difficult to see exactly what streets closer to the mine site have the “completed” fuel treatment projects and which are “planned”. Yet my pointing out the fact that very little fuel treatment has occurred proximate to the project site was dismissed. I was told “…the DEIR is to describe existing wildfire setting in the project region”. How are fuel reduction projects far from the mine relevant to the environmental impact of the mine?

- I questioned item 4.13-4 regarding the potential for flooding and landslides after a wildfire on the mine property. There was a detailed post-fire debris-flow hazard assessment of the 2017 McCourtney Fire and the analysis was applied to the project properties. Their conclusion was the risk of flooding and landslides would be, again, “less than significant”. They acknowledge the McCourtney Fire did not include the consideration of mine tailing and the presence of North Fork Wolf Creek. Mine tailing will NOT allow rains to soak into the ground and the runoff from potentially hazardous waste rock will drain into the creek.

  I also pointed out the homes located along Wolf Creek which have always been prone to flooding. We can watch the water rise from Mill Street and from the freeway during big rains and worry for those homes. How will the runoff, in addition to the initial 3.6 million gallons a day for six months, followed by 1.2 million gallons a day for 80 years, NOT have an impact on those properties? We are fortunate to have had hydrologists address the other serious concerns of the discharge of these huge volumes of water in other comment letters which I hope you all will have also had the opportunity to read.

  Raney’s response is to tell me there will be “drainage facilities to capture runoff and slow down post-fire runoff”, and that “these proposed detention basins would

hold back peak flows". How can these detention basins hold back runoff, heavy rain fall AND the millions of gallons that will be pumped from the mine shafts every day? Raney did NOT address my questions in the FEIR.

There are more questions in my original comment letter in the DEIR that were not satisfactorily addressed including matters as follows:

- How can putting in a potable water line for residents on East Bennett Street be included in the claim of fuel reduction to reduce wildfire risk?

- How will a "comprehensive vegetation management plan required by the County Fire Marshall's Office" be adhered to in "perpetuity" if the company goes bankrupt or is closed down for environmental infractions as the company did in British Columbia?

- The DEIR makes extrapolations regarding dewatering of the mine and state the discharge into South Fork Wolf Creek will prevent the lowering of ground water levels along the creek. Then it says "only a small fraction of the groundwater that was removed from the subsurface would come from that area". In effect it is saying it will not and it will impact the groundwater. I asked for clarification and was only referred to Master Response 33 – Groundwater Dependent Vegetation. The information is contradictory and no clarification was offered.

- The DEIR asserts the PGE lines installed to the project would contribute no risk to wildfire. I questioned this in light of so many wildfires resulting from trees falling on PGE line and was told CEQA does not require the analysis of speculations. It seems to me that any impacts for any proposed project are always "in the future" and therefore planning efforts are always "speculative". The FEIR can be speculative yet the public's questions can be discarded if deemed speculative? This is NOT right.

Part 3. Closing comments

I am thoroughly disheartened to read the second sentence in the Master Response 6 – Wildfire Impacts which states: "However, as thoroughly analyzed in Chapter 4.13 of the DEIR, all potential wildfire impacts as a result of the Project, would be mitigated to less than significant". It is clear that the concerns I raised about this project made no difference to Raney, the authors of the FEIR. It is my conclusion that the FEIR fails to see the big picture for the impact of the project on the Wildfire in our community. When I look at the big picture, I find the pieces do not add up and the presence of this mine will

have serious and significant impacts on wildfire near our community. “Less than Significant” impacts does NOT mean no impact at all. The impacts include:

1. The county will have no authority to shut down the mine in the event of a wildfire
2. Clear cutting the forest on the mine property will not eliminate fire dangers
3. 3600 gallons of diesel fuel and transport of explosives will increase danger
4. The function of the “fire flow system” is only theoretical and inadequate
5. Fires can burn the mine site properties regardless of the topography
6. Our community’s risk of burning down is increased
7. Fuel treatment plans in the region are not adequate to reduce fire at the mine site
8. The scouring of the Little Wolf Creek creek-bed will be detrimental to that ecosystem
9. Peoples’ homes will be impacted by flooding
10. The groundwater will be impacted by pumping out the mine shafts
11. PGE will have more power lines to keep clear of trees and branches

I am a discerning person with an abundance of common sense. I am not a scientist by profession but do have a strong background in health care and value the concepts of integrity and transparency. As I read this final massive document, knowing how many people, people with scientific knowledge and professional credentials, submitted comments on the DEIR, I was deeply disturbed that Raney changed so little and continues to state that, with only four “notable exceptions”, all concerns will be mitigatable and this heavy industrial complex called the Idaho-Maryland Mine will have “No Significant Impact” on our community. Our community disagrees with this conclusion!

Those “notable exceptions”, which are minimized in the FEIR include:

1. substantially degrade the existing visual character or quality of the site and its surroundings (Impact 4.1-2);
2. long-term changes in visual character (Impact 4.1-4);
3. generation of a substantial temporary increase in ambient noise levels in the project vicinity (Impact 4.10-1);
4. and conflicts with a program, plan, ordinance, or policy addressing study intersections (Impacts 4.12-1, 4.12-8, and 4.12-10).

The visual character will be change for all time. The “temporary” increase of noise would be for 80 years! The mine traffic will be more than an annoyance at intersections. The evacuation of the populace in the event of a wildfire will be a nightmare for many. One of the mandates of the Public Resource Code (21000-21001) that the FEIR quotes is to: “**Create and maintain conditions under which man and nature can exist in productive harmony to fulfill the social and economic requirements of present and future generations”**. The intent of the Public Resource Code is to protect the quality of our environment. This project will degrade the quality of life for the people of Nevada County and the environment.

The EIR process undertaken by the Rise Gold appears to have been accomplished in a manner consistent with the CEQA statute and guidelines. Raney quotes the following: CEQA is not a tool to forestall any and all changes to the environment, but rather to establish thresholds and manage such changes accordingly, while meeting the economic requirements and needs of the community… "NEEDS OF THE COMMUNITY" …NOT the needs of an industrial mining corporation!

It is my hope that each individual involved in the decision making process for whether or not to accept this FEIR will be wise and decerning. There will be a legacy to live with. Will the individuals working for Nevada County's Planning Commission and the five members of Nevada County's Board of Supervisors be known for standing up for the citizens of our community and rejecting the application of Rise Gold to reopen the Idaho-Maryland Mine. I hope so and wish you all wisdom and clear sight.

Respectfully submitted,

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jennifer Scott. I live at 12246 , Shady Lane, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Sincerely,

Jennifer Scott

Dear Nevada County Supervisors and Planning Commissioners,

My name is FRANCES LOGUE. I live at 14199 Sun Forest Dr, Penn Valley, CA 95946.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have been living in Lake Wildwood for 5 years. The very reason that we moved up here (from the North Bay Area) to NC was because of the peace and quiet, no traffic and clean air & water. All will be destroyed if the Mill is allowed to operate.

Sincerely,

FRANCES LOGUE

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Sharon Cummings. I live at 17600 Shoshoni Trail, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The year is 2023.
Environmental disaster and catastrophe is widespread around the globe.
We are currently living in an 11th hour planetary emergency.
Are you kidding me with this shit?
Humankind has done enough plundering and mining of "valuable" resources.

The gold rush and subsequent incessant prioritization of capitalist profit over human life and sacred land cursed beautiful, bountiful California with a reproachable Native American genocide for which there has STILL been no acknowledgement or reparations. The only acceptable answer is to give the land back.

I have lived and owned a business in this community for over 10 years.
Every single person I know locally is against this mine. There are zero short or longterm benefits.
Stop the nonsense debate. Immediately. Full stop.
NO MINE.
NO.

A YES vote to re-open this mine directly translates to a big, fat, deplorable NO to ANY respect to the human and animal lives who live here, or to our precious planet which is deeply in need of regeneration.

Additionally, please note, anyone voting "YES" to this mine will not get richer, but will absolutely be revealed as morally bankrupt.

Sincerely,

Sharon Cummings

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Mark Novak. I live at 14827Meadow Dr, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hello my name is Mark Novak and I live off Highway 174 in Grass Valley. It is a quiet peaceful community out here and I drive by the proposed mine site every day on my way to work, while heading to town, and taking my kids to school and other events. The mine will cause much unwelcomed traffic, add pollution to the whole Ecosystem between greenhorn and Grass Valley. Drain the wells of local homeowners and turn a beautiful quiet country road and do a destructive industrial district. This community has suffered enough from gold mining over the years and I adamantly stand against this mine coming to our community. Seeing how the company proposing this Toxic endeavor is not local or even American for that matter. I think our community should strongly stand against this project. Also with the new housing development down off of Idaho Maryland it seems like a horrible amount of congestion to be constantly sending trucks full of gravel directly by this new community in Grass Valley.

Sincerely,

Mark Novak

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kimberly Carlsen. I live at 328 2nd Street, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am also a top-producing Realtor in the area, and I have significant fears about how the potential of the mine would detrimentally affect home prices in our area. I worry that the entire Greenhorn/Idaho-Maryland/Cedar Ridge/Brunswick and surrounding areas will see home prices take a dramatic dive, and families will lose their homes in short sales due to the value being depleted based on the proximity of the mine. As a general rule, I strongly believe that home prices will be affected to some degree throughout the entire Nevada County and that our area which once was seen as so desirable, will weaken in the eyes of anybody considering relocating up here. All of the local homeowners who already have invested in what was to be their forever home will be faced with a major depletion of their investments. With our entire community being affected, I imagine both historic downtowns to lose revenue, and many places to go out of business. I believe if the mine is approved, we will see a

tremendous downturn in our economic health and well-being throughout Nevada County. This concerns me very much. Thank you so much for your time.

Sincerely,

Kimberly Carlsen

Dear Nevada County Supervisors and Planning Commissioners,

My name is Laura Gerhart. I live at 11010 Brunswick Drive, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am writing to you from Cedar Ridge. I am a 30 year resident of Nevada County, 25 of which I have owned a home. For 30 years I've paid my taxes, raised children supported local business and recreated in our beautiful community.

My property is on the edge of the proposed Idaho Maryland mine. The area is home to bears, deer, all the little creatures of the forest and maybe even big cats. Developing the Idaho Maryland, mine property and pumping all that water through Wolf Creek will definitely negatively impact their habitat. And there's less and less habitat left for them these days.

The impact on the forest creatures is in addition to the faulty and overstated economic claims, environmental claims and community support claims that those

proposing Idaho Maryland mine have made all along. I'll leave that argument for those more skilled and articulate in addressing those facts, but I absolutely do not believe the mine has our best interests at heart. They are outsiders with a very poor track record.

I urge you to pass on the mine proposal with a no vote when the time comes.

Sincerely,

Laura Gerhart

Dear Nevada County Supervisors and Planning Commissioners,

My name is John Totino. I live at 12751 Morro Dr., Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada County since 2008 and I live in district one. I really love the peace, natural beauty and friendliness of the people here. I oppose the re-opening of the Idaho-Maryland mine because of all of the negative impacts it would bring to the quality of life here: traffic, air pollution, noise, harm to the environment and homeowners. Please consider voting against the re-opening of this mine, thank you. Sincerely, John Totino

Sincerely,

John Totino

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Anna Welle. I live at 17002 Piper Lane, Penn Valley, CA 95946.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I've lived in Penn Valley (district 4) for 6 years and I love this entire county. I am looking to purchase a new home closer to Grass Valley and an active mine would deter me from wanting to live anywhere close to it. There will be excessive noise from both the operation and the increased traffic. (Especially from the trucks). The water quality will be at risk. And water availability for nearby homeowners is not adequately addressed. Which is a massive risk.

I beg you, please do not allow this mining operation to open. It is not worth it!

Sincerely,

Anna Welle

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Hannah Lipski at hannah.lipski@live.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Hannah Lipski. I live at 547 W Broad St, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a resident of Nevada City, district 1. I have been living here for over five years. I have a deep love for this place, and it feels like home.

However, I have noticed that since I have moved here, I now have chronic congestion. Since the air quality is already so poor in our area, it concerns me to have a significant mining operation taking place. Nevada county residents are two times more likely to get lung disease compared to other counties in our state. Further, it was given an F by the 2020 state of the air report from the American Lung Association in particulate pollution levels and ozone levels. What we really need is to be actively working to remedy our community's air quality issue. Reopening the mine would send the message that the health of our community is not of your concern, because the operation of the mine would contribute to the pollution of our air from

significant sources of dust and fumes.

This personally impacts me and others in the present. However, potentially a more chilling consequence is the long term effects of the production of toxic waste. Toxic waste impacts can stick around for generations, long after my lifetime.

I am also seriously concerned about water. Climate change is not going to go away. California's drought is not going to let up anytime soon. We need to be conservative about our water. Rise Gold's plan of 3.6 million gallons per day is unsustainable. Further, the damage of creeks, habitat and risk of wells is concerning. The number one issue related to animal and plant endangerment is habitat loss.

Rise Gold is not to be trusted. The answer is simple. No mine!

Let's instead protect our people and land and clean up what is already contaminated and persisting as a problem, ie. low air quality.

Thank you!

Sincerely,

Hannah Lipski

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Ray Bryars. I live at 11574 Northview Drive, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hi. My name is Ray Bryars and I have lived on Banner Mountain in District 1 since 1984, when I moved to the area to work for Grass Valley Group. Although I retired in the early 2000s, my wife and I love the area and have made this our forever home. I volunteer with Bear Yuba Land Trust, Habitat for Humanity and the Senior Firewood Program. I feel that all these organizations make a positive contribution to our community.

Below is an Opinion Piece that I recently submitted to The Union. It covers numerous concerns regarding the Economic Impact Report:

Experts review the Economic Impact Report for the proposed Idaho Maryland Mine. The report was prepared by Robert D Niehaus (RDN).

I attended the excellent Webinar discussing the recently released Economic Impact Report for the Idaho Maryland Mine that Community Environmental Advocates Foundation (CEAF) organized on December 20th. A group of very knowledgable presenters conducted detailed analysis in a number of areas. The amount of information was overwhelming, so this is an attempt to list some, of their concerns - There are many more.

• Well monitoring to provide a baseline for the DEIR was a requirement when the most recent San Juan Ridge MIne, also known as the Siskon Mine was approved. A similar requirement must be placed on Rise Gold to ensure that over 300 wells are monitored for at least 3 years.

• CEAF is concerned that there are many unanswered questions in the Environmental Impact Report (EIR). Therefore it cannot be considered “Final”.

• Dr David Chambers noted that a Technical Report NI 43-101 has not been completed for 5 years. So this is all we have to go on. It showed that there is not enough information to specify any mineral resources and mineral reserves. It is highly unusual to ask for a production permit without these being defined. Dr Chambers claims that he has never seen such a lack of information.

• Economic impact of Waste disposal. This is a problem because selling mine waste is difficult due to liability risks. Testing is required, but the current samples are not adequate. Most buyers will be reluctant to buy since there are many lower risk alternatives.

• Characterization of mine waste is suspect since It was not tested properly. Distilled water was used instead of the typically used, weak acid solution.

• Since there has not been proper testing of mine waste rock. If it could not be sold, where would the 2 million tons in 11 years of mining go?

• Financial assurance must be a requirement. It is common that mines have catastrophic events that end up being a burden on the community. We need to be assured that if there is a catastrophic event or the mine closes, it is done properly so there is not an impact to the community. The caveat is that historically, financial assurance, never covers catastrophic events. However there should be enough money put aside to compensate the community in case a catastrophe occurs and the the mine goes bankrupt.

• Does anyone seriously believe that there can ever be justification to permit a mine operation for 80 years? There is nothing that would justify this.

• Rise claims that it will be 3 years to get to full production. This is contrary to the reality that typically the industry takes 6 - 7 years after the permits are obtained. This will have a huge financial impact and should be seriously considered. Note that the time to get permits was not considered.

• The CEAF experts feel that spending patterns of construction and mine workers is overblown. Construction workers will likely be from outside the county, will probably share accommodation and spend much less than expected in the community. Their estimate is that spending would be 1/4 of that claimed.
• The cost to mine that Rise Gold is using is 1/2 of the industry average. This is way too optimistic and should have been seriously questioned in the Economic Impact Report.
• James Steinmann's conclusion on the Economic Impact Report: "The input data is questionable, the benefits are substantially overstated, the costs of operation are understated and the risks are ignored".
• Charlie Brock a local Real Estate expert strongly contests the conclusion that there will be no effect on real estate values. The consensus of surveyed agents was that there will be long term detrimental effects.
• Another expert estimated that even a small (5-10%) negative impact on tourism plus the impact on property values would be far greater than any positive financial impact that the mine claims.
• The comparisons with other mines that was used for looking at the impacts on property values was seriously misleading. There were none that had the same housing density, so close to the mine. We have approximately 2000 homes within 1/2 mile from the mine.
• Not discussed, but important, is that Economic Impact Reports for other mine operations, commonly include a comparison of the economic impact of alternative uses for the property. This may be an intentional omission since there are likely many other uses for the site that could provide greater benefits, with very much less risk and environmental impact.
• What is the estimated cost for installing the infrastructure, construction of buildings, purchase and installation of equipment and excavation down to a point where gold can be extracted? A detailed economic report should include a timeline of expenditures and income to show the breakeven point.
• The cost to first cleanup the Centennial Site was not included, but it should be completed to show the true economic picture. The mine intends to dump mine waste rock on this site.
The Remedial Action Plan for the Centennial Site will not be complete until sometime in 2023. Since the use of this site is a major part of the project plan, it seems wrong to move forward until this is finalized.
To see the CEA Webinar go to: https://www.minewatchnc.org and click on: "The Other Side of the Story"

You are encouraged to write your concerns to your supervisor and attend Planning Commission and Supervisors meetings. Look for public meeting dates, your participation is important.

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of David Myers at davidtroym@hotmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is David Myers. I live at 14915 Quail Pointe Lane, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a resident of District 1; my family moved to the area 4 years ago.

I am deeply concerned by the prospect of the Idaho-Maryland mine reopening. The risk to the local economy and residents’ quality of life is not worth the very uncertain (and inflated estimates of) county revenue.

The estimates of new revenue to the county are uncertain at best. Any county revenues that do materialize will be more than offset by lost revenue from the tourism industry, declining property values, and the very likely need for the county to pay for environmental mitigation measures in the future. Meanwhile, our local housing crisis will be exacerbated by transient mining workers who will contribute very little to sales tax revenues.

My family moved here because of the incredible quality of life, particularly the natural beauty. That beauty is about to be destroyed by large-scale mining operation. Everyone should expect noise and pollution to increase dramatically from the mine. Rise Gold has a well-documented history of leaving pollution and broken promises in the wake of its operations.

Do not enrich a foreign company at the expense of your constituents. I urge you to vote “No” on the mine reopening. And to be frank, I (and many others) will make it a mission to have any supervisor who votes “yes” lose their position in upcoming elections.

Sincerely,

David Myers

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Julie Carville. I live at 14582 Alderwood Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I'm a long time home owner in district 1 in Nevada County, for more than 30 years. We have had historial damage from mining here starting with the gold rush. The murdering and starvation of Indians and the stealing of their land, and also huge destruction to the environment caused by mining should be enough for us to have stopped mining forever, even though the conditions are different now.

Yet we still consider mining requests, with their welknown damaging results, including what happened to wells up on the North San Juan Ridge even with the promise that their mine would be safe and safely monitered.

After all this why do we glorify mining, as if were good for the community?? Is wealth for the few and a few jobs worth it for the more likely damage it will cause over a

horrifying 80 years. That alone should make you say NO. Mning didn't build our community, people did, and we should be ashamed at how we continue to glorify it.

Please create a zonning law or whatever will stop any more mines forever, so we don't we don't waste time and money and unpset the community, as is happening now, over this new mine. Create a law now that stops all mining in the future. Right now you have enough threatening information (even just the 80 yrs request!!!) now to say no to the Idaho-Maryland Mine. Just say NO now. Represent our community, stop the mine.

Sincerely,

Julie Carville

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Susan Lane. I live at 19158 Tiger Lily Lane, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I've lived in Nevada County for 39 years. I love this community. That being said, I believe it is impossible to truly know how draining the mine would affect the local ground water. Most of the tunnels under in the area are interconnected.

This mine feels like a repeat of stopping the mine off Idaho Maryland Rd. I was for the mine in the beginning. Most of the projects was to be completed underground, but they estimated there would be 1 semi truck leaving every hour 24 hrs. a day. At that time I was living at Rookwood Condos and you could hear everything that went on in that valley. The building of Mouls Paint and Glass, Sierra Nevada Memorial Hospital building 4, and Wheelers dealership. Cal Trans was also rerouting semis off I 80 at night due to construction. It was a lot of traffic. That's when I decided that mine was not a good idea.

I have well water where I live now. I'm concerned about what dewatering the mine would do to the groundwater. Many wells have been drilled post the closing of Empire Mine. There is also the impact on infrastructure, mainly the roads. There are many new houses developments that will use Idaho Maryland, Dorsey, and Brunswick Rd. to access the freeway, but there have been no improvements to handle the added stress on those resources and a bunch of semis will make it even worse.

Please say no to this proposal.
Susan Lane

My name is Janet Goodban. I live at 38 Candy Ln, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

There needs to be more thorough studies completed on the surrounding well sites before a decision is made. Why would you decide on something that will affect our community so hugely with only a small part of information? The majority of the community is adamantly against this, especially with a foreign company with a bad track record of ruining other communities like ours, leading it. This is all fueled by greed. There is absolutely no benefit to us if this goes through, it will only be detrimental in so many ways. I’m astounded it’s even gotten this far. Thank you in advance for doing the right thing and voting against it.

Sincerely,

Janet Goodban

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Rose Gander. I live at Pobox 105, Penn Valley, CA 95946.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada County for most of the last 45 years. I don't see how this project benefits County residents or enhances our quality of life. I oppose this project. No need for a mine. Nothing but trouble for the community.

Sincerely,

Rose Gander

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Phyllis Hegeman. I live at 12600 Bolinas Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Good day! I live off Idaho Maryland Rd. I am a concerned citizen asking you to just say no to re--opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger our community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk. But what is of utmost concern is there is so much cancer and illness in Nevada County that has been traced to toxins from mining. I have a friend who started getting seizures at age 72. She just had in depth tests and several toxins known to be identified directly from mining, Some concerns include noise pollution, air pollution, lots of truck traffic, wells going dry, property values dropping, an industrial complex destroying the beauty of nature and the peaceful environment of our community, etc.
Thank you for hearing and taking deeply the incredible detrimental effects opening the mine will have and deeply considering and feeling whether or not you want to be

responsible for a decision that will physically, mentally, and spiritually harm your fellow human beings.
Phyllis Hegeman

Sincerely,

Phyllis Hegeman

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Jeffrey Hunt at huntapplevalley@aol.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jeffrey Hunt. I live at 15494 Clover Valley Road, GRASS VALLEY, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My wife Darlene and I live in the unincorporated section Alta Sierra, District 2. My spouse and my two little dogs moved to Alta Sierra in June of 2021. She a retired Nurse, and I a retired 25 year builder and 18 year Special Education Elementary Teacher.
40 years ago we were visiting relatives in Grass Valley and we both thought it would be wonderful to live in this part of California. Well, we are here now for good. This geographical area is truly, "wonderful!" The wildlife, landscapes, trees, waters, air, extremely low manufacturing green- house emissions, the peace and quiet, the people, schools, 1st responders , business owners, and the History are very special. No amount of profit can justify potentially destroying this magnificent region of California by re-opening the Idaho-Maryland Mine. Even the highest estimates of

profits from the proposed re-opening of the mine pales in comparison to the future profits of the long-term continuation of the way of life and business that now exsist, and is to come if we simply vote NO! to this mine re-opening proposal.
Please let History show that we as citizens made the correct and healthy choice and said, YES!! to keeping our prosperous and beautiful way of life here in Nevada County.
Respectfully,
Jeff and Darlene Hunt-

Sincerely,

Jeffrey Hunt

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Linda Elston. I live at 12406 Gayle Lane, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am a resident in District 1 on lower Banner Mountain in Nevada City. My house has a view of some of the Brunswick Road traffic, plus we can see the intersection light at Idaho Maryland Road and portions the Brunswick Basin. I have lived in Nevada County for almost 25 years and run my own business as a commercial MAI appraiser from my home. I am extremely concerned about the re-opening of the Idaho-Maryland Mine for many reasons. I can see and hear the traffic slightly along Brunswick Road below my house now. I am very concerned the noise will be much worse from the mine due to additional trucks and increased traffic needed to haul away the materials and waste, perhaps 24/7. With global warming getting worse each year and with prolong droughts and more wild fires, I don’t think our community can affordable to give away any additional water that is needed to run this mine. We will most likely be challenged enough just to keep up with our basic water demands

in these times of global warming and the uncertain weather changes. Everyone in California knows that water is becoming more “scarce”. We cannot afford to think differently by allowing a mining company within our community to risk our future. As an appraiser and economist, I don’t believe for a minute that this new mine will produce any substantial and sustainable jobs for our community, and probably outsiders that will get the higher paying positions. We need to think of attracting greener and other cleaner industries into our community that reflect our values and that are more sustainable vs. a risky/dirty mine. Also as an appraiser, I am well aware of the risks this new mine could have on our property values from the additional noise in the outlining neighborhoods, additional pollution, additional hazardous risk to our environment and this community, the additional risk for water production/reductions to our well/properties, and all the other potential negative effects this mine will have on our community, our homes and our health. I moved to Nevada City and the Sierra Foothills because of the beauty and higher consciousness of this community. The re-opening of the Idaho-Maryland Mine is just about the worst thing our community could do. It is actually backwards thinking in terms of caring and stewarding our foothills and the protecting our precious resources, especially as the future gets even more challenging. So I am a strong “NO” on reopening this mine. I hope we can all come together and put our land, our water, our air, our community and it’s people, and all the good things we already have here now as our first priority before any corporate greed and outside Canadian miners who can destroy all that has been precious to those who live here now. So please, please just say and vote “NO” to re-opening the mine as the representatives of our community. Please protect and reflect the bigger picture for the good of our entire community, the well-being our health, and long-term care of our citizens and our property/land here. Thank you for your service.

Sincerely,

Linda Elston

Dear Nevada County Supervisors and Planning Commissioners,

My name is Don Davis. I live at PO Box 1083, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hello, my name is Don Davis. I first moved to Nevada County in 1988. I own my second home since coming to the area. I love this place and, after spending time elsewhere, I always return. It has changed over the years and that's not a bad thing. The proposed change, the Idaho-Maryland mine, is not a good change. I've read all the "stuff" and been to the meetings. I don't know why it's still being considered. I see no real benefit to the community. Perhaps some individuals will benefit but - overwhelmingly - this is a bad idea for Nevada County. Please use your vote to rid us of the unneeded, unwanted encroachment by denying this horrible opportunity. Thank you, Don Davis

Sincerely,

Don Davis

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Dear Nevada County Supervisors,
Please say no to the Idaho-Maryland mine! My grandparents live within 5 miles of the mine so it would largely impact their property. For me, being able to go to my grandparent's house and play in the stream, build forts and dams, climb trees, and garden is really special to me and I am worried that the environmental impact of the mine will destroy that. I want to be able to keep having fun there. Please consider your decision and don't say yes to the mine.

Thank you,
Torin Johnson, Age 10

Dear Nevada County Supervisors and Planning Commissioners,

My name is Sasha Soukup. I live at 13125 BURMA RD, GRASS VALLEY, California 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live about three miles from the proposed mine site, on bucolic Burma Road. If this mine is constructed, it will create a noisy traffic corridor that I have to drive through to get to any destination in town. I have lived here for 18 years, and while I accept the increase in traffic and congestion that comes with building new dwelling units in the area, I cannot accept the noise and pollution in the name of an operation that could impact water quality, air quality, and real estate values for decades to come. I am a small business owner that has always paid all of my local and state taxes to the max, as well as being a lynch pin in our thriving local arts and music scene. I have many friends who have been renting in town for years, and who are now hitting savings goals for home down payments. They are currently considering making Nevada County their permanent home, but having a mine here would change

everything for them. Are these the folks we want to drive away from our wonderful community?!? Thanks for your time. -Sasha

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Mark Hotsenpiller. I live at 17274 Oscar Drive, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We have resided in Alta Sierra for three years, moving here from SF. We are very concerned about the mine opening up and causing serious traffic with hundreds of trucks hauling waste on our roads. There is an unaddressed concern about neighbors' water wells drying up or being contaminated. One thing that is rarely addressed is the business practices of Ben Mossman and his company. As you know, they have been sued in Canada for leaving toxic waste and not fulfilling their obligations to the province and country. Unless we can be assured that cannot happen here, you must not approve the mine here. The last thing we need will be a defunct, dirty mine 18 months after it is opened, as in Canada. Residents will leave in droves, and our beautiful foothill location will be spoiled for a long time. All one needs to do is look at the signs around Grass Valley and Nevada City. The vast majority of them say "No on the mine". Please do the will of the people and do not

approve the mine.
Thank you very much.

Sincerely,

Mark Hotsenpiller

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in the Echo Ridge estates area. When carefully considered, the mine will bring only very small ECONOMIC benefits to our community compared to the huge environmental risks. Plus, Ben Mossman has a clear track record of illegal behavior on his prior projects. This adds up to a vote of NO. Thank you for considering my comments.

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Carl Hall. I live at 404 Redbud Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Residents of our county have been living with the continuing environmental impact of past mining activities for more than a century. Please don't add to this burden.

Thank you,

Carl Hall

Sincerely,

Carl Hall

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jim Vaught. I live at 185 E Main St, #1234, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live downhill from the proposed mine. As most residents, I only have access to my personal well water. I grow most of my own fruits and vegetables. I will live in continuous fear of this mine begins operating. Please DO NOT CREATE ANOTHER FLINT, MICHIGAN!!!

Sincerely,

Jim Vaught

Dear Nevada County Supervisors and Planning Commissioners,

My name is Sequoiah Briseno. I live at 12090 Paddock Lane, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Grass Valley for 2 years and was shocked to find out that the town was considering re-opening the mine. Even though my property is far away, I feel horribly for the residents in close proximity to the mine who must be terrified of environmental impacts. Re-opening the mines would negatively impact ground water and community health. It has very few benefits for the community and MANY unknowns and risks. I strongly oppose the re-opening of the mine.

Sincerely,

Sequoiah Briseno

My name is Veronica Monet. I live at 204 West Main Street, Suite 122, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada County for a dozen years. My office is located in downtown Grass Valley in the historic Alpha Building. I love our friendly, small community. Being a transplant from the Bay Area, I know how special our mountains and the Yuba are. I know that while the rest of California is struggling to get here on the weekends, we are lucky enough to already be here! And why is the rest of our great State of California "escaping" to our community? Because we are blessed with beautiful forests and pristine rivers. We are blessed with a variety of flora and fauna including bears, cougars, bobcats, fox and so many beautiful birds. In short, it is our natural environment that is most valuable to us and to our visitors. Please protect our land, our water, our wildlife and our way of life. Say NO to the Idaho-Maryland

Mine. Thank you. Veronica Monet, resident and small business owner.

Sincerely,

Veronica Monet

RECEIVED

FEB 23 2023

NEVADA COUNTY
BOARD OF SUPERVISORS

Unable to identify District

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 2-19-23

Lisa Swarthout.

Dear Supervisors Sue Hoek, Heidi Hall, Ed Scofield, ~~Dan Miller~~, and Hardy Bullock:

I work/own a business in Nevada County and I am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corp. I expect that you will be voting on the project based on the Environmental Impact Report and community input.

I have listened to both sides of the argument and find the Rise Gold Corp. (RYES) reports and advertising to be inaccurate. They fail to adequately mitigate many significant negative impacts of this large industrial project on my community and business. It is in my business and personal interest that you do not approve this project.

My business's opposition to this project is based on RYES plans, reports and the DEIR (Draft Environmental Impact Report). Experts have reported to me that there will be significant increases in air pollution, traffic in key areas, noise from both above and below ground operations, wildfire evacuation blockages, reduction of our community's water resources, etc. They also report that any economic gains do not justify the costs to the County. Adding 312 jobs to the County workforce of approximately 44,000 is trivial no matter what the wages, and well-paying jobs will not go to County residents.

Businesses depend upon a quality living experience for residents and visitors alike. I am especially concerned about tourism, likely the largest single public industry in the County. Huge diesel trucks and machines spewing exhaust and using key access roads to Grass Valley are not going to improve our vital image as a tourist destination.

Many tourists come here for the outdoors, art, food and wine, and live performances. Please do not permit the County's attractive environment to be damaged by air and noise pollution, a large factory, waste dumps, and industrial traffic.

Sincerely, Lisa White

Thank you we have received your email, and your comments on the Idaho-Maryland Mine – Rise Grass Valley Project and they will be included as part of the public record.

- A noticed public hearing(s) will be scheduled before the Nevada County Planning Commission to consider a recommendation to the Nevada County Board of Supervisors on the proposed project and the EIR.

- A noticed public hearing(s) will then be scheduled before the Nevada County Board of Supervisors to consider the proposed project, the EIR and the Planning Commission's recommendations. The Board of Supervisors will take action on the proposed project during their noticed public hearing.

- All comments received will be forwarded to the Planning Commission and the Board of Supervisors for their review and consideration at their future noticed public hearing(s).

Thank you again for your comments on the proposed project. There will be additional opportunities to comment on the proposed project throughout the public hearing processes.

Available application materials and supporting documents related to the proposed project including the Draft EIR & Final EIR with Technical Appendices are available for public review at the following locations:

- Nevada County Planning Department, 950 Maidu Avenue, Suite 170, Nevada City, CA 95959.

- Madelyn Helling Library, 980 Helling Way, Nevada City, CA 95959.

- Grass Valley Library – Royce Branch, 207 Mill Street, Grass Valley, CA 95945.

Or they may be viewed at: https://www.nevadacountyca.gov/3195/Idaho-Maryland-Mine---Rise-Grass-Valley

Nevada County Democrats pass Resolution Opposing the Reopening of the Idaho Maryland Mine

For Immediate Release

Contact: Steve Hurley, Chair
530-210-3865

The Nevada County Democratic Central Committee passed a resolution opposing the reopening of the Idaho Maryland Mine. The local Democratic party has not been one to spend much time writing resolutions, but according to Eric Robins, chair at the time of its passing, “This proposal is too risky for the environment and public health to keep silent on it. Even if you accept the findings of the DEIR (or now FEIR), Rise Gold Grass Valley’s track record shows they cannot be trusted to implement the mitigation measures. They have a history of leaving waste to be cleaned up, had 35 charges filed against them in various courts, and a local bankruptcy judge, in evaluating the economic reports published by the company, thinks bankruptcy is likely.”

Proponents of the mine often site the possible 300 new jobs that could come with it. This job gain would likely be offset by the big risks for the tourism industry, high tech, and medical industry that won’t be able to work in a situation where they are vibrations from underground blasting, the possible loss of hundreds of wells, and lowering of property values. However, right now Nevada County has more jobs available than workers, and very low housing stock.

The loading and dumping of rock would add tremendous pollution to the “F’ Nevada County already earns from the American Lung Associations grading system due to the ozone in our air at times during the heat of the summer.

We could go on, but here is the text of the resolution.

Nevada County Democratic Central Committee

Resolution

Opposing Rise Gold’s proposal to re-open the Idaho Maryland Mine

Whereas, the Nevada County Democratic Central Committee desires to oppose Rise Gold’s proposal to open the former Brunswick Mine, in Nevada County; and

Whereas, the CEO of Rise Gold, Ben Mossman, formally the CEO of Banks Island Gold, Ltd and the Yellow Giant Mine was found guilty of Environmental Management Act violations in British Columbia, polluting tribal waters, including 35 provincial and federal charges when officers found evidence that the company was dumping waste into the surrounding woods, creeks and wetland areas, which CEO Mossman failed to report to the regulatory authorities; and

Whereas, Banks Island Gold, Ltd and the Yellow Giant Mine operations went bankrupt and left Canadian citizens with the responsibility and cost for the clean-up; and

Whereas, Mossman is still facing federal charges and a trial in Canada, along with Dirk Meckers, Rise Gold’s Chief Geologist. British Columbia’s Supreme Court ruled in October 2020 that both Mossman and Meckers must stand trial, a trial that has not yet been scheduled; and

Whereas, quoting from California Judge Jerome T. Newsome, said, “My experience as a U.S bankruptcy judge for 28 years leads me to believe that this company is destined for financial failure;” and

Whereas, evaluation of the Company’s SEC filings dated April 30, 2021 reflects only $1,534,934 in cash on hand and an accumulated deficit of $18,969,011, giving rise to serious concerns about the Company’s’ financial health and viability; and

Whereas, the potential negative environmental impacts of air, noise, water, private residential well loss and contamination, and the proposed 24-hour operations will severely harm the quality of life and property values- because mining operations and the trucking of mine materials are enormous and beyond the scope of what we believe the citizens of Nevada County can or should tolerate; and

Whereas, the proposal to open the mine has severely undercounted the number of private wells that will be impacted. Latest number of impacted parcels in the estimate of local well professionals exceeds 800; and

Whereas, the potential economic losses to homeowners within the mineral rights area has been estimated to exceed $5 million in the value of their homes, with many homes being unsellable; and

Whereas, the jobs Rise Gold purports to be creating to stimulate the local economy will need to be filled by outside labor, as Nevada County no longer has a pool of trained underground miners; and

Whereas, Nevada County and California suffers from a severe housing shortage both in rental and sale properties, leaving imported workers unhoused locally; and

Now, Therefore, be it Resolved, that the above recitals are true and correct to the best of our knowledge and shall serve as findings of the Nevada County Democratic Central Committee.

Be it Further Resolved, that the Nevada County Democratic Central Committee calls upon the Nevada County Board of Supervisors to deny any and all permits for opening and operating the Brunswick/Idaho Maryland Mine, and to protect the citizens of Nevada County from the potential losses and hardships this proposal will cause.

Be it Further Resolved, that the Nevada County Democratic Central Committee opposes the proposal to allow Rise Gold to open the Brunswick/Idaho Maryland Mine and further opposes Rise Gold to operate in Nevada County.

PASSED AND ADOPTED by the full membership of the Nevada County Democratic Central Committee at its meeting held on the 20th day of October, 2021.

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Frederick Bianchi. I live at 12 Mill St., Rockland, ME 4841.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

While the adverse effects of reopening the mine have surely been well-articulated by others with expertise in the environmental impacts, I will not repeat that detail here. My more immediate concern regards my plan to retire next year and relocate to Grass Valley. The beauty of this area and the environmental resources of Nevada County would provide me the opportunity to continue my post-academic writing and research activities. However, if the mine reopening proposal is passed, I would certainly reconsider my intent to relocate to the area.

In closing, I have read the literature regarding the proposal and have studied both sides of the argument. My hope is that you will act in the best interest of the environment and for the people living in the area.

Sincerely,
Dr. Frederick Bianchi
Worcester Polytechnic Institute
Massachusetts

Sincerely,

Frederick Bianchi

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Janet Miller at janetsm@pacbell.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Janet Miller. I live at 10401 Jitney Lane, Grass Valley, California, US 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My husband and I have lived in Grass Valley since 1986, in District 3. We moved here because I had been hired as a computer engineer by Mitsubishi R&D Center (which left Nevada County in 1995). Our two sons grew up here and attended the local schools and graduated from NUHS.

The more I learn about Ben Mossman, the more I oppose the re-opening of the Idaho-Maryland mine. His Yellow Giant gold mine in British Columbia, from which he released mine waste and contaminated water into creeks, ponds and wetlands, was shut down after one year of operation (L.A. Times 6/24/22). His apparent disdain for the people to be affected by reopening the mine, shown by the flawed environmental and economic impact reports (YubaNet, 12/16/22 and Minewatch, 12/4/22)

reinforces my opposition.

Regards,
Janet Miller

Sincerely,

Janet Miller

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Reed Hamilton at reedhamilton2@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Reed Hamilton. I live at 13310 Nannas Way, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 4 and have been a county resident for 40 years. I am retired now but owned businesses here from the 1980’s to my retirement a few years ago. After examining the DEIR and the FEIR and doing considerable reading, I have concluded that there are too many unanswered question and defects in those documents and the economic analysis report commissioned by the county to approve this project. The county and its citizens are assuming too much risk in regard to regulation of the mine, traffic, air pollution, water pollution and well dewatering, and real estate values to allow an underfinanced junior company with a poor track record to begin such a project without further financial and regulatory guarantees. I ask you to reject this application as it stands and require a new one with new documents to address the many question.

Sincerely,

Reed Hamilton

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Anita Wald-Tuttle. I live at 6 Rockwood Drive, Grass Valley., CA 95945-5607 530-277-6195 anitaw1t3@gmail.com, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

At the present time I live in District 3, but moved to this area in 1989 and helped run our business, The Tanglewood Forest, for 26 wonderful years. This community has blossomed and draws visitors from near and far to enjoy the culture, dining, and outdoor pleasures that abound. It is too precious to lose to heavy industry and very limited benefits if any. Please say "NO" regarding the permit. The people who elected you into your offices need to know that you are listening to them and will safeguard this wonderful area for a long, long time.

Sincerely,

Anita Wald-Tuttle

Dear Nevada County Supervisors and Planning Commissioners,

My name is Maciel Dotson. I live at 14941 Julia Ranch Road, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in district three off of Greenhorn road. I’m deeply concerned that reopening the mine will cause a significant threat to our local environment. We do not have the infrastructure to support heavy duty equipment running on our roads 24/7.
Along with that is the grave danger of lowering the water table. Water is precious here in California and people in the area close by the mine have already had to re-drill their wells. I urge the Supervisors and Planning Commissioners to make the right choice for our community and say no to reopening the mine.

Thank you,

Maciel Dotson

Dear Nevada County Supervisors and Planning Commissioners,

My name is MaryBeth Fitzsimmons. I live at 15443 Orchard Springs Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We've lived in Chicago Park since 2006, moving here to enjoy the natural beauty and rural lifestyle of Nevada county. We rely on our groundwater. We don't have confidence in a Canadian mining company to make environmentally sound decisions over profit. There are many alternatives to job and tax growth in the county. Please show respect for the long term health and well-being of Nevada county citizens and do not approve the mine.

Sincerely,

MaryBeth Fitzsimmons

Dear Nevada County Supervisors and Planning Commissioners,

My name is dean olson. I live at 13075 Woolman Lane, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Besides its huge impact on our local environment and community structure, it also adds insult to injury when we are presently becoming aware of what mining did in the destruction of the Nisenan Tribe in our area, the confiscation of their land, and the almost total destruction of their food sources and the ecology of our area.

There are too many precious areas of our environment that are already under severe stress, besides the water table and the grassland and forest areas. We have lived for twenty years on the Sierra Friends Campus, the Woolman Program, a 240 acre working farm and educational facility. We went through the Jones Bar Fire, had massive destruction of areas of woodland besides many of our buildings burned completely to the ground, with only the metal roofs left on the ground and stone chimneys like tombstones.

The last thing we need is another assault on this sacred land and water table and environment by a mining operation.

Sincerely,

dean olson

Environmental impacts unavoidable - The FEIR lists several significant and unavoidable
environmental impacts that endanger this community's health and quality of life. These include
aesthetics, traffic, and noise. There are also serious deficiencies in the FEIR that put the County
and its citizens at even greater risk. Key deficiencies are shown in sections 2-6 of this document. https://www.minewatchnc.org/post/the-county-should-deny-the-idaho-maryland-mine-and-should-not-certify-the-final-eir

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Chris Vaughan at cvaughan25@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Chris Vaughan. I live at 121 Orchard Street, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The FEIR’s conclusion that water quality impacts related to mine waste will not be significant is
unsupported. The Water Board made it clear in Draft EIR comments that more rock testing is
needed to assess the likely concentration levels of hazardous elements in the rock to be mined.
The FEIR’s plan for storing and disposing of mine waste has extensive gaps, creating a risk for
long-term mine water pollution similar to what this community has seen in the past.
● Rise Gold’s project plans to deposit 1000 tons of tailings and waste rock per day on the
Centennial and Brunswick sites for the first 11 years. After that, the plan is to

dispose of it via
off-site sales. However, only waste classified as Group C can be used for engineered fill deposits
or off-site sales. The more hazardous Groups A and B require special handling. The FEIR asserts
that “mine materials will likely be classified as Group C”, but its conclusions rely on just 11 feet of
drill core samples.

● The FEIR does not provide adequate provisions for the storage of Group A or Group B mine
waste, which will be required by the Water Board. Since any waste that is not Group C cannot be
used for engineered fill or off-site sales, viable alternative strategies must be defined. The FEIR
introduced a new suggestion that if not Group C “...the waste rock would be placed underground”,
but CEQA requires storage of Group A or B mine waste underground to be reviewed in a Draft
EIR.

● This extensive set of gaps in mine waste management also introduces uncertainties about Rise
Gold’s ability to operate by disposing of mine waste from off-site sales.

Sincerely,

Chris Vaughan

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is David Agran. I live at 13755 Quaker hill cross rd, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

As I said after reviewing the deir. There are a couple key reasons why just so no is the only option that is good for nevada county and especially grass valley and banner Mtn. And the watershed downstream.

1) an 85 year permit to a bankrupt company being litigated against by the Canadian govt and first peoples and I think the state for going against their word and commitments and not being safe and polluting pristine areas and then not cleaning up the mess but instead declaring bankruptcy and then fleeing the country. Since past behavior is THE best predictor of future behavior (just ask anyone who runs your credit report why they do that before they trust you) does not seem a worthy partner to jump in bed w for 85 years.

2). What if they are wrong. BP Texas offshore deep water horizon thought they were safe. They were wrong. The challenger disaster those experts thought it was safe to launch. They were wrong. Three mile island disaster those nuclear scientists thought they were right. They were wrong. What's that big dam about an hour away near yuba city that failed a few years back those experts said the spillway was safe. They were wrong. I live on banner Mtn about 3 miles from proposed mine tunnels. I have an ole mining shed and air vents on My property. I have been her 15 years I have a low producing well that's getting worse. With drought nearly universal. What if after they drain millions of gallons water from underneath me and my well goes dry. Are you gonna promise in writing that you are gonna take care of me. If my well goes dry what if they are wrong. The final EIR is already proving that their experts are already. wrong. Are they happy to buy solidly fully financed insurance policies for clean up and mitigation for harm done to the community and its members like me for the next 125 years.

3). The environmental and sustainability goals that you all set. There are bad outcomes and potential harm to each goal from the mine. Good governance has no place for "yes men and yes women"! who say yes to everyone's ask jistbto please everyone (or curry favor) . Are you really a hypocrite or do you just play on o. The commissions dias. Don't do that. Especially when the mine clearly goes against long term health and well being. We the community anre here for ever. Not just 85 years to rape and
plunder the earth and leave us holding the Messy bag to clean up, once they leave or sell to an even lessScrupulous mining company

4). Mining is our Glorious past but not our future. Back in the glory days. There were not over15,000 people living within a few miles and close to downtown.

This is pure folly. Just say no. Thank you. It's your only ethical and value driven choice if you truely support the community and our safety and security

Jist say no. Thank you.
David agran.

Sincerely,

David Agran

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

District 3, Washington Heights.
My husband's family moved here during the Depression to work in the mines. They were not fun places to work, it was brutally hard and dangerous. If they were alive today, they'd question the motives of re opening a mine. They did what they could to get OUT of the mines. This will benefit a handful of Canadians, that's it. We will be left with the environmental damage for decades.
I cannot believe ANY of you would fall for this. I vote in every election and often help with campaigning. If any Yes votes come from this board, you can be assured I'll be vocal about my displeasure. Alternatively, a NO vote will ensure my support in future elections.
You cannot allow this mine to re-open, it's a major loss for our town.
There are alternatives to finding jobs for 100 people. My husband's company, for

instance, is hiring engineers with high levels of education to work in Grass Valley, luring them away from the Bay Area. People love living here! Be creative, don't go for the low lying, environmentally horrific fruit.
Thanks for your consideration.

Sincerely,

Beth Moorehead

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Kathryn Canan at kacanan@yahoo.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kathryn Canan. I live at 469 Pine Street, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in Grass Valley, District 3, near Empire Mine State Park, which is the best possible use of a former gold mine. I have lived here 8 years, and I teach and perform music. I love our quiet, lovely forests and hiking trails, and my profession depends greatly on the tourists who come to enjoy our fabulous arts community. Please do not approve this dangerously toxic, noisy, and destructive mine project.

Sincerely,

Kathryn Canan

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is JS Peterson. I live at 12304 Rough And Ready Hwy, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I was born and raised in Grass Valley and came back here when I retired. I came back because of the beauty, environmental concern of the citizens, and the beautiful streams.

We do not need a foreign corporation coming into this area to open a polluting mine. No to tons of water polluted by heavy metals going down Wolf Creek through the middle of town.

JUST VOTE NO ON THE MINE!

Sincerely,

JS Peterson

Dear Nevada County Supervisors and Planning Commissioners,

My name is Lesley Estes. I live at 10377 tillicum, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live off Old Downieville in district 1. I spent my 30 year career in water quality regulation implementation for local government. I reviewed more EIRs than i can count and have participated in the creation of many EIRs. I know how they can be misleading, inaccurate and biased despite best efforts and especially when benefits are dependent on ongoing mitigation measures. The vast majority of time mitigation measures require significant government oversight therefore government resources, always more than anticipated.
Over time these resources dwindle and violations are missed and mitigation becomes non existent within just a few years. I've seen this over and over again, despite best intentions. Time becomes the friend of the exploiter and the exploiter is fully aware of the future limitations of government oversight. Sometimes it's just best to be cynical of mitigation measures and simply weigh the possible risks vs. benefits.

The risks and impacts are possibly severe, the benefits are questionable and minimal at best. Why risk it?

Sincerely,

Lesley Estes

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Brian Ward at gregward1@prodigy.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Brian Ward. I live at 13120 Wood Rose Way, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My name is Brian Ward. I have lived at 13120 Wood Rose Way since 20000. My property is located very close to the Brunswick entrance to the mine property. I am concerned about excessive noise, increased traffic, air quality degradation, contamination of Wolf Creek and the list goes on and on and on. I am asking that you vote NO on allowing the mine to re-open. Nevada County has allowed residential neighborhoods to be developed all around the mine and a large industrial project such as the Mine should not be allowed to open and operate in what is now a residential neighborhood.

I am also concerned about the impact the mine will have on property values. The Economic Impact Study that you commissioned is flawed in many ways. One of the flaws is in regard to property values. The mining communities chosen for the case

studies are in no way similar to Grass Valley and should not be used to determine if property values could be impacted. Further, the study discounted the opinions of hundreds of Realtors who have stated that property values would decline if the mine were to open. Who would know better about property values than Realtors..

Please vote NO and save our beautiful community from being ruined.

Sincerely,

Brian Ward

RECEIVED
MAR 15 2023
NEVADA COUNTY
BOARD OF SUPERVISORS

Nevada County Board of Supervisors
950 Maidu Avenue, Suite 200
Nevada City, CA, 95959

Date: 5/1/22

Dear Supervisors Sue Hoek, Heidi Hall, Ed Scofield, Dan Miller, and Hardy Bullock:

I work/own a business in Nevada County and I am opposed to the reopening of the Idaho-Maryland Mine by Rise Gold Corp. I expect that you will be voting on the project based on the Environmental Impact Report and community input.

I have listened to both sides of the argument and find the Rise Gold Corp. (RYES) reports and advertising to be inaccurate. They fail to adequately mitigate many significant negative impacts of this large industrial project on my community and business. It is in my business and personal interest that you do not approve this project.

My business's opposition to this project is based on RYES plans, reports and the DEIR (Draft Environmental Impact Report). Experts have reported to me that there will be significant increases in air pollution, traffic in key areas, noise from both above and below ground operations, wildfire evacuation blockages, reduction of our community's water resources, etc. They also report that any economic gains do not justify the costs to the County. Adding 312 jobs to the County workforce of approximately 44,000 is trivial no matter what the wages, and well-paying jobs will not go to County residents.

Businesses depend upon a quality living experience for residents and visitors alike. I am especially concerned about tourism, likely the largest single public industry in the County. Huge diesel trucks and machines spewing exhaust and using key access roads to Grass Valley are not going to improve our vital image as a tourist destination.

Many tourists come here for the outdoors, art, food and wine, and live performances. Please do not permit the County's attractive environment to be damaged by air and noise pollution, a large factory, waste dumps, and industrial traffic.

Sincerely,

Public Comment to the Nevada County Board of Supervisors, Mar. 14, 2023: Example of Inadequate Mitigation in Rise Gold Mine Inc. (IMM reopening) Final Environmental Impact report (FEIR), Asbestos Pollution

Hi, I'm Jim Bair, Leader of the Stop the Mine Task Force in Grass Valley. I appreciate the opportunity to comment on the 'Rise Gold' FEIR today. I'm submitting a technical report with details. [i] [Blue type not read publicly].

After several months of research, we find that the proposed Asbestos Mitigation Measure [4.3-2] is inadequate for dozens of reasons.[ii] Here are a few key points.

1. There's no question asbestos is present in the mineral rights area. [iii] The quantity cannot be predicted because the rock sampling using 19 bore holes to generalize to 2500 acres is invalid. Even so, asbestos was found in a significant proportion of samples (FEIR p.123, parag.5, and p.416.) (Sect. 4.4 of Appendix K.2 of the DEIR)
2. Given asbestos will become airborne, there is no adequate measurement once it's in the air.
3. Measurement technology is limited by the sub-microscopic size of asbestos fibers. [iv]
4. Extremely small numbers of asbestos fibers can cause cancer, asbestosis, and death....[v]
5. The proposed mitigation is for **dust** which is larger particles (PM10) while asbestos fibers are often 10 to 20 times smaller than dust -- .5 microns thick (<PM2). Asbestos is more like smoke and can toxify air miles from its source including County Districts 2 and 4.
6. The proposed asbestos mitigation measure is **only for dust** using water spraying, washing truck tires, sealing the hauling trucks, paving the rock processing area, chemical stabilizers, etc. Even then the FEIR admits some dust will escape (become fugitive).
7. The required the submission of an Asbestos Dust Mitigation Plan (ADMP) to Northern Sierra Air Quality Management District (NSAQMD) for review is not to be done until after project approval. I have recently discussed asbestos mitigation with 2 senior staff of the Northern Sierra Air Quality Management District—their input is not being addressed in the FEIR.[vi]
8. Finally, the FEIR states in at least 7 places that details of mitigation measures are not required by CEQA which is a subjective and situational interpretation [vii]

I've presented similar information to the Planning Commission. Thanks again for your time and attention.

[i] Title: Example of inadequate mitigation in Rise Gold Mine Inc. Final Environmental Impact report (FEIR), Asbestos Comment (amended), March 5, 2023.

[ii] The report submitted with this comment on the FEIR for Rise Gold Mine Inc. explains how the FEIR does not adequately address Public Comments on the Draft Environmental Impact Report (DEIR). It is highly likely there will be significant and unavoidable negative environmental impacts from the Mine's asbestos emissions resulting from the processing of 1,500 tons of mine rock per day.

[iii] See J. Bair, Idaho-Maryland Gold Mine Project, DEIR Comment on *Appendix E2: Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan* for a description of the statistically invalid measurement of in-ground asbestos.

[iv] (see EPA ref., p.8 of my report).

[v] NOTE that TACs (toxic air) Contaminants in the EIR include gases as well as particulates. The Northern Sierra Air Quality Management District's (NSAQMD) cancer and noncancer thresholds to assess health risk significance for CEQA is consistent with AB 2588 risk assessment procedures, **but are not adequate for asbestos fibers > 3 microns [length]**. CEQA may not be current enough to cover all airborne pollutants even though it does apply to worksite toxins related to dust.
Further, Airborne dispersion models (Dudeck Appendix K) are only for larger particles as well as gases.
Notes:

1. The FEIR (p. 7456) continues to delegate asbestos pollution to the State: "As stated on page 4.3-42 of the DEIR, use of the NSAQMD's cancer and noncancer thresholds to assess health risk significance for CEQA is consistent with AB 2588 [California Air Toxics "Hot Spots" Information and Assessment Act] risk assessment procedures. The threshold of significance for health risk is an increased cancer risk of >10 cases per million persons. The Health Risk Assessment prepared for the project concludes that the health risk to the most sensitive receptor will be below this threshold."
    a. The referenced AB2588 depends upon The California Air Resources Board *Implementation Guidance Document for Test Method 435 Field Sampling and Laboratory Practices.* **This test method is for naturally occurring asbestos (NOA) by limiting the asbestos content of surfacing materials.** It does address airborne asbestos. https://ww2.arb.ca.gov/resources/documents/test-method-435
    b. **Further, even rock aggregate measurement is difficult:** ***"ARB staff conducted a M435 Interlaboratory Study (ILS). The ILS identified variability in laboratory equipment and procedures that can significantly affect the reported asbestos content of M435 rock and soil samples."***
2. **The law depends upon Rise Gold Inc. to inform the agencies & public:** While AB 2588 is relevant, ***the law depends upon the*** **facilities emitting toxic substances** to provide local air pollution control districts with information that will allow an assessment of the air toxics problem, identification of air toxics emissions sources, location of resulting hotspots, notification of the public exposed to significant risk, and development of effective strategies to reduce potential risks to the public over five years. DEIR p.300.

[vi] ***Comments on Draft EIR for Idaho-Maryland Mine, Nevada County, CA***, Northern Sierra Air Quality Management District's (NSAQMD), April 4, 2022.

[vii] Quote: "*The engineering details and intensive sampling described by many commenters* ***would be*** *developed and completed through the implementation of mitigation measures, and is not required to be completed as part of the CEQA process*"—I provide legal citations [vii] **– this is a highly subjective interpretation.**
FEIR makes legal claims on pp. 119, 411 (*details to be from the County*), 638, 6835, 7590, 7797, and 8187. FEIR states Engineering level detail is not required in an EIR based on *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.) Which cites *Sacramento Old City Assn. v. City Council,* Court of Appeal Third District Apr 30, 1991, **are not comparable – irrelevant precedent.**

RECEIVED

MAR 14 2023

NEVADA COUNTY
BOARD OF SUPERVISORS

Good Morning. My name is John Vaughan. I live in District 3.

The last time I was here, one of the things I noted is that the Final EIR responses demonstrate a bias towards the applicant. In case you have not had time to review the letter I sent which includes that topic, I'm going to talk about it today.

One example is the Final EIR response to the Draft EIR comments submitted by the City of Grass Valley. Part of the City's letter challenges the 80 year permit and suggests a 30 year alternative[i].

The Final EIR response defends the Rise proposal by speculating in part that "Long permit terms are commonly requested for **large mining operations** because they are capital intensive, and it is not economically feasible to invest tens or even hundreds of millions of dollars…when the number of years…to obtain return on...investment are limited to **only a few decades**."

First, words matter and lead the reader in a particular direction. E.g., where is the definition of "**large mining operations**"? What data supports that a self-declared "Junior Mining Company"[ii] is large?

Second, "not economically feasible" and "when the number of years…to obtain a return…are limited to **only a few decades**" is speculation on behalf of Rise which is not supported by any research or facts.

The data provided by Rise for the Economic Report and the Draft EIR shows startup costs between $70M - $100M[iii]. **AND** it shows a NET PROFIT of just under $112 MILLION dollars/yr[iv] after startup. Using the Net Profit numbers provided by Rise, it would take less than 1 year to pay off the startup costs.

But let's recognize that those numbers are inflated to entice investors, the public, and the County, so in reality it may take them several years to pay off the initial startup costs. Certainly, it won't exceed ten years.

While I disagree with the Economic Report conclusions that are based on data provided by Rise, the Final EIR authors had access to all the data but chose to claim the Rise **large mining operation** could not afford to operate unless they can spread the costs over 80 years. **Speculative at best and biased at worst.**

I have not read each of the 8,661 pages of the Final EIR but I have reviewed enough to see that speculation and bias exist in other parts of the report as well.

I respectfully request you **JUST SAY NO** to the Final EIR and the Rise Gold Proposal.

John Vaughan, 11793 Lower Colfax Rd, Grass Valley, CA 95945, 916-807-0430, jvaughan1946@gmail.com 03/14/2023

Mine Waste and Asbestos Management in the Final EIR
March 14, 2023

Overview

Airborne asbestos is hazardous to inhale, leading to lung cancer and other diseases. The Idaho-Maryland Mine Final EIR does not provide enough data to determine the potential impacts of airborne asbestos, and the asbestos management plan (ASUR plan) for preventing hazardous emissions is inadequate.

Very limited asbestos testing was done, constituting less than 2/10,000 of the total rock to be mined over the project lifespan. As the Air Quality Board stated "It would be short-sighted to commit to the ASUR Plan for the entire life of the mine based on the few samples that have been tested so far." (FEIR Page 2-360)

The ASUR plan was developed to limit emissions, but it is a flawed document that fails to provide the needed protections. Under the plan, if the asbestos concentrations on any 1000-ton lot of mined materials would put the 3-month rolling average asbestos concentration over a threshold of 0.01%, it would not be allowed to be exported.

A key problem is accurate and timely testing. It takes 2 weeks to get the results. The Final EIR has no provisions for stockpiling materials while waiting for results. And no temporary storage on the surface is provided. To avoid the need for stockpiling mined materials, the plan states that exploratory drilling tests will determine what can be mined in advance. Then grab samples will be taken as the rock is loaded into silos for deployment. But the testing is too sparse.

The loading into silos of 1000 tons of rock requires about 166 6-ton skip loads. This means that the grab test will only capture, on average, about 1 out of 55 skip loads, and even then, the three grab samples will be mixed together to form one combined test. And even accurate sample testing before shipping will not always prevent exceeding the safe average threshold.

Examination of how this system may fail reveals that large quantities of mine waste could pass through undetected. And though the ASUR plan talks about what happens when the delayed testing shows that the threshold was exceeded, it doesn't actually provide a credible solution or adequate oversight.

Finally, it's important to note that <u>all</u> exported Mine Waste from this mine must be classified as "Restricted Materials" (ASUR 9.2, p18) Aggregate suppliers in the region have indicated that they do not handle Restricted Materials because there is no market for them and there already are abundant aggregate sources regionally.

In conclusion, the Final EIR does not provide adequate data on asbestos concentrations, and fails to adequately address processing and disposal of asbestos-bearing mine waste.

I support reopening the Idaho Maryland Mine

Just received your fancy brochure announcing Rise Grass Valley "Career Day." What a farce. This event, a naked publicity stunt, will raise hopes that you will never fulfill, with most of the good jobs going to people from elsewhere. This is just cruel.

But these are not the kind of jobs this region needs anyway. Given the inherent toxic nature of gold mining, combined with Rise Corporation's terrible track record of environmental abuse and community disrespect, there is no way on earth I would support your effort to re-open this mine. This region of California is already still dealing with pollution from the initial gold rush over a century-and-a-half ago and into fairly recent history. We don't need you adding more pollution and community upheaval, regardless of the happy-talk lies you have been peddling. For that matter, we don't "need" the gold.

Go away, thank you.

To: Nevada County Board of Supervisors

Suppose I wanted to buy a house in Nevada County and spoke to a lender to get pre-approved for a home loan. My credit history and employment history would be reviewed. I would need to list past residences, disclose any legal actions against me and provide proof of current income. Basically, the lender must determine if I am able to "make good" on the loan or if the risk is too high.

Unless I am paying cash for a home, I understand this process. I accept that there are price range limits that I should consider based on my approval and a realtor would not waste their time showing me a $5 Million home that I could not afford.

I'm confused why we are wasting time entertaining the 80-year permit request by Rise Gold to re-open the Idaho-Maryland mine. As a company, they look terrible on paper. Is there any reason to believe they would "make good" on their stewardship of Nevada County resources like air quality or water supply? Will the rumble of large work trucks increase or decrease neighborhood quality of life? Property values? Rise Gold promises jobs. That's an appealing promise with little to no credibility.

I hesitate to even claim that they have any intention of opening a mine. I believe their main objective is investor dollars. Period.

It's time for the Nevada County Board of Supervisors to stand up to Rise Gold's risky Ponzi scheme and stop wasting concerned residents' and business owners' time and resources. Nevada County has other issues to resolve. Enough.

Subject: Public Comment on the Idaho Maryland Mine Project FEIR
Date: Monday, March 6, 2023 7:43:52 AM

CAUTION: This email is from an external sender. If you are not expecting this email or don't recognize the sender, consider deleting.

Do not click links or open attachments unless you recognize the sender and know the content is safe. If you have more questions search for Cybersecurity Awareness on the County InfoNet.

The focus of this public comment are certain California appellate court opinions involving what the California courts have held are legal inadequacies in an environmental impact report ("EIR"). These court opinions clearly apply to the Idaho-Maryland mining project (the "Project"). Due to the legal inadequacies, as further discussed below, the Board of Supervisors cannot approve the Project based on the current EIR.

The most significant court opinions for purpose of this comment are Saint Ignatius neighborhood Association v. City and County of San Francisco, 85 Cal.App.5th 1063 (2022) (hereinafter "St. Ignatius") and Save Our Capital! v. Department of General Services, 85 Cal.App.5th 1101 (2023) (hereinafter "Save Our Capital"). Both of these court opinions held EIR's to be legally incomplete and invalid because they did not adequately allow for public input or informed decision-making. More specifically, those court decisions found that the EIR's they addressed did not adequately provide for (1) alternatives to what the sponsors of the proposed projects wanted to be approved; (2) addressing the impacts of aesthetics, light and glare;(3) addressing the impacts to traffic, utilities and public waste systems; and (4) a sufficient notice to the circulation of the draft EIR by all reasonably affected parties.

Concerning the legal requirement for alternatives to the proposed Project, the most accurate legal criticism of this Project's EIR is that there is virtually an absence of any alternatives included in the EIR from what this Project's sponsors proposed. In fact, in the public meeting on the Project hosted by the drafters of the Economic Impact Report for the Project, the representative of the report's preparer, Robert D. Niehaus, Inc., directly stated in response to a question from the public that he and his company had been expressly told by the County not to address any alternatives in any manner in this report. This same approach is reflected in the EIR itself and its failure to address any alternatives to the proposed mine operations by the Project's sponsors. There are a very large number of available alternatives, including but not limited to restricting hours, days or even seasons of mine operations, or limiting the size and time of dynamite blasting or removal times for removal of asbestos or arsenic-contained materials, or even having the mine limiting its total production of gold. The legal point is that

it was the County's and Project sponsors obligation to identify and include these alternatives in the EIR's discussion. Both failed in this respect in almost every key aspect of the EIR.

Concerning the impact on aesthetics, light and glare issues, while the EIR very briefly touches on this, it ignores the day-to-day reality of the effect of the mine's intended operations. Anyone living in or near the operation or even just driving through the area would readily observe that is a very big and very noisy operation. The overhead lights scattered throughout the mining site and its car and truck parking areas would make it nearly impossible to see anything else. In short, no wildlife of any type would ever go near this, and nor should any humans except those who work there. Again, restrictions on the size of these operations as alternatives to all of these issues should have been addressed in the EIR to meet CEQA's legal standards, but no substantive restrictions of any type were imposed on this Project.

Moreover, the EIR ignores completely the overall impacts on traffic, safety, and utilities from trucks as well as their 118 drivers and nearly 200 other employees working in the mine's operations.While there was a limited EIR discussion on traffic from the expected 236 total daily truck trips with the equally expected heavy rock loads, there is a great deal more involved in these proposed operations than just
that.

For example, neither a single homeowner nor a small business owner could ever get approval for a septic and underground water system just to dispose of the waste from the level of human activity which will occur at the mine from its employees and visitors. The air pollution from the start-up and running of the mine's 118 trucks and the other employee vehicles used by its more than 300 employees visiting and working at the mine make even breathing anywhere at or near the mine a potentially dangerous activity, especially during what we now call "fire season". With this dangerous and highly congested volume of vehicle activity, any reasonable parent or school official would take steps to exclude school busses or other transportation of children from going anywhere near the mine's operations. The failure of the EIR to address these issues or any alternatives to their severity is just one more legal defect in the existing EIR.

For the last category of EIR defects addressed in this comment, nowhere does the EIR even attempt to address how far throughout the Grass Valley and Nevada City areas the underground mineral rights the Project's owners claim they own extends. But the Project's owners most certainly will move from one tunnel to the next when the existing tunnel being mined is exhausted of gold or just becomes too difficult to mine. Nothing in the EIR even remotely addresses how much dewatering and rock removal these new mining locations will need, or even exactly where this mining waste will be dumped. The EIR report should have but legally failed to identify and address these issues, and the EIR is fatally defective in this

key respect also.

As another related defect arising from all of these legal EIR deficiencies, the County failed to give the required notice of this Project and its proposed EIR to all of the required persons in Nevada City and Grass Valley. In effect, what the County's position on this notice issues is saying is that it is alright for the County residents to first learn how negatively this Project can affect their lives such as when they first experience a dynamite boom and shaking from new mine activity under their residence. To be clear, it undoubtedly was not the County's intention to have this occur, but it also was the County's job to make sure its affected residents and property owners received proper notification of the proposed Project and this EIR.

In summary, the legal issues raised in this comment clearly apply to the proposed Project and this EIR. The fact-related discussion in this comment is not intended to address every detail and aspect of this. However, the focus of this factual discussion, while set forth in a generalized manner, is intended to illustrate that the application of these legal issues is a very real and very serious point for the County to consider.

Of equal significance, it is the County's duty to investigate and analyze these issues. Once it does, for these and all other reasons discussed in this comment itself and in the numerous other public comments opposing this Project and its EIR, the County and its Board of Supervisors reasonably must conclude that this Project and its EIR cannot be approved.

Dear Nevada County Supervisors and Planning Commissioners,

My name is Joan Staffen. I live at 516 Temby Street, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am horrified that anyone on the Planning Commission or Board of Supervisors would support opening a toxic mining business in the heart of Nevada County without regard to our air, water, land and people., as if any amount of money could be worth the well being and lives of the people of Nevada County. The mining project is counter to the will of the people. One only need to look to the Ben Mossman's past history who are in the midst of a Canadian court cases for violating environmental laws on native peoples lands to know that Rise Gold is a sham of a company. Vote No against the Mine and Yes for the people of Nevada County.

Sincerely,

Joan Staffen

CULTURAL RESOURCES

February 8, 2023

County of Nevada

RE: Idaho-Maryland Mine Project

Dear Matt Kelly,

Thank you for your letter dated December 16, 2022, regarding the above-mentioned project. Based on the information provided, the Shingle Springs Band of Miwok Indians is not aware of any known cultural resources on this site. However, SSR would like to have continued consultation through updates, as the project progresses. This will foster greater communication between the Tribe and your agency.

SSR would also like to request any, and all completed record searches and or surveys that were done in or around the project area up to and including environmental, archaeological, and cultural reports. If during the progress of the project new information or human remains are found, we would like to be able to go over our process with you to protect such important and sacred artifacts (especially near rivers and streams).

If such finds are made, please contact Kara Perry, Director of Site Protection, at (530) 488-4049 or kperry@ssband.org.
Thank you for providing us with this notice and opportunity to comment.

Sincerely,

Daniel Fonseca
Cultural Resource Director

Dear Nevada County Supervisors and Planning Commissioners,

My name is Bruce Lattyak. I live at 13052 Somerset Dr., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I’ve lived in Cedar Ridge for almost 15 years. As a physician, I am especially concerned about the potential health risks of the proposed mine reopening to our neighborhood and the surrounding area. Please protect our community by saying no to the Idaho-Maryland Mine.

Sincerely,

Bruce Lattyak

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Cathe' Fish at sunshine.works@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Cathe' Fish. I live at PO Box 501, Rough and Ready, CA 95975.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Dear Nevada County Supervisors and Planning Commissioners,

I live in District 4 and Sue Hoek is my Supervisor.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk. We have enough problems cleaning the destruction of previous mines from years ago. Why add to our problems?

Water in Nevada County is the "New Gold." Please don't take a chance of destroying the water in the Grass Valley Area for an out of town corporation. I have talked to

water researchers and hydro experts locally. They are painting a grim picture of what this mine opening will do to our region, especially the immediate neighborhoods. JUST SAY NO. JUST SAY NO. JUST SAY NO.

Sincerely,

Cathe' Fish

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Christapher And Lisa Cogswell. I live at 16919 Bissell Pl, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We live in District 2 and strongly oppose the opening of the mine. We are not at all convinced that the mining can be done safely, and are extremely worried about the many potential consequences. There already is a terrible environmental legacy of mining in this area and we do not want to see this further exacerbated to the detriment of our community.

Thank you.

Sincerely,

Christapher And Lisa Cogswell

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Clay Olson. I live at PO Box 3565, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Noise, dust, heavy metals in the dust, heavy wear 'n tear on the roads 24/7, unknown and UNpredictable effects on wells, probable insufficient financial bonding to cover decades+ of depleted wells and other damages, small "blasting-earthquakes" 24/7 and the unpredictable consequence of the blasting on the water tables and adjacent strata, negative history of the mine company's principals, inaccurate data in the EIR, unpredictable journey of heavy metals from the rains washing over the tailings, and more. Must I also say no to the reopening attempt of this mine?

Sincerely,

Clay Olson

Dear Nevada County Supervisors and Planning Commissioners,

My name is David and Ann Wallace. I live at 11276 Via Vista, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My wife and I have lived here for 40 years and witnessed the previous attempt to open the mine.

The economic factors of this mine operation will force environmental and human costs which would be a sad burden for our children to carry. As for economic benefits, there is plenty of work here. Let's put value on forestry, fire safe, education and health care.. In the big picture, gold does not create jobs once it is mined. It serves only the powerful people who do not live here. Timber creates jobs and homes.

Sincerely,

David and Ann Wallace

Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Deborah Patterson. I live at 14787 Sontag Road, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am concerned that the main lure for the mine are the promised jobs, which won't go to the locals that need them How many of those jobs require mining experience that the average citizen of Nevada County does not have? I watched many years ago as the Pelican Bay Prison was being proposed with the promise of jobs from construction to prison guard. All of the construction went to out of town contractors and the majority of the jobs within the prison went to those with experience that came from other prisons. I also am concerned about the air, water and noise pollution that will most certainly happen and the increase in traffic along Hwy 174 and Brunswick Rd. That area is already congested with a lot of accidents on a regular basis. I work during the day so can't join any of the daytime meetings, but if I could, I would be present. Please hear my voice as if I were in the same room with

you. A resounding NO to the mine!

Sincerely,

Deborah Patterson

Dear Nevada County Supervisors and Planning Commissioners,

My name is Donna Levreault. I live at 10752 Alta, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in District 3, Grass Valley for over 12 years. Even though I don't live close to the mine, I will feel the impact on our water, our air, our roads, our way of life. This mine has no business being so near a large population, particularly an area whose area depends on tourism. This land has been ravaged enough by mining. We are still cleaning up Empire Mine after it has been closed for seventy years. The EIR report has left many gaps and does not fully examine the effects this operation would have.

Sincerely,

Donna Levreault

My name is gary pierazzi. I live at 13997 emerald Ct., grass valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have been living here in district 3 for over 30 years. My property and well are located over the mine.
I'm asking that the Planning Commission and Board of Supervisors deny the applicant a permit to move forward.
There are so many real and potential impacts brought to light in reading the FEIR that it would be reckless and shortsighted to allow this project. I'm hoping that you realize that the vast majority of Nevada County residents are opposed to the mine. Just say NO!

Thank you, Gary Pierazzi

My name is Joanne Harris. I live at 305 W. main st, Apt 402, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Tourism will suffer with all of the pollution and noise that comes with the mine. A few jobs, probable not locals will not begin to replace the city's lost income from tourism. And tourism is far less polluting than this mine will be, run by people who only care about the dollar and will leave a mess behind for others to clean up. That is assuming there is any thing left of Grass Valley.

Sincerely,

Joanne Harris

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Judy Gazzoneo. I live at 10281 Tillicum Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Sincerely,

Judy Gazzoneo

Dear Nevada County Supervisors and Planning Commissioners,

My name is Julie Wagner Schuetz. I live at 170 Grove Street,, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have been a Nevada County resident for over 45 years..
I worked for Placer Mining Corporation for 4 years while they searched for gold reserves that were
feasible to extract from our county and none were found.
It’s a classic Canadian mining company’s practice to boast about gold reserves and potential big money to be made to their investors. This ploy has happened many times before and I actually witnessed it in Sierra City in
1986. A Canadian mining company promised many jobs and an inflow of big money if they were allowed to do exploratory drilling at an abandoned mine site. Mean while they charged logging , meals and equipment to local shop owners. I actually read their newsletter to investors announcing big profits “ will be made” . Instead they

packed up in the middle of the night and left the business owners will their charges and mess.

Please don’t be fooled!

Sincerely,

Julie Wagner Schuetz

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kalita Todd. I live at 14494 Lower Colfax Rd., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Rise Gold has a terrible business history for dealing with the communities they have been doing business in. They have been flagrantly devious and dis-honorable to the indigenous tribes and to the county officials that allowed their Canadian mine to open. Why would a savvy county like Nevada Co.do business with such a dubious company? Especially after the disaster that took place on the San Juan Ridge a few years back.
We are talking about a much more densely populated area in this situation. Many more folks lives will be negatively impacted with noise and pollution. I can imagine a slew of law suits over well contamination and noise factor.

I have lived in this county for 45 years. This will forever change the face of Nevada County for the worse.

Sincerely,

Kalita Todd

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kathy Doty. I live at P.o.box 1805, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am very concerned about the possible re-opening of the Idaho Maryland mine! Aside from long term pollution from asbestos and other toxic chemicals released during this 80 year lease, this will have such such a devastating effect on our beautiful community where I have lived for 44 years now! Wells can and will go dry , property values will drop....just to mention a small part of the devastation! Our beautiful community will suffer great consequences should you, OUR BOARD OF SUPERVISORS allow this to happen!! How can you even consider this???? We have heard from several physicians who have spoken about the rise of childhood cancers and other diseases, not to mention everything else that will be destroyed should you even consider this ridiculous proposal of which we the community of Grass Valley and Nevada City live in!!!! Please DO NOT SUBJECT US TO THIS !!!

Sincerely,

Kathy Doty

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Loren Swift. I live at 16887 Champion Rd, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 5 and have been a Nevada Count resident for 22 years. I put a very high value on the rural nature of the county and share values the other residents of rural living, with quiet environs, clean air and water. We know reopening the mine will bring lots of noise and air pollution with the big trucks coming and going, and worse, it will destroy our already slim water reserves. This is an absolutely WRONG idea that will serve only the greed of the mining company itself. We live in an era of corporate greed overtaking any semblance of care or respect for the environment or the people. This has got to stop, not only here, but everywhere in order to bring us back into balance with nature as well as ourselves.
VOTE NO ON THE MINE!

Sincerely,

Loren Swift

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Lorraine Reich at reichlawoffice@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Lorraine Reich. I live at 254 Colfax Avenue, Suite C., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I own property and operate my business on Colfax Avenue in Grass Valley. I am opposed to this reo9pening of the Idaho-Maryland Mine for a number of reasons: further air and water pollution, arsenic and other underground waters already degraded from previous mine operations, increased traffic particularly trucks accessing and egressing the mine site, and along both residential and commercial streets. Compromising the aquifers beneathe the ground level. Decreased water to residents' wells. Unnecessary use of water in a state suffering from a drought!

This mine and all its ramafications (noise and traffic) will hamper our tourist industry. Who wants to vacation in a town with massive industrial mining going on?

Why don't you the Planning Commission, and the Board of Supervisors do the right thing for the people for once. The people DO NOT WANT a reopening of the mine.

Lorraine Reich, Attorney

Sincerely,

Lorraine Reich

lynettesmithjames@yahoo.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Lynette Smith-James. I live at 13430 Jeabjo Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live just off of Bitney Springs Road across from the Nevada City School of the Arts in District 4. I have lived in Nevada County for 48 years, coming from the Los Angeles area where I was raised. I came to this county to escape the noise, crime and overcrowding that became untenable in the 1960s and continues to plague Los Angeles to this day. I have so enjoyed the beauty, peace, quiet, safety, and lack of crowding in this lovely area. I raised three children here and am now enjoying my retirement years in a home on 45 acres. What I particularly enjoy is the wildlife, the quiet, and the small town atmosphere.

I am concerned about the re-opening of the mine because of the constant noise it

will produce, the increase in traffic in the Glenbrook basin, the de-watering of the tunnels and the effect that will have on the surrounding properties, the decrease in property values for those who live near the mine, and the negative financial, legal and environmental track record of Rise Gold in Canada. The number of jobs that will be available to local residents cannot, cannot, cannot compete with the utter destruction the mine would cause to the way of life I so carefully chose and have so enjoyed for decades.

Please do not approve this ill-advised project.

Sincerely,

Lynette Smith-James

Dear Nevada County Supervisors and Planning Commissioners,

My name is Lynn Marie Lumiere. I live at 16791 Greenhorn Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live on Greenhorn Road. Our home is only 4 miles from the proposed mine site. If this mine is re-opened, it will destroy our environment by polluting the soil and water, will allow noise pollution 7 days a week, and will immediately lower the value of our house, causing us to lose large amounts of money as we are forced to move. This would be a disaster for my husband and I, as well as for our community. We cannot trust Rise Corporation! They have been shown to be polluters and only concerned with profits. Please, please, please, do not allow mining back into our community!!

Sincerely,

Lynn Marie Lumiere

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Mark Reilly. I live at 118 Conaway Avenue, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I've visited the Grass Valley/Nevada City area annually for over thirty years, and in 2016 I was finally able to call Grass Valley home. It's a thriving and vibrant community with a strong concern for the environment. I live near the Grass Valley Veterans Memorial Building, mere blocks away from the Empire Mine.

The negative impacts of the Empire Mine are still prevalent and visible in our community. Just last year, soil instability and cave-ins prompted part of the the Empire Mine State Park to be closed out of safety concerns. The water in the mines is toxic and is still being treated sixty seven years after the mine closed. Mines have long-term, negative impacts on the environment and the community.

The individuals behind Rise Grass Valley have no ties to our community or reason to

care for it and protect our resources for the long haul. They have a proven track record of walking away from environmental issues their projects create and then claiming bankruptcy to protect themselves, not he community they harm. Is this the type of business and neighbor we want in Nevada County? I and many others say no, and I sincerely hope you'll do the right thing and also "say no" to re-opening the Idaho-Maryland Mine.

Sincerely,

Mark Reilly

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Martha Burdick-Mohr. I live at 10277 Gold Dr, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in the Squirrel Creek neighborhood of district 3 and I adamantly oppose the Rise Gold project as an abomination of all that brought me to this area over 30 years ago. The peaceful nature of the Grass Valley/Nevada City environs are threatened to be upended by this ill thought out project which threatens us environmentally on so many levels.

I find it abhorrent that the planning commission would entertain this project, especially with a company whose CEO's last venture polluted tribal waters, went bankrupt, and left Canadians with a mess to clean up. Thank you for your attention to this letter and please, just vote "NO"!

Martha Burdick-Mohr

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Nicki Hansen-Dix. I live at 115 Union Jack St, #38, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 3. My family has been in Nevada County since the mid 1850's. I am an architect who has reviewed Environmental Impact Reports for the Federal Government. I sent a six page letter to the Planning Commission delineating numerous misstatements, errors and unaddressed issues of the DEIR. Going ahead with this project would be devastating to the health of our environment and residents.

Sincerely,

Nicki Hansen-Dix

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Pam Winterbourne. I live at 10505 Quail Creek Road, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I moved to Grass Valley in 2014 because of the air environment, beautiful trees, & peacefulness. We still have pollution from the old mines. Why do you want to add more pollutants that may get into our drinking water. There are a lot of people who are on wells. There is no guarantee that their wells won’t be effected. The noise pollution alone is enough reason not to allow the mine to open. There is no quiet or non polluting way to extract materials. The risk to the people of Grass Valley is too great. I hope you will consider the people’s needs instead of corporate greed.

Sincerely,

Pam Winterbourne

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of PAMELA KISSLER at pamkissler@att.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is PAMELA KISSLER. I live at 15484 AUBURN ROAD, GRASS VALLEY, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My family has owned property in Nevada County since 1967. I own a twenty-eight acre ranch on Auburn Road in Grass Valley. It is covered with native California grasses, Blackberries, and beautiful wildflowers. There are old growth Black Oak trees, Ponderosa Pine, White Alder, Incense Cedar, Black Walnut, Redwood, Colorado Blue Spruce, Sequoia, Manzanita, White Leaf Maple, Douglas Fir, and Willow trees.

Wolf Creek runs along my property, and is home to a diverse species of fish, and birds. There are deer, foxes, opossum, raccoons, wild turkeys, Canadian geese, hawks, owls, bats, squirrels, snakes, coyotes, and an occasional mountain lion, bobcat, and black bear. All these animals would be negatively impacted, threatened,

if Rise Gold were to be allowed to reopen the MINE.

Based on its past record of mining operations in Canada, Rise Gold cannot be trusted to honor their word to carry out self-monitoring, and clean up after themselves, even if it were possible to mitigate the horrendous impact mining would have on our environment. Reopening the mine would be devastating to plants, trees, and all wildlife in the area. It would destroy the quality of our water, impact our wells, pollute our air, and the quality of our lives. Our groundwater would be further depleted and poisoned. All this so that Rise Gold owners can get rich.

My family has enjoyed the beauty of this area as well as the abundance of hiking and biking trails, campsites, and rivers. We have rafted on Bear River, Yuba River, and the American River. Please do not allow the mine to reopen, and destroy the beauty which God has given to us. He charged us to be good custodians of the earth, and to protect the animals and their habitats. It is in your hands, whether we will be allowed to do so.

Thank you for your wise an compassionate consideration in this matter.
Sincerely,
Pam Kissler

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Patrick Fogarty. I live at 21380 Cameron Way, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We have lived in South county for over a decade, and visited frequently for years before moving here, drawn by the natural beauty of the area and the good people we met. Many people have since joined us, and the county has grown. The idea that trying to reopen the Idaho-Maryland mine would improve the county in any way is at best wishful thinking, and at worst it is a way for a very few to profit at great cost to our community. In an environment concerned with scarcity of water and vulnerable to pollution, trying to squeeze more profits out of mining here when the economy has changed to one based on tourism and a high standard of living, would be shortsighted and irresponsible.

Sincerely,

Patrick Fogarty

Dear Nevada County Supervisors and Planning Commissioners,

My name is Randy Partch. I live at 16984 Scott Way, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I reside in Alta Sierra and feel very fortunate to live in such a beautiful area.
Why can’t we learn lessons from the past? It should be a no brainer to say no to opening the mine.
Why put profits for a few people over the health and safety of tens of thousands of citizens. There will be more noise, diesel fumes, dust, traffic, road abuse, etc. This is wrong for our beautiful grass valley and wrong for the people who live here.
I don’t buy into the whole (it will provide jobs) garbage.
There is plenty of work in the trades. Just my opinion.

Sincerely,

Randy Partch

Dear Nevada County Supervisors and Planning Commissioners,

My name is Raymond Baldock. I live at 12975 Somerset Dr, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The CEO Foundation/Minewatch has done an exemplary job providing background research and bringing experts to critique the EIR and the issues related to a mine in our areas. Our county is at risk. Tourism is at risk.
Our quality of life is at Risk, I have no doubt that a mine proposed in unpopulated areas would receive more support, but a mine so close to an expanding residential area just does not make sense,

With so many significant environmental impacts, approval of the mine is inconsistent with the County’s General Plan and endanger this community's health and quality of life – including aesthetics, traffic, and noise. There are also serious deficiencies in the Final EIR that put the County and its citizens at further risk, including air and

water. A few jobs and uncertain tax revenues just aren’t worth the risk.

Gold mining is a serious threat to wells and area groundwater and again way too close to residential areas. Water is one of our most precious resources. Without it, or when the quality is compromised, towns die a slow horrible death. Haven't we seen this in recent times despite assurances to the contrary that there would be no impact. You all will be dead and gone when impacts of the mine could be felt. Is this the situation you want for your grandchildren?

Last, and again due to the proposed location of the mine and proposed dump sites, the location of this project is just wrong for our beautiful towns and their residents, You represent us the residents of the county - please hear the overwhelming voices opposing this project. I urge you to Just Vote NO.

Sincerely,

Raymond Baldock

Dear Nevada County Supervisors and Planning Commissioners,

My name is Roberta Dean. I live at 370 Pleasant Street, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My husband and I bought a home and moved to the City of Grass Valley (District 3) several years ago. We love this area and community and are acutely distressed at the prospect of a mine reopening in our immediate area.
We simply cannot fathom how this could be allowed knowing what we now know about the devastating effects of mining, and the environmental record of those involved wth is proposed project.

We are urging those responsible for making this decision to rule on the common good, rather than the promised revenues given by a company who has shown little regard for the community or the environment.

Sincerely,

Roberta Dean and Bruce Stewart

Dear Nevada County Supervisors and Planning Commissioners,

My name is Scott Merritt. I live at 16887 Champion Mine Rd., Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada County for 33 years. I live on Champion Mine Road in Nevada City, District 5. I want to express that to reopen the mine will compromise the water availability for the area residents, increase traffic and noise to unacceptable levels, will not create enough on-going jobs to be of benefit, overall. There are too many questions about the company from Canada regarding their past practices and attitude towards the local people and environment. It has all the markings of a money grab by a foreign company that will be taking money out of Nevada County, not working in collaboration with the people here.

Sincerely,

Scott Merritt

Dear Nevada County Supervisors and Planning Commissioners,

My name is Shirley Porter. I live at 12968 Burma Road, rass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My family live in the Burma Road area. My husband's parents bought this 7 acre piece property in 1950. They then lived here for 3 years. We have been up here visiting from the Bay Area for all of these years. My spouse and I moved here in 2004 on our retirement. Our son and wife and daughter and spouse are moving here from Sacramento to support us as we age. So all three families would be wrongly impacted by the development of the mine. We live in District 3.

It is clear that the environmental impacts would be catastrophic for the community and especially for those of us who use Brunswick Road often. And I can't see any financial benefits that override these concerns. Please" just say NO" to the re-opening of the Idaho-Maryland Mine. That decision will support the wonderful aspects of our community.

Sincerely,

Shirley Porter

Dear Nevada County Supervisors and Planning Commissioners,

My name is Wayne Jarosh. I live at 11588 Ridge Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Water is the most important resource. Taking it out of the aquifer and pumping millions of gallons directly to the ocean is obscene. We in California are in the process of finding solutions to preserve water. Aquifers are one important way to do this. We need to think of ways to capture rainfall and snowmelt and store it underground. Water moves underground and eventually fills an aquifer further downslope. Farmers depend on well water when reservoirs run low. The proposed mine is doing the opposite of what we should be doing.
As you are aware, there are many reasons for denying the proposed mine. We should continue doing what we have been doing for the past several decades: encouraging clean businesses and occupations to consider moving to Nevada County.
Supervisors in all five districts should be concerned about Nevada County's

reputation for thinking ahead. Keep our county great.
Thank you.

Sincerely,

Wayne Jarosh

The Centennial Clean-Up Must Be Included in the EIR
Jan 24, 2023

The Final EIR for Rise Gold's Idaho-Maryland Mine Project is significantly flawed because it does not include the plans to cleanup the Centennial site.

California Department of Toxic Substances Control (DTSC) is managing the cleanup of the 56 acre Centennial site, which is polluted by the mine's historic operations. After it is cleaned up under what is known as a Remedial Action Plan, or RAP, Rise intends to dump mine waste there for about 5 years. But, currently, the cleanup is not done.

Under CEQA the current conditions of a project must be assessed so that the environmental impacts and appropriate mitigations can be determined. The current conditions of the Centennial site are largely unknown because most of the current conditions aren't included in the EIR.

Instead, Rise has included in its EIR what it **assumes** to be a baseline of the future conditions that might occur **after** the cleanup. Adding to the inadequacy of this approach, **an approved RAP does not even exist at this time.** But even if the RAP had been finalized and approved by the DTSC, using a future condition for establishing a baseline in an EIR is almost never valid.

Including the Centennial cleanup in the EIR would have addressed most of these problems because the initial conditions of the site would be described adequately and the steps necessary to prepare the site for mine waste would have been set into the context of the project as a whole. This would have provided a means of determining potential impacts and defining mitigations correctly.

As it is, the true impacts of the project cannot be determined. For example, the draft RAP recognizes that 44 acres will be buried in mine waste and it includes stripping off acres of soil from areas that are not contaminated to provide clean soil to put over the capped contaminated materials and other work areas, destroying wetlands and woodlands. How much of this habitat destruction is really necessary for the clean soil, considering that the mine plans to dump 1000 tons per day of fill on the site? If the cleanup was included in the Mine project, this habitat destruction could be assessed and probably significantly reduced.

In conclusion, Rise's EIR project description is legally inadequate because it does not include the cleanup, which is plainly part of the Project. Instead, the EIR is left guessing as to what the true impacts of the mine project might be. This Final EIR is inadequate under CEQA.

Thank you,

Ralph Silberstein
CEA Foundation

Addendum

- **The FEIR continues to maintain that the Centennial clean-up project is a separate project.**
    - The DEIR's project description is legally inadequate because it excludes the required cleanup of existing contamination on the Centennial Site, which is plainly part of the Project. FEIR p. 2-798, 2-803-05. CEQA defines a "project" broadly to include the "whole of an action," rather than "each separate governmental approval." CEQA Guidelines § 15378(a), (c). Where two actions are integrally related or where one is conditioned on another, they must be considered together as one project; segmenting their analysis is a way to evade a complete impact analysis, and is accordingly forbidden. *Nelson v. County of Kern*, 190 Cal.App.4th 252, 271 (2010).
    - The FEIR merely restates the same faulty justifications from the DEIR for the decision to piecemeal the Centennial cleanup from the IMM Project. The County's assertion that the IMM project can proceed regardless of whether the Centennial cleanup is completed (DEIR at 1-7, FEIR at 2-8) ignores the fact that one of the objectives of the IMM Project is to reclaim the Centennial Site for future industrial use. DEIR at 3-42, 3-46.
    - The DEIR also uses an inconsistent baseline: for certain impact areas, the DEIR pretends that the Centennial cleanup has already occurred, while for others, it uses the current contaminated conditions as the baseline. DEIR 4.0-1. CEQA requires that the baseline "describe physical environmental conditions as they exist at the time the notice of preparation is published," and it prohibits the use of hypothetical conditions. CEQA Guidelines § 15125(a). Accordingly, the DEIR's use of a hypothetical baseline for various impact areas in which the Centennial cleanup has already occurred renders its analysis legally inadequate and unsupported by substantial evidence. FEIR p. 2-801. The FEIR contends that it was not using a future conditions baseline, but instead the "conditions expected when the project becomes operational." FEIR at 2-295. However, there is no evidence that that the Centennial cleanup will have occurred such that it can be "expected" by the time the Project is operational.
    - The FEIR's reliance on *Citizens for a Sustainable Treasure Island v. City and County of San Francisco*, 227 Cal.App.4th 1036 (2014), is misplaced. FEIR 2-9. In that case the issue was not whether the Navy's cleanup should be studied as part of the subsequent development project, but instead whether the project proponent had properly disclosed how it would manage and dispose of hazardous materials in the event it took responsibility for the cleanup. *Id.* at 1058-59. Furthermore, the project proponent in *Treasure Island* had included "exhaustive information" in the EIR about the presence and location of hazardous substances and adopted mitigation measures in case it were required to undertake some cleanup efforts. *Id.* at 1056, 1059. Because it was impossible to know whether the project proponent would have to undertake cleanup efforts, it was appropriate for it to defer environmental assessment. *Id.* at 1059. Here, in contrast, the County provided virtually no information about the contamination on the Centennial site and the process required to remediate it, despite the fact that the Project objectives include increasing the usable land on the Centennial Site to allow for its future use as industrial land. DEIR 3-12.

NEVADA COUNTY
BOARD OF SUPERVISORS

The County should deny the Idaho Maryland Mine and should not certify the EIR.

- **The many environmental impacts associated with the mine, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the mine project.**

- **Denying the mine project does not deprive the applicant of use of the land under its current zoning. It is not a taking.**
  The entire Brunswick Industrial Site is currently zoned M1-SP (Light Industrial, Site Performance Combining District), per the County's Zoning Code. Its land use designation is IND (Industrial) under the County's General Plan. The applicant is proposing to re-zone it as M1-ME (Light Industrial with Mineral Extraction Combining District) as part of the project. The Centennial Industrial Site and potable water pipeline easement areas are both zoned as M1 (Light Industrial) and designated as IND. All these land use designations provide a reasonable economic use of the property and, on their face, defeat any claim that the applicant is entitled to establish a gold mine at the site.

- **If it denies the Project, the County is under no obligation to certify the EIR.** (Las Lomas Land Co., LLC v. City of Los Angeles (2009)). In this case, the court upheld a decision to stop preparation of an EIR and specific plan where the city determined the project was not consistent with its land use policies.

  There is no reason to continue with the EIR. We believe that continuing the EIR will just cost the County in loss of time and energy as well as that of staff and the community. We can better spend this time on critical issues like wildfire safety and climate change.

  If the EIR is certified as it stands now, even if the project is denied, it will be a flawed EIR in county records that can be used under future applications.

- **The bottom line is that the community overwhelmingly does not want the Idaho Maryland Mine to reopen.**
  The mine will be counter to the adopted General Plan land use policies and vision which the community supports. The County should deny the Idaho Maryland Mine Final EIR and not certify the EIR.

Nevada County General Plan Goals and Policies Justify Denial of the Idaho Maryland Mine

The Idaho Maryland Mine project is inconsistent with numerous Nevada County General Plan goals and policies which provide justification to deny the project independent of the environmental analysis:

Land Use Element

GOAL 1.5 Within Community Regions, ensure that development reflects our small-town character, the characteristics of the land and the natural environment.

GOAL 1.6 Allow for growth while protecting, maintaining and enhancing communities and neighborhoods.

Policy 1.8.3 Within the City/Town spheres of influence, the Nevada County General Plan Land Use Maps will generally reflect the City's/Town's General Plan land use mapping. In some instances, the County may provide for a less intensive land use due to infrastructure capability, environmental constraints or effect on land use and development patterns outside the city's sphere. However, the County's Plan will not preclude implementation of the City's/Town's Plan by providing for a significantly more intensive land use than the City's/Town's Plan.

GOAL 1.8 Coordinate with the cities/town in land use planning and development within their spheres of influence.

Policy 1.7.10 The County shall provide for facilities for the management of hazardous waste produced on-site in the Commercial, Business Park, Industrial, and Public land use designations, and shall provide for facilities for the management of hazardous waste produced on or off-site in the Industrial and Public land use designations. All facilities shall be located in a manner consistent with criteria established in the State-approved Nevada County Hazardous Waste Management Plan approved by the County.

Economic Element

Goal 2.1 Provide for a strong economic base while protecting and maintaining communities and neighborhoods.

Objective 2.4 Encourage economic development which favors a high economic multiplier effect.

Policy 2.9 In support of the County Economic Policy, develop and implement an ongoing, aggressive business recruitment and marketing program featuring the County's strengths in areas such as education and quality of life. Target the program to prospective types of business (particularly those that are entrepreneur-oriented) that are best suited to provide significant long-term job opportunities in industries such as biotechnology, electronics and communications, and energy-related products.

Objective 2.14 Encourage protection and enhancement of the natural scenic beauty of this County in support of the tourist trade.

Safety Element

GOAL CC-10.13 Build Climate-Resilient Communities and Protect Neighborhoods, Public Infrastructure and Natural Resources Through Mitigating Climate Change.

Policy CC-10.13.4 Require new discretionary development to include an analysis of potential affects to climate change impacts and water resources in the project review process. Projects shall reduce or limit impacts as feasible.

GOAL HM-10.5 Protect public health, safety, natural resources, and property through regulation of use, storage, transport, and disposal of hazardous materials.

Policy HM-10.5.5 The County will actively promote prompt clean-up or remediation of properties contaminated by mine waste or other hazardous materials and shall not grant any discretionary or ministerial land use approvals to develop or change boundaries or reconfigure parcels believed to be contaminated, unless and until the nature, extent, type and location of the contamination is determined and satisfactory arrangements are made for clean-up or remediation, in accordance with Nevada County standards or State regulations.

Noise Element

GOAL 9.1 Provide for the health, safety, and welfare of the people of Nevada County through a set of policies designed to encourage an environment free of unnecessary and annoying noise.

Policy 9.1.10 Strongly discourage those General Plan amendments and zone changes that would likely create land use conflicts relative to noise.

Aesthetics Element

Goal 18.1 Promote and provide for aesthetic design in new development which reflects existing character.

Water Element

Goal 11.1 Identify, protect and manage for sustainable water resources and riparian habitats.

Policy 11.2 Encourage the protection of resources which produce water for domestic and agricultural consumption.

Objective 11.2 Preserve surface and sub-surface water quality and, where feasible, improve such quality.

Policy 11.4 Cooperate with State and local agencies in efforts to identify and reduce to acceptable levels all sources of existing and potential point- and non-point-source pollution to ground and surface waters, including leaking fuel tanks, discharges from storm drains, Chapter 11: Water Element Volume I - Page 11-4 Nevada County General Plan auto dismantling and dump sites, sanitary waste systems, parking lots, roadways, logging and mining operations.

Objective 11.3 Preserve and, where economically feasible, restore the density and diversity of water dependent species and continuous riparian habitats based on sound ecological principles.

Mineral Management Element

Goal 17.1 Recognize and protect valuable mineral resources for current and future generations in a manner that does not create land use conflicts.

Policy 17.6 Encourage extraction of mineral resources in compatible areas prior to intensified urbanization or conversion to other incompatible land use development.

Policy 17.11 Recognize the importance of water conservation and quality for the present and future needs of the County by: 1. Requiring the conservation of on-site water during mining operations. 2. Requiring that off-site water discharge complies with State water quality standards. 3. Requiring that any increase or decrease of off-site discharge is not detrimental to the downstream environment or downstream water users.

Policy 17.14 Already existing development - commercial, residential, and community - as well as undeveloped private lands, shall be protected from adverse environmental effects caused by mining through enforced use permit conditions and mitigations measures, or denial of the projects. The County shall be the enforcement agency.

Legal Background Supporting Denial of Idaho Maryland Mine FEIR Certification and Project

The following background was prepared by attorneys Shute, Mihaly, and Weinberger who represent CEA Foundation on our mine project responses:

The County should deny the Project and should not certify the EIR. The many environmental impacts associated with the Project, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the Project. If it denies the Project, the County is under no obligation to certify the EIR. Las Lomas Land Co., LLC v. City of Los Angeles (2009) 177 Cal.App.4th 83 (upholding decision to stop preparation of an EIR and specific plan where city determined the project was not consistent with its land use policies); Pub. Res. Code § 21080 (a) (CEQA applies only to projects that public agencies carry out or approve.)

Denial of the Project would also consistent with a long line of case law recognizing that public agencies may limit the use of land to protect public values without resulting in a taking of property. Penn Cent. Transp. Co. v. City of New York (1978) 438 U.S. 104, 129 (1978) ("[T]his Court has recognized, in a number of settings, that States and cities may enact land-use restrictions or controls to enhance the quality of life by preserving the character and desirable aesthetic features of a city.") (citations omitted); id. ("[I]n instances in which a state tribunal reasonably concluded that 'the health, safety, morals or general welfare" would be promoted by prohibiting particular contemplated uses of land, this Court has upheld land-use regulations that destroyed or adversely affected recognized property interests."); Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency (2002) 535 U.S. 302, 324 ("Land-use regulations are ubiquitous and most of them impact property values in some tangential way— often in completely unanticipated ways. Treating them all as per se takings would transform government regulation into a luxury few governments could afford.")

The Supreme Court has identified two primary tests to determine whether regulation causes a taking of property. First, a taking may occur if the regulation eliminates all use or value of the property. See Lucas v. S.C. Coastal Council (1992) 505 U.S. 1003. Under that test, there must be no value whatsoever remaining in the property; even a diminution of value of 95% is insufficient. See Tahoe-Sierra, 535 U.S. at 330 (citing Lucas, 505 U.S. at 1019 n.8). The second test involves evaluation of multiple factors, including the severity of the impact of the regulation on the value of the property, the extent of its interference with reasonable investment-backed expectations of use of the property, and the character of the governmental action. See Lingle v. Chevron (2005) 544 U.S. 528, 538-39 (citing Penn Central, 438 U.S. at 124.) Courts have consistently held that Penn Central test requires elimination of nearly all value in the property. The Ninth Circuit has recently recognized that even "diminution in property value because of governmental regulation ranging from 75% to 92.5% does not constitute a taking." Colony Cove Props. LLC v. City of Carson (9th Cir. 2018) 888 F.3d 445, 451; see also Hadacheck v. Sebastian (1915) 239 U.S. 394, 405 (no taking despite diminution in value from $800,000 to a maximum of $60,000, and property could not be used for any purpose permitted under city's ordinance).

In fact, as long as permissible uses exist, a denial would not deprive the applicant of economically viable use of its property. (Shea Homes Limited Partnership v. County of Alameda (2003) 110 Cal.App.4th 1246, 1267 [finding no regulatory taking because agricultural designation allowed single family use if certain County standards were met].) Here, the entire Brunswick Industrial Site is currently zoned M1-SP (Light Industrial, Site Performance Combining District), per the County's Zoning Code. Its land use designation is IND (Industrial) under the County's General Plan. The applicant is proposing to re-zone it as M1-ME (Light Industrial with Mineral Extraction Combining District) as part of the project. The Centennial Industrial Site and potable water pipeline easement areas are both zoned as M1 (Light Industrial) and designated as IND. All of these land use designations provide a reasonable economic use of the property and, on their face, defeat any claim that the applicant is entitled to establish a gold mine at the site.

Comment to Board of Supervisors, Mar. 28, 2023.

Hi, I'm Jim Bair, chairperson of ***Stop the Mine Task Force***, Grass Valley, CA. I am here today to report that the Task Force has found a **recurring** pattern of excluding critical content in the FEIR document for the Idaho-Maryland Mine Project. The authors of the FEIR repeat in at least seven places the same statement (Note 1):

RECEIVED
MAR 28 2023
NEVADA COUNTY
BOARD OF SUPERVISORS

> "*The engineering details and intensive sampling described by many commenters* ***would be*** *developed and completed through the implementation of mitigation measures, and* ***is not required to be completed as part of the CEQA process".***

Such exclusion of engineering details and appropriate sampling must be based on the interpretation of legal cases that are relevant and comparable. We interpret the cited cases as **not comparable and insufficient to justify material exclusion**.

One of the more blatant examples of excluding critical information in the FEIR is deferring measurement of airborne toxins such as asbestos that will result from the mining operation (c.f. Note 4). The FEIR acknowledges that the mine operation's release of toxins is extremely difficult to measure, and will represent a significant environmental impact to the community. It is imperative that all the details to mitigate the release of toxins be included in the FEIR.

The CEQA requirements are clear as stated (Notes 2 and 3):

> "*The project description* ***must contain sufficient specific information*** *about the project to allow the public and reviewing agencies to evaluate and review its environmental impacts. A project description that omits integral components of the project may result in an EIR that fails to disclose the actual impacts of the project."*

We humbly request that County Council review the referenced cases (Note 1) where full details and sampling have been deferred in the FEIR. I understand that the County has contracted with a CEQA attorney who can assist with interpreting the fair relevance of the CEQA case law.

Thank you.

Jim Bair (UUCM) 510.910.2300

CC: Nevada County Planning Commission (**by email**), and County Council

NOTE 1: FEIR references the legal cases on pages 119, 411, 638, 6835, 7590, 7797, 8187. Page 411 also defers to the County, "*details to be from the County*".

The cases are *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.), which cites *Sacramento Old City Assn. v. City Council,* Court of Appeal Third District Apr 30. 1991.

DRY CREEK CITIZENS COALITION v. Artesia Ready Mix Concrete, Inc., Real Party in Interest and Respondent. (1999) https://caselaw.findlaw.com/ca-court-of-appeal/1129797.html

NOTE 2: CEQA quote in *Santiago County Water Dist. v. County of Orange (1981) 118 Cal.App.3d 818, 829, 173 Cal.Rptr. 602.*

NOTE 3: CEQA Requirements -- CEQA states:

"There must be sufficient information to understand the environmental impacts of the proposed project. *(CEQA Guidelines, § 15146, discussion.) The EIR must achieve a balance between technical accuracy and public understanding. (Guidelines, § 15147, discussion.)"* [A detailed description of the project and mitigation measures is provided to illustrate the required level of detail.]

NOTE 4: Dependency upon State agencies for implementation after IMM Project approval

For example, the FEIR says that plans to control the lethal air pollution and other negative environmental impacts will be done **after** the Mine Project is approved. They justify not doing the "engineering" plans by citing two legal decisions that are not relevant in our opinion. The FEIR adds that asbestos pollution management responsibility is *to be* done by The Northern Sierra Air Quality Management District (NSAQMD). I spoke at length with two senior staff in the District this week and believe that is not the case (they were wonderfully helpful).

In this instance, the FEIR tries to delegate the full sampling, testing, and mitigation plan for toxins to a State agency, NSAQMD, that does not fully accept that responsibily.

NEVADA COUNTY
BOARD OF SUPERVISORS

MEMORANDUM

TO: NEVADA COUNTY BOARD OF SUPERVISORS

FROM: RANDALL J. NEWSOME
NEVADA CITY, CA

RE: DENIAL OF RISE GRASS VALLEY'S APPLICATION FOR A CONDITIONAL USE PERMIT

Although there are many factual and legal reasons why Rise Grass Valley (RGV) should be denied a conditional use permit to reopen the Idaho-Maryland Mine, two have received little, if any, attention. First, RGV's application to amend Nevada County's zoning ordinance is invalid on its face, since it fails to meet the basic requirements for amending that law. Second, even if RGV meets all of the legal requirements for issuance of a conditional use permit (which it doesn't), the Board of Supervisors has the discretion to deny the permit to protect the health, safety and welfare of the public. This memorandum addresses these two issues.

1. **RGV's application to amend the county zoning ordinance does not meet the basic requirements for such an amendment.**

The Idaho-Maryland Mine complex (hereafter referred to as IMM) is a combination of five mines that commenced production in 1863. Active mining operations ceased by 1956. Both the IMM and the Centennial site currently are zoned as Light Industrial (M1). RGV has applied to have the IMM rezoned M1 with Mineral Extraction Combining District. The zoning ordinance describes a "ME" Mineral Extraction Combining District as follows:

> The purpose of this District is to allow for surface mining and to provide for **public awareness of the potential for surface**

mining to occur where adequate information indicates that significant mineral deposits are likely present. The district shall only be used on those lands that are within any of the compatible Nevada County General Plan designations and which are not in a residential zone (emphasis added).

This description contemplates that the Mineral Extraction Combining District will only be allowed in areas where current residential use has not made mining an incompatible use. This is consistent with Chapter 17 of the General Plan governing Mineral Management Element, which states in its introduction that "Mine development is encouraged in compatible areas **before encroachment of conflicting uses."** (Emphasis added). It's also consistent with Section L-II 5.9 of the zoning ordinance entitled Amendments to the Nevada County General Plan and Zoning Ordinance. Part G of that section requires that the Planning Commission and Board of Supervisors make three findings as a prerequisite to allowing an amendment to the zoning ordinance:

1. The proposed amendment is consistent with and furthers the goals, objectives, policies, and implementation measures of the General Plan and the provisions of this Code;
2. The proposed amendment will not be detrimental to the public interest, health, safety, convenience, or welfare of the County;
3. For General Plan land use map and zoning district map amendments, the site is physically suitable for the requested Plan designation(s) and zoning district(s) and anticipated land use development(s). Factors considered to evaluate suitability shall include access, provision of public facilities and utilities, **compatibility with nearby land uses,** and presence or absence of resources and constraints as found in the Resource Standards (emphasis added).

Putting aside RGV's inability to satisfy the first two of these prerequisites for a zoning change, on its face it fails to meet the third prerequisite as well . Section L-II 3.22(8) defines "Incompatible Land Uses" as "[l]and uses inherently incompatible with mining. . . . Examples of such uses may include, but shall not be limited to residential uses, public facilities,. . .and commercial." The mine abuts land zoned Residential Agriculture on all sides. It's also a short distance from other residential neighborhoods, schools, churches and small businesses. However compatible the location of the IMM may have been in 1956, it clearly is incompatible with the area as it now exists. On this basis alone, RGV's request to amend the zoning ordinance to M1-ME must be denied.

2. **Regardless of whether the RGV plan meets all of the requirements of state and local law, the Board of Supervisors has the discretion to deny RGV's application for a conditional use permit on the grounds that it will be detrimental to the health, safety, and welfare of the residents of Nevada County.**

Despite the length and complexity of both the County's General Plan and the zoning ordinance that implements it, the lodestar for both documents is the preservation and protection of the health, safety and welfare of the people of Nevada County. This principle is repeated throughout both documents. *See, e.g.,* General Plan Introduction, p.1-10 (one guiding planning principle is the protection of "the health and welfare of the residents of the County."); General Plan Goal 9.1, p.9-2 ("[p]rovide for the health, safety and welfare of the people of Nevada County through a set of policies designed to encourage an environment free of unnecessary and annoying noise."); Land Use and Development Code Section L-II

5.9 (G)(2) ("[t]he proposed amendment will not be detrimental to the public interest, health, safety, convenience, or welfare of the County.").

This fundamental principle is also enshrined in Article XI, Section 7 of the California Constitution. Citing this provision, the Supreme Court of California held in *California Building Industry Assn. v. City of San Jose,* 61 Cal.4th 435, 455 (2015) that ". . .a municipality has broad authority, under its general police power, to regulate the development and use of real property within its jurisdiction to promote the general welfare."

Even if an applicant meets the requirements of a county's zoning ordinance and general plan, the permitting agency has the discretionary authority to deny the application if it finds that it threatens the health, safety and welfare of the surrounding community. *Guinnane v. San Francisco City Planning Com.*, 209 Cal. App.3d 732, 739, 257 Cal. Rptr. 742 (1989). Such a finding can be made based on "subjective factors, such as the spiritual, physical, aesthetic and monetary effect the project may have on the surrounding neighborhood. . . . [A] negative declaration on environmental effects does not and should not resolve the question whether a permit application should be approved. . . . The EIR is only an informational document." [Citations omitted.] *Dore v. County of Ventura*, 23 Cal.App.4th 320, 328-29, 28 Cal. Rptr.3d 299 (1994).

Moreover, "expert testimony on these issues is not necessary. It is appropriate and even necessary for the [agency] to consider the interest of neighboring property owners in reaching a decision whether to grant or deny land use entitlement, and the opinions of neighbors may constitute substantial

evidence on this issue." *Desmond v. County of Contra Costa,* 21 Cal.App.4th 330, 337, 25 Cal.Rptr.2d 842 (1993).

In *Dore,* the plaintiff applied for a permit to construct a three-building commercial center. The property was zoned for commercial use, the proposed structure was found to have no negative environmental effects, and it otherwise complied with the county's general plan. Nonetheless, noting that "[c]ompliance with zoning laws does not necessarily entitle one to a permit" (28 Cal.Rptr.2d at 304), the court upheld the county's refusal to issue a permit based upon the opposition of the neighbors and the increase in traffic on a dangerous road.

The proposed second story addition to a residence suffered the same fate in *Desmond,* and for much the same reasons. The county zoning administrator approved the permit, but the County Planning Commission and Board of Supervisors found that the addition was architecturally incompatible with the rest of the neighborhood and would threaten the public health, safety and welfare.

The same held true in *Harris v. City of Costa Mesa,* 25 Cal.App.4th 963, 51 Cal.Rptr.2d 1 (1994), where the construction of an accessory apartment was at issue. Even though the city planner found that the development satisfied all development standards, the city denied approval of the permit on the grounds that "'the project would have an adverse impact on the public health, safety and welfare, and therefore would be inconsistent with the General Plan.'" 31 Cal.Rptr. at 2. Specifically, the members of the city council found that the apartment would be incompatible with the surrounding neighborhood.

What these cases make clear is that even if RGV's application could somehow pass muster under environmental regulations, the County zoning ordinance and the General Plan (and it can't), the Planning Commission and the Board of Supervisors are not bound to issue a conditional use permit if they find that the mine is incompatible with the surrounding neighborhood or find that it otherwise threatens the health, safety and welfare of the community. Just because all the right boxes have been checked doesn't mean the County's hands are tied and the application must perfunctorily be stamped, "Approved." The County has the right and obligation to consider the views of the people living near the mine; evaluate this proposed monstrosity's impact upon and compatibility with the surrounding neighborhood; and determine whether reopening a gold mine in the middle of a residential area is consistent with the most basic function of local government: the protection of the health, safety, and welfare of the community.

Mine Waste and Asbestos Impacts Comments on the Final EIR
March 14, 2023

Overview

Airborne asbestos is hazardous to inhale, leading to lung cancer and other diseases. The Idaho-Maryland Mine Final EIR does not provide enough data to determine the potential impacts of airborne asbestos, and the asbestos management plan (ASUR plan) for preventing hazardous emissions is inadequate.

Very limited asbestos testing was done, constituting less than 2/10,000 of the total rock to be mined over the project lifespan. As the Air Quality Board stated "It would be short-sighted to commit to the ASUR Plan for the entire life of the mine based on the few samples that have been tested so far." (FEIR Page 2-360)

The ASUR plan was developed to limit emissions, but it is a flawed document that fails to provide the needed protections. Under the plan, if the asbestos concentrations on any 1000-ton lot of mined materials would put the 3-month rolling average asbestos concentration over a threshold of 0.01%, it would not be allowed to be exported.

A key problem is accurate and timely testing. It takes 2 weeks to get the results. The Final EIR has no provisions for stockpiling materials while waiting for results. And no temporary storage on the surface is provided. To avoid the need for stockpiling mined materials, the plan states that exploratory drilling tests will determine what can be mined in advance. Then grab samples will be taken as the rock is loaded into silos for deployment. But the testing is too sparse.

The loading into silos of 1000 tons of rock requires about 166 6-ton skip loads. This means that the grab test will only capture, on average, about 1 out of 55 skip loads, and even then, the three grab samples will be mixed together to form one combined test. And even accurate sample testing before shipping will not always prevent exceeding the safe average threshold.

Examination of how this system may fail reveals that large quantities of mine waste could pass through undetected. And though the ASUR plan talks about what happens when the delayed testing shows that the threshold was exceeded, it doesn't actually provide a credible solution or adequate oversight.

Finally, it's important to note that all exported Mine Waste from this mine must be classified as "Restricted Materials" (ASUR 9.2, p18) Aggregate suppliers in the region have indicated that they do not handle Restricted Materials because there is no market for them and there already are abundant aggregate sources regionally.

In conclusion, the Final EIR does not provide adequate data on asbestos concentrations, and fails to adequately address processing and disposal of asbestos-bearing mine waste.

A. Introduction

Asbestos is found in all the rock types within the Idaho-Maryland Mine in varying concentrations, though it is predominantly associated with Serpentinite, which can contain high concentrations. Airborne asbestos is hazardous to inhale. It can lead to mesothelioma cancer, asbestosis, and other diseases, and is closely regulated by the California Air Resources Board (CARB). The mine's "Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan" (DEIR Appendix E.2) was developed to address the management of asbestos airborne emissions. Regulation of asbestos emissions falls under the jurisdiction of CARB and the Northern Sierra Air Quality Management District (NSAQMD). Management of asbestos to prevent hazardous emissions is complicated by the difficulties of accurately testing for it and by the fact that concentrations can be found close to gold ore.

B. Criteria

The FEIR Condition of Approval 3 (COA-3) and the ASUR Plan establish a limit of 0.01% asbestos by weight as the threshold for managing all mine waste that leaves the enclosed project structures or containment structures, such as the silos, conveyors, and processing facility. Under the ASUR Plan, if the asbestos concentrations on any 1000 ton lot of mined materials would put the 3-month rolling average asbestos concentration over 0.01%, then that lot would not be allowed to be sent out of the containment structures.

The Final EIR does not provide enough baseline data to determine whether the project can be mined while meeting this threshold. Very limited testing was done. Thirty-seven samples were taken, but they came from only 3 drill holes. (Drill Holes 1-18-11, 1-19-13, and 1-19-14, ASUR Plan, Appendix C, p55-57). Assuming that each sample provided a good estimate of the asbestos concentrations for a 2000 cubic foot volume (20' h x 10' w x 10' d), the tests constituted less than 2/10,000 of the total rock to be mined over 75 years. The criteria for sample selection was not specified and the sampling party was not named.

Even so, of the 37 drill core samples from the mine that were tested, asbestos testing (TEM method) determined that 15 had asbestos, and 8 of those had asbestos over the 0.01 limit. A potential hazard clearly exists.

There are three test methods. Polarized Light Microscopy (PLM) is fast but not precise, being only valid for detecting above 0.25%. This method is not adequate for detecting the 0.01% threshold, but it is used to define the threshold for surfacing applications under the Airborne Toxic Control Measure (ASTM). The Transmission Electron Microscopy (TEM) process is more accurate, but takes up to 2 weeks to get a result. The TEM test is what dictates most of the management activities in the ASUR Plan to prevent asbestos emissions. (A third method, Phase Contrast Microscopy (PCM), is not valid for rock sampling but is used for air quality monitoring and provides a referential standard for TEM.) (ASUR, p8).

The FEIR has NO plans for the temporary stockpiling of mined materials. So, to avoid the need for stockpiling mined materials, the ASUR Plan states that samples from exploratory drilling will be tested for asbestos in advance of mining. If the anticipated rolling average asbestos levels exceed 0.01%, gold ore will not be mined and barren rock will either not be mined or mined using a dust collection system and materials will be disposed underground (ASUR, p9). However, the prescribed testing is sparse and could easily miss rock having higher asbestos levels. Just one combined test per 1000 thousand tons of mine rock is prescribed (1000 tons is approximately equal to an 8'x8'x170' block).

The mined rock will be lifted from the mine to the silos on the surface with skips. Gold ore will be dumped into a silo with 1000 tons of capacity and barren rock into two smaller silos with 400 tons of capacity. From the gold ore silo, material is fed into the processing facility via an enclosed conveyor.

The project plans to process about 1500 tons of rock per day, from which 1000 tons is expected to be mineralized rock (gold ore) and 500 tons is expected to be waste rock (barren rock). The gold ore will be run through the processing facility to extract a gold concentrate, leaving 1000 tons of fine sand tailings material which must be disposed.

About half of the sand tailings, 500 tons per day, will be mixed with cement to form a cement paste backfill material which will be put back into the mine. The other 500 tons per day of sand tailings will stockpiled to be loaded onto trucks with a front-end loader and trucked off. The 500 tons of barren rock that are mined daily will be moved via conveyors to the truck loading building for export.

C. Deficiencies of the Testing and Processing Plans

To prevent the 3-month rolling average of asbestos in rock from exceeding the 0.01% threshold, the ASUR Plan relies on developing an inventory of asbestos levels of un-mined rock through exploration and testing, and then avoiding mining the rock that would violate the threshold.

However, the critical test that monitors what will be exported is taken when the gold ore and barren rock are lifted and dumped into the silos. A minimum of three grab samples must be taken for each 1000 tons that are transferred. These three samples will then be combined to form a composite sample for a single test result. Each sample is added to the record which tracks the rolling average of exported materials.

The materials are lifted into the silos using skip carts that lift around 6 tons (ASUR, Fig 2). The processing of 1000 tons requires about 166 skip loads. Each grab test will only capture, on average, about 1 out of 55 skip loads, and even then, the three grab samples will be mixed together in a combined test. Because of the sparseness of the sampling, 1000 tons of mine rock, or about 50 truckloads worth, could contain excessive levels of asbestos and still pass through undetected.

Complicating that, the materials go into a split output stream, with a daily average of 1000 tons going to the processing facility and 500 tons going directly off-site as barren waste rock. It is not specified how the grab samples would be associated with the two output streams.

After processing, as described previously, the sand tailings are exported: 500 tons of the tailings will go off-site, and 500 tons will be transported back into the mine and used as cemented paste backfill. The plan should specify separate sampling criteria for each stream of materials which should follow those materials through the process phases.

The amount of required testing is inadequate to reasonably detect the asbestos levels of materials leaving the containment structures. The ASUR Plan does not even specify testing of the sand tailings after processing, and there are no provisions for the gold ore to be tracked to associate the specific test results with the 1000 ton loads as the material is sent through the processing facility. If a TEM grab test comes back with unexpectedly high asbestos values, how would the processing system determine which sand tailings from the processing output should be redirected to be used as cemented-paste backfill? This part of the plan is inadequate in assuring that higher-than-expected levels of asbestos are not being exported.

The materials' processing is a stream, but the ASUR Plan tries to manage the materials by testing blocks of un-mined rock. Materials from multiple sites within the mine will be transported, crushed to 6" maximum size and lifted for processing. Most of the materials will then be sent via conveyors to the processing facility, and the resultant sand tailings will be conveyed and accumulated for hauling out. The testing procedure is poorly suited for tracking the materials through the processing system. How will the process keep track of which final outputs were from a given block of un-mined rock?

In addition, under certain conditions as described in ASUR Plan Section 6.0-7i (ASUR, p8), gold ore with high asbestos levels would be processed, which means introducing gold processing tailings with known exceedances into the same system.

D. Deficiencies in the Moving Average Approach

Exceeding the 0.01% threshold would only be detected in hind-sight once the TEM tests are processed. In addition, a series of many individual loads in excess of 0.01% could be shipped out and still not exceed the 3-month rolling average if the average started out low. Given that there is no plan for on-site storage, the possibility is real that, during the 2 week testing lag time, many additional 1000-ton batches of materials exceeding 0.01% asbestos would be processed. Taken together, many weeks' worth of mine waste with high levels of asbestos could be shipped out.

We noted above that one test from 3 grab samples is sparse and can likely give inaccurate results. But even if testing accurately measures the asbestos levels per day, it does not assure that the 3-month rolling average won't end up exceeding the 0.01% threshold. For example, the following test results would result in a 0.024% average asbestos concentration on Day 120 even after an operations shut down on day 106.

Threshold Exceedance Example

Day 105:
- 75 days exported averaging 0.008%
- 15 days exported averaging 0.02% ((75x0.008)+(15x0.02)) /90 = **0.01% average. OK**
- 15 days exported (test results not back yet, avg 0.03%)

Day 106:
- 74 days exported averaging 0.008%
- 15 days exported averaging 0.02%
- 1 day exported at 0.03% (74x0.008)+(15x0.02) + (0.03) /90 = **0.0102% average, SHUT DOWN**
- 14 days already exported (test results not back yet, avg 0.03%)

:

Day 120:
- 60 days exported averaging 0.008%
- 15 days exported averaging 0.02%
- 15 days exported averaging 0.03% ((60x0.008)+(15x0.02)+(15x0.03))/90 = **0.024%**

Results in 15 days exceeding the 0.01% rolling average!

In the Threshold Exceedance Example, the 90 day average asbestos level ends up at 0.024% even while complying with the ASUR Plan by shutting down on the first day of exceedance (Day 106). Plus, in total, 30 individual days of output exceeded 0.01% asbestos concentration.

The ASUR plan to prevent the asbestos levels from exceeding the 0.01% threshold is inadequate.

E. Surface Exposures of Airborne Asbestos at the Engineered Fill Sites

There will be about 500 tons per day of sand tailings exported from the ore processing plant. This represents approximately one half of 1000 tons of tested gold ore from the silo. The sand tailings from the gold ore processing is stockpiled inside a containment structure to be loaded onto trucks with a skip loader and shipped off. Operations run for 24/7 but materials are only shipped off 16 hours per day and may have weather related days of no shipping, accumulating the sand tailings, which are loaded into trucks outside the structure (FEIR Page 2-543). Conceivably, the 30 days of gold ore that were processed in the Threshold Exceedance Example could produce sand tailings exceeding the 0.01% threshold.

How would it be determined which sand tailings came from the contaminated materials that end up in the sand tailings containment structure?

After the sand tailings are delivered to the planned Engineered Fill dumping sites at the Centennial site, and later the Brunswick site, they will be mixed with the barren rock in the open air by "on-site blending of blast rock and sand tailings" (DEIR Centennial GeoTechnical Report, p13). Using the Threshold Exceedance Example, thirty days of materials exceeding the asbestos threshold - equivalent to 1500 truck loads - could be mixed in the open air on the Engineered Fill sites, in clear violation of the ASUR Plan goals for reduction of airborne asbestos.

F. Exported Mine Waste is Classified as "Restricted Materials"

All mine waste, aka "Engineered Fill" or "sand tailings and barren rock," from the Idaho-Maryland Mine is considered "Restricted Materials" under 17 CCR 93106(d)(1). (ASUR Plan, p16-17).

The Restricted Materials can be separated into two groups, one group being below the 0.25% threshold under the ASTM rule, and the other group being equal or above that threshold.
For materials below 0.25% asbestos using the PLM test, the material can be transported and used for Engineered Fill or surface applications, but "*Any person who transports Engineered Fill (considered a restricted material) must maintain a copy of all receipts with the material at all times during transit and application*" (ASUR p16).
The following receipts must be provided:

A. The amount of restricted material that was sold or supplied;
B. The date that the restricted material was sold or supplied;
C. The dates that the restricted material was sampled and tested; and
D. A statement that the asbestos content of the restricted material is less than 0.25 percent.

Because the ASUR plan establishes a threshold of 0.01% for the rolling 3-month average using TEM testing, it is probable that most of the mine waste that is output from the facility would fall below 0.25%. However, it is worth noting that some 1000 ton daily outputs could exceed 0.25% and still not cause the rolling 3 month average to exceed 0.01%. (For example, 89 days with an average of 0.007% and 1 day with 0.25% asbestos concentration by weight equals a rolling average of less than 0.01%.)

For materials at or above 0.25% asbestos, the mine waste is classified as "Asbestos Containing Material" under ATCM for Surfacing Standards. For Engineered Fill materials detected at or above 0.25% using the PLM test, strict usage requirements are imposed to prevent exposure or possible future

disturbances. ATCM requires that "*the material shall not be used for surfacing applications pursuant to 17 CCR 93106*" (ASUR p16).

In the case of at or above 0.25%, it cannot be used for surfacing, but it may be used for operations that assure the materials will be handled under strict conditions. All materials in this classification must be accompanied with the following written receipt:

WARNING!
This material may contain asbestos.
It is unlawful to use this material for surfacing or any application in which it would remain exposed and subject to possible disturbances.
Extreme care should be taken when handling this material to minimize the generation of dust.

Any person who transports Engineered Fill (considered a restricted material) must maintain a copy of all receipts with the material at all times during transit and application.

Of course, the three-month rolling average must also be less than 0.01% to even be shipped out.

G. The "Restricted Materials" classification may severely limit off-site sales.

As the ATCM rules make it clear:
"**All aggregate extracted from the Idaho-Maryland** *underground mine, including barren rock and mineralized material sent for processing,* **is considered Restricted Material** *under the ATCM for Surfacing Applications*" (ASUR 9.2, p18).

Aggregate suppliers in the region have indicated that they do not handle Restricted Materials because there is no market for them.

H. Unapproved Underground Dumping May Violate Water Board Standards

The ASUR Plan does not address how the mine waste which might be diverted to underground storage because of high asbestos levels would be tested to conform with the Water Board's requirements to prevent pollution of ground and surface waters through leaching of hazardous chemicals. Because the Final EIR did not include adequate testing of the mine rock for possible water contamination, the Water Board is requiring continuous testing to determine whether the materials conform to Group C mine waste, which is required for off-site use, or whether the Water Board will require special processing as the more hazardous Group A or Group B mine waste.

I. The ASUR Plan is Ambiguous and Self Contradictory

1) Ambiguous Terms

The ASUR Plan discusses the processing and testing of mine waste by utilizing the euphemism "Engineered Fill," eventually describing it on page 13 in the statement: "...asbestos content of Engineered Fill (barren rock and sand tailings) placed and compacted..." Since there is an intent to simply sell the the mine waste, "Engineered Fill" doesn't seem to mean the applicant is including the "placement and compacting." Hence, the document seems to define Engineered Fill simply as "barren rock and sand tailings."

The use of the term "engineered fill" is ambiguous when there are statements such as ""the remainder of the *sand tailings* will be used for *engineered fill*." Substituting the words "barren rock and sand tailings" for "engineered fill" in this statement then reads thus: "the remainder of the *sand tailings* will be used for *barren rock and sand tailings*."

Another confusing example is the use of the term "Asbestos Containing Materials." This term is explicitly defined in the document to mean materials having over 0.25% asbestos under the ASTM rule. However, materials having asbestos exceeding 0.01% are also referred to as "asbestos containing materials," as seen on ASUR Plan page 20.

The ASUR Plan document contains numerous ambiguous statements which distort the meaning and validity of the document.

2) Aggregates, Surfacing and Loopholes

Rock aggregates that are used in the construction industry include a wide range of materials mostly consisting of specific crushed rock sizes that are generally screened or filtered to within certain size limits (e.g. ¾" Class II road base) and many also require washing. The barren rock that is produced by the mine will be mixed crushed rock 6 inches or less in size and would need to be recrushed to the right sizes, screened, and sometimes washed to meet most aggregate market demand. The sand tailings are fine sand or silt size granules which have very limited use. (See https://www.gohbe.com/index.php/rock-masonry.) However, the ASUR Plan mistakenly treats Engineered Fill and surfacing materials interchangeably. Engineered Fill made of barren rock and sand tailings is not suitable for surfacing applications. Sand tailings have little use and the barren rock would first need additional processing, which requires facilities that the mine does not provide.

The word "aggregate" is commonly known but is not specifically defined in the ASUR Plan. In Section 8.4 (p16), the term is used to describe regulatory restrictions: *"If a composite sample determines that aggregate is not Asbestos-Containing Material, a written receipt must be provided to the recipient of the Engineered Fill."* This statement is ambiguous in that it is not clear that the Engineered Fill being referred to is the "aggregate" used in this sentence, or some additional materials.

The ASUR Plan repeatedly refers to surfacing materials as if they are equivalent to Engineered Fill. For example, the statement in Section 6.0 -Item 7(i):
"If planned mining is projected to result in insufficient material available for Surfacing in Engineered Fill Placement Plan:
i. An operational plan will be prepared and approved…."

Item 7(i) in section 6.0 also describes ambiguous conditions about "insufficient materials" which seemingly allow mining of Asbestos Containing Material if it is gold ore.
Then the subsequent Item 8(i) in Section 6.0 then states that if the 0.01% threshold would be exceeded, gold ore will not be mined. *(ASUR, p9)* This is in direct contradiction to Item 7(i)!

3) Operations Oversight

The ASUR Plan lacks clearly defined oversight for the management of the asbestos materials. Nor are guidelines for approval of changes to operations or procedures provided. Here the responsibility is given to an unspecified "geology department."

"If the three-month rolling Asbestos Inventory for materials hoisted to surface exceeds 0.01% asbestos by mass of PCM equivalent units the geology department will immediately investigate the source of the

asbestos containing material and halt mining in the area of concern until a revised mine plan is prepared in compliance with the ASUR Plan" (ASUR, p20).

This is inadequate. To provide reasonable safeguards, an independent party should be responsible for overseeing monitoring, investigations, reporting, and corrective actions. What constitutes a valid report should be defined. And guidelines for subsequent actions should be explicitly defined and authorized by the County and NSAQMD, and not be done by employees of the mine.

The ASUR Plan was written by Rise Gold (ASUR, p1).

Conclusion

The Final EIR does not provide adequate data on asbestos concentrations in mine rock to determine the potential impacts under CEQA. In addition, the ASUR Plan fails to adequately address processing and disposal of asbestos-bearing mine waste to meet its stated goals, and the ASUR Plan is internally inconsistent and ambiguous, providing numerous loopholes in regulatory oversight.

The potential for hazardous airborne pollution from the mine project is a significant health concern which is inadequately addressed in the Idaho-Maryland Mine Final EIR. This Final EIR should be rejected.

The appended figure is from page 106 of Rise Gold's "Technical Report On The Idaho-Maryland Project" (https://www.risegoldcorp.com/uploads/content/I-M_Tech_Report.pdf). It shows the Morehouse Fault and the location of gold ore in close proximity to surrounding Serpentinite rock beds. Serpentinite is generally high in asbestos. The purple shows Serpentinite, the orange shows Gabbro, and the red line shows the gold-quartz ore vein. The region near the bottom of the figure is a primary target for the proposed project.

Off-site Sales of Mine Waste and the Idaho-Maryland Mine Final EIR
March 20, 2023

Introduction

The Idaho-Maryland Mine Final Environmental Impact Report (FEIR) does not provide adequate information regarding the viability of the plan to dispose of mine waste through off-site sales and does not have provisions for adequate on-site temporary storage or permanent disposal of mine waste, leading to potentially significant impacts.

The project documents call for approximately 11 years of operations in which the mine waste will be disposed of on the Centennial and Brunswick sites as "Engineered Fill," but the FEIR fails to resolve uncertainties affecting the viability of that plan. Due to inadequate testing information in the FEIR, the mine waste could not be classified as Group C mine waste by the Regional Water Quality Control Board as needed to allow dumping onto these two sites. In addition, due to inadequate testing of mine drill cores for asbestos to establish a reasonable assessment of the potential hazards due to airborne asbestos, numerous management issues regarding the safe handling and placement of asbestos-bearing rock as "Restricted Materials" remain unresolved.

Worse still, for the remaining 65 or more years of operations, even if the issues of potential water and asbestos impacts are resolved, significant issues remain as to how and where the mine waste will be disposed.

Mine Waste Disposal Plans

The mine operations will require disposing of 1500 tons/day of mine waste 365 days/year for approximately 75 years. Five hundred tons/day of sand tailings are to be returned underground in the form of cemented paste backfill. The remaining 1000 tons/day, consisting of 500 tons/day of barren rock and 500 tons/day of sand tailings, will be exported from the containment structures of the processing facility.

The mineralized rock (ore) and barren rock will be removed from the mine by hoisting and dropping the materials into the silos on the surface at the New Brunswick shaft. The silos will have a capacity of 1000 tons for the ore and 400 tons for the barren rock. This means that the silos will have a maximum capacity of just under the daily production of 1500 tons. The 1000 tons/day ore will then be run through the processing facility and the sand tailings for export will be loaded into haul trucks with a front-end loader from within an enclosed structure. The barren rock will be loaded directly into haul trucks from the silo.

Market Demand

The FEIR states that after the Centennial and Brunswick sites are full, "...hauling of engineered fill (barren rock and sand tailings) would shift entirely to be utilized in local and regional construction markets." (FEIR Page 2-59). The market demand for this mine waste (barren rock and sand tailings) has not been established.

The FEIR mistakenly assumes that the aggregate market is analogous to the market for mine waste rock (or barren rock) and sand tailings. The FEIR then argues that there is substantial market demand for aggregates in the region. (See FEIR Master Response 11, "Evidence for Market Demand", Page 2-61, 62)

The FEIR notes that the Sacramento County aggregate production-construction area has less than 50% of its 50-year aggregate demand currently permitted, and also lists the annual demands for Nevada County, Placer County, and Yuba City/Marysville. The FEIR then concludes, "This master response demonstrates that there is sufficient market demand for engineered fill (barren rock and sand tailings)". This is a false conclusion based upon selectively excerpting data from the California Department of Conservation Mapsheet 52, 2018, (https://www.conservation.ca.gov/cgs/Documents/Publications/Map-Sheets/MS_052_California_Aggregates_Map_201807.pdf)

In fact, the Department of Conservation data shows that Sacramento County has 327 million tons of aggregate supplies already permitted, enough to meet 21 to 30 years of demand. In addition, it is entirely reasonable to expect that within the next 20 to 30 years, more permits may be issued in Sacramento County. In addition, the aggregates map also shows that surrounding counties already have more than enough surplus aggregate supplies to provide for the needs of Sacramento County. Placer County has more than double the estimated 50 year aggregate demand already permitted (387 million tons vs 188 million tons needed), Nevada County has 125% of the 50 year aggregate demand already permitted (52 of 41 needed), and Yuba City-Marysville has almost 200% already permitted (679 of 344 needed).

A realistic view of the market for aggregates is that there are abundant aggregate supplies in the region, the aggregate market is very competitive, demand varies significantly by season, and most importantly, the mine waste is ill-suited to compete in the aggregate market.

Mine Waste versus Aggregate Demand

The FEIR addresses the market viability for off-site sales based upon assumptions of annual mass volume demand of aggregate and erroneously assumes that the mine's barren rock and sand tailings would be suitable for meeting that aggregate demand.

Aggregate production is a business which requires the delivery of specific rock sizes and grades depending on the nature of the customer's project. A producer must be able to produce and deliver rock that meets the specifications - such as those noted below - in the specific tonnages required by the customers. Regional market demands for aggregates are wildly varied in grade and size and producers must comply with aggregate specifications. Consequently, aggregate producers have to produce and stockpile numerous specific products, which have different production inputs, screening, crushing, and washing needs.

The mine will be exporting 500 tons/day of "sand tailings" and 500 tons/day of "barren rock." The sand will be a mix of medium and fine sand, down to very fine silt that has limited market value (300 - 0.044 mm). The barren rock will be crushed to "approximately 6 inches maximum dimension." (DEIR appendix H4, p14) These two products fulfill only a small portion of the aggregate market.

At the very least, in order to compete in the aggregate market, significant processing of the mine waste would be required, and the Idaho-Maryland Mine project does not include any of the facilities needed for that processing. The mine waste material may only be suitable for fill, while the majority of aggregate sales in the region are for specified aggregate types.

Example Aggregate Products *

Crushed Aggregate – No Fines		
Crushed Aggregate (3/8" Hot Plant)	3/16" x 7/16"	Black & white river rock used for pathways landscaping and underdrains.
Crushed Aggregate (1/2" Hot Plant)	7"/16" x 5/8"	Black & white river rock used for pathways landscaping and underdrains.
Crushed Mine Rock	1" x 2"	1" x 2" Good rock in muddy areas. Lays down well, very angular.
Crushed Mine Rock	2" x 5"	very angular rock good for very muddy and wet locations.
3/4" Clean Crush	5/8" x 1"	Crushed angular rock with very few fines is popular for parking areas and driveways.
Permeable Class 1 Type B (1/4" x 1/2")	1/4" x 1/2"	round river rock used for underdrains.
Trench Fill, Crushed certain NID jobs	3/16" x 5/8"	This aggregate has been designed to meet fill material specifications for
Crushed Aggregate With Fines		
Aggregate Base 3/4" Class II	1" minus	State spec. product. Compacts well use under driveways, roads, etc
Limestone Base Rock ¾"	1" minus	Blue-gray angular rock with fines. Packs very hard.
Road Rock 1/2"	1/2" minus	Crushed black & white rock with fines.
Road Rock 3/4"	1" minus	Crushed black and white rock with fines.
3/4" AB II Ridge Rock slopes	1" minus	This very angular blue/green-gray rock packs well on driveways and is good on slopes
Crushed Mine Rock 1 1/2"	2" minus	Very angular blue/green-gray to brown rock, packs very well.
Recycled Base Rock 3/4"(ClassII)	1" minus	Base rock made from 100% recycled asphalt, concrete and aggregate products.
3/16" x 5/8" Clean Crushed	3/16" x 5/8"	This angular crushed product is made at our Ridge Rock Quarry.
Sand		
Crushed Sand	1/4" minus	This sand packs very well. Used for backfill under pipes and culverts and pathways.
Masonry Sand	1/8" minus	Fine washed sand used for stucco, mortar & horse arenas.

Fill Sand, PG&E Spec.	1/8" minus	This economical sand packs well. Used as fill in trenches over pipe and gas lines.
Pond Sand/Silt	1/16" minus	Very fine unwashed product, typically used as affordable fill material.

*Partial Aggregate List From Hansen Bros. Enterprises, https://www.gohbe.com/index.php/rock-masonry . See also https://teichert.com/materials/aggregate-products/, https://unionquarries.com/crushed-stone-sizes-for-construction/

The FEIR speculates that the project can meet the specific business needs of the aggregate market without providing a plan for how to actually produce the aggregates needed to meet the actual aggregate market demands. In addition, the FEIR does not provide any market demand data for the rock and sand tailings that will actually be produced by the mine.

Seasonal Demand

Furthermore, the market for aggregates is seasonal. There is little demand for aggregate in the winter months, as little construction is taking place due to weather restrictions. In addition, winter weather can shut down any ongoing operations. How will the mine waste be managed during long winter shutdowns? There is no provision for temporary stockpiling of output materials anywhere on the project sites.

Asbestos Bearing Mine Waste

The FEIR does not provide adequate testing to assess the potential impacts of asbestos bearing rock and air pollution hazards, utilizing samples from just 3 drill cores. The few tests that were conducted represented only approximately 2/10,000 of the mine rock volume planned for excavation. This is inadequate.

Management of asbestos bearing rock is described in the "Asbestos, Serpentinite, and Ultramafic Rock Management Plan" (ASUR Plan) in DEIR Appendix E.2. Due to the potential for the occurance of asbestos-bearing rock in the Idaho-Maryland Mine, which is in an Ultramafic Rock zone, all materials extracted from the Idaho-Maryland Mine are considered "Restricted Materials" under the California Air Resources Board (CARB) asbestos Airborne Toxic Control Measures (ATCM). (ASUR Plan, p18). This requires written documentation to accompany any handling, transport and application of the materials, including testing information, amounts, dates, etc. Reportedly, area aggregate suppliers avoid using Restricted Materials because there isn't a market for them.

In addition, the North Sierra Air Quality Management District (NSAQMD) requires that the 3-month rolling average of asbestos levels in all mined materials that leave the enclosed project facilities must not exceed 0.01% asbestos by weight. Concerningly, there are multiple deficiencies in the ASUR plan which could fail to determine exceedances of this 0.01% rolling average threshold until after the materials have already been shipped out.

The ASUR Plan does not adequately safeguard against exceeding the toxic thresholds that are established for this project. These safeguard deficiencies are identified in "MineWaste_Asbestos_Impacts_Comments_Final.pdf" (https://www.cea-nc.org/wp-content/uploads/2023/03/MineWaste_AsbestosImpacts_Comments_Final_3-14-23.pdf)

Contaminated Mine Waste and Water Impacts

As mentioned, the FEIR has not adequately determined that the mine waste can be disposed of by off-site sales (see above). Nor has it been adequately determined that the waste can be disposed of by dumping it as Engineered Fill because of its potential to pollute ground and surface waters by the leaching of hazardous chemicals. This inadequacy falls under the jurisdiction of the Central Valley Regional Water Quality Control Board (CVRWQCB, or Water Board).

The Water Board classifies mine waste by Groups A, B, and C. Only Group C, which has relatively low levels of contaminants, is clean enough to be used for off-site sales. Groups A and B require more stringent controls. The Water Board requires sufficient mine waste testing to determine its classification. In its response to the Draft EIR, the Water Board states: "The applicant shall not sell or utilize waste rock and tailings from the Project for construction aggregate or fill purposes offsite unless such material has been tested and confirmed to qualify as Group C mining waste..." (FEIR Page 2-61).

In the DEIR, the Water Board and numerous other parties identified that there was insufficient testing to determine whether the mine waste would be classified as Group C. Therefore, its suitability for off-site sales is in question. Per the Water Board comments:"...the alternative scenario that the mining waste is not suitable for off-site use should be examined." The Water Board goes on to state that Rise should assess any constraints or challenges associated with waste disposal, in case they can't do off-site sales for construction aggregate. They conclude with: "The Draft EIR should be revised to address this comment" (FEIR Page 2-233, 234). The FEIR does not address the Water Board's comment. This is unacceptable, especially given that Rise Gold could easily have done an adequate amount of testing to accommodate the Water Board's requests, given the plethora of drill cores and samples to which Rise Gold has access.

Rise Gold acquired a collection of drill cores and samples from Emgold Mining when they purchased the mine. In addition, they did over 67,500 linear feet of exploratory drilling, themselves. Yet, from all those samples, they chose to test only 11 feet – of the 67,500 - to characterize what will be over 25 million tons of mine waste that will be produced over the life of the mine (1000tons/day x 365days/year x 75years = 27 million tons).

Disposal of mine waste is a critical element of the project with the potential for causing significant, negative, long term impacts if it is inappropriately stored or disposed of. Yet, in spite of the wholly inadequate testing represented in the DEIR, the fact that no further testing of the drill cores was required by the FEIR is inexplicable and unacceptable.

The FEIR response uses speculative, unproven assumptions stating that the mine rock "...would not be mined until mine waste characterization has been performed to ensure the rock will be suitable for off-site sale. Rock types that are not suitable for off-site sale would likely not be mined, and if mined, the waste rock would be placed underground," (FEIR Page 2-60).

Mine waste classified as Group A or Group B requires specific management that must be determined by the Water Board and cannot automatically be placed underground. Backfilling with waste rock and tailings is the exact scenario which has led to polluted ground water discharges in so many mines in our area. This new project element, the placement of Group A or Group B mine waste underground, was

not included in the Draft EIR and if not addressed adequately has a high potential of creating the same type of long-term toxic mine water discharge again.

Even disposal of mine waste on the project sites for Engineered Fill (Centennial for 5 years, Brunswick for 6 years) requires testing and will have to meet the Water Board's approval. Quoting the Final EIR: " The barren rock and sand tailings would undergo testing as part of obtaining WDRs [Water Discharge Requirements] for use in the Engineered Fill pads, and compliance with water quality objectives will need to be demonstrated to the CVRWQCB prior to that placement," (FEIR Page 2-59, 60). This is further detailed in Mitigation Measure 4.8-1 (e) (FEIR Page 3-37,38,39).

The FEIR Master Response 11 makes false and misleading assertions. The discussion makes the false claim that "...the historic mine waste has been determined to be Group C mining waste from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity," (FEIR Page 2-59). In fact, the historic mine waste has not been determined to be Group C by the Water Board. The site is currently undergoing a cleanup under the Department of Toxic Substances Control (DTSC) and was conditionally deferred from being processed as a superfund site provided the cleanup is completed. See "IMM_TRANSMITTAL_Signed.pdf" at https://www.envirostor.dtsc.ca.gov/public/final_documents2?global_id=29100007&enforcement_id=60472136. The DTSC does not need to do cleanup on sites that have only Group C mine waste.

In any event, the legacy tailings on the Centennial site cannot be used to determine the likely classification of the mine waste from the proposed project because:

1. The tailings on the site have been subject to over 67 years of oxidation and leaching, reducing the presence of soluble hazardous chemicals which may pollute the surface and ground waters.
2. The geology varies in the Idaho-Maryland Mine.
3. The samples provide by the DEIR were for selected areas and did not undergo examination and testing to the satisfaction of the Water Board to warrant its classification as Group C.

However, the Centennial site does serve as a cautionary tale of the hazards associated with dumping mine tailings.

The FEIR fails to provide information necessary to assess the potential impacts to surface and ground waters from the leaching of contaminants from mine waste. The mine waste must be classified as Group C mine waste in order to be used for off-site sales. The Water Board requested additional testing to be done and the DEIR to be recirculated to provide adequate data for review. The FEIR provides no additional testing. The FEIR provides no viable plan for storage or disposal of those materials. Instead, the FEIR suggests that "Rock types that are not suitable for off-site sale would likely not be mined, and if mined, the waste rock would be placed underground," (FEIR Page 2-60). Mine waste classified as Group A and B requires specific management that must be determined by the Water Board, and cannot automatically be placed underground. The FEIR fails to provide adequate information to reasonably determine how to characterize the mine waste for safe disposal.

Conclusion

The FEIR Master Response 11 states:
"If the Project's proposed engineered fill sites and the Brunswick and Centennial Industrial Sites were complete and there was low demand for barren rock or sand tailings, or the material was unsuitable for construction use, the operation would by necessity reduce or halt generation of these materials

until an appropriate market, such as fill material or other use of rock material for which the material met appropriate specifications, could be identified."

As this statement demonstrates, rather than following the requirements of CEQA, the FEIR chooses to ignore the need for assessing the potential impacts of the disposal of mine waste. Instead the FEIR assumes, without substance, that an appropriate market would be found to provide a solution. In addition, the FEIR fails to address a potential that the mine waste may not be suitable for dumping on the project's two Engineered Fill sites, or provide a mechanism for managing the reduction or cessation of operations. Who would make the determination to halt, and under what authority? How would the contaminated materials that are in process be managed? This is a recipe for a failed project leaving yet another toxic problem.

In summary,

- No evidence was provided that an adequate market for Restricted Materials in the form of barren rock and sand tailings exists.
- Most aggregate sales require rock ground to specifications that require an aggregate processing facility. No facilities or other provisions to produce those materials were provided.
- No temporary stockpiling capacity is included in the project description or FEIR to deal with a lack of market demand, or even to accommodate variations in demand. The applicant apparently envisions starting and stopping mining operations as individual orders come in from unknown sources.
- The FEIR does not provide adequate testing to determine the potential impacts of the mine from airborne asbestos.
- The FEIR does not provide adequate testing to determine if the mine waste will qualify as Group C.
- The viability of the critical operational plan to dispose of mine waste is not demonstrated.

CEQA requires that the EIR *"**...give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts.**" (CEQA 15125)* This Final EIR fails to meet that requirement.

March 23, 2023

Dear Commissioners,

We have attached our attorney's comments on the FEIR which will also be in your packets for the upcoming hearings. You can view the technical attachments to the letter at the link below.

As you know, Community Environmental Advocates Foundation (CEAF) has been coordinating the CEAF/Minewatch campaign to defeat the Idaho Maryland Miner reopening.

We are particularly concerned about the adequacy of the Final Environmental Impact Report. We commented extensively on the Draft EIR and we do not believe that the FEIR answered many critical impact questions. For example, we are left not knowing what the critical surface water quality, air quality/asbestos, greenhouse gas, and groundwater/well impacts really are. In fact, the FEIR is so flawed that we are asking that the Planning Commission not recommend certification of the DEIR and to simply recommend denial of the project.

You will also receive our Minewatch Coalition comment letter soon. It represents the concerns of many local and statewide organizations.

Thank you for your work on this important decision.

Sincerely,
The Community Environmental Advocates Foundation Board

Re: Idaho-Maryland Mine Project Final Environmental Impact Report

Dear Mr. Kelley:

On behalf of Community Environmental Advocates Foundation (CEA Foundation), we respectfully submit these comments in connection with the Final Environmental Impact Report (FEIR) for the Idaho-Maryland Mine Project (Project). As demonstrated in our comments on the Draft Environmental Impact Report (DEIR), the DEIR failed to comply with the California Environmental Quality Act (CEQA), Public Resources Code section 21000 *et seq.* Numerous inadequacies in its scope, project description, and analysis and mitigation of environmental impacts precluded any meaningful review of the Project, and required that the DEIR be revised and recirculated. Our comments had also explained that it would be improper and infeasible to attempt to correct these deficiencies within an FEIR.

Unfortunately, the FEIR has not fixed the myriad issues in the DEIR. In particular, it continues to erroneously exclude the remediation of the Centennial Site from the Project description and environmental baseline. Its alternatives analysis also remains deficient. And it has not adequately addressed the numerous faults in the DEIR's analysis and mitigation of impacts related to waste rock and tailings, hydrology, water quality, air quality, greenhouse gas (GHG) emissions, or energy use. Because the EIR remains deeply flawed, CEA Foundation urges the County to deny the Project and not certify the EIR.

This letter, along with the February 2, 2023 report prepared by Baseline Environmental Consulting regarding air quality, GHG emissions, and energy use (attached as Exhibit A), constitute our comments on the FEIR. Please refer to that report for further detail and discussion of the FEIR's continued inadequacies.

I. The EIR still fails to describe the Project accurately or to use an accurate baseline by refusing to admit that the Centennial Site remediation is part of this Project.

We previously commented that the DEIR's project description is flawed because it improperly excludes the proposed remediation of the Centennial Industrial Site (the "Centennial cleanup") pursuant to a Voluntary Cleanup Agreement with the California Department of Toxic Substances Control ("DTSC"). The DEIR also lacks a legally adequate baseline because it assumes the Centennial cleanup will have been completed as the baseline to analyze certain impacts, while using existing conditions—*i.e.*, without the cleanup—on the site as the baseline to analyze other impacts. The FEIR failed to correct either of these problems.

A. The FEIR does not correct the improper project description, but instead continues to omit the Centennial cleanup.

The DEIR's project description is legally inadequate because it excludes the required cleanup of existing contamination on the Centennial Site, which is plainly part of the Project. FEIR p. 2-798, 2-803-05. CEQA defines a "project" broadly to include the "whole of an action" with the potential to result in a physical change in the environment, rather than "each separate governmental approval." CEQA Guidelines § 15378(a), (c); *Nelson v. County of Kern*, 190 Cal.App.4th 252, 271 (2010) (the term "project" is "broadly construed and applied in order to maximize protection of the environment.") Where two actions are integrally related or where one is conditioned on another, they must be considered together as one project; segmenting their analysis is a way to evade a complete impact analysis, and is therefore forbidden. *Nelson*, 190 Cal.App.4th at 271.

Courts have described several ways that actions can be related such that they are deemed a single project under CEQA. *See POET, LLC v. State Air Resources Bd.* (2017) 12 Cal.App.5th 52, 74 ("[T]here are different ways actions can be related."). For example, one action is considered part of the remainder of the project when that action is "among the 'various steps which taken together obtain an objective," or when it is "part of a coordinated endeavor." *Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007) 155 Cal.App.4th 1214, 1226, 1228 (internal citation omitted).

Additionally, activities are related and constitute a single project when they are "related in 1) time, 2) physical location, and 3) the entity undertaking the action." *Id.* at 1227.

Based on these factors and considerations, the Centennial cleanup is plainly part of the IMM Project. First, it is an integral step to achieving the IMM Project's objectives. The DEIR lists as a project objective the aim to "[i]ncrease the usable land at the Centennial Industrial Site to allow its future use as industrial land." DEIR at 3-12. Accordingly, the applicant proposes to dump the approximately 500 tons of waste rock and tailings it will generate daily on the Centennial and Brunswick sites as "engineered fill." DEIR at 3-19; *id.* at 3-29; *see also* FEIR at 2-48 (defining "engineered fill" as "barren rock and sand tailings"). The engineered fill would be graded into pads intended to support future industrial development on both sites. DEIR at 3-29. However, the Centennial site cannot be used as a dumping ground for "engineered fill" from the IMM Project until it has been remediated pursuant to a DTSC-approved Remedial Action Plan (RAP). DEIR at 3-10. The RAP similarly reveals that the objective of the Centennial cleanup is to prepare the property for use to place "additional mine waste (mine rock and crushed sand tailings) resulting from future mining operations." *See* Exhibit C to Shute Mihaly & Weinberger March 30, 2022 Comments on DEIR (Draft Final RAP) at xv. Accordingly, the Centennial cleanup is one of the steps to obtaining this Project objective. *See Tuolumne County*, 155 Cal.App.4th at 1226.

Furthermore, the review process and proposed timeline for the Centennial cleanup are closely related in time to the review process and proposed start of the IMM Project. The applicant submitted the Centennial RAP January 25, 2021. *See* Exhibit C to Shute Mihaly & Weinberger March 30, 2022 Comments on DEIR (Draft Final RAP). Around that same time, the applicant was beginning the environmental review process for the IMM Project: the County issued the Notice of Preparation on July 17, 2020, and it issued the DEIR in December 2021. And, as evidenced by the fact that the DEIR assumes the Centennial cleanup will have already occurred, the applicant aims to complete the cleanup before the IMM Project commences. Accordingly, this factor shows that the Centennial cleanup is closely related to the IMM Project. *See Tuolumne County*, 155 Cal.App.4th at 1227.

The physical location of the Centennial cleanup is also closely related to the IMM Project: the Centennial site comprises the physical site of the IMM Project. DEIR at 3-1, 3-12. Finally, the same entity is undertaking both the Centennial cleanup and the IMM Project: Rise Grass Valley, the project applicant. *Compare* Exhibit F to Shute Mihaly & Weinberger March 30, 2022 Comments on DEIR (Department of Toxic Substances Control, Voluntary Cleanup Agreement) at 1 (naming Proponent as Rise Grass Valley,

Inc.) *with* DEIR at 1-1. Accordingly, under any test used to determine whether an action is part of a project for purposes of CEQA, the Centennial cleanup is plainly part of the IMM Project. *See Tuolumne County*, 155 Cal.App.4th at 1227.

Nevertheless, the FEIR merely restates the same faulty justifications from the DEIR for its decision to piecemeal the review of the Centennial cleanup from the IMM Project. FEIR at 2-7 to 2-10. These justifications remain unsatisfactory.

First, the FEIR contends that the IMM Project is "designed to proceed whether the DTSC clean-up project is completed or is not completed." FEIR at 2-8. Relatedly, the FEIR contends that the Centennial cleanup has independent utility, serves a different purpose, and can be implemented independently of the IMM Project. *Id.* at 2-9. These assertions ignore the fact that one of the IMM Project's objectives is to reclaim the Centennial Site for future industrial use. DEIR at 3-42, 3-46. The assertions are also belied by the fact that all of the alternatives considered in the DEIR assume the Centennial cleanup has occurred and the DEIR assumed the Centennial cleanup had occurred as the baseline to analyze several environmental impacts, as discussed further below.

Accordingly, the FEIR's citation of *Banning Ranch Conservancy v. City of Newport Beach* (2012) 211 Cal.App.4th 1209, 1223, only serves to reinforce that the Centennial cleanup is part of the IMM Project. *See* FEIR at 2-8. According to the FEIR, this case provides that one of the only circumstances in which two activities will be considered a single project under CEQA is when development of the project under review requires or presumes completion of another activity. *Id.* However, that is *exactly* the circumstance here: the DEIR presumes in much of its analysis that the Centennial cleanup will have occurred. *See* DEIR at 1-6 to 1-7; *id.* at 6-16 to 6-42.

Second, the fact that the EPA identified the Centennial site for possible remediation before the applicant owned the IMM Project site, and that discussions about the Centennial cleanup "began between the U.S. EPA, the DTSC and the site owner prior to any application for the IMM Project having been submitted" (FEIR at 2-8) is immaterial to whether the Centennial cleanup is part of the IMM Project. Whether there were amorphous "discussions" and "coordination" among the parties does not change the fundamental fact that the DEIR includes as a project objective the use of the Centennial site, and that it presumes the Centennial cleanup will have occurred and relies on that presumption in its impacts and alternatives analyses.

Third, the FEIR says, the Centennial cleanup is under DTSC's control, whereas the IMM Project is under the County's control. FEIR at 2-8. However, this fact is irrelevant for purposes of defining the "project." Indeed, the CEQA Guidelines expressly state that a project comprises the "activity which is being approved and which may be subject to several discretionary approvals by governmental agencies. The term 'project' does not mean each separate governmental approval." CEQA Guidelines § 15378(c). Courts have elaborated that this requirement is meant to prevent the exact circumstances present here: a project proponent filing "separate environmental reports for the same project to different agencies thereby preventing 'consideration of the cumulative impact on the environment...'" *Nelson*, 190 Cal.App.4th at 271 (internal citation omitted). Here, the applicant filed its EIR with the County for the IMM Project, and it entered into the Voluntary Agreement and submitted the Draft Final RAP to the DTSC for the Centennial cleanup. Doing so does not change the fact that these are part of the same project for CEQA purposes, and that they must be analyzed together.

The FEIR's reliance on *Citizens for a Sustainable Treasure Island v. City and County of San Francisco* (2014) 227 Cal.App.4th 1036, is unavailing. *See* FEIR 2-9. There, the Court of Appeal upheld an EIR for the City's proposed development project on Treasure Island that would occur after the Navy had cleaned up hazardous materials on the project site. 227 Cal.App.4th at 1056. The cleanup was "the sole responsibility of the Navy," and the EIR assumed that it would be completed before the property was conveyed to the City. *Id.* at 1056-57. However, the EIR also contemplated the possibility that the City might assume responsibility for remediating certain sites on the property. *Id.* at 1057. Accordingly, although the possibility of any cleanup effort by the City was "abstract and speculative," the EIR nevertheless included a contingent mitigation measure in case the City were to assume control of the cleanup. *Id.* at 1058. The court upheld the City's deferral of CEQA analysis for any such potential cleanup, noting that the City could not "possibly know whether it will be called upon to undertake a more active role" in the cleanup. *Id.* at 1058-59.

Treasure Island does not help the County, because that case did not address whether the Navy's cleanup should have been part of the project being analyzed in the EIR. Instead, the court was addressing the question whether the City had properly disclosed how it would manage and dispose of hazardous materials in the event it took responsibility for part of the cleanup. *Id.* at 1058-59.

Additionally, to the extent the court in *Treasure Island* sanctioned reviewing the cleanup separately from the later development project, the facts of that case are distinct. There, the Navy, rather than the project proponent, was responsible for cleaning up the

site. *Id.* at 1056-57. Here, the project applicant is responsible for both the Centennial cleanup and the IMM Project. Furthermore, the Navy cleanup was already under way in *Treasure Island*, and nearly half of the project site had been cleaned up or was uncontaminated. *Id.* at 1056. And, the cleanup activities would occur "with or without the Proposed Project." *Id.* Here, in contrast, it is unclear whether the Centennial cleanup will be approved let alone whether it will be completed during the lifetime of the IMM Project. Accordingly, while it might have been reasonable to assume the Navy cleanup would occur in *Treasure Island*, there is no similar reason to assume that the Centennial cleanup will occur, nor to rely on that assumption to analyze impacts or alternatives.

Finally, in the alternative, even if it were appropriate to sever the Centennial Cleanup from the IMM Project, the DEIR and FEIR would have erred by failing to analyze the cumulative impacts of these projects together. CEQA requires the "cumulative effects of two separate projects which are 'individually limited but cumulatively considerable' to be addressed in the EIR." *San Joaquin Raptor Rescue Center v. County of Merced* (2007) 149 Cal.App.4th 645, 733 (citing Pub. Resources Code § 21083(b)). Because the Centennial Cleanup was severed from the project description, and the combined effects of the Cleanup and the IMM Project were not considered in the DEIR or the FEIR, these documents provide an "inaccurate assessment" of the IMM Project's impacts. *See id.* at 733.

B. The FEIR does not correct the inaccurate and shifting baseline, which assumes for some impact analyses that the Centennial Cleanup is complete, and for others that it is not.

As we explained in our comments on the DEIR, CEQA requires that an EIR include an accurate description of a project's environmental setting, which provides "the baseline physical conditions by which a lead agency determines whether an impact is significant." CEQA Guidelines § 15125(a). This baseline "should describe physical environmental conditions *as they exist at the time the notice of preparation is published*." *Id.* (emphasis added)."Without a determination and description of the existing physical conditions on the property at the start of the environmental review process, the EIR cannot provide a meaningful assessment of the environmental impacts of the proposed project." *Save Our Peninsula Com. v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 119. CEQA also prohibits the use of "hypothetical conditions, such as those that might be allowed, but have never actually occurred, under existing permits or plans, as the baseline." CEQA Guidelines § 15125(a)(3).

Here, the DEIR pretended that the Centennial Site cleanup was already completed in its analysis of aesthetic impacts, agriculture and forestry resources, biological resources, hazards and hazardous materials, and wildfire risk. DEIR at 1-6 to 1-7. However, in the analysis of other impact areas and elsewhere, the DEIR and FEIR acknowledged that the Centennial Site cleanup might not be approved by DTSC. *See, e.g.*, DEIR at 1-3, 3-26; FEIR at 2-8 (acknowledging the cleanup might not be completed within the life of the IMM Project).

In our comments on the DEIR, we explained that it was improper to define existing conditions with reference to conditions "expected when the project becomes operational" because there is no guarantee that the Centennial site cleanup will have even begun—let alone been completed—before the Project begins operations. FEIR at 2-801. The DEIR *itself* acknowledges that the cleanup may not be approved by DTSC, and may never be completed. DEIR at 1-3, 3-26. Accordingly, the DEIR's use of a hypothetical baseline for various impact areas in which the Centennial cleanup has already occurred renders its analysis legally inadequate and unsupported by substantial evidence. FEIR at 2-801.

The FEIR contends that it was not using a future conditions baseline, but instead the "conditions expected when the project becomes operational." FEIR at 2-295. However, there is no evidence that that the Centennial cleanup will have occurred such that it can be "expected" by the time the Project is operational.

The FEIR does nothing to correct this fundamental deficiency in the Project's baseline. Instead, the FEIR doubles down on its use of an inconsistent baseline for the DEIR's impact analyses. According to the FEIR, "the baseline for the Centennial Site was adjusted because the proposed project could not possibly impact that site unless and until the DTSC cleanup project has already been completed." FEIR 2-924. Therefore, the FEIR says, "presenting the Project's impacts to the Centennial Site based on the pre-DTSC Project conditions would be misleading . . . and would not represent actual project impacts." *Id.*

To the contrary, it is the EIR's strategy of separating the Centennial cleanup from the IMM Project that it is misleading. The EIR truncates its environmental analysis and only considers a portion of the impacts attributed to the IMM Project, without considering the considerable impacts of the Centennial cleanup. By assuming the Centennial cleanup has already been completed for purposes of defining the baseline to analyze impacts—while at the same time claiming that it may never happen and is not part of the Project—the EIR ignores the impacts caused by the Centennial cleanup. *See*

Woodward Park Homeowners Assn., Inc. v. City of Fresno (2007) 150 Cal.App.4th 683, 707 ("If an EIR for a construction project on vacant land uses something other than vacant land as its baseline, the EIR will report only a portion of the impacts the project will have.").

Additionally, the EIR's inconsistent baseline precludes a consistent description of the IMM Project's impacts. CEQA allows the use of multiple baselines only if the EIR compares the project to *each* of the baselines. *See Woodward Park Homeowners Assn., Inc. v. City of Fresno* (2007) 150 Cal.App.4th 683, 707. For example, in *Woodward Park* the EIR acknowledged that the existing condition of the project site was a vacant lot, but then in many instances it compared the project's impacts to those of the maximum buildable development under zoning and plan designations. 150 Cal.App.4th at 707. Had the EIR actually evaluated the project's impacts "in relation to *both* a vacant lot *and* a large development permissible under existing zoning and plan designations," the court found that the treatment of the baseline would have been legally correct. *Id.* Instead, the EIR largely compared the proposed project to buildout possible under the zoning, "combined with a scattered, partial discussion of some of the project's impacts relative to vacant land." *Id.* at 707-08. Accordingly, the EIR did not present a "clear or consistent description" of the project's impacts compared with the effects of leaving the land in its existing state." *Id.* at 708.

The FEIR also contends it "explicitly addresses" the situation in which the cleanup might not occur by analyzing the impacts of placing engineered fill on the Brunswick Site but not the Centennial Site, and hauling the remaining fill to local and regional markets. FEIR at 2-925 (citing DEIR 1-3). In response to comments noting that the DEIR failed to analyze the impacts if the Centennial Site were not available to receive 1.6 million tons of mine waste, the FEIR merely added a condition of approval that would require the use of electric trucks to transport waste rock and engineered fill offsite before 2033. FEIR at 2-925-26. However, this condition assumes the use of electric vehicles is a panacea for all potential impacts caused by hauling this waste rock offsite. To the contrary, there may be impacts to water quality caused by the debris left by electric vehicles traveling greater distances to transport the waste rock; air quality impacts caused by dust and debris from the vehicles; GHG impacts associated with producing the electricity for the vehicles, and more. The County should revise the DEIR to analyze these potential impacts if the Centennial site is unavailable.

The FEIR asserts that our comment letter "mistakenly reference[d] CEQA Guidelines Section 15125(a)(2), for 'future conditions' baselines, but the DEIR relied on CEQA Guidelines Section 15125(a)(1), which allows use of a baseline consisting of

'conditions expected when the project becomes operational.'" FEIR at 2-925. According to the FEIR, the reliance on expected conditions was appropriate because "it is reasonably expected that the DTSC cleanup project will be complete with the project becomes operational." *Id.* This response is not only belied by the FEIR's acknowledgements elsewhere that the DTSC cleanup might not be completed at all within the 80-year term of the IMM Project, but it also misapprehends our comments on the DEIR.

As we explained, despite asserting that it was *not* using a future baseline, the DEIR in fact *does* use a future baseline when it assumes that the Centennial Site Cleanup has occurred. Comments at 7-8. As the CEQA Guidelines make clear, projected future conditions are simply "those beyond the date of project operations." Guidelines § 15125(a)(2). Because the FEIR and DEIR have acknowledged that the post-remediation baseline for the Centennial Site may not occur until after Project operations have begun, (DEIR at 1-3, 3-26), they are using a projected future conditions as its baseline.

Accordingly, the FEIR *must* satisfy the requirements for a future baseline, which include demonstrating "with substantial evidence that use of existing conditions would be either misleading or without informative value to decision-makers and the public." Guidelines § 15125(a)(2). The EIR may not avoid these requirements simply by asserting that it does not purport to use a future baseline. *See* DEIR at 1-4, FEIR at 2-925. Similarly, the FEIR may not avoid the requirements to justify its use of a future conditions baseline by contending that it expects the Cleanup project to be complete by the time the IMM project becomes operational, especially when it has also acknowledged the opposite is also possible. *See* FEIR at 2-925; *id.* at 2-10.

II. The FEIR does not correct the DEIR's deficient alternatives analysis.

CEQA requires that an EIR consider a "reasonable range" of alternatives "that will foster informed decision-making and public participation." CEQA Guidelines § 15126.6(a). These alternatives must "feasibly attain most of the basic objectives of the project" but "avoid or substantially lessen any of the significant effects of the project." *Id.* The DEIR's alternatives analysis was flawed both because it failed to find certain impacts significant, and therefore it did not study alternatives that would avoid those impacts, and also because it failed to study alternatives that would reduce any of the Project's significant impacts on aesthetics, noise, and transportation to less than significant levels. DEIR at 6-44; FEIR at 2-853 to 2-854.

The FEIR simply doubled down on the DEIR's alternatives analysis, reciting the number of alternatives it considered and rejected and those that it analyzed in detail. FEIR 2-924 (noting that the DEIR "considered nine different alternatives," five of which were rejected, and four of which were analyzed in detail). The County "believes" the DEIR's approach, and specifically the *number* of alternatives it considered, "provides a reasoned choice of alternatives for consideration by the public and decisionmakers." *Id.* However, the number of alternatives has no bearing on whether the EIR actually considered alternatives that could reduce the Project's significant impacts. As commenters pointed out, the DEIR's alternatives would not reduce *any* of the Project's significant impacts. FEIR at 2-853 to 2-854. For that reason, the EIR's analysis of alternatives did not permit a reasoned choice about the IMM Project.

In response to comments that the DEIR failed to find certain impacts significant, the FEIR contends these comments did not explain why the DEIR reached the wrong conclusion about these impacts. FEIR at 2-946. However, this response ignores the comments' copious discussion about the deficiency of these impact analyses. *See, e.g.*, FEIR at 2-809 to 2-817 (explaining the deficiency in the DEIR's analysis of hydrology and water quality impacts); FEIR at 2-825 to 2-837 (explaining the deficiency in the DEIR's analysis of hazards); FEIR at 2-827 to 2-833 (explaining the deficiency in the DEIR's analysis of air quality impacts); *see also* FEIR at 2-853 (explaining that the DEIR's incorrect significance conclusions tainted its alternatives analysis).

Additionally, all the alternatives, including the no-project alternative, assumed that remediation of the Centennial site would occur. DEIR at 6-16 to 6-42; FEIR at 2-855. The FEIR contended there was no reason its alternatives should *not* assume that the Centennial site is remediated. FEIR at 2-947 ("The commenter does not explain why the DEIR must assume the DTSC project is not completed for the purpose of analyzing alternatives to the project."). This assertion is belied by the FEIR *also* acknowledging the very real possibility that "Project activities would not be allowed on the Centennial Site" if the cleanup is not completed. FEIR at 2-10. As described above, the EIR also has strenuously denied that the IMM Project relies on the Centennial cleanup being completed. If that is the case, and given the potential that the cleanup may never be approved, let alone completed, the EIR should study alternatives that do not assume that the Centennial cleanup will be completed.

The DEIR also defined the Project so narrowly that very few alternatives could reasonably meet its objectives. FEIR at 2-854. "The purpose of an EIR is *not* to identify alleged alternatives that meet few if any of the project's objectives so that these alleged alternatives may be readily eliminated." *Watsonville Pilots Assn. v. City of Watsonville* (2010) 183 Cal.App.4th 1059, 1089. Attempting to defend the Project's narrowly-defined

objectives, the FEIR contended that setting a particular ore production level as an objective was necessary in order to feasibly finance and construct a mine "that will take in excess of 100 million dollars to construct." FEIR at 2-946. However, this circular logic simply assumes Project as described in the DEIR will be built and will cost 100 million dollars, thereby failing to consider alternatives that would be cheaper to construct and therefore could be feasible at lower production levels. Furthermore, this response ignores the CEQA Guidelines requirement to focus on alternatives that would avoid significant effects, even if those alternatives "would be more costly." Guidelines § 15126.6(b).

Additionally, in contending that it was necessary to achieve a certain ore production level, the FEIR ignored evidence showing that a mining project with lower production would still be economically viable. An independent economic analysis of the proposed Idaho-Maryland Mine conducted for the County showed that the project would be profitable even assuming very low reserves. *See* Exhibit B (RDN, Robert N. Niehaus, Inc., "Economic Impact of the Proposed Idaho-Maryland Mine Project," Nov. 15, 2022, at 52-53). This analysis assessed a "high-end scenario," based on assumed yearly production of 108,400 ounces of gold. *Id.* at 52. Under this scenario, the mine would earn $179.8 million annually, with $68.3 million in annual expenses, resulting in a net annual income of $111.5 million. However, even under the "low-end scenario," in which the mine would produce only 26,500 ounces of gold annually, and earning only $44 million annually and incurring annual expenses of $16.7 million, the mine would still be profitable, netting an annual $27.3 million. *Id.* at 53. Furthermore, even assuming production were cut in half from the low-end scenario to $22 million, and conservatively assuming expenses remained the same, at $16.7 million, the mine operations would *still* yield $5.3 million in net annual income, reflecting a roughly 25% profit. *See id.* Accordingly, the FEIR should have included a more flexible objective with respect to the project's output.

The FEIR also defended the objective to locate the project on property owned by the applicant with existing access to underground workings, because economical quantities of gold "exist in very limited locations." FEIR at 2-947. However, this response ignores the information in the DEIR itself that sets out numerous mineral resource zones containing in Western Nevada County alone. DEIR at 6-9 to 6-10. The response also fails to justify why the IMM Project must take place on property with existing access to underground workings—an objective that unnecessarily narrows the field of possible project sites.

The FEIR's attempt to justify only the Project's first two objectives also ignores the eight other project objectives that impermissibly narrow its scope and thus the range of potential alternatives. For example, the objective to "[u]tilize existing underground

access points" limits the project to properties with such infrastructure, while the objective to "[p]rovide property owners along East Bennett Road a reliable and clean potable water source" narrows the possible locations to one near this road. DEIR at 3-12.

The FEIR also contends that it has satisfied the Guidelines section 15126.6(b) requirement to focus on alternatives that would avoid or substantially lessen any significant effects "even if these alternatives would impede to some degree the attainment of the project objectives" because the DEIR "does include discussion of alternatives that do not satisfy all project objectives." FEIR at 2-946 to 2-947. However, this interpretation of the Guidelines ignores the *most salient* requirement of that Guideline: that the alternatives considered would avoid or substantially lessen significant effects. Guidelines § 15126.6(b). Here, the EIR examined alternatives that did not avoid or substantially lessen the Project's significant effects on aesthetics, noise, and transportation. Instead, the County should revise the DEIR to include an analysis of alternatives that would actually reduce these significant effects

The FEIR also attempted to refute commenters' argument that it should have selected Alternative 2 as the environmental superior argument. This Alternative would reduce the Project's significant impacts in nine of the ten categories found to be significant. DEIR at 6-42. However, according to the FEIR, while this Alternative would "lessen some traffic impacts," it would not "substantially lessen" environmental impacts, and therefore it does not preclude approval of the Project. FEIR at 2-948 to 2-949 (citing DEIR 6-21 to 6-29). This response, which focuses inexplicably on traffic impacts, ignores the fact that the Alternative would reduce nine out of ten significant impacts.

Further, the Guidelines do not define "substantial," nor do they require an alternative to reduce an impact from significant to less than significant in order to substantially lessen an impact. *See* CEQA Guidelines § 15021(a)(2). Here, the County's own description of Alternative 2 explains that it would have "fewer" impacts in nine of ten impact areas, without specifying the degree of these decreases, i.e., whether they would be "substantially less." *See* DEIR at 6-44. Accordingly, it is disingenuous to claim that these reductions are not "substantial" enough for CEQA's purposes. Finally, the County's interpretation ignores its fundamental duty under CEQA to "avoid or minimize environmental damage where feasible." CEQA Guidelines § 15021(a).

III. The FEIR continues to defer the testing required to ensure that waste rock and tailings will not result in harmful discharges, and it still does not have a plan for safely storing this fill material on site pending its sale and use offsite.

The DEIR includes a plan to utilize waste rock and mine tailings generated by the Project as "engineered fill" on the Centennial and Brunswick sites, and then, once these sites are at capacity, to sell these materials for use as construction aggregate in the region. FEIR 2-59, 2-826. This waste rock has the potential to be contaminated. As a result, whether these materials are used as engineered fill on the Centennial and Brunswick sites, are sold offsite, or are stockpiled onsite pending some further action, they risk discharging contaminants and causing water quality issues.

The DEIR found that the impact to water quality from mine waste was potentially significant, and that mitigation is required for this impact. FEIR at 2-45. Proposed mitigation includes submitting a Report of Waste Discharge to the Regional Water Quality Control Board, and obtaining approval of a Waste Discharge Requirements permit before placing mine waste as engineered fill. FEIR 2-60 to 61. According to the FEIR, significant testing will be required to obtain Waste Discharge Requirements permit from the Water Board. FEIR at 2-45. As part of this process, the Water Board will determine the appropriate mining waste classification for the proposed engineered fill. FEIR at 2-61. Mine waste is classified pursuant to regulations as either Group A, Group B, or Group C, based on an assessment of the risk of water quality degradation. 27 C.C.R. § 22480(b). According to the FEIR, testing done for the DEIR shows that the waste rock from the IMM Project will likely be considered Group C mining waste, FEIR at 2-47, which is waste from which any discharge would be in compliance with the applicable water quality control plan. 27 C.C.R. § 22480(b)(3).

However, commenters pointed out that the waste characterization conducted on the Project site—which relied on two samples, from a total of 11 feet of drill core, to characterize waste rock generated during the entire 80-year life of the project (FEIR 2-502)—was inadequate, and that further testing was required to ensure that the use of fill would not impact water quality. FEIR 2-433. The FEIR denies the need for additional testing, relying on the inadequate testing done to date to assert that "mine materials will *likely* be classified as Group C mine waste." FEIR 2-59 (emphasis added). This response ignores commenters' concerns that the testing done to date has been insufficient. The FEIR also deferred any further testing to the waste characterization process done as part of the process of submitting a Report of Waste Discharge to the Water Board. *Id.* at 2-47.

The FEIR also refused to plan for the potential scenario that the waste rock is not fit for sale and must instead be stored onsite. *See* FEIR at 2-507. The Central Valley

Regional Water Quality Control Board commented that it was "concerned with the general assumption" that "a significant volume of the mining waste produced during the life of the Project will be suitable for off-site sale and use . . . with limited regulatory restrictions (i.e., Group C mining waste)." FEIR at 2-233. As a result, the Water Board noted that the County "should examine[]" the "alternative scenario that the mining waste is not suitable for off-site use." *Id.* The FEIR brushed off this concern, asserting that its testing showed that this situation "is not reasonably expected to occur." FEIR at 2-238 to 239. Elsewhere, the FEIR affirmed that "[n]o stockpiles of fill material are proposed on-site," failing to explain its plan to store these materials pending sale or in the event they are not fit for sale. FEIR at 2-564.

The FEIR modified Mitigation Measure 4.8-1(e) to state that only mining products previously classified as Group C mining waste will be utilized for local and regional construction projects. FEIR 2-60. However, this modification to the Mitigation Measure does not assuage concerns that waste that does not qualify as Group C waste could nevertheless be stored onsite or used as "engineered fill" at the Brunswick and Centennial Sites. *See* FEIR 2-61 (the Mitigation Measure was modified to add the sentence, "The applicant shall not sell or utilize waste rock and tailings from the Project for construction aggregate or fill purposes *offsite* (*i.e., sites other than the applicant[']s Brunswick and Centennial sites*) unless such material has been tested and confirmed to qualify as Group C mining waste.") (emphasis added).

The Mitigation Measure should be modified to also prohibit the applicant from using waste rock and tailings for fill purposes *on the Brunswick and Centennial Sites* unless it is tested and confirmed to qualify as Group C waste. The Water Board's comments on the DEIR affirmed this point, noting that the waste rock "being proposed for engineered fill will need to be characterized as Group C mining waste . . . prior to its use as engineered fill." FEIR at 2-233. And yet, in response to the Water Board's comment, the FEIR merely deleted a statement that the "engineered fill would be considered a Group C mining waste," (FEIR at 2-237), and the FEIR's change to Mitigation Measure 4.8-1(e) gives no indication that it will require the waste rock used as fill on the Brunswick and Centennial sites to qualify as Group C waste.

The FEIR avoids a full evaluation of water quality impacts related to the use of waste rock and mine tailings as engineered fill by stating that the project proponent would be required to submit a Report of Waste Discharge (RoWD) and that Waste Discharge Requirements (WDR) before the mine waste is placed. FEIR 2-516. However, compliance with existing policies and regulations does not excuse the agency from describing project activities or from analyzing resulting impacts. *See Protect the Historic Amador Waterways v. Amador Water Agency* (2004) 116 Cal.App.4th 1099, 1108-09

(environmental effect may be significant despite compliance with such requirements). To simply assert that water quality standards will be met is not sufficient for the public or decisionmakers to assess either the adequacy of water treatment methods proposed or the adequacy of the standards proposed for the discharge permit.

Finally, to avoid mining waste rock that is contaminated, the FEIR also asserts that the applicant will collect samples before mining, and that "[r]ock types that are not suitable for offsite sale *would likely* not be mined, and if mined, the waste rock would be placed underground." FEIR 2-60 (emphasis added). This flimsy prediction of what *might* happen is no assurance that the Project will not result in contaminated waste rock with the potential to cause water quality issues as it sits onsite before being shipped offsite, or is used as fill on the Brunswick and Centennial sites. Furthermore, the EIR's statement that the applicant will simply place contaminated waste rock that is unsuitable for sale "underground" provides no binding guarantee about how this waste will be treated to ensure it does not result in water quality issues. The EIR must provide a clear plan for how it will safely store waste rock that does not qualify as Group C waste fit for sale that does not risk contaminating water onsite.

IV. The FEIR does not address the basic deficiencies in the DEIR's groundwater and water quality analyses.

The EIR's existing groundwater analysis remains deeply—and admittedly—flawed. The FEIR proposes to correct these errors by eventually doing the necessary analysis, but only after the project has been approved. This is inadequate. The EIR itself needed to have included a current and accurate environmental baseline. Without one, the EIR's impacts analysis and mitigation measures also are necessarily defective. Moreover, the FEIR has not adequately responded to concerns commenters raised with the soundness of its groundwater level modeling methodology.

A. The EIR's outdated groundwater baseline deprives its impacts and mitigation analyses of any value.

The most recent groundwater well level measurements in the EIR are from 2007. These data were collected by the Idaho-Maryland Mining Corporation (IMMC) from 79 private domestic wells during two monitoring periods, from 1995 through 2001 and again from 2003 through 2007. *See* DEIR 4.8-11; DEIR App. K.2 at 26–28. The DEIR relied upon these data to construct its groundwater level baseline and to calibrate its modeling of groundwater impacts. (*See* FEIR 2-74.) Several commenters contested this approach, explaining that fifteen-year-old data cannot possibly furnish an accurate environmental baseline. *See id.* at 2-73, 2-76.

The FEIR does not meaningfully refute these criticisms. In fact, it acknowledges that there are major gaps in the existing data. *See* FEIR 2-74 "[N]o groundwater level measurements have been completed since 2007, which creates some uncertainty to [*sic*] the predicted impact to percentage of water column in domestic well."). But it claims that all these deficiencies will be cured through the implementation of a groundwater monitoring plan—*after* the EIR has been certified and the Project approved. *See id.* Under this plan, "water-level monitoring data" will be "collected before commencement of dewatering," and any "[i]mpacts to domestic water wells will be measured against those current baseline measurements and not historic water levels." *Id.*; *see also id.* at 2-76 ("This water level monitoring [under the post-approval plan] will provide the baseline levels prior to dewatering. The collection of 12 months of baseline data allows for the seasonal change in water levels at each location to be captured.").

This is not so much an explanation as it is an admission that the EIR is legally deficient. The FEIR cannot postpone to some opaque post-CEQA process the articulation of the environmental baseline that should have been the foundation of the EIR's impacts analysis. *See County of Amador v. El Dorado Cnty. Water Agency* (1999) 76 Cal.App.4th 931, 952 ("Before the impacts of a project can be assessed and mitigation measures considered, an EIR must describe the existing environment. It is only against this baseline that any significant environmental effects can be determined."); CEQA Guidelines §§ 15125, 15126. This is not, as the FEIR presents it, simply a matter of deferred mitigation. *See* FEIR 2-931 through -932, 2-951 through -952. It is the deferral of the EIR's entire groundwater impacts analysis.

That postponement would be improper under any circumstances. *See Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 441 ("CEQA's informational purpose is not satisfied by simply stating information will be provided in the future." (citation and internal quotation marks omitted)). But it is especially unjustifiable here, given that the FEIR offers no reasons for why new well level data cannot be collected and analyzed until after the Project is approved. *See* FEIR 2-74, 2-76 (acknowledging comments that said new groundwater data needed to be incorporated within the EIR, but not explaining why this could not or need not be done).

Because the EIR lacked "an adequate baseline description" of existing groundwater levels, it was "impossible" for the EIR to have provided a reasoned "analysis of impacts, mitigation measures[, or] project alternatives." *County of Amador*, 76 Cal.App.4th at 953. For example, the EIR could not reasonably conclude that the Project's potentially significant impacts to domestic groundwater wells would be limited to the East Bennett area, when that impacts modeling was based on admittedly deficient inputs. *Contra* FEIR 2-79. Nor could it accurately predict the extent of the Project's one-

foot "drawdown isopeth," and thus the extent of the properties that should be eligible for the newly proposed Domestic Well Monitoring Program. *Contra* FEIR 2-79 through -80. As the FEIR itself correctly observes, "speculation" and "unsubstantiated opinion . . . does not constitute substantial evidence." (*Id.* (quoting CEQA Guidelines § 15384).); *see also Kings Cnty. Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 721–23 (mandating an EIR must consider environmental impacts over the entire area where one might reasonably expect them to occur). But "speculation" is all the EIR rests upon until there is an adequate inventory of existing environmental conditions.

Elsewhere, the FEIR also implies that the newly collected data will not reveal anything different, in any event, since the existing domestic well data do not display any "long-term increasing or decreasing trends." FEIR 2-74; *see also id.* at 2-93, 2-519, 2-952,[1] 2-5824. This secondary response is no more compelling. First, the FEIR's idle speculation about what current measurements might show is no reason to delay their collection. Second, datapoints collected sporadically over a twelve-year period ending over fifteen years ago is hardly a basis from which to gauge "long-term" trends. This is especially true when climatic conditions between 1995 and 2007 were significantly and consistently wetter than over the next fifteen years.[2] The region's mean annual precipitation from 1995 to 2007 was approximately 57.63 inches—over 8 inches more than the 49.33-inch annual average from 2008 through 2022.[3] And the 2008 through 2022 period saw *five* years that were drier (2008, 2013, 2015, 2020, 2022) than the driest single year between 1995 and 2007 (2007).[4] These included the driest single year on record (2013), and four of the five driest years for which near-complete data are available (2008,

[1] This passage, in particular, alleges that new data would not change the DEIR's groundwater impact analysis because that analysis "was based on a computer model of groundwater wells under existing (pre-dewatering) conditions." FEIR 2-952. This is incorrect. The existing model—as the FEIR and DEIR elsewhere admit—was calibrated using well level data that are at least fifteen years old. Without valid current data, it is entirely speculative to claim that "[a]dditional measurements would not substantially inform or change that [impacts] analysis." *Id.*

[2] All calculations here were derived from the same dataset that the DEIR used. *See* Western Regional Climate Center (WRCC), Grass Valley No. 2, CA – Total of Precipitation (Inches) (last updated Feb. 16, 2023), https://wrcc.dri.edu/cgi-bin/cliMAIN.pl?ca3573. A printout of this dataset is included as Exhibit C to this letter.

[3] This is also about 4.5 inches more than the 52.18-inch annual mean for the entire available reporting period (1966 through 2022). *See* Exhibit C (WRCC dataset).

[4] *See* Exhibit C (WRCC dataset).

2013, 2015, and 2020).[5] It strains credulity to assume that whatever "trends" in groundwater levels may or may not have emerged between 1995 and 2007 necessarily held up under these intervening circumstances.[6]

The FEIR also suggests that groundwater level data from individual "domestic wells" suffer from "uncertainties" that render the data unusable—or at least much less useful—for modeling purposes. FEIR 2-77, 2-953; *see also id.* at 2-955 through -956. This seems to be the basis for the FEIR's insistence that new groundwater monitoring wells must first be drilled before any accurate baseline information can be collected. *See id.* But this stance is in obvious tension with the fact that the DEIR's analysis *did* incorporate the existing domestic well level data from the 1995 through 2007 monitoring period. *See* FEIR 2-74, 2-76, 2-92 through -93; DEIR 4.8-11 through -12, 4.8-55 & n.34; DEIR App. K.2 at 26–28; DEIR App. K.3 at 7–8. If these datapoints from domestic wells are as nebulous as the FEIR claims, the DEIR and its appendices had no basis for relying upon them—even putting aside their outdatedness. But if domestic well level data *are* sufficiently reliable to serve as inputs, the EIR needed to have used measurements that are less than fifteen years old. The EIR's waffling about when and what domestic well data are useable suggests that its methodology was informed more by convenience than good science.

In sum, CEQA demands an accurate and up-to-date baseline from which to assess a project's impacts, alternatives, and mitigation measures. The EIR's groundwater level baseline does not fit that description. It admittedly uses no actual recent data from either domestic or monitoring wells. As a result, the EIR's entire groundwater supply analysis is unsupported. Promising to collect the baseline data later and to then re-run the analysis is not a "fix"; it is a concession that the EIR violates CEQA.

---

[5] *See id.*

[6] The FEIR acknowledges that there is, at minimum, a possibility that changes in climate and precipitation levels will impact groundwater recharge rates. *See* FEIR 2-93 through -94. But it dismisses any downward trend in recharge as "speculative" and unworthy of further analysis. *See* FEIR 2-94. The FEIR has it backwards. What is "speculative" is declining to collect new and readily available groundwater level data that could then be compared against the pre-drought 1995–2007 measurements, and instead insisting that any "trends" in the old dataset must have remained consistent over the past fifteen years.

B. The FEIR does not adequately respond to commenters' concerns regarding its faulty groundwater modeling.

Several commenters explained that the DEIR's groundwater analysis was flawed not only due to its bad inputs, but also because the modeling methodology itself was inappropriate and unjustified. *See, e.g.*, FEIR 2-812, 2-866, 2-5779 through 2-5782. Specifically, they emphasized that it was improper for the DEIR to have relied upon a flow model designed for porous media, at least without first conducting the extensive analysis necessary to determine if the fractured rock underlying the Project site actually displays those tendencies. *See id.* They noted that fractured rock aquifers can behave drastically differently than porous media aquifers, and thus the DEIR's models—and all of the impacts analyses and mitigation measures that relied upon them—could be entirely off base. *See id.*

The FEIR does not meaningfully respond to these criticisms. It simply reiterates that the DEIR was justified in assuming porous media conditions, and asserts that the new monitoring data to be collected post-Project approval will help to confirm whether these assumptions were correct. *See* FEIR 2-5783 through -5785; *id.* at 2-5785 ("A porous media representation is an appropriate way to model a fractured bedrock system at the scale of this project. However, the DEIR acknowledges that without the implementation of a groundwater monitoring program and well mitigation plan, the project could result in a significant impact to groundwater supplies.").

Once again, this response gets things completely backwards. The time to *confirm*—not to merely *assume*—what groundwater models would be appropriate for this Project site was during the DEIR preparation process. If a detailed geological evaluation had revealed that accurate modeling of the groundwater environment would instead require a more nuanced approach than the simplistic porous media model that the EIR currently uses, that is what CEQA demands.[7] Because the EIR instead relies on

[7] As multiple commenters pointed out, there are strong indications that the porous media model is inapt for the Project site. Among other evidence, existing well level data reflect a level of hydrologic discontinuity in the region that appears incompatible with a porous media environment. *See* FEIR 2-5780 through -5781. The FEIR's main response—apart from again asserting that post-approval data collection will help to fill in the analytical gaps—is that these discontinuities might not be quite as severe as commenters alleged. *See* FEIR 2-5784. But this does not address the broader questions of whether the aquifer is, in fact, a porous media environment or what Project-specific evidence the EIR drew upon in reaching that conclusion. Instead, the FEIR's responses suggest that it opted for the porous media model because the Project site's fractured rock environment appeared

uncorroborated assumptions and a smattering of outdated well level datapoints, *see* FEIR 2-5783, its groundwater modeling methodology is not supported by substantial evidence. As a result, each component of the EIR's groundwater analysis that relies upon that model—including its drawdown isopleth projections, the groundwater monitoring program, and the newly proposed domestic well monitoring plan—are themselves unsupported and inadequate. *See County of Amador*, 76 Cal.App.4th at 952; *Vineyard Area Citizens for Responsible Growth*, 40 Cal.4th at 441; CEQA Guidelines § 15384.

C. The EIR should have addressed how chemicals released from truck tires would impact water quality and aquatic species.

The Project would cause a substantial increase in truck traffic on regional roadways, including on roads that adjoin waterbodies like Wolf Creek and South Fork Wolf Creek. *See* DEIR 3-26 through 3-29, 3-30 (Fig. 3-13), 4.8-3 (Fig. 4.8-1). As they wear down, these trucks' tires inevitably would release the pollutant 6PPD-quinone (6PPD-q), a chemical that is ubiquitous in modern rubber tires.[8] There is a growing body of scientific literature demonstrating that 6PPD-q released from truck tires and leached into neighboring waterways is highly lethal to multiple species of fish and other aquatic organisms.[9] The EIR should have addressed the foreseeable impacts to water quality and biological resources that would result from increased 6PPD-q pollution associated with

---

roughly analogous, and implementing a more nuanced model would be too inconvenient. *See* FEIR 2-5783, 2-5785 (referencing three times the "large scale" of the Project when attempting to justify the use of the porous media model).

[8] *See* Erik Stokstad, *Common Tire Chemical Implicated in Mysterious Deaths of At-risk Salmon*, Science (Dec. 3, 2020), *available at* https://www.science.org/content/article/common-tire-chemical-implicated-mysterious-deaths-risk-salmon (attached as Exhibit D); Kate Raphael, *A Nasty Salmon-Killing Chemical Is in Bay Waterways. Can It Be Cleaned Up?*, Bay Nature (Mar. 2, 2023), *available at* https://baynature.org/2023/03/02/a-nasty-salmon-killing-tire-chemical-is-in-bay-waterways-can-it-be-cleaned-up/ (attached as Exhibit E).

Project vehicle trips. And, if necessary, the EIR should have incorporated feasible measures to mitigate these impacts.[10]

V. The FEIR's analysis and mitigation of impacts relating to air quality, GHG emissions, and energy use are flawed.

Commenters had pointed to several issues in the DEIR's evaluation of impacts and mitigation measures relating to air quality, GHG emissions, and energy use. The FEIR generally does not attempt to correct those errors, and instead offers up various rationales for sticking by the DEIR's analysis. For the reasons set forth below, each of the FEIR's responses is unavailing. The EIR remains deeply flawed, and in some areas the FEIR has made matters worse by offering up contradictory responses and unexplained proposals.

A. The FEIR provides only one justification for refusing to mitigate the Project's potentially significant operational air quality impacts, and that justification is wrong.

The DEIR recognized that the Project's operational impacts from ROG, NO_x, and PM_{10} emissions would be "potentially significant," based on the North Sierra Air Quality Management District's (NSAQMD) significance thresholds. But the DEIR also predicted that there would be no difference whatsoever between the project's "unmitigated" and "mitigated" operational emissions for these pollutants. *See* DEIR 4.3-67 through -70, 4.3-74 through -76. In other words, the DEIR identified a significant impact, and then did nothing to mitigate it. This violates CEQA's clear mandate that an EIR must either adopt all feasible mitigation measures to reduce impacts to less-than-significant levels, or it must explain why further mitigation is infeasible. *See King & Gardiner Farms, LLC v. County of Kern* (2020) 45 Cal.App.5th 814, 852; Cal. Pub. Res. Code § 21081(a); CEQA Guidelines § 15126.4(a).

Inexplicably, the FEIR and DEIR nonetheless assert that the Project's operational air quality impacts *have* been mitigated to less-than-significant levels. *See* FEIR 2-103; DEIR 4.3-73; DEIR App. E.1 at v, 51. The FEIR does not—and cannot—claim that the EIR's *construction*-related air quality mitigation measures will have any actual impact on the Projects *operational* air quality emissions; the DEIR itself shows that they will not.

---

[10] *See, e.g.*, J.K. McIntyre et al., *Soil Bioretention Protects Juvenile Salmon and Their Prey from the Toxic Impacts of Urban Stormwater Runoff*, 132 Chemosphere 213 (2015) (finding "relatively inexpensive" green stormwater infrastructure technologies can be "highly effective at reversing" severe adverse effects of contaminated runoff on fish and aquatic macroinvertebrate species) (attached as Exhibit H).

See DEIR 4.3-67 through -70, 4.3-74 through -76. Rather, the FEIR says only that as a legal matter, a project's potentially significant operational air quality impacts are automatically reduced to less-than-significant levels as long as the EIR adopts certain construction-phase measures listed in the NSAQMD's CEQA guidelines. *See* FEIR 2-104, 2-183; *see also* DEIR 4.3-67 n.38.

The FEIR is incorrect. Unsurprisingly, the NSAQMD guidelines do not say that a project can automatically reduce its potentially significant *operational* air quality impacts simply by incorporating pro forma *construction*-related mitigation measures. The guidelines instead provide a "suggested list" of mitigation measures that is explicitly "not all-inclusive." NSAQMD Guidelines 10. The only measures that the DEIR incorporated, and which the FEIR insists are sufficient to mitigate all of the Project's air quality impacts, are listed in the NSAQMD guidelines under the heading, "Mitigations for Use *During Design and Construction Phases*." *Id.* (emphasis added). The guidelines expressly contemplate that "additional, project-specific mitigation measures" may be necessary to "ensure that impacts are sufficiently mitigated." *Id.* In other words, the NSAQMD guidelines are not some rubber stamp that allows every project to mitigate all potentially significant impacts via construction-related measures.

This flexible, project-specific methodology is also exactly what CEQA requires. *See* Cal. Pub. Res. Code § 21081(a); CEQA Guidelines § 15370. That is because if mitigation measures are not "at least partially effective" in reducing an otherwise significant impact, they do not qualify as mitigation measures at all. *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 523; *King & Gardiner Farms*, 45 Cal.App.5th at 865. The NSAQMD guidelines cannot absolve the EIR of its obligation to incorporate "effective" mitigation. Construction-phase measures that have literally zero impact on operational air quality emissions do not satisfy this requirement.

The FEIR points to CEQA materials from other past projects in the region that it claims have interpreted the NSAQMD guidelines in the same way. *See* FEIR 2-104 & n.14, 2-183 & n.13. This past practice cannot supplant the clear directives in the NSAQMD guidelines and in CEQA itself. But even if those previous studies were relevant, not a single one supports the FEIR's position. Three of the four projects had no estimated operational emissions at all. Thus, there was no need to even analyze operational air quality impacts, much less mitigate them.[11] And the one project that *did*

[11] *See Lake Wildwood Tennis Facility Lighting Expansion – Notice of Availability for Public Review and Notice of Intent to Adopt a Proposed Mitigated Negative Declaration and Excerpt of Initial Study* (July 2022) at 15 ("The proposed project would result in a temporary but incrementally small net increase in pollutants due to minor land

involve operational air quality emissions incorporated mitigation measures that substantially and quantifiably reduced those emissions[12]—exactly what the EIR needed to do here.

In short, the EIR relies on a single faulty legal justification to excuse itself from CEQA's basic mitigation requirements. The FEIR does *not* claim that it would be infeasible to adopt measures that would lessen the Project's operational air quality impacts.[13] It simply asserts that it did not need to consider such measures in the first place. That is wrong, and the EIR is legally deficient as a result.

---

disturbance and construction vehicle and equipment emissions related to the installation of the 24 light poles and trenching for underground electrical.") (attached as Exhibit I); *Auburn Ski Club Lighting Expansion – Notice of Availability for Public Review and Notice of Intent to Adopt a Proposed Mitigated Negative Declaration and Excerpt of Initial Study* (July 2022) at 16–17 ("The proposed project would result in a temporary but incrementally small net increase in pollutants due to minor land disturbance and construction vehicle and equipment emissions related to the installation of the 40 light poles and trenching for underground electrical.") (attached as Exhibit J); *Empire Mine State Historic Park Site Characterization and Remediation Draft Program Environmental Impact Report Section 4.2, Air Quality* (Aug. 2009) at 4.2-21 ("This air quality impact analysis does not evaluate the impacts following completion of the Project (such as exposure to visitors walking on trail systems), but the impacts as a result of the Project Actions that would occur during the Project implementation.") (attached as Exhibit K).

[12] *See Rincon del Rio Draft Environmental Impact Report Section 3.3, Air Quality* (Jan. 2012) at 3.3-21 through 3.3-22 (analyzing two mitigation measures that would result in a significant reduction in operational ROG, NO_x, and PM_{10} emissions relative to unmitigated levels) (attached as Exhibit L).

[13] Nor could it: One such measure—the use of electric trucks to haul mine waste off-site during the operational phases of the Project—is a potentially feasible method of reducing operational emissions. *See* FEIR 2-10. The fact that the FEIR botched its analysis of this new mitigation proposal, *see* Section V.D., *infra*, does not necessarily mean that it is infeasible. *But cf.* Section V.D., *infra*; Exhibit A (Baseline Report (Feb. 2023)) at 3 (questioning whether heavy-duty electric trucks will be available in sufficient numbers during the early years of Project operations).

B. The FEIR's discussion of the Project's applicant-proposed measures (APMs) for air quality is incoherent.

The DEIR identified several air quality APMs that would be implemented during the construction and/or operational phases of the Project, including (1) exhaust emission controls (APM-AQ-1), (2) fugitive dust control measures (APM-AQ-2), and (3) an asbestos minimization plan (APM-AQ-3). *See* DEIR 4.3-65. The DEIR was clear that it had factored the first two APMs in to its "unmitigated" emissions assessment. *See id.* at 4.3-73 ("The emission data presented in Table 4.3-17 (i.e., unmitigated emissions) reflect the reductions that would occur with implementation of APM-AQ-1 and APM-AQ-2. Table 4.3-19 shows the estimated maximum daily mitigated emissions associated with construction, operation, and reclamation of the project, accounting for additional emissions associated with Mitigation Measure 4.3-1(b) . . . ."). Commenters were equally clear that this approach was improper. They explained that the EIR needed to treat these APMs as the mitigation measures that they actually are, rather than as design features of the Project. That would require omitting them from the "unmitigated" emissions scenario and separately quantifying their impacts on Project emissions.

Rather than correcting these substantive issues in the DEIR, the FEIR offers up conflicting excuses. Its first and clearest response is that the DEIR merely had a typo—that the sentence on page 4.3-73 was meant to read, "[t]he emission data presented in Table 4.3-17 (i.e., unmitigated emissions) reflect the reductions that would occur without implementation of APM-AQ-1 and APM-AQ-2." FEIR 2-182; *see also id.* at 2-184. In other words, the APMs "were not actually included in the unmitigated emissions inventory." *Id.* at 2-182. With that "minor change . . . to clarify the DEIR text," the FEIR reassures us, "no change to the analysis in the DEIR" is necessary. *Id.*

Elsewhere, however, the FEIR says exactly the opposite—that the DEIR *did* include APM-AQ-1 and APM-AQ-2 within the "unmitigated" emissions scenario, and thus did not treat them as mitigation measures. *See* FEIR 2-104 ("These APMs, which go above and beyond the measures suggested in the NSAQMD [guidelines] . . . *were already incorporated into the assessment* and, therefore, do not result in additional reductions under the mitigated scenario, nonetheless the APMs do reduce emissions of criteria air pollutants compared to the Project if it did not incorporate these emission reduction features." (emphasis added)); *id.* at 2-940 ("As the applicant proposed these [APMs] as part of the project, prior to analysis of air quality impacts of the project, they are properly considered as part of the Project Description."); *id.* at 2-941 ("[T]he project's criteria air pollutant emissions incorporating the APMs as part of the proposed

project can be directly measured against numerical emissions thresholds established by [NSAQMD].").[14]

These two contradictory responses cannot both be true. The result—that it is impossible for the reviewing public to discern how or whether the EIR evaluated the air quality APMs—is a violation of CEQA in and of itself. *See Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 439 (holding "[f]actual inconsistencies and lack of clarity in the FEIR leave the reader—and the decision makers—without substantial evidence" to support the EIR's conclusions); *Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal.* (1988) 47 Cal.3d 376, 404 ("[T]here must be a disclosure of the analytic route the agency traveled from evidence to action." (cleaned up)).

But even if the EIR were clear that it considered the APMs *either* (1) as part of the "unmitigated" Project emissions baseline, *or* (2) as mitigation measures, the EIR's air quality discussion would still violate CEQA. If scenario (1) is true—and thus the "typo" excuse is wrong—the EIR is deficient for all the reasons already pointed out in the comments on the DEIR. Specifically, an EIR may not "compress[] the analysis of impacts and mitigation measures into a single issue" by folding mitigation into the project description; the EIR must first evaluate the Project's unmitigated impacts and then gauge the extent to which the mitigation measures lessen them. *Lotus v. Dep't of Transp.* (2014) 223 Cal.App.4th 645, 656, 658.

If scenario (2) is right, the EIR is flawed because it does not separately assess the impact of these measures or explain why a more detailed analysis is infeasible.[15] A one-sentence assertion that the APMs "do[] achieve a reduction in emissions as compared to the unmitigated emissions," FEIR 2-182, is not enough. *See King & Gardiner Farms*, 45

---

[14] This response seems to be the correct one. Notably, the DEIR's "unmitigated" emissions table also includes footnotes explaining how APM-AQ-1 and APM-AQ-2 were factored in to the "unmitigated" calculations. *See* DEIR 4.3-70. Additionally, the DEIR's separate air quality report includes the same sentence as on page 4.3-73 of the DEIR, *see* DEIR App. E.1 at 47–48, and its "unmitigated" emissions table includes the same footnotes regarding the APMs as the DEIR's table, *see id.* at 44. The FEIR does not purport to correct or explain any of these issues, each of which conflicts with the "typo" explanation. *See also* Exhibit A (Baseline Report (Feb. 2023)) at 3.

[15] And, in any event, the APMs would not be valid mitigation measures as to *operational* air quality impacts, since the Project's "unmitigated" and "mitigated" operational emissions are the same. *See* Section V.A., *supra*; *Sierra Club*, 6 Cal.5th at 523 (requiring that mitigation measures be "at least partially effective" in lessening impacts).

Cal.App.5th at 869 ("To fulfill the EIR's informational role, the discussion of the mitigation measures must contain facts and analysis, not bare conclusions and opinions."); *Sierra Club*, 6 Cal.5th at 522 (agreeing that the "use of the term 'substantial' to describe the impact the proposed mitigation measures would have on reducing the Project's significant health effects, without further explanation or factual support, amounted to a 'bare conclusion' that did not satisfy CEQA's disclosure requirements"). In either scenario, the basic problem is the same: The EIR provides virtually no explanation of the effect the APMs will have on Project emissions. *See also* Exhibit A (Baseline Report (Feb. 2023)) at 3–4 (describing in further detail the issues with the EIR's analysis of the impacts of the APMs).

These exact same issues recur in the EIR's discussion of GHG emissions. That is because the DEIR's GHG emissions analysis—apparently like its air quality analysis—incorporated the effects of APM-AQ-1 within its "unmitigated" operational emissions inventory. *See* DEIR 4.3-94 (explaining, in footnote "a" of Table 4.3-23, that the "unmitigated" emissions calculations "[a]ccount[] for APM-AQ-1 (Exhaust Emission Controls), including Tier 4 Final equipment"). Again, this was improper: The EIR first should have calculated the Project's GHG emissions without the APMs in place, and then separately quantified the APMs' effects on emissions. *See Lotus*, 223 Cal.App.4th at 656, 658. The error is all the more glaring in this GHG context, since the EIR found that the Project's "unmitigated" operational GHG emissions—even after improperly factoring in APM-AQ-1—were barely below the significance threshold. *See* DEIR 4.3-94. Consequently, had the EIR handled the APMs correctly, this impact might well have been "significant" without mitigation.

C. The EIR's plan to test for and manage the asbestos content of mined rock is internally inconsistent and likely to fail, and it improperly defers mitigation.

The applicant prepared an Asbestos, Serpentinite, and Ultramafic Rock Management Plan ("ASUR Plan") that purportedly incorporates measures to minimize asbestos in the engineered fill generated by the Project. DEIR at 3-20. According to the EIR, the ASUR Plan "requires testing of *all* mined materials" to "ensure that average mined material and engineered fill contains less than 0.01% asbestos by mass." DEIR at 4.3-61 (emphasis added); *id.* at 3-20. Thus, the EIR gives the impression that all rock generated by the Project will be tested, and that it will achieve an average level of less than 0.01% asbestos by mass. However, to the contrary, the EIR and ASUR Plan elsewhere obliquely reveal that very little of the mined rock will actually be tested, that it will be held to a much lower standard of 0.25% asbestos, and that there is no concrete plan for what to do if the engineered fill is found to be contaminated with asbestos.

Furthermore, the EIR improperly deferred mitigation measures to address the Project's asbestos risks.

1. The EIR improperly relies on the ASUR Plan's inadequate asbestos testing

The ASUR Plan contains measures related to the asbestos content of barren rock and sand tailings generated by the Project. DEIR Appendix E.2 (ASUR Management Plan) at 13 ("ASUR Plan"). The ASUR Plan asserts that it is designed so that "all aboveground materials are sampled and analyzed for asbestos before they are loaded for transportation and used as Engineered Fill." *Id.* (emphasis in original). However, the sampling plan for the barren rock and sand tailings fails to account for the sheer volume of these materials and does not allow enough time for accurate testing to determine their asbestos content.

Although the Project will result in 1,500 tons per day of mined material (*see* ASUR Plan at 5-6), the ASUR Plan describes an above-ground silo to store barren rock and sand tailings that can hold slightly less than a single day's production. *Id.* at 13 (silo has capacity of 1,400 tons). Before the material is transferred to the silo, the applicant will conduct three random grab samples from the barren rock or the mineralized material for every 1,000 tons of material. *Id.* To determine if the samples are "Asbestos Containing Material," which is any material with an asbestos content of 0.25% or greater, the samples will be analyzed using Polarized Light Microscopy (PLM), which has the ability to detect 0.25% asbestos. *Id.* at 2, 13. In addition, for purposes of maintaining an "Asbestos Inventory," which will measure the "rolling three-month weighted average" of the mined materials, the samples will also be tested using the Transmission Electron Microscope (TEM) method, which can detect 0.01% asbestos. *Id.* at 13-14; *id.* at 15. However, the more accurate TEM test requires two weeks for results. *See* FEIR at 2-542.

The ASUR Plan also contains several requirements for what must happen if the engineered fill contains asbestos. ASUR Plan at 16-17. If a sample shows that the material is Asbestos-Containing Material *and* the three-month rolling average asbestos content is at least 0.01%, then all barren rock "represented by the composite sample" will be disposed underground as cemented paste backfill rather than loaded onto trucks for use as Engineered Fill. *Id.* at 16. Similarly, all sand tailings derived from processing Asbestos-Containing Material will be used for underground cemented paste backfill and not for Engineered Fill. *Id.* at 16-17. Additionally, if the three-month rolling Asbestos Inventory exceeds 0.01% asbestos, then the "geology department will immediately . . . halt mining in the area of concern until a revised mine plan is prepared." *Id.* at 20.

However, these planned actions fail to account for the two weeks for a TEM test result to come back, during which time the barren rock and rock tailings will have moved far beyond the surface silo. Because the testing would occur before the materials are transferred to the silo, which only has the capacity to store materials produced from a single day, the mined materials would be moved on to the next phase of processing before the TEM test results are developed. *See* ASUR Plan at 14 (noting that rock is "stored in bins with capacity of ~1 day"). Given this limited storage, during the 2-week testing period, any material containing asbestos will likely have been transported offsite or used as engineered fill at the Brunswick or Centennial Sites, where it would pose a risk of airborne asbestos exposure. *See* DEIR at 2-546 (noting that the "project site is not designed to hold 3-months of mined material in inventory and will not do so"). The EIR also fails to explain how the geology department will determine the source of contaminated material, given the volume of material mined, the very small sample rate, and the lapse in time from the sample to the result.

The FEIR gives no assurances about this process, noting instead that "[m]ining will continue as normal during the two week turn-around time for TEM samples," and vaguely contending that the "asbestos content [of] mined material" will be "managed through the measures of the ASUR plan which included exploration sampling, mine planning, and testing of materials on surface to monitor and ensure the effectiveness of these measures." FEIR at 2-542. Again, this response fails to account for the fact that—given limited storage capacity—contaminated material may already be far from the project site by the time the problem comes to light. Conceding that the more accurate TEM testing will be largely ineffective, the FEIR asserts that the purpose of TEM testing "is not to control the fate of the rock and tailings after it reaches surface [sic]," because "that is the purpose of the PLM testing." FEIR at 2-514.

2. The EIR improperly defers development of asbestos mitigation measures

The EIR relies on the ASUR Plan as an "applicant proposed measure" (APM) for air quality impacts (DEIR 4.3-65) without clarifying that this Plan actually purports to mitigate potentially significant asbestos impacts. DEIR at 4.3-65. Comments on the DEIR explained that the APMs, including the ASUR Plan, were "in reality mitigation measures, which the DEIR improperly fails to recognize as such," despite being incorporated into the Project. FEIR at 2-830, 2-874-75. In response, the FEIR simply stated that these measures were part of the project, rather than mitigation measures. *Id.* at 2-922. However, simply calling a measure that is meant to mitigate impacts a part of the project

does not cure the fundamental defect in this approach: namely, that it obscures the true extent of the impacts. *Lotus*, 223 Cal.App.4th at 656 (EIR may not compress the analysis of impacts and mitigation measures by incorporating the mitigation measure into the project's features). Here, for example, the EIR fails to evaluate the Project's asbestos impacts resulting both from the mining process and from the storage and shipment of engineered material offsite, opting instead to hide behind the assertion that these impacts will be mitigated through the ASUR Plan and ill-defined plans therein. Instead, the EIR must classify the ASUR Plan as a mitigation measure and evaluate the significance of the Project's asbestos impacts with and without the Plan.

Furthermore, the ASUR Plan itself defers development of important mitigation measures, instead relying on ill-defined and unenforceable plans. *See* ASUR Plan at 8. In particular, the ASUR Plan and the EIR both contend that TEM testing will be used to determine the asbestos content "during the exploration and pre-mining phase before mining is commenced," (FEIR at 2-547), and this "was made an explicit requirement of the ASUR Plan." *Id.* at 2-514. To the contrary, the ASUR Plan lacks any concrete and measurable commitments to test for asbestos, and instead defers creating measures to detect and mitigate the presence of asbestos in mined material. In so doing, the EIR falls short of its primary purpose to "describe feasible measures which could minimize significant adverse impacts." CEQA Guidelines § 15126.4(a)(1).

For example, the ASUR Plan asserts that "[e]xploration core drilling and core logging shall be supervised by a California Licensed Geologist," and that "[l]ithological units and gold mineralization will be adequately sampled and tested for naturally occurring asbestos." ASUR Plan at 8. However, the ASUR Plan does not specify when core drilling and logging and the related sampling and testing will occur, including how frequently and how far in advance of mining operations. Similarly, the ASUR Plan does not specify what "adequate" sampling and testing entails, and what standards will be applied to the materials before determining whether or not to proceed with mining. These vague assertions do not constitute mitigation measures for the potentially serious asbestos contamination associated with the Project. *See* at *California Clean Energy Committee v. City of Woodland* (2014) 225 Cal.App.4th 173, 198 (vague or speculative mitigation measures do not comply with CEQA); *Lincoln Place Tenants Assn. v. City of Las Angeles* (2007) 155 Cal.App.4th 425, 445 (mitigation measures must be feasible and enforceable).

Similarly, after in situ testing, the ASUR Plan contends that "[a]n Engineered Fill Placement Plan will be maintained to ensure that adequate non-Asbestos Containing Material, as determined by PLM testing, is available for Surfacing applications." ASUR Plan at 8. This Engineered Fill Placement Plan will "be designed to ensure that Asbestos

Containing Material is not used for Surfacing," and will "designate areas which are suitable for the placement of Asbestos Containing Material." *Id.* at 17. However, the EIR fails to provide any details about what this plan will contain or require, or to include specific performance standards, including the criteria for an area to be "suitable" for the placement of Asbestos-Containing Material. In so doing, the ASUR Plan and the EIR have improperly deferred mitigation. *See Preserve Wild Santee v. City of Santee,* 210 Cal.App.4th 260, 281 (2012) (EIR improperly deferred formulation of mitigation measures in part because it did not state why specifying performance standards for habitat management was impractical or infeasible); *see also San Joaquin Raptor*, 149 Cal.App.4th at 670 (deferring the formulation of mitigation measures until after a project is approved "leave[s] the reader in the dark about what . . . management steps will be taken, or what specific criteria or performance standard will be met").

Relatedly, the ASUR Plan's plan to provide auxiliary ventilation and dust collection in the event that tunneling is projected to exceed a 3-month rolling average of 0.01% asbestos is similarly flawed due to the failure to provide any specific performance standards. *See* ASUR Plan at 10. Instead, it merely asserts that under such circumstances, "an experienced professional" would select "dust collection equipment . . . to suit the conditions and air flow." *Id.* Similarly, the "dust collection equipment will be designed to allow removal of collected dust and filter cartridges without exposing workers or releasing dust into the air." *Id.* As a result of these vague assertions, the EIR is only able to contemplate that the "workers *should* not be exposed to rock with unexpected high values of asbestos." FEIR at 2-514 (emphasis added). This vague assertion does not constitute the binding commitment to achieve a specific performance standard that is required, and the EIR did not attempt to justify its failure to specify the details. *See* CEQA Guidelines § 15126.4(a)(2) (an EIR may postpone development of the "specific details" of a mitigation measure only if it first demonstrates why "it is impractical or infeasible to include those details during the project's environmental review").

Finally, the EIR contains inconsistent conclusions regarding the risk associated with asbestos exposure. On the one hand, the EIR states that implementing the ASUR Plan "would ensure that underground mining activities and use of project-generated fill would not result in the emission of asbestos containing dust." DEIR at 4.3-82. However, the EIR also states that without implementing an Asbestos Dust Mitigation Plan (ADMP), "the project could result in a significant impact with respect to exposing receptors to substantial concentrations." *Id.*; *see also* DEIR at 6-32. If the Project will not result in the emissions of dust containing asbestos, why is an ADMP required to avoid significant impacts related to the exposure to *substantial concentrations of asbestos*? In reaching this conclusion, the EIR is tacitly conceding that the ASUR Plan alone is not

reasonably likely to reduce asbestos exposure to a less-than-significant level, contrary to the EIR's statements elsewhere that it would. Accordingly, the EIR must be revised to provide specific mitigation measures that include concrete and measurable performance standards to mitigate the risk of exposing mine workers and the public to asbestos.

D. The FEIR fails to support its use of an unjustifiably high threshold of significance for operational GHG emissions.

Several commenters explained at length that it was inappropriate for the DEIR to use a significance threshold of 10,000 metric tons of carbon dioxide equivalent (MT CO_2e) per year for operational GHG emissions. They pointed out that this ad hoc threshold is outdated, unsupported by Project-specific evidence, and unreasonably high. The FEIR once again ignores these concerns and doubles down on the single rationale provided in the DEIR: The threshold is acceptable because other agencies elsewhere in the State have used it before. *See* FEIR 2-115 through -116.

This response misses the mark for several reasons. First, the mere fact that other jurisdictions have adopted a certain significance threshold in the past is not adequate to justify its use for this particular Project. As various commenters noted, all of the thresholds that the DEIR references were developed before the enactment of S.B. 32 in 2016. That law set significantly more aggressive targets for reducing statewide GHG emissions compared to the earlier A.B. 32 regime. Thus, one cannot assume that what was a less-than-significant contribution to GHG emissions in 2015 remains so today. These thresholds were also all designed for "industrial" and/or "stationary source" projects. That makes for an awkward fit with this Project, where mobile sources are projected to be the second largest contributor to operational GHG emissions. *See* DEIR 4.3-93 through -94. In light of all these changes and nuance, "if it's good enough for them, it's good enough for us" is not substantial evidence. *See Golden Door Props., LLC v. County of San Diego* (2018) 27 Cal.App.5th 892, 904–05.

Second, the FEIR's rationale is wrong even on its own terms. Some of the very agencies whose lead the FEIR purports to be following have now abandoned the 10,000 MT CO_2e threshold. For example, the July 2022 Draft Environmental Impact Report prepared by the County of Santa Clara for the analogous Sargent Ranch Quarry project, which is located within the jurisdiction of the Bay Area Air Quality Management District (BAAQMD), uses a *net-zero* significance threshold for operational GHG emissions. *See* Sargent Ranch Quarry Draft Environmental Impact Report Section 3.8, Greenhouse Gas

Emissions at 3.8-10 (July 2022) (attached as Exhibit M).[16] The Sargent Ranch Quarry DEIR adopted this threshold after expressly—and correctly—recognizing that BAAQMD's old standards "were designed . . . to meet the AB 32 goal of reducing GHG emissions to 1990 levels by 2020," and thus were no longer "consistent with the more recently adopted SB 32 target of reducing statewide GHG emissions to 40 percent below 1990 levels by 2030." *See id.*[17] The FEIR does not acknowledge this shift. It instead incorrectly asserts that the 10,000 MT CO_2e "is [still] used by" BAAQMD "for industrial and/or stationary source emissions of GHGs." FEIR 2-116 (quoting DEIR 4.3-43).

Had the EIR conducted its own meaningful review of the current GHG landscape, the only reasonable conclusion it could have reached was that the same net-zero threshold is appropriate for this Project. And had the threshold been reduced by even a tiny fraction of that—to 9,000 MT CO_2e per year—the Project's operational emissions would have been significant and required mitigation. *See* DEIR 4.3-94 (estimating annual operational GHG emissions of 9,041.23 MT CO_2e in years 2033 to 2102). At minimum, the EIR needed to try to explain why it relies on outdated thresholds used in other jurisdictions—thresholds that purportedly deserve complete deference when set at 10,000 MT CO_2e, *see* FEIR 2-116—when those same jurisdictions now use thresholds that have been updated and lowered to reflect the serious threat of climate change. *See also* Exhibit A (Baseline Report (Feb. 2023)) at 7–8. Because the EIR did none of this, its significance threshold lacks substantial evidence and violates CEQA. *See Golden Door Props.*, 27 Cal.App.5th at 904–05.

E. The FEIR's new proposal to use electric trucks to haul mine waste off-site is unexplained and underdeveloped.

For the first time, the FEIR proposes a new condition of approval for the Project: "In the event that sand tailings or waste rock material is transported from the Brunswick Site prior to 2033 to locations other than the Centennial Site, all transport of such materials shall be accomplished using electric vehicles." FEIR 2-10. The FEIR includes no analysis of this new plan—just a few of cursory sentences implying that this condition

[16] Available at https://stgenpln.blob.core.windows.net/document/10747_Sargent_Ranch_Quarry_DEIR_July_2022.pdf.

[17] This transition away from a bright-line GHG significance threshold is also more consistent with the California Supreme Court's intervening decision in *Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal.4th 204, 220–23, which requires that a project's GHG emissions be evaluated in the context of the State's long-term climate goals.

would not result in "greater air quality and GHG emissions impacts or energy use impacts than analyzed under the DEIR." *See id.* at 2-926; *see also id.* at 2-10, 2-940.

Using electric trucks to haul mine waste off-site is a good idea, in theory. But there are major problems with the FEIR's proposal. First, as explained in the Baseline report, there are significant questions about whether this measure would even be feasible as presented in the FEIR, given that heavy-duty electric trucks are not expected to be widely commercially available during the early years of the Project's operations. *See* Baseline Letter (Feb. 2023) 3. The FEIR leaves these feasibility questions entirely unanswered, and instead seems to simply assume that this measure can be implemented. But CEQA demands more than unspoken assumptions; it requires *evidence* of feasibility. *See Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1119–20 (holding a "mitigation measure[is] inadequate under CEQA" where "there is not substantial evidence to conclude that this [mitigation] option is even feasible").

Second, the FEIR is void of analysis regarding the environmental impacts that may arise from this new plan. The DEIR had identified several environmental impacts that were on the cusp of significance. For example, the Project's operational GHG emissions were predicted to fall slightly below the EIR's (unjustifiably high) significance threshold. *See* DEIR 4.3-93. And the Project's electricity demand was projected to bring the circuit serving the Project site within just a couple of megawatts of its total capacity. *Id.* at 4.11-34 through -35. Would the increased GHG emissions[18] and electricity demand associated with using grid energy to charge the electric trucks cause these or any other significance thresholds to be surpassed? The FEIR is defective as an informational document because it does not even begin to acknowledge these foreseeable impacts, much less "contain analysis sufficient to allow informed decision making." *See Laurel Heights*, 47 Cal.3d at 403–05; *see also* Exhibit A (Baseline Report (Feb. 2023)) at 3.

Finally, even if the FEIR had correctly analyzed the feasibility and the environmental impacts of this new proposal, it would still be flawed because the measure does not go far enough. Specifically, there was no basis for limiting the proposal to off-site hauling that occurs "prior to 2033" and "to locations other than the Centennial Site." As discussed above, this Project will have potentially significant—and so far entirely unmitigated—operational air quality impacts. *See* Section V.A., *supra*. To address those impacts, the EIR should have included off-site electric truck use as an enforceable

[18] Notably, the use of grid-supplied electricity is projected to be *by far* the largest contributor to operational GHG emissions over the duration of the Project. *See* DEIR 4.3-92 through -94.

mitigation measure, without any of the current limitations.[19] *See King & Gardiner Farms*, 45 Cal.App.4th at 865 (emphasizing CEQA requires the adoption of "*all* feasible mitigation measures"). And the EIR should have explained the degree to which this measure would reduce the Project's operational air quality impacts. *See Sierra Club*, 6 Cal.5th at 522. Those steps would not have been sufficient to fix the many flaws in the EIR's air quality analysis. But they were necessary steps, and without them the EIR cannot be certified.

F. The FEIR fails to address several other concerns raised about the DEIR's handling of air quality, GHG emissions, and energy use.

Commenters expressed concerns that the DEIR's Project description stated that construction would last for 18 months, whereas the air quality analysis assumed a 12-month construction timeline and provided no explanation for this discrepancy. *See* FEIR 2-111. The FEIR's one response is effectively "no harm, no foul": Because a 12-month timeline would result in shorter but more intensive impacts, it purportedly represents a "worst-case" scenario. *Id.* at 2-112. But this is not responsive to the concerns actually raised by commenters, which focused on the DEIR's lack of analysis to support its assertion that a shorter timeline is, in fact, a "worst-case." For example, commenters flagged that a longer construction timeline could result in a more extensive exposure to critical air pollutants, and thus possibly more severe—or at least different—impacts. The FEIR fails to either account for these comments or furnish any evidence showing that the DEIR's approach really is more "conservative" than an 18-month construction timeline.

Commenters also explained at length the lack of evidence supporting the DEIR's Health Risk Assessment (HRA). *See, e.g.*, FEIR 2-179, 2-942. To its credit, the FEIR includes some new analysis in response to these concerns. *See* Exhibit A (Baseline Report (Feb. 2023)) at 4–5. Unfortunately, this new information does not support the DEIR's optimistic projections regarding the extent to which Mitigation Measure 4.3-1(b) will reduce the risks of cancer linked to Project emissions. In particular, and as discussed at greater length in the Baseline Environmental Consulting letter, the FEIR does not provide any explanation of how Measure 4.3-1(b)'s estimated 2% reduction in total diesel exhaust emissions could, standing alone, produce a 27% decrease in cancer risk. *See id.* at 4–6.

[19] Even if it turned out that it would be infeasible to use electric haul trucks during the early years of the Project's operations, the FEIR should have considered whether it would be feasible to begin implementing this measure in a later operational year, when heavy-duty electric trucks are projected to be more broadly available.

Finally, the FEIR makes several changes to Mitigation Measure 4.3-7(b) (GHG Offset Credits), apparently in recognition of the fact that the version of the measured proposed in the DEIR would be impermissible under *Golden Door Properties, LLC v. County of San Diego* (2020) 50 Cal.App.5th 467. What the FEIR does not explain, though, is why it is appropriate to use offset credits to accomplish 100% of the Project's GHG emissions reductions, instead of implementing feasible on-site measures. Commenters had pointed to several possible on-site measures, including the retention of additional on-site vegetation, the use of solar power during construction, and the use of electric construction equipment and haul trucks. The FEIR ignores each of these specific suggestions and points back to its pro forma response regarding GHG credits. *See* FEIR 2-945; *see also id.* at 2-753 (alleging "feasible construction GHG emissions mitigation is very limited," but not responding to the specific suggestions provided in comments). The notion that on-site GHG mitigation measures are currently infeasible also flatly conflicts with the FEIR's new proposal to use electric haul trucks. *See id.* at 2-10.

VI. The County should deny the Project and should not certify the EIR.

The many environmental impacts associated with the Project, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the Project. If it denies the Project, the County is under no obligation to certify the EIR. *Las Lomas Land Co., LLC v. City of Los Angeles* (2009) 177 Cal.App.4th 83 (upholding decision to stop preparation of an EIR and specific plan where city determined the project was not consistent with its land use policies); Pub. Res. Code § 21080(a) (CEQA applies only to projects that public agencies carry out or approve).

Denial of the Project would also consistent with a long line of case law recognizing that public agencies may limit the use of land to protect public values without resulting in a taking of property. *Penn Cent. Transp. Co. v. City of New York* (1978) 438 U.S. 104, 129 ("[T]his Court has recognized, in a number of settings, that States and cities may enact land-use restrictions or controls to enhance the quality of life by preserving the character and desirable aesthetic features of a city.") (citations omitted); *id*. ("[I]n instances in which a state tribunal reasonably concluded that 'the health, safety, morals or general welfare" would be promoted by prohibiting particular contemplated uses of land, this Court has upheld land-use regulations that destroyed or adversely affected recognized property interests."); *Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency* (2002) 535 U.S. 302, 324 ("Land-use regulations are ubiquitous and most of them impact property values in some tangential way—often in completely unanticipated ways. Treating them all as *per se* takings would transform government regulation into a luxury few governments could afford.").

The Supreme Court has identified two primary tests to determine whether regulation causes a taking of property. First, a taking may occur if the regulation eliminates *all* use or value of the property. *See Lucas v. S.C. Coastal Council* (1992) 505 U.S. 1003. Under that test, there must be no value whatsoever remaining in the property; even a diminution of value of 95% is insufficient. *See Tahoe-Sierra*, 535 U.S. at 330 (citing *Lucas*, 505 U.S. at 1019 n.8). The second test involves evaluation of multiple factors, including the severity of the impact of the regulation on the value of the property, the extent of its interference with reasonable investment-backed expectations of use of the property, and the character of the governmental action. *See Lingle v. Chevron* (2005) 544 U.S. 528, 538-39 (citing *Penn Central*, 438 U.S. at 124). Courts have consistently held that *Penn Central* test requires elimination of nearly all value in the property. The Ninth Circuit has recently recognized that even "diminution in property value because of governmental regulation ranging from 75% to 92.5% does not constitute a taking." *Colony Cove Props. LLC v. City of Carson* (9th Cir. 2018) 888 F.3d 445, 451; see also *Hadacheck v. Sebastian* (1915) 239 U.S. 394, 405 (no taking despite diminution in value from $800,000 to a maximum of $60,000, and property could not be used for any purpose permitted under city's ordinance).

In fact, as long as permissible uses exist, a denial would not deprive the applicant of economically viable use of its property. *Shea Homes Ltd. P'ship v. County of Alameda* (2003) 110 Cal.App.4th 1246, 1267 (finding no regulatory taking because agricultural designation allowed single family use if certain County standards were met).

Here, the entire Brunswick Industrial Site is currently zoned M1-SP (Light Industrial, Site Performance Combining District), per the County's Zoning Code. Its land use designation is IND (Industrial) under the County's General Plan. The applicant is proposing to re-zone it as M1-ME (Light Industrial with Mineral Extraction Combining District) as part of the project. The Centennial Industrial Site and potable water pipeline easement areas are both zoned as M1 (Light Industrial) and designated as IND. All of these land use designations provide a reasonable economic use of the property and, on their face, defeat any claim that the applicant is entitled to establish a gold mine at the site.

Conclusion

As set forth above, the FEIR failed to address or correct the many fundamental issues with the DEIR. As a result, the EIR violates CEQA and cannot be certified. The County should exercise its authority to deny the Project.

Very truly yours,

SHUTE, MIHALY & WEINBERGER LLP

Supervisors Hall, Scofield, Swarthout, Hoek, Bullock

Thanks for your leadership and work to guide our community into a healthy and productive future. In that light, your pending decision on the reopening of the Idaho/Maryland Mine seems a crucial one. I've talked with community members and colleagues about the reopening and have done some research on the industry and Rise Gold. I believe the reopening would be a mistake and lead to a significant loss in quality of life for county residents and the environment we all share.

I believe that visionary and effective governance includes human values and environmental awareness along with a sustainable level of economic activity. An extractive industry, operated by a company with questionable ethics and economics, placed in the heart of a rural/suburban community seems like a bad idea.

Please consider these ideas and vote "no" on the reopening of the Idaho/Maryland Mine.

Take care,

Daniel Desmond

Comment to Board of Supervisions, Mar. 28, 2023.

Hi, I'm Jim Bair, Stop the Mine Task Force, Grass Valley, CA. After hundreds of hours searching through the Idaho-Maryland Mine Project FEIR, I've found a pattern of explicitly excluding critical content. In order to predict of the adequacy of mitigation measures, CEQA requires that the FEIR provide details of how negative environmental impacts are to be mitigated. It does not based on a disclaimer. For example, it states that measurements of toxins such as asbestos will be measured **after approval** based on plans also developed after approval. The FEIR includes the following questionable judgement in at least 7 places:

To quote, "*The engineering details and intensive sampling described by many commenters **would be** developed and completed through the implementation of mitigation measures, and **is not required to be completed as part of the CEQA process".*** This judgement is *based* on the interpretation of legal cases that depend on the relevance and comparability of the cases. I've listed seven FEIR occurrences of that quote in the written version of this Comment (See Note 1).

BUT on the contrary, CEQA states :

"*The project description must contain **sufficient specific information** about the project to allow the public and reviewing agencies to evaluate and review its environmental impacts. A project description that omits integral components of the project may result in an EIR that fails to disclose the actual impacts of the project. (Santiago County Water Dist. v. County of Orange (1981) 118 Cal.App.3d 818, 829, 173 Cal.Rptr. 602.)*
Several cases are references to illustrate inadequate migration descriptions.

I humbly request that County Council review these cases to determine the adequacy of the exclusion statements in the FEIR. I understand that the County has contracted with a CEQA attorney to assist with interpreting the fair relevance of the CEQA cases.

Thank you, Jim Bair 510.910.2300

CC: Nevada County Planning Commission (**by email**), and County Council

NOTE 1: FEIR references the legal cases on pages 119, 411 ("*details to be from the County"*), 638, 6835, 7590, 7797, 8187.

The cases are *Dry Creek Citizens Coalition v. County of Tulare* (1999) 70 Cal.App.4th 20, 26.) Which cites *Sacramento Old City Assn. v. City Council,* Court of Appeal Third District Apr 30, 1991.

DRY CREEK CITIZENS COALITION v. Artesia Ready Mix Concrete, Inc., Real Party in Interest and Respondent. (1999) https://caselaw.findlaw.com/ca-court-of-appeal/1129797.html

NOTE 2: CEQA Requirements

CEQA states:

"There must be sufficient information to understand the environmental impacts of the proposed project. (CEQA Guidelines, § 15146, *discussion*.) The EIR must achieve a balance between technical accuracy and public understanding. (Guidelines, § 15147, discussion.) [A detailed description of the project and mitigation measures is provided to illustrate the required level of detail.]

CEQA requires a "general description" of the project's technical characteristics. "General" means involving only the main features of something rather than details or particulars. (Webster's *New Internet Dict.* (3d ed.1986) p. 944.) The "general description" requirement for the technical attributes of a project is consistent with other CEQA mandates to make the EIR a user-friendly document. **For example, CEQA Guidelines section 15140 states that EIRs must be written in plain language so that decision makers and the public can rapidly understand them. [The IMM FEIR violates this guideline, but fortunately we have the capability to understand the technicalities.]**

NOTE 3: Dependency upon State agencies for implementation after IMM Project approval

For example, the FEIR says that plans to control the lethal air pollution and other negative environmental impacts will be done **after** the Mine Project is approved. They justify not doing the "engineering" plans by citing two legal decisions that are not relevant in my opinion. The Mine adds that asbestos pollution management responsibility is *to be* done by The Northern Sierra Air Quality Management District. I spoke at length with two senior staff in the District this week and believe that is not the case (they were wonderfully helpful).

Subject: Individual Comment 388 (1-12)
Idaho-Maryland Mine Project Draft Environmental Impact Report

Dear Mr. Kelley,

Listed below are my responses to the FEIR, re: my letter of 2/28/2022 identified in the FEIR as "Individual Comment 388-1 thru 388-12. My responses are indented and bolded below the "Response to Comment Ind 388-x" and identified as "**JV January 2023 FEIR Response, Ind 388-x**" where x is the specific item 1-12.

A note about "context": The process used for "Response to Comment…" often breaks down a paragraph out of context with other paragraphs, in effect, providing a response as if no other information had been provided. In this specific example, "Individual Comment 388-2" thru "Individual Comment 388-6" provide information about a single point; they are not independent comments. Breaking responses down by paragraph creates responses that disregards information provided in the previous and subsequent paragraphs(s).

In summary, the FEIR is inadequate. With all due respect, besides taking comments out of context, the responder(s) seem to revel in claims of "speculation" when the DEIR/FEIR are based assumptions on and filled with speculation. E.g., see "**JV January 2023 FEIR Response, Ind 388-2**" below.

Individual Comment 388-1
My name is John Vaughan. I have been a resident of Nevada County since 1967 (55 years). My wife Gail and I live on Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. Our property is served by a well. We are District III voters.

We do not support the Rise Gold project due to the huge negative impacts on our people, water supplies and property values and urge you to vote NO on the project.

Response to Comment Ind 388-1
The commenter's opposition to the project is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

Individual Comment 388-2
I'd like to highlight one of my many areas of concern with the Draft Environmental Impact Report (DEIR), specifically the lack of inclusion and detailed review of the Nevada County Business and Industrial Center[1] (NCBIC) alternative, which with existing M1-SP zoning could include a 54,000 ft^2 Business Park, 242,000 ft^2 for Service Business/Light Manufacturing and 238,000 ft^2 for Industrial uses[2].

[1] DEIR page 6-11, Nevada County Ordinance 1853, February 1994
[2] DEIR page 6-11/12

Response to Comment Ind 388-2
The alternative proposed by the commenter was discussed on pages 6-11 to 6-13 of the DEIR, but was dismissed from further consideration because the surface uses are reasonably anticipated to be more intense and cause more impacts than the proposed project. This would be contrary to CEQA's objectives for an alternative, which is to avoid or substantially lessen any of the significant effects of the project (Section 15126.6(f)). Therefore, this alternative is rejected from further consideration. Comment noted.

JV January 2023 FEIR Response, Ind 388-2

The response and the section of the DEIR on which it is based are speculative at best and does not address my question. The relevant paragraph in the DEIR, page 6-13 is:

"As shown in the above list of permitted uses for the existing property zoning, intense uses such as Auto Dismantling Yards, Wholesaling and Distribution Facilities are already permitted without the need for a discretionary County permit. As such, under existing zoning, uses are allowed by right that potentially could cause substantial noise, traffic, aesthetic and air quality impacts without the need for further CEQA review or mitigation. Notably, the permitted use such as Distribution Facilities and Office/Professional would likely have substantial traffic impacts. The permitted uses including Auto Dismantling Yards and Milling and Planing Facilities would potentially create noise impacts similar or greater to the proposed project."

Note the usage of "reasonably", "potentially" and "likely". All are various forms of speculation. There is no data provided in the DEIR/FEIR to support the consultants conclusions, only speculation. As noted in **Individual Comment 388-3** below, I have an extensive background in logistics. Based in my experience and after consulting with other logistics professionals, **none** of the worst-case scenarios noted for Distribution Facilities, Auto Dismantling, Milling and Planing Facilities are feasible at this site and therefore, would never produce the speculated impact suggested in the DEIR/FEIR. In the real-world, businesses shown in the referenced "above list" (pages 6-12, 6-13) could easily locate at the Idaho-Maryland (IMM) site but none of the larger uses in the list, on which the consultant assumption is based, would be interested in this location. The DEIR/FEIR and this response are inadequate, as they have done no work to provide data to prove their point…which is my point: The DEIR/FEIR and this response speculate a negative outcome that is unsupported by any data, research or experience.

Even if Distribution Facilities were feasible at this site, speculating that Distribution Facilities and Office/Professional traffic impacts would be the same as mine employee traffic plus at least 236 diesel truck trips per day just makes the consultant sound ignorant and/or biased towards the applicant.

I ran a 24x7 Distribution Facility, shipping printer parts all over the world, with 12 loading docks, in a building larger than what will fit on the Idaho-Maryland site. The building also included thousands of square feet for an Office/Professional workforce. The traffic impacts from employees and distribution semi-trucks were nowhere close to what is proposed for the Idaho-Maryland Mine. The consultants are making major assumptions and speculating a pre-determined outcome without providing any data.

Individual Comment 388-3
I am currently retired but the last 20 years of my career were spent at PRIDE Industries in Roseville. The last 10 of those I was the Senior Vice President of Manufacturing and Logistics,

including responsibility for a large distribution contract for Hewlett Packard. We operated a shipping/receiving/distribution warehouse shipping millions of printer parts/year all over the world. Our facility was just over 200,000 square feet with 12 loading docks about 10 minutes from Interstate 80. The in/out diesel truck traffic was 10-15 trucks/day between 6am-6pm. In short, I know a bit about distribution and logistics.

Response to Comment Ind 388-3

The comment does not address the adequacy of the DEIR. Comment noted.

JV January 2023 FEIR Response, Ind 388-3

The consultant does not seem to understand that Comment 388-3 is provided in context to inform the reader that I have the logistics experience to support my conclusion that Distribution Facilities, Auto Dismantling, Milling and Planing Facilities are not feasible at this site.

All sections from 388-2 thru 388-6 are focused on the same point. The attempt to take each paragraph out of context as if it were a separate topic creates an inadequate response.

Individual Comment 388-4

The DEIR Chapter 6 "Alternatives Considered but Dismissed from Further Analysis"[3] is incorrect and incomplete. Specifically, in the "No Project" section, the analysis of the currently permitted NCBIC alternative[4] contains incomplete information and notes examples of negative impacts that are extremely unlikely to occur in the real-world. The DEIR concludes an overall negative impact of these uses and rejects this alternative without adequate review.

Response to Comment Ind 388-4

The commenter asserts that the DEIR is incorrect in its assessment of impacts from uses that are permitted under the current M1-SP zoning, but does not provide specific examples. Please see Master Response 1.

JV January 2023 FEIR Response, Ind 388-4

The consultant response did not address my point. Again, this paragraph is taken out of context. See above "JV January 2023 FEIR Response, Ind 388-2" and "JV January 2023 FEIR Response, Ind 388-3".

Individual Comment 388-5

In the summary section for the NCBIC alternative[5], the DEIR rejects this option assuming noise, traffic, aesthetics and air quality would be the same or worse for the NBCIC alternative vs. the Rise Gold mine. In virtually all cases for the types of businesses, using existing zoning, that would actually locate there, the traffic and noise would be daytime, mostly weekdays, not 24x7, comprised largely of passenger cars and small trucks with large truck traffic substantially less than the 236 trips/day for the Rise Gold project[6] and almost none of the traffic hauling toxic waste.

Response to Comment Ind 388-5

[3] DEIR page 6-8

[4] Beginning at the bottom of Page 6-11

[5] Bottom of Page 6-13, last 2 paragraphs before "Reduced Hours"

[6] 118 round trips, see Table 4.12-8, page 4.12-34

The commenter asserts that the traffic impacts and related traffic noise under existing zoning would be less than the project because the vehicles would be passenger cars, small trucks with less large trucks and less trips. The commenter appears to focus on only the less intense permitted uses, but does not acknowledge that the existing zoning allows heavy industrial uses such as large wholesaling and distribution facilities, lumber yards, auto dismantling yards, milling and planing facilities, and contractor equipment and storage yards, among other industrial uses. These types of uses (large wholesaling and distribution facilities, for example) involve far higher volume of heavy truck traffic than proposed by the project, and many of the permitted uses would involve greater noise impacts as the facilities (e.g., milling and planing facilities, auto dismantling) would be on the surface rather than underground as proposed for many aspects of the project.

JV January 2023 FEIR Response, Ind 388-5

The response is speculative (see JV January 2023 FEIR Response, Ind 388-2), inadequate, taken out context and has (again) ignored the details provided above in 388-2 thru 388-6, re: lack of real-world feasibility for any of the uses noted in the DEIR/FEIR justification for not researching the actual impact of the NBCIC alternative. The consultant also added "contractor equipment and storage yards" to the list which are not shown in the DEIR. Addressing that issue, in the real-world, there are no contractors in Nevada County who have a large enough footprint to store enough equipment to create an impact equal to 238 diesel truck trips/day, much less equal to all the other noise and pollution from the mine. And, for all the reasons noted in 388-2 thru 388-6 no large contractor would move their operations to this site.

In addition, the responder speculates "These types of uses (large wholesaling and distribution facilities, for example) involve far higher volume of heavy truck traffic…and… would involve greater noise impacts…" but provide no evidence, no research, no data to support the conclusion.

Individual Comment 388-6

The DEIR identifies (among others) Distribution Facilities and Auto Dismantling Yards as examples of business that would "…cause substantial noise, traffic, aesthetic and air quality impacts…" While these business types are permitted under existing zoning, the likelihood of such ventures at this location is extremely low. Both Distribution Facilities and Auto Dismantling Yards (and Saw Mills and Planing Mills) require easy access to major freeways like Interstate 80 and therefore are not realistic for this site. In the case of large 24x7 Distribution Facilities, anything further than 10-15 minutes from a major freeway is not feasible and 238,000 square feet (238K) is too small.[7] Even if you attracted a Distribution Facility tenant, 238K would not support enough loading docks to create the same large truck traffic as the Rise Gold Mine project. Additionally, for Distribution Facilities and other permitted businesses, at the scale available at this site, the semi-truck traffic would be limited to weekday or daytime use as small to mid-size facilities are unlikely to operate 24x7. The DEIR also notes that a Milling and Planing Facility "would potentially create noise similar or greater to the proposed project." Frankly, that's hard to believe as there was a saw mill and planing mill at that site for decades.[8]

Response to Comment Ind 388-6

[7] While PRIDE's facility was considered too small we were awarded the HP contract, and kept it for years, because of HP's commitment to PRIDE's mission to create jobs for people with disabilities.

[8] There is already a custom milling operation at 11429 East Bennett Rd - Freds Custom Milling and Lumber

The commenter speculates that many of the more intense uses that are permitted under the current zoning (e.g., distribution facilities and auto dismantler) are not likely to be constructed and should be eliminated from the DEIR's consideration. However, the commenter does not provide evidence as to this opinion other than noting the distance from freeways. Accordingly, the elimination of numerous permitted use categories from consideration of potential impacts is speculative. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." As this comment amounts to speculation, no further response is necessary. The commenter states that a milling and planning facility would not be as loud as the project, but offers no evidence of that assertion besides pointing out that a saw mill and planing mill existed on the site for decades. Many of the project's noise-generating activities are underground or enclosed within buildings, which is not acknowledged by the commenter in its comparison. The commenter's opinion that a much lighter mix of land uses would actually occupy the Brunswick site under existing zoning is speculation and is not substantial evidence under CEQA. Nevertheless, the comment has been forwarded to the decision makers for their consideration.

JV January 2023 FEIR Response, Ind 388-6

See comment at beginning of this letter, re: **A note about "Context".** The response speculates that no evidence has been provided but takes this paragraph "out of context" and ignores the evidence provided in 388-2 thru 388-6 with speculation that large industrial operations would exist at the site at all, and if they did, further speculates they would therefore create more environmental issues than the mine.

In the sentence "The commenter states that a milling and planning facility would not be as loud as the project, but offers no evidence of that assertion besides pointing out that a saw mill and planing mill existed on the site for decades."…the rampant speculation provided by the responder just gets silly after a while…the evidence is the fact that a saw mill and planing mill existed on the site for decades with no complaints about noise.

The sentence beginning "The commenter's opinion…" is incorrect. No such assertion was made. The DEIR/FEIR bases its speculative conclusion on large industrial operations. The Individual Comments in 388-2 thru 388-6 address the fact that the DEIR/FEIR speculative conclusion regarding large industrial operations is an assumption with no evidence.

The speculative conclusions provided in the DEIR/FEIR with no actual evidence or data provided are difficult to take seriously.

Individual Comment 388-7

Re air quality: The impact on air quality would be greatly reduced with tenants that reflect what would happen in the real-world at the NCBIC vs. the unrealistic scenarios in the DEIR.

Response to Comment Ind 388-7

Please see Response to Comment 388-6.

JV January 2023 FEIR Response, Ind 388-7

The response speculates again that the mine would have a smaller environmental impact than other uses that would actually happen at the site. No evidence, no research, no data.

Individual Comment 388-8

Re traffic: The DEIR suggests that car and truck traffic to/from the NCBIC would generate the same pollution as the projected traffic to/from the proposed mine, which includes 236 semi-truck trips/day. Each diesel semi-truck emits as much pollution as 150 cars[9]. Considering only the diesel semi-trucks, producing the same emissions as 236 trips/day requires 35,400 trips/day from cars and light trucks, an unlikely scenario for the mix of businesses that might actually occupy the NCBIC.

Response to Comment Ind 388-8

Please see Response to Comment 388-6.

JV January 2023 FEIR Response, Ind 388-8

The response speculates that the mine would have a smaller traffic impact than other uses that would actually happen at the site. In fact, the traffic impact of the IMM proposal has been labeled "Significant and Unavoidable". No evidence, no research, no data has been provided to prove the other uses would also create "Significant and Unavoidable" traffic impacts.

Individual Comment 388-9

Re aesthetics: Given the site is already zoned for the buildings and businesses noted, aesthetic issues could be easily mitigated and included in a proposal for development of all or part of the NCBIC.

Response to Comment Ind 388-9

The commenter asserts that aesthetic impacts could be easily mitigated under an existing zoning alternative. Whether aesthetic impacts could be mitigated to less than significant would depend on the layout and height of the actual buildings and facilities proposed under the existing zoning, or in the case of an auto dismantling yard, the extent and type of screening around the facility. Given that the landscape could change to more intense uses and would be visible from public viewpoints, similar to the project, aesthetic impacts may be similar under the commenter's proposed alterative.

Individual Comment 388-10

Virtually all of the businesses listed in "Examples of Permitted Uses"[10] already exist or have existed in Nevada County without hundreds of local residents protesting about potential traffic, noise, water consumption, water usage or pollution. It seems like a reasonable model to follow to do more of what we already know how to do without changing the nature of our community for the next 80 years. I believe many of the people who oppose this mine would likely support a "No Project" alternative with the NCBIC as the best outcome.

Response to Comment Ind 388-10

The commenter's opposition to the project and preference for the No Project alternative is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

Individual Comment 388-11

Assigning a "not feasible" label to the NCBIC alternative using unrealistic assumptions makes it appear as if the DEIR authors have not done their homework. I'm not saying that the NCBIC

[9] www.cleanairtrust.org/trucks.dirtytruth.html

[10] DEIR pages 6-12/13

should be built now (or ever), that's not my decision, but to reject this alternative without a more detailed review using real-world scenarios and real-world outcomes makes no sense.

Response to Comment Ind 388-11

The commenter appears to believe that the existing-zoning alternative was rejected because it was infeasible. However, as discussed on page 6-13 of the DEIR, this alternative was rejected because it could result in more intense uses and environmental impacts as compared to the project, which would be contrary to CEQA's objectives for an alternative. Please see Response to Comment Ind 388-6.

JV January 2023 FEIR Response, Ind 388-11

As noted many times, the response is speculative. E.g., "…it **could** result in more intense uses…". Whether you call it "not feasible" or "Alternatives Considered But Dismissed From Further Analysis" is irrelevant. The DEIR/FEIR has not done anything but speculate. There is no data provided to support the DEIR/FEIR conclusion.

Individual Comment 388-12

Rise Golds advertising "postcard" claims the "Science is Clear". That's debatable given that much of their science is based on assumptions and forecasts. The same postcard claims are there are "no significant impacts" while the DEIR clearly states there are "Significant and Unavoidable" impacts.

What is clear is this is the wrong project for Nevada County.

I urge you to vote NO on this project.

Response to Comment Ind 388-12

The commenter's opposition to the project is noted for the decision makers. Please see Master Response 1 - Non-EIR/Administrative Issues.

Thank you.

950 Maidu Avenue, Suite 170
Nevada City, CA 95959-7902

Subject: Idaho-Maryland Mine Project Draft Environmental Impact Report

Dear Mr. Kelley,

Listed below are my responses to the FEIR, re: my letter of 3/24/2022 identified in the FEIR as "Individual Comment 393-1 thru 393-45. My responses are indented and bolded below the "Response to Comment Ind 393-x" and identified as "**JV January 2023 FEIR Response, Ind 393-x**" where x is the specific item 1-45.

A note about "context": The process used for "Response to Comment…" often breaks down a paragraph out of context with other paragraphs, in effect, providing a response as if no other information had been provided. Breaking responses down by paragraph creates responses that disregard information provided in the previous and subsequent paragraphs(s), resulting in inadequate/incomplete responses.

In summary, the FEIR is inadequate. With all due respect, besides taking comments out of context, the responder(s) seem to revel in claims of Individual Comment "speculation" when the DEIR/FEIR are based on assumptions and filled with speculation that for ***80 years***, nothing could go wrong.

Individual Comment 393-1
Please include my project-specific comments and questions in response to the Rise Gold Idaho-Maryland Mine Project Draft Environmental Impact Report (DEIR).

My name is John Vaughan. I have been a resident of Nevada County since 1967 (55 years). My wife Gail and I live on Lower Colfax Road, approximately 100 yards from the southwest edge of the Rise Gold mineral rights area. Our property is served by a well. We are District III voters.

I have a number of issues, comments and questions about the adequacy of the DEIR, which is missing key information, underestimates significant negative impacts and proposes inadequate mitigation measures.

This document is organized in categories of "Issues" which are followed by factually supportive commentary, which are then followed by questions, based on the commentary, related to the issue I am concerned about regarding the inadequacy of the DEIR.

Response to Comment Ind 393-1 The commenter states the DEIR is inadequate. Please see Master Response 1 and the responses to specific comments provided below.

Individual Comment 393-2
Issue #1: Water Supply for well owners:
I have serious concerns about how this proposal impacts wells in the area, including those properties not included in the DEIR, outside the studied area along East Bennett Rd.

This project will dewater to a depth of 3200 feet[1], including initial dewatering for approx. 6 months, removing over 815 million gallons, followed by maintenance dewatering, removing 450-750 million gallons/year. **That's over 1 BILLION gallons during the first year** (Enough to cover 43,560 square feet with column of water 3,685 feet deep[2]) **and over 40 billion gallons for the life of the project**. The DEIR acknowledges the significant and unavoidable negative impact of this dewatering but only in the small footprint of East Bennett Rd.

In a Fox40 news video from mid-March 2022[3], Ben Mossman, CEO of Rise Gold, talks about the maps used for modeling the tunnels are from the "World War II era". The reporter notes the maps reveal "nearly 100 miles of tunnel". It makes no sense that removing 40 billion gallons of water will have no negative impact on water availability in an area much broader than East Bennett Rd. The level of our aquifers are already at risk from years of drought behind and likely ahead of us.

The DEIR notes "the proposed project would result in substantial reduction in groundwater supplies"[4]. For well owners not serviced by NID, this is a "Significant and Unavoidable" issue. The DEIR does require mitigation where properties along East Bennett would be serviced by NID. But that does not solve the groundwater issue for other properties which are negatively impacted by groundwater loss where NID is not an option. For these properties, including ours, the impact is "Significant and Unavoidable". The mitigations required in the 1996 Use Permit for Emperor Gold and the 2008 Emgold Mining DEIR are a reasonable starting place for minimal mitigations that are needed today and should be added to the DEIR. These options are not mentioned in the Rise Gold DEIR.

Response to Comment Ind 393-2 The commenter states that the DEIR acknowledges that dewatering will have a significant and unavoidable impact. This is incorrect, as the DEIR concludes that the project will have a less than significant impact with regard to dewatering and water supply after implementation of mitigation. The commenter asserts that the DEIR's mitigation does not address impacts to properties outside of the anticipated drawdown area. While the DEIR does not require installation of an NID pipeline beyond the 30 properties that are to be provided with the option of connecting to NID water supply, the DEIR does include a groundwater well monitoring plan designed to detect any unexpected drawdown impacts outside of the anticipated area of effect, and requires immediate replacement of water supply by the mine operator for any significant impacts to those wells pursuant to Mitigation Measure 4.8-2(b) and General Plan Policy 17.12. Please see Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and with regard to the commenter's reference to the Emgold and Emperor projects, see Master Response 13 - Historic Hydrogeologic Assessments. As noted in Master Response 15, the applicant has also provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1-ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

[1] DEIR page 4.8-54

[2] 3,685 acre feet is the same as one acre covered in 3,685 feet of water. One acre = 43,560 square feet.

[3] www.youtube.com/watch?app=desktop&v=o6HbA2C55ds&t=310s

[4] DEIR Chapter 6, Alternatives Analysis page 6-6

JV January 2023 FEIR Response, Ind 393-2

It is a fact the DEIR notes "the proposed project would result in substantial reduction in groundwater supplies"[4]. It is a fact that for well owners not serviced by NID, this is a "Significant and Unavoidable" issue. The FEIR even attempts to recognize this fact by adding a less than complete "additional assurance" for 378 property owners. The proposed "additional assurance" for 378 property owners is inadequate, as it is not described as a formal mitigation, does not provide an appropriate baseline (1 year vs. 3 years) and does not include all the wells within a 1000' buffer zone of the Rise Gold mineral rights.

Individual Comment 393-3

The 1993 final report for groundwater modeling and underground mining at the Siskon Mine on San Juan Ridge, which was approved by the County, and which, just like the Rise Gold proposal, was based on the currently available science at the time, stated: "Water levels in water supply wells surrounding the site are predicted to undergo very little or no impact from mine dewatering." The predictions were wrong. In 1995, there was a breach of an aquifer discharging millions of gallons of water and mine waste into Spring and Shady Creeks. The breach also drained community wells including those of Grizzly Hill School and North Columbia Schoolhouse Cultural Center. In 1997, the Siskon Mine was closed. As the security bond money ran out years ago, Grizzly Hill School continues to pay thousands of dollars/year to maintain a treatment system to provide drinking water for students and staff.[5]

In January 1997, a containment dam at the abandoned Lava Cap Mine (just 5 miles from the Idaho Maryland Mine) failed, releasing ~10,000 cubic yards of arsenic-rich tailings into its watershed including Little Clipper Creek and Lost Lake. Evidence of unsafe mine-related arsenic contamination was found in Little Clipper Creek, Lost Lake, surrounding property and local water wells. The properties around the Little Clipper Creek have been deemed an EPA Superfund site.[6] Since this area was declared an EPA Superfund site, the homeowners have had to test their wells several times/year. To date, all this work has been done at taxpayers' expense. 21 years later, in 2018, a $32 million judgement was obtained against Elder and Sterling CentreCorp related to cleanup costs. No cleanup has started.

Response to Comment Ind 393-3 The commenter references two different mining projects that resulted in unexpected water supply and water quality impacts. Notably, the proposed project is in a different location with different geologic settings than the referenced projects, so the impacts from those projects are not directly comparable. Nonetheless, the County has seriously considered the potential impacts of the project to water supply and quality, prepared thorough analysis of those impacts in Chapter 4.8 of the DEIR, imposed mitigation measures to ensure that any impacts are mitigated, and hired an independent expert to peer review and provide input on the analysis. Please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells. With regard to the commenter's concern over potential breach of a tailings dam, the project does not propose a tailings dam. Please see Chapter 3 of the DEIR.

JV January 2023 FEIR Response, Ind 393-3

[5] www.sjrtaxpayers.org/history

[6] en.wikipedia.org/wiki/Lava_Cap_Mine

The responder speculates the issues noted at the Siskon Mine are not comparable as the IMM is in a different location. The point the responder does not acknowledge is the "science" predicted/speculated no impact, as it does for the IMM. The science and all the associated assumptions were wrong. Speculating that today's assumptions, mitigations and today's science are better is meaningless.

Individual Comment 393-4

This February (2/28/2022), the United Nations Intergovernmental Panel on Climate Change published a report[7] on climate change showing that:

- "…we have zero years left to avoid dangerous climate change, because it's here."
- "…as many as three billion people around the world will experience chronic water scarcity…".
- "…ecosystems and all sectors of human society and human well-being fundamentally depends on water…"
- "A water crisis is already brewing in the Western United States. Multiyear drought has drained reservoirs and triggered unprecedented water cuts for the region."

On 3/18/2022, The Union newspaper published an article titled "Hot spring forecast: Drought deepens in West, flooding ebbs".[8] A few selected quotes include:

- "There is no relief in sight for the West's record-shattering megadrought…"
- "The reason the West is warming is climate change, especially over the multiple decade timeframe."
- "California has 1.5 million acre feet less water available than it did this time last year."
- "The more than 20-year megadrought…is the worst in 1,200 years and is stoked by…climate change…"

The Nevada County Energy Action Plan, accepted by the Board of Supervisors by vote of 5-0 on 2/12/2019 states the following:[9]

> "…Nevada County…faces challenges associated with regional climate change…climate change poses an immediate and escalating threat to the region's environment, economic strength, and public health. The region is affected by more intense dry periods…and more frequent periods of drought in California…The region is also impacted by a higher proportion of precipitation falling as rain instead of snow…and ***shortages in runoff and water supply, as well as substantial changes in runoff patterns and timing. This will affect groundwater recharge…"*** [emphasis added]

Goal 3 in the Nevada County Energy Action Plan states: "Encourage the Efficient and Safe Transportation and Use of Water Resources". While this section focuses mostly on in-home efficiencies, it notes "water losses" a number of times. Pumping 1 billion gallons of water into Wolf Creek in the first year followed by half a billion gallons per year for the following 79 years is a very substantial "water loss". Some of that water can be reclaimed by a downstream NID water treatment plant but much of it will be "lost" to Nevada County as it flows to the ocean. Please explain how this project is consistent with the water loss goals in the Nevada County Energy Action Plan.

The NID Board Meeting on 2/9/2022 included an agenda item to review the Idaho-Maryland

[7] www.cnn.com/2022/02/28/world/un-ipcc-climate-report-adaptation-impacts/index.html

[8] The Union, 3/18/2022, Page 5. Source NOAA Meteorologists"

[9] Nevada County Energy Action Plan, Chapter 1, page 6

Mine Water Supply Assessment, prepared by Raney Planning and Management (RPM). NID Director Karen Hull, posed a question regarding the impact of climate change on the water models to Mr. Houmau Liu, Ph.D., P.E. from Itasca International, a subcontractor to RPM. Dr. Liu's credentials are impeccable[10]. His response was a detail review of his analysis, including the statement "…but definitely ***we did not look into extensive [impact] of climate change*** [emphasis added] because those are not defined into the future."[11] The DEIR must be amended to include analysis of multiple scenarios that will arise due to climate change over the next 80 years.

Response to Comment Ind 393-4 The commenter provides information on climate change, drought and the Nevada County Energy Action Plan. Additionally, the commenter asserts that the DEIR did not adequately assess climate change, and cites a statement from Dr. Houmau Liu that Itasca did not look into climate change as part of the groundwater model. While the DEIR does consider variations in whether events such as multiple dry years and storm events, the impact of climate change in connection with the project is speculative; and therefore, not required to be analyzed under CEQA. Please see Master Response 16 - Drought and Climate Change, and Master Response 25 - Nevada County Energy Action Plan.

JV January 2023 FEIR Response, Ind 393-4

Global and local climate change is real. There will be local impacts, e.g., the catastrophic snow storms in Nevada County in early January 2022 and the on-going major rain storms and in Nevada County and flooding throughout large parts of California in January 2023. It is a fact that Dr. Liu said they did not model for climate change. It is a fact the DEIR/FEIR are not providing decision makers with all relevant data without modeling the impact of climate change on this project.

Individual Comment 393-5

Please respond to the following questions regarding the adequacy of the DEIR:

- With over 100 miles of tunnels that have not been mapped since World War II and have not been accessed in over 66 years (1956), the DEIR lacks inclusion of the larger area of risk to residential wells included in both the 1996 and 2008 Use Permit/DEIR applications. Please explain.

Response to Comment Ind 393-5 The commenter asserts that the existing mine tunnels have not been mapped since the World War II era, and therefore the DEIR did not adequately assess groundwater impacts to the larger area. The location of the underground mine works is documented in historic materials from the prior mining operations and was used as part of the groundwater model. There is no evidence to suggest that there are significant underground mine works that are unmapped or that these would change the groundwater analysis. Please see Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, Master Response 15 - Adequacy of Groundwater Monitoring Wells, and Master Response 13 - Historic Hydrogeologic Assessments.

Individual Comment 393-6

[10] www.itascainternational.com/about/staff-bios/houmao-liu

[11] NID Board Meeting, 2/9/2022, Dr. Houmau Liu, General Manager/Principal Hydrogeologist, Itasca International

How will well owners know that an effective pre-dewatering assessment of all wells within and immediately surrounding the Rise Gold mineral rights boundaries will be performed by independent consultants?

Response to Comment Ind 393-6 The implementation of mitigation required in Chapter 4.8 of the DEIR to monitor groundwater levels and mitigate any impacts is under the authority of Nevada County, who has enforcement authority to ensure compliance. Please see Master Response 15 - Adequacy of Groundwater Monitoring Wells. As also noted in Master Response 15, the applicant has now provided a Domestic Well Monitoring Plan to monitor domestic water wells within or nearby the predicted 1- ft drawdown isopleth of the project. These 378 properties are listed in Table 1 and shown in Figure 1 of Master Response 15. To provide property owners additional assurance, a condition of approval will be imposed on the project requiring this domestic well monitoring.

JV January 2023 FEIR Response, Ind 393-6
See "**JV January 2023 FEIR Response, Ind 393-2**"

Individual Comment 393-7

- For the next 80 years:
  - What systems are in place to remedy a well that is negatively impacted?
  - How will reduced well output (gallons/minute) be monitored?
  - How will well recharging rates be monitored?
  - How will well contamination be monitored?
  - Who determines root cause of degraded well function?
  - Who determines liability?
  - How and how quickly will temporary water provisions be in place when a well fails?
  - Why are the properties of well owners burdened with losing what little assurances are currently proposed if they sell their property?
  - What financial systems are in place to provide mitigation funding when issues arise?
  - What steps are planned to avoid a disaster like the one at the San Juan Ridge Mine in 1995?

What steps are planned to avoid a disaster like the one at the Lava Cap Mine in 1997?

Response to Comment Ind 393-7 The commenter asks how the required monitoring and water replacement mitigation will be implemented. The implementation of mitigation required in Chapter 4.8 of the DEIR to monitor groundwater levels and mitigate any impacts is under the authority of Nevada County, who has enforcement authority to ensure compliance. Mitigation Measure 4.8-2(b) and General Plan Policy 17.12 require an immediate replacement of water supply at the expense of the Mine Operator. The threshold of significance for groundwater well impacts was determined in the DEIR to be a reduction of 10% of the well water column. See Chapter 4.8 and Appendix K.9 of the DEIR. The Well Mitigation Plan (Appendix K.9) has been modified to clarify actions that would be taken under the well mitigation plan outside of the E. Bennett Road area. Please see Appendix D to this Final EIR for a revised Well Mitigation Plan, and Master Response 15 - Adequacy of Groundwater Monitoring Wells regarding the applicant's commitment to conduct monitoring of domestic wells within the predicted 1-foot drawdown contour. Please see Response to Comment Ind 393-3 regarding the San Juan Ridge Mine and Lava Cap Mine.

JV January 2023 FEIR Response, Ind 393-7
See "**JV January 2023 FEIR Response, Ind 393-2**"

Individual Comment 393-8

What is the justification for why properties with proposed replacement NID water service along East Bennet Rd are required to assume the cost of NID services if the property is annexed into Grass Valley or sold?

Response to Comment Ind 393-8 The commenter asks why properties that are annexed into Grass Valley or sold would not receive payment for the cost of water supply. Please see Response to Comment Agcy 10-6.

Individual Comment 393-9

How will the DEIR address the real concerns from well owners outside the limited study area along East Bennet?

Response to Comment Ind 393-9 The commenter questions how impacts to wells outside the East Bennett area will be addressed. Please see Mitigation Measures 4.8-2(a) and 4.8-2(b) and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

JV January 2023 FEIR Response, Ind 393-9
See "**JV January 2023 FEIR Response, Ind 393-2**"

Individual Comment 393-10

Why are the mitigations required in 1996 and 2008 not the baseline for the current DEIR analysis?

Response to Comment Ind 393-10 The commenter asks why mitigation proposed for previous projects in 2008 and 1996 are different than the mitigation proposed for the project. Please see Master Response 13 - Historic Hydrogeologic Assessments and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

Individual Comment 393-11

- How has the failure, huge negative impacts, on-going costs and lessons learned from the Siskon Mine in North San Juan been factored into the analysis of the Rise Gold mine?

How has the failure, huge negative impacts, on-going costs and lessons learned from the Lava Cap Mine been factored into the analysis of the Rise Gold mine?

Response to Comment Ind 393-11 Please see Response to Comment Ind 393-3 regarding the San Juan Ridge Mine and Lava Cap Mine.

JV January 2023 FEIR Response, Ind 393-11
See "**JV January 2023 FEIR Response, Ind 393-3**". Additionally, responder has not addressed my question, re: lessons learned.

Individual Comment 393-12

Will Nevada County provide inspectors and support systems to oversee well monitoring, potential contamination and reaction to a spill? If so, who pays these salaries?

Response to Comment Ind 393-12 With regard to well monitoring, please see Mitigation Measure 4.8-2(a). Groundwater-level information shall be obtained from the project's groundwater monitoring wells and collected on a quarterly basis, and submitted in report form to the Nevada County Environmental Health Department. The County typically charges permit holders for inspections and other costs associated with enforcement and monitoring of permit conditions. The same would apply to Rise's project. Please also see Master Response 15 – Adequacy of Groundwater Monitoring Wells, regarding the applicant's commitment to monitor domestic wells within the predicted 1-foot drawdown contour. Spills would be reported to the Central Valley Regional Water Quality Control board in compliance with regulations of the State of California. See Chapter 4.8 of the DEIR.

JV January 2023 FEIR Response, Ind 393-12

The response says the well monitoring program will be "self-monitored" with reports provided to the County for review quarterly. An inadequate process at best, both because there is not independent monitoring and because the timing is too slow to for remediation. Also see "**JV January 2023 FEIR Response, Ind 393-2**".

Individual Comment 393-13

If "self-monitoring" and reporting is used, who audits the process used to develop the reports? If audits are performed, how often and who pays the salaries of the auditors?

Response to Comment Ind 393-13 The County has authority over enforcement of all required mitigation measures and conditions of approval through the Mitigation Monitoring and Reporting Program (Chapter 4 of this Final EIR). To the extent that certain conditions or mitigation measures include self-monitoring, the County has enforcement authority to ensure compliance. The County typically charges permit holders for inspections and other costs associated with enforcement and monitoring of permit conditions. The same would apply to Rise's project.

JV January 2023 FEIR Response, Ind 393-13

The response does not address my question: "Who audits the process used to develop the reports?" Additionally, "To the extent…include self-monitoring" suggests that self-monitoring is a small/insignificant part of monitoring, when Response 393-12 clearly shows the DEIR/FEIR allows self-monitoring for one of the most critical impacts of this project, well monitoring.

Individual Comment 393-14

Why are water models for 80 years when the models are based on maps from the 1940's and "did not look into the extensive impact of climate change because those are not defined into the future"?[12]

[12] NID Board Meeting, 2/9/2022, Dr. Houmau Liu, General Manager/Principal Hydrogeologist, Itasca International

Response to Comment Ind 393-14 Please see Master Response 13 – Historic Hydrogeologic Assessments, and Master Response 16 - Drought and Climate Change. The groundwater model incorporated historic data and current data to set the proper existing conditions baseline as required by CEQA.

JV January 2023 FEIR Response, Ind 393-14

It is a fact that Dr. Liu said they did not model for climate change. Without modeling the impact of climate change on this project, the DEIR/FEIR assumes it is providing decision makers with the proper existing conditions baseline.

Individual Comment 393-15

What steps are being taken to ensure the water models are correct, taking into consideration the "immediate and escalating threat of climate change amid the worst megadrought in 1,200 years?"

Response to Comment Ind 393-15 To ensure accuracy of the analysis, the County hired an independent expert to review and provide input on the groundwater model, impact analysis and mitigation measures. The independent expert's comments have been incorporated into the analysis and mitigation. Please see Chapter 4.8 of the DEIR, Master Response 7 - Location of Future Mining Areas, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

Individual Comment 393-16

Have other hydrologists been consulted for peer review of the water models?

Response to Comment Ind 393-16 As discussed in Response to Comment Ind 393-15, the County's independent expert, West Yost, peer-reviewed the hydrogeology studies as disclosed in Chapter 4.8 of the DEIR.

Individual Comment 393-17

- Given that Nevada County knows in advance from the DEIR that "*the proposed project would result in substantial reduction in groundwater supplies*" and knows from the Nevada County Energy Plan that climate change will create "*shortages in runoff and water supply, as well as substantial changes in runoff patterns and timing*. *This will affect groundwater recharge"*. How can the County justify removing 1 billion gallons of water in the first year followed by half a billion per year for the next 79 years?
- What specific steps is Nevada County taking to avoid liability for the above issue?
- What are the additional County liability insurance costs related to approval of this project? How are the costs for additional liability passed down to property owners in the county?

Response to Comment Ind 393-17 The water that is being pumped from the underground mine workings is not being disposed of such that it is wasted. Rather, the water will be treated to State permit standards and discharged into South Fork Wolf Creek, where it can be used by NID for water customers in the County or used by other downstream water users. Liability and

insurance costs are not within the scope of CEQA analysis, but these comments have been forwarded to the decision makers for their consideration.

JV January 2023 FEIR Response, Ind 393-17

The responder speculates that NID and/or other unspecified water users for unspecified conditions will use the water, therefore mitigating waste.

Individual Comment 393-18

The FEIR needs to analyze all the wells potentially impacted by the project. The DEIR impact analysis on wells outside of Ease Bennett Rd is incomplete and proposes inadequate mitigation measures.

Response to Comment Ind 393-18 Please see Responses to Comments Ind 393-7, Ind 393-7, Master Response 14 - Adequacy of Groundwater Model, and Master Response 15 - Adequacy of Groundwater Monitoring Wells.

JV January 2023 FEIR Response, Ind 393-18

See "**JV January 2023 FEIR Response, Ind 393-2**"

Individual Comment 393-19

For the above reasons, re Issue #1: Water Supply for well owners, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24 and is as out of compliance with the Nevada County Energy Action Plan. Please provide a detailed explanation why this project should be allowed to proceed.

Response to Comment Ind 393-19 The commenter asserts that the project is inconsistent with the General Plan and is inconsistent with the Nevada County Energy Action Plan. Please see Master Response 25 - Nevada County Energy Action Plan. General Plan Policy 17.14 requires existing development to be protected from impacts caused by mining. The DEIR provides extensive mitigation measures and conditions of approval to protect already existing development - commercial, residential, and community - as well as undeveloped private lands, from adverse environmental effects caused by mining. Accordingly, the DEIR found that the project is consistent with General Plan Policy 17.14. General Plan Policy 17.24 requires subsurface mining to be conditionally approved only after environmental review under CEQA is completed to address surface land uses, water quantity and quality, noise and vibration, land subsidence, and traffic associated with surface access. The DEIR provides extensive analysis and mitigation measures regarding the listed impacts on the environment in compliance with CEQA. Accordingly, the DEIR found that the project is consistent with General Plan Policy 17.24.

Individual Comment 393-20

Issue #2: Lack of inclusion and detailed review of the Nevada County Business and Industrial Center[13] (NCBIC) alternative: The last 20 years of my career were spent at PRIDE Industries in Roseville. The final 10 years I was the Senior Vice President of Manufacturing and Logistics, including responsibility for a large distribution contract for the world's largest printer manufacturer. We operated a shipping, receiving and distribution warehouse shipping millions

[13] DEIR page 6-11, Nevada County Ordinance 1853, February 1994

of printer parts/year all over the world. Our facility was just over 200,000 square feet with 12 loading docks about 10 minutes from Interstate 80. The in/out diesel truck traffic was 10-15 trucks/day between 6am-6pm. In short, I know a bit about distribution and logistics.

The DEIR lacks inclusion and detailed review of the NCBIC alternative, which with existing M1-SP zoning could include a 54,000 ft^2 Business Park, 242,000 ft^2 for Service Business/Light Manufacturing and 238,000 ft^2 for Industrial uses[14].

The DEIR Chapter 6 "No Project" section discussing "Alternatives Considered but Dismissed from Further Analysis"[15] is incorrect and incomplete. The analysis of the currently permitted NCBIC alternative[16] contains incomplete information and notes examples of negative impacts that are extremely unlikely to occur in the real world. The DEIR concludes an overall negative impact of these uses and rejects this alternative without adequate review.

In the summary section for the NCBIC alternative[17], the DEIR concludes a negative impact and rejects this option assuming noise, traffic, aesthetics and air quality would be the same or worse for the NCBIC alternative vs. the Rise Gold mine. Those assumptions are wrong. Unlike the Rise Gold project, in virtually all cases for the types of businesses that would actually locate there (using existing zoning) the traffic and noise would be comprised largely of passenger and small trucks operating in daytime, mostly weekdays and not 24x7. Diesel truck traffic would be substantially less than the 236 trips/day for the Rise Gold project[18] and almost none of the traffic hauling toxic waste.

The DEIR identifies (among others) Distribution Facilities and Auto Dismantling Yards as examples of business that would "…cause substantial noise, traffic, aesthetic and air quality impacts…" While these business types are permitted under existing zoning, the likelihood of such ventures at this location is extremely low. Both Distribution Facilities and Auto Dismantling Yards (and Saw Mills and Planing Mills) require easy access to major freeways like Interstate 80 and therefore are not realistic for this site. In the case of large 24x7 Distribution Facilities, anything further than 10-15 minutes from a major freeway is not feasible and 238,000 square feet (238K) is too small[19]. Even if you attracted a Distribution Facility tenant, 238K would not support enough loading docks to create the same diesel truck traffic as the Rise Gold mine project. Additionally, for Distribution Facilities and other permitted businesses, at the scale available at this site, the semi-truck traffic would be limited to weekday or daytime use as small to mid-size facilities are unlikely to operate 24x7. The DEIR also notes that a Milling and Planing Facility "would potentially create noise similar or greater to the proposed project." Frankly, that's hard to believe as there was a saw mill and planing mill at that site for decades and there is already a custom milling operation at 11429 East Bennett Rd (Freds Custom Milling and Lumber).

Response to Comment Ind 393-20 This comment is redundant with comments from Individual Comment Letter 388. See Responses to Comments Ind 388-3 through Ind 388-6.

Individual Comment 393-21

Re air quality and traffic: The impact on air quality would be greatly reduced with NCBIC tenants that reflect what would happen in the real world vs. the unrealistic scenarios in the DEIR. The DEIR suggests that car and truck traffic to/from the NCBIC would generate the same pollution as the projected traffic to/from the proposed mine, which includes 236 semi-truck trips/day. Each diesel semi-truck emits as much pollution as 150 cars[20]. Considering only the diesel semi-trucks, producing the same emissions as 236 trips/day requires 35,400 trips/day from cars and light trucks, an unlikely scenario for the mix of businesses that might actually occupy the NCBIC.

Re aesthetics: Given the site is already zoned for the buildings and businesses noted, aesthetic issues could be easily mitigated and included in a proposal for development of all or part of the NCBIC.

Response to Comment Ind 393-21 This comment is redundant with comments from Individual Letter 388. Please see Responses to Comments Ind 388-7 through Ind 388-9.

JV January 2023 FEIR Response, Ind 393-21
See "**JV January 2023 FEIR Response, Ind 388-7**" thru "**JV January 2023 FEIR Response, Ind 388-8**"

Individual Comment 393-22

The DEIR discusses a "Project List"[21] noting 20 projects including "…those that would contribute to the impacts on the same environmental resources, infrastructure, or public services and facilities that would be impacted by the proposed project…". Table 5-1[22] summarizes the scale associated with these 20 projects showing 1,209 Dwelling Units, 23,300ft^2 Office, 119,676 ft^2 Commercial and 471,500 ft^2 Business Park/Industrial. Considering only the "Non-Residential" projects, a couple of items stand out:

1) There is business growth in Nevada County at a scale that could be easily accommodated at the NCBIC location. With the NCBIC option available, some of these or similar businesses would have likely considered locating there. None of them would have negative impacts that are "more intensive"[19] than the Rise Gold mine.
2) Generally speaking, people who live here understand business growth is good for the local economy. With the exception of the Dorsey Marketplace, which has a number of negative environmental impacts, I have not seen an "anti-growth" outcry from local residents and businesses regarding the projects noted in the "Project List".

The DEIR inaccurately states "As demonstrated below, development of the Brunswick Industrial Site[23] with industrial uses, consistent with the current M1-SP zoning, could reasonably be

[20] www.cleanairtrust.org/trucks.dirtytruth.html
[21] DEIR pages 5-4/7
[22] DEIR page 5-7
[23] Brunswick Industrial Site is synonymous with NCBIC

expected to result in above-ground uses that are more intensive in certain respects than the proposed project."[24] The DEIR also notes that the "Environmentally Superior Alternative"[25] would be "Alternative 2, Elimination of the Centennial Industrial Site".

It is clear from my experience, as I am confident one would find from other experts, that the DEIR *does not demonstrate* what it claims. It can be reasonably expected and that with detailed review (vs. exclusion without review) the NCBIC would be found to be the "Environmentally Superior Alternative".

Virtually all of the businesses listed in "Examples of Permitted Uses"[26] already exist or have existed in Nevada County without hundreds of local residents protesting about potential traffic, noise, water consumption, water usage or pollution. A reasonable model to follow would be to do more of what we already know how to do without changing the nature of our community for the next 80 years. I believe many of the people who oppose this mine would likely support a "No Project" alternative with the NCBIC as the best outcome.

Assigning a "not feasible" label to the NCBIC alternative using unrealistic assumptions makes it appear as if the DEIR authors have not done their homework. To reject this alternative without a more detailed review using real world scenarios and real world outcomes makes no sense.

Response to Comment Ind 393-22 This comment is similar to comments from Individual Letter 388. Please see Responses to Comments Ind 388-10 through Ind 388-12.

JV January 2023 FEIR Response, Ind 393-22
See "**JV January 2023 FEIR Response, Ind 388-11**"

Individual Comment 393-23
Please respond to the following questions regarding the adequacy of the DEIR:

- Will the DEIR be updated to include real world scenarios for the NCBIC?
- If not, please explain in detail.
- From a review of the "Project List" noted above, it can be reasonably concluded that the NCBIC would *not* be "more intensive" than the Rise Gold mine. Please explain why the EIR reviews for the "Project List" were not considered before claiming the NCBIC is "not feasible"?
- If the "Project List" projects were contrasted and compared to the Rise Gold mine, please explain the specific areas in the DEIR where those comparisons were made and justified.
- What are the specific measurements, using real world scenarios for noise, traffic, aesthetics and air quality that were done prior to rejecting this alternative?
- If no specific measurements were done, what assumptions, using real world scenarios, were used as the basis to conclude that noise, traffic and aesthetics "could reasonably be expected to result in above-ground uses that are more intensive in certain respects than the proposed project."[27]?
- Why does the DEIR claim "As demonstrated below…could reasonably be expected"[17] when no actual review of real world scenarios was conducted?

[24] DEIR page 6-11
[25] DEIR page 6-42
[26] DEIR pages 6-12/13
[27] DEIR page 6-13

- Without detailed review of the NCBIC how can it be reasonably concluded that "Alternative 2, Elimination of the Centennial Industrial Site" is the "Environmentally Superior Alternative"?

For the above reasons, re Issue #2: Lack of inclusion and detailed review of the NCBIC alternative, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

Response to Comment Ind 393-23 This comment is redundant with comments from Individual Letter 388. Please see Responses to Comments Ind 388-1 through Ind 388-12.

JV January 2023 FEIR Response, Ind 393-22
See "**JV January 2023 FEIR Response, Ind 388-1**" thru "**JV January 2023 FEIR Response, Ind 388-11**"

Individual Comment 393-24
Issue #3: Negative Impacts: Few, if any, of the 83 negative impacts are fully eliminated by the required mitigations, they are only reduced. Look at the long list of negative impacts, especially the "Significant and Unavoidable" impacts listed in the DEIR[28].

Chapter 5, section 5-5[29] "Significant Irreversible Environmental Changes" of the DEIR notes that:

"An irreversible environmental change would be considered significant if ***any*** [emphasis added] of the following would occur:
- The project would involve a large commitment of nonrenewable resources;
- The primary and secondary impacts of the project would generally *commit future generations* [emphasis added] to similar uses (e.g., a highway provides access to a previously remote area);
- The project involves uses in which *irreversible damage could result from any potential environmental accidents* [emphasis added] associated with the project; or
- The phasing of the proposed consumption of resources is not justified (e.g., the project involves a wasteful use of energy).

The proposed project would likely result in, or contribute to, the irreversible environmental changes…".

Among the "Significant and Unavoidable" issues, the DEIR concludes traffic at "SR174/Brunswick" and "Brunswick Road/Sutton Way" cannot be mitigated. Average injury accidents/year for the last 3 years in Nevada County was 405 (CHP Data), including 13 fatalities. With "Significant and Unavoidable" traffic issues, it is statistically likely that more accidents will occur at these intersections.

Response to Comment Ind 393-24 The commenter states that it is likely that more accidents will occur at the two intersections, where project traffic would result in a significant and unavoidable impact, but provides no evidence. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical

[28] DEIR pages 6-7/8
[29] DEIR pages 5-8/9

impacts on the environment does not constitute substantial evidence." It is also noted that the DEIR includes mitigation for the two impacted intersections. For example, while the DEIR concludes that the proposed project would have a significant and unavoidable impact to the SR 174/Brunswick Road intersection, Mitigation Measure 4.12-1(b) of the DEIR requires the applicant to enter into a Traffic Mitigation Agreement with the County regarding the SR 174/Brunswick Road intersection. The Agreement shall require the applicant to pay the project's fair share contribution toward the improvements necessary to improve intersection operations to an acceptable level. The Agreement shall include the fair share calculations and total payment amount. Based on the Caltrans methodology to assess fair share, it is estimated that the fair share percentage is 14.9%. While the project is contributing toward addressing its contribution of traffic to the SR 174/Brunswick Road intersection, the remaining funding needed to improve the intersection (e.g., signalization) is not yet certain, nor secured. As a result, the DEIR conservatively concludes that the impact would remain significant and unavoidable. Regarding the Brunswick Road/Sutton Way intersection, with project traffic, queues in the northbound left turn lanes of the intersection would exceed the threshold of significance. Re-timing of the Brunswick Road/Sutton Way intersection is required by Mitigation Measure 4.12-10 of the DEIR and would maintain LOS C conditions (29.5 seconds per vehicle) with queues declining for this movement. As such, implementation of MM 4.12-10 would reduce the potential impact to a less-than-significant level. However, because the intersection is within the jurisdiction of the City of Grass Valley, Nevada County does not have legal authority to impose this mitigation measure and ensure its eventual outcome. As a result, the impact is conservatively determined to be significant and unavoidable.

JV January 2023 FEIR Response, Ind 393-24

Responder states "…provides no evidence." Yet my comments cite CHP data: "Average injury accidents/year for the last 3 years in Nevada County was 405 (CHP Data), including 13 fatalities." See www.ots.ca.gov/media_and_research/Rankings/default.asp and www.chp.ca.gov/switrs/ and the "2021-2022 Budget Demographic & Statistical Profile" for Nevada County, prepared by the Nevada County Executive Office.

It is statistically impossible that, every year for ***80 years***, adding 238 heavy truck trips/day seven days a week and 312 employee trips/day Monday-Friday to intersections creating a "Significant and Unavoidable Impact" will not create more accidents. The DEIR/FEIR authors can do the same research and calculations I have to conclude there will be some accidents. Yet the DEIR/FEIR ignores the issue and does not provide any statistics relating to traffic accidents. The DEIR/FEIR speculates that increased car and heavy truck traffic through intersections where issues are already identified as "Significant and Unavoidable" will result in no accidents, injuries or fatalities over ***80 years***.

Individual Comment 393-25

Please respond to the following questions regarding the adequacy of the DEIR:

- Is it acceptable if only a few traffic accidents, including injuries and possibly fatalities, occur because of the Significant and Unavoidable traffic impact?
- If yes, please provide justification for how this benefits Nevada County.
- Is it acceptable if water quality, water supply or property values go down for only a few residents?
- If yes, please provide justification for how this benefits Nevada County.

- Is it acceptable if only a few residents have medical issues from the additional air pollution?
- If yes, please provide justification for how this benefits Nevada County.
- Is it acceptable if we only have one toxic spill during the next 80 years?
- If yes, please provide justification for how this benefits Nevada County.
- Is it acceptable if only a few of the negative impacts have larger than planned repercussions?

If yes, please provide justification for how this benefits Nevada County.

Response to Comment Ind 393-25 Please see Response to Comment Ind 393-24 regarding traffic accidents. Water quality and water supply are analyzed in Chapter 4.8 of the DEIR. With regard to economic issues and property values, please see Master Response 1 - Non- EIR/Administrative Issues, and Master Response 2 - Social and Economic Impacts. With regard to air quality, please see Chapter 4.3 of the DEIR and Master Response 18 - Air Quality Thresholds. With regard to "toxic spills" see Chapters 4.7 and 4.8 of the DEIR. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." While many of the project-related concerns noted by the commenter were not identified as significant and unavoidable in the DEIR, it is noted that under CEQA Guidelines Section 15043, the County maintains the authority to approve projects despite significant and unavoidable environmental effects under certain circumstances. Should the Nevada County Board of Supervisors seek to move forward with certifying this EIR and approving the project entitlements, due to the significant and unavoidable impacts that would occur with implementation of the project, the Board would be required to adopt a Statement of Overriding Considerations. The Statement of Overriding Considerations would publicly disclose the process by which the Board weighs the environmental impacts of the project against any other factors. As enumerated in Section 15093 of the CEQA Guidelines, factors to be balanced by the Board when considering projects that would result in a significant and unavoidable environmental impact include economic, legal, social, and technological benefits of projects as well as region-wide or statewide environmental benefits.

JV January 2023 FEIR Response, Ind 393-25

See "**JV January 2023 FEIR Response, Ind 393-24**", re: traffic. The responder does not directly address my questions but uses the "speculation" accusation to defend the DEIR/FEIR speculation that no unforeseen negative events, e.g., toxic spills will occur at any time during the ***80 year*** life of the project. That speculation defies logic. One of many examples includes the 2019 creation of Nevada Gold Mining, a combination of Barrick and Newmont Mining for all operations in the State of Nevada, creating "…the world's single-largest gold producer…" (source: https://www.newmont.com/investors/news-release/news-details/2019/Barrick-and-Newmont-Forge-Nevada-Joint-Venture-Agreement/default.aspx) which has resulted in the State of Nevada leading the nation in toxic releases for 3 years running. (sources: https://elkodaily.com/mining/nevada-leads-us-in-toxic-releases/article_5df955ca-8970-5fbd-9242-3d0c0ead7aa1.html and https://lasvegassun.com/news/2002/may/24/mining-keeps-nevada-at-top-of-pollution-list/). Speculation in the DEIR/FEIR that ***for 80 years*** the mitigations provided will create a scenario in which Rise Gold outperforms the largest mining operation in the US is absurd.

Individual Comment 393-26

Why are the significant irreversible environmental changes noted not considered "adverse environmental impacts" under CEQA?

Response to Comment Ind 393-26 Analysis of significant irreversible environmental changes is a distinct topic of analysis mandated by CEQA Guidelines, Section 15126.2, which is distinct from CEQA's requirement to assess potentially significant impacts in individual resource areas (e.g., noise, traffic, air quality).

Individual Comment 393-27

- Please explain why this project should proceed, given there are "Significant Irreversible Environmental Changes" including "The project involves uses in which *irreversible damage could result from **any** potential environmental accidents* [emphasis added] associated with the project".
- Please explain why this project should proceed, given there are "Significant Irreversible Environmental Changes" and "The primary and secondary impacts of the project would generally commit future generations…"[30], including the grandchildren and great grandchildren of students currently enrolled in Nevada County, to the same use for *the next 80 years*.
- Why are projects even considered with negative Significant Irreversible Environmental Changes as well as Significant and Unavoidable issues?

Assuming even a few of these negative impacts and possible outcomes are *not acceptable*, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

Response to Comment Ind 393-27 Any project that consumes non-renewable energy or mines non-renewable resources would be considered to cause significant irreversible environmental changes. The commenter's suggestion that any project with significant irreversible environmental changes is inconsistent with the General Plan is untenable and would result in the rejection of virtually every project. If the project is approved by the County, the reasons for approval will be outlined in the CEQA findings and the Statement of Overriding Considerations, as discussed in Response to Comment Ind 393-25.

JV January 2023 FEIR Response, Ind 393-27

The response does not address the DEIR statement that "The project involves uses in which *irreversible damage could result from **any** potential environmental accidents* [emphasis added] associated with the project" or "The primary and secondary impacts of the project would generally commit future generations…". The responder mis-represents my comment, which states both conditions need to be true "Significant Irreversible Environmental Changes as well as Significant and Unavoidable issues", then speculates that all projects would be rejected. What I said is when both conditions are true, then a project should be rejected.

Individual Comment 393-28
Issue #4: Air Pollution:
Rise Gold proposes to purchase Carbon Offsets to mitigate greenhouse gas (GHG) emissions

[30] DEIR pages 5-8/9. Also note this project spans 4 generations.

during construction[31] and notes "This shall include…for GHG reduction activities within the Nevada County region."[32].

- First, Carbon Offsets are an after the fact solution. Offsets purchased to mitigate GHG during construction "within the Nevada County region"[33] may be acceptable under CEQA, but may not actually mitigate the negative impacts on the people in and around Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley in a reasonable time-frame.

Second, there will be on-going emissions from daily operations, not just during construction. For the years following construction, GHG emissions range from 7,000-9,000 Metric Tons(MT)/year[34]. The DEIR uses a threshold of 10,000 MT/year, after construction, to conclude that no mitigation is required. The Air Quality Districts used in the DEIR[35] are not similar to Nevada County and should not be used to set Nevada County's air quality thresholds.

Response to Comment Ind 393-28 Please see Master Response 27 - Greenhouse Gas Thresholds, and Master Response 28 - Greenhouse Gas Credits.

JV January 2023 FEIR Response, Ind 393-28

The FEIR Master Responses noted speculate that as long as the additional pollution contributed by the Rise Gold project is below "thresholds" it is ok. The statistics provided for cancer risk currently equate to 1 person per 100,000 as below the "threshold of significance". With Nevada County population at ~100,000 that means one person can get cancer from the additional pollution without breaking the threshold. I suppose that's fine as long as you are not that one person. Re: the reliability of thresholds, the April 2010 President's Cancer Panel study from the NIH, states the following: "Existing regulations, and the exposure assessments on which they are based, are outdated in most cases…Enforcement of most existing regulations is poor. In virtually all cases, regulations fail to take multiple exposures and exposure interactions into account…Industry has exploited regulatory weaknesses, such as government's reactionary (rather than precautionary) approach to regulation." (source: https://deainfo.nci.nih.gov/advisory/pcp/annualReports/pcp08-09rpt/PCP_Report_08-09_508.pdf?_ke=eyJrbF9jb21wYW55X2lkIjogIk1VdnZiOCIsICJrbF9lbWFpbCI6ICJuaWNvbGxlLm1hY2tpbm5vbkBnbWFpbC5jb20ifQ%3D%3D)

Individual Comment 393-29

On 2/28/2022, the United Nations Intergovernmental Panel on Climate Change (UNIPCC) published a report[36] showing that:

- "Greenhouse gas emissions will push warming to 1.5ºC"
- "The world is already 1.1 degrees Celsius warmer than before industrialization...We are now rapidly barreling toward 1.5 degrees."
- "Only by making deep cuts to greenhouse gas emissions, while also removing carbon dioxide from the atmosphere, can we halt the precipitous trend."
- "Bottom line is that we have zero years left to avoid dangerous climate change, because it's here."

[31] DEIR Chapter 2, Table 2-1, item 4.3-7(b) Construction GHG Emissions Reductions, page 2-23

[32] DEIR Chapter 2, Table 2-1, item 4.3-7(b), page 2-24

[33] DEIR page 4.3-96

[34] DEIR Chapter 4, Table 4.3-23, page 4.3-93

[35] DEIR pages 4.3-42/43

[36] www.cnn.com/2022/02/28/world/un-ipcc-climate-report-adaptation-impacts/index.html

- The chart in the above UNIPCC report shows that at current trends GHG emissions will reach 1.5ºC between 2030 and 2050, well before end of the Rise Golds 80-year project.

The California Air Resources Board classifies diesel particulate matter (DPM) as a toxic air contaminant, and estimates that about 70% of the cancer risk the average Californian faces stems from DPM.[37] The American Lung Association gives our community an F grade for ozone levels, designating 105 days per year "unhealthy."[38] During the last two years, wildfires contributed to entire weeks when the Northern Sierra Air Quality Management District labeled Nevada County's air quality "very hazardous." Ongoing climate change, with warmer and drier conditions, intensifies wildfires. Nevada County's air quality is certain to get worse even without the additional pollution from the Rise Gold mine.

Response to Comment Ind 393-29 Please see Master Response 27 - Greenhouse Gas Thresholds, Master Response 18 - Air Quality Thresholds, and Master Response 166 – Drought and Climate Change.

JV January 2023 FEIR Response, Ind 393-29
See "**JV January 2023 FEIR Response, Ind 393-28**"

Individual Comment 393-30

Please respond to the following questions regarding the adequacy of the DEIR:

Besides Carbon Offsets, what is being done to monitor and mitigate the negative impacts of the Rise Gold project on increased GHG for the people in and around Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley during construction?

Response to Comment Ind 393-30 Climate change is a global issue and not only a project specific issue. The project's incremental contribution of GHG emissions would be less than cumulatively considerable (see page 4.3-95 of the DEIR).

JV January 2023 FEIR Response, Ind 393-30
Response does not address my question.

Individual Comment 393-31

Why isn't Nevada County requiring the necessary research to determine the appropriate GHG threshold specifically for the Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley areas, including the negative impact of 7,000-9,000 MT/year of new GHG emissions added during the dangerously unhealthy air quality in the much longer fire and smoke seasons vs. using assumptions from other dissimilar counties?

Response to Comment Ind 393-31 The County determined that 10,000 MT/year of CO_2 equivalent GHG emissions is the proper CEQA threshold to apply to the project. Please see Master Response 27 - Greenhouse Gas Thresholds. Greenhouse gas emissions are not

[37] ww2.arb.ca.gov/resources/overview-diesel-exhaust-and-health
[38] www.lung.org/research/sota/city-rankings/states/california/nevada

included in health risk assessments, as they are not considered toxic air contaminants. Please see Chapter 4.3 of the DEIR.

JV January 2023 FEIR Response, Ind 393-31
The FEIR Master Responses noted speculate that as long as the additional pollution contributed by the Rise Gold project is below "thresholds" it is ok.

Individual Comment 393-32

Given the already serious impacts of climate change, what specific steps will Nevada County take to ensure a net zero impact from this project vs. adding 7,000-9,000 MT/year to the problem?

Response to Comment Ind 393-32 Please see Master Response 27 - Greenhouse Gas Thresholds. The project is not required to achieve net zero GHG emissions.

JV January 2023 FEIR Response, Ind 393-32
Net zero may not be required, but it is the right thing to do. Hiding under regulations does not help reduce GHG.

Individual Comment 393-33

- Understanding the changing impact of climate change for the next 80 years:
  - What is being done to mitigate the negative impacts of increased GHG on the people in and around Grass Valley, Nevada City, Alta Sierra, Lake Wildwood and Penn Valley?
  - How will GHG emissions be monitored to ensure compliance?
  - How will 7,000-9,000 MT/year of new GHG emissions added during fire season impact already poor air quality?
  - What production mitigations, e.g. fewer diesel trucks/day, will occur at the Rise Gold mine when air quality as measured by the Northern Sierra Air Quality Management District for the Grass Valley, Nevada City, Alta Sierra, Lake Wildwood or Penn Valley areas is "very hazardous"?
  - What mitigations will occur if parts of the proposed Rise Gold schedule changes (e.g., more trucks delivering Engineered Fill now vs. later), driving emissions over the thresholds noted in the DEIR?
  - How will anyone outside of Rise Gold know about schedule changes that impact GHG emissions?
  - Who will do the monitoring?

How frequently will monitoring data be published?

Response to Comment Ind 393-33 Please see Chapter 4.3 of the DEIR, Master Response 18 - Air Quality Thresholds, and Master Response 27 - Greenhouse Gas Thresholds. The project is not required to monitor or publish emissions of GHG. GHG emissions during fire season would not cause a direct air quality impact as GHG emissions are not toxic air contaminants or criteria air pollutants. Climate change is a global impact and not specific to the individual communities listed by the commenter, thus individual analysis of those communities is not required by CEQA.

Individual Comment 393-34

For the above reasons, re Issue #4: Air Pollution, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

Response to Comment Ind 393-34 Air quality impacts from the project are less than significant after mitigation. Please see Chapter 4.3 of the DEIR. If the project is approved by the County, the reasons for approval will be outlined in the CEQA findings and the Statement of Overriding Considerations.

Individual Comment 393-35

Issue #5: Trips/Day: There has been much talk about "100 trips/day" for large trucks which counts "round trips". It's actually 200 one-way trips/day for hauling mine waste plus 36 other large truck trips/day[39]. Each trip creates GHG emissions locally that won't be mitigated by Carbon Offsets from somewhere else in Nevada County. Diesel trucks generate up to 150 times the emissions of passenger vehicles.[40] Producing the same emissions as 236 large truck trips/day requires 35,400 trips/day from cars and light trucks. Following construction, Rise Gold is not required to provide any mitigation for GHG emissions comparable to as many as 35,400 passenger vehicles/day[41]. In addition, traffic issues at "SR174/Brunswick" and "Brunswick Road/Sutton Way" are "Significant and Unavoidable" and cannot be mitigated.[42]

The DEIR notes that the "Environmentally Superior Alternative"[18] would be "Alternative 2, Elimination of the Centennial Industrial Site" yet there are still "Significant and Unavoidable" issues for Transportation.[43]

Response to Comment Ind 393-35 GHG emissions attributable to trucks has been analyzed in the DEIR. Please see Chapter 4.3 of the DEIR. Please also see Response to Comment 393-24 regarding significant traffic impacts. The commenter notes that the DEIR identifies Alternative 2, Elimination of the Centennial Industrial Site, as the environmentally superior alternative, but said alternative still has significant and unavoidable issues for transportation. What the commenter does not mention is that Alternative 2 would eliminate one significant project-related noise impact (DEIR, p. 6-28). This is the impact related to potential use of Jake brakes along the haul route connecting the Brunswick and Centennial Industrial Sites. The EIR determined that the proposed project could result in a substantial increase in ambient noise levels in the vicinity of the project due to haul truck traffic should Jake brakes be used. As also noted on page 6-29, implementation of Alternative 2 would also eliminate the truck turning movements along Whispering Pines Lane into the Centennial Industrial Site driveway; thus, widening along the Centennial Industrial Site's frontage for purposes of facilitating adequate truck turn movements into and out of the Site would not be required for this Alternative. Alternative 2 would also eliminate certain project-related pavement impacts along the haul route from the Brunswick to Centennial Sites. As discussed on page 6-2 of the DEIR, the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be

[39] DEIR Chapter 4, Table 4.12-7, page 4.12-33

[40] www.cleanairtrust.org/trucks.dirtytruth.html

[41] 236 truck trips/day x the equivalent 150 passenger vehicle trips, see www.cleanairtrust.org/trucks.dirtytruth.html

[42] DEIR, 4.12-8, 4.12-10, pages 5-11/12

[43] DEIR, Table 6-1, page 6-44

more costly (CEQA Guidelines Section 15126.6[b]). Alternative 2 would avoid some of the proposed project's impacts, and therefore, meets the CEQA requirement for an alternative.

JV January 2023 FEIR Response, Ind 393-35
See "**JV January 2023 FEIR Response, Ind 393-31**". Responder also notes the benefits of Alternative 2. The DEIR states (page 6-44) "…Alternative 2 would be considered the environmentally superior alternative." Yet the FEIR proceeds anyway with the original proposal noted in the DEIR with minor modifications in the FEIR.

Individual Comment 393-36
Please respond to the following questions regarding the adequacy of the DEIR:

Following construction, given the data for GHG "thresholds" is from counties dissimilar to Nevada County, why are no mitigations required for GHG emissions comparable to as many as 35,400 passenger vehicles/day?

Response to Comment Ind 393-36 Please see Master Response 27 - Greenhouse Gas Thresholds.

JV January 2023 FEIR Response, Ind 393-36
See "**JV January 2023 FEIR Response, Ind 393-31**".

Individual Comment 393-37

- Given that the County knows in advance there will be injuries and possibly fatalities directly related to "Significant and Unavoidable" traffic issues, how does Nevada County justify the project at all?

How will the County compensate victims of vehicle and pedestrian injury accidents and fatalities at intersections where the traffic impact from the Rise Gold project is "Significant and Unavoidable"?

Response to Comment Ind 393-37 The commenter states that it is likely that more accidents will occur at intersections due to project traffic but provides no evidence for this argument. CEQA does not require the analysis of speculative impacts. As stated in CEQA Guidelines Section 15384, "[a]rgument, speculation, unsubstantiated opinion or narrative, evidence which is clearly erroneous or inaccurate, or evidence of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment does not constitute substantial evidence." Please also see Response to Comment Ind 393-24. Liability insurance is not an environmental issue requiring analysis under CEQA.

JV January 2023 FEIR Response, Ind 393-37
See "**JV January 2023 FEIR Response, Ind 393-24**".

Individual Comment 393-38

- Given that the County knows in advance there will be injuries and possibly fatalities directly related to "Significant and Unavoidable" traffic issues, how does Nevada County avoid significant liability?

- What are the additional liability insurance costs related to approval of this project? How are the costs for additional liability passed down to property owners in the county?

Response to Comment Ind 393-38 Please see Response to Comment Ind 393-37.

JV January 2023 FEIR Response, Ind 393-38
See "**JV January 2023 FEIR Response, Ind 393-24**".

Individual Comment 393-39

- Why are projects even considered with negative Significant and Unavoidable issues?

For the above reasons, re Issue #5: Trips/Day, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

Response to Comment Ind 161-39 Please see Responses to Comments Ind 393-19 and Ind 393-25.

Individual Comment 393-40
Issue #6: Trust and Financial Stability: Trust and Financial Stability may not sound like *environmental* issues, but in fact are an overlay on all environmental issues and planned mitigations. How can the County trust an organization led by a CEO who walked away from the Banks Island Mine in British Columbia after they were caught dumping toxic waste, claiming (in part) that they were allowed to "discharge waste into the *environment* [emphasis added]"?[44] Anyone who would make such a claim or believe it's okay to dump toxic waste into the environment should not be allowed to run a project in Nevada County.

Re Financial Stability: The most recent Rise Gold Corp. Form 10-Q, including its wholly-owned subsidiary Rise Grass Valley Inc., filed with the Securities and Exchange Commission for the quarter ending October 31, 2021 says the following on Page F-5:

> "The Company has incurred a loss of $212,300 for the three-month period ended October 31, 2021 and has accumulated a deficit of $19,756,777. The ability of the Company to continue as a going concern is dependent on the Company's ability to maintain continued support from its shareholders and creditors and to raise additional capital and implement its business plan. There is no assurance that the Company will be able to obtain adequate financing in the future or that such financing will be on terms advantageous to the Company. However, the Company has been able to obtain such financings in the past. The consolidated financial statements do not include any adjustments that might be necessary if the Company is unable to continue as a going concern. At October 31, 2021, the Company had working capital of $474,447 (July 31, 2021 - $956,524). As such, ***these material uncertainties cast a substantial doubt regarding the Company's ability to continue as a going concern*** [emphasis added]."

Page F-20 of the 10-Q document states:

> "The Company expects to operate at a loss for at least the next 12 months. It has no agreements for additional financing and cannot provide any assurance that additional funding

[44] www.thenorthernview.com/news/witnesses-testify-in-court-on-banks-island-mine-disaster

will be available to finance its operations on acceptable terms in order to enable it to carry out its business plan. There are no assurances that the Company will be able to complete further sales of its common stock or any other form of additional financing. However, the Company has been able to obtain such financings in the past. If the Company is unable to achieve the financing necessary to continue its plan of operations, then it will not be able to carry out any exploration work on the Idaho-Maryland Property or the other properties in which it owns an interest and its business may fail. As such, ***these material uncertainties cast a substantial doubt regarding the Company's ability to continue as a going concern*** [emphasis added]."

Please respond to the following questions regarding the adequacy of the DEIR:

- Why does the DEIR not address how Rise Gold plans to manage this project without the excuse that they were allowed to "discharge waste into the environment"?
- What is the specific plan for when a toxic spill occurs?
- Who takes action?
- Who does the cleanup?
- Who bears the cost?
- Who reviews and modifies procedures to ensure the issue is solved and will not occur again?
- If the answer to the previous question is Rise Gold, who will review their work to ensure the issue is solved and will not occur again?
- How and when will the public have access to information during and after a toxic spill?
- Given the "…substantial doubt regarding the Company's ability to continue as a going concern" are funds set aside in escrow, before any construction or dewatering starts, to cover the cost of:
  - all required mitigations for the life of the 80 year project?
  - cleanup following a toxic spill?
  - additional NID connections when wells in the Rise Gold mineral rights area but beyond the planned pipeline on East Bennett are negatively impacted?
  - water well replacement for property owners who do not have access to NID?
  - Emergency water supplies for wells that dry up from mine dewatering?
- Given the history associated with Rise Gold's CEO, what steps are in place to mitigate the conflict of interest associated with self-monitoring and accurate reporting to the County?

For the above reasons, re Issue #6: Trust and Financial Stability, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

Response to Comment Ind 393-40 Please see Master Response 3 - Operator Responsibility. Please see Response to Comment Ind 393-19 regarding General Plan Policy consistency.

JV January 2023 FEIR Response, Ind 393-40

As noted in Master Response 3, the FEIR speculates the County can easily revoke the use permit at any time. However, if the use permit is revoked, there would then be a loss of 312 Rise jobs, 163 "Community" jobs and over $700K/year in County tax revenue (Note: all numbers are from Rise Gold publications). These considerations change the decision process as the County is left with a choice between allowing continuation of business or accepting unreasonable delays to repair violatoins when they would otherwise revoke the permit vs. loss of local jobs and County revenue.

Additionally, the response states "While the commenter's concerns are not a CEQA environmental issue for purposes of the EIR…" In all other cases in the FEIR responses to Letter 393, "…not required by CEQA" or "…not a CEQA requirement" is the end of the response. But in this case, responder supplies a detailed defense provided by Mr. Mossman. If Mr. Mossman provides a defense, why were the Candian courts contacted to include their comments?

Individual Comment 393-41

Issue #7: 80-Year Plan: The "80-year" plan is more than unrealistic. The grandchildren and great grandchildren of students currently enrolled at Nevada County schools will still be dealing with the fallout from this project. Rise Gold is owned by an investment group. All such groups have an "exit strategy" before they invest. That plan considers how to make a quick return on their investment. They will not be here for the long-term or to cover the cost of clean-up that will be required when something fails. That's why they declared **bankruptcy** in British Columbia but the "Management" bio for Ben Mossman at the Rise Gold website says "…he led…a **profitable** gold mine in British Columbia…"[45]. What that conflicting message means is they stayed long enough to make a profit for their investors and then bailed out.

Please respond to the following questions regarding the adequacy of the DEIR:

- When Rise Gold is sold to or merged with another mining company what plans are in place to ensure continued compliance and avoid concessions (e.g., the new company saying something like "we can't continue to operate if we have to continue various mitigations, so provide concessions or risk losing 300+ jobs")?
- What assurances do the people of Nevada County have that money is set aside now to cover the cost of clean-up and remediation when/if Rise Gold (again) declares bankruptcy?
- If money is set aside up front, what process is used to ensure it's enough for clean-up and remediation across the 80-year life of this project?
- Please explain why this project should proceed given there are "Significant Irreversible Environmental Changes" and "The primary and secondary impacts of the project would generally commit future generations…"[46], including the grandchildren and great grandchildren of students currently enrolled at schools in Nevada County, to the same use for the next 80 years.

For the above reasons, re Issue #7: 80-Year Plan, this project is out of compliance with Nevada County General Plan Policy 17.14 and 17.24. Please provide a detailed explanation why this project should be allowed to proceed.

Response to Comment Ind 393-41 Please see Master Response 3 - Operator Responsibility. Please see Response to Comment Ind 393-19 regarding General Plan Policy consistency.

JV January 2023 FEIR Response, Ind 393-41

The response does not address my questions. Also see "**JV January 2023 FEIR Response, Ind 393-40**".

Individual Comment 393-42

[45] www.risegoldcorp.com/management

[46] DEIR pages 5-8/9

Issue #8: Incorporation by Reference: The DEIR document "3.0 Introduction to the Environmental Analysis"[47] notes incorporation by reference of the "Nevada County General Plan Final Environmental Impact Report, dated March 1995 (State Clearinghouse Number 1995102136)" and possibly a DEIR for Dollar General Stores from December 2016 (Dollar General is noted in the footer on all pages). This section refers to technical information "in the above referenced EIR" (the Nevada County General Plan Final EIR).

Please respond to the following questions regarding the adequacy of the DEIR:

- What are the specific places where items that are incorporated by reference are used in the Idaho-Maryland Mine Project DEIR?
- In each case, why is the information incorporated by reference?

Also note that the County website link provided in the DEIR for the referenced document ["Nevada County General Plan Final Environmental Impact Report, dated March 1995 (State Clearinghouse Number 1995102136)"] is incorrect and should be www.mynevadacounty.com/1065/General-Plan.[48]

Response to Comment Ind 393-42 Documents used directly in an EIR's impact analysis are typically included in the appendices (e.g., technical studies performed specifically for the project). However, outside documents that only indirectly relate to the project are sometimes incorporated by reference into an EIR to avoid inflating the length of the EIR and its appendices to an unmanageable size. Citations are provided for referenced documents, so that readers can locate those documents if desired.

JV January 2023 FEIR Response, Ind 393-42

The response does not address my questions. The responder notes "Citations are provided for referenced documents" but does not provide the citations.

Individual Comment 393-43

Nevada County's General Plan, as approved by the Board of Supervisors, following thousands of hours of work and thousands of dollars in cost, has the following four Central Themes:

- Fostering a rural quality of life.
- Sustaining a quality environment.
- Development of a strong diversified, sustainable local economy.
- Planned land use patterns will determine the level of public services appropriate to the character, economy and environment of each region.

Please provide detailed reasoning why the Rise Gold Idaho-Maryland Mine Project should be approved when:

- The DEIR includes "Significant and Unavoidable" issues, which by definition cannot be addressed.

The serious concerns noted in my questions and commentary, re Issues 1-7 above have not been adequately addressed in the DEIR.

Response to Comment Ind 393-43 Please see Response to Comment Ind 393-19 regarding General Plan Policy consistency. General Plan consistency was analyzed in the

[47] DEIR pages 3.0-2/3

[48] 1/28/22 email from Matt Kelley

DEIR, which concluded that the project is generally consistent with the General Plan. If the project is approved by the County, the reasons for approval will be outlined in the CEQA findings and the Statement of Overriding Considerations, as discussed in Response to Comment Ind 393-25.

JV January 2023 FEIR Response, Ind 393-43
See **JV January 2023 FEIR Response, Ind 393-1 thru JV January 2023 FEIR Response, Ind 393-42**." The DEIR and FEIR responses are speculative in many areas and do not properly address the issues raised here or the many issues raised in other public commentary responses to the DEIR.

Individual Comment 393-44

- Lack of compliance with
  - at least 2 Central Themes of the Nevada County General Plan
  - Nevada County General Plan Policy 17.14

Nevada County General Plan Policy 17.24 including "All other related impacts **shall** [emphasis added] also be addressed."

Response to Comment Ind 393-44 Please see Response to Comment Ind 393-43.

Individual Comment 393-45

The Nevada County Energy Action Plan

Response to Comment Ind 393-45 Please see Master Response 25 - Nevada County Energy Action Plan.

From: Barbara Rivenes, Sierra Nevada Group/Sierra Club

Re: Idaho-Maryland Mine Project Final EIR comments

The Sierra Nevada Group of the Sierra Club continues to have concerns about the Idaho-Maryland Mine re-opening in Nevada County. The following are our responses to the Final Environmental Impact Report (FEIR). As with the earlier EIR we support the submitted FEIR comments/responses of the Community Environmental Advocates Foundation.

As part of the Sierra Club which is our nation's largest and most influential grassroots organization with millions of members and supporters, the Sierra Nevada Group serves approximately 1000 members in Nevada, Yuba and Sierra counties. Our mission includes working to promote clean

energy, safeguard the health of our communities and protect wildlife through activism, public education, lobbying and legal action.

The California Environmental Quality Act (CEQA) is an important tool to help communities understand the scope and impact of a project being proposed. As such, it requires that all the information regarding the proposed Project be examined and found to be complete and answer all the questions that could arise should the Project be approved. In the case of the Idaho-Maryland Mine re-opening, clearly a large industrial venture will pose a considerable impact on its rural residential neighbors and the nearby city.

The release of the Idaho-Maryland Mine EIR enumerated the number of impacts the re-opening would have. That number was a staggering 83 potential impacts with 3 that would not be able to be mitigated and the other 80 were considered to be significant or less than significant and could be successfully mitigated below that level. The following are a few of the incomplete and inadequate responses to the EIR's treatment of impacts that continue to raise serious concerns.

CEQA issues: CEQA requires the EIR to identify the whole of the Project's activities as a single and complete Project to analyze its potential impacts. The full project includes the use of the currently toxic laden Centennial property as a repository for "engineered fill" from the mine. It assumes that the property will have been cleaned up in advance of the production and transport of mine material but does not discuss this clean-up and its impacts as part of the Project. The environmental impacts rightfully need to be described, enumerated, and counted as part of the entire Project. A CEQA requirement is to identify the "whole" of the Project as a single and complete Project and should not have parts excluded. It could lead to an underestimation of impacts and not inform the public of the actual harm this project in its entirety could cause.

The Centennial cleanup is not a stand-alone project and the considerable impacts of grading, traffic, air quality and wetland disturbance associated with it should be added to the entire Project. It is a serious failure of the EIR not to have incorporated the impacts of the Centennial Site cleanup as part of the project.

We dispute the argument made under Master Response 4 that Centennial Site cleanup is a separate project for the following reasons:

1. The FEIR Does Not Use the Correct Baseline of Existing Conditions at the Centennial Site. The EIR does not consistently use existing conditions as the baseline for the Centennial Site and cannot merely assume that the proposed Centennial cleanup will be approved or completed. The document's analysis of aesthetic impacts, agriculture and forestry resources, biological resources, hazards and hazardous materials, and wildfire risk (which all use the assumed post-remediation baseline) do not evaluate those impacts with reference to existing contaminated conditions on the Centennial Site and must consider the possibility that the cleanup may not occur before mine operations begin, or at all.
2. The FEIR's Project Description Improperly Excludes the Cleanup of the Centennial Site from the Project Scope. Rise Gold would not have entered the Voluntary Agreement to undertake the Centennial cleanup and its associated

costs if it did not serve the Applicant's goal of dumping fill on the site as part of the IMM Project. If the IMM Project does not go forward, the Applicant could withdraw from its commitment to the Centennial cleanup.

3. The Nevada County Idaho-Maryland Project Description dated November 2019 contains a request for a Use Permit and Reclamation Plan to allow transport of engineered fill from the Brunswick Industrial site and placement at the Centennial Industrial Site. Clearly this Project Description considers the use of the Centennial Industrial Site as part of the Project and should not be separated.

The Centennial cleanup is not a stand-alone project and the considerable impacts of grading, traffic, air quality and wetland disturbance associated with it should be added to the entire Project. It is a serious failure of the EIR not to have incorporated the impacts of the Centennial Site cleanup as part of the project.

Noise: Calculations regarding the changes in noise levels in the Brunswick Industrial Site where the actual mine entrance is located along with various mine and waste processing, two silos, mine dewatering and filtration pond, truck loading and unloading and most of the employees was found in the EIR calculations not to exceed normal decibels. The project location is surrounded by a rural residential neighborhood with generally low ambient noise thresholds.

An expert in noise and vibration analysis noted that the Project includes many operations that will occur at nighttime hours. In addition, many of the nearby sensitive receptors are located away from notable sources of ambient noise and therefore receive very low nighttime background noise. The Project's noise levels could be 20 to 35 decibels louder than the current median/background ambient noise levels, causing a severe impact. The EIR fails to address sensitive receptors located farther away.

The proper question is not the relative amount of noise resulting from the Project, but "whether any additional amount of noise should be considered significant" in light of existing conditions.
Conformity with the absolute or maximum noise level specified in a general plan does not prevent a fair argument from being made that the proposed project will generate environmentally significant noise impacts. Considering this very quiet ambient environment, the FEIR should have thoroughly examined the Project's potential to generate nighttime noise. Unfortunately, it does no such thing.

The FEIR asserts that because the Project's on-site noise sources must comply with the County's nighttime noise level standards, an evaluation of sleep disturbance is not warranted. EIR at 4.10-23. This assertion is absurd. The Project includes many operations that will occur during early morning or nighttime hours, including dewatering, indoor facility construction, truck loading/unloading and off-site hauling mineralization processing, and water treatment. DEIR at 3-37. The combination of morning and nighttime industrial activities and low background/ambient noise levels represent a significant risk for Project-related noise to impact the community, annoy residents, and cause sleep disturbance.
The FEIR further omits an analysis of the noise impacts resulting from remediation of the Centennial site, which we contend is part of this Project.

Wells and Groundwater: Groundwater resources are of extreme concern. The proposed Project

would significantly affect local groundwater resources by dewatering the mine thereby lowering groundwater levels. The EIR recognizes that 242 well owners will be affected but assumes others in the vicinity will not be dramatically affected, but merely have their wells lowered a couple of feet. Looking forward to positive indications of drought and future climate change, this arbitrarily low impact threshold is invalid. The mitigations proposed are inadequate with respect to the number of affected well-owners in the large area of uncertainty. Monitoring should be required for at least three years.

There are over 300 properties with wells within 1000 feet of the Project's mineral rights area. The EIR did not provide current monitoring data from these domestic wells and relied only on sparse patches of data from over 15 years ago. Further, the groundwater modeling done for the EIR is limited to a very narrow region. More basic data needs to be gathered and a valid groundwater hydrological model must be built. These and other pressing groundwater issues need to be rectified.

The EIR explains that to implement a Ground Watering Plan, the Applicant must collect additional groundwater level data and then perform a water-level assessment for individual wells. These steps are necessary to evaluate *baseline* groundwater level conditions and to determine the Project's impacts on individual domestic wells. EIR at 4.8-67. This post approval data collection and impact analysis constitutes an inappropriate deferral of mitigation. **"Formulation of mitigation measures should not be deferred until some future time." CEQA Guidelines § 15126.4(a)(1)(B).**

The model does not describe how drawdown would be determined relative to baseline conditions. Private domestic wells in the Project vicinity have seasonal fluctuations that may vary from 10 to 50 feet between wet and dry seasons. Exhibit A (Baseline Report) at 11 (citing EIR Appendix K.3 at 7). The EIR provides no explanation as to how these seasonal water fluctuations would be distinguished from Project-related drawdown. Nor does the groundwater model accurately account for the groundwater depression that will be created by the constant drainage from the existing mine workings. As Baseline explains, calibrating the groundwater model without incorporating the proper mechanisms to simulate the drainage of groundwater from existing mine workings could introduce substantial error to the overall modeling results. Exhibit A (Baseline Report) at 8.

Conclusion: Machines rumbling around beneath homes, blasting, trucks laden with toxic dust particles (impossible to contain), nighttime noise/glare, 7 stories of "engineered fill" on two properties within ¼ mile of a city of 36,000 people need adequate mitigation. Two creeks, Wolf Creek and South Fork Wolf Creek, border each of these mine properties and will be impacted by dewatering and being used as a conduit for used Mine water.

The overall environmental damage is significant and cannot be adequately mitigated.
The above are just a few of the 80 impacts which have not been adequately addressed by the proponents**.**

The Planning Commission meeting in April 2022 on the Idaho-Maryland EIR and about 100 people spoke. Each shared their legitimate concerns about either the inadequacies of the report or of the outsized impact that a large industrial project will have on some neighborhoods and/or the

ambience of the area in general. Since the beginning of the EIR process in 2021, large numbers of residents have written personal letters, signed petitions and campaigns against the re-opening of the IMMine.

On behalf of the Sierra Nevada Group, we conclude that the IMM FEIR does not meet the standards of adequacy in mitigating the impacts discussed in this response. We urge a No vote on recommendation to the Nevada County Board of Supervisors for approval.

Sincerely,

Barbara Rivenes, Vice-chair
Sierra Nevada Group/Sierra Club

Matt Kelley Planning Commission Supervisor

Our Family is VERY OPPOSED to the Idaho-Maryland Mine.

There are many claims made by the Rise Gold Corp. that we find to be inaccurate . Many of them were pointed out in the article written on the April 1, 2022, "Digging Deeper " (published in THE UNION).

The Rise Corp states the they will be creating hundreds of jobs in our community. When I look at the actual details they want to hire people locally to work in the mine. The community will be expected to add jobs to local business to service those people. My question is, "Why would we need more services for people that already live here and use existing services in our community?"

We also feel that TOURISM will be greatly impacted by pollutant being added to the RIVERS, WATERWAYS and AIR QUALITY . These will not only impact our community but will impact the surrounding communities as we have learned form Malakoff Diggins .

If the community is hoping for a revenue, there are other ways to achieve solutions. I'd much rather see a Costco be put in than having to be held responsible for the environmental impacts that this mine will create. If the community were to do something like this, we could ensure local jobs and local tax to improve the community fiscally. Such an endeavor would not have permanent irreparable damage on the environment that makes our community so rich.

PROPERTY VALUES will also be impacted greatly. Our family will be expecting great reductions in our property taxes because of our proximity to the mine .

Thank you for your time,

The Huddleston Family

Dear Planning Commision and Supervisors,

My family and I are against the re-opening of the Idaho-Maryland mine, also known as the RISE Mine project. I have lived in Nevada county for 25+ years and for 6 years, I attended UNR to complete my Bachelor's and Master's Degree in Biology. I have researched the Rise Mine website and have also researched the long-term devastation caused by deep-ground mining (even if it is termed as "green gold mining"). The negative, long-term environmental consequences outweigh the positive, short-term economic benefits. I believe that the RISE firm has appealed to the community with said economic benefits. There are examples from scientifically researched and supported organizations, like safewater.org, that show deep water mining does ultimately and greatly affect the water tables of the environment. If it is not our immediate water tables that are affected (at a more shallow fractured water tables), we will be taking from some neighboring locationthat can only be determined when the damage has been done. Mines in Arizona and Nevada can still be traced as sources draining water from areas of northern california even decades after the mines have ceased to function. If this is the case, and we deplete another community's water supply, I think it would likely be traced right back to our community if the mine is approved. We would be economically responsible for restoring water should we be responsible for depleting neighboring water supplies. I also feel that the RISE website appeals to the community because of LIP SERVICE. The statements are not scientifically supported, or they have kept their sources a secret which contadicts the importance of having proper research to back facts up in the first place. RISE uses misleading verbiage and notions to suggest that they would positively benefit our community via employment opportunities. The RISE company has been inconsistent about the selection of employees. They haven't clearly specified if these employees would be local because the company states that some employees would be temporarily moved to our community to work on the mine. They have claimed that they will provide hundreds of

local jobs, and restated that that many of these jobs are implied local business hires because of the influx of cash flow at local businesses. This is a contradiction to what they have said about hiring locally. If the hired workers already live locally then they already use community services. So where would this new revenue be coming from? They are either not hiring locally or they will not generate new revenue locally, which one is it? Let's not be hoodwinked by superficial jargon and deceptive information. There is a reason that a corporation with an unpleasant history (abandonment of job site cleanup and neglect for the environment) is trying to establish temporarily here, ruse our community, and exploit our land. When things sound too good to be true, they typically are. There is no such thing as an environmentally friendly way to do a large mine operation. My last thought is in regard to the deep ore that RISE claims will be removed from the ground and used for development of land surrounding the mining site. The breaking up of this solid ore means crushing and releasing other contaminants in the ground. The solid ore that is broken up to be brought out of the deep mining sight contains elements that when exposed to oxygen release contaminants into our environment. We might not see the effects of these harmful contaminants on a short-term time scale. RISE claims that extra waste will be cleaned up by third party industries, but they have not specified where the waste ends up, who these companies are, and if disposal of the contaminated material is even possible. Perhaps 10 years down the line, we will be experiencing irreparable damage visible by the absence of insect and animal life in the community. We will have to wonder how to explain to our children and their children why the land and water is unusable, or why it is hard to find insects or birds in our area. We will have to reflect on the forgotten few years of supposed financial gain and wonder if it was worth the tradeoff. The long-term effects of mining are what really need to be considered. For our community, reopening one of CA's largest gold mines could be the worst path possible. Please DO NOT approve this mine operation.

Thank you for your time,

Jennifer Todd

To Whom It May Concern:
Please forward this letter to each of the Nevada County Planning Commissioners wit the attachments.

March 10, 2023

Dear Commissioners:

As you know, CEA/Minewatch is coordinating the community campaign asking that you deny the application to reopen the Idaho Maryland Mine.

Thank you for hearing our presentation on the water quality impacts of the mine yesterday.

We will continue to make presentations on one or two key issues at each Commission meeting leading up to the hearing on the project. We promise to keep them short and factual. We hope you will find them useful.

We have attached a summary of our key concerns and information from our previous presentations as well as for some of our future presentations so that you will have an electronic copy for your ease of use. Each file has an easy to follow title. Our asbestos comments are still on the way!

Our website is also a good place to research the project. It includes an extensive "library" with videos, op-eds, press articles, etc. Just go to: https://linkprotect.cudasvc.com/url?a=https%3a%2f%2fminewatchnc.org&c=E,1,3dAS647bgvkWBdFfsT6Sq3YhArhngUmANcBjVSpDImCJKkDh-vVMjEGUSpcUctMNkCKvzn4n2Pm2U3Ed_6A5Joy6J1g1-FWxPylEbxugqmDYvjS-8boqBhbh&typo=1

Thank you for your work and consideration on this important issue.

Sincerely,
Board of Directors

Community Environmental Advocates

The County should deny the Idaho Maryland Mine and should not certify the EIR.

- **The many environmental impacts associated with the mine, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the mine project.**

- **Denying the mine project does not deprive the applicant of use of the land under its current zoning. It is not a taking.**
  The entire Brunswick Industrial Site is currently zoned M1-SP (Light Industrial, Site Performance Combining District), per the County's Zoning Code. Its land use designation is IND (Industrial) under the County's General Plan. The applicant is proposing to re-zone it as M1-ME (Light Industrial with Mineral Extraction Combining District) as part of the project. The Centennial Industrial Site and potable water pipeline easement areas are both zoned as M1 (Light Industrial) and designated as IND. All these land use designations provide a reasonable economic use of the property and, on their face, defeat any claim that the applicant is entitled to establish a gold mine at the site.

- **If it denies the Project, the County is under no obligation to certify the EIR.** (Las Lomas Land Co., LLC v. City of Los Angeles (2009)). In this case, the court upheld a decision to stop preparation of an EIR and specific plan where the city determined the project was not consistent with its land use policies.

  There is no reason to continue with the EIR. We believe that continuing the EIR will just cost the County in loss of time and energy as well as that of staff and the community. We can better spend this time on critical issues like wildfire safety and climate change.

  If the EIR is certified as it stands now, even if the project is denied, it will be a flawed EIR in county records that can be used under future applications.

- **The bottom line is that the community overwhelmingly does not want the Idaho Maryland Mine to reopen.**
  The mine will be counter to the adopted General Plan land use policies and vision which the community supports. The County should deny the Idaho Maryland Mine Final EIR and not certify the EIR.

Nevada County General Plan Goals and Policies
Justify Denial of the Idaho Maryland Mine

The Idaho Maryland Mine project is inconsistent with numerous Nevada County General Plan goals and policies which provide justification to deny the project independent of the environmental analysis:

Land Use Element

GOAL 1.5 Within Community Regions, ensure that development reflects our small-town character, the characteristics of the land and the natural environment.

GOAL 1.6 Allow for growth while protecting, maintaining and enhancing communities and neighborhoods.

Policy 1.8.3 Within the City/Town spheres of influence, the Nevada County General Plan Land Use Maps will generally reflect the City's/Town's General Plan land use mapping. In some instances, the County may provide for a less intensive land use due to infrastructure capability, environmental constraints or effect on land use and development patterns outside the city's sphere. However, the County's Plan will not preclude implementation of the City's/Town's Plan by providing for a significantly more intensive land use than the City's/Town's Plan.

GOAL 1.8 Coordinate with the cities/town in land use planning and development within their spheres of influence.

Policy 1.7.10 The County shall provide for facilities for the management of hazardous waste produced on-site in the Commercial, Business Park, Industrial, and Public land use designations, and shall provide for facilities for the management of hazardous waste produced on or off-site in the Industrial and Public land use designations. All facilities shall be located in a manner consistent with criteria established in the State-approved Nevada County Hazardous Waste Management Plan approved by the County.

Economic Element

Goal 2.1 Provide for a strong economic base while protecting and maintaining communities and neighborhoods.

Objective 2.4 Encourage economic development which favors a high economic multiplier effect.

Policy 2.9 In support of the County Economic Policy, develop and implement an ongoing, aggressive business recruitment and marketing program featuring the County's strengths in areas such as education and quality of life. Target the program to prospective types of business (particularly those that are entrepreneur-oriented) that are best suited to provide significant long-term job opportunities in industries such as biotechnology, electronics and communications, and energy-related products.

Objective 2.14 Encourage protection and enhancement of the natural scenic beauty of this County in support of the tourist trade.

Safety Element

GOAL CC-10.13 Build Climate-Resilient Communities and Protect Neighborhoods, Public Infrastructure and Natural Resources Through Mitigating Climate Change.

Policy CC-10.13.4 Require new discretionary development to include an analysis of potential affects to climate change impacts and water resources in the project review process. Projects shall reduce or limit impacts as feasible.

GOAL HM-10.5 Protect public health, safety, natural resources, and property through regulation of use, storage, transport, and disposal of hazardous materials.

Policy HM-10.5.5 The County will actively promote prompt clean-up or remediation of properties contaminated by mine waste or other hazardous materials and shall not grant any discretionary or ministerial land use approvals to develop or change boundaries or reconfigure parcels believed to be contaminated, unless and until the nature, extent, type and location of the contamination is determined and satisfactory arrangements are made for clean-up or remediation, in accordance with Nevada County standards or State regulations.

Noise Element

GOAL 9.1 Provide for the health, safety, and welfare of the people of Nevada County through a set of policies designed to encourage an environment free of unnecessary and annoying noise.

Policy 9.1.10 Strongly discourage those General Plan amendments and zone changes that would likely create land use conflicts relative to noise.

Aesthetics Element

Goal 18.1 Promote and provide for aesthetic design in new development which reflects existing character.

Water Element

Goal 11.1 Identify, protect and manage for sustainable water resources and riparian habitats.

Policy 11.2 Encourage the protection of resources which produce water for domestic and agricultural consumption.

Objective 11.2 Preserve surface and sub-surface water quality and, where feasible, improve such quality.

Policy 11.4 Cooperate with State and local agencies in efforts to identify and reduce to acceptable levels all sources of existing and potential point- and non-point-source pollution to ground and surface waters, including leaking fuel tanks, discharges from storm drains, Chapter 11: Water Element Volume I - Page 11-4 Nevada County General Plan auto dismantling and dump sites, sanitary waste systems, parking lots, roadways, logging and mining operations.

Objective 11.3 Preserve and, where economically feasible, restore the density and diversity of water dependent species and continuous riparian habitats based on sound ecological principles.

Mineral Management Element

Goal 17.1 Recognize and protect valuable mineral resources for current and future generations in a manner that does not create land use conflicts.

Policy 17.6 Encourage extraction of mineral resources in compatible areas prior to intensified urbanization or conversion to other incompatible land use development.

Policy 17.11 Recognize the importance of water conservation and quality for the present and future needs of the County by: 1. Requiring the conservation of on-site water during mining operations. 2. Requiring that off-site water discharge complies with State water quality standards. 3. Requiring that any increase or decrease of off-site discharge is not detrimental to the downstream environment or downstream water users.

Policy 17.14 Already existing development - commercial, residential, and community - as well as undeveloped private lands, shall be protected from adverse environmental effects caused by mining through enforced use permit conditions and mitigations measures, or denial of the projects. The County shall be the enforcement agency.

Legal Background Supporting Denial of Idaho Maryland Mine FEIR Certification and Project

The following background was prepared by attorneys Shute, Mihaly, and Weinberger who represent CEA Foundation on our mine project responses:

The County should deny the Project and should not certify the EIR. The many environmental impacts associated with the Project, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the Project. If it denies the Project, the County is under no obligation to certify the EIR. Las Lomas Land Co., LLC v. City of Los Angeles (2009) 177 Cal.App.4th 83 (upholding decision to stop preparation of an EIR and specific plan where city determined the project was not consistent with its land use policies); Pub. Res. Code § 21080 (a) (CEQA applies only to projects that public agencies carry out or approve.)

Denial of the Project would also consistent with a long line of case law recognizing that public agencies may limit the use of land to protect public values without resulting in a taking of property. Penn Cent. Transp. Co. v. City of New York (1978) 438 U.S. 104, 129 (1978) ("[T]his Court has recognized, in a number of settings, that States and cities may enact land-use restrictions or controls to enhance the quality of life by preserving the character and desirable aesthetic features of a city.") (citations omitted); id. ("[I]n instances in which a state tribunal reasonably concluded that 'the health, safety, morals or general welfare" would be promoted by prohibiting particular contemplated uses of land, this Court has upheld land-use regulations that destroyed or adversely affected recognized property interests."); Tahoe-Sierra Preservation Council, Inc. v. Tahoe Regional Planning Agency (2002) 535 U.S. 302, 324 ("Land-use regulations are ubiquitous and most of them impact property values in some tangential way— often in completely unanticipated ways. Treating them all as per se takings would transform government regulation into a luxury few governments could afford.")

The Supreme Court has identified two primary tests to determine whether regulation causes a taking of property. First, a taking may occur if the regulation eliminates all use or value of the property. See Lucas v. S.C. Coastal Council (1992) 505 U.S. 1003. Under that test, there must be no value whatsoever remaining in the property; even a diminution of value of 95% is insufficient. See Tahoe-Sierra, 535 U.S. at 330 (citing Lucas, 505 U.S. at 1019 n.8). The second test involves evaluation of multiple factors, including the severity of the impact of the regulation on the value of the property, the extent of its interference with reasonable investment-backed expectations of use of the property, and the character of the governmental action. See Lingle v. Chevron (2005) 544 U.S. 528, 538-39 (citing Penn Central, 438 U.S. at 124.) Courts have consistently held that Penn Central test requires elimination of nearly all value in the property. The Ninth Circuit has recently recognized that even "diminution in property value because of governmental regulation ranging from 75% to 92.5% does not constitute a taking." Colony Cove Props. LLC v. City of Carson (9th Cir. 2018) 888 F.3d 445, 451; see also Hadacheck v. Sebastian (1915) 239 U.S. 394, 405 (no taking despite diminution in value from $800,000 to a maximum of $60,000, and property could not be used for any purpose permitted under city's ordinance).

In fact, as long as permissible uses exist, a denial would not deprive the applicant of economically viable use of its property. (Shea Homes Limited Partnership v. County of Alameda (2003) 110 Cal.App.4th 1246, 1267 [finding no regulatory taking because agricultural designation allowed single family use if certain County standards were met].) Here, the entire Brunswick Industrial Site is currently zoned M1-SP (Light Industrial, Site Performance Combining District), per the County's Zoning Code. Its land use designation is IND (Industrial) under the County's General Plan. The applicant is proposing to re-zone it as M1-ME (Light Industrial with Mineral Extraction Combining District) as part of the project. The Centennial Industrial Site and potable water pipeline easement areas are both zoned as M1 (Light Industrial) and designated as IND. All of these land use designations provide a reasonable economic use of the property and, on their face, defeat any claim that the applicant is entitled to establish a gold mine at the site.

The Centennial Clean-Up Must Be Included in the EIR
Jan 24, 2023

The Final EIR for Rise Gold's Idaho-Maryland Mine Project is significantly flawed because it does not include the plans to cleanup the Centennial site.

California Department of Toxic Substances Control (DTSC) is managing the cleanup of the 56 acre Centennial site, which is polluted by the mine's historic operations. After it is cleaned up under what is known as a Remedial Action Plan, or RAP, Rise intends to dump mine waste there for about 5 years. But, currently, the cleanup is not done.

Under CEQA the current conditions of a project must be assessed so that the environmental impacts and appropriate mitigations can be determined. The current conditions of the Centennial site are largely unknown because most of the current conditions aren't included in the EIR.

Instead, Rise has included in its EIR what it **assumes** to be a baseline of the future conditions that might occur **after** the cleanup. Adding to the inadequacy of this approach, **an approved RAP does not even exist at this time.** But even if the RAP had been finalized and approved by the DTSC, using a future condition for establishing a baseline in an EIR is almost never valid.

Including the Centennial cleanup in the EIR would have addressed most of these problems because the initial conditions of the site would be described adequately and the steps necessary to prepare the site for mine waste would have been set into the context of the project as a whole. This would have provided a means of determining potential impacts and defining mitigations correctly.

As it is, the true impacts of the project cannot be determined. For example, the draft RAP recognizes that 44 acres will be buried in mine waste and it includes stripping off acres of soil from areas that are not contaminated to provide clean soil to put over the capped contaminated materials and other work areas, destroying wetlands and woodlands. How much of this habitat destruction is really necessary for the clean soil, considering that the mine plans to dump 1000 tons per day of fill on the site? If the cleanup was included in the Mine project, this habitat destruction could be assessed and probably significantly reduced.

In conclusion, Rise's EIR project description is legally inadequate because it does not include the cleanup, which is plainly part of the Project. Instead, the EIR is left guessing as to what the true impacts of the mine project might be. This Final EIR is inadequate under CEQA.

Thank you,

Ralph Silberstein
CEA Foundation

Addendum

- **The FEIR continues to maintain that the Centennial clean-up project is a separate project.**
  - The DEIR's project description is legally inadequate because it excludes the required cleanup of existing contamination on the Centennial Site, which is plainly part of the Project. FEIR p. 2-798, 2-803-05. CEQA defines a "project" broadly to include the "whole of an action," rather than "each separate governmental approval." CEQA Guidelines § 15378(a), (c). Where two actions are integrally related or where one is conditioned on another, they must be considered together as one project; segmenting their analysis is a way to evade a complete impact analysis, and is accordingly forbidden. *Nelson v. County of Kern*, 190 Cal.App.4th 252, 271 (2010).
  - The FEIR merely restates the same faulty justifications from the DEIR for the decision to piecemeal the Centennial cleanup from the IMM Project. The County's assertion that the IMM project can proceed regardless of whether the Centennial cleanup is completed (DEIR at 1-7, FEIR at 2-8) ignores the fact that one of the objectives of the IMM Project is to reclaim the Centennial Site for future industrial use. DEIR at 3-42, 3-46.
  - The DEIR also uses an inconsistent baseline: for certain impact areas, the DEIR pretends that the Centennial cleanup has already occurred, while for others, it uses the current contaminated conditions as the baseline. DEIR 4.0-1. CEQA requires that the baseline "describe physical environmental conditions as they exist at the time the notice of preparation is published," and it prohibits the use of hypothetical conditions. CEQA Guidelines § 15125(a). Accordingly, the DEIR's use of a hypothetical baseline for various impact areas in which the Centennial cleanup has already occurred renders its analysis legally inadequate and unsupported by substantial evidence. FEIR p. 2-801. The FEIR contends that it was not using a future conditions baseline, but instead the "conditions expected when the project becomes operational." FEIR at 2-295. However, there is no evidence that that the Centennial cleanup will have occurred such that it can be "expected" by the time the Project is operational.
  - The FEIR's reliance on *Citizens for a Sustainable Treasure Island v. City and County of San Francisco*, 227 Cal.App.4th 1036 (2014), is misplaced. FEIR 2-9. In that case the issue was not whether the Navy's cleanup should be studied as part of the subsequent development project, but instead whether the project proponent had properly disclosed how it would manage and dispose of hazardous materials in the event it took responsibility for the cleanup. *Id.* at 1058-59. Furthermore, the project proponent in *Treasure Island* had included "exhaustive information" in the EIR about the presence and location of hazardous substances and adopted mitigation measures in case it were required to undertake some cleanup efforts. *Id.* at 1056, 1059. Because it was impossible to know whether the project proponent would have to undertake cleanup efforts, it was appropriate for it to defer environmental assessment. *Id.* at 1059. Here, in contrast, the County provided virtually no information about the contamination on the Centennial site and the process required to remediate it, despite the fact that the Project objectives include increasing the usable land on the Centennial Site to allow for its future use as industrial land. DEIR 3-12.

Idaho-Maryland Mine Greenhouse Gas Emissions Are Significant
Feb 7, 2023

The Idaho-Maryland Mine Final Environmental Impact Report (EIR) is inadequate in its assessment of greenhouse gas (GHG) emissions. A valid threshold for GHG emissions was not set in the EIR.

As stated in the EIR, CEQA Guidelines allow a lead agency to determine its own thresholds for environmental impacts (including GHG emissions), and "explicitly provides that an agency may consider thresholds adopted by other agencies provided that such decision is supported by substantial evidence."[1]

The Northern Sierra Air Quality Management District has not set thresholds for GHG emissions, so, as lead agency, Nevada County simply applied the 10,000 Ton/year [2] carbon-dioxide-emission threshold chosen by some other air districts for this project. However, the justifications for adopting these thresholds are unique to each air district. These other air districts have prepared detailed GHG inventories to identify and evaluate strategies for achieving the statewide GHG reduction goals within their districts.

Nevada County cannot simply assume that the justifications used by other air districts to adopt their thresholds also apply in Nevada County. Hence, the EIR failed to provide "substantial evidence" required by CEQA by just relying other districts for setting the threshold. In fact, the EIR provided no evidence beyond just copying what other districts used.

But this is doubly wrong because the other air districts originally adopted the 10,000 Ton threshold to achieve the older statewide GHG goal under California Assembly Bill 32, which is no longer consistent with the current statewide GHG reductions goals.[3]

In 2015, the California Supreme Court determined that a project's GHG emissions should be evaluated based on its effect on California's efforts to meet its long-term climate goals.[4]

Then, in 2017, the California Air Quality Board Climate Change Scoping Plan stated "Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development."[5]

And in 2018, Governor Brown signed Executive Order 55-18, calling for the state to achieve carbon neutrality as soon as possible and no later than 2045, and to achieve and maintain net-negative emissions thereafter.[6] In view of this, the mine's 9000 tons/year of emissions for 80 years should be considered significant and unmitigated.

The mine is proposing an 80 year project, and no consideration was given to meeting the state's GHG emission goals. The EIR should have established a net zero threshold for GHG emissions from the proposed project.

For example, in considering current goals, the recent Draft EIR for another mine - the analogous Sargent Ranch Quarry project within the Bay Area Air District uses a net-zero significance threshold for operational GHG emissions.[7]

This EIR should have done the same. The EIR does not explain why the Project should be exempted.

Nevada County Energy Action Plan

The Nevada County Energy Action Plan's (EAP) goal is to reduce the projected annual grid supplied electricity the county will use in 2035 by 51% and the annual natural gas use by 30% through energy efficiency measures. The mine's electricity use is equal to adding the energy use of 5,575 homes in Nevada County. This almost eliminates the results of any energy-saving measures planned by the county.

This project will consume 49,000 Megawatts of electricity, in direct conflict with the County's energy reduction goals.[8] The FEIR states "...although the EAP is not a Qualified GHG Emissions Reduction Plan under CEQA the project was nevertheless determined to be consistent with the EAP."[9] This statement is essentially false. [10]

In fact, the Mine operation is antithetical to the County's Energy Action Plan. The Nevada County Planning Commission and the Board of Supervisors should ask the question: Are we serious about the Energy Action Plans? If so, this mine should not be approved.

In conclusion, the EIR for the mine fails to correctly identify a valid threshold for GHG emissions by assuming an outdated 10,000 Ton threshold without any substantial evidence, failing to consider the current State goals, and it would also effectively undo a large part of the goals of the Energy Action Plan.

Under CEQA, this EIR is totally inadequate in addressing the significant impacts of greenhouse gas emissions from Rise Gold's proposed mine.

Thank you,

Don Rivenes

Mine Waste and the Water Pollution Problem
Jan 10, 2023

The Final EIR for Rise Gold's Idaho-Maryland Mine is inadequate because it fails to address the potentially significant impact of mine waste disposal.

The Mine project plans to export 1000 tons of tailings and waste rock per day. This mine waste will be dumped into 2 Engineered fill piles over the course of the first 11 years. After that, the mine waste will be disposed of through off-site sales.

There are significant issues with the disposal of mine waste due to the potential to pollute ground water and surface waters by leaching hazardous chemicals. This falls under the jurisdiction of the Regional Water Quality Control Board.

The Water Board classifies mine waste by Groups A, B, and C. Only Group C, which has relatively low levels of contaminants, is clean enough to be used for off-site sales. Groups A and B require more stringent controls. The Water board requires mine waste testing to determine classification. In response to the Draft EIR, the Water Board stated: "The applicant shall not sell or utilize waste rock and tailings from the Project for construction aggregate or fill purposes offsite unless such material has been tested and confirmed to qualify as Group C mining waste..." [1]

In the EIR, the Water Board and numerous other parties identified that there was insufficient testing to determine whether the mine waste would be Group C, suitable for off-site sales.
Per the Water Board comments:
"*...the alternative scenario that the mining waste is not suitable for off-site use should be examined."*
The Water Board goes on to state that Rise should assess any constraints or challenges associated with waste disposal in case they can't do off-site sales for construction aggregate. They conclude with:
"The Draft EIR should be revised to address this comment."[3]

Rise Gold acquired a collection of drill cores and samples from Emgold Mining when they purchased the mine. In addition, they did over 67,500 linear feet of exploratory drilling. . Yet, from all those samples, they chose to test only 11 feet to characterize what will be over 25 million tons of waste rock that will be produced over the life of the mine. [2]

Disposal of mine waste is a critical element of the project with the potential for causing significant long term impacts. Yet no further testing was produced for the Final EIR. This is inexplicable.

CEQA requires that the EIR "…give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." [4]
This Final EIR fails to do that.

You are being asked to approve a project without knowing if any portion of the mine waste will qualify as Group C. Currently, there is no realistic plan for continued mine operations if you can't sell the mine waste.

The Final EIR response uses speculative, unproven assumptions stating that the mine rock "...would not be mined until mine waste characterization has been performed to ensure the rock will be suitable for off-site sale. Rock types that are not suitable for off-site sale would likely not be mined, and if mined, the waste rock would be placed underground" [5].

Mine waste classified as Group A and B requires specific management that must be determined by the Water Board, and cannot automatically be placed underground.

Backfilling with waste rock and tailings is the exact scenario which has led to polluted ground water discharges in so many mines in our area. This new element, the placement of Group A or B mine waste underground, was not included in the Draft EIR.

Even disposal of mine waste on the project sites for Engineered fill (Centennial for 5 years, Brunswick for 6 years) requires testing and will have to meet the Water Board's approval. Quoting the Final EIR:

"The barren rock and sand tailings would undergo testing as part of obtaining [Water Discharge Requirements] WDRs for use in the Engineered fill pads, and compliance with water quality objectives will need to be demonstrated to the [Water Board] prior to that placement ." [6]

The project description fails to provide an adequate means of interim storage for mine waste.

The viability of the entire project is dependent upon the safe disposal of mine waste under Group C. There were numerous core samples available that could have undergone static and long-term dynamic testing, yet, subsequent to the release of the Draft EIR, no additional testing was done.

Even if the mine waste is all Group C, it is hard to believe there will be no need to stockpile any of it for shipping off site. 1,000 tons/day will be coming out of the shaft. That's about 50 truck loads/day. Construction aggregate is seasonal. Most construction shuts down in the winter.

The Final EIR is inadequate because if fails to address the potentially significant impact of mine waste disposal. Again, critical testing after project approval does not provide an "…accurate and understandable picture…of the projects likely…impacts".

Thank you.

Groundwater Baseline Requirements and the Idaho-Maryland Mine EIR

Presented as Public Comment to the Board of Supervisors, Dec 13, 2022.

The California Environmental Quality Act (CEQA) does not allow the deferral of important studies necessary to characterize a project's impacts.

According to CEQA Guidelines § 15125(a), an Environmental Impact Report (EIR) must include an accurate description of a project's environmental setting, which provides "the baseline physical conditions by which a lead agency determines whether an impact is significant."[1] It goes on to state: this baseline "should describe **physical environmental conditions as they exist at the time the notice of preparation is published**."[2] (i.e. before the Draft EIR is prepared.) The purpose of this requirement is, per CEQA Guidelines, "to give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts."[3] And the court case of *Save Our Peninsula Com. v. Monterey County Bd. of Supervisors (2001)* affirmed that point: "Without a determination and description of the existing physical conditions on the property at the start of the environmental review process, the EIR cannot provide a meaningful assessment of the environmental impacts of the proposed project."[4]

Note that the Rise Gold project Draft EIR clearly acknowledges that this baseline is needed. It states that for each domestic well, a projected and seasonally averaged water level shall be estimated **"...which will serve as a baseline groundwater level.**"[5] But **this incorrectly defers** the collection of the needed additional groundwater data to after the EIR process is over.

Let's look at it using common sense. Unless the EIR identifies current well levels and related data, it cannot establish performance criteria and evaluate how dewatering may impact wells, and it's not possible to define appropriate mitigations. For example, Rise Gold's hydrology model estimates that water levels will drop between 1-10 feet for over 150 wells. But there is no current data that could tell what the impact would be to well owners. A two foot drop could be critical. How would that be determined? Are some wells near failure? We don't know.

CEQA law, County precedents, and common sense all say the same thing: Collection of data must not be deferred until some future date, as proposed in the current Draft EIR. Current domestic well monitoring data needs to be included in a revised Draft EIR to establish a baseline so that it can be reviewed and then used in the decision making process.

The Wells Coalition members are alarmed that the County seems to be skipping this important step.

Thank you.

Subject: the Idaho-Maryland Mine Draft EIR groundwater hydrological model predictions and risk to domestic wells in the area of the Project.

The proposed well mitigations in the Draft EIR for Rise Gold fail to acknowledge risks posed to domestic wells in the surrounding area of the Idaho-Maryland Mine project, and in doing so does not provide protections to those wells from impacts due to dewatering the mine.

The Draft EIR for Rise Gold states:

" All potentially impacted wells are located in the E. Bennett Road area. Domestic water wells outside this area will not be impacted." [1], [2]

But expert opinions contradict the certainty of these statements, citing repeatedly the uncertainties in hydrologic predictions and impacts to wells:

Emgold's 2008 DEIR for the Idaho-Maryland Mine states

"Due to the uncertainties regarding the complex geology and groundwater flow, dewatering ***impacts to domestic water supply wells cannot be accurately predicted."*** [3]

Also, Emgold's project description states

*"**The geologic formation in which the mine is located is fractured bedrock whose hydrogeology is difficult to predict.** Therefore, reliance on Domestic Well Level Monitoring Program data will be required to assess impacts and discern appropriate* ***mitigation measures for each domestic well*** *owner."* [4]

After reviewing the hydrology computer model from the DEIR for Rise Gold an expert hydrogeologist in groundwater modeling stated

"Even a well calibrated model has a large uncertainty to it, in its predictions. It turns out that this model is not well calibrated, so the uncertainties are almost certainly larger."[5]

A review of the current Draft EIR by Baseline Environmental Consultants states

> ***"there is a high level of uncertainty associated with the groundwater model that was used in the DEIR*** *as justification to identify a very small subset of the domestic wells in the East Bennett area that are likely to be adversely affected by the project, and to characterize impacts to a vast number of other domestic wells in the project vicinity as less than significant.* ***This is a flawed approach and provides no assurance for residences and businesses that rely on groundwater wells in the region.****"*[6]

Even the hydrologist who prepared the hydrology computer model for the current Draft EIR, told the NID board of directors.

> "***With fractured rock there will always be uncertainty and during my career there won't be any 100% confidence in predictions."***[7]

It is because of these uncertainties that we are appealing to you to require protection for all wells with a domestic well monitoring plan before the Draft EIR is finalized and prior to any dewatering of the mine.

Thank You,

Gary Pierazzi
The Wells Coalition
wells@cea-nc.org

Additional expert opinion quotes regarding uncertainties in groundwater modeling and fractured rock.

"The EMKO Report describes a three-step procedure used to assess potential drawdown effects in perimeter areas. A major assumption underlying the procedure is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth. ***However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of this uncertainty and the overall uncertainty of the analytical and***

numerical model predictions with respect to groundwater level impacts on individual wells should be provided. expanded to include an assessment of the uncertainty in the conclusions developed by Todd Engineers."*[8]*

"Although the analysis is considered conservative in methodology, ***several complexities in the groundwater system could potentially result in a larger or smaller radius of influence. Although larger impacts seem unlikely, it is difficult to prove that aberrations in the system do not exist."*** *[9]*

"Uncertainties in the analysis indicate that monitoring should occur over a slightly larger area than where impacts are predicted. In addition, the monitoring program should consider adjustments specifically for geologic faulting." *[9]*

"Monitoring locations should also include areas outside of the predicted impact zone to account for uncertainties in the analysis," *[9]*

"The fracture systems existing in buried bedrock beneath Grass Valley are not mappable within the resolution needed to predict specific dewatering effects. Technology and state-of-the-art hydrogeology have not developed to a level that fracture mapping is possible. Due to this limitation, hydrogeologic modeling is attempted by making an assumption on fracture connectivity." *[10]*

"The groundwater in this particular area is contained in and flows through fractures in near surface bedrock and because of this fracture flow regime, the groundwater flow in quantity varies considerably with location and ***cannot be predicted with certainty. Furthermore, complete hydraulic separation between the deeper groundwater within the underground mine workings and the shallow groundwater within fractures and supplying the domestic wells cannot be assumed."*** *[11]*

"Based upon the significance criteria established on page 4.3-4, ***the risk to all wells within the study area, regardless of risk category, represent a potentially significant impact."*** *[12]*

"The study area has not been monitored by an approved groundwater monitoring system designed to observe the dynamics associated with subsurface hydrology. Therefore, ***many of the initial unknown hydrogeologic and geologic parameters located within the earth between well and mine elevations still exist."***

Subject: Well Monitoring - Protection for homeowners from proposed IMM Mine

As a well owner in district 1, I need to make sure you all know how serious our concerns are regarding the IMM mine.

It is imperative that we have a process in place to gather baseline data for our wells before there is any further movement on this propos al. We could, literally, be facing life altering consequences and complete financial ruin without it.

For miles in every direction from the IMM site, we have densely populated land, and hundreds of homes with domestic wells that produce our only source of clean water. In the event of a well gone dry during dewatering, we would be thrown into chaos trying to save our families from severe undue hardship.

Imagine this real possibility in your own home; You wake up and discover all the pressure is gone from your faucets. The toilet flushed, but it's not refilling. Your spouse, and maybe kids, are asking, what's wrong with the water? Your face goes pale. A million thoughts race through your mind. Oh my god! Without water, my property is worthless. How could thi s have happened? Where is the protection from my county, whom I pay to do so?

It's catastrophic, and you have no recourse to blame the obvious cause, let alone, options for a solution, since no plans were in place to secure your rights and prevent the dem ise of your well.

This is by no means, overstating the danger. There are facts by historical example all over the gold mining west. There are facts by expert hydro professionals, and, then there's the grand daddy of all facts: "Gravity"! Nothing can stop it from drawing down water to the lowest point. Undeniably, it is impossible to know where the water highways are below us.

It is simply not acceptable to overlook the necessary protections, or downplay the high risk consequences of mining operations in populated areas with hundreds of primary water source wells. There should be no expense spared by the proposing mine company and governing county, to ensure every well owner will be 100% protected from loss,damage and contamination. This begins with a comp rehensive well monitoring program before any other due process continues. This should have been in place long ago.

Ultimately, the future must include infrastructure, for immediate transfer to an equal alternative water source, at zero cost to all residents, forever. No one would want anything less for their family and life investment in their home.

I don't believe anyone here today would accept even the tiniest risk that they could lose their water in exchange for gold in the pockets of strangers. We implore the board to mandate this well monitoring starting point for our protection, immediately.

Thank You for addressing this matter with action.

December, 13 2022

Nevada County Supervisors
950 Maidu Avenue
Nevada City, CA 95959

Honorable Supervisors,

My name is Sol Henson, I grew up on the San Juan Ridge and hold a master's degree in hydrology. I am the president of the San Juan Ridge Taxpayers Association and speak for the Association today.

I'm here to talk about the importance of baseline monitoring for wells to protect our community from industrial mining impacts.

In 1995 Siskon Gold operated a gold mine in the North Columbia Diggings on the San Juan Ridge. During mining operations, they breached a water bearing fault-line 300 feet underground. This breach led to water quantity and quality impacts to at least a dozen wells including the wells for our middle school and the community Cultural Center. These impacts occurred up to 2 miles from the breached location. This was a disaster for those whose wells were affected, but we still do not know the extent of well impacts in the area. Some wells may have lost 50% capacity or had arsenic levels rise above drinking water standards but without baseline data, owners could not prove that the mine had impacted their wells.

This was a single catastrophic event. Wells are more commonly impacted by the extraordinary amount of water pumped out of mine tunnels just to maintain daily industrial mining operations. Over time, millions of gallons of water a day must be removed from the surrounding fractured bedrock aquifer. In such cases, well impacts can be slow to develop and can be hidden within seasonal cycles.

In 2012, the San Juan Ridge Mine Corporation submitted a new permit application to mine the North Columbia Diggings. Exhibiting due diligence, and with community input, the County helped to create a baseline monitoring program for domestic wells. This program established a baseline through monthly collection of water quantity and quality data before the DEIR was produced. This information would have been invaluable for the environmental review process. Should the mine have been permitted, well owners would have had recourse to say with some confidence if their well had been impacted.

We firmly support the precedent of baseline monitoring for projects of such scale and impact as the Idaho Maryland Mine. Significant monitoring programs have been developed in the past for the IMM site, including for the 1996 permit to dewater the mine for exploration and the 2008 Emgold Mine environmental review process. It is unclear why the current Rise Gold effort to permit the IMM lacks a monitoring plan that would form a baseline for water quantity and quality of domestic wells in the surrounding area. We believe that the community is owed these safeguards and that CEQA requires it. Thank you very much.

Sincerely,

Sol Henson

Sol Henson

President of the San Juan Ridge Taxpayers Association

Subject: Domestic Well Monitoring Program for Rise Gold's Proposed Reopening of The Idaho -Maryland Mine

The Wells Coalition is a group of well owners near the Idaho-Maryland Mine. Our purpose is to protect our only source of water, our wells .

We are astounded that a comprehensive *domestic* well monitoring program was not established before the Draft EIR for Rise Gold's mine was published. Such a program is a necessary step to establishing the baseline data required by CEQA. We're here today to ask the County to facilitate the development of this program and work with the community to ensure its viability.

Even though there are over 300 properties with wells within 1000 feet of the Mine's mineral rights area, the DEIR did not provide current monitoring data from these domestic wells. It relied only on sparse patches of data from over 15 years ago.

The DEIR's proposed approach is to install just fifteen non -domestic *monitoring* wells in the future to do the job of estim ating impacts for all water supply wells. With our complex fractured bedrock spread over thousands of acres, monitoring water levels at fifteen locations could not possibly provide the data needed to precisely and immediately identify or mitigate groundwat er impacts across hundreds of wells.

Timing of baseline data collection is another issue. With mine dewatering, previous dry years, and the drought likely to continue, a *domestic* well monitoring program is vital in determining a baseline for groundwater q uantity and quality prior to any dewatering of the mine. Collecting data on our wells takes time though, requiring a *minimum* of 3 years before a reliable baseline could be established. Also, this data is critical to assist in determining if mining or droug ht conditions are the cause of an impact to a well.

CEQA requires that a baseline be established prior to the evaluation of potential impacts. Also, under CEQA a mitigation measure must be achievable, enforceable, and must be capable of actually reducing the Project's impacts.

The DEIR's approach does not achieve any of these requirements. It acknowledges that more groundwater level data is needed to assess potential impacts, but the critical flaw is that it defers development of that data for "later". One place in the report says it would happen after the EIR is finalized. Another place says it would happen *after* dewatering begins. Neither approach is in compliance with CEQA.

Not having a baseline established by a *domestic* well monitoring program before publishing an EIR is unacceptable. Our wells are not currently being monitored . Since it will take several years for Rise Gold to establish a reliable baseline, we request a domestic well monitoring plan be initiated sooner, rather than later. Your response is appreciated.

Sincerely,

Christy Hubbard

The County should deny the Idaho-Maryland Mine and should not certify the Final EIR. February 7, 2023

1 The County has no obligation to approve the Mine.

The many environmental impacts associated with the mine, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the mine project. The Final EIR (FEIR) also has serious deficiencies and should not be certified. It fails to substantiate several claims that impacts would not be "significant" and does not comply with CEQA (California Environmental Quality Act).

- **Environmental impacts unavoidable** - The FEIR lists several significant and unavoidable environmental impacts that endanger this community's health and quality of life. These include aesthetics, traffic, and noise. There are also *serious deficiencies in the FEIR* that put the County and its citizens at even greater risk. Key deficiencies are shown in sections 2-6 of this document.

- **Inconsistent with General Plan** - The Mine project is inconsistent with numerous Nevada County General Plan goals and policies. The Plan's goal 17.1 calls for recognizing and protecting mineral resources in a manner that *does not create land use conflicts*. And yet, multiple conflicts exist with goals for not only land use, but also economic development, safety, climate change, noise, aesthetics, water, and coordination with cities and towns [1].

- **Legal considerations** - The County can confidently proceed with denial knowing the decision *does not qualify as "taking"*, which is a legal term that describes a project rejection that denies an owner their right to develop a property. Both the Brunswick and Centennial properties are currently zoned "Light Industrial", which provide a reasonable use of the properties. The applicant would need to secure approval of rezoning the Brunswick site to M1-M1 (Light Industrial with Mineral Extraction) in order to proceed with the project.

  There is ample case law to uphold the rejection of FEIR certification if a project is denied. If the current FEIR were to be certified, then the project later denied, it will be a flawed EIR in County records that could be used in future applications [2].

- **Inadequate economic justification** - The Economic Impact Report on the Mine showed a huge range of possible revenue outcomes from very low to very high, *making actual revenue potential uncertain*. Only the lower estimates were backed by proven gold reserves.

  Expert community reviewers found that even low-end figures were overly optimistic with a heavy reliance on information provided by the applicant. The assertion that property values wouldn't decline was a big miss. It failed to recognize local realtor expertise or use acceptable home appraisal methods. Additional downside risk was not evaluated [3].

- **Just say no! -** Continuing with the EIR and project consideration will just cost the County in loss of time and energy as well as that of staff and the community. *This community is overwhelmingly opposed to the Mine project*, as evidenced by the over 5,500 petition signatures submitted to the County last summer and the fact that 95% of the opinion pieces published in The Union about the mine are against it [4].

Following are five key deficiencies of the FEIR.

2 Well Owners Shafted in the Final EIR

The FEIR's conclusion that groundwater impacts from the mine project will not be significant was not substantiated. Serious deficiencies identified by expert reviewers of the Draft EIR were not addressed, resulting in a final report that does not comply with CEQA and fails to identify the potential impacts.

- CEQA requires a *current* baseline to assess potential impacts and determine mitigations. The computer model used for the analysis did not use current monitoring data from any of the over 300 domestic wells in the mineral rights area. It relied only on sparse patches of data from over 15 years ago. The Final EIR acknowledges that data is needed, but the approach calls for drilling 15 new monitoring wells as a basis for verifying the computer model *after* the EIR is certified! The questionable computer model estimates well water drops at 1 to 10 feet for 152 wells, then avoids declaring the impact as "significant" by creating an arbitrary threshold of significance at 10%.

- The final EIR also adds a *completely inadequate supplemental domestic monitoring plan* for 378 newly identified properties. Among the many deficiencies, the new program only includes about half the wells in the mineral rights vicinity and provides neither additional NID infrastructure to speed water replacement nor a third-party liaison to negotiate issues if problems arise [5].

3 Mine Waste Management Inadequacies Risk Water Quality

The FEIR's conclusion that water quality impacts related to mine waste will not be significant is unsupported. The Water Board made it clear in Draft EIR comments that more rock testing is needed to assess the likely concentration levels of hazardous elements in the rock to be mined. The FEIR's plan for storing and disposing of mine waste has extensive gaps, creating a risk for long-term mine water pollution similar to what this community has seen in the past.

- Rise Gold's project plans to deposit 1000 tons of tailings and waste rock per day on the Centennial and Brunswick sites for the first 11 years. After that, the plan is to dispose of it via off-site sales. However, only waste classified as *Group C* can be used for engineered fill deposits or off-site sales. The more hazardous Groups A and B require special handling. The FEIR asserts that "mine materials will *likely* be classified as Group C", but its conclusions rely on just 11 feet of drill core samples.

- The FEIR does not provide adequate provisions for the storage of Group A or Group B mine waste, which will be required by the Water Board. Since any waste that is not Group C cannot be used for engineered fill or off-site sales, viable alternative strategies must be defined. The FEIR introduced a new suggestion that if not Group C "...the waste rock would be placed underground", but CEQA requires storage of Group A or B mine waste underground to be reviewed in a Draft EIR.
- This extensive set of gaps in mine waste management also introduces uncertainties about Rise Gold's ability to operate by disposing of mine waste from off-site sales [6].

4 Mine Waste Management Inadequacies Put Air Quality at Risk

The FEIR's conclusion that air quality impacts related to mine waste will be effectively mitigated is unsupported. Asbestos is found in all rock types in the Idaho-Maryland Mine in varying concentrations. The FEIR's plan for managing concentration levels to ensure that mine waste meets safety requirements before being shipped out of the facility is inadequate.

- Management of asbestos emissions is a complicated task. If the rolling average over a 3-month period of asbestos concentration *in mine waste exceeds 0.01% by weight, it cannot be shipped out of the mine facility.* Rise Gold's primary approach – as described in the Asbestos, Serpentinite, and Ultramafic Rock (ASUR) management plan – simply proposes that cores would be sampled before excavation and that if asbestos levels are too high, the rock won't be mined. *There is not enough evidence*, however, to establish that they can feasibly stay below the limits using this plan.

- The test data in the FEIR for determining the potential impacts from Asbestos is inadequate for CEQA compliance. Of the testing that was provided, which came from just 3 drill cores, 40% of the samples exceeded the 0.01% threshold. Thus, for assessing the impacts of asbestos air pollution, spot sampling has been done on less than 1/1000th of the mine rock that will be excavated over the 80-year life of the Use Permit.

5 FEIR Fails to Assess Impacts of Centennial Site

The FEIR excludes the Centennial Site from the full analysis of the impacts of the mine project. This prevents the County from understanding the full environmental impacts and is a clear violation of CEQA, which requires that impact assessments be based on current conditions, not a speculative future condition.

- The 56-acre Centennial site is the location of hazardous waste left over from past Idaho-Maryland Mine operations. The California Department of Toxic Substances Control (DTSC) is managing the cleanup, but their Remedial Action Plan (RAP) is only in draft form. It is unclear when the plan will be finalized or when DTSC might approve the clean up.

- Per CEQA, *the EIR must provide an environmental assessment of the current conditions of a project site to establish a baseline in order to determine impacts.* This was not done. The FEIR assumes the site will be cleaned up before it gets used to deposit new mine waste. The plan calls for placing 1.6 million tons of mine waste (assuming it qualifies as Group C) over the course of 5 years, covering about 44 acres to a height of up to 55 feet. And yet, the significant work needed to accomplish this clean-up is not disclosed or evaluated in the FEIR. Numerous aspects of this RAP draft have been questioned in public comments and the final project details are unknown [7].

6 Greenhouse Gas Emission Impacts dismissed in FEIR.

The FEIR concludes that the mine's greenhouse gas (GHG) emission impacts will be "less than significant", but it uses an unsupportable, obsolete threshold measure to justify its position. The only correct threshold – given current climate studies, CA SB-32, and today's state goals – is *net zero*. The County has not formally adopted its own threshold of significance, but it has set ambitious goals to reduce GHG through energy reduction in its Energy Action Plan. The Mine's sizable energy footprint would be a serious setback.

- The FEIR sets the significance impact threshold of 10,000 Metric Tons (MT) of GHG emissions per year. Mine operations are projected to produce approximately 9,000 MT per year, which is just under the set limit. This does not, however, include the over 4000 MT of additional emissions that will be generated by cement manufacturers to provide the massive amount of cement that will be used to produce cemented paste backfill for 500 tons/day of mine tailings.

- *The outdated 10,000 MT/year threshold* is one that was used by other air districts such as the Bay Area in the past. More recent projects, however, such as the Sargent Ranch Quarry project managed by the Bay Area Air Quality Management District in 2022, *use net zero for the significance threshold.*
- The mine's electricity usage is approximately equivalent to the annual use of 5000 homes. The Mine's energy use would be so sizable that it would completely offset the amount of residential reductions the County wants to achieve each year in its Energy Action Plan [8].

Re: Idaho-Maryland Mine Project Final Environmental Impact Report

My name is Don Rivenes. I lived in Nevada County for 13 years and have now lived in Grass Valley for the last 8 years. I am a member of the Nevada County and Grass Valley Energy Action Plan working groups and Coordinating Chair of Nevada County Climate Action Now.

I appreciate the opportunity to answer the FEIR responses to my letter on behalf of Nevada County Climate Action Now on the DEIR for the proposed Idaho-Maryland mine. I find the FEIR responses inadequate and do nothing to support approval of the DEIR. I concentrated my comments on the impact the mine would have on greenhouse gas emissions and on the Energy Action Plan goals of Nevada County. Below are the FEIR responses and rebuttal to the responses.

Comments on the FEIR response.

Grp 17.1

FEIR response

The Response states: “Given that it is unknown if/ when a PSPS would occur, it is considered a speculative event, and per the CEQA Guidelines, if a particular impact is too speculative for evaluation, the agency should note its conclusion and terminate discussion of the impact (14 CCR 15145).”

My rebuttal

Though it is not known when a PSPS event will occur, the events are occurring with a regularity and can be estimated as to how many would occur in a particular year. The amount of gold dug up in a particular year is also speculative, yet the FEIR relies on this speculation. The FEIR should provide the total MT CO2e from Emergency uses and add them to the operational MT CO2e figures.

Grp 17.2

FEIR response

The Response states: “Numerous revisions were made to the Air Quality Report during the preparation of the DEIR. The report presented in Appendix E.1 of the DEIR is the final version of this report.”

My rebuttal

My comment was that the total hours for this electric equipment in 2022-2032 are just a small part of the off-road equipment and shouldn’t account for the difference going from 2130 metric tons in the February 2020 report to 755 metric tons in the DEIR. The FEIR must account for this difference. How can you expect the public to believe such as gross difference between the original figure and the new Appendix E figure without an explanation to account for the change. It brings in to question the reliability of any of the data in the DEIR.

Grp 17.3

FEIR response

The Response states: “The commenter identifies differences between the analysis in the DEIR and a draft version of the Air Quality and GHG Report. Please see response to comment Grp 17-2 regarding draft versions of the air quality report. Emission factors for conversion of miles driven to carbon dioxide (CO2) and other emissions are already included in Appendix E.1 of the DEIR.”

My rebuttal

My comment was that the DEIR must show the factors used when converting miles driven to CO2 emissions for each of the vehicles. I also asked what factors were used to relate miles travelled with emissions generated. This must be provided. I have scanned Appendix E-1 and found table entries that show miles driven and CO2 emissions, but the actual factors used are not stated anywhere. There is no reference to the scientific source of any conversion factors.

Grp 17.4

FEIR response

The FEIR response states “The commentator suggests that GHGs associated with the transport of cement by third parties should have been included in the DEIR. This comment pertains to a “lifecycle” analysis, which is not required under CEQA. Please see Master Response 26 – Life Cycle GHG emissions.”
Master response 26: “The Project will use materials including cement, steel, and various products and materials. The manufacture of many of the materials that are used by the proposed project occurs outside of Nevada County boundaries, outside of the local agencies’ jurisdictional control or substantial jurisdictional influence. The project GHG emissions estimate includes the shipping of these materials to the site from an origin of 60 miles. “

My rebuttal

My contention is that the cement is not transported only 60 miles. Table 4.3-11 figures do not include the CO2 emissions from transporting the cement from production point to Sacramento (for example from Oro Grande in the desert to Stockton and from Stockton to a pickup point for the truck). If you include transport from Sacramento, you must include the transport from place of manufacture.

Grp 17.5

FEIR response

When discussing project-level GHG emissions reduction actions and thresholds in the context of CEQA, the CARB 2017 Scoping Plan states that “achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development” for project-level CEQA analysis.
Master Response 27 states: “As discussed above, the CEQA Guidelines allow a CEQA lead agency to determine its own thresholds for environmental impacts (including GHG emissions), and explicitly provides that an agency may consider thresholds adopted by other agencies provided that such decision is supported by substantial evidence.”

My rebuttal

I see no evidence from other districts that the level used is an appropriate level. At minimum, it needed to explain why it was standing by the 10,000 MT CO2e threshold at the same time that other agencies are concluding that a much more stringent standard is necessary. Because it did neither, the EIR’s significance threshold for operational GHG emissions is unsupported and legally deficient. There is no legitimate reason that the County should adopt a standard for an 80-year project that is not consistent with the S.B. 32’s statewide GHG reductions goals for 2030 and beyond. The thresholds adopted by the other air districts (1) relied on detailed and region-specific justifications, and (2) are

now obsolete, because they all predated the new and much more stringent GHG reduction targets set in 2016 by S.B. 32. Thus, the EIR erred by simply copying other existing thresholds without providing its own project-specific rationale.

Grp 17.6

FEIR response

Master Response 26 says: “In some instances, materials may be manufactured for many different projects as a result of general market demand, regardless of whether one particular project proceeds. Thus, such emissions may not be "caused by" the project under consideration. Similarly, in this scenario, a lead agency may not be able to require mitigation for emissions that result from the manufacturing process. Mitigation can only be required for emissions that are actually caused by the project. (State CEQA Guidelines, § 15126.4(a)(4).)”

My rebuttal

My contention is that a bag of Portland Cement is made the same way for each project. If this project was not done, the bag would not have been manufactured. Whether CEQA thinks it is too difficult to follow a “lifecycle” process or not, the fact is that the Mine project is responsible for the cement emissions and the County should consider these emissions from a project consideration, beyond what CEQ calls for.

Grp 17-7

FEIR response

The response states: The commenter suggests that GHGs associated with the manufacture and transport of cement by third parties should have been included in the DEIR. This comment pertains to a “lifecycle” analysis, which is not required under CEQA.

My rebuttal

Cement emissions may already have been counted at the plant level and for state goals, but we are including them for this project as avoidable emissions in that the emissions would not have occurred if this project were not done.

Therefore, to calculate the GHG impact from the Idaho-Maryland mine, one must include the embedded impact from the manufacture of the Portland cement. Embedded cost, in the context of energy costing, refers to the full amount required for a certain amount of energy to be provided.
By including them, the project will be exceeding the arbitrary level of 10,000 MT CO2e each year for 80 years, and thus require mitigation.

Grp 17.8

FEIR response

The response states: “With regard to the validity of Mitigation Measure 4.3-7(b), which requires carbon offsets to reduce the project’s construction emissions of GHG below the applicable threshold, please see Master Response 28 - Greenhouse Gas Credits.’

My rebuttal

The proposed mitigation for construction emissions beyond the chosen 1,100 MT CO2e leaves 1,000 MT CO2e still being emitted. The emissions are a calculation that could vary either direction from the limit. I ask that the mitigation cover the probability that they will be exceeded by a certain percentage. As opposed to a mitigation, I suggest that the emissions be cut back onsite to below the threshold. The emissions from the purchased mitigation will already have taken place regardless of this project.

Grp 17.9

FEIR response

The Response states: However, as demonstrated in the DEIR, estimated operational GHG emissions are below the applied numeric threshold of 10,000 MT CO2e per year. The DEIR determined that project-generated construction GHG emissions would exceed the applied GHG threshold of 1,100 MT CO2e per year, as addressed above”.

My rebuttal

I appreciate the changes made to the mitigation measure 4.3-7(b), but it doesn’t change the fact that the mitigation can occur anywhere in California, while Nevada County still will exceed the suggested level. The offset mitigation should be confined to Nevada County.

GRP 17.10

FEIR response

The Response states: “Of note, projects that consume electricity do not necessarily conflict with the County energy reduction goals. Additionally, although the EAP is not a Qualified GHG Emissions Reduction Plan under CEQA pursuant to the requirements outlined in the CEQA Guidelines, Section 15183.5(D), the project was nevertheless determined to be consistent with the EAP (see Table 4.3-22 of the DEIR)”.

My rebuttal

Though it is true that the Energy Action Plan refers to all of its savings in kilowatt hours and thus is not qualified under CEQA, the Energy Action Plan cites California laws and executive orders for reduction of GHG emissions. Also, “In April, 2009, the County adopted the “Nevada County Energy Plan” to support the reduction of energy use throughout the County facilities and operations. The Plan sets energy reduction goals and targets and correlates to the County’s 2011 GHG study. Numerous County energy projects have been completed to date.” [1]

In addition, this statement is essentially false for the following reasons.

This mine project will consume 49,000,000 kilowatts of electricity annually, in direct conflict with the County's energy reduction goals.[2] The mine operation may be energy efficient and still use vast amounts of electricity and natural gas additional to other County uses. In 2021, the average annual electricity consumption for a U.S. residential utility customer was 8,616 kilowatt hours (kWh). [3] The mine usage equates to the energy use of 5,575 homes in Nevada County.

There are 1,774 businesses in Nevada County.[4] In 2017 they used 53,393,272 kwh.[5] The forecasted 2035 efficiency savings for businesses is 8,905,888.[6] That leaves 44,487,384 kwh usage. The annual usage of the mine of 49,000,000 kwh is more than the usage of all businesses in the County, even after the EAP savings.

The proposed Idaho-Maryland Mine is not only not consistent with the EAP, but is opposite to the goals of the Nevada County Energy Action Plan.

Conclusion

The Nevada County Planning Commission and the Board of Supervisors must consider what direction the approval of the mine takes us. Do we want to do our part in combatting the impacts of climate change on our rural community as called for in the Energy Action Plans and the new California guidelines on emission standards, or are we willing to contribute to the impacts?

cc. Grass Valley Union Newspaper

From: Bob Mora,11683 Alta Vista Ave.,Grass Valley,CA. 95945

RE: No vote on Mine re-opening

I cannot understand why the Board of Supes. or anyone else would even consider granting a use permit to Ben Mossman and RGVG. Ben Mossman is going through court proceedings now for a failed mining venture in British Columbia that he left with the Canadian tax payers having to pick up the clean-up bill. Just the light pollution alone from a plant running 24 hours a day 7 days a week less than a mile from central Grass Valley would be enormous. We can have a town that is a Meca for art, music and tourism or an industrial town but not both.

There are several good articles in the Grass Valley Union newspaper, in the "**Other Voices**" section articulating why the re-opening of the Idaho-Maryland mine is a very bad idea; Friday Feb.24,2023 "RGV, Time for a financial reckoning", Randy Newsome; "The mine's Economic Impact Report;" Ray Bryars,Jan.20,2023 and "Save our Town",Patricia Sharp,Feb.22,2023. I would encourage the board and everyone considering the use permit for Rise Gold to read these articles and vote NO on re-opening the mine.

Sincerely, Bob Mora,Grass Valley

To the members of the Planning Department,

We moved to Grass Valley seven years ago with hopes of retiring and enjoying all that this area has to offer, and then the mine issue came up. As an environmental geologist, I cannot understand how re-opening the mine can even be considered while knowing the damage that mines have done here and elsewhere. Since we have not been given the opportunity to vote on this potentially-disastrous issue, I hope that you will represent all of us who are counting on you to say no to the mine so that we can get back to worrying about wildfires and protecting our groundwater supply which are top-priority issues that we struggle with. We don't need another thing to worry about. Not allowing the mine to re-open is something that you can control on our behalf.

Thank you!

Idaho.MMEIR@nevadacountyca.gov

Dear Nevada County Supervisors and Planning Commissioners,

I write to you as a ***very*** concerned resident of Nevada County to implore you to reject the re-opening of the Idaho-Maryland Mine. I live on Banner Mountain (District 1) and I am terrified of the consequences not only to me and my property, but to the community as a whole, if this mining operation is allowed.

In a moment I will briefly summarize some of the significant reasons to reject the proposal, but you are no doubt familiar with those facts, so I wish to begin by something far more obvious and indisputable. That is, if you lie down with snakes you are going to get bit(ten). Rise, and its C.E.O., have a demonstrated track record of environmental carnage, broken contracts, and such. Rise Gold has never opened or operated a mine and has never made a profit. Their C.E.O.'s predecessor company polluted tribal waters, declared bankruptcy, and left responsibility for their cleanup to the Canadian citizens. Their C.E.O. is currently on trial on charges relating to toxic spills in current operations.

Why would anyone in their right mind consider doing business with persons or institutions that can so predictably be counted on to compromise public health and cause economic crises and environmental destruction?

The economic projections that Rise puts before you in support of their application are neither fact-based nor honest. They are, at most, happy-talk and unbounded optimism. Bear in mind that, "figures don't lie, but liars often figure." So is the case here.

Why would anyone consider exposing our community to the sacrifice of its character for the benefit of a Canadian company? The re-opening of the mine will cause significant and unavoidable impacts. The increased traffic (18 wheelers) and noise on Brunswick alone is reason enough to reject this proposal, and that traffic increase can neither be denied nor mitigated. The threats to water wells and air quality scream for denial of the application. You simply cannot pump 3.6 million gallons of polluted water ***every day*** for six months and another 1.2 million gallons per year for up to 80 years without creating health and environmental damages. The claim in the E.I.R. that this dewatering will not

have significant impacts has to be recognized as the unmitigated horse pucky that it is.

Our county's air quality already gets failing marks. How can this not be exacerbated by fugitive dust from continuous rock crushing, hauling, and compacting that will release asbestos and silica particles, in addition to the output from hundreds of diesel trucks each day. Again, the E.I.R. drops the ball here, calling these inpacts, "less than significant."

Many residents, for miles around, will suffer reduced quality of life and diminished property values. The staggering amount of greenhouse gasses (more than 9000 metric tons annually) will contribute to our terminal problem of climate change – shame.

There is ***NO*** demonstrable need to extract our subterranean gold. There is sufficient gold already in vaults to satisfy the legitimate needs of generations to come. This proposal is only justified by the profit motives and greed of outsiders, untrustworthy outsiders at that.

As for the highly suspect predictions of economic benefits to our community, consider instead promoting high-speed, fiber-optic, Internet connectivity. Our area is a mecca for educated professionals fleeing major metropolitan areas to live in our bucolic paradise. But many of these people are working, or want to work, remotely, thus bringing economic benefits to our community with no negative impacts, environmental or otherwise. Why not support, instead, this area of economic growth that poses no downside?

Please do not be hoodwinked by the dazzling but false claims by Rise Gold. Please do the right thing as officials we elected or appointed to lead and protect us in an honest and exemplary manner. Please deny Rise Gold and instead focus on shepherding us into the 21st century with fitting and appropriate technology and infrastructure.

Thank you.

Very truly yours,

Peter N. Brewer

Dear Mr. Kelley,

Please see the attached PDF file with my responses to the responses to my comments, presented in the FEIR for the Idaho-Maryland Mine, These are submitted on behalf of CEA Foundation.

Best regards, June A. Oberdorfer

Responses to FEIR Responses to my "Comments on Groundwater Modeling, Idaho-Maryland Mine" referring to Itasca Denver, Inc., March 2020*, Predictions of Groundwater Inflows to the Underground Mine Workings at the Idaho-Maryland Mine,* later included as *Appendix K-3* to the Draft EIR, November 2020 with the same title

Response to Comments Grp 8 -127 through -133

June A. Oberdorfer, February 16, 2023

Rather than addressing the substance of my comments, the responses by the mine's EIR preparer are to indicate that I am confused about certain hydrogeologic concepts. I have been practicing hydrogeology since 1980 as both an academic researcher and consultant, have a PhD focused on hydrogeology, have taught hydrogeology at the university level and supervised Masters students' research, and have consulted in hydrogeology extensively.

I have taught groundwater modeling at the graduate level, conducted my own modeling both as an academic and as a consultant, and have supervised thesis modeling projects. The confusion exists in the mine's modeling report which has internal contradictions and is not forthcoming with important modeling results that would clarify the issues being contested. The report produced by the mine's modeling consultant would not have been an acceptably thorough report in my graduate course.

The results of the modeling are crucial for understanding the extent of mine-dewatering impact in the shallow aquifer, both the magnitude of drawdown and the lateral extent of the neighborhoods whose wells would be affected. If, as appears to be the case, the modeling report underestimates the impacts, mitigation efforts would need to be implemented over a larger area than indicated in the report, adding to both cost of the project and the number of well-owners affected.

The parts of Itasca's modeling report (November 2020) that indicate internal inconsistencies:

Source	Parameter	Value
Itasca, p. 24	Dewatering rate during historic mining period	700 gpm
Itasca, p. 23	Predicted dewatering rate during future mining	900 gpm (1,100 gpm max)
Itasca, p. 24	Additional dewatering above historic	200 – 400 gpm
Draft EIR, p. 4.8-14 to -16	Discharge rate at drains at present due to mine workings	Tens to a few hundred gpm
Itasca, Fig. 5-3	Maximum drawdown contour in shallow aquifer from flow to drains at present	10 ft
Itasca	Maximum drawdown contour in shallow aquifer at end of historic dewatering	Not stated

Itasca, Fig. 5-4	Maximum drawdown contour in shallow aquifer from future mine dewatering	10 ft
Itasca, Fig. 4-7 (top)	Drawdown in the Union Hill Mine at the end historic mining	20 ft
Itasca, Fig. 4-7 (top)	Current drawdown at the Union Hill Mine from drainage to springs	~0 ft
Itasca, Fig. 5-4	Predicted drawdown at the Union Hill Mine from future mine dewatering	3-5 ft
Itasca, p. 23	Initial condition for future predictive modeling: water levels in 1956 "when mine workings were pumped dry"	
Itasca, Fig. 5-4	Initial conditions for the results of predictive modeling: "relative to 2019 levels"	

1) Current groundwater flow to drains along Wolf Creek at tens to a few hundred of gallons per mintue (gpm), according to EMKO Environmental in Draft EIR. Itasca does not state discharge rate to drains in calibrated present-day model. This discharge causes a maximum of around 10 ft of drawdown in the shallow aquifer relative to pre-mining levels. Increasing the dewatering discharge to over 900 gpm would, according to Itasca, only cause an additional 10 ft of drawdown. The much greater discharge would be expected to produce much greater drawdown, not a similar magnitude of drawdown as the current much lower discharge to the drains.
2) Dewatering of the mine will increase discharge from the mine works by about one third above the discharge rates at the end of historic mining. Drawdowns in the shallow aquifer would be expected to be greater than drawdowns at the end of the historic mining. Itasca does not provide a figure and/or hydrograph presenting the drawdown in the shallow aquifer from the calibrated simulation of historic mining with discharge at 700 gpm so the drawdown in the shallow aquifer in 1956 is unknown. While the future drawdown in the shallow aquifer would be expected to be greater than the historic drawdown, it is not possible to know the magnitude of that drawdown from the report.
3) The one place we know shallow drawdown at the end of the historic mining period at shallow depths is in the closed Union Hill Mine. The calibrated historic pumping created just slightly over the observed drawdown in 1956 of 20 feet (Figure 4-7 top). This drawdown of 20 feet occurs in the shallow aquifer as the current depth to water at the Union Hill Mine is a few feet. The drawdown under current flow-to-drain conditions is ~0 feet. The predicted future drawdown with increased pumping would be expected to be greater than 20 feet. The drawdown given in the figure of predicted drawdown towards the end of future mining, as shown in Itasca Fig. 5-4, is 3 to 5 feet, much less than the greater-than-20-feet expected.
4) In order to calibrate the historic much higher water levels in the computer model at the Union Hill Mine, Itasca had to insert a low permeability layer (Itasca, p. 22), isolating the Union Hill Mine hydrogeologically from the adjacent mining areas. This hydrogeologic isolation means that the drawdown on the other/active mining side of the hydrogeologic

barrier would be considerably greater than the historic value of 20 feet measured in the Union Hill Mine. Since Itasca does not present either water levels or drawdown in 1956, at the end of historic mine dewatering, it is not possible to know what that greater simulated drawdown was.

5) The most likely cause of this disconnect between probable future drawdown (based on the observations above) and the predicted future drawdown presented in Figure 5-4, is the selection of the 1956 water levels as the initial condition (starting point) for the future predictive simulations. The 1956 water levels represent "when the mine workings were pumped dry" (Itasca, p.23); instead of starting with the 1956 water levels, they should have used the 2019 water levels they simulated for "present conditions" as the starting point. If one models future impact of 900 gpm pumping beginning with a condition in equilibrium with 700 gpm pumping (as in 1956), one will get much less additional drawdown than if one starts with no dewatering pumping and only moderate discharges to drains. The additional 10 feet of drawdown shown in Figure 5-4 most likely represents the incremental drawdown from increasing the pumping rate from 700 gpm to 900 gpm.

The above concepts were the basis for my initial comments of March 27, 2022. Below are brief explanations as to why the responses to my comments were inadequate.

GRP 8-127: The response does not clarify why the modeling reports states that the predictive modeling begins with the 1956 water levels (#5 above) nor explain the underestimation of drawdown in the vicinity of the Union Hill Mine (#3 above) and presumably much greater underestimation elsewhere in the future scenarios. "Initial conditions" has a very specific meaning in groundwater modeling: the starting water levels from which changes are measured. The model appears to have used the wrong initial conditions.

GRP 8-128: Response 5: We don't know what the simulated water levels in the shallow aquifer at the end of historic mining (19560 are since the report does not present those results even though they are crucially important. Since the drawdown in the shallow aquifer would be expected to be somewhat greater in 2025 than in 1956, because the extraction rate is greater, the report needs to be forthcoming about those important calibrated historic water levels in 1956. We know that the shallow aquifer recovered to a significant degree after the cessation of mining as seen in the essentially zero drawdown at present in the vicinity of the Union Hill Mine when it was simulated to be over 20 feet in 1956. The predictive modeling should have started with the current (2019) water levels to predict future drawdown.

GRP 8-130: In response to my request for a figure showing a drawdown map for 1956, at the end of historic mine dewatering, the response directs to inserted Sheet 16 (FEIR Vol. VIII, Appendix L). This sheet is labeled as Monitoring Wells and Projected Drawdown after Initial Dewatering. This figure cannot represent the water levels from 1956 since the drawdown in the shallow aquifer in the vicinity of the Union Hill Mine is a few feet, not the greater-than-20-feet indicated for 1956 (Figure 4-7 top).

Hi Matt,
Attached is Sierra Foothills Audubon Society's response to the FEIR Idaho-Maryland proposed mine. I also sent a copy via snail mail.
Don Rivenes

Sierra Foothills Audubon

February 24, 2023

To: Matt Kelley, Senior Planner
Nevada County Planning Department Staff
950 Maidu Ave, Suite 170
Nevada City, CA 95959
Ph: 530 265-1423
Email: matt.kelley@co.nevada.ca.us

The Sierra Foothills Audubon Society's mission is to educate ourselves and others to the variety and beauty of our natural environment and protect our wildlife and natural places. We have over 500 members in Nevada County.

We are writing in response to the Final Environmental Impact Report for the Idaho-Maryland Mine Project.

In March 2022 SFAS submitted comments on the Draft Environmental Impact Report for the proposed Idaho-Maryland mine. We stated that Gold Country Avian Studies had submitted to the county, California Natural Diversity Database (CNDDB) detections of over 15 special status Special Status bird species (of one or more individuals). The data indicated that the SF Wolf Creek may be used regularly during migration season by the endangered Willow Flycatcher, and species of special concern – Olive Flycatcher, Yellow-breasted Chat and Yellow Warbler.

The only species documented in the mine survey were the possibilities of California Black Rails and Cooper's Hawk.

FEIR response to Comment Grp 22-3

FEIR added mitigation measures describing these species of special concern, and where they would likely to be found. They also added a description of California spotted owl and documented past occurrences within the area.

"As such, potential for presence was already acknowledged by the DEIR, and the DEIR then concluded that "on-site removal of vegetation could result in adverse effects to nesting raptors and other birds protected under the MBTA should they be nesting on-site prior to commencement of construction." (Id.) As such, a potential impact to this species was already assumed by the DEIR. Mitigation Measure 4.4-2(g) was therefore

included requiring preconstruction surveys and buffers from nests if the species is present."

SFAS response

The statement that "potential for presence was already acknowledged by the DEIR" is false. The only species documented in the mine survey were the possibilities of California Black Rails and Cooper's Hawk.

FEIR Response to Comment Grp 22-3

THE FEIR response to explain why they hadn't located these species that Gold County Avian found.:

"While the reconnaissance level surveys conducted on July 10th and 14th 2019 for the Centennial Site and July 14th and 16th for the Brunswick Site may not fall within the survey protocol recommended windows for all species, protocol-level surveys are not required for CEQA analysis. Rather, the survey results along with review of CNDDB records and appropriate mitigation measures including pre-construction surveys was relied on to appropriately reach the conclusion that impacts to wildlife species is less than significant after mitigation."

SFAS response

We ask that Rise Gold perform studies in all seasons to verify species that could be impacted by the mine both at Centennial and east Brunswick. There may be more Species of Special Concern at the Brunswick site where extensive monitoring has not taken place.

FEIR Response as a mitigation

Mitigation: "Prior to initiation of ground-disturbing activities for any phase of project construction, if construction is expected to occur during the raptor nesting season (February 1 to August 31), a qualified biologist shall conduct a preconstruction survey prior to vegetation removal, including one daytime survey and one nighttime survey targeted at California spotted owl, consistent with the USFWS (1992) California spotted owl survey protocol.

SFAS Response

This only refers to California Spotted Owl and not other species such as Cooper's hawk and other Species of Special Concern.

FEIR Response to Comment Grp 22-4

Further mitigation was: “Removal of any trees within the Brunswick Area would occur between September 1st and January 31st to ensure that no nesting birds, raptors, or owls would be impacted by the proposed IMM project. If any active nests are located within the proposed disturbance area, including active nests within riparian habitat for the Yellow-breasted Chat, Willow Flycatcher, Yellow Warbler, and Olive-sided Flycatcher, an appropriate buffer zone shall be established around the nests, as determined by the project biologist.”

SFAS response

These additional mitigations are necessary, but the fact that Gold County Avian and Audubon had to point out the missing species suggests a inadequate DEIR preparation and concern over what else is missing. In addition, the removal of a large number of trees where California Spotted Owl have nested in the past shows the lack of concern for existing bird habitat.

FEIR Response to Comment Grp 22-6

Noise impacts to wildlife and bird species was analyzed in Impact 4.4-2 and determined to be less than significant. Air Quality impacts were assessed in Chapter 4.3 of the DEIR and were found to be less than significant. The commenter provides no evidence that the project’s incremental increase in regional emissions would cause significant impacts to bird species.

SFAS response

In our original letter we commented: “Table 4.3-11 indicate 36,500 Engineered fill trucks trip per year plus 120,788 employee trips per year. This additional traffic on Centennial Drive and East Bennett Roads will cause excessive noise and air quality impacts that would affect nesting birds in the area. In a study published in the January 2016 Proceedings of the National Academy of Sciences, researchers found that adults and nestlings of three bird species including the Western Bluebird showed multiple signs of chronic stress caused by noise pollution, including skewed stress hormone levels, due to increased anxiety, distraction, and hypervigilance.”

The FEIR response ignored the Study we cited saying we had provided no evidence.

Furthermore, the mine is proposed to operate for 80 years with the excess noise, air quality impacts and stream pollution. To respond that they will stop activity during construction if nests are found ignores the long-term impacts of the mine that will make this a wasteland for raptors and other bird species of special concern.

Conclusion

SFAS and most of the community have concluded that the FEIR proposed mitigations are inadequate allowing the mine to destroy bird habitat, and impact air and water

quality, and the health of the community not only during construction but during 80 years of operation.

SFAS is recommending the Planning Commission not certify the FEIR and that the project be rejected.

03/15/2023

To the Board of supervisors,

Dear board members, we write to-day to ask you to please say NO to the reopening of the Idaho Maryland mine. It is plain that the very few, if any, benefits to this community and the surrounding areas are vastly out-weighed by the disastrous environmental and economic consequences.

Rise Gold promises many new jobs and workers with pay checks to spend supporting local businesses. In reality there are likely to be very few jobs, most of them unattractive to those without mining experience. The majority of those with the necessary skills will not live locally nor put money into our community. In any case it will be years before any hiring occurs. It is also evident that the financial position of the applicants is very unstable and could easily become exponentially worse if court judgements relating to previous mining ventures go against Rise Gold. Instead, we may expect local businesses will be destroyed by the environmental and economic consequences.

In our opinion the EIR did not take into account many of the likely destructive impacts of re-opening the mine; polluted air, never ending noise, heavy traffic, disruption and loss of wildlife, likely damage to the water table leading to unsafe drinking water and agricultural disasters and unsightly dumps of extracted debris are simply categories for consequences which will be far wider in range and of longer duration than the report implies.

Mr. Steinmann's analysis of the economic impacts of re-opening the mine, published in the March 14th. issue of The Union, is very clearly organized and chilling in its conclusions. The City and County general plans provide for a much more reliable source of new, clean jobs which will not destroy all we value here. An estimated $7.00 per year per County resident, should the mine succeed, is not worth the multiple risks the mine project offers. The gold will go to Canada.

Please JUST SAY NO!

Jennifer P. Kelly

Nevada City, CA 95959

Dear Decision Makers:

I am writing today to urge you to VOTE NO on the re-opening of the Idaho-Maryland Mine. The environmental impact, in addition to the effect on our quality of life and community health, is undeniable.

However, I am most concerned about the impact on our roads and transportation, especially considering the increased housing developments. Already there has been a major increase in cars on the road.

As a very concerned citizen, I urge you to soundly reject the re-opening of the mine.

Regards, A G Schlosser

bdofsupervisors@nevadacountyca.gov
Idaho.MMEIR@nevadacountyca.gov

Dear Nevada County Supervisors and Planning Commissioners,

I write to you as a ***very*** concerned resident of Nevada County to implore you to reject the re-opening of the Idaho-Maryland Mine. I live on Banner Mountain (District 1) and I am terrified of the consequences not only to me and my property, but to the community as a whole, if this mining operation is allowed.

In a moment I will briefly summarize some of the significant reasons to reject the proposal, but you are no doubt familiar with those facts, so I wish to begin by something far more obvious and indisputable. That is, if you lie down with snakes you are going to get bit(ten). Rise, and its C.E.O., have a demonstrated track record of environmental carnage, broken contracts, and such. Rise Gold has never opened or operated a mine and has never made a profit. Their C.E.O.'s predecessor company polluted tribal waters, declared bankruptcy, and left responsibility for their cleanup to the Canadian citizens. Their C.E.O. is currently on trial on charges relating to toxic spills in current operations.

Why would anyone in their right mind consider doing business with persons or institutions that can so predictably be counted on to compromise public health and cause economic crises and environmental destruction?

The economic projections that Rise puts before you in support of their application are neither fact-based nor honest. They are, at most, happy-talk and unbounded optimism. Bear in mind that, "figures don't lie, but liars often figure." So is the case here.

Why would anyone consider exposing our community to the sacrifice of its character for the benefit of a Canadian company? The re-opening of the mine will cause significant and unavoidable impacts. The increased traffic (18 wheelers) and noise on Brunswick alone is reason enough to reject this proposal, and that traffic increase can neither be denied nor mitigated. The threats to water wells and air quality scream for denial of the application. You simply cannot pump 3.6 million gallons of polluted water ***every day*** for six months and another 1.2 million gallons per year for up to 80 years without creating health and environmental damages. The claim in the E.I.R. that this dewatering will not

have significant impacts has to be recognized as the unmitigated horse pucky that it is.

Our county's air quality already gets failing marks. How can this not be exacerbated by fugitive dust from continuous rock crushing, hauling, and compacting that will release asbestos and silica particles, in addition to the output from hundreds of diesel trucks each day. Again, the E.I.R. drops the ball here, calling these inpacts, "less than significant."

Many residents, for miles around, will suffer reduced quality of life and diminished property values. The staggering amount of greenhouse gasses (more than 9000 metric tons annually) will contribute to our terminal problem of climate change – shame.

There is ***NO*** demonstrable need to extract our subterranean gold. There is sufficient gold already in vaults to satisfy the legitimate needs of generations to come. This proposal is only justified by the profit motives and greed of outsiders, untrustworthy outsiders at that.

As for the highly suspect predictions of economic benefits to our community, consider instead promoting high-speed, fiber-optic, Internet connectivity. Our area is a mecca for educated professionals fleeing major metropolitan areas to live in our bucolic paradise. But many of these people are working, or want to work, remotely, thus bringing economic benefits to our community with no negative impacts, environmental or otherwise. Why not support, instead, this area of economic growth that poses no downside?

Please do not be hoodwinked by the dazzling but false claims by Rise Gold. Please do the right thing as officials we elected or appointed to lead and protect us in an honest and exemplary manner. Please deny Rise Gold and instead focus on shepherding us into the 21st century with fitting and appropriate technology and infrastructure.

Thank you.

Very truly yours,

Peter N. Brewer

PLANNING DEPARTMENT

March 29, 2023

Dear Planning Commision and Supervisors,

My family and I are against the re-opening of the Idaho-Maryland mine, also known as the RISE Mine project. I have lived in Nevada county for 25+ years and for 6 years, I attended UNR to complete my Bachelor's and Master's Degree in Biology. I have researched the Rise Mine website and have also researched the long-term devastation caused by deep-ground mining (even if it is termed as "green gold mining"). The negative, long-term environmental consequences outweigh the positive, short-term economic benefits. I believe that the RISE firm has appealed to the community with said economic benefits. There are examples from scientifically researched and supported organizations, like safewater.org, that show deep water mining does ultimately and greatly affect the water tables of the environment. If it is not our immediate water tables that are affected (at a more shallow fractured water tables), we will be taking from some neighboring locationthat can only be determined when the damage has been done. Mines in Arizona and Nevada can still be traced as sources draining water from areas of northern california even decades after the mines have ceased to function. If this is the case, and we deplete another community's water supply, I think it would likely be traced right back to our community if the mine is approved. We would be economically responsible for restoring water should we be responsible for depleting neighboring water supplies. I also feel that the RISE website appeals to the community because of LIP SERVICE. The statements are not scientifically supported, or they have kept their sources a secret which contadicts the importance of having proper research to back facts up in the first place. RISE uses misleading verbiage and notions to suggest that they would positively benefit our community via employment opportunities. The RISE company has been inconsistent about the selection of employees. They haven't clearly specified if these employees would be local because the company states that some employees would be temporarily moved to our community to work on the mine. They have claimed that they will provide hundreds of local jobs, and restated that that many of these jobs are implied local business hires because of the influx of cash flow at local businesses. This is a

contradiction to what they have said about hiring locally. If the hired workers already live locally then they already use community services. So where would this new revenue be coming from? They are either not hiring locally or they will not generate new revenue locally, which one is it? Let's not be hoodwinked by superficial jargon and deceptive information. There is a reason that a corporation with an unpleasant history (abandonment of job site cleanup and neglect for the environment) is trying to establish temporarily here, ruse our community, and exploit our land. When things sound too good to be true, they typically are. There is no such thing as an environmentally friendly way to do a large mine operation. My last thought is in regard to the deep ore that RISE claims will be removed from the ground and used for development of land surrounding the mining site. The breaking up of this solid ore means crushing and releasing other contaminants in the ground. The solid ore that is broken up to be brought out of the deep mining sight contains elements that when exposed to oxygen release contaminants into our environment. We might not see the effects of these harmful contaminants on a short-term time scale. RISE claims that extra waste will be cleaned up by third party industries, but they have not specified where the waste ends up, who these companies are, and if disposal of the contaminated material is even possible. Perhaps 10 years down the line, we will be experiencing irreparable damage visible by the absence of insect and animal life in the community. We will have to wonder how to explain to our children and their children why the land and water is unusable, or why it is hard to find insects or birds in our area. We will have to reflect on the forgotten few years of supposed financial gain and wonder if it was worth the tradeoff. The long-term effects of mining are what really need to be considered. For our community, reopening one of CA's largest gold mines could be the worst path possible. Please DO NOT approve this mine operation.

Thank you for your time,

Jennifer Todd, M.S.
(530)477-1940

March 29, 2023

Matt Kelley Planning Commission Supervisor

Our Family is VERY OPPOSED to the Idaho-Maryland Mine.

There are many claims made by the Rise Gold Corp. that we find to be inaccurate . Many of them were pointed out in the article written on the April 1, 2022, "Digging Deeper " (published in THE UNION).

The Rise Corp states the they will be creating hundreds of jobs in our community. When I look at the actual details they want to hire people locally to work in the mine. The community will be expected to add jobs to local business to service those people. My question is, "Why would we need more services for people that already live here and use existing services in our community?"

We also feel that TOURISM will be greatly impacted by pollutant being added to the RIVERS, WATERWAYS and AIR QUALITY . These will not only impact our community but will impact the surrounding communities as we have learned form Malakoff Diggins .

If the community is hoping for a revenue, there are other ways to achieve solutions. I'd much rather see a Costco be put in than having to be held responsible for the environmental impacts that this mine will create. If the community were to do something like this, we could ensure local jobs and local tax to improve the community fiscally. Such an endeavor would not have permanent irreparable damage on the environment that makes our community so rich.

PROPERTY VALUES will also be impacted greatly. Our family will be expecting great reductions in our property taxes because of our proximity to the mine .

Thank you for your time,

The Huddleston Family

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is John Bansemer. I live at 11975 Lower Colfax Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I am in district 3 and live on Lower Colfax Road since 2000. I purchased the property from my uncles and Father in 1999. My grandparents lived here on this property since 1948. I am in the construction industry and have enjoyed the tranquility and nature over the years of my early childhood visiting and swimming in the pond here and enjoying the many recreation opportunities this community has.

Mines are meant to be in rural places far and away from people and communities, proposing and reactivating a mine so close to and underneath our community is not a right fit nor belongs a topic in this present day. Further this is a threat to those living in more rural settings with close to town and our ground wells would be affected by any dewatering, clearly a violation of our rights as we applicated for wells

many years back and have put in place the assurance of potable drinking water and adhering to County Approvals for such building requirement. There is no guarantee by the county that my water will not be affected this is wrong and narrow minded. And WRONG. Nor has Rise Corporation stepped up with a guarantee/ bond or otherwise any viable potable water solutions for our rural community nor any attempt to mitigate this for rural well owners.

Sincerely,

John Bansemer

Dear Nevada County Supervisors and Planning Commissioners,

My name is Laura Wagner. I live at 18286 Nubian Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Sincerely,

Laura Wagner

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Maura Halama. I live at 519 Sacramento St, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in district one. I am a kindergarten teacher at Deer Creek elementary and have served our community as an educator for the past ten years. I grew up here and care deeply about our community and the quality of life of current and future generations. I am incredibly concerned about toxins in our water, air, and soil. My sister is a water treatment specialist for state parks and our water quality in Nevada County is horrifying as a result of mining in the past. I already do not feel safe drinking it. Our county also has a very high cancer rate compared to other counties in California. I believe that has a direct correlation to the toxins we are exposed to from prior mining. I am currently pregnant and want my child's future to be healthy and bright. The mine will put my child's health and the health of thousands of others at risk. Please consider all of this. Put the health of our population first and do not approve the mine. Thank you for your consideration.

Warmly,
Maura Halama

Sincerely,

Maura Halama

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Mitchell Christensen at mitchellch@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Mitchell Christensen. I live at 12626 Baccarat Ct, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I recently moved to Grass Valley. I was drawn by its natural beauty and unspoiled wilderness. During closing of the real estate contract I was informed of the potential of reopening the mine. This was a serious detractor for me and it almost killed the real estate deal and sent me looking elsewhere to spend last 10 years of my career, and my retirement dollars. How many other people will have a similar reaction?

We need to advocate for our citizens. We need to advocate for our future. We need to advocate for our forest and wildlife. What we don't need to advocate for is an unscrupulous outside corporation swooping in to steal the gold from beneath our feet and leave us to deal with the aftermath.

Please join me in saying NO to the selfish interests of the few and saying YES to the citizens of Grass Valley and Nevada County.

Sincerely,

Mitchell Christensen

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Phyllis and William Huddleston. I live at 14459 LaNoria Ct., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Matt Kelley Planning Commission Supervisor

Our Family is VERY OPPOSED to the Idaho-Maryland Mine.

There are many claims made by the Rise Gold Corp. that we find to be inaccurate . Many of them were pointed out in the article written on the April 1, 2022, "Digging Deeper " (published in THE UNION).

The Rise Corp states the they will be creating hundreds of jobs in our community. When I look at the actual details they want to hire people locally to work in the mine.

The community will be expected to add jobs to local business to service those people. My question is, "Why would we need more services for people that already live here and use existing services in our community?"

We also feel that TOURISM will be greatly impacted by pollutant being added to the RIVERS, WATERWAYS and AIR QUALITY . These will not only impact our community but will impact the surrounding communities as we have learned form Malakoff Diggins .

If the community is hoping for a revenue, there are other ways to achieve solutions. I'd much rather see a Costco be put in than having to be held responsible for the environmental impacts that this mine will create. If the community were to do something like this, we could ensure local jobs and local tax to improve the community fiscally. Such an endeavor would not have permanent irreparable damage on the environment that makes our community so rich.

PROPERTY VALUES will also be impacted greatly. Our family will be expecting great reductions in our property taxes because of our proximity to the mine .

Thank you for your time.

Sincerely,

Phyllis and William Huddleston

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Randi Pratini. I live at 10222 Elliott Way, 10222, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1, on the flank of SugarLoaf Mountain in Nevada City and have been at this residence since 1997. I also own and operate a small, organic nursery business here.

I say no to this mine. Quite simply, the company asking to re-open it has a very poor reputation where it does and has done business. Our area has no need for what they have to offer nor for the unknowns that can very likely to arise.

PLEASE- JUST SAY NO!

Sincerely,

Randi Pratini

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Rebecca Blanton. I live at 11200 Hackett Court, 11200 Hackett Court, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Additionally, the company behind the push for re-opening the Idaho-Maryland Mine has a history of severe enviornmental harm left in the wake of mines it opens briefly and then closes. Multiple countries and cities have sued the company for failing to meet the promised jobs for the area and causing significant, long-lasting environmental harm.
Please do not destroy Grass Valley's water, land, and community for the campaign dollars you have been given to support this project.

Sincerely,

Rebecca Blanton

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Roberta Clarke. I live at 11010 Banner Mine Way, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We have been coming to this area for many years and loved it so much that we moved here 4 years ago
from Santa Rosa. We live on Banner Mine Way, in the Forest Knolls development. I am very concerned about
the pollution and the impact on our community. I am especially concerned about the noise. I am very sensitive
to noise and the way it reverberates around our area. I believe that mining is our history in this area, not our future. I think, that opening the mine would very much have a negative impact on our quality of life in our
home.
Thank you for your consideration and please vote NO.

Sincerely,

Roberta Clarke

I am opposed to the Idaho-Maryland mine. the mitigation does not cover increased costs to the county and to citizens due to likely accidents with Ore mining trucks, including serious injury + loss of life. I am very concerned about plans to use mineralized rock from the mine as engineered fill. Since tailing already present on the site and newly excavated mineralized Rock may contain toxic levels of arsenic, chromium, copper, mercury lead and nickel, all tailing and engineered fill should be tested for metals and disposed of according to hazardous waste disposal regulations. No materials should be released that exceed EPA screening levels.

Sincerely,

Dear Nevada County Supervisors and Planning Commissioners,

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk. Imagine people having to absorb blasting earth shaking explosions, 7 days a week, beneath our hospital and many of our senior care facilities along the Sutton corridor. In addition to the many people living peacefully in their homes, which happen to be beneath the 2,585 acres comprising the allowed blasting area of the mine. The water risk is not worth the risk either. Wolf Creek is currently still in recovery from the effects of turn of the century mining incursions; imagine 3-5 million gallons of treated mine water re-entering the creek + water ways PER DAY! This surely could impact how much water as well as the natural flora and fauna of the creek

Sincerely,

This mine should be permanently put to rest. Since it's closure, the economy + community have moved on in a way that makes this mine unfeasible + a hazard in many ways. I think the county should acquire the mineral rights + leave it.*

I moved in 1978 from the Midwest to California to enjoy the sun, the ocean, and a different climate. After 11 years in San Diego I was enticed by my daughter in 1989 to move up here and help her create fantasy dolls and help run a gallery called The Tanglewood Forest. I never heard about the Idaho Maryland Gold Mine and no one ever mentioned that I was living next to the upper-end of the San Andreas Earthquake Fault line which I had heard about and read about back in Michigan - until now!!

An underground exploratory gold mine should not be reopened next to a fault line, let alone in a bustling tourist area!! A mine which requires thousands of gallons of our drinking water to flush multiple mine toxins out into a limited stream bed which flows through wetlands out into the Pacific Ocean, home to some of our food!! Add to that 24/7 noise, air pollution, earth pollution, habitat destruction, and uranium!!!

Sincerely, PLEASE SAY "NO"!!!

The lure of get rich quick schemes around gold mining speculation has existed for nearly 200 years in our area. Many have been enticed, but few rewarded. Lets learn from our history & refuse to jeopardize our health, environment & well being for greed based on promises made by companies such as Rise Gold who have seriously tarnished reputations. Just say NO to this modern day folly & spare us from a nightmare we will surely regret.

Re: Final Environmental Impact Report
Rise Gold Idaho Maryland Mine reopening study
Grass Valley, California

Dear Mr. Kelley:

As I shared with the large audience in attendance at the Wells Coalition meeting held last week on April 6th, the Final EIR is patiently flawed in the assertion that all properties affected by failing wells in the Bennet Road area can be ready mitigated via obtaining domestic water service from Nevada Irrigation District (NID). This assertion is patently false.

As clearly set forth in the attached NID Water Service Regulations (Section 10.09), parcels to be served with NID water MUST front on a NID water main. There are many parcels that DO Not front on Bennet Road. See enclosed plats that identify approximately twenty parcels that will NOT have main line frontage.

Furthermore, all parcels NOT having said required frontage must petition the NID Board of Directors for a Variance to obtain service. A Variance Request affords NO guarantee that service will be approved.

Furthermore, for a parcel not fronting on the main line, the meter is set at the street. It is then the property owner's responsibility to extend the private service line from the meter location to their property. There are two significant issues with this requirement: 1) some parcels that do not front on Bennett Road have significant elevation gain from the location where the meter will be set and therefore possible requiring a pump to provide sufficient pressure deliver the water to the home location. Said pumping system will necessitate extending electrical service from the home, downhill to the meter location. Both installation of pump cost and future operational cost of same were not considered nor addressed in the Final EIR. 2) NID requires the variance applicant to demonstrate the property enjoys sufficient legal access or easement right of way across the parcels lying between the parcel to be served and the proposed meter location (see section 10.08 and Form 10-8 Variance Request application in attached). It is deemed highly unlikely that the affected parcels have any such easement rights in place at this time as there existed no prior need for same, and nor is there any guarantee such easement could actually be procured or granted by the ownership of the parcels from which the easement must be obtained. Here again, the Final EIR failed to recognize or address this serious limitation of proposed NID water service and rather patently **errantly presumed and asserted water line extensions are simply physically and legally feasible and therefore a valid mitigation measure**. Regretfully, this is not true.

Respectfully submitted,

Daniel R. Ketcham

10.08.03 Expiration Date

All approved variances will have an expiration date of not more than two years. All conditions of approval must be met before the expiration date. Thereafter, the District will consider the variance expired. After expiration, any request for variance will be considered a new request subject to the processing fee and all District regulations at the time of the new request.

eff. 6/9/99

10.08.04 Appeal of Variance

The applicant may appeal a denied variance. All appeals must be in writing and received by the District within 60 days from the date of written notice of the District's decision. After 60 days, a request for appeal would be considered a new application requiring the applicant to submit a new Form 10-B and processing fee.

The first appeal would be made to the Engineering Committee, who may unanimously deny the appeal or forward the appeal to the Board of Directors with recommendations. If the Engineering Committee unanimously denies the appeal, the applicant may make a final appeal to the Board of Directors for a majority vote.

eff. 6/9/99

10.09 PRIVATE PIPELINE REPLACEMENT

10.09.01 General

In earlier years, the District allowed treated water service through private pipelines that served two or more parcels not fronting a District water main. As indicated in these Regulations, current requirements allow water service to a parcel only if it is adequately fronted by a District water main. Many of these aging private pipelines have experienced leaks that waste valuable District water supplies. In order to minimize this problem, the following participation program is available.

10.09.02 District Participation

District participation will be considered on any private pipeline elimination project where District water main replacement is involved. The new water main must meet all requirements as contained in this section of these Regulations. The District will determine, at its sole discretion, if it is in the

10.08 REQUEST FOR VARIANCE

10.08.01 Request Procedure

The applicant shall submit a completed Form 10-B Variance Request and pay an Administrative-Processing fee. The processing fee is non-refundable regardless of approval or denial of any part of the variance request.

The District is not a party to and accepts no liability or responsibility for rights in private property downstream of the District's meter. The applicant is solely responsible for the acquisition, retention (and compliance with all terms and conditions) of satisfactory rights, in favor of applicant from underlying landowners for applicant to install and maintain applicant's service line over private lands downstream of District's meter, and will defend and indemnify District from all claims, demands, and damages arising from applicants use and maintenance of the service line.
eff. 6/9/99; rev. 1/26/11; rev. 10/9/13; rev. 01/13/16

10.08.02 Review of Variance

The Staff Variance Screening Committee, consisting of representatives from Management, Engineering Department, and Operations Department, as determined by the General Manager, will review requests for variances from District Regulations pertaining to treated water systems.

The Staff Variance Screening Committee may unanimously deny a variance. Applicant may appeal per Section 10.08.04.

The Staff Variance Screening Committee may unanimously recommend variance approval and conditions of approval to the General Manager. The General Manager may then approve the variance and conditions of approval.

If the Staff Variance Screening Committee and the General Manager are not in unanimous agreement, they will submit the Variance Request to the Engineering Committee. The Engineering Committee may unanimously deny the variance, and the applicant may appeal per Section 10.08.04. If the Engineering Committee does not unanimously deny the variance, it will make recommendations to the Board of Directors. The Board of Directors' decision, by majority vote, will be final.

FORM 10-B

NEVADA IRRIGATION DISTRICT
1036 W. Main Street, Grass Valley, CA 95945
(530) 273-6185

VARIANCE REQUEST

District regulations require, at least 50 percent of the parcel, but in no case less than 50 feet, must be fronted by a minimum 8-inch diameter water main. Owner hereby applies for a variance to District Regulations per Section 10.08. Consideration for approval of a variance is based upon the District's ability to provide treated water service to the subject property while maintaining orderly development of the water system.

I am a long time resident of Grass Valley and am concerned about the long term economic stability of the community. As such, I feel the opening of the Idaho Maryland Mine would be beneficial on balance and I support such a move. The de-watering of wells adjacent to the mine certainly has to be addressed of course. I hope you will support this endeavor, and work to address any negative impacts, so that the mine can succeed and operate in a responsible, environmentally friendly manner.
Sincerely, Steven Barnes

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Devin Cormia. I live at 11011 Gold Hill Drive, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My family and I live in the Gold Hill neighborhood quite close to the proposed reopened mine. My wife and I picked the Grass Valley Area for the scenic beauty and outdoor opportunities to raise our children. The devastating legacy of mining can still be seen throughout our region and should serve as a lesson learned, that choices made for short term profits have long lasting effects for untold generations to come. Please vote against reopening the Idaho Maryland mine. Our county should be an outdoor destination, for the scenic forests and rivers. An active gold mine would decrease visitors, and encourage folks to move away.

Sincerely,

Devin Cormia

My name is Donald Wilkinson. I live at 11167 Daniels Dr, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

For the simple fact that Risegold is set up with no financial resources of a parent company or other interests and the intention to go bankrupt as soon as profits shrink and cleanups loom. What reason would they have to clean up after themselves? Especially since the president has already displayed this business model previously?

Sincerely,

Donald Wilkinson

My name is Donn Carlson. I live at 10805 Gold Hill Drive, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in the Grand View Terrace neighborhood of District 3. I have lived here for 19 years. I do vote, and have a good memory. The county cannot possibly know what the impact of the mine will be, particularly for the 80 year term of the license. Rise Gold could not possibly put up a sufficient bond to indemnify the taxpayers from potential cleanup costs. Vote NO on this fiasco.

Sincerely,

Donn Carlson

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Geoff Erwin. I live at 10407 S Ponderosa Way, Rough and Ready, CA 95975.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

If it is the case that you work for the constituents of Nevada County, to safeguard and protect our health, interests, and the environment in which we live, then you must vote NO on the mine. Failure to do so would be a dereliction of your duty as a public servant. It is rather startling that this has gone on as long as it has, given the overwhelming dangers Rise Gold poses to our community. I trust the reason for the longevity of the decision is that it was necessary to give them a chance. Now that they have failed to address the giant holes in the FEIR, I trust that you will, in good faith, vote NO on the mine.

Thank you for your service,

Sincerely,

Geoff Erwin

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jeff Murphy. I live at 10126 Alta Sierra Dr., Grass Valley, CA 95949.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

Please, NO MINE. These roads are dangerous enough without endless large, loud, slow trucks all day and night. The noise and negative environmental contributions that this and any new mine would bring shall never be justifiable. Please STOP the mine at all cost. We the community see through their lies about public safety and job creation. Nevada county no longer needs to line to thrive. Let's focus on the homeless and fire issues instead of pipe dream mine scams.
Thank you. JM

Dear Nevada County Supervisors and Planning Commissioners,

My name is Nancy Sargent. I live at 232 Mallard Drive, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada County since 1984, now in District 3. I've read all of the very informative letters, Other Voices, etc., printed in The Union, from so many individuals with amazing credentials and insight about this proposed re-opening of the mine. I was against it from first learning about it, and to date I cannot see a single positive. Not only that, I do not trust a word from Rise Gold's CEO. Canada made the mistake of trusting them, and common sense tells us that we must not do the same.

I urge you all, the Board of Supervisors and Planning Commissioners to "just say no".

Sincerely,

Nancy Sargent

Dear Nevada County Supervisors and Planning Commissioners,

My name is Sandra Staser. I live at 501 Searls Ave, Nevada City, CA 95959.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

I was born and raised here and am 5th generation here in Nevada City. I'm very concerned about the water issue, noise, pollution, and the owner of Rise Gold. We have water this year, but who knows what will happen in the future, we shouldn't waste water on mining because of drought. The noise from mining would be horrible.
The pollution to the air and the water would be terrible. The owner of Rise Gold didn't do a good job with his last mine. It just isn't worth it!

Sincerely,

Sandra Staser

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Suzanne Marriott. I live at 800 Freeman Ln, Apt 104, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

Please think of the health of the residents and the environment and stop this mine.

Sincerely,

Suzanne Marriott
smarriott2@sbcglobal.net

April 5, 2023

To:
Members of the Nevada County Planning Commission,
Nevada County Board of Supervisors,
and Nevada County Planning Department Staff
Attn: Matt Kelley, Senior Planner
950 Maidu Ave, Suite 170
Nevada City, CA 95959
matt.kelley@co.nevada.ca.us

To All Concerned:

MineWatch is a coalition of community and environmental organizations in Nevada County and throughout the State. We appreciate the opportunity to provide public comment on the Final Environmental Impact Report (FEIR) on the proposed reopening of the Idaho Maryland Mine (Mine Project, Mine, or Project).

We are concerned about both the short-term and long-lasting environmental impacts that the Mine Project would cause and that the environmental analysis of the FEIR is inadequate.

On behalf of:
Community Environmental Advocates Foundation,
The Sierra Fund,
South Yuba River Citizens League,
Wolf Creek Community Alliance,
Wells Coalition,
Patagonia,
California Native Plant Society Redbud Chapter,
Sierra Foothills Audubon Society,
Sierra Nevada Group Sierra Club,
Center for Biological Diversity,
Friends of Bear River,
Sierra Streams Institute,
Nevada County Climate Action Now,
Elders Action Network,
Friends of Banner Mountain,
Brunswick Pine Road Association,
Brunswick Manor HOA,
San Juan Ridge Taxpayers Association,
Earth Justice Ministries,
Earthworks,
Fly Fishers International, Northern California Council,
American Rivers,
Nevada County Sunrise,
Sierra Watch,
Nevada City Rancheria,

And members of the Nevada County community at large who have identified many issues of concern regarding the potential reopening of the Idaho-Maryland Mine in Grass Valley.

We respectfully request and recommend that the County deny the approval of the Idaho-Maryland Mine Project and not certify the FEIR.

The County is under no obligation to approve the Mine Project:

- **You as decision makers have the discretion to deny this project simply based on your understanding of the needs of your community.**
  In addition, the many environmental impacts associated with the mine, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the mine project.

- **The Mine Project is inconsistent with the General Plan.**
  The Mine project is inconsistent with numerous Nevada County General Plan goals and policies. The Plan's goal 17.1 calls for recognizing and protecting mineral resources in a manner that does not create land use conflicts. You, as our decision makers, can logically

conclude that a Mine project of this magnitude in an urban area will have multiple conflicts with adopted goals for not only land use, but also economic development, safety, climate change, noise, aesthetics, water, and coordination with cities and towns. These are all solid justification for your denial of the Mine. [1]

Both the Brunswick and Centennial properties are currently zoned “Light Industrial”, which provides for reasonable and better alternative uses of the properties.

- **There is no adequate economic justification for the Mine.**
  In fact, it is likely that issues with mine waste disposal and unforeseen production limits will shorten or halt mine operations early on.

  We assembled a panel of local experts who reviewed the Economic Impact Report on the Mine. They concluded that:
  --The Economic Report showed a huge range of possible revenue outcomes from very low to very high, making actual revenue potential uncertain. Even low-end revenue figures were overly optimistic with a heavy reliance on information provided by the applicant.
  --The assertion in the economic study that property values wouldn’t decline was demonstrated to be invalid; it failed to utilize local realtors’ consensus or to use accepted home appraisal methods.
  --The Mine will likely result in less than 132 locally held jobs.
  --The economic benefit per capita will be approximately only $7/year/resident, a minimal benefit compared to the environmental risks posed by the mine.
  (See presentation at youtube.com/watch?v=sffB7TY78Pw)

- **Environmental impacts will be severe and unavoidable.**
  The FEIR lists several significant and unavoidable environmental impacts that endanger this community's health and quality of life. These include aesthetics, traffic, and noise.

  There are also serious deficiencies in the FEIR that underestimate numerous other significant and unavoidable environmental impacts which our organizations and the community have identified throughout this process. We summarize many of these later in this letter and in our more detailed letters submitted separately. [2]

  Economic risks and unsubstantiated benefits clearly show that there are not adequate overriding considerations to justify acceptance of these impacts within our community.

- **There is a strong legal basis allowing the County to deny the project without certifying the EIR.**
  There is ample case law to uphold the rejection of FEIR certification if a project is denied. (Las Lomas Land Co., LLC v. City of Los Angeles (2009)). [3]

  We believe that continuing to process the EIR will just cost the County staff and the community a loss of time, money, and energy. We can better spend this time on critical issues like wildfire safety, watershed restoration, and response to climate change.

- **The bottom line is that the community overwhelmingly does not want the Idaho Maryland Mine to reopen.**
  The Mine will be counter to the adopted General Plan land use vision which the community supports. It will hamper the growth of the green technology economy we are successfully attracting in a place where quality of life counts.

Critical Issues

A number of our key concerns on both the project and the FEIR are summarized below.

More detailed comments from the CEA Foundation and the CEA Foundation attorneys can be found at www.cea-nc.org/idaho-maryland-mine-final-eir-comments.

1
Centennial Site. The FEIR has left us guessing as to what the true impacts of the Mine Project will be since it does not include a discussion of the critical impacts associated with the Centennial mine waste disposal site. This is a clear reason to deny the project.

- **Centennial Site Remedial Action Plan is still not approved.** One of our biggest concerns regarding the FEIR is the continued failure to adequately address impacts associated with the Centennial Industrial Site (Centennial). This site is the location of hazardous mine waste left over from past Idaho Maryland Mine operations.

- **The FEIR does not adequately define the Mine Project to include the Centennial site and, as a result, fails to identify all potential impacts.** The FEIR assumes that the Centennial site will be cleaned up before the use of the site for deposition of new mine waste. Yet the significant work which is needed to accomplish this clean-up is not evaluated in the FEIR. For instance, the draft Remedial Action Plan proposes stripping contaminated materials, destroying wetlands and woodland. Yet these impacts are not discussed in the FEIR. Rather, the FEIR assumes that the clean-up has already been accomplished and improperly uses the post clean-up conditions as the baseline for its environmental impact assessments. As a result, assumptions about baseline conditions for purposes of assessing impacts are speculative at best.

2
Groundwater and well impacts. The FEIR's assumption that groundwater impacts from the mine project will not be significant was not substantiated.
The project should be denied out of concern over unanswered questions on impacts to area wells and groundwater supply.

- **Baseline groundwater conditions not determined.**
  CEQA requires a current baseline to assess potential impacts and determine mitigations. The questionable computer model used for the analysis did not use current monitoring data from any of the over 300 domestic wells in the mineral rights area. It relied only on

sparse patches of data from over 15 years ago. [4] The FEIR acknowledges that data is needed, but the approach calls for drilling 15 new monitoring wells as a basis for verifying the computer model **after** the FEIR is certified! Not having a baseline established by a domestic well monitoring program before publishing the FEIR on this project is unacceptable.

- **Domestic well monitoring plan inadequate.**
  The FEIR adds an inadequate supplemental domestic monitoring plan for 378 newly identified properties. Among the many deficiencies, the new program only includes about half the wells in the mineral rights vicinity and provides neither additional NID infrastructure to speed water replacement nor a third-party liaison to negotiate issues if problems arise. [5]

- **Learn from the Siskon Mine well disaster.** Given the catastrophic well failures that happened as a result of the Siskon Mine in our own county, the lack of baseline monitoring of area wells before any underground mine project is approved is unconscionable. [6]

3

Mine Waste Management Inadequacies Risk Water Quality. The FEIR fails to provide evidence that there are no water quality impacts related to mine waste disposal. Actual hazard levels of the mine waste, adequacy of proposed storage, and feasibility of disposal via off-site sales are all in question.
Due to the risk of pollution from the discharge or leaching of heavy metals, or the release of other hazardous substances, the Mine Project should be denied.

- **Inadequate rock testing for hazard levels.**
  The Central Valley Regional Water Quality Control Board (Water Board) made it clear in their Draft EIR comments that more rock testing is needed to assess the likely concentration levels of hazardous elements in the rock to be mined. The FEIR's plan for storing and disposing of mine waste has extensive gaps, resulting in a risk of long-term mine water pollution similar to what this community has seen in the past.

  Rise Gold plans to deposit 1000 tons of tailings and waste rock per day on the Centennial and Brunswick sites for the first 11 years. After that, the plan is to dispose of it via off-site sales. However, only waste classified as Group C can be used for engineered fill deposits or off-site sales. The more hazardous Groups A and B require special handling. The FEIR asserts that "mine materials will likely be classified as Group C", but its conclusions rely on just 11 feet of drill core samples. The mine drain is currently discharging excessive levels of arsenic. We simply do not know how much of the more hazardous Groups A and B will result.

- **Adequate provision for storage or removal of more hazardous level waste rock levels not provided.**
  The FEIR does not provide adequate provisions for the storage of the more hazardous Group A or Group B mine waste, which will be required by the Water Board. Since any

waste that is not Group C cannot be used for engineered fill or off-site sales, viable alternative strategies must be defined. The FEIR introduced a new suggestion that if the mine waste is not determined to be Group C "...the waste rock would be placed underground." Under CEQA, plans for how the management and storage of hazardous mine waste would be safely achieved must be included in the FEIR.

- **The market for off-site sales of waste rock is already saturated.**
  The FEIR does not provide adequate information regarding the viability of the plan to dispose of mine waste through off-site sales and does not have provisions for adequate on-site temporary storage or permanent disposal, leading to potentially significant impacts.

  The FEIR states that after the Centennial and Brunswick sites are full, "...hauling of engineered fill (barren rock and sand tailings) would shift entirely to be utilized in local and regional construction markets." (FEIR Page 2-59). Yet, the market demand for this mine waste (barren rock and sand tailings) has not been established.

  The FEIR notes that the Sacramento County aggregate production-construction area has less than 50% of its 50-year aggregate demand currently permitted. The FEIR then concludes "…that there is sufficient market demand for engineered fill (barren rock and sand tailings)." This is a false conclusion.

  In fact, Department of Conservation data shows that, in addition to the 327 million tons of aggregate supplies already permitted for Sacramento County, enough to meet 21 to 30 years of demand, surrounding counties have more than enough surplus aggregate to provide for the needs of Sacramento County. Placer County has more than double the estimated 50 year aggregate demand already permitted (387 million tons vs 188 million tons needed), Nevada County has 125% of the 50 year aggregate demand already permitted (52 of 41 needed), and Yuba City-Marysville has almost 200% already permitted (679 of 344 needed). [7]

  In addition, due to the potential for the occurrence of asbestos-bearing rock in the Idaho-Maryland Mine, all materials extracted from the Idaho-Maryland Mine are considered "Restricted Materials" (Draft EIR, E.2 ASUR Plan, 9.2).This requires written documentation to accompany any handling, transport and application of the materials, including testing information, amounts, dates, etc. Reportedly, area aggregate suppliers avoid using Restricted Materials because there isn't a market for them.

  A realistic analysis of the market for aggregates reveals that there are abundant aggregate supplies in the region, the aggregate market is very competitive, demand varies significantly by season, and most importantly, the mine waste is ill-suited to compete in the aggregate market.

4
Air quality impacts

Asbestos

The Idaho-Maryland Mine Final EIR does not provide enough baseline data to determine the potential impacts of airborne asbestos and plans for preventing hazardous emissions are inadequate. The unanswered questions related to exposure to this highly hazardous substance calls for denial of the Mine project.

Asbestos is a highly hazardous substance. Even minute amounts can cause lung cancer and other diseases. And Nevada County already suffers 2 times the average occurrence of lung cancer.

Very limited asbestos testing was done, constituting less than 2/10,000 of the total rock to be mined over the project lifespan. As the Air Quality Board stated: “It would be short-sighted to commit to the ASUR Plan [asbestos management plan] for the entire life of the mine based on the few samples that have been tested so far.” (FEIR Page 2-360).

The ASUR Plan fails to provide the needed protections. Under the ASUR Plan, if the asbestos concentrations on any 1000 ton lot of mined materials would put the 3-month rolling average asbestos concentration over 0.01%, it would not be allowed to be exported. The problem is, it will take 2 weeks to get results. The project and the FEIR mitigations have no provisions for temporarily stockpiling materials during this wait period.

Instead, to avoid the need for stockpiling mined materials, awaiting testing, the FEIR states that exploratory drilling tests will determine what can be mined in advance. Then grab tests will be taken as the material is loaded into silos and sent off. But the testing is too sparse. The processing of 1000 tons requires about 166 - 6 ton skip loads. This means that the grab test will only capture, on average, about 1 out of 55 skip loads, and even then, the three grab samples will be mixed together in a combined test. Even accurate sample testing before shipping will not always prevent exceeding the threshold. Examples of how this system may fail are detailed in “Mine Waste and Asbestos Impacts,” [8] showing that large quantities of mine waste could exceed the threshold and still pass through undetected.

And though the ASUR plan talks about what happens when the 0.01% threshold is detected after-the-fact, it doesn’t actually provide a credible solution or adequate oversight.

Finally, it’s important to note that ALL exported mine waste from this mine must be classified as “Restricted Materials.” (Ibid ASUR 9.2). Aggregate suppliers in the region have indicated that they do not handle Restricted Materials because there is no market for them.

In addition, the market for aggregate material is already saturated for decades to come in the Sacramento region, and the output of the mine (fine sand tailings and barren rock) would be unsuitable for most of the aggregate market in any case. This means that mine waste may not be

able to be exported, which is a critical part of the Mine plan. Placing the material back in the tunnels has been suggested which has its own water quality issues. We question the ability to mitigate asbestos impacts of the Mine at all.

In conclusion, the Final EIR does not provide adequate asbestos baseline data, and fails to adequately address the hazards of airborne asbestos in the proposed ASUR plan. Yet air quality is concluded to be a less than significant impact. We are left not understanding the amount of asbestos that we may be exposed to and where it will go if thresholds are exceeded. These unanswered questions on this extremely critical health hazard call for denial of the Mine project.

Other Air Quality Impacts.

The FEIR underestimated air quality impacts and provided inadequate mitigation measures. A project of this scale cannot be approved with questions remaining about critical air quality impacts.

The FEIR review letter by our attorneys, Shute, Mihaly and Weinberger, noted: "The DEIR recognized that the Project's operational impacts from ROG, NO_x, and PM_{10} emissions would be 'potentially significant,' based on the North Sierra Air Quality Management District's (NSAQMD) significance threshold." [9] The DEIR identified a significant impact, and then did nothing to mitigate it. And, iinexplicably claiming that construction related mitigations will impact operational air pollution impacts, the FEIR and DEIR assert that the Project's operational air quality impacts *have* been mitigated to less-than-significant levels.

"In short, the EIR relies on a single faulty legal justification to excuse itself from CEQA's basic mitigation requirements." [10] With an operational phase of close to 80 years, and a community that already is suffering from air quality that is rated "F", the FEIR should have incorporated robust and fully compliant air emissions mitigations.

The FEIR is legally deficient under CEQA. The FEIR should not be certified and the Mine project should be denied.

5

Greenhouse Gas Emission Impacts dismissed in FEIR.

The Mine is inconsistent with latest State Greenhouse Gas (GHG) thresholds and the Nevada County Energy Action Plan. The FEIR should not be certified and the Project should be denied.

- **Net Zero Threshold should have been used in EIR.**
  The Mine's GHG emissions are estimated to exceed 9000 Metric tons of Carbon Dioxide equivalent (CO2e) greenhouse gases annually, and this does not include over 4000 Metric tons emitted to manufacture the cement needed for the project operations. The Mine's energy use would be so sizable that it would completely offset the amount of residential reductions the County wants to achieve each year in its Energy Action Plan. [11]

Yet, the FEIR concludes that the Mine's GHG emission impacts will be "less than significant", using an unsupportable, obsolete threshold measure to justify its position. A valid threshold for GHG emissions was not set in the EIR. The only correct threshold – given current climate studies, CA SB-32, and today's state goals – is net zero as described below:

The Northern Sierra Air Quality Management District has not set thresholds for GHG emissions, so, as lead agency, Nevada County simply applied the 10,000 Metric ton per year carbon-dioxide emission threshold chosen by some other air districts for this project. Nevada County cannot simply assume that the justifications used by other air districts to adopt their thresholds also apply in Nevada County.

In 2015, the California Supreme Court determined that a project's GHG emissions should be evaluated based on its effect on California's efforts to meet its long-term climate goals. [12]

Then, in 2017, the California Air Quality Board Climate Change Scoping Plan stated "Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development. [13]

And in 2018, Governor Brown signed Executive Order 55-18, calling for the state to achieve carbon neutrality as soon as possible and no later than 2045, and to achieve and maintain net negative emissions thereafter. [14]

In view of this, the EIR should have established a net zero threshold for GHG emissions from the proposed project and the Mine's 9000 tons/year of emissions for 80 years should be considered significant and unmitigated.

- **The Nevada County Energy Action Plan should guide the decision on the Mine Project.**

  The Nevada County Energy Action Plan's (EAP) goal is to reduce the projected annual grid supplied electricity the county will use in 2035 by 51% and the annual natural gas use by 30% through energy efficiency measures. The mine's electricity use is equal to adding the energy use of 5,575 homes in Nevada County. This would almost eliminate the results of any energy-saving measures planned by the county.

  This project will consume 49,000 Megawatts of electricity, in direct conflict with the County's energy reduction goals. (FEIR Appendix M, p1945) The FEIR states "...although the EAP is not a Qualified GHG Emissions Reduction Plan under CEQA the project was nevertheless determined to be consistent with the EAP." (FEIR Page 2-753) This statement is essentially false.

  The Nevada County Planning Commission and the Board of Supervisors should ask the question: Are we serious about the Energy Action Plans? If so, the Mine should not be approved.

Summary

Over the past three years our organizations have worked diligently to participate in the process of reviewing and commenting on the proposal to reopen the Idaho Maryland Mine. During that time the community concern has been overwhelming:

- We have collected over 5,500 signatures in opposition to the mine.
- Scores of mine opponents have sent in letters on the DEIR and FEIR.
- Almost 500 people attended the hearing on the Draft EIR.
- Over 175 Other Voices guest editorials were printed in The Union against the Mine,
- Almost 100 County realtors have stepped forward in public opposition to the Mine.
- Over 150 additional business owners have openly opposed the mine via petition, public letter, or social media.
- SYRCL named the No Mine campaign its Activist Activity of the 2023 Wild and Scenic Film Festival.
- Our Coalition includes 25 state and local organizations.

Our community is plainly at risk from the reopening of the Idaho Maryland Mine. It threatens to change the character of the community we love. Even the flawed FEIR concludes that the Mine will have unavoidable air, traffic, and noise impacts.

Our conclusion is that reopening the Mine is not supported by a majority of Nevada County constituents. Nevada County is no longer a resource extraction county. We have shifted towards a new 21st century green economy, and our residents support this shift. Are a few jobs and uncertain tax revenue worth the risk?

We ask that the County deny the approval of the Idaho Maryland Mine Use Permit and not certify the Final Environmental Impact Report.

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jennifer Todd. I live at 14459 La Noria Ct., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My family and I are against the re-opening of the Idaho-Maryland mine, also known as the RISE Mine project. I have lived in Nevada county for 25+ years and for 6 years, I attended UNR to complete my Bachelor's and Master's Degree in Biology. I have researched the Rise Mine website and have also researched the long-term devastation caused by deep-ground mining (even if it is termed as "green gold mining"). The negative, long-term environmental consequences outweigh the positive, short-term economic benefits. I believe that the RISE firm has appealed to the community with said economic benefits. There are examples from scientifically researched and supported organizations, like safewater.org, that show deep water mining does ultimately and greatly affect the water tables of the environment. If it is not our immediate water tables that are affected (at a more shallow fractured water tables), we will be taking from some neighboring locationthat can only be determined

when the damage has been done. Mines in Arizona and Nevada can still be traced as sources draining water from areas of northern california even decades after the mines have ceased to function. If this is the case, and we deplete another community's water supply, I think it would likely be traced right back to our community if the mine is approved. We would be economically responsible for restoring water should we be responsible for depleting neighboring water supplies. I also feel that the RISE website appeals to the community because of LIP SERVICE. The statements are not scientifically supported, or they have kept their sources a secret which contadicts the importance of having proper research to back facts up in the first place. RISE uses misleading verbiage and notions to suggest that they would positively benefit our community via employment opportunities. The RISE company has been inconsistent about the selection of employees. They haven't clearly specified if these employees would be local because the company states that some employees would be temporarily moved to our community to work on the mine. They have claimed that they will provide hundreds of local jobs, and restated that that many of these jobs are implied local business hires because of the influx of cash flow at local businesses. This is a contradiction to what they have said about hiring locally. If the hired workers already live locally then they already use community services. So where would this new revenue be coming from? They are either not hiring locally or they will not generate new revenue locally, which one is it? Let's not be hoodwinked by superficial jargon and deceptive information. There is a reason that a corporation with an unpleasant history (abandonment of job site cleanup and neglect for environment) is trying to establish temporarily here, ruse our community, and expend our land. When things sound too good to be true, they typically are. There is no such thing as an environmentally friendly way to do a large mine operation. My last thought is in regard to the deep ore that RISE claims will be removed from the ground and used for development of land surrounding the mining site. The breaking up of this solid ore means crushing and releasing other contaminents in the ground. The solid ore that is broken up to be brought out of the deep mining sight contains elements that when exposed to oxygen release contaminants into our environment. We might not see the effects of these harmful contaminants on a short-term time scale. RISE claims that extra waste will be cleaned up by third party industries, but they have not specified where the waste ends up, who these companies are, and if disposal of the contaminated material is even possible. Perhaps 10 years down the line, we will be experiencing irrepairable damage visible by the absence of insect and animal life in the community. We will have to wonder how to explain to our children and their children why the land and water is unusable, or why it is hard to find insects or birds in our area. We will have

to reflect on the forgotten few years of supposed financial gain and wonder if it was worth the tradeoff. The long-term effects of mining are what really need to be considered. For our community, reopening one of CA's largest gold mines could be the worst path possible. Please DO NOT approve this mine oppereation.
Thank you for your time.

Sincerely,

Jennifer Todd

Nevada City, CA 95959

RE: SAY NO to the Idaho-Maryland Mine

Dear Nevada County Board of Supervisors,

We are writing to urge you to say NO to the reopening of the Idaho-Maryland Mine.

Since 2019, when Rise Gold submitted a project description to reopen the Idaho-Maryland Mine, we have been deeply invested in understanding this project for impacts to our community. **We have concluded that the reopening of the Idaho-Maryland Mine poses a significant environmental threat to the Yuba River watershed and to our community as a whole.**

We are deeply concerned that, should the Idaho-Maryland Mine reopen, mining operations would pollute our waterways, dewater groundwater, dry up private wells already impacted by drought, and degrade wildlife habitat. Hundreds of nearby private wells are at risk of failing or becoming contaminated, acres of woodlands, grasslands and other critical habitat will be destroyed, and millions of gallons of wastewater will be released into waterways if this project moves forward.

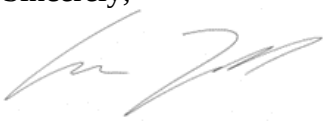
Legacy mining also poses serious health impacts, exposing the community to heavy metals such as arsenic and mercury, as well as greenhouse gas emissions. Mining operations will occur 24 hours a day, 7 days a week and produce 9,000 metric tons of greenhouse gas emissions per year. This massive increase in greenhouse gases will further degrade air quality in a community already suffering from smoke pollution due to extended wildfire seasons and climate change. In addition to posing a threat to the Nisenan Tribe's tribal and cultural resources, the 1,500 tons of waste rock and tailings processed daily from the mine will further degrade the environment.

In addition to these environmental impacts, we are also concerned about the effects the mine will have on community culture and tourism. Businesses and residents from all walks of life overwhelmingly agree that a toxic mine in the middle of our vibrant community is reckless and a huge step backwards – it's simply not worth the risk.

We are looking to the Nevada County Board of Supervisors to reject the Idaho-Maryland Mine and to <u>protect our water, air and quality of life.</u>

Please say NO to the reopening of the Idaho-Maryland Mine when the project comes before you for consideration.

Sincerely,



Aaron Zettler-Mann
Interim Executive Director & Watershed Science Director
South Yuba River Citizens League

Individual Petition Comments:

Kimberly Acuna: I'm against the reopening of this mine. I'm a property owner and a permanently disabled person. The ramifications of this would create a hardship for me. Please do NOT open that mine.

Barbara Agrimonti: I say no! Protect our air and water quality and our local business!

Peter Alsing: Please do the right thing and do NOT allow the reopening of this mine which would cause so much harm to the people of our community and the environment.

Colin Arisman: Please make sure this destructive mine is not allowed to open.

Ben Arnoldy: Grass Valley and Nevada City have long ago diversified off mining to tourism and the arts. The environmental damage, risk to drinking water, threat to Native cultural resources, and noise are incompatible with this region's modern identity.

Annika Artle: This mine is an unacceptable addition to Nevada County. The Yuba River is a true gem, we cannot risk the effects of a toxic mine.

Beau Askew: Thank you, next!

Dorian Askew: It's 2023. We prioritize quality of life and the future of the planet now. Be the future.

Grace Austermiller: This mine is bad for the environment and bad for our health. We don't want it.

Barry Bailey: Nothing about this project seems above board from the horrific record of this company in the past to the future destruction of this beautiful area...I say NO MINE!

James Bair: I am working full time to present evidence that the Mine would be unacceptable in our County.

Michael Bankston: Reopening this mine is a terrible idea.

Leita Barlow: The negative effects for the community far outweigh any small gains for a few.

Erin Bassie: I can't believe people are trying to reopen this toxic mine. Don't pollute my community, my home.

Carolyn Battaini: With all the information about the harmful human & environmental effects of mining, how can the BOS approve this? Who do they represent? The vote should be for their constituents, the environment of Nevada County and the waterways that flow to the ocean. Vote this down!!!!!!!

Steve Bauhs: History makes it CRYSTAL clear, the mine is VERY bad idea.

Ken Bebensee Water and quality of life is more important than gold.

Nicolette Beebe-Renoir: No mine! Protect our flora, fauna and wells!

Diana Behn: We need our supervisors to step up and vote no for on reopening the Idaho-Maryland Mine. It's just not worth the risk to our beautiful communities and folks that live here. Rise-Gold has no track record of being successful at such an endeavor. They are completely underfunded to take on the task and guarantee our community against future mishaps. Where do you think they will be after even 30 years let alone 80?

Matty Behr: A mine in Nevada county? I know it seems like our country is backwards currently but this is irreversible damage to our land, air, water! WAKE UP!

Mara Belzer Can we please be done with this! It only benefits a small few while destroying the lives and health of everyone close by.

Steve Benoit: No on the mining in my community.

Kian Berreman: The harm to air quality will affect our local community for years to come. A few will get rich and many will feel the negative affects of the mine.

DennisBertaccini: Mining is our past, not our future. There are far too many negatives than positives with this project! BOS, please, please say NO!

David Bess: If passed, the Rise Gold mining effort would endanger our water and air quality and would make the whole area un-attractive to tourism.

Jude Bischoff: This mind will destroy our quiet rural community with noise and pollution.

Beverly Blake: I am a Realtor. The mine will destroy all our property values, not just in Grass Valley!

Patricia Boehle: Opening the mine is a disastrous idea and will only bring health hazards to our beautiful county. Not to mention we should not be doing business wit someone who is still in court in Canada.

Rebecca Bone: As a community Nevada City/Grass Valley has shown progressive thinking and action for many years with regards to protecting our environment and watershed. The formation of SYRCL and their protection of the South Yuba is just one small example. I urge you as the board of supervisors to continue this lineage of protection of our resources by saying NO to the reopening of the Idaho Maryland mine.

William Brady: Going forward into climate change, our air and water quality already face many challenges. To add an additional source of pollution to these challenges would further jeopardize the quality of life we bequeath to our community's future generations.

Tim Brennan: Don't ruin our county! No mine!

Peter Brewer: Please do not be taken in by these demonstrated scoundrels.

Kimberly Brickei: Why would it be a good idea to contract with a company whos owner is already being sued for misconduct at another mine in another area?! It makes zero sense to me that we even need to petition such an idiotic plan in the first place! It shouldn't even be being considered!

Anthony Brillante: This will be detrimental to the community as a whole. The risk isn't worth the reward.

Maria Brillante: I am strongly opposed to the reopening of the Idaho-Maryland mine.

Charles Brock: Mine is: 1. applying for a zoning change to allow them to increase height limits from 45 to 165. Project does not comply w/County General Plan. 2. Requesting removal of a 200 building setback (400 swath) from an earthquake fault line the runs right thru the middle of the main mine building site. 3. There's more if you've read this far please attend the upcoming Planning Commission and Bd of Supervisors meetings to spark in opposition to the mine.

Adam Broner: As a resident of Washington Ridge, and a neighbor of a now-closed mine, I have become aware of the devastating impact of mining on our land, waterways and heritage to those who follow. There is more gold to be found in the hearts of our children than could ever be mined from the earth.

Lindsay Brooke: I cannot think of one good reason to open the Rise Gold mine in the Grass Valley area. From all I've learned about it, it would in my opinion, be an environmental nightmare, of no real economic plus to our community, reduce land values and create more social problems!!! Please, Please, Please, JUST SAY NO TO THIS INSANE PROJECT!!! you have the power to destroy our way of life for 80 years... Think deeply about how you will vote!!! I do not believe the majority of the member of the community want this!!!

Daniel Buckley: We need water way more than we need gold

Betsy Bultema: Please say no to re-opening the Idaho Maryland mine. Let's pursue a more future minded, sustainable approach to creating job opportunities in our community. This mine will not bring long term economic sustainability to our community and approving it will only cost our community its health in the long term.

Camilla Burke: Please act in the best interest of all your constituents by saying no to the Idaho Maryland Mine. Thank you!

Peter Burnes: You mitigate a bad idea. The mine is a bad idea!

Jennifer Burt: Terrible project for the community and local quality of life. Terrible project for the environment. Terrible project for groundwater and water quality. Don't be fooled by Rise Gold's propaganda and inaccurate environmental documentation, nothing good would come out of approving this project.

Krista Busselle: No to the mine! No to the environmental impacts! Gold is not worth the health of the people in this community!

John C: No I-M Mine equals cleaner air, usable wells for residents, much less industrial noise, and more peace of mind for everyone countywide.

Christy Canale: Dear Nevada County Board of Supervisors, We are writing to urge you to say NO to the reopening of the Idaho-Maryland Mine. Since 2019, when Rise Gold submitted a project description to reopen the Idaho-Maryland Mine, we have been deeply invested in understanding this project for impacts to our community. We have concluded that the reopening of the Idaho-Maryland Mine poses a significant environmental threat to the Yuba River watershed and to our community as a whole. We are deeply concerned that, should the Idaho-Maryland Mine reopen, mining operations would pollute our waterways, dewater groundwater, dry up private wells already impacted by drought, and degrade wildlife habitat. Hundreds of nearby private wells are at risk of failing or becoming contaminated, acres of woodlands, grasslands and other critical habitat will be destroyed, and millions of gallons of wastewater will be released into waterways if this project continues.

Kimberly Carlsen: No mine! Let's not go back in time. Let's not add the environmental hazards, let's not dramatically reduce our property values. Let's keep Nevada County clean and green!!

Chris Carpenter: Our community values water over gold. No mine please.

Janette Carpenter: Absolutely not! Our air is already terrible! Grade F. We are in a drought! I have asthma and only developed it loving on Nevada county for 10 years. And sinus infections too! I don't want to die from the worse air of mine was here. I am an ENT doctor and surgeon. Too many people here have terrible sinus and allergies and asthma. We don't need more. We don't need dry wells. We have NOT ENOUGH water in California. This is a terrible idea for a drought laden county. And I do not want to destroy the Bear River. Nor does our community need to expose our citizens to toxic air, arsenic, mercury poisoning. We don't need to have trucks 24/7 w noise pollution which is associated with stress, depression, anxiety, insomnia. Nor do we need to co tribute to more CO2 in our local (and worldly) air. The CEQA requires carbon neutral and this is NOT!!! Please do not even think the tax dollars will be close to worth it. You'll end making us all suffer and end up spending more money on clean up.
Jeff Carver there is no good to come from this mine.

Nancy Cattaneo: We are all watching this board to see if you vote in the interest of our environment or in your own interest. We don't want or need jobs that take water from our children and ruin their future

Bethany Celio: Please say no to the mine! This is not the kind of future we want to see for our community. We want to preserve our environment and focus on enhancing the local economy. Not to mention, Rise Gold's track record shows that they will not be responsible stewards of the land or responsible business partners. The future we want is sustainable, it's local, and it's built on respect for land and each other. Sincerely, Bethany Celio

Marlee Chamberlin: NO MINE

Grace Christal: We need to protect our water. Fire is an all high concern. We can't be wasting water to run this mine. Not to add that it's going to pollute our environment.

Ellen Clephane: On every level, the mine would be a disaster. Please, please, please vote NO to the mine. Preserve our precious, peaceful, beautiful community.

Jack Clute: Add my name to those that opposes the Rise gold mine.

David Cooper: It's morally irresponsible to allow this company who has a track record of polluting ground water in other communities to even think of coming into our community and putting our clean water in jeopardy. Providing jobs are important but no job is worth risking the safety or health for our children and children's children to make another man's company richer. Please do the right thing for the greater good of our community supervisors and don't allow the reopening of this mine to profit a company who could care less about our peoples well being and place we call home. Thank you.

Mary Cooper: We should be moving forward and taking steps to protect our environment not causing further harm to it. Re-opening this mine is counterproductive to those efforts and should be stopped now.

Matthew Coulter: The South Fork of Wolf Creek is an incredible tributary. Save It ! I can't believe we're even considering this disastrous greed to re-root. Our Toxic Legacy Mining of Nevada County California.

Caroline Courtright: No to the mine application. The EIR is inadequate and inconsistent with both Grass Valley's and the county's land use plans. The Eir omits plans to clean up the Centennial site. Rise intends to dump mine waste there for about 5 years, but the clean up has not been done. This final eir is inadequate according to CEQA.

Sandra Creighton: BOS: Say NO to the reopening of Idaho-Maryland Mine.

James Crowley: How are we having this conversation in 2023?

Andre Cuellar-Nelson: Please vote to not allow the mine to go forward.

Deborah Curtis: Please say NO to the mine.

Rob Cutuli: Stop the insanity! Protect our beautiful city.

Susan Cutuli: Stop this disaster. This company is corrupt.

Djuni Dadon: No to the mine!!

Keri Dahlstrom: The mine will not support our changing water tables and high fire conditions

Keith Dailey: No mine! This mine would destroy quality of life for my community

David Dalzell: Keep our water clean. Keep your greedy selfs out of our neighborhoods and leave the gold where it belongs!

Daniel Desmond: It will degrade the environment and community.

Sandy Devine: Mining pollution is bad for children and other living things.

Melanie Dixon: Keeping our community mine-free protects our health, our environment, our dignity as people who steward the land and the future. Keeping our community mine-free shows our respect for the Nevada City Rancheria Nisenan Tribe, whose way of life was brutalized by the Gold Rush. Keeping our community mine-free means we have learned from the past and that in our collective wisdom, we are creating a sustainable, healthy environment for ourselves, our ecosystem and our coming generations.

Annemarie Dompe: The waters underground that our wells draw from, the waters of the Yuba that we slip into on a sweltering day in summer, the water that moves through our bodies without which we cannot live: all are connected, and all are to be cherished, tended, and protected.

Karen Donaldson: This will never be a good idea. We must absolutely refuse to allow this mine to go through. The risk is just too great.

Brian Donovan: Get gold from the landfill instead!

Katherine Dorsch: We must preserve the environmental integrity of our beloved Nevada County for our children and grandchildren!

Kathy Doty: I find that to discuss this mine, and especially Rise Gold, an incredibly irresponsible company who is currently in court in British Columbia for leaving a toxic waste dump, would jeopardize our air quality, water, and air pollution, (not to mention asbestos and other toxic substances, is horribly irresponsible to even have our board of Supervisors to even consider this!!! Why would any member allow an 80 year lease with all the damages to our way of life here in our beloved foothills???

Anita DuPratt: TRAFFIC ON HWY 49 WILL BE HORRIFIC. We will no longer be the scenic tourist area that we covet.

Nancy Eadington: Not in Our Hometown.

Sam Echeverria: Protect the land, our environment, and our health!

John Egan: No Crooked Canadian Miners Allowed!

Dean Endress: NO to the Idaho- Maryland mine!! Stop destroying the environment for greedy corporations!!

Laurel Evans: Please say no to reopening the Idaho-Maryland mine.

Gwen Eymann: Please do not let this mine happen. I strongly believe it does not serve our community well.

Monica Farbiarz: It is critical that we stand by the side of nature and the well-being of all people, animals and trees. After witnessing what has been the impact of these kind of projects in the past we need to really see things for what they are, for the protection f our community, the future of the next generations and our planet. Please every small action based on greed in the name of development, will affect us all! With love and light Monica

Charles Farrar: Why despoil our beautiful community for so few jobs to allow profits to be made by absentee owners who can simply bankrupt and leave town when it makes economic sense to them to do so? These promoters are known scam artists. Please say No!

Suzanne Fellows: Vote no to opening the mine!

Kathleen Fenton: The Idaho-Maryland Mine poses an obvious and enormous toxic threat to our community. The Board of Supervisors must do its job and protect our environment and quality of life by voting it down.

Suzanne Ferroggiaro: Former 15-year Grass Valley resident, long time & current SYRCL member, current Wolf Creek Community Alliance member.

Nancy Finlay: I ask the Nevada County Board of Supervisors to reject the polluting gold mine. Let's move our county forward toward health and prosperity!

Fred Finney: No Mine, lots of potential for future environmental & financial disasters for Nevada County, The reward is not worth the risks.

Magdalene Florence: As my elected representatives, I urge you to deny the opening of this mine for the safety and health of our community.

Lynn Forbes: A mine makes absolutely no sense at this time in the history of Nevada County - who has suffered enough from the aftermath of mining - climate change, geopolitics and economic realities.

Cindy Foxfoot: I'm very concerned about the health hazards associated with the mine activity. I am a cancer survivor and do not approve of the mine.

Lana Dakota Fredrickson: No. No. No. The mine is not a potential benefit to our community!

Shirley Freriks: I want to keep our community vibrant and gentle - no big industry! Please!

Mara Fuller: Don't destroy the epically beautiful tourist-outdoor destination towns of Nevada City and Grass Valley to turn them into dirty, polluted, toxic mining towns for a few measly itinerate jobs. The people, the nature, the animals that already live here are worth more!

Kate Gazzo: The precautionary principle states that even when a small amount of risk is present when the stakes are high, to avoid the risk entirely. Even with a low chance of environmental risk, do we want to gamble our water supply, tourism economy, and land values for a bit of gold?

Galen Gentry: I oppose the mine!

Patty Glikbarg: Definitely NO!

Mary Good: I urge you to recognize and uphold the value of our beloved foothills to homeowners who've chosen to live in nature, and to tourists who flock here to bask in nature. Please do not allow this Mine to despoil the beauty that is the essence of Grass Valley.

Diane Gould: The mine will only hurt our county.

McKenzie Grandas: NO To the mine! - McKenzie Jo Grandas

Laura Gravelle: It is clear this community does not want this mine. The environmental impact study is riddled with inaccurate claims and faulty analysis. Please listen to the community and do not approve this project.

Joy Gray: No mine please. Not worth it!

Jaya Green: As a native who grew up near proposed mine I do not support it's re opening especially to a foreign company with a poor track record!

Morgan Greenwood: I say no to reopening the Idaho-Maryland Mine! This is a threat to the community and while the mining company says it will be a 'green' mine, there is no such thing. They will be threatening the health of the community and will be impacting the air and water for generations. Mining is outdated and should not be allowed in communities!

Delphine Griffith: Reopening the mine would be one of the most disastrous decisions for our communities, our watersheds, and ecosystems! No to the Idaho Maryland Mine!

Gary Griffith: No mine. It's dangerous, damaging to our quality of life, and incompatible with our community. Mining is history. Let's keep it that way.

Corry Guinn: Please, no mine opening.

Jason Hacche: Protect Grass Valley!

Michelle Hamil: Just say NO to reopening the Idaho-Maryland mine. Vote for clean water. Vote with a concern for the totality of all living things in our home. Vote to repair and restore the sins of the Gold Era, not revive and relive them. Vote NO.

Fraser Hardie: No mine. The people behind this venture have a terrible history and still facing charges for previous environmental violations. Water is too precious in this community. The risks are too great for the profit of so few. Do the right thing and Stop this mine.

Maureen Hardy: I object to the reopening of this mine. Mining is toxic and will degrade this beautiful area. As a longtime visitor I am opposed to it

Amy Harper: NO MINE!

Kyle Hedrick: Protect our water.

Lorraine Hendriksen: This would be a devastating mistake for our community and land. Absolutely NO MINE!

Chris Hendriksen: NO.

Declan Hickey: Say NO.

Roger Hicks: We need clean water and a livable community- that's the real gold.

Camen Hodges: The mine should stay in the romantic past, not in the present.

Ella Hodorowski: PROTECT OUR AIR, WATER, AND QUALITY OF LIFE!!

Allison Hogue: Please no mine, put small town would turn into an environmental disaster. Born and raised in Grass Valley, I've been around the history of mining, seeing the devastating effects. Pollutes top soil and ground water to be exact. We don't need this, and don't want it. Please say no.

Todd Hoida: The known potential to ruin our environment and water is not worth any financial gain. NO Please!

Edson Holmes: We get lots of bad air days already from the pollution blowing up here from our neighbors to the west, can we afford to have tons more added on a daily basis? I would like to continue to breath without needing a mask most of the time!

Wally Holtan: There is no justification for opening a mine that will cause pollution and contaminate our environment.

Robert Hubbard: A mine in the middle of a residential neighborhood??? Nonsense!!!

Jeffrey Hunt: I totally agree that the re-opening of the Idaho-Maryland Mine would categorically be a catastrophic mistake. Please vote no on the proposed re-opening of this mine Thank you, Jeff Hunt.

April Hyde: Heck no!!! Forget about it.

Susan Iversen: The proposed project Rise Gold wants to impose would create the worst possible future for our community on every level. Common sense and past experience indicate that turning down this proposal will keep this area from certain damage due to mining that cannot be undone. Protect our residential and tourist community from this sure threat.

Bill Jacobson: NO MINE!

Lore James: The future of Grass Valley should not be placed in the hands of a for-profit company that is not local. Rise Gold is not in This to make our town better, don't believe their lies and false promises.

Kelly Janes: Born and raised in Nevada City, this is an incredibly important and special place for me. I am also a water resource planner with USACE and as such it is my professional opinion. That the risks to the watershed and the environment and well as the social values of the community and the indigenous stewards are to great to support this regressive plan. The potential economic do not come close to outweighing the risks.

Karen Jarvis: I say No Mine !!!!!!!!

Eileen Jorgensen: Mining has already scared our community...never mine again!

Lin Jovanovic: We need clean energy, not more toxic mines. We need the leadership of the Nevada County Board of Supervisors to say NO!

Allison Kalt: F*ck the mine

Beth Karow: NO MINE!!!!

Danielle Keiser: Keep nature the way it was intended.

Emma Kelly: This land has been through enough already.

Darlene Kemens: I am looking to the Nevada County Board of Supervisors to reject the Idaho-Maryland Mine and to protect our water, air and quality of life. Please say NO to the reopening of the Idaho-Maryland Mine when the project comes before you for consideration.

Janie Kesselman: Opening this mine will have dire consequences to availability and purity of our drinking water. There will be 24-hour noise pollution, and other toxic consequences. Don't do it!

Joan Keyes: This mine would be a disaster for our community, both financially for the city and its residents and for the environment. Please say NO.

Amy Kiene: Please don't put the air, water, and health of this community at risk.

Natalie Kilmer: We need to protect the water for generations to come.

David Kimmel: This mine is bad for the community. Most of the profits will leave the community. The damage will stay here. Please vote no.

Matt Kimura: Please stop this mine! Matt Kimura

Mykola Kindrat: No Mine! No Way!

Kim King: I can hardly believe that the Board of Supervisors is even considering this horrific proposal.

Kevin Kingma: A big corporate mine in a vital watershed -- what could possibly go wrong -- and be unrepairable.

Melanie Kisler: I just moved down south but while I was up in Sacramento the yuba river was one of my favorite places to swim. I couldn't bear it if that amazing little swimming hole was harmed.

Kasandra Klassy: I appreciate all the work everyone is doing on this!

Janice Knight: Our community will be suffer irreparable harm if the mine is allowed to proceed. We don't need the noise, pollution, decrease in property values etc. at the hands of a company that left the last community worse off after they set up a mine. Just vote no.

Danielle Krauss: As a member of this community, I firmly stand AGAINST the reopening of this mine. It is outrageous to consider ever again putting outside shareholder perceived profits of gold over the environmental well-being and health of our community. We are still suffering and dealing will destructive & toxic ramifications of mining in this area from over a century ago, and if anything is clear it is that this proposed mining operation will have a significant negative unknown impact on those that live in this community for the next century to come. Do not make a mess of this, you have a chance to stand on the right side of local community and history in protecting the town and its inhabitants from further outside corporate greed. NO to this mine!!!!

Barbara Kroczak: Please do not ruin this lovely quiet town.

Charles LaCivita: Waste of time and money. A real danger to people and the environment.

Lauren Lauria: Bringing back this toxic industry would destroy our towns and drive residents out of the area. It would cost the county and citizens millions when the mine fails and their ceo violates terms, as he did before.

Tony Lauria: Stop this horrible plan to destroy our county! Mining in a densely populated area is a recipe for total disaster and tens of millions in damage costs to the county and community. Never allow the zoning to be changed. Permanently stop this from ever being proposed again.

Bill Lawrence: Gold mining may have been our past, but it is not the present, nor should it be in the future of Grass Valley. The reopening of the Idaho Maryland mine is just too close to town.

Frank Lawrence: This proposed mine project is a disaster on every level. It will damage our health, environment, tourist economy, housing market, and quality of life. Supervisors, vote no!

Karen Lian: Those of us with wells are so concerned about the effect this will have on our water. We have seen what's happened before with unsafe projects. Do not risk our health and water supply. No mine.

Lilliana Libecki: mines are poopy

Maria Lievano: The threat this mine poses to the Yuba River watershed cannot be tolerated.

Sharon Lipski: The reopening of the mine would cause environmental devastation now and for generations to come. We should have a commitment to the earth to protect it, sustain it, and live in harmony with for all it's gifts it brings to us gratitude not destruction.

Margaret Little: Please do all you can on behalf of all Nevada County residents to defeat the reopening of the Idaho Maryland Mine. I have read through available reports and attended an informational meeting hosted by experts in several pertinent fields. I can not endorse this project and ask you as our elected officials to vote it down. Thank you Margaret Little

Debra Little: The water issue alone is enough to immediately stop any further consideration - a deal killer.

Jess Litton: Can't believe we're still not seeing how we affect this planet, with our actions and greed. We must do better for the next 7 generations.

Heather Llewellyn: Why create an industrial disaster in a beautiful community for the sake of gold jewelry collectors and mining shareholders? Yes, gold's main value is in jewelry and for those holding shares in mines. It appears the company at stake has a truly terrible reputation for lying and for leaving rural communities holding the environmental disaster clean-up bag (could the community afford to pursue them for a breach of contract?) Any tax revenue earned will not be nearly enough to offset the negative effects on our watershed, our property values, air quality and the quiet beauty of our rural community. It's hard to believe that local officials are even considering inviting industrial poison and noise and air pollution in. Our watersheds haven't recovered from the previous bout of mining a century ago. The drop in property values alone will make us the laughingstock of the Western Sierra. Gold mining is our past, not our present or our future.

Catherine Lofgren: Opening a mine in this day and age is simply nuts. Additionally, this company has a reputation for walking away when things go badly, rather than fixing what they've broken.

Michaelyn Logue: No mine or no Peace of mind.

Tess Lotter: Protect our precious water and beautiful land and say no to the mine!

Tamara Luckinbill: Not opening this mine with this company in this area is a no brainer. Protect our resources. Clean air. Clean water. Clean noise please!!!

Richard Mallamo: This project does nothing positive for Grass Valley, it only enriches a few scam artists in Canada. No on the Idaho Maryland Mine!

Emily Mallonee: We do not want the Idaho-Maryland mine in our backyard !!

Lee Margadant: There is no way that we can continue to make the same mistakes from our past and expect different results. Mining can only cause negative effects to the environment.

Morga Margulies: Stop degenerative extraction on our sacred lands!!!

Beverly Martling: This mine reopening goes against everything we love about our community. It makes a mockery of our Wild and Scenic Festival. NO to the reopening of the Idaho Maryland Mine.

Marika McGraw: It will ruin the city's desirability charm and environment. Not the mention property values.

Tiffany McGuckin: No Mine

Liam McInerney: This will be a giant step backwards in all of the efforts to clean our water that was poisoned by mining during the 19th and 20th centuries. A slap in the face to the communities in these areas just so that a few rich people can get slightly richer. Any so called benefits from employment opportunities by these mining companies will be negated by the long term health impacts.

Kathleen McKeough: Given the precarious state of our climate and widespread environmental degradation, I think we need to switch from assessing projects primarily on their risks to assessing whether a project restores, regenerates, or maintains environmental quality as one of the benchmarks for approval. It would take a lot of projects off the table that we currently have to fight and allow more focus, energy and momentum for projects that move us in the direction that we truly need to go in our relationship with the environment at this time.

Theresa McLain-Musser: We need clean air and water more than shiny gold! Do what is right for the community that you represent and vote no!

Mary Menconi: I don't trust Rise Gold, the CEO has a history of not complying with environmental laws. The mine is not appropriate for our area now, too many people here.

Scott Merritt: Please, NO mine opening.

Luke Mertens: No mine please.

Keiko Mertz: This community is already facing impacts of legacy mining - poisoned water, neurological disease, ruined landscapes, and erasure of Nisenan history. Let's move beyond the area of resource extraction and toward the era of resource stewardship. This mine will further the housing crisis in the County and funnel money to Wall Street. NO MINE.

Chris Metzler: Avoid the mine.

Tom Milam: Gold is more valuable left in the Earth!

Steven Millard: Reopening this long shuttered mine is a horrible idea wrapped in a Pandora's box of what ifs. A gamble that would bankrupt the county if any number of things go wrong & with a CEO who

has proven himself as a failure to operate his mine projects in his recent past polluting a river in an unpopulated area & being barred from doing business in Canada. Grass Valley has become a retirement community where residents have invested their life savings in their properties & would be devastated morally & financially should this unwise venture go in the direction of his last mine & let's not forget that he did not report mine spillage into the river & never came clean about his bad decisions. He even retaliated against his employees for doing their jobs in reporting conditions to the overseeing body & its officials. How many failures does it take for you to reject this proposal. For every positive listed in the DEIR there have been contrary opinions by experts who have examined it.

William B Miller: Strongly opposed to mine, based on public health and quality of life concerns!

Jaede Miloslavich: Protect our county from foreign companies profiting from environmental destruction.

Elaine Moe: Absolutely NO MINE FOR THE LOVE OF OUR HOME

Summer Moe: No Mine! It would be a travesty upon our home here in Nevada County. Poisoning our environment, our bodies, not to mention all the undesirable and harmful road traffic in our residential neighborhoods. Disturbing the peace on every level. No Mine! It's an obvious choice if you care!

Martin Montejano: No mine!

Elizabeth Montejano: No mine!

George Morgan: The reopening of the Idaho Maryland Mine would be a complete disaster for Nevada County for may ways that this petition outlines. How it got this far in the planning commission, EIR and board of supervisors is a complete mystery. A very large majority of Nevada County residences are completely opposed to this insane proposal. Vote it down and take action so that no other charlatan can come to our beautiful community and destroy our way of life.

Natalie: No way should we continue to destroy the environment so some lame corporation can get rich.

Martha Naythons: Reopening the mine will have disastrous consequences for all of us. Please do the right thing and do not let this move forward.

Graham Nelson: NO!

Daniel Netherby: We are still recovering from the last gold rush.

Michelle Newbon: Absolutely, unequivocally, No!

Robin Nichols: Yes, mining is a part of out past. But so is slavery. Lets keep both in the past and learn from history rather than repeating our mistakes. There are numerous contaminated sites and streams, sink holes and other fallouts from mining in our area. The Idaho Maryland Mine is in a residential neighborhood, not an industrialized area. Both EIRs, the Environmental and Economic Impact Reports contain conclusions based upon insufficient or skewed data. For example, the 3 mine sites chosen as comparable sites with regard to their impact on neighborhood properties and property values are not in

comparable neighborhoods. Also, because our wells are fed by underground streams rather than water tables, there is no way to monitor the impact of dewatering the mine simply by sampling wells on the mining property, or even in the general vicinity of the mine. If you dam or divert water upstream, all water downstream is affected. This is as true for underground streams as for surface rivers.

Mariana Nielsen: Environmental, traffic, and tourism CATASTROPHE all for people outside of our county to make money. We will end up paying the clean up costs as always for these projects.

Bob Norman: I'm a tour guild at Empire Mine Horrible process I can't even believe it's even being considered.

Heather Normandale: In previously lived up in that beautiful area and want to support efforts to oppose destructive mining projects.

Tim Ogburn: Preserve our future. Stop the mine.

George Olive III: A community with a gorgeous watershed and all its creeks and creatures is NO place for an active gold mine.

Happy Om: After decades of work to clean up the mining impacts in Nevada County, we are not letting another mine happen in our town. Start packing your bags sooner than later.

Donna Omo: The environmental dangers and health risks inherent in this 19th century project so greatly outweigh the limited positives it seems absurdly obvious that it should never happen.

Bruce: Orinstein: The mine is not safe for residents and the environment, so please vote no on the mine.

Sara Orrick: As a former Nevada County resident and a current volunteer for SYRCL, I visit Nevada City, Grass Valley and surrounding area regularly (spending plenty of money at local businesses). Please don't let corruption and recklessness ruin this beautiful place.

Matthew Osypowski: No no no. Awful idea.

Renate Otto: No Mine = No Shaft!

Geoffrey Panek: I do not want a mine destroying the beauty and environment of the Grass Valley/Nevada City area.

Micah Panzich: I am writing to urge you to say NO to the reopening of the Idaho-Maryland Mine.

Landon Parker: I am deeply concerned that, should the Idaho-Maryland Mine reopen, mining operations would pollute our waterways, dewater groundwater, dry up private wells already impacted by drought, and degrade wildlife habitat. Hundreds of nearby private wells are at risk of failing or becoming contaminated, acres of woodlands, grasslands and other critical habitat will be destroyed, and millions of gallons of wastewater will be released into waterways if this project moves forward.

Andria Parker: Our community is in the heart of natural beauty, filling our lives with joy from being here. Why has this mine project even been considered by our community and it's stewards, when mining is know to be one of the most destructive and polluting business? If we follow what is best by the guide of our heart, and our desires to sustainably direct the future for our region and our planet, then there will be no mine. There are mis-truths behind the persuasions of pro mine advocates, forming a destructive influence to the way of life as we know it in Nevada County.

Jim Partidos: Stop the mine! It will ruin Nevada City, Grass Valley, our natural resources, and all of what we who live here enjoy.

Mike Pasner: This mine is a looser for our community in many ways!

Yara Pasner: This mine is a terrible idea!!

Barbara Perkins: NO MINE!

Wolfgang Perner: There are still environmental issues from mining affecting wells, creeks and tailings from over 100 years ago . It is irresponsible to allow a company that has a terrible record and reputation from Canada to jeopardize our health and tranquility for the profit of their shareholders.

Sandra Petersen: We do NOT want to reintroduce mining to Nevada county!! Pollution, noise, overdevelopment are all very concerning!!!

Patricia Phillips: I live close to the mine and will be directly impacted by their noise and pollution on my street. Also as a member of this community all of the negative impacts will effect me and my family. NO TO THE MINE.

Lorrie Poch: We don't need this in Nevada County!

Janice Polucha: Say NO to the Mine

Janice Powers: No real good will come from this in the long run. It's been done before, we know the destruction and modern technology won't change that.

Kaitlin Purvis: Please do not reopen the mine. It's not necessary and it'll just cause horrific damage to the environment as well as negatively impact our residents.

Robert Purvis: I firmly believe the catastrophic nature of mineral extraction far outweighs any potential economic experiences. Resuming mining operations in this region would only serve to further pollute our water ways and other natural resources.

Jeffrey Rassier: Please don't pollute the environment of grass valley so that a corrupt company from outside our country can profit. We all know how this ends. Will greed make the city of grass valley look the other way?

Gary Reedy: Just say NO.

Mark Reilly: The environmentally destructive days of mining in our area have passed. Don't allow a foreign based company, whose leadership has a failed track record, open the mine for their profit and our demise. Grass Valley and Nevada County deserve better.

Ronit Rieser: Let the land recover!

Catherine Roberts: Environmental disaster brought to you by scammer businessmen.

Jake Robinson: No to Idaho Maryland Mine. Preserve the water table, wildlife, plant life and small town infrastructure. No to the Crook trying to exploit Nevada County.

Karl Ronning: No mine!

Roland Rouda: Honestly, I don't understand how the Board of Supervisors, with any unassailable integrity and commitment toward preserving the well-being of our community, could condone this project.

Brittany Roussel: Do not pollute our waters!

Paula Routh: I do not believe this mine will provide the jobs as promised. More importantly, I believe reactivating the mine will harm the environment, our water and quality of life.

Steven Rugge: Water is more precious than gold these days. Let's not flush 3 million gallons a day of our ground water away, just so a few people can make some money from the gold.

Cheri Russell: NO MINE!

Andrew Rust: Quality of life does not include a working mine.

Jessica Rutherford: I've been a resident of Nevada County since 1983. I am a therapist and work and own a home near downtown Grass Valley. I am very opposed to bringing this destructive unsustainable environmentally unsound project to our community.

Pete Sabey: Only way this misbegotten project could be approved would be through stupidity or corruption. I hope I am not overestimating the intelligence and integrity of County Supervisors in assuming a firm, fact-based rejection.

Jesse Sabin: The potential private rewards are not worth the public risks this project would take. Our water and air is worth more than their mine

Eva Saelens: We live on stolen land. We must rehabilitate our presence here with ethical and sensitive actions. The mine is the antithesis of the apology by which we must live. No mine, not now, not ever! Thank you

Nicole Saksa: Please don't.

Belle Sandwith: This company has a history of violations. Keep Nevada county and all points west safe. No Mine!

Susan Santanna: Just say no. Don't ruin Grass Valley.

Ian Santillan: Please protect our children's future!

Antonia Sarria: Absolutely not. Please do not do this!

Will Schaaf: NO!!!!

Barbara Scheck: Please keep our environment healthy, and don't waste our precious water!

Gregg Schiffner: PLEASE VOTE NO!

Beverly Schorr: Protect our environment & rural lifestyle from the inevitable pollution of the mine.

Paul Schwartz: Way to go SYRCL and CEA.

Heidi Seely: I was born and raised in Nevada City and strongly oppose this mine. The environmental impacts on our community to too detrimental and override any potential benefits.

Michael Shea: No Mine!

Deborah Shriver: No Mine.

Kimberly Shureen: Please DO protect our way of life. Vote NO for the mine to come to Nevada County.

Pamela Shyne: No mine.

Ralph Silberstein: One only needs to consider the GHG emissions to realize that the project is a horrible idea. Just say NO!

Barbara Simmons: This a ridiculous proposition and a waste of money.

Kim Snyder: I oppose any gold mining in our area. There is no Safe mine for humans, wildlife trees and our water shed. Take your GREED, elsewhere!

Eric Sommerauer: No mine!

Violet Starkey: Water is life.

Dana Stayrook Hobbs: The Yuba River watershed already suffers negative impacts from previous mining activity that was never sufficiently cleaned up and continues to pollute our amazing resource, particularly during rain events. Please do not make it worse by allowing mining in our town. We do not want it, we do not need it. Our community is successful and growing without introducing hazards associated with this mine.

Etta Stewart: Our community and ecosystem deserves health. Let's not throw that away for money.

Catherine Stifter: This community needs jobs, but not mining jobs! Don't believe the hype. Re-opening the mine is not good for our community and all living things.

Anne Stockdon: The mine is an environmental disaster waiting to happen.

Roger Strong: Vote no on the reopening of the Idaho-Maryland mine!

Elise Stupi: It's 2023, not 1960 or 1850! Protect our environment, our wells, our health, and our community. The cost to our community far outweighs any possible benefit--the benefit which only serves Rise Gold. NO MINE!!

Thea Sutton: No mine!

Corey Swartsel: After a decade of dreaming and working hard to make it happen we moved our family here three years ago with a commitment to set roots and raise our children. We didn't move here for the great economy, we moved here in-spite of the economic limitations. We moved here for nature, for outdoors activities, for the arts, for the scenery the past history and for the community, a rare mix of both liberalism and small town values, we moved here to get away from urban blight and industrial wastelands, and a culture of shallow greed. Please don't succumb to a project that endangers all these things that draw people to this area to satisfy the myopic greed of a company representing a single carpetbagger and known criminal polluter.

Loren Swift-Merritt: No mine: no shaft

Lauren Tackbary: There is no reason to open the mine beyond profits. Prioritize people over profits and help preserve our community and and just say no to the mine!

Andrew Tailor: No to Idaho- Maryland Mine!

Stephen Tassone: Keep Nevada County Safe, vote no on the mine.

Mark Tenboer: NO MINE !!!

Tina Tesene: Please consider the history of the SYSCON mine on the San Juan Ridge when you're considering this. I was a secretary at Grizzly Hill school they had no drinking water for years. A lot of people lost their wells in the area and I live in the area. Don't let this mind go through. It's not true what they say well happened.

Josh Thiem: Sunrise movement stands for the planet, not for profit.

Wendy Thompson: I saw many films at the WSFF that pointed to many ill fated projects that in hindsight most agreed NEVER SHOULD HAVE BEEN STARTED! Please just don't ever start this project where so many questions remain UN Answered from the Final EIR and proper mitigations do not exist for the problems Rise Gold would create. Our community is unique, we will be so UNHAPPY with a mine in our community. Truly consider the devastation this would bring upon us all. Thank you!

Peter Thornton: There is no long term benefit to our community by allowing this mine to reopen. We should prioritize the ecology of our surroundings over extracting a near useless precious metal that will only line the pockets of a Canadian company. Say no to the mine.

Ken Trillo: I urge you to say NO to the reopening of the Idaho-Maryland Mine.

JessicaTucker: Please say no to this mine! The effects will be devastating to the community and our earth.

Carol Turner: We don't want this dirty business in our beautiful community.

Martha Turner: Together WE can stop this mine from reopening!

Amy Umpleby: NO to Rise Gold NO to wasting water NO to pollution NO to the mine.

Pamela Vadakan: Mining destroys the natural beauty of this place. We need to move away from an ancient industry.

Gordon Vaughan: Do not create a scandal by approving a mining development that is nearly universally opposed by the community within which it would be located. Such a decision undermines trust in our government and democracy. Just say no.

John Vaughan: The environmental impact is unjustified and inconsistent with the County General Plan, Energy Plan and more. The economics make no sense and are absolute best case half of what is projected. The data provided by Rise is speculation or outright falsification.

Jorge Velasquez: No Mine! It will ruin the peace and quiet of our neighborhood!

Gabriel Vulfs: Please don't ruin our lovely town. Born and raised in Nevada City and have seen the aftermath of the Empire mine contaminating surrounding areas to this day. Despite cleanups of groundwater and streams, the land is still recovering and I'm positive that more mining would significantly setback and progress in restoring the area. Please take your money and leave our town.

Daniel Walmsley: Please no mine. Thx.

David Walters: If this mine is approved, there will be huge regrets in the future in our community. Say no!

Loraine: Webb: This is a no-brainer. This applicant has left communities to clean up his poisons elsewhere. Grass Valley… Just say NO!

Laura Weil: I strongly oppose the mine.

Emily Weissman: Please protect our health and well being and air and water quality. Let's move into the future instead of the past.

Brian Westlund: My grandfather was a minor in California. Before he passed, he told my entire family how wrong it was to mine & destroy the earth.

Valerie Wilkoff: Leave it alone.

Nita Winter: Mining causes more waste than any other human activity. Never mind the toxic legacy it leaves for centuries.

David Wong: Supervisors, please do not put dubious and known health risks ahead of your constituents wellness!

Charlene Woodcock: Gold mines poison water and soil with mercury damage health and the environment. That will not benefit residents of Nevada County!

Nadine Yamada-Light: Thank you to SYRCL for this petition and for spreading the word near and far about this potential environmental disaster.

Rose Zapel: There is no do-over. The jobs created may be beneficial but the negative environmental impact will be irretrievable. Mine would be owned by company in another country with no ties and no stake in our air or water.

Heidi Zimmerman: This is great. You will get alot of signatures to close out this ludicrous consideration of opening a full fledge mine in the middle of a beautiful historic town.

Cheryl Zook: Mining is our past not our future! Just say no to reopening the Idaho-Maryland Mine!

Dear Planning Commissioners -

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

If nothing else, surely all available information must have created real doubt about the proposed mine's benefits vs. risks. And all such doubts should be resolved in favor of protecting what we have, against the risk of what we could lose.

Thanks,

Stephen Greenberg

Dear Board of Supervisors,

I am a 22 year Nevada County resident. I own & reside on a 43 acre ranch off Pleasant Valley Rd in Penn Valley. I am horrified the county is considering opening this mine. I urge you to say NO to this project.

Thank You,

Sharon Blume

Dear Planning Commission members,

I won't repeat here all the negative consequences I believe the opening of the mine would involve because I know you'll have read the same thing a ton of times and I don't want your eyes to glaze over. Just let it be said I strongly oppose the mine.

However I do want to remind you that past behavior is the best indicator of future behavior. I would hope no one would argue the issues with the lack of success, integrity and honesty of the people proposing to do business here in Nevada County. Please vote no and keep us from being added to the list of unfortunate areas that have dealt with them in the past.

Thank you,

Patricia Nelson

Subject: Nevada County Planning Commission Special Meeting Notice of Public Hearing on the Idaho-Maryland Mine - Rise Grass Valley Project

Good Afternoon:

Attached please find a copy of the Notice of Public Hearing for the Special Meeting of the Nevada County Planning Commission for the proposed Idaho-Maryland Mine - Rise Grass Valley Project. For more information on how to participate in the Public Hearing and how to submit written and oral comments, please see the attached Notice of Public Hearing.

The Special Meeting of the Nevada County Planning Commission will take place on Wednesday, May 10, 2023, at 9:00 a.m. and may be continued on May 11, 2023 at 9:00 a.m., or soon thereafter as the matter may be heard, in the Board Chambers of the Eric Rood Administrative Center, at 950 Maidu Avenue, Nevada City, California. The Nevada County Planning Commission with hold a public hearing to consider project recommendations to the Board of Supervisors for the proposed Idaho-Maryland Mine - Rise Grass Valley Project. Members of the public who want to participate, including, but not limited to, providing oral public comments in the meeting, should plan on attending the meeting on May 10, 2023, because there is no guarantee that it will be necessary to continue the meeting to May 11, 2023.

The Agenda along with all documents pertaining to the proposed actions, Staff Reports and other supporting documents will be available for public review and consideration no later than April 25, 2023 at the Nevada County Planning Department, 950 Maidu Avenue, Suite 170, Nevada City, CA 95959 or can be found online at: https://www.nevadacountyca.gov/1752/Planning-Commission.

Copies of the Environmental Impact Report and any other project materials are available for public review on-line by visiting the Nevada County Planning Department webpage dedicated to this project at: https://www.nevadacountycagov/3195/Idaho-Maryland-Mine---Rise-Grass-Valley

A printed copy of the Environmental Impact Report is available for public review at the following locations during normal business hours:

- Nevada County Planning Department, 950 Maidu Avenue, Suite 170, Nevada City, CA 95959
- Madelyn Helling Library, 980 Helling Way, Nevada City, CA 95959
- Grass Valley Library – Royce Branch, 207 Mill Street, Grass Valley, CA 95945

Matt Kelley, Nevada County Planning Department
950 Maidu Avenue, Ste 170
Nevada City, CA 95959

Dear Mr. Kelley,

Would you consider buying a house that is at risk of having its well de-watered on account of the mine and promises to restore access to water made by a company headed by a C.E.O. that has a questionable history ?

Further, Rise's financial condition is weak and even with good intentions may not have the financial where with all to carry out its promises. If you roll the dice and buy the house, and you lose, your property value would decline drastically. Any takers? That is the predicament of the 300+ homeowners who have wells and live near the mine.

Even if one house loses access to water for a period of time and Rise Gold does not quickly make good on their promises, it is likely to stigmatize the other 300+ houses in the area and likely devalue all the properties at best or render them worthless at worst. California real estate law requires full disclosure. History is filled with cases of companies promising one thing and not delivering. Rise Gold has already made some questionable claims. If they want the project so bad, then why aren't they willing to post a bond in the event of damages?

Em Gold monitored the wells in the area for several years. Rise is only offering one year and at 15 monitoring sites. What happens if Rise takes the position: your well failed because of conditions other than the mine, like a drought. There is not a lengthly baseline of well monitoring or an independent advisory board to make a determination. Homeowners might require expensive long legal action to remedy.

The homeowners in the mine area are being asked to put their trust and faith into Rise Gold. Why should we? Would you? Some have said then you should not have bought a property near a mine. My reply is Rise Gold should not have bought a mine that had been closed for 70 years and is surrounded by homes.

Lastly, the roads in the mine area are two lane, curving with blind and semi blind turns. People leaving private roads to access Bennett or Hwy 174 at times have to cross oncoming traffic. Increasing the amount of commuter trips due to the mine will increase accident danger. About three years ago a woman was killed in a head on accident on Brunswick. About five to seven years ago a person was killed on Hwy 174 in a collision with a Hanson brothers truck that crossed the center line. I almost had a head on collision on Bennett while taking my daughter to school.

Please don't use the mine area residents as sacrificial lambs.

Subject: Protection for Well Owners in the Final EIR for the Idaho-Maryland Mine is Unacceptable

Dear Mr. Kelley:

The Wells Coalition is a group of property/well owners and residents near the Idaho-Maryland Mine. Our purpose is to protect our only source of water, our wells.

We, the undersigned members of the Wells Coalition, respectfully ask that the County REJECT the Final Environmental Impact Report (FEIR) for the Idaho-Maryland Mine and VOTE NO on the project. Huge risks are not being addressed, making this project completely unacceptable for well owners in the area.

100% certainty is a myth.

The Final EIR asserts that stronger mitigations and/or financial assurances are *"not necessary because no significant impact to domestic water wells are predicted".*

But a "prediction" is only an educated guess – NOT a certainty. And in this case, it is based on an analysis that has serious flaws.

The stakes are too high to get this wrong. A review of the County's Economic Impact Report revealed this project is unprecedented in its proximity to so many homes [1]. Pumping over a million gallons a day from an area with hundreds of wells is a huge risk. If "predictions" are wrong, it could cost the County, NID, and individual homeowners tens of millions of dollars – and years or decades – to connect a permanent water supply to each property.

Claiming "no significant impact" defies both science and common sense.

The FEIR is inadequate and provides well owners with very limited assurances for at least the following three reasons:

1) Predictions of the groundwater model have limited reliability.

In DEIR comments, the Wells Coalition provided many quotes from hydrology experts confirming that groundwater models in fractured bedrock like ours can NOT deliver 100% certainty. [2] There are also numerous defects in the groundwater model [3]. Even the FEIR agrees that additional data is needed for validating the model.

2) FEIR provides no current well baseline data / Domestic well monitoring program is too little, too late, and too short.

The FEIR lacks *current* well baseline data and is inadequate under CEQA. The FEIR relies only on sparse patches of data from 15 years ago.

Baseline data is needed in order to assess potential impacts to groundwater and well owners *prior* to determining mitigations. Current well performance data is key to establishing what current conditions are – e.g., establishing water quality or determining when a well has gone down or doesn't recharge as quickly. It is also the lynchpin in determining what "threshold" should be used to determine whether an impact is "significant". Legal experts call the FEIR's choice of setting the significance threshold at a 10% drawdown in water level arbitrary and invalid. [4]

The Final EIR's addition of a Domestic Well Monitoring Program (DWMP) for 378 properties does little to ease the concerns of well owners within the designated area or beyond (it does not include properties with wells in NID-served areas). It is included as a condition of approval, but it is not mitigation.

Instead of collecting data before evaluating the project, as CEQA requires, this program takes place after the fact. It won't collect the well performance data NID or the County needs. Monitoring is scheduled for only 12 months and takes just one water quality sample, which doesn't account for seasonal variations. A minimum of three years are needed to collect valid water quantity data and water quality should be tested twice a year. The program also expires five years after dewatering, but that provides no protection for accidents that could occur in future years as the mine operation expands. [5]

3) The proposed mitigations, which are not technically valid under CEQA, are deeply flawed.

Without accurate data on groundwater conditions and data from the actual domestic wells, valid mitigations cannot be determined. What constitutes a significant impact must be based on real data, not arbitrary ideas created by the applicant. For example, even the current groundwater model shows groundwater level drops over a large area. But it is unknown how that may affect well owners.

In other words, well owners are being told to trust that nothing will go wrong with their water supply for 80 years based on assumptions and speculation. The FEIR compounds this uncertainty with a dizzying array of feeble mitigations and "peace of mind" programs stitched together with vaguely worded promises.

This statement in the FEIR Mitigation and Monitoring Program seemingly assures everyone that the applicant would mitigate potential well impacts – *"pursuant to Nevada County General Plan Policy 17.12, the project applicant shall be responsible for providing a comparable supply of water to such homes and businesses whose wells are significantly impacted"* – but the rest of the FEIR does not demonstrate how the applicant would meet these requirements.

Key concerns for members of the Wells Coalition include:

a. **No financial bond or plan for connecting to NID if wells are damaged (beyond 30 parcels)**

NID asked for a $14M bond to cover the costs of providing service to three neighborhoods in the event of unrecoverable well damage or failure [6]. The FEIR dismissed it, insisting NID needs nothing.

At the same time, the FEIR expanded the area of potential impact with the addition of the supplemental Domestic Well Monitoring Plan (which defined the area of impact as within the 1' drawdown isopleth in the groundwater model) – suggesting that even more money is needed.

There is no plan for connecting impacted wells beyond the 30 properties along Bennett Road. For example: no additional wells identified as needing mitigation; no water assessment to determine the feasibility of NID service, no plan for design, construction, permitting, or easements; and no timeline commitments if NID service is required.

This is a recipe for disaster. Even under the best of circumstances, today's NID projects take many years to complete, but a failure in this project could create a large-scale crisis. Neither the County nor NID want citizens screaming "where's my water?" for years on end. And property owners connected to unsightly water trucks will be faced with plummeting home values. A property with no water is worthless.

b. **Promises to Fix Wells or Provide Water Trucks Won't Cut It**

One of the most significant gaps in the FEIR is the absence of accountability. Its most concrete promise about providing potable water for impacted well owners is this: *"If water supply to a property is disrupted for an appreciable amount of time (greater than a day) a temporary water supply will immediately be provided to the property using water tanks..."*. [7] These words fall short of holding the mine operator accountable for specific or reasonable timelines – for either fixing wells - or providing a permanent water supply replacement.

Even more concerning, all decisions about fixing wells or replacing water are left solely up to the mine operator, who would take action only if the 15 monitoring well locations in the official Groundwater Monitoring Program flags an impact. It makes no commitment to use the data from the individualized measurements in the supplemental Domestic Well Monitoring Program to flag an impact. This is especially concerning because the complexity of the fractured bedrock geology in the area may mask impacts and the threshold for triggering that impact is arbitrarily set at a 10% drawdown.

For homeowners with marginal wells, much smaller drawdowns may make their wells useless long before they get a call from the mine operator. For all well owners in the area, the described approach opens the door to unending debates about whether damage to a well was caused by the mine or some other condition.

If the mine were to reopen, a separate oversight committee or commission must be required. Such a committee would be authorized to make determinations of impact to well owners, resolve disputes, provide professional analysis and reporting of data regarding the monitoring, assure timely execution of mitigations, and administer fines or corrective notices.

c. **E. Bennett Road Well Owners Forced to Make Compromises**

For the 30 well owners who live along E. Bennett Road, connecting to NID is a compromise compared to their current situation. These wells typically cost very little to operate each year and produce sweet water without quantity restrictions, the need to add heavy chemical treatments, or fear of microplastic contaminants.

The fact that the mine is offering to pay the bills for a new service they don't currently need has little value – and it comes with a list of compromises. The property owner will be responsible for paying for NID water usage over 400 gallons a day (gpd), which may be a burden for some. There has been no measurement of existing gpd usage at any of these 30 properties. If they don't shut down their well, they'll need to pay monthly fees for a double-check valve to prevent backflow. And if the property is annexed to Grass Valley or sold to anyone else, they'll get stuck with the full water bill - which increases the cost of maintaining their home.

Conclusion

The FEIR's assertion that there will be no significant impact to wells defies both science and common sense. The groundwater model is questionable. The FEIR provides no current well baseline data and tries to make up for it with a flimsy domestic well monitoring program that is too little, too late, and too short. And the proposed mitigations, which are not technically valid under CEQA, are deeply flawed.

This alarmingly inadequate FEIR provides no procedure, no funding guarantees, and no independent oversight of the means by which the replacement of a permanent water source could be provided in a timely fashion for well owners. Ultimately, it does not provide a mechanism by which we can concretely say whether or not a well has been impacted by mine dewatering. Without such information there is no way to hold the mine accountable for lost domestic wells and the cost of replacement water services.

Please REJECT the Final Environmental Impact Report for the Idaho-Maryland Mine and VOTE NO on the project. This project is completely unacceptable for well owners in the area.

Sincerely,

Re: The Idaho-Maryland Mine Project and Final Environmental Impact Report

Community Environmental Advocates Foundation (CEA Foundation) is respectfully submitting these comments on the Idaho-Maryland Mine Project application documents and Final Environmental Impact Report (FEIR). (Mine, Mine Project, Project)

The FEIR concludes that the aesthetic impacts are significant and unavoidable. For this reason, the project should be denied.

Even though the aesthetics were determined to be significant and unavoidable, the FEIR fails to provide a realistic representation of the aesthetics of the project. As stated in the FEIR, "*Panorama photographs were taken to include peripheral elements that a viewer would see...*" (FEIR Page 2-612) As stated in the comment, depicting the project in this fashion misrepresents the scale and visual impact of the project aesthetically. Even though the project has been determined to have significant and unavoidable impacts, this does not preclude providing accurate information. In fact, viewing the project in the renderings gives a false sense of size and scale, easily misleading the viewer into thinking that the project's visual impacts are not as aesthetically offensive as the reality. For example, the renderings do not convey the scale of the processing facility, which is 425 feet long and over 6 stories high, which will be overtly visible from Brunswick Road. (See DEIR Page 4.1-40).

The FEIR contains inaccurate and misleading information and does not conform with the requirements of CEQA.

Reclamation plans are inadequate aesthetically and environmentally.

The FEIR argues that reclamation of the barren slopes caused by the Project by the sole use of an "*erosion control seed mix*" is adequate, citing erosion control as the main motivation. (FEIR Page 2-615) In fact, the Project is destroying healthy oak and conifer woodlands and other vital habitats, causing environmental and aesthetic impacts which have not been addressed. A failure of the FEIR to provide a more representative reclamation of the damaged land will result in inadequate mitigation, leading to potentially significant and unavoidable impacts. In addition to erosion control grasses, habitat must be restored by planting of native species of trees and under-story shrubs and managing their care over the course of the Project to assure that invasive species do not become established. The FEIR reclamation plans are inadequate.

Mine exhaust moisture creates potential air quality, hazard, and aesthetics impacts.

The FEIR fails to provide information about the potential impacts of the voluminous vertical discharge of saturated air into the Airport Safety Zone 5, creating possible turbulence and visual obstruction. Response to Comment Grp 8-5 states that "*The project will be reviewed by the Airport Land Use Commission* , (FEIR 2-616) The results of a review by the Airport Commission were not included in the FEIR, nor is the Airport Commission listed on DEIR Table 3-11, Potential Permits and Approvals for the Proposed Project.. Specifically, the concerns about the impacts of the persistent cloud plume which may extend into the airport airspace have not been addressed. Nor have the impacts of the constant upward moving air mass created by 200,000 cfm of air with a velocity of 7.7ft/sec been addressed and how that may induce turbulence. The FEIR also fails to address the aesthetic impacts of a visible plume extending above the head frame. Under some conditions, the plume may be visible for miles around.

In response to comment Grp 8-5, the FEIR states "*The project would not create a persistent cloud plume or fog, and the commenter provides no substantial evidence to support its claim that the mine exhaust would create turbulence.*" However, the commenter clearly outlined conditions in which the saturated warm air (68F) would interact with the humid cold air in typical winter weather conditions. The high humidity that often occurs in the winter has little to no additional moisture carrying capacity. For example, as calculated in the DEIR comment letter "Mine Exhaust Moisture" (See Plume reply Grp 7-95, Page 2-463), calculations are provided which show that the exhaust air would have to mix with at least 40 times its volume before dispersing. In addition, the relative humidity is often lower than the given examples, which would require much greater mixing volumes to disperse.

The FEIR response ignores this point and states without evidence: "This water vapor would be quickly dispersed." It then makes unsubstantiated assumptions about the rates of mixing, ignoring factors such as laminar flow and upward convection in conditions where turbulence is low. In addition, the response chooses a select case of 6 mile-per-hour wind for a singular example, failing to consider worse cases which would likely occur in which the wind is calmer.

Modeling the movement and mixing of air masses in a case such as this cannot be accurately assessed without more sophisticated modeling. The FEIR response is inadequate and fails to adequately assess the potential impacts to air traffic and aesthetics.

Management of safeguard controls for asbestos is inadequate.

The Final EIR does not provide adequate data on asbestos concentrations in mine rock to determine the potential impacts under CEQA. In fact, testing was conducted from just two drill holes and represents only 2/10,000 of the planned volume to be mined. In addition, the asbestos management plan (ASUR Plan) fails to adequately address processing and disposal of asbestos-bearing mine waste to meet its stated goals, and the ASUR Plan is internally inconsistent and ambiguous, providing numerous loopholes in regulatory oversight.
Additional comments are in Attachment 5, "MineWaste_AsbestosImpacts_Comments_Final_3-14-23." (A copy is also posted at https://www.cea-nc.org/wp-content/uploads/2023/03/MineWaste_AsbestosImpacts_Comments_Final_3-14-23.pdf)

The potential for hazardous airborne pollution from the mine project is a significant health concern which is not addressed adequately. The Final EIR should be rejected.

The management of fugitive dust after it leaves the mining facilities is inadequate.
The FEIR fails to consider exposures to airborne asbestos for longer than 30 years, claiming that "*the assumption that exposure at all sensitive residential receptors would begin in the 3rd trimester of gestation and that the baby would be born and would grow through childhood and adulthood at the same home for the next 30 years. This scenario is unlikely to happen, yet it captures a conservative situation for health risk assessment purposes.*" This is speculation. Credible data demonstrating the likelihood of living in the same home for no more than 30 years was not provided. Some homes are lived in for generations by the same family. Furthermore, people may conceivably live in a different home within the same exposure area or could move away for a few years and then return, easily accumulating more than 30 years.

The FEIR uses invalid meteorological data to determine exposures of Toxic Air Contaminants.
In Nevada County, the mortality rate from Chronic Lung Disease is already – without the added toxic emissions from the mine – double the statewide rate. Nevada County also has higher-than-state-average levels of air pollutants, ozone and particulate matter, radon, chronic disease, an aging population, and poverty. Given the extent of health risk to so many and so wide a range of people, the FEIR's Health Risk Assessment (HRA) is completely inadequate.

The HRA relies on questionable assumptions. The model relies on meteorologic input data, with the quality, quantity, speed, and direction of travel of the air toxins dependent on these meteorological factors. Yet the meteorological data input used in the FEIR comes from a Blue Canyon site - not from a Grass Valley site - an area with a significantly different meteorological profile than that of Grass Valley.

Blue Canyon, located on Highway 80, bears little meteorologic resemblance to Grass Valley: it notably deviates from Grass Valley in elevation, temperature, rainfall, snowfall, wind speed, and wind direction. Furthermore, the topography of Grass Valley is such that air movement does not compare at all with Blue Canyon in rates of dispersion. Using Blue Canyon's meteorologic data will not correlate with Grass Valley meteorologic data under many circumstances, making any Toxic Air Contaminants (TAC) statistics invalid.

The FEIR states that "*There is no AERMOD pre-processed met data from Grass Valley or the Nevada County Airport*" (FEIR Master Response 17, Page 2-96) and concludes that "*The use of meteorological data from the Blue Canyon area represents the best available processed data for use in the HRA and is adequate for purposes of CEQA.*" (Ibid.) However, the selection criteria for choosing this data was not provided, nor did the FEIR provide a basis for ignoring other data sources, regardless of whether it may take more comprehensive analysis. In view of the issues raised by comments in the Draft EIR, the FEIR failed to adequately respond and justify the use of Blue Canyon other than to claim that the NSAQMD "did not suggest" using different data. This is an inadequate response.

Because of the lack of evidence that the meteorological data is valid for the HRA assessment, the FEIR is inadequate in addressing the potential impacts due to toxic air contaminants.

Removal of flora, fauna, topsoil, wetlands and overburden down to bedrock to prepare the Centennial site for mine waste dumping represents a significant impact.
The Project calls for the removal of flora, fauna, topsoil, wetlands and overburden down to bedrock to prepare the Centennial site for mine waste dumping. The FEIR fails to adequately address impacts to

these resources and is inadequate. A full analysis of this impact is provided by Shute, Mihaly, & Weinberger LLP, "SMW_IMM_FEIR_Comment_Letter.pdf," March 20, 2023, p2-9, submitted under separate cover.
(A copy is also posted at https://www.cea-nc.org/wp-content/uploads/2023/03/SMW_IMM_FEIR_Comment_Letter.pdf)

Additional Centennial Site Impacts to the Hap-Warnke Lumber Mill Site from the dumping of mine waste are not addressed in the FEIR.
The FEIR failed to accurately assess impacts that mine waste dumping will have on the Centennial site even after the DTSC cleanup is completed. Separating the Centennial cleanup from the FEIR creates ambiguity and uncertainty about the impacts. As stated in comment Grp 7-2, "...any assumptions about baseline conditions for purposes of assessing impacts to the Mine Project are speculative at best, and at worst, significantly underestimate the actual impacts of the Project." (Page 2-430) This comment also addresses deficiencies in Master Response 4.

The former Hap Warnke Lumber Mill (HWLM) is located on the Centennial site. The land on which the mill sits has been identified as an area of "potential ecological concern," because it contains detectable amounts of mercury toxin which exceed the DTSC standards for safety. (Remedial Action Plan Draft, Centennial M-1 Property, January 25, 2021, pg. 18)

The DTSC is not planning on cleaning up the Hap Warnke area, however, because this area is currently sealed by an impermeable layer of concrete and asphalt. This layer helps prevent the detected mercury from being released into the environment.

According to the DTSC, as long as this protective layer is not disturbed, but remains in place, then all that needs to be done to the mercury-contaminated area is periodic soil samplings to assure that the mercury remains contained. (Ibid)

However, unknown to the DTSC, the Mine Project **DOES** plan on developing a portion of the Hap Warnke area when dumping its mine waste rock on-site. (See Application Documents, 11_C101-CentennialSitePlan_Infrastructure.pdf.) Included in Rise's plans to develop this area is the digging of a substantial drainage ditch along the mine waste's perimeter. (See Application Documents, C1-CentennialSiteGrading.pdf.) But in order to dig this drainage ditch, Rise will have to ignore the DTSC's conditions for the mill site clean-up. Instead, Rise will necessarily demolish the existing Hap-Warnke Lumber Mill structure and excavate a portion of this area to create a drainage ditch. This may significantly disturb the mercury-contaminated soil. Not only does this disturbance ignore the DTSC's conditions, but it also has the potential for releasing mercury toxins into the environment.

The FEIR fails to adequately assess the potential mercury contamination of groundwater and Wolf Creek from the creation of the drainage ditch and other activities related to dumping of mine waste on the Centennial Site.

South Idaho Shaft physical closure potentially impacts Pine Hill flannelbush.
The work to close the South Idaho Shaft that is situated on the Centennial site could proceed either before or after the DTSC cleanup and could take place before the issuance of grading permits as mentioned in Mitigation Measure 4.4-1(a). See Response to Comment Grp 8-25. Therefore, even though there are currently no identified Pine Hill flannelbush plants at the South Idaho Shaft location, a Condition of Approval must be included to fence off and protect the Pine Hill flannelbush prior to the start of work on the closure of the South Idaho Shaft and Tunnels as well. Otherwise, there is no

safeguard to prevent heavy equipment or bush clearing activities from inadvertently damaging the flannelbush.

Draw down of groundwater within the mine workings may increase the potential for settlement or collapse of shallow workings which will affect individual property owners directly.
Despite the potential for damages, the FEIR fails to address the lack of financial assurances or adequate mitigations for some businesses and/or property owners that are in the areas where mine features exist, and the mine water level is close to the surface. When the mine is dewatered, the risk of damages is greatly increased, as discussed in "DEIR Appendix H.6_Geotech Review of Near-Surface Features.pdf."

In the case of 125 Spring Hill Drive, a business building sits atop the Eureka Shaft. The FEIR claims that after incorporation of proposed mitigation 4.6-3(c), the impact would be less than significant. The FEIR states that the DEIR's conclusions "*were peer reviewed by the County's independent expert, who concurred with the conclusions.*" (FEIR Page 2-626) However, for any business or property owners who could potentially suffer a financial loss or impact, a provision for financial assurances to fully compensate them for damages should be included. The FEIR fails to provide adequate protections for businesses and property owners who may be impacted.

In addition, sinkholes or other damages may occur at sights where legacy mining features are not currently known or apparent. The FEIR fails to address the potential for additional sinkholes to occur in areas where current mine water levels are closer to the surface. As evidence that the potential exists, the comment provides an example of a sinkhole that occurred at a location where there was no current record of a mining feature.

The FEIR inappropriately dismisses the concerns for addressing potential damages by stating: "As there is a low probability of settlement or collapse, the commenter's concern about liability for such collapse is speculation..." (FEIR Page 2-626) Note that the FEIR admits there is a probability of settlement or collapse, but fails to provide adequate protections in this case. Mitigation Measure 4.6-3(c) only requires the applicant to close the identified features prior to initial dewatering. The mitigation has no provisions of financial assurances to protect the property owners or businesses. The FEIR is inadequate on this point.

The FEIR should provide financial assurances or adequate mitigations for all businesses and/or property owners that are within the area of potential damages from dewatering and/or mining activities.

Probabilities of near-surface collapse hazards are not adequately addressed.
The FEIR failed to provide answers to the basic information requested, which bears directly upon the potential hazards. The Draft EIR stated that "...collapse of a deep (e.g., 100 feet bgs) mine feature is not likely to be expressed at the ground surface" (DEIR Appendix H.6, pg 2). But this response to the comment is not addressing near surface features, leaving this impact inadequately addressed and mitigated.

The FEIR utilized an arbitrary threshold for significant greenhouse gas (GHG) emissions.
Instead of determining a GHG threshold suitable for Nevada County, the FEIR arbitrarily chose an outdated threshold that was used in other air districts. The correct threshold should be "net zero" for projects of this type. For details, see Attachment 4, "CEA_GHG_Comments_2-7-23.pdf."

Cement manufacturing is not included in the GHG analysis.

The FEIR states that the GHG emissions from the production of cement is not required to be included in the impacts under CEQA. Regardless of this technicality, cement is a tremendous contributor to climate change and the Mine will be using very large quantities of it to create 500 tons/day of cement-paste backfill. This amounts to roughly 4000 tons of added GHG emissions per year, bringing the true total emissions of GHG to over 13,000 tons/year. In addition, metal shoring materials for miles of tunnels are not included in the total, and the emissions from the processing of the gold concentrate, which will be shipped off-site, are not included.

We are in the midst of a climate change crisis. This level of emissions is unethical and exceeds the latest threshold of significance. The threshold for GHG emissions should be net-zero, per detailed explanation cited previously. The GHG emissions from the Mine Project will be significant and unavoidable and must be fully mitigated. The FEIR fails to adequately address this impact.

Provisions for temporary storage of explosives on the surface are inadequate.

The FEIR fails to provide information about the storage location of explosives during construction. The Response to comment Grp 8-47 states: "Explosives would be immediately transported underground once delivered to the site." However, this will not be possible until the dewatering has been completed and considerable work is done to allow for storage underground. Any explosives temporary storage location on the surface should have been identified in the FEIR. The FEIR does not provide enough information to assure that the location chosen will provide the necessary safety.

Curing of mass concrete can generate significant heat and needs to be managed.

The Mine would dispose of 500 tons/day of sand tailings back into the mine by using Cement Paste Backfill (CPB). No analysis of heat generated by CPB is provided in the DEIR. Comment Grp 8-50 provided valid information regarding the heat emissions from curing concrete, and then provided calculations to show that the heat generated would be over 200,000 Kilojoules (KJ) per metric ton. Using a conservative value, the heat from curing the estimated 83 tons of cement per day would add over 17 million KJ/day* to the mine tunnel environment.

The following calculations were provided:

*"Heat of curing is dependent upon the cement Type. Here, we use Portland Type IV: Heat 55cal/g (note 1 cal/g == 4.184kJ/kg , 55cal/g * 4.184kJ/kg//cal/g == 230kJ/kg) (230kJ/kg x 907kg/ton == 208,610kJ/metric ton)"*

There are numerous studies and an abundance of guidelines for managing the curing heat of cement. (E.g. see https://www.forconstructionpros.com/concrete/equipment-products/article/11598829/kb-engineering-llc-how-to-plan-and-manage-curing-for-mass-concrete-pours)

The FEIR ignored the information that was provided. Instead, the Response to Comment Grp 8-50 dismisses the point by making the incoherent statement: "*No "heat management mitigations" are required or proposed for the placement of cemented paste backfill, as* **there is no evidence that any evidence could result.**" [Emphasis added.] This response reflects the commenter's ignorance about the exothermic nature of curing concrete, how accumulated heat in larger quantities of curing cement can destroy the strength and durability characteristics of the concrete or cement mix, and how the working areas of the mine may become overheated.

In addition, the Response failed to even answer the simpler questions posed about the quantity of cement that would be used daily, or what mitigations would be established to protect workers from excessive heat. The FEIR response is inadequate on this point.

Evaluation of potential hazards to enclosed near-surface shafts during dewatering is not adequate.

Upon initial dewatering of the Mine, the physically sealed mine shafts such as the one under the Spring Hill Drive business will potentially experience a negative air pressure as the water level drops. This would occur in any enclosed mine works that lacks ventilation to the surface.

NV5 attempted to address this issue in FEIR Appendix P, p3748. Unfortunately, NV5 seemingly failed to understand the nature of the problem. The conclusion of NV5 states: *"...the water in the mine would drop at approximately 2.7 feet per hour. This rate of water level drop is not expected to result in significant forces related to temporary air pressure fluctuation due to the air recirculation in the mine and large frictional and volume exchange differences between water and air."*

In the case of the shaft under Spring Hill Drive, which is directly under a business, there is no evidence that air could enter the shaft allowing "air recirculation" to take place. "*The original shaft construction likely included a concrete collar. The specific method of physical closure is not known,*" DEIR Appendix H.6, p3.

The current state is of a water filled shaft with approximately 35 feet of air space above the water. (i.e. the water level is about 35 feet below the concrete slab floor of the business.) As the water level drops, the air pressure will lessen as the volume occupied by the air increases. Without a vent to allow air to enter the shaft, the pressure will continue to drop. For example, within 13 hours, the water level will have dropped about 35 feet. Without an air vent to allow air into the shaft, this will create a vacuum of about 7 pounds per square inch on all the walls of the shaft and the floor of the business.

These questions were not addressed:

- How will air enter the shafts as the water drops?
- How will this impact potential surface structures?
- Were the additional net load forces upon the sides and top of the shafts taken into consideration?

There is clear evidence that the lowering of the mine water level creates an additional potential hazard due to a drop in air pressure within an enclosed shaft. The FEIR fails to adequately address this potential hazard. The FEIR response to this potential hazard is inadequate.

The DEIR does not address potential riparian and surface water impacts from physical closure of the East Eureka Shaft.

East Eureka Shaft and the East Eureka Drain are located at 815 Idaho Maryland Road. The Shaft is under an existing commercial building occupied by Navo and Sons, within 50 feet of Wolf Creek. The East Eureka Drain is a 24 inch culvert that runs approximately 70 feet from the East Eureka Shaft at Navo and Sons to the bank of the Wolf Creek, where it discharges. (See DEIR Appendix H.6, pgs 4,13,14.)

Closure of this mine feature will require excavation around the shaft, followed by study of the feature and implementation of a structural concrete cap and permanent drainage solution. Per DEIR Appendix

H.6 page 8, *"The likely course of action will be to over-excavate surface soil in the areas of these features to determine where competent, native soil/rock is located and attempt to identify the trend of any subsurface mining-related structures (i.e. tunnel, shaft, drift, etc.)."*

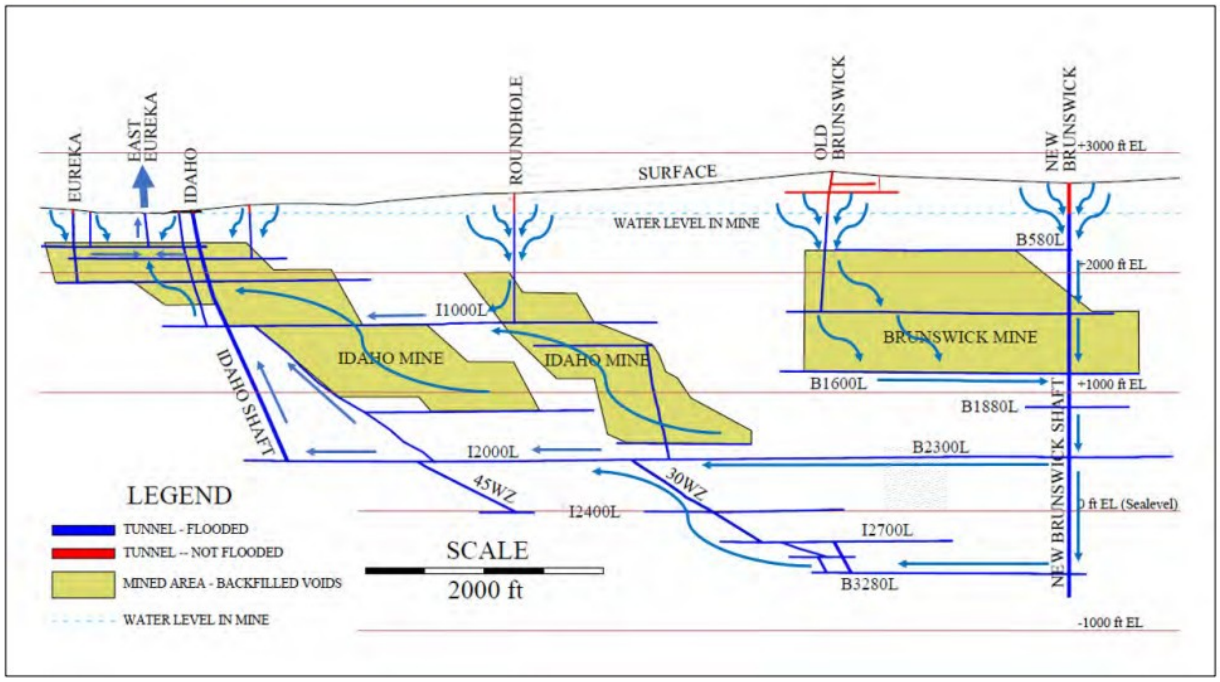
The surface of the mine water is about 4 feet below the surface (Ibid.), almost at the low flow level of Wolf Creek. Thus, almost the entire operation of closing the shaft will involve working at or below the mine water level, and the continuous discharge of the mine water will have to be managed to avoid discharging any sediment or contaminants into the creek. In addition, any work necessary to reconfigure the drain will be within the riparian zone working very close to the creek, below top-of-bank. A trench at least 50 feet long at a depth below top-of-bank and open into the creek will be excavated to reconfigure the drain.

The FEIR Response to Comment 8-52 claims that the "*Work will not be conducted underwater or within Wolf Creek.*" (FEIR Page 2-629) In addition, the FEIR affirms that the work will be done prior to dewatering.

Clearly, this will require permits from the California Department of Fish & Wildlife for working within Wolf Creek (generally designated as below the top of the creek bank) and careful management to protect Wolf Creek from pollution while maintaining the outflow from the mine. In addition, diverting the mine drain outflow would require additional permits. The FEIR has not adequately addressed the potential impacts, nor the required permits required for this work.

Assessments of the current mine water chemistry are inadequate.
This comment addresses the fact that the mine water at the mine drains in the vicinity of Wolf Creek and is a more accurate representation of the water chemistry of the mine than the mine water in the Brunswick Shaft. This is blatantly obvious when considering the flow directions of the water as shown here. (DEIR Appendix K.2, Figure 3-20.) The water flows in at the New Brunswick Shaft and hence has not passed through the mine yet. Then it flows out the mine drain at the East Eureka Shaft after it has passed through about 1 ½ miles of the mine works, providing opportunity for the water to mix and interact. Testing of the water after it flows through the mine rather than before it flows through the mine will likely provide a better sample of the water in the mine.

Figure 3-20 Groundwater Movement in Mine Workings



The characterization of the mine water has been misrepresented by the use of samples from the Brunswick Shaft. The FEIR fails to acknowledge this simple point. A single test of the current discharge at the mine drain **after the water has passed through the mine** showed elevated levels of arsenic. This limited testing is inadequate. The concentrations of contaminants may vary with flow rates and may depend upon the amount of near surface inflows to the mine. The EIR should have tested the drain waters repeatedly over time to assess the pollutant concentrations during different flow conditions.

The chemistry of the mine water is largely unknown. Of the 72 miles of tunnels in the existing flooded Idaho-Maryland Mine, there may be areas where oxidation of tunnel surfaces and backfilled materials has leached significant levels of contaminants into the stagnant water which will be discharged when the mine is de-watered. The water that exits the mine drains is a better representative of the typical mine water chemistry, but it is not an adequate representative to fully characterize what the water quality will be on average.

Thus, unknown are the long term impacts to water quality from reopening the mine, increasing the oxidation of existing rock and backfill, increasing the amount of exposed tunnel surfaces, addition of cemented paste backfill, and finally re-flooding the mine upon mine closure.

There is more at stake here than just whether the mine will treat the water which it discharges into the South Fork Wolf Creek during operations. Without plans for a permanent water treatment facility operating after the mine has closed and been re-flooded, there is a potentially significant long-term impact to water quality from mine water effluent. Given what is currently known from tests of the mine drain, the current mine drain water already constitutes a point source pollution and needs immediate remedy. It is highly probable that it will be worse after dewatering and more mining.

In addition, discharge of mine water that is contaminated with arsenic and other toxins into the 7-acre pond for oxidation is another potential impact that was not adequately assessed and may be harmful to waterfowl and other wildlife, in addition to creating a potential air quality hazard from aerating the water as planned.

The FEIR fails to provide sufficient information to assess the potential impacts of initial dewatering and long-term maintenance dewatering. Nor does it provide for long-term treatment of the mine water after closure. The FEIR is inadequate on these points.

Drill core testing for water quality impacts used insufficient samples.
The FEIR fails to adequately address the potentially significant impact from mine waste and its potential to pollute ground water and surface waters by the leaching of hazardous chemicals. There was not sufficient sampling of the intended mineral resource area. And, of the samples taken, there is no validating record of the chain of custody and correct processing of the samples.

It is a requirement of CEQA that adequate information be provided to determine the potential impact of a project and to determine adequate mitigations. Yet in this case, only 11 linear feet of drill core were used to assess 80 years of mining operations which would process approximately 27 million tons of rock. And the integrity of the few samples that were assessed is not established.

A key element of the project is the planned disposal of the mine waste via “off-site sales”. Yet in the EIR, the Water Board and numerous other parties identified that there was insufficient testing to determine whether the mine waste would be Group C, suitable for off-site sales. (FEIR Page 2-333, 234)

CEQA requires that the EIR “…give the public and decision makers the most accurate and understandable picture practically possible of the project’s likely near-term and long-term impacts.” (Section 15125 – Environmental setting) This EIR fails to meet that standard.

The FEIR states that mitigation measures address the potential impacts and that additional testing would not alter the significance identified in the DEIR. Note that the testing has not identified the scale and scope of the levels of toxicity in the materials to be mined. Thus, it has not been established that the applicant has a viable business plan or method of disposal. The project depends upon off-site sales as a means of disposal of mine waste. Given the lack of information about the composition of the mine waste and its potential for hazardous discharge into the environment, an alternative mine waste disposal plan must be provided which meets the criteria for Group A and Group B mine waste disposal.

Additional comments are in Attachment 2, “ MineWaste_Water Impacts_Comments_Final 1-10-23.

The hydrology study incorrectly tested for potential long-term acid mine type drainage.
In addressing the potential for acid mine type drainage, the FEIR ignores the key point of comment 8-66 and others: The testing methods used for the Draft EIR were not reliable for predicting the long-term potential of contaminants to be leached out of mine waste. This point is made clear by statements from experts from The Sierra Fund (FEIR Grp 26, Page 2-1015) , CSP2 (FEIR Grp 7-176 , Page 2-502), and others.

Also, there is some direct physical evidence that long-term or kinetic testing is required. What is flowing out of the mine is a useful indication as to what will flow out of the mine waste. A real world long-term test datum is available from Idaho-Maryland Mine's current drainage along Wolf Creek. And even though the outflow is likely diluted by additional near surface contributions, the tests from there show elevated arsenic.

However, the FEIR did not provide any additional testing data. Instead, in Master Response 8, the FEIR claims that sufficient testing has been done and that any additional testing that may be needed will be conducted under the permits from the Regional Water Quality Control Board. This is incorrect. Adequate testing cannot be deferred until later. To satisfy CEQA and to provide the lead agency with sufficient information regarding the potential impacts of the project, the potential for toxic drainage from the mine waste must be adequately evaluated in the FEIR. This would ensure that the necessary mitigations can be established: whether the mine waste will be Group C, or Group A or B, and thus how it might be managed to prevent unwanted discharge of toxins in the future.

The waste rock's potential to produce poor quality effluent should be thoroughly characterized using appropriate tests to the satisfaction of the Water Board (e.g., ASTM D 5744) over a sufficient period, also to the satisfaction of the Water Board (e.g., 40 weeks). And this information should be included in the FEIR.

The FEIR analysis of this issue is not adequate.

Under CEQA, it is not adequate to defer analysis of mine waste, a potential hazard, to some future date without providing substantial evidence that the proposed actions will not result in environmental impacts.
The FEIR has not provided adequate testing data to characterize the water quality impacts of the Project's mine waste but persists in maintaining that it is not needed for the EIR. FEIR Master Response 8 states "*Given the geochemical testing that has already been conducted to characterize the water quality impacts of engineered fill and cemented paste backfill placement, and the further waste characterization that will be required as part of the WDRs approval process, additional testing is not required for the purposes of CEQA.*" (FEIR Page 2-45)

While it is true that further waste characterization will be required, the requirements of CEQA are that adequate data must be provided to assess the potential environmental impacts. The FEIR has failed to do that for both the potential impacts to surface and ground waters as well as potential impacts due to airborne asbestos.

FEIR comments submitted by Shute, Mihaly, & Weinberger LLP on behalf of CEA Foundation provide a full discussion of the requirements under CEQA as they apply to the required testing of mine waste for this Project. (See "SMW_IMM_FEIR_Comment_Letter.pdf," March 20, 2023, pgs 13-15. A copy is also posted at https://www.cea-nc.org/wp-content/uploads/2023/03/SMW_IMM_FEIR_Comment_Letter.pdf .)

Furthermore, the FEIR repeatedly fails to provide an accurate description about the status of classification of the mine waste as Group C and the suitability of using it for Engineered Fill.

--The FEIR states: "*California Waste Extraction (WET) testing was performed on samples of mine materials and the results of these tests suggest the engineered fill (barren rock and sand tailings) will be a Group C mining waste*." (FEIR Master Response 8, Page 2-48.) Relying upon a suggestion is speculation. The classification of the mine waste has not been determined.

--The FEIR repeatedly makes the false claim that "*...the historic mine waste has been determined to be Group C mining waste from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity.*" (FEIR Page 2-516, Page 2-6208, Page 2-8062.)

--It is not clearly communicated that, using the test data provided, the mine waste can be dumped on the two local sites (Centennial and Brunswick) as Engineered Fill. It has to first be tested and determined as Group C mine waste by the Water Board. As stated in the Water Board comment regarding Engineered Fill "...the Draft EIR indicates that mining waste used as engineered fill would be considered a Group C mining waste. The language leaves the reviewer with the impression that because mining waste is used as engineered fill, it is considered a Group C mining waste. This is not correct." It goes on to say that materials "...being proposed for engineered fill will need to be characterized as Group C mining wasted prior to its use as engineered fill." (FEIR Page 2-233) In other words, the viability of the entire business plan for the Mine is in question.

The FEIR does not provide adequate test data to determine the potential impacts of the mine waste and fails to provide an accurate description of the mine waste and the unresolved problems of mine waste disposal.

Water Quality, Reclamation. No provisions were made with respect to treatment of mine effluent after mining operations cease.

Whether the Mine operates for a full 80 years, or whether it shuts down within a decade, the FEIR must address the potential impacts of shutting down. However, the FEIR fails to provide adequate information on the management of Mine closure and the cessation of Mine maintenance dewatering. If maintenance dewatering is stopped, the mine will refill and resume discharge of mine water at or near the mine drain(s) along Wolf Creek.

Also, the FEIR does not include provisions for long term monitoring and treatment of mine water. Should it be tested as exceeding allowable thresholds, how would the mine water be contained and/or treated? For example, levels of arsenic, iron, and manganese could exceed allowable thresholds. A water treatment plan must be included in the FEIR that could operate indefinitely after the mine closes, and adequate permanent funding assurances should be required.

In addition to provisions for monitoring mine water outflows, a means to monitor drainage from the engineered fill must be included in the FEIR.

In total, the FEIR fails to assess the impacts of shutting down operations on South Fork Wolf Creek and Wolf Creek, as well as potential impacts to ground water, wells, drainage, etc.

The FEIR inappropriately defers the collection of additional water monitoring data to the future.

The FEIR fails to address the inconsistency identified by comment Grp 8-73 with respect to Mitigation 4.8-2(a)(4):

" A projected water-level impact assessment for individual domestic wells shall be performed once dewatering of the underground mine workings commences, based on responses of the measured groundwater levels of the project monitoring wells. The projected groundwater drawdown shall be estimated for each domestic well in the project area." (FEIR Page 4-79)

Clearly, the proposed assessment would be initialized too late to be included in this EIR. The assessment of impacts for domestic wells must be included in the EIR. This FEIR analysis is inadequate on this issue.

Furthermore, Mitigation 4.8-2(a)(4) continues to assume that the creation of monitoring wells in 15 locations, rather than directly monitoring the domestic wells, constitutes an adequate assessment of the water levels in all of the potentially impacted domestic wells. This is a presumption with no actual supporting data from current domestic well conditions and is an implausible proposal due to the nature of fractured rock stratigraphy. As noted repeatedly, the ground water levels and recharge rates can vary significantly over short distances due to the fractured rock strata.

The FEIR inappropriately defers the collection of additional data (via a Groundwater Monitoring Plan) to the future. CEQA does not allow the deferral of important studies necessary to characterize impacts because it denies decision-makers the information they need to make well-reasoned decisions regarding the impacts and appropriate mitigations of the project. See Attachment 7, "CEA_GroundwaterBaselineRequirements_1-12-2023" for additional comments.

Relying on fifteen monitoring wells to estimate the impacts on all water supply wells around the mine area is inadequate.

Fractured rock geology does not provide a uniform aquifer. Water holding capacity and transmissivity can vary significantly over short distances. A good example of this is the adjoining Union Hill Mine, which is part of the Mine holdings. The water level in that mine was 20 feet at the end of the historic mining in 1956, while a short distance away the mine was completely dewatered. Examples abound of the difficulty in predicting groundwater impacts in fractured rock strata. In the prior Emgold Mine project description for this same mine, it states: "*The geologic formation in which the mine is located is fractured bedrock whose hydrogeology is difficult to predict. Therefore, reliance on Domestic Well Level Monitoring Program data will be required to assess impacts and discern appropriate mitigation measures for each domestic well owner.*" (Idaho-Maryland Mine Project, Revised Project Description (May 2011) Appendix N-T-3) See "Wells Coalition Comments Jan-12-2023" for additional examples. (https://www.cea-nc.org/wp-content/uploads/2023/03/Wells_Coalition_comments_Jan-12-2023.pdf)

The FEIR presumes that the placement of monitoring wells at 15 strategic locations are adequate for predicting groundwater draw-downs that may result from the mine: "*...the measurements of water levels in the monitoring wells can be used to verify the groundwater draw downs as dewatering progresses to provide sufficient time to predict adverse impacts to domestic wells before they occur so that appropriate mitigation measures can be implemented.*" (FEIR Page 2-951)

There are basic flaws in this reasoning. As noted, due to fractured rock there is a high likelihood that domestic wells may be impacted differently than the monitoring wells. Also, the proposed monitoring wells are situated according to the predictions of the Itasca Groundwater Model, which may be

incorrect. In fact, the FEIR documentation "*...acknowledges that there are uncertainties in groundwater modeling [sic] and states that the predicted contours are based upon the numerical groundwater flow model and the assumptions inherent in the model. Actual, in-field measured water levels may be different from the predicted water levels due to heterogeneities in the hydrogeologic system.*" (See FEIR Page 2-952.) [Emphasis added.]

And finally, even if the monitoring wells could "*...provide sufficient time to predict the adverse impacts to domestic wells*" as stated in the FEIR, they do not provide sufficient time to prevent the adverse impacts. They merely detect them. There usually will be a substantial delay before the effects of dewatering are fully transmitted regionally and felt in the area's domestic wells. Even if the mine dewatering is halted, it may be years before the groundwater impacts return to equilibrium.

Monitoring wells are useful for supplying information about the impacts of the mine, but are not sufficient to determine impacts to the domestic wells that they are intended to protect. Monitoring directly at the domestic wells is needed. Without that, the impacts cannot be accurately detected, and the mitigations cannot be adequately defined. The FEIR is inadequate in addressing this issue.

Impacts from using the 7 acre freshwater pond as a treatment pond are not adequately assessed.

The 7 acre freshwater pond on the Brunswick site is currently home to abundant waterfowl and is surrounded by rich riparian habitat. No biological analysis was conducted at this pond. Instead, FEIR states that "*...the water treatment pond is an artificial pond constructed for industrial uses. As such, the pond berms are not riparian areas and vegetation on the structure will be removed. Untreated water in the pond would not be released to the environment. No mitigation to replace habitat in the pond is proposed nor required.*" (FEIR Page 2-637)

The FEIR statement "*...the pond berms are not riparian areas...*" is blatantly false. Regardless of the intended use or history, the pond has supported riparian habitat for decades. A survey for special status plant species, and special status wildlife species should have been conducted.

The FEIR failed to provide a biological assessment of the pond and is inadequate under CEQA.

The FEIR Alternative Land Use analysis is flawed.

In considering Alternative Land Uses and responding to Comment Grp 8-97, the FEIR argues that current land use already allows activities that "*could likely be more intense and impactful than the project in numerous resource areas*." (FEIR Page 2-639) Several suggested impacts from several specific examples are listed as representing what "*could likely be more intense and impactful.*"

This is not a justification for allowing a more intensive use. First, the Mine Project has significant and unavoidable impacts typical of heavy industrial use, including frequent haul trucks dumping of mine waste on the surface and using heavy equipment to spread, grade, and compact the mine waste into large tailings piles for years. Thus, it is not consistent with existing zoning. Second, in any zoning designation, one can imagine worse case scenarios, but that is not a basis for justification of allowing a non-conforming use in an existing zoning which might be similar to those worse case scenarios. Using this argument could lead to no zoning at all, with pig farms in residential neighborhoods because someone has a pet pig.

The arguments presented in the FEIR justifying the adequacy of the Alternatives analysis are not valid. The Alternatives analysis is not adequate. In addition, the Mine should be designated a heavy industrial project.

Dumping of mine waste on the Centennial site is a heavy industrial activity.
In Response to Comment 8-99, the FEIR states that the dumping of the mine waste on the Centennial site should be considered construction under Section L-II 3.22 D.4.b of the Nevada County Land Use and Development Code, and therefore does not violate the land use ordinances. However, for the purposes of the other impact areas of the FEIR the Centennial site is considered part of operations. It can't be both. Furthermore, the impacts would need to be recalculated for both the construction phase and the operation phase of the project if the dumping of mine waste on the Centennial site were considered part of construction. Dumping of mine waste on the Centennial site is a heavy industrial activity and conflicts with current land use zoning.

Land Use inconsistencies at the Centennial Site.
The FEIR is also deficient in not analyzing the mine project's inconsistencies with the Grass Valley General Plan. The mine project is within the Grass Valley Sphere of Influence. The Centennial site is within Grass Valley's first phase annexation area. A portion of the Centennial site is also zoned by Grass Valley for Urban Medium Density housing. The Nevada County General Plan requires the county to designate lands within the cities' Spheres of Influence consistent with the city land use designations. The County has not done this; thus, the Industrial designation and the mine project's operations are clearly inconsistent with its own General Plan and the Grass Valley General Plan. Physical land use compatibility impacts (industrial uses next to medium density housing) will also result. The FEIR fails to adequately address these issues and respond to comments 8-98. (Page 2-640)

Dumping mine waste on the Centennial site defeats the Project Goal of providing industrial land.
A Project goal of the Mine is to provide usable industrial land on the Centennial site, a benefit. (See DEIR Project Description, Page 3-33.) This is repeated referenced in the FEIR. (E.g.: "*The objective of the placement of engineered fill, over approximately 5 years, at Centennial site is to increase the usable land area at the Centennial site to allow its future use as industrial land (see page 3-12 of the DEIR)*" (FEIR Page 2-640)

However, the FEIR assumes that the baseline for the CEQA analysis of environmental conditions on the Centennial site is that the project has been cleaned up by the DTSC. Thus, the entire 44 acres of the Centennial site that will be covered with mine waste will be suitable for industrial development before the Mine begins operations.

The Mine Project plan is to dump mine waste on the site as "Engineered Fill", covering the 44 acres. This will result in 37 acres of usable industrial land. So in fact, the Mine Project is reducing the amount of usable industrial land by 7 acres.

Since the FEIR insists that the Centennial DTSC cleanup is a separate project, the Mine Project claims of benefit from the dumping of mine waste on the Centennial site are false.

The DEIR has not demonstrated that mine waste disposal by off-site sales would be viable.
The Mine Project relies entirely upon off-site sales as a means of disposing 1000 tons of mine waste daily as "*Engineered Fill*" to be used in construction projects regionally. However, the viability of this plan has not been established. An analysis of the market for the mine waste materials and the issues impacting the feasibility is provided in "FEIRComments_OffSiteSales_3-21-23.pdf", Attachment 6. (The document is also available online at https://www.cea-nc.org/idaho-maryland-mine-final-eir-comments/ .)

FEIR Master Response 11 (FEIR Page 2-61,62) affirms that "*No large-scale temporary rock or sand storage facilities/stockpiles are proposed for the Project.*" The lack of definition of "*large-scale*" leaves open the possibility that materials will be stockpiled on the site, significantly altering the potential impacts on air quality, aesthetics, noise, and water.

The EIR must include a clear restriction stating that no mine waste (i.e. Engineered Fill, barren rock, waste rock, tailings, aggregates or sand) shall be temporarily or permanently stored outside the Project structures on either the Centennial or Brunswick sites other than to complete the two "*Engineered Fill*" pads that are included in the Project Description, and that Mine operations shall reduce or halt generation of these materials if necessary to comply with this mitigation.

Without a credible assurance that the Mine Project has a solution for mine waste disposal, the FEIR is not adequate.

There is scant data on the outflow from the mine.
The FEIR dismisses a valid question about the scant groundwater outflow data from the mine, stating:
"The commenter asserts that there is "scant data" relating to the groundwater outflow values reported in the DEIR. However, measured outflows from the drains were completed by EMKO in April 2019 for the preparation of the Groundwater Hydrology and Water Quality Analysis..."

In fact, here are all of the data from the 4 discharge points that were provided for the FEIR:

Flow data, ED-1: [Eureka Drain]
"...in the range of 100 gpm (Condor, 1994)
"...only a few gpm" (EMKO Feb 2018, Dec 2018)
"...in the range of 20 to 25 gpm" (EMKO, April 17, 2019)

Flow data, IMD-1: [East Eureka Shaft Drain]
"...to be about 60 gpm." (Todd Engineers, 2007)
"...consistent with Todd..." (EMKO Feb 2018, Dec 2018)
"...approximately 100 gpm." (EMKO April 17, 2019)

Flow data, IMD-2: [East Eureka Shaft steel pipe]
"...in the range of 1-2 gpm." (EMKO Feb, 2018)

Flow data, D-1: [A potential mine drain]
"...only a few gallons per minute" (EMKO? Feb, Dec 2018, April 2019)

EMKO failed to actually measure the outflows from the drains. Instead, EMKO estimated them, making vague statements such as "..consistent with Todd...". Those estimates were done on 3 dates (Feb 2018, Dec 2018, and April 2019.)

The FEIR failed to provide an answer to the question "What is the actual measured outflow?" In addition, these few estimates do not provide adequate data for assessing the groundwater baseline. No measurements to assess seasonal variations were undertaken, and the amount of outflow that was predicted by the Itasca Groundwater Model was not provided as requested. As a result, no data to compare the predicted outflows with the actual outflows was provided, which would provide some validation to the Itasca model. The FEIR failed to provide this information.

In responding to comment 7-68, the FEIR introduces data from the 1991 measured drain flows: "*This table provides the following flow data for the drains: IMD-1 = 50 gpm, ED-1 = 110 gpm, IMD-2 = 30 gpm, Drain = 20 gpm (across the street from Roto-Rooter building). These measurements of drain flow are similar to measurements of flow presented in Appendix K.2 of the DEIR.*" (FEIR Page 2-527).

This totals 210 gpm. Note that 210 gpm is significantly outside the range of values estimated by EMKO of 60-125. This further affirms that the FEIR lacks valid current measurements about the amount of water flowing out of the mine. This important deficiency is inappropriately dismissed by the FEIR.

The FEIR goes on to respond that that the current flow rate from the drains was not used for the calibration of the Groundwater Model, and hence not relevant to the analysis.

The absence of mine water outflow data and predicted outflow is a deficiency in the Groundwater Model. Comparing the predicted outflow with the measured outflow is a means of validating the model.

Furthermore, Goal 3 of the Itasca Groundwater Model was stated as to predict "The potential reduction of baseflows of selected nearby creeks as the result of future mining." (Itasca, DEIR Appendix K.3, pg ix) If the current average mine outflow is not known, the potential impacts of the mining upon the creek flow rates cannot be accurately assessed. Clearly the Itasca Groundwater Model does not adequately address this point.

The analysis of seasonal measurements of the level of water in the mine is flawed and does not support the transmissivity assumptions used in the model.
The analysis of seasonal measurements of the level of water in the mine is flawed. (See "Review of the Idaho-Maryland Mine DEIR Groundwater Model" FEIR Page 2-454) The FEIR does not refute this comment regarding the Groundwater Hydrology and Water Quality Analysis Report by EMKO (DEIR Appendix K.2). Instead, the FEIR deflects recognizing the flaw by stating that the topic is irrelevant: "*...the observations presented in Section 3.3.3.3 of Appendix K.2 of the DEIR are not used as the basis for estimating transmissivity values used in the Groundwater Model.*"

In Section 3.3.3.3 of Appendix K.2 the DEIR states "*The differences in the magnitude and cyclicity of the water level fluctuations in the measurements from the New Brunswick Shaft versus those from the domestic wells indicate that there are not any direct connections (e.g. via fractures) between the domestic wells and any of the underground mine workings.*" (EMKO, p31) This is a critical flaw. Here EMKO was attempting to establish that when the groundwater levels vary seasonally (due to precipitation, usage, etc.), the water level in the mine doesn't show corresponding variations, and that this demonstrates low transmissivity (i.e., that the groundwater does not migrate down through the rock and into the mine.) However, the problem is if more water flows into the mine above a certain level, it quickly just flows out the openings at the drain. So regardless of the amount of increased inflow to the mine, the water level remains fairly constant.

The FEIR states that this fact is irrelevant. Apparently, the FEIR is maintaining that the Groundwater Hydrology and Water Quality Analysis Report is wrong in this conclusion:
"...**it is important** *to note that the seasonal patterns in water levels observed in the wells are not reflected in the water levels measured in the mine. The lack of a seasonal pattern in the mine water levels indicates that the mine workings are not directly connected to the wells by through-going fractures...*" (EMKO, p81)

The FEIR clearly fails to address this fundamental error in the EMKO report. The FEIR states "*As described on page 81 of Appendix K.2, the lack of a seasonal pattern in the mine water levels indicates*

that the mine workings are not directly connected to the wells by through-going fractures..." (FEIR Page 2-527)

This is a false conclusion. That is the point being made by the comments Grp 7-70,72 (FEIR Page 2-455 through 457). Read this statement again: "*Obviously, if the water level exceeds the drain level, the water will flow out*" *(Page 2-455). I.e. regardless of how much water flows into the mine, the water level height is limited, and so one cannot derive any meaningful conclusion about seasonality or transmissivity by simply comparing the mine water level.*"

The FEIR is flawed and inconsistent in it's analysis of the groundwater impacts from the mine.

Invalid interpretations of seasonal precipitations vs mine water levels.
The FEIR fails to acknowledge or correct invalid data in the EMKO Report (DEIR Appendix K.2). As noted in comment Grp 7-73, the graph in the EMKO Report, Figure 3-7, is still incorrect, providing misleading information. In addition, the graph in Figure 3-7 lacks sufficiently granular data to correctly represent any actual correlation between precipitation and mine water levels, if they existed.

For example, in close examination of the data for 2005, there is a clear drop in levels between the late winter sample and the mid-summer sample followed by a fall rebound. Also, again in 2006, there is a clear drop from late winter to mid-summer followed by a rebound. Thus, data from both of those years seems to imply that there actually is a seasonal correlation. This discrepancy illustrates that the EMKO Report has inappropriately used sparse data to infer a conclusion which is not valid.

Invalid references used in the FEIR.
The FEIR repeatedly refers the reader to Grp 19-20, Grp 19-21, Grp 19-66, Grp 19-68. (E.g. see Page 2-528.) These Response to Comments do not exist.

Data from monitoring of wells is old, limited to a few years, and with no well owners' usage data.
The Response argues that the monitoring that was conducted in the years 1995-2001 and 2003-2007 was adequate to provide current data on the amount of seasonal variation and the amount of lowering of the ground water level due to drought. The Response states "*Based on the lack of changes in the individual well hydrographs between wet and dry climatic cycles, the amount of recharge, as described in Section 3.2, appears to be consistent from year to year and is not affected substantially by drought or wet cycles.*"

This is misleading. For example, the Response noted below normal rainfall in 2004 and 2007, and near normal in 2003 and 2005, and above normal in 2006. Sequentially the years 2004-2007 are: near normal, below normal, above normal, below normal. This does not constitute "drought or wet cycles". This constitutes normal annual variation. In addition, there is no consideration of lag times between precipitation and ground water recharge. Furthermore, the data is misleading because the "precipitation year" is not the same as the calendar year.

The hydrology report is full of similar statements intending to support a presupposed argument.
For example, even though the analysis of sensitivity scenarios conducted in the Groundwater Model by Itasca was not part of comment Grp 7-77, the Response attempts to provide evidence that the groundwater recharge "has been evaluated" via the Itasca Groundwater Model here by explaining "*that increasing or decreasing recharge by 50% only changes the predicted inflows to the mine by +/- 3% compared to the base case.*" (FEIR Page 2-520)

Of course, this is not actual measured data. This is using the computer simulation with assumed transmissivity values, presumed findings on the impacts of drought on ground water levels, and then concluding that the amount of actual variations of inflow into the mine would even be known to any degree of precision. Plus, there has not been any precise measurement of the outflow from the mine over the same time periods. (Note: clearly the level of water in the Brunswick Shaft is not an adequate measure of mine water inflow as confirmed by comments.) So it is only natural that if one assumes a certain low transmissivity in the bedrock and model accordingly, one would end up confirming what one just assumed.

The response goes on to state "*Thus, there may not be a substantial variation in recharge to the water-bearing geologic materials in the project area. Nevertheless, the sensitivity of the model to changes in recharge has been evaluated*." This is not adequate. What is needed is actual ground water data from the domestic wells! To obtain adequate data to assess variation in recharge due to weather cycles, it should be collected over legitimate periods of high precipitation and low precipitation such as the period of drought we have experienced in 2007-2009, and 2012-2016.

The FEIR Response to Comment Grp 7-77 continues with the following statement, attempting to dismiss the credibility of climate science findings: "*The future effects of climate change on groundwater recharge are unknown and CEQA does not require the analysis of speculative impacts*." (FEIR Page 2-530.)
The FEIR analysis of the groundwater impacts is inconsistent, supports flawed data, ignores valid information, and states that climate science findings are speculation. The FEIR inadequately addresses the subject of groundwater impacts from the mine.

Domestic well usage data is important for assessing groundwater variability.
The FEIR inappropriately dismisses the importance of consumption data. (Comment Grp 7-77, FEIR Page 2-531). Rates of consumption may drastically impact the measured levels of water in domestic wells and may accentuate the seasonal variation in wells. This is obvious: there is more water usage in the dry season for irrigation.

Much of the baseline data used by the Groundwater Model is derived from domestic wells. However, the FEIR mistakenly includes a reference to the Itasca Technical Memo (Append 0) and points out that "Consumption water uses from individual wells are not considered in the groundwater flow model due to the lack of consumptive-use data and the fact that consumptive use is small, relative to regional groundwater flow."

Of course, the local variations in ground water around wells may not drastically affect the overall mine water inflow. But this is not the FEIR defect being addressed. The point made in the final paragraph of comment Grp 7-77 is that the impacts due to drought, seasonal variations, the addition of more wells, etc. need to be factored into the estimates of potential ground water impacts to well owners. The FEIR fails to assess these potential impacts.

The study fails to account for a substantial decrease in groundwater recharge from precipitation as a result of planned project development.
The FEIR fails to provide a quantification of the impacts caused by the reductions in permeability on at least 81 acres due to the project. The FEIR Response speculates that the decrease in infiltration "would be trivial." The reduction in recharge would also have changed the results of the "Sensitivity Scenario 5." These reductions in infiltration would increase the lowering of groundwater levels that were

estimated by the Itasca Groundwater Model and should have been included in the FEIR. The Final EIR is inadequate in its assessment of the Project impacts on groundwater resources.

Additional groundwater impacts from the new access shaft cone of depression.
There will be two shafts at the Brunswick site. One is the existing main Brunswick shaft and head frame, which will be significantly modified. The second "new access shaft" will be constructed about 1000 ft SE from the main Brunswick shaft and will be within 100 ft of the South Fork Wolf Creek (SFWC) natural drainage bed, which will be placed into a new culvert. For a better detail, see Sheet 2, Page 3-14, of the DEIR and note the "Service Shaft Complex".

The FEIR states: "*The proposed service shaft is located approximately 440 ft east of the South Fork Wolf Creek as shown in Figure 3-8 of the DEIR. The service shaft and the excavation to construct it will not be within 100 feet of the creek.*" (FEIR Page 2-531.)

Here the FEIR again relies upon an inaccurate record. SFWC runs through the project and originates east of Brunswick Rd. The natural creek bed runs adjacent to the shaft and is not correctly shown. Instead, the figures only show the creek as it exists in the culvert.

The difficulty in locating the proposed new service shaft in relation to the creek is indicative of the general inadequacy of detail in the project description. The proximity to the natural creek drainage should be evaluated. The fact that the existing creek bed and natural groundwater movement and drainage into the creek is not evaluated is a defect in the EIR.

The impacts of the removal of approximately 60 ft of overburden as shown in Section F-F of "Brunswick Site Plan – Section Views" are not addressed. (See Application Materials, Plans and Elevations) How would it impact the natural drainage of the creek?

The FEIR persists in claiming that "South Fork Wolf Creek originates from the outlet of this 48-inch culvert" This is a false statement. SFWC is a perennial stream that originates on the East side of Brunswick Road.

The FEIR is inadequate in addressing this issue.

The groundwater model should be run for the full term of the 80-year project proposal.
The FEIR notes that "*The comparison of draw-down contours between Scenario 6 and the Base-Case Scenario suggests that the added potential mining (beyond the 65 years modeled) will not lead to large incremental draw-downs as the mining progresses because the mining activities occur in deep, low-K rocks.*" (FEIR Page 2-534)

This is an admission that there likely would be additional draw-down, but the amount is unknown. Clearly the model fails to evaluate the impacts on groundwater over the full course of the project, and is thus inadequate.

The FEIR mentions that the model will be updated in the future. Updating the groundwater model in the future based upon observed data would be valuable in the future as a means of determining whether the model is accurate and allow for model corrections and improved predictions, but that does not provide information for the FEIR as required by CEQA.

The FEIR fails to provide a realistic construction schedule.
The FEIR fails to provide a realistic construction schedule and fails to adequately respond to the issues raised in comments to the DEIR. The assumptions made in Master Response 24 are based on a lack of understanding the nature of construction project scheduling in general and demonstrates a failure to perform simple addition. Furthermore, the claim that *"...increase in the duration of construction activities and/or the completion of activities sequentially would serve to reduce environmental impacts in many areas."* (FEIR Page 2-513) in fact also illustrates that, by not correctly addressing the scope of the construction project, the true impacts from noise, fugitive dust, traffic, greenhouse gases, etc. remain unknown, failing to meet the requirements of CEQA.

The Mine Project will take at least a year to obtain the necessary permits to begin site work. Substantial site work must then be done and a 14 foot build-up pad be constructed before construction could begin on the water treatment facility. This will take at least an additional year. The water treatment facility will be constructed on top of the pad and will take about one year. Assuming other elements needed for dewatering are complete (pond repair, physical closure of near surface shafts, etc), dewatering can begin. Dewatering is at least a six month process. After dewatering has taken the water levels down about 1200 feet, access and construction of the new access shaft can theoretically begin. The new access shaft will take about a year to build. (FEIR Page 2-643). This brings the construction time total to over 3.5 years, and there still remains the lengthy job of removing old shoring and restoring the existing mine works to allow operations at depth.

The updated construction schedule as presented in Master Response 24 is simplistic and misses the key critical path elements of a normal construction schedule. For example, how would dewatering begin without PG&E service? Would generators be used to run the pumps? If so, what are the air quality impacts of that change?

The analysis of air quality impacts, noise, traffic, and hazards cannot be reasonably expected to be accurate based upon the assumptions in the DEIR, which used the estimate of 1 year for construction. The FEIR is inadequate because of this inaccuracy.

Conclusion
The FEIR is a flawed document that does not adequately address the impacts of the proposed Idaho-Maryland Mine Project. We ask that the County deny the approval of the Idaho Maryland Mine Use Permit and not certify the Final Environmental Impact Report.

Thank you,

On behalf of the CEA Foundation Board of Directors,
Ralph Silberstein, President
CEA Foundation

Subject: Protection for Wells Near Idaho-Maryland Mine Still Not Adequate

The Wells Coalition is a group of well owners near the Idaho-Maryland Mine. Our purpose is to protect our only source of water, our wells.

We are astounded that a comprehensive domestic well monitoring program was not established *before* the Draft EIR was published last year. Such a program is a necessary step to establishing the baseline data required by CEQA. It's clear that this omission was recognized in the Final EIR, but the proposed solution is little more than a band-aid that doesn't actually address the serious, underlying problem.

Even though there are over 300 properties with wells within 1000 feet of the Mine's mineral rights area, neither the draft nor final EIRs provided current monitoring data from these domestic wells. They relied only on *sparse patches of data from over 15 years ago*. The quality of this input data is one of many concerns identified by numerous experts who contradicted the findings of the Draft EIR's groundwater study in their written comments.

The EIR's primary approach is to install fifteen non-domestic *monitoring wells over a limited area* to do the job of predicting impacts for all water supply wells. With our complex fractured bedrock spread over thousands of acres, this approach is inadequate. This is further complicated by the fact that the estimated area of potential impact is based on the findings of a questionable study. In addition, the 378 properties identified in the Final EIR's *supplemental domestic well monitoring program* only capture about 150 of the 300 plus wells in the mineral rights area.

Timing of baseline data collection, however, is really the central issue. CEQA requires that a baseline be established prior to the evaluation of potential impacts. This was not done. With mine dewatering, previous dry years, and drought still predicted for the future, it is imperative that we get this right. Adding a well monitoring program *after* the project is approved and just one year before the mine is dewatered - as the Final EIR proposes - is not only out of compliance with CEQA, but is also extremely shortsighted and risky. Multiple experts provided comments telling us that it takes a minimum of 3 years to establish a reliable baseline in order to account for year-over-year variations.

Also, under CEQA a mitigation measure must be achievable, enforceable, and must be capable of actually reducing the Project's impacts. The Final EIR's supplemental domestic well monitoring program is not even defined as a mitigation.

Not having a baseline established by a properly constructed *domestic* well monitoring program before publishing a Final EIR is unacceptable. Our wells are not currently being monitored. Since it will take several years for Rise Gold to establish a reliable baseline, we request the current EIR be rejected and that any future EIRs include at least 3 years of comprehensive well monitoring data.

Sincerely,

Christy Hubbard (District 3 resident)

Nevada County Planning Commissioners
950 Maidu Avenue
Nevada City, Ca. 95959

Dear Commissioners,

My name is Sol Henson, I grew up on the San Juan Ridge and hold a master's degree in hydrology. I am the president of the San Juan Ridge Taxpayers Association and speak for the Association today. I'm here to talk about the importance of baseline monitoring for wells to protect our community from industrial mining impacts.

In 1995 Siskon Gold operated a gold mine in the North Columbia Diggings on the San Juan Ridge. During mining operations, they breached a water bearing fault-line 300 feet underground. This breach led to the loss of nearly a dozen wells including the well for our middle school and the community Cultural Center. This was a disaster for those who lost their wells, but we still do not know the extent of well impacts. Some wells may have lost 50% or even 75% capacity but without baseline data, owners could not prove that the mine had impacted their wells.

This was a single catastrophic event. Wells are more commonly impacted by the extraordinary amount of water pumped out of mine tunnels just to maintain daily industrial mining operations. Over time, millions of gallons of water a day must be removed from the surrounding fractured bedrock aquifer. In such cases, well impacts can be slow to develop and can be hidden within seasonal cycles.

In 2012, the San Juan Ridge Mine Corporation submitted a new permit application to mine the North Columbia Diggings. Exhibiting due diligence, and with community input, the County helped to create a baseline monitoring program for domestic wells. This program established a baseline through monthly collection of water quantity and quality data. This information would have been invaluable for the environmental review process. Should the mine have been permitted, well owners would have had recourse to say with some confidence if their well had been impacted.

We firmly support the precedent of baseline monitoring for projects of such scale and impact as the Idaho Maryland Mine. Significant monitoring programs have been developed in the past for the IMM site, including for the 1996 permit to dewater the mine for exploration and the 2008 Emgold Mine environmental review process. It is unclear why the current Rise Gold effort to permit the IMM lacks a monitoring plan that would form a baseline for water quantity and quality of domestic wells in the surrounding area. We believe that the community is owed these safeguards and that CEQA requires it. Thank you very much.

Sincerely,

Sol Henson

Idaho.MMEIR@co.nevada.ca.us
planning@nevadacountyca.gov

Subject: the Idaho-Maryland Mine Final EIR groundwater hydrological model predictions and risk to domestic wells in the area of the Project.

The proposed well mitigations in the Final EIR for Rise Gold fail to acknowledge that there are significant risks posed to domestic wells in the surrounding area of the Idaho-Maryland Mine project, and it does not comply with CEQA.

The Final EIR for Rise Gold states:

" All potentially impacted wells are located in the E. Bennett Road area. Domestic water wells outside this area will not be impacted." [1]

But expert opinions contradict the certainty of these statements, citing repeatedly the uncertainties in hydrologic predictions and impacts to wells:

Emgold's 2008 DEIR for the Idaho-Maryland Mine states

"Due to the uncertainties regarding the complex geology and groundwater flow, dewatering ***impacts to domestic water supply wells cannot be accurately predicted."*** [2]

Also, Emgold's project description states

*"**The geologic formation in which the mine is located is fractured bedrock whose hydrogeology is difficult to predict.** Therefore, reliance on Domestic Well Level Monitoring Program data will be required to assess impacts and discern appropriate **mitigation measures for each domestic well** owner."* [3]

After reviewing the hydrology computer model from the EIR for Rise Gold an expert hydrogeologist in groundwater modeling stated

"Even a well calibrated model has a large uncertainty to it, in its predictions.

It turns out that this model is not well calibrated, so the uncertainties are almost certainly larger."[4]

The hydrology report for the Idaho-Maryland Mine's 2008 EIR affirms the uncertainty in predicting whether ground water from near surface well waters may drain down into the deeper mine workings.

"The groundwater in this particular area is contained in and flows through fractures in near surface bedrock and because of this fracture flow regime, the groundwater flow in quantity varies considerably with location and ***cannot be predicted with certainty. Furthermore, complete hydraulic separation between the deeper groundwater within the underground mine workings and the shallow groundwater within fractures and supplying the domestic wells cannot be assumed."***[9]

Even the hydrologist who prepared the hydrology computer model for the EIR, told the NID board of directors.

"***With fractured rock there will always be uncertainty and during my career there won't be any 100% confidence in predictions."***[5]

It is because of these uncertainties that we are appealing to you to require protection for all wells with a comprehensive well monitoring plan for at least 3 years to gather baseline data to be used in a revised EIR.

Thank You,

Gary Pierazzi
The Wells Coalition
wells@cea-nc.org

Additional expert opinion quotes regarding uncertainties in groundwater modeling and fractured rock.

"The EMKO Report describes a three-step procedure used to assess potential drawdown effects in perimeter areas. A major assumption underlying the procedure is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth. ***However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of this uncertainty and the overall uncertainty of the analytical and numerical model predictions with respect to groundwater level impacts on individual wells should be provided. expanded to include an assessment of the uncertainty in the conclusions developed by Todd Engineers."****[6]*

"Although the analysis is considered conservative in methodology, ***several complexities in the groundwater system could potentially result in a larger or smaller radius of influence. Although larger impacts seem unlikely, it is difficult to prove that aberrations in the system do not exist."*** *[9]*

"Uncertainties in the analysis indicate that monitoring should occur over a slightly larger area than where impacts are predicted. In addition, the monitoring program should consider adjustments specifically for geologic faulting." *[7]*

"Monitoring locations should also include areas outside of the predicted impact zone to account for uncertainties in the analysis," *[7]*

"The fracture systems existing in buried bedrock beneath Grass Valley are not mappable within the resolution needed to predict specific dewatering effects. Technology and state-of-the-art hydrogeology have not developed to a level that fracture mapping is possible. Due to this limitation, hydrogeologic modeling is attempted by making an assumption on fracture connectivity." *[8]*

"Based upon the significance criteria established on page 4.3-4, ***the risk to all wells within the study area, regardless of risk category, represent a potentially significant impact."*** *[10]*

"The study area has not been monitored by an approved groundwater monitoring system designed to observe the dynamics associated with subsurface hydrology. Therefore, ***many of the initial unknown hydrogeologic and geologic parameters located within the earth between well and mine elevations still exist."***

I'm a resident & well owner in district 1.

I can appreciate the inclusion of a well monitoring program in the FEIR, but it falls significantly short of what we really need. I should not have to beg for protection from the county to keep our sacred resource safe. Our well is amazing! It provides safety from wildfires by allowing us to maintain green space. It keeps my family and pets healthy and happy. Just imagine what you would do if the water in your own home suddenly vanished. Your spouse and kids, asking what's wrong with the water? Oh my god! Without water my property is worthless! How could this have happened? Where is the protection from my county?

Experts have weighed in on the amount of monitoring time necessary to obtain a dependable baseline. In some cases, 3 years is not even enough. It's also a stretch to accept a program that is deficient in infrastructure to replace my water resource if it becomes damaged? As I read the details, I would be subject to some sort of nebulous negotiations with Rise Gold to get my water
connected to NID. Would this make you feel protected? To be forced to deal with a CEO that has demonstrated severe environmental failures in Canada, and spreads contrary information through press releases and interviews, stating, "there will be no impacts", or, "the community overwhelmingly supports the project"?

I should not be required to compromise or negotiate when it comes to an intruder causing harm to my family and home. None of the hundreds of well owners asked for this. None of us would be the recipient of any benefit whatsoever. We need complete protection from this potential catastrophe, with a comprehensive well monitoring program that is designed around the adequate years necessary to produce dependable data. This data should have been obtained before the DEIR, according to CEQA. This program must also lay out, in specific details, the transfer to an equal replacement water source, with all necessary infrastructure in place, and independent from Rise Gold for immediate implementation when a well fails.

Our stress levels are off the charts dealing with these potential consequences, including financial ruin and loss of our nest egg. The fact that I must beg for protection in 3 minutes here is just as stressful. No one here today would accept even the tiniest risk that they could lose their water in exchange for gold in the pockets of strangers. I implore the board reject this FEIR and take
everything back to the drawing board with our protection as top priority.

Mine Waste and the Water Pollution Problem
Jan 10, 2023

The Final EIR for Rise Gold's Idaho-Maryland Mine is inadequate because it fails to address the potentially significant impact of mine waste disposal.

The Mine project plans to export 1000 tons of tailings and waste rock per day. This mine waste will be dumped into 2 Engineered fill piles over the course of the first 11 years. After that, the mine waste will be disposed of through off-site sales.

There are significant issues with the disposal of mine waste due to the potential to pollute ground water and surface waters by leaching hazardous chemicals. This falls under the jurisdiction of the Regional Water Quality Control Board.

The Water Board classifies mine waste by Groups A, B, and C. Only Group C, which has relatively low levels of contaminants, is clean enough to be used for off-site sales. Groups A and B require more stringent controls. The Water board requires mine waste testing to determine classification. In response to the Draft EIR, the Water Board stated: "The applicant shall not sell or utilize waste rock and tailings from the Project for construction aggregate or fill purposes offsite unless such material has been tested and confirmed to qualify as Group C mining waste..." [1]

In the EIR, the Water Board and numerous other parties identified that there was insufficient testing to determine whether the mine waste would be Group C, suitable for off-site sales.
Per the Water Board comments:
"*...the alternative scenario that the mining waste is not suitable for off-site use should be examined."*
The Water Board goes on to state that Rise should assess any constraints or challenges associated with waste disposal in case they can't do off-site sales for construction aggregate. They conclude with:
"The Draft EIR should be revised to address this comment."[3]

Rise Gold acquired a collection of drill cores and samples from Emgold Mining when they purchased the mine. In addition, they did over 67,500 linear feet of exploratory drilling. . Yet, from all those samples, they chose to test only 11 feet to characterize what will be over 25 million tons of waste rock that will be produced over the life of the mine. [2]

Disposal of mine waste is a critical element of the project with the potential for causing significant long term impacts. Yet no further testing was produced for the Final EIR. This is inexplicable.

CEQA requires that the EIR "…give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." [4]
This Final EIR fails to do that.

You are being asked to approve a project without knowing if any portion of the mine waste will qualify as Group C. Currently, there is no realistic plan for continued mine operations if you can't sell the mine waste.

The Final EIR response uses speculative, unproven assumptions stating that the mine rock "...would not be mined until mine waste characterization has been performed to ensure the rock will be suitable for off-site sale. Rock types that are not suitable for off-site sale would likely not be mined, and if mined, the waste rock would be placed underground" [5].

Mine waste classified as Group A and B requires specific management that must be determined by the Water Board, and cannot automatically be placed underground.

Backfilling with waste rock and tailings is the exact scenario which has led to polluted ground water discharges in so many mines in our area. This new element, the placement of Group A or B mine waste underground, was not included in the Draft EIR.

Even disposal of mine waste on the project sites for Engineered fill (Centennial for 5 years, Brunswick for 6 years) requires testing and will have to meet the Water Board's approval. Quoting the Final EIR:

"The barren rock and sand tailings would undergo testing as part of obtaining [Water Discharge Requirements] WDRs for use in the Engineered fill pads, and compliance with water quality objectives will need to be demonstrated to the [Water Board] prior to that placement ." [6]

The project description fails to provide an adequate means of interim storage for mine waste.

The viability of the entire project is dependent upon the safe disposal of mine waste under Group C. There were numerous core samples available that could have undergone static and long-term dynamic testing, yet, subsequent to the release of the Draft EIR, no additional testing was done.

Even if the mine waste is all Group C, it is hard to believe there will be no need to stockpile any of it for shipping off site. 1,000 tons/day will be coming out of the shaft. That's about 50 truck loads/day. Construction aggregate is seasonal. Most construction shuts down in the winter.

The Final EIR is inadequate because if fails to address the potentially significant impact of mine waste disposal. Again, critical testing after project approval does not provide an "…accurate and understandable picture…of the projects likely…impacts".

Thank you.

The Centennial Clean-Up Must Be Included in the EIR
Jan 24, 2023

The Final EIR for Rise Gold's Idaho-Maryland Mine Project is significantly flawed because it does not include the plans to cleanup the Centennial site.

California Department of Toxic Substances Control (DTSC) is managing the cleanup of the 56 acre Centennial site, which is polluted by the mine's historic operations. After it is cleaned up under what is known as a Remedial Action Plan, or RAP, Rise intends to dump mine waste there for about 5 years. But, currently, the cleanup is not done.

Under CEQA the current conditions of a project must be assessed so that the environmental impacts and appropriate mitigations can be determined. The current conditions of the Centennial site are largely unknown because most of the current conditions aren't included in the EIR.

Instead, Rise has included in its EIR what it **assumes** to be a baseline of the future conditions that might occur **after** the cleanup. Adding to the inadequacy of this approach, **an approved RAP does not even exist at this time.** But even if the RAP had been finalized and approved by the DTSC, using a future condition for establishing a baseline in an EIR is almost never valid.

Including the Centennial cleanup in the EIR would have addressed most of these problems because the initial conditions of the site would be described adequately and the steps necessary to prepare the site for mine waste would have been set into the context of the project as a whole. This would have provided a means of determining potential impacts and defining mitigations correctly.

As it is, the true impacts of the project cannot be determined. For example, the draft RAP recognizes that 44 acres will be buried in mine waste and it includes stripping off acres of soil from areas that are not contaminated to provide clean soil to put over the capped contaminated materials and other work areas, destroying wetlands and woodlands. How much of this habitat destruction is really necessary for the clean soil, considering that the mine plans to dump 1000 tons per day of fill on the site? If the cleanup was included in the Mine project, this habitat destruction could be assessed and probably significantly reduced.

In conclusion, Rise's EIR project description is legally inadequate because it does not include the cleanup, which is plainly part of the Project. Instead, the EIR is left guessing as to what the true impacts of the mine project might be. This Final EIR is inadequate under CEQA.

Thank you,

Ralph Silberstein
CEA Foundation

Addendum

- **The FEIR continues to maintain that the Centennial clean-up project is a separate project.**
  - The DEIR's project description is legally inadequate because it excludes the required cleanup of existing contamination on the Centennial Site, which is plainly part of the Project. FEIR p. 2-798, 2-803-05. CEQA defines a "project" broadly to include the "whole of an action," rather than "each separate governmental approval." CEQA Guidelines § 15378(a), (c). Where two actions are integrally related or where one is conditioned on another, they must be considered together as one project; segmenting their analysis is a way to evade a complete impact analysis, and is accordingly forbidden. *Nelson v. County of Kern*, 190 Cal.App.4th 252, 271 (2010).
  - The FEIR merely restates the same faulty justifications from the DEIR for the decision to piecemeal the Centennial cleanup from the IMM Project. The County's assertion that the IMM project can proceed regardless of whether the Centennial cleanup is completed (DEIR at 1-7, FEIR at 2-8) ignores the fact that one of the objectives of the IMM Project is to reclaim the Centennial Site for future industrial use. DEIR at 3-42, 3-46.
  - The DEIR also uses an inconsistent baseline: for certain impact areas, the DEIR pretends that the Centennial cleanup has already occurred, while for others, it uses the current contaminated conditions as the baseline. DEIR 4.0-1. CEQA requires that the baseline "describe physical environmental conditions as they exist at the time the notice of preparation is published," and it prohibits the use of hypothetical conditions. CEQA Guidelines § 15125(a). Accordingly, the DEIR's use of a hypothetical baseline for various impact areas in which the Centennial cleanup has already occurred renders its analysis legally inadequate and unsupported by substantial evidence. FEIR p. 2-801. The FEIR contends that it was not using a future conditions baseline, but instead the "conditions expected when the project becomes operational." FEIR at 2-295. However, there is no evidence that that the Centennial cleanup will have occurred such that it can be "expected" by the time the Project is operational.
  - The FEIR's reliance on *Citizens for a Sustainable Treasure Island v. City and County of San Francisco*, 227 Cal.App.4th 1036 (2014), is misplaced. FEIR 2-9. In that case the issue was not whether the Navy's cleanup should be studied as part of the subsequent development project, but instead whether the project proponent had properly disclosed how it would manage and dispose of hazardous materials in the event it took responsibility for the cleanup. *Id.* at 1058-59. Furthermore, the project proponent in *Treasure Island* had included "exhaustive information" in the EIR about the presence and location of hazardous substances and adopted mitigation measures in case it were required to undertake some cleanup efforts. *Id.* at 1056, 1059. Because it was impossible to know whether the project proponent would have to undertake cleanup efforts, it was appropriate for it to defer environmental assessment. *Id.* at 1059. Here, in contrast, the County provided virtually no information about the contamination on the Centennial site and the process required to remediate it, despite the fact that the Project objectives include increasing the usable land on the Centennial Site to allow for its future use as industrial land. DEIR 3-12.

Idaho-Maryland Mine Greenhouse Gas Emissions Are Significant
Feb 7, 2023

The Idaho-Maryland Mine Final Environmental Impact Report (EIR) is inadequate in its assessment of greenhouse gas (GHG) emissions. A valid threshold for GHG emissions was not set in the EIR.

As stated in the EIR, CEQA Guidelines allow a lead agency to determine its own thresholds for environmental impacts (including GHG emissions), and "explicitly provides that an agency may consider thresholds adopted by other agencies provided that such decision is supported by substantial evidence."[1]

The Northern Sierra Air Quality Management District has not set thresholds for GHG emissions, so, as lead agency, Nevada County simply applied the 10,000 Ton/year [2] carbon-dioxide-emission threshold chosen by some other air districts for this project. However, the justifications for adopting these thresholds are unique to each air district. These other air districts have prepared detailed GHG inventories to identify and evaluate strategies for achieving the statewide GHG reduction goals within their districts.

Nevada County cannot simply assume that the justifications used by other air districts to adopt their thresholds also apply in Nevada County. Hence, the EIR failed to provide "substantial evidence" required by CEQA by just relying other districts for setting the threshold. In fact, the EIR provided no evidence beyond just copying what other districts used.

But this is doubly wrong because the other air districts originally adopted the 10,000 Ton threshold to achieve the older statewide GHG goal under California Assembly Bill 32, which is no longer consistent with the current statewide GHG reductions goals.[3]

In 2015, the California Supreme Court determined that a project's GHG emissions should be evaluated based on its effect on California's efforts to meet its long-term climate goals.[4]

Then, in 2017, the California Air Quality Board Climate Change Scoping Plan stated "Achieving no net additional increase in GHG emissions, resulting in no contribution to GHG impacts, is an appropriate overall objective for new development."[5]

And in 2018, Governor Brown signed Executive Order 55-18, calling for the state to achieve carbon neutrality as soon as possible and no later than 2045, and to achieve and maintain net-negative emissions thereafter.[6] In view of this, the mine's 9000 tons/year of emissions for 80 years should be considered significant and unmitigated.

The mine is proposing an 80 year project, and no consideration was given to meeting the state's GHG emission goals. The EIR should have established a net zero threshold for GHG emissions from the proposed project.

For example, in considering current goals, the recent Draft EIR for another mine - the analogous Sargent Ranch Quarry project within the Bay Area Air District uses a net-zero significance threshold for operational GHG emissions.[7]

This EIR should have done the same. The EIR does not explain why the Project should be exempted.

Nevada County Energy Action Plan

The Nevada County Energy Action Plan's (EAP) goal is to reduce the projected annual grid supplied electricity the county will use in 2035 by 51% and the annual natural gas use by 30% through energy efficiency measures. The mine's electricity use is equal to adding the energy use of 5,575 homes in Nevada County. This almost eliminates the results of any energy-saving measures planned by the county.

This project will consume 49,000 Megawatts of electricity, in direct conflict with the County's energy reduction goals.[8] The FEIR states "...although the EAP is not a Qualified GHG Emissions Reduction Plan under CEQA the project was nevertheless determined to be consistent with the EAP."[9] This statement is essentially false. [10]

In fact, the Mine operation is antithetical to the County's Energy Action Plan. The Nevada County Planning Commission and the Board of Supervisors should ask the question: Are we serious about the Energy Action Plans? If so, this mine should not be approved.

In conclusion, the EIR for the mine fails to correctly identify a valid threshold for GHG emissions by assuming an outdated 10,000 Ton threshold without any substantial evidence, failing to consider the current State goals, and it would also effectively undo a large part of the goals of the Energy Action Plan.

Under CEQA, this EIR is totally inadequate in addressing the significant impacts of greenhouse gas emissions from Rise Gold's proposed mine.

Thank you,

Mine Waste and Asbestos Impacts Comments on the Final EIR
March 14, 2023

Overview

Airborne asbestos is hazardous to inhale, leading to lung cancer and other diseases. The Idaho-Maryland Mine Final EIR does not provide enough data to determine the potential impacts of airborne asbestos, and the asbestos management plan (ASUR plan) for preventing hazardous emissions is inadequate.

Very limited asbestos testing was done, constituting less than 2/10,000 of the total rock to be mined over the project lifespan. As the Air Quality Board stated “It would be short-sighted to commit to the ASUR Plan for the entire life of the mine based on the few samples that have been tested so far.” (FEIR Page 2-360)

The ASUR plan was developed to limit emissions, but it is a flawed document that fails to provide the needed protections. Under the plan, if the asbestos concentrations on any 1000-ton lot of mined materials would put the 3-month rolling average asbestos concentration over a threshold of 0.01%, it would not be allowed to be exported.

A key problem is accurate and timely testing. It takes 2 weeks to get the results. The Final EIR has no provisions for stockpiling materials while waiting for results. And no temporary storage on the surface is provided. To avoid the need for stockpiling mined materials, the plan states that exploratory drilling tests will determine what can be mined in advance. Then grab samples will be taken as the rock is loaded into silos for deployment. But the testing is too sparse.

The loading into silos of 1000 tons of rock requires about 166 6-ton skip loads. This means that the grab test will only capture, on average, about 1 out of 55 skip loads, and even then, the three grab samples will be mixed together to form one combined test. And even accurate sample testing before shipping will not always prevent exceeding the safe average threshold.

Examination of how this system may fail reveals that large quantities of mine waste could pass through undetected. And though the ASUR plan talks about what happens when the delayed testing shows that the threshold was exceeded, it doesn’t actually provide a credible solution or adequate oversight.

Finally, it’s important to note that all exported Mine Waste from this mine must be classified as “Restricted Materials” (ASUR 9.2, p18) Aggregate suppliers in the region have indicated that they do not handle Restricted Materials because there is no market for them and there already are abundant aggregate sources regionally.

In conclusion, the Final EIR does not provide adequate data on asbestos concentrations, and fails to adequately address processing and disposal of asbestos-bearing mine waste.

A. Introduction

Asbestos is found in all the rock types within the Idaho-Maryland Mine in varying concentrations, though it is predominantly associated with Serpentinite, which can contain high concentrations. Airborne asbestos is hazardous to inhale. It can lead to mesothelioma cancer, asbestosis, and other diseases, and is closely regulated by the California Air Resources Board (CARB). The mine's "Asbestos, Serpentinite, and Ultramafic Rock (ASUR) Management Plan" (DEIR Appendix E.2) was developed to address the management of asbestos airborne emissions. Regulation of asbestos emissions falls under the jurisdiction of CARB and the Northern Sierra Air Quality Management District (NSAQMD). Management of asbestos to prevent hazardous emissions is complicated by the difficulties of accurately testing for it and by the fact that concentrations can be found close to gold ore.

B. Criteria

The FEIR Condition of Approval 3 (COA-3) and the ASUR Plan establish a limit of 0.01% asbestos by weight as the threshold for managing all mine waste that leaves the enclosed project structures or containment structures, such as the silos, conveyors, and processing facility. Under the ASUR Plan, if the asbestos concentrations on any 1000 ton lot of mined materials would put the 3-month rolling average asbestos concentration over 0.01%, then that lot would not be allowed to be sent out of the containment structures.

The Final EIR does not provide enough baseline data to determine whether the project can be mined while meeting this threshold. Very limited testing was done. Thirty-seven samples were taken, but they came from only 3 drill holes. (Drill Holes 1-18-11, 1-19-13, and 1-19-14, ASUR Plan, Appendix C, p55-57). Assuming that each sample provided a good estimate of the asbestos concentrations for a 2000 cubic foot volume (20' h x 10' w x 10' d), the tests constituted less than 2/10,000 of the total rock to be mined over 75 years. The criteria for sample selection was not specified and the sampling party was not named.

Even so, of the 37 drill core samples from the mine that were tested, asbestos testing (TEM method) determined that 15 had asbestos, and 8 of those had asbestos over the 0.01 limit. A potential hazard clearly exists.

There are three test methods. Polarized Light Microscopy (PLM) is fast but not precise, being only valid for detecting above 0.25%. This method is not adequate for detecting the 0.01% threshold, but it is used to define the threshold for surfacing applications under the Airborne Toxic Control Measure (ASTM). The Transmission Electron Microscopy (TEM) process is more accurate, but takes up to 2 weeks to get a result. The TEM test is what dictates most of the management activities in the ASUR Plan to prevent asbestos emissions. (A third method, Phase Contrast Microscopy (PCM), is not valid for rock sampling but is used for air quality monitoring and provides a referential standard for TEM.) (ASUR, p8).

The FEIR has NO plans for the temporary stockpiling of mined materials. So, to avoid the need for stockpiling mined materials, the ASUR Plan states that samples from exploratory drilling will be tested for asbestos in advance of mining. If the anticipated rolling average asbestos levels exceed 0.01%, gold ore will not be mined and barren rock will either not be mined or mined using a dust collection system and materials will be disposed underground (ASUR, p9). However, the prescribed testing is sparse and could easily miss rock having higher asbestos levels. Just one combined test per 1000 thousand tons of mine rock is prescribed (1000 tons is approximately equal to an 8'x8'x170' block).

The mined rock will be lifted from the mine to the silos on the surface with skips. Gold ore will be dumped into a silo with 1000 tons of capacity and barren rock into two smaller silos with 400 tons of capacity. From the gold ore silo, material is fed into the processing facility via an enclosed conveyor.

The project plans to process about 1500 tons of rock per day, from which 1000 tons is expected to be mineralized rock (gold ore) and 500 tons is expected to be waste rock (barren rock). The gold ore will be run through the processing facility to extract a gold concentrate, leaving 1000 tons of fine sand tailings material which must be disposed.

About half of the sand tailings, 500 tons per day, will be mixed with cement to form a cement paste backfill material which will be put back into the mine. The other 500 tons per day of sand tailings will stockpiled to be loaded onto trucks with a front-end loader and trucked off. The 500 tons of barren rock that are mined daily will be moved via conveyors to the truck loading building for export.

C. Deficiencies of the Testing and Processing Plans

To prevent the 3-month rolling average of asbestos in rock from exceeding the 0.01% threshold, the ASUR Plan relies on developing an inventory of asbestos levels of un-mined rock through exploration and testing, and then avoiding mining the rock that would violate the threshold.

However, the critical test that monitors what will be exported is taken when the gold ore and barren rock are lifted and dumped into the silos. A minimum of three grab samples must be taken for each 1000 tons that are transferred. These three samples will then be combined to form a composite sample for a single test result. Each sample is added to the record which tracks the rolling average of exported materials.

The materials are lifted into the silos using skip carts that lift around 6 tons (ASUR, Fig 2). The processing of 1000 tons requires about 166 skip loads. Each grab test will only capture, on average, about 1 out of 55 skip loads, and even then, the three grab samples will be mixed together in a combined test. Because of the sparseness of the sampling, 1000 tons of mine rock, or about 50 truckloads worth, could contain excessive levels of asbestos and still pass through undetected.

Complicating that, the materials go into a split output stream, with a daily average of 1000 tons going to the processing facility and 500 tons going directly off-site as barren waste rock. It is not specified how the grab samples would be associated with the two output streams.

After processing, as described previously, the sand tailings are exported: 500 tons of the tailings will go off-site, and 500 tons will be transported back into the mine and used as cemented paste backfill. The plan should specify separate sampling criteria for each stream of materials which should follow those materials through the process phases.

The amount of required testing is inadequate to reasonably detect the asbestos levels of materials leaving the containment structures. The ASUR Plan does not even specify testing of the sand tailings after processing, and there are no provisions for the gold ore to be tracked to associate the specific test results with the 1000 ton loads as the material is sent through the processing facility. If a TEM grab test comes back with unexpectedly high asbestos values, how would the processing system determine which sand tailings from the processing output should be redirected to be used as cemented-paste backfill? This part of the plan is inadequate in assuring that higher-than-expected levels of asbestos are not being exported.

The materials' processing is a stream, but the ASUR Plan tries to manage the materials by testing blocks of un-mined rock. Materials from multiple sites within the mine will be transported, crushed to 6" maximum size and lifted for processing. Most of the materials will then be sent via conveyors to the processing facility, and the resultant sand tailings will be conveyed and accumulated for hauling out. The testing procedure is poorly suited for tracking the materials through the processing system. How will the process keep track of which final outputs were from a given block of un-mined rock?

In addition, under certain conditions as described in ASUR Plan Section 6.0-7i (ASUR, p8), gold ore with high asbestos levels would be processed, which means introducing gold processing tailings with known exceedances into the same system.

D. Deficiencies in the Moving Average Approach

Exceeding the 0.01% threshold would only be detected in hind-sight once the TEM tests are processed. In addition, a series of many individual loads in excess of 0.01% could be shipped out and still not exceed the 3-month rolling average if the average started out low. Given that there is no plan for on-site storage, the possibility is real that, during the 2 week testing lag time, many additional 1000-ton batches of materials exceeding 0.01% asbestos would be processed. Taken together, many weeks' worth of mine waste with high levels of asbestos could be shipped out.

We noted above that one test from 3 grab samples is sparse and can likely give inaccurate results. But even if testing accurately measures the asbestos levels per day, it does not assure that the 3-month rolling average won't end up exceeding the 0.01% threshold. For example, the following test results would result in a 0.024% average asbestos concentration on Day 120 even after an operations shut down on day 106.

Threshold Exceedance Example

Day 105:
- 75 days exported averaging 0.008%
- 15 days exported averaging 0.02% ((75x0.008)+(15x0.02)) /90 = **0.01% average. OK**
- 15 days exported (test results not back yet, avg 0.03%)

Day 106:
- 74 days exported averaging 0.008%
- 15 days exported averaging 0.02%
- 1 day exported at 0.03% (74x0.008)+(15x0.02) + (0.03) /90 = **0.0102% average, SHUT DOWN**
- 14 days already exported (test results not back yet, avg 0.03%)

:

Day 120:
- 60 days exported averaging 0.008%
- 15 days exported averaging 0.02%
- 15 days exported averaging 0.03% ((60x0.008)+(15x0.02)+(15x0.03))/90 = **0.024%**

Results in 15 days exceeding the 0.01% rolling average!

In the Threshold Exceedance Example, the 90 day average asbestos level ends up at 0.024% even while complying with the ASUR Plan by shutting down on the first day of exceedance (Day 106). Plus, in total, 30 individual days of output exceeded 0.01% asbestos concentration.

The ASUR plan to prevent the asbestos levels from exceeding the 0.01% threshold is inadequate.

E. Surface Exposures of Airborne Asbestos at the Engineered Fill Sites

There will be about 500 tons per day of sand tailings exported from the ore processing plant. This represents approximately one half of 1000 tons of tested gold ore from the silo. The sand tailings from the gold ore processing is stockpiled inside a containment structure to be loaded onto trucks with a skip loader and shipped off. Operations run for 24/7 but materials are only shipped off 16 hours per day and may have weather related days of no shipping, accumulating the sand tailings, which are loaded into trucks outside the structure (FEIR Page 2-543). Conceivably, the 30 days of gold ore that were processed in the Threshold Exceedance Example could produce sand tailings exceeding the 0.01% threshold.

How would it be determined which sand tailings came from the contaminated materials that end up in the sand tailings containment structure?

After the sand tailings are delivered to the planned Engineered Fill dumping sites at the Centennial site, and later the Brunswick site, they will be mixed with the barren rock in the open air by "on-site blending of blast rock and sand tailings" (DEIR Centennial GeoTechnical Report, p13). Using the Threshold Exceedance Example, thirty days of materials exceeding the asbestos threshold - equivalent to 1500 truck loads - could be mixed in the open air on the Engineered Fill sites, in clear violation of the ASUR Plan goals for reduction of airborne asbestos.

F. Exported Mine Waste is Classified as "Restricted Materials"

All mine waste, aka "Engineered Fill" or "sand tailings and barren rock," from the Idaho-Maryland Mine is considered "Restricted Materials" under 17 CCR 93106(d)(1). (ASUR Plan, p16-17).

The Restricted Materials can be separated into two groups, one group being below the 0.25% threshold under the ASTM rule, and the other group being equal or above that threshold.
For materials below 0.25% asbestos using the PLM test, the material can be transported and used for Engineered Fill or surface applications, but "*Any person who transports Engineered Fill (considered a restricted material) must maintain a copy of all receipts with the material at all times during transit and application*" (ASUR p16).
The following receipts must be provided:

A. The amount of restricted material that was sold or supplied;
B. The date that the restricted material was sold or supplied;
C. The dates that the restricted material was sampled and tested; and
D. A statement that the asbestos content of the restricted material is less than 0.25 percent.

Because the ASUR plan establishes a threshold of 0.01% for the rolling 3-month average using TEM testing, it is probable that most of the mine waste that is output from the facility would fall below 0.25%. However, it is worth noting that some 1000 ton daily outputs could exceed 0.25% and still not cause the rolling 3 month average to exceed 0.01%. (For example, 89 days with an average of 0.007% and 1 day with 0.25% asbestos concentration by weight equals a rolling average of less than 0.01%.)

For materials at or above 0.25% asbestos, the mine waste is classified as "Asbestos Containing Material" under ATCM for Surfacing Standards. For Engineered Fill materials detected at or above 0.25% using the PLM test, strict usage requirements are imposed to prevent exposure or possible future

disturbances. ATCM requires that "*the material shall not be used for surfacing applications pursuant to 17 CCR 93106*" (ASUR p16).

In the case of at or above 0.25%, it cannot be used for surfacing, but it may be used for operations that assure the materials will be handled under strict conditions. All materials in this classification must be accompanied with the following written receipt:

> **WARNING!**
> **This material may contain asbestos.**
> *It is unlawful to use this material for surfacing or any application in which it would remain exposed and subject to possible disturbances.*
> *Extreme care should be taken when handling this material to minimize the generation of dust.*
>
> *Any person who transports Engineered Fill (considered a restricted material) must maintain a copy of all receipts with the material at all times during transit and application.*

Of course, the three-month rolling average must also be less than 0.01% to even be shipped out.

G. The "Restricted Materials" classification may severely limit off-site sales.

As the ATCM rules make it clear:
"**All aggregate extracted from the Idaho-Maryland** *underground mine, including barren rock and mineralized material sent for processing,* **is considered Restricted Material** *under the ATCM for Surfacing Applications*" (ASUR 9.2, p18).

Aggregate suppliers in the region have indicated that they do not handle Restricted Materials because there is no market for them.

H. Unapproved Underground Dumping May Violate Water Board Standards

The ASUR Plan does not address how the mine waste which might be diverted to underground storage because of high asbestos levels would be tested to conform with the Water Board's requirements to prevent pollution of ground and surface waters through leaching of hazardous chemicals. Because the Final EIR did not include adequate testing of the mine rock for possible water contamination, the Water Board is requiring continuous testing to determine whether the materials conform to Group C mine waste, which is required for off-site use, or whether the Water Board will require special processing as the more hazardous Group A or Group B mine waste.

I. The ASUR Plan is Ambiguous and Self Contradictory

1) Ambiguous Terms

The ASUR Plan discusses the processing and testing of mine waste by utilizing the euphemism "Engineered Fill," eventually describing it on page 13 in the statement: "...asbestos content of Engineered Fill (barren rock and sand tailings) placed and compacted..." Since there is an intent to simply sell the the mine waste, "Engineered Fill" doesn't seem to mean the applicant is including the "placement and compacting." Hence, the document seems to define Engineered Fill simply as "barren rock and sand tailings."

The use of the term “engineered fill” is ambiguous when there are statements such as ““the remainder of the *sand tailings* will be used for *engineered fill*.” Substituting the words “barren rock and sand tailings” for “engineered fill” in this statement then reads thus: “the remainder of the *sand tailings* will be used for *barren rock and sand tailings*.”

Another confusing example is the use of the term “Asbestos Containing Materials.” This term is explicitly defined in the document to mean materials having over 0.25% asbestos under the ASTM rule. However, materials having asbestos exceeding 0.01% are also referred to as “asbestos containing materials,” as seen on ASUR Plan page 20.

The ASUR Plan document contains numerous ambiguous statements which distort the meaning and validity of the document.

2) Aggregates, Surfacing and Loopholes

Rock aggregates that are used in the construction industry include a wide range of materials mostly consisting of specific crushed rock sizes that are generally screened or filtered to within certain size limits (e.g. ¾” Class II road base) and many also require washing. The barren rock that is produced by the mine will be mixed crushed rock 6 inches or less in size and would need to be recrushed to the right sizes, screened, and sometimes washed to meet most aggregate market demand. The sand tailings are fine sand or silt size granules which have very limited use. (See https://www.gohbe.com/index.php/rock-masonry.) However, the ASUR Plan mistakenly treats Engineered Fill and surfacing materials interchangeably. Engineered Fill made of barren rock and sand tailings is not suitable for surfacing applications. Sand tailings have little use and the barren rock would first need additional processing, which requires facilities that the mine does not provide.

The word “aggregate” is commonly known but is not specifically defined in the ASUR Plan. In Section 8.4 (p16), the term is used to describe regulatory restrictions: “*If a composite sample determines that aggregate is not Asbestos-Containing Material, a written receipt must be provided to the recipient of the Engineered Fill.*” This statement is ambiguous in that it is not clear that the Engineered Fill being referred to is the “aggregate” used in this sentence, or some additional materials.

The ASUR Plan repeatedly refers to surfacing materials as if they are equivalent to Engineered Fill. For example, the statement in Section 6.0 -Item 7(i):
“*If planned mining is projected to result in insufficient material available for Surfacing in Engineered Fill Placement Plan:*
i. An operational plan will be prepared and approved….”

Item 7(i) in section 6.0 also describes ambiguous conditions about “insufficient materials” which seemingly allow mining of Asbestos Containing Material if it is gold ore.
Then the subsequent Item 8(i) in Section 6.0 then states that if the 0.01% threshold would be exceeded, gold ore will not be mined. *(ASUR, p9)* This is in direct contradiction to Item 7(i)!

3) Operations Oversight

The ASUR Plan lacks clearly defined oversight for the management of the asbestos materials. Nor are guidelines for approval of changes to operations or procedures provided. Here the responsibility is given to an unspecified “geology department.”

“*If the three-month rolling Asbestos Inventory for materials hoisted to surface exceeds 0.01% asbestos by mass of PCM equivalent units the geology department will immediately investigate the source of the*

asbestos containing material and halt mining in the area of concern until a revised mine plan is prepared in compliance with the ASUR Plan" (ASUR, p20).

This is inadequate. To provide reasonable safeguards, an independent party should be responsible for overseeing monitoring, investigations, reporting, and corrective actions. What constitutes a valid report should be defined. And guidelines for subsequent actions should be explicitly defined and authorized by the County and NSAQMD, and not be done by employees of the mine.

The ASUR Plan was written by Rise Gold (ASUR, p1).

Conclusion

The Final EIR does not provide adequate data on asbestos concentrations in mine rock to determine the potential impacts under CEQA. In addition, the ASUR Plan fails to adequately address processing and disposal of asbestos-bearing mine waste to meet its stated goals, and the ASUR Plan is internally inconsistent and ambiguous, providing numerous loopholes in regulatory oversight.

The potential for hazardous airborne pollution from the mine project is a significant health concern which is inadequately addressed in the Idaho-Maryland Mine Final EIR. This Final EIR should be rejected.

The appended figure is from page 106 of Rise Gold's "Technical Report On The Idaho-Maryland Project" (https://www.risegoldcorp.com/uploads/content/I-M_Tech_Report.pdf). It shows the Morehouse Fault and the location of gold ore in close proximity to surrounding Serpentinite rock beds. Serpentinite is generally high in asbestos. The purple shows Serpentinite, the orange shows Gabbro, and the red line shows the gold-quartz ore vein. The region near the bottom of the figure is a primary target for the proposed project.

Off-site Sales of Mine Waste and the Idaho-Maryland Mine Final EIR
March 20, 2023

Introduction

The Idaho-Maryland Mine Final Environmental Impact Report (FEIR) does not provide adequate information regarding the viability of the plan to dispose of mine waste through off-site sales and does not have provisions for adequate on-site temporary storage or permanent disposal of mine waste, leading to potentially significant impacts.

The project documents call for approximately 11 years of operations in which the mine waste will be disposed of on the Centennial and Brunswick sites as "Engineered Fill," but the FEIR fails to resolve uncertainties affecting the viability of that plan. Due to inadequate testing information in the FEIR, the mine waste could not be classified as Group C mine waste by the Regional Water Quality Control Board as needed to allow dumping onto these two sites. In addition, due to inadequate testing of mine drill cores for asbestos to establish a reasonable assessment of the potential hazards due to airborne asbestos, numerous management issues regarding the safe handling and placement of asbestos-bearing rock as "Restricted Materials" remain unresolved.

Worse still, for the remaining 65 or more years of operations, even if the issues of potential water and asbestos impacts are resolved, significant issues remain as to how and where the mine waste will be disposed.

Mine Waste Disposal Plans

The mine operations will require disposing of 1500 tons/day of mine waste 365 days/year for approximately 75 years. Five hundred tons/day of sand tailings are to be returned underground in the form of cemented paste backfill. The remaining 1000 tons/day, consisting of 500 tons/day of barren rock and 500 tons/day of sand tailings, will be exported from the containment structures of the processing facility.

The mineralized rock (ore) and barren rock will be removed from the mine by hoisting and dropping the materials into the silos on the surface at the New Brunswick shaft. The silos will have a capacity of 1000 tons for the ore and 400 tons for the barren rock. This means that the silos will have a maximum capacity of just under the daily production of 1500 tons. The 1000 tons/day ore will then be run through the processing facility and the sand tailings for export will be loaded into haul trucks with a front-end loader from within an enclosed structure. The barren rock will be loaded directly into haul trucks from the silo.

Market Demand

The FEIR states that after the Centennial and Brunswick sites are full, "...hauling of engineered fill (barren rock and sand tailings) would shift entirely to be utilized in local and regional construction markets." (FEIR Page 2-59). The market demand for this mine waste (barren rock and sand tailings) has not been established.

The FEIR mistakenly assumes that the aggregate market is analogous to the market for mine waste rock (or barren rock) and sand tailings. The FEIR then argues that there is substantial market demand for aggregates in the region. (See FEIR Master Response 11, "Evidence for Market Demand", Page 2-61, 62)

The FEIR notes that the Sacramento County aggregate production-construction area has less than 50% of its 50-year aggregate demand currently permitted, and also lists the annual demands for Nevada County, Placer County, and Yuba City/Marysville. The FEIR then concludes, "This master response demonstrates that there is sufficient market demand for engineered fill (barren rock and sand tailings)". This is a false conclusion based upon selectively excerpting data from the California Department of Conservation Mapsheet 52, 2018, (https://www.conservation.ca.gov/cgs/Documents/Publications/Map-Sheets/MS_052_California_Aggregates_Map_201807.pdf)

In fact, the Department of Conservation data shows that Sacramento County has 327 million tons of aggregate supplies already permitted, enough to meet 21 to 30 years of demand. In addition, it is entirely reasonable to expect that within the next 20 to 30 years, more permits may be issued in Sacramento County. In addition, the aggregates map also shows that surrounding counties already have more than enough surplus aggregate supplies to provide for the needs of Sacramento County. Placer County has more than double the estimated 50 year aggregate demand already permitted (387 million tons vs 188 million tons needed), Nevada County has 125% of the 50 year aggregate demand already permitted (52 of 41 needed), and Yuba City-Marysville has almost 200% already permitted (679 of 344 needed).

A realistic view of the market for aggregates is that there are abundant aggregate supplies in the region, the aggregate market is very competitive, demand varies significantly by season, and most importantly, the mine waste is ill-suited to compete in the aggregate market.

Mine Waste versus Aggregate Demand

The FEIR addresses the market viability for off-site sales based upon assumptions of annual mass volume demand of aggregate and erroneously assumes that the mine's barren rock and sand tailings would be suitable for meeting that aggregate demand.

Aggregate production is a business which requires the delivery of specific rock sizes and grades depending on the nature of the customer's project. A producer must be able to produce and deliver rock that meets the specifications - such as those noted below - in the specific tonnages required by the customers. Regional market demands for aggregates are wildly varied in grade and size and producers must comply with aggregate specifications. Consequently, aggregate producers have to produce and stockpile numerous specific products, which have different production inputs, screening, crushing, and washing needs.

The mine will be exporting 500 tons/day of “sand tailings” and 500 tons/day of “barren rock.” The sand will be a mix of medium and fine sand, down to very fine silt that has limited market value (300 - 0.044 mm). The barren rock will be crushed to “approximately 6 inches maximum dimension.” (DEIR appendix H4, p14) These two products fulfill only a small portion of the aggregate market.

At the very least, in order to compete in the aggregate market, significant processing of the mine waste would be required, and the Idaho-Maryland Mine project does not include any of the facilities needed for that processing. The mine waste material may only be suitable for fill, while the majority of aggregate sales in the region are for specified aggregate types.

Example Aggregate Products *

Crushed Aggregate – No Fines		
Crushed Aggregate (3/8" Hot Plant)	3/16" x 7/16"	Black & white river rock used for pathways landscaping and underdrains.
Crushed Aggregate (1/2" Hot Plant)	7"/16" x 5/8"	Black & white river rock used for pathways landscaping and underdrains.
Crushed Mine Rock	1" x 2"	1" x 2" Good rock in muddy areas. Lays down well, very angular.
Crushed Mine Rock	2" x 5"	very angular rock good for very muddy and wet locations.
3/4" Clean Crush	5/8" x 1"	Crushed angular rock with very few fines is popular for parking areas and driveways.
Permeable Class 1 Type B (1/4" x 1/2")	1/4" x 1/2"	round river rock used for underdrains.
Trench Fill, Crushed certain NID jobs	3/16" x 5/8"	This aggregate has been designed to meet fill material specifications for
Crushed Aggregate With Fines		
Aggregate Base 3/4" Class II	1" minus	State spec. product. Compacts well use under driveways, roads, etc
Limestone Base Rock ¾"	1" minus	Blue-gray angular rock with fines. Packs very hard.
Road Rock 1/2"	1/2" minus	Crushed black & white rock with fines.
Road Rock 3/4"	1" minus	Crushed black and white rock with fines.
3/4" AB II Ridge Rock slopes	1" minus	This very angular blue/green-gray rock packs well on driveways and is good on slopes
Crushed Mine Rock 1 1/2"	2" minus	Very angular blue/green-gray to brown rock, packs very well.
Recycled Base Rock 3/4"(ClassII)	1" minus	Base rock made from 100% recycled asphalt, concrete and aggregate products.
3/16" x 5/8" Clean Crushed	3/16" x 5/8"	This angular crushed product is made at our Ridge Rock Quarry.
Sand		
Crushed Sand	1/4” minus	This sand packs very well. Used for backfill under pipes and culverts and pathways.
Masonry Sand	1/8” minus	Fine washed sand used for stucco, mortar & horse arenas.

Fill Sand, PG&E Spec.	1/8” minus	This economical sand packs well. Used as fill in trenches over pipe and gas lines.
Pond Sand/Silt	1/16” minus	Very fine unwashed product, typically used as affordable fill material.

*Partial Aggregate List From Hansen Bros. Enterprises, https://www.gohbe.com/index.php/rock-masonry . See also https://teichert.com/materials/aggregate-products/, https://unionquarries.com/crushed-stone-sizes-for-construction/

The FEIR speculates that the project can meet the specific business needs of the aggregate market without providing a plan for how to actually produce the aggregates needed to meet the actual aggregate market demands. In addition, the FEIR does not provide any market demand data for the rock and sand tailings that will actually be produced by the mine.

Seasonal Demand

Furthermore, the market for aggregates is seasonal. There is little demand for aggregate in the winter months, as little construction is taking place due to weather restrictions. In addition, winter weather can shut down any ongoing operations. How will the mine waste be managed during long winter shutdowns? There is no provision for temporary stockpiling of output materials anywhere on the project sites.

Asbestos Bearing Mine Waste

The FEIR does not provide adequate testing to assess the potential impacts of asbestos bearing rock and air pollution hazards, utilizing samples from just 3 drill cores. The few tests that were conducted represented only approximately 2/10,000 of the mine rock volume planned for excavation. This is inadequate.

Management of asbestos bearing rock is described in the “Asbestos, Serpentinite, and Ultramafic Rock Management Plan” (ASUR Plan) in DEIR Appendix E.2. Due to the potential for the occurance of asbestos-bearing rock in the Idaho-Maryland Mine, which is in an Ultramafic Rock zone, all materials extracted from the Idaho-Maryland Mine are considered “Restricted Materials” under the California Air Resources Board (CARB) asbestos Airborne Toxic Control Measures (ATCM). (ASUR Plan, p18). This requires written documentation to accompany any handling, transport and application of the materials, including testing information, amounts, dates, etc. Reportedly, area aggregate suppliers avoid using Restricted Materials because there isn’t a market for them.

In addition, the North Sierra Air Quality Management District (NSAQMD) requires that the 3-month rolling average of asbestos levels in all mined materials that leave the enclosed project facilities must not exceed 0.01% asbestos by weight. Concerningly, there are multiple deficiencies in the ASUR plan which could fail to determine exceedances of this 0.01% rolling average threshold until after the materials have already been shipped out.

The ASUR Plan does not adequately safeguard against exceeding the toxic thresholds that are established for this project. These safeguard deficiencies are identified in “MineWaste_Asbestos_Impacts_Comments_Final.pdf” (https://www.cea-nc.org/wp-content/uploads/2023/03/MineWaste_AsbestosImpacts_Comments_Final_3-14-23.pdf)

Contaminated Mine Waste and Water Impacts

As mentioned, the FEIR has not adequately determined that the mine waste can be disposed of by off-site sales (see above). Nor has it been adequately determined that the waste can be disposed of by dumping it as Engineered Fill because of its potential to pollute ground and surface waters by the leaching of hazardous chemicals. This inadequacy falls under the jurisdiction of the Central Valley Regional Water Quality Control Board (CVRWQCB, or Water Board).

The Water Board classifies mine waste by Groups A, B, and C. Only Group C, which has relatively low levels of contaminants, is clean enough to be used for off-site sales. Groups A and B require more stringent controls. The Water Board requires sufficient mine waste testing to determine its classification. In its response to the Draft EIR, the Water Board states: "The applicant shall not sell or utilize waste rock and tailings from the Project for construction aggregate or fill purposes offsite unless such material has been tested and confirmed to qualify as Group C mining waste..." (FEIR Page 2-61).

In the DEIR, the Water Board and numerous other parties identified that there was insufficient testing to determine whether the mine waste would be classified as Group C. Therefore, its suitability for off-site sales is in question. Per the Water Board comments:"...the alternative scenario that the mining waste is not suitable for off-site use should be examined." The Water Board goes on to state that Rise should assess any constraints or challenges associated with waste disposal, in case they can't do off-site sales for construction aggregate. They conclude with: "The Draft EIR should be revised to address this comment" (FEIR Page 2-233, 234). The FEIR does not address the Water Board's comment. This is unacceptable, especially given that Rise Gold could easily have done an adequate amount of testing to accommodate the Water Board's requests, given the plethora of drill cores and samples to which Rise Gold has access.

Rise Gold acquired a collection of drill cores and samples from Emgold Mining when they purchased the mine. In addition, they did over 67,500 linear feet of exploratory drilling, themselves. Yet, from all those samples, they chose to test only 11 feet – of the 67,500 - to characterize what will be over 25 million tons of mine waste that will be produced over the life of the mine (1000tons/day x 365days/year x 75years = 27 million tons).

Disposal of mine waste is a critical element of the project with the potential for causing significant, negative, long term impacts if it is inappropriately stored or disposed of. Yet, in spite of the wholly inadequate testing represented in the DEIR, the fact that no further testing of the drill cores was required by the FEIR is inexplicable and unacceptable.

The FEIR response uses speculative, unproven assumptions stating that the mine rock "...would not be mined until mine waste characterization has been performed to ensure the rock will be suitable for off-site sale. Rock types that are not suitable for off-site sale would likely not be mined, and if mined, the waste rock would be placed underground," (FEIR Page 2-60).

Mine waste classified as Group A or Group B requires specific management that must be determined by the Water Board and cannot automatically be placed underground. Backfilling with waste rock and tailings is the exact scenario which has led to polluted ground water discharges in so many mines in our area. This new project element, the placement of Group A or Group B mine waste underground, was

not included in the Draft EIR and if not addressed adequately has a high potential of creating the same type of long-term toxic mine water discharge again.

Even disposal of mine waste on the project sites for Engineered Fill (Centennial for 5 years, Brunswick for 6 years) requires testing and will have to meet the Water Board's approval. Quoting the Final EIR: " The barren rock and sand tailings would undergo testing as part of obtaining WDRs [Water Discharge Requirements] for use in the Engineered Fill pads, and compliance with water quality objectives will need to be demonstrated to the CVRWQCB prior to that placement," (FEIR Page 2-59, 60). This is further detailed in Mitigation Measure 4.8-1 (e) (FEIR Page 3-37,38,39).

The FEIR Master Response 11 makes false and misleading assertions. The discussion makes the false claim that "...the historic mine waste has been determined to be Group C mining waste from which any discharge would be in compliance with the applicable water quality control plan, including water quality objectives other than turbidity," (FEIR Page 2-59). In fact, the historic mine waste has not been determined to be Group C by the Water Board. The site is currently undergoing a cleanup under the Department of Toxic Substances Control (DTSC) and was conditionally deferred from being processed as a superfund site provided the cleanup is completed. See "IMM_TRANSMITTAL_Signed.pdf" at https://www.envirostor.dtsc.ca.gov/public/final_documents2?global_id=29100007&enforcement_id=60472136. The DTSC does not need to do cleanup on sites that have only Group C mine waste.

In any event, the legacy tailings on the Centennial site cannot be used to determine the likely classification of the mine waste from the proposed project because:

1. The tailings on the site have been subject to over 67 years of oxidation and leaching, reducing the presence of soluble hazardous chemicals which may pollute the surface and ground waters.
2. The geology varies in the Idaho-Maryland Mine.
3. The samples provide by the DEIR were for selected areas and did not undergo examination and testing to the satisfaction of the Water Board to warrant its classification as Group C.

However, the Centennial site does serve as a cautionary tale of the hazards associated with dumping mine tailings.

The FEIR fails to provide information necessary to assess the potential impacts to surface and ground waters from the leaching of contaminants from mine waste. The mine waste must be classified as Group C mine waste in order to be used for off-site sales. The Water Board requested additional testing to be done and the DEIR to be recirculated to provide adequate data for review. The FEIR provides no additional testing. The FEIR provides no viable plan for storage or disposal of those materials. Instead, the FEIR suggests that "Rock types that are not suitable for off-site sale would likely not be mined, and if mined, the waste rock would be placed underground," (FEIR Page 2-60). Mine waste classified as Group A and B requires specific management that must be determined by the Water Board, and cannot automatically be placed underground. The FEIR fails to provide adequate information to reasonably determine how to characterize the mine waste for safe disposal.

Conclusion

The FEIR Master Response 11 states:
"If the Project's proposed engineered fill sites and the Brunswick and Centennial Industrial Sites were complete and there was low demand for barren rock or sand tailings, or the material was unsuitable for construction use, the operation would by necessity reduce or halt generation of these materials

until an appropriate market, such as fill material or other use of rock material for which the material met appropriate specifications, could be identified."

As this statement demonstrates, rather than following the requirements of CEQA, the FEIR chooses to ignore the need for assessing the potential impacts of the disposal of mine waste. Instead the FEIR assumes, without substance, that an appropriate market would be found to provide a solution. In addition, the FEIR fails to address a potential that the mine waste may not be suitable for dumping on the project's two Engineered Fill sites, or provide a mechanism for managing the reduction or cessation of operations. Who would make the determination to halt, and under what authority? How would the contaminated materials that are in process be managed? This is a recipe for a failed project leaving yet another toxic problem.

In summary,

- No evidence was provided that an adequate market for Restricted Materials in the form of barren rock and sand tailings exists.
- Most aggregate sales require rock ground to specifications that require an aggregate processing facility. No facilities or other provisions to produce those materials were provided.
- No temporary stockpiling capacity is included in the project description or FEIR to deal with a lack of market demand, or even to accommodate variations in demand. The applicant apparently envisions starting and stopping mining operations as individual orders come in from unknown sources.
- The FEIR does not provide adequate testing to determine the potential impacts of the mine from airborne asbestos.
- The FEIR does not provide adequate testing to determine if the mine waste will qualify as Group C.
- The viability of the critical operational plan to dispose of mine waste is not demonstrated.

CEQA requires that the EIR *"**...give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts.**" (CEQA 15125)* This Final EIR fails to meet that requirement.

Groundwater Baseline Requirements and the Idaho-Maryland Mine EIR

Presented as Public Comment to the Planning Commission Jan 12, 2023

The California Environmental Quality Act (CEQA) does not allow the deferral of important studies necessary to characterize a project's impacts.

According to CEQA Guidelines § 15125(a), an Environmental Impact Report (EIR) must include an accurate description of a project's environmental setting, which provides "the baseline physical conditions by which a lead agency determines whether an impact is significant."[1] It goes on to state: this baseline "should describe **physical environmental conditions as they exist at the time the notice of preparation** is published."[2] (i.e. before the Draft EIR is prepared.) The purpose of this requirement is, per CEQA Guidelines, "to give the public and decision makers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts."[3] And the court case of *Save Our Peninsula Com. v. Monterey County Bd. of Supervisors (2001)* affirmed that point: "Without a determination and description of the existing physical conditions on the property at the **start** of the environmental review process, the EIR cannot provide a meaningful assessment of the environmental impacts of the proposed project."[4]

Note that the Rise Gold project Final EIR clearly acknowledges that this baseline is needed. It states that for each domestic well, a projected and seasonally averaged water level shall be estimated **"...which will serve as a baseline groundwater level.**"[5] But this **incorrectly defers** the collection of the needed additional groundwater data to after the EIR process is over.

Let's look at it using common sense. Unless the EIR identifies current well levels and related data, it cannot establish performance criteria and evaluate how dewatering may impact wells, and it's not possible to define appropriate mitigations. For example, Rise Gold's hydrology model estimates that water levels will drop between 1-10 feet for over 150 wells. But there is no current data that could tell what the impact would be to well owners. A two foot drop could be critical. How would that be determined? Are some wells near failure? We don't know.

CEQA law, County precedents, and common sense all say the same thing: Collection of the well data should have been included in the Draft EIR, not deferred until after the CEQA decision has been made.

Current domestic well monitoring data should have been collected and included in the EIR to establish a baseline so that it can be reviewed and then used in the decision making process. The County has ignored this critical step and released an inadequate Final EIR.

Thank you.

Just Say No to the Final EIR and the Idaho Maryland Mine

Presented to the Nevada County Planning Commission 1/12/23

The previous speakers made it very clear that the groundwater impacts of the proposed mine have not been adequately addressed in the Final EIR… and could be catastrophic. Rather, the Final EIR holds to their Draft EIR conclusion, with no additional analysis, that impacts will be less than significant.

This is a theme throughout the Final EIR responses. The consultants continually dismiss comments from our technical experts on numerous big-ticket impacts, against all common sense, and continue to conclude that impacts will be less than significant.

That is why when we come before you in the next few months, we will ask you to just say no. Please do not certify this flawed EIR. And do not approve the project. The many environmental impacts associated with the Project, as well as its inconsistency with Grass Valley's and the County's land use plans provide ample justification for denying the Project. If you deny the Project, the County is under no legal obligation to certify the EIR. This has been well-litigated by other counties.

The bottom line is that the community overwhelmingly does not want the-Idaho Maryland Mine to reopen. We believe that the impacts will be severe, and it will permanently alter the community we have become since it was closed down almost 70 years ago.

There is no reason to continue with the EIR. We believe that continuing the EIR will just cost the County in loss of your time and energy as well as that of your staff and the community. We can better spend this time on critical issues like wildfire safety and climate change.

Yes, you can certify the EIR and deny the project just to get it out of the way. But do we want a flawed EIR in our records that can be used in the future by the next Canadian gold mining company?

We appreciate that staff and the decision makers have worked so well with the community.

Now we are asking you to please say no to the Final EIR and the mine.

Thank you for your time,

Laurie Oberholtzer
District 1 Resident
Board Member, Community Environmental Advocates Foundation

Mr. Kelley,

As someone who resides and provides health care in Grass Valley I implore you to reject the FEIR and vote NO on the Idaho Maryland- Mine project,
As part of your obligations I assume you must know that the overwhelming majority of county residents oppose the opening of the Idaho Maryland Mine. This has been demonstrated at multiple meetings as well as opinion pieces in the Union. I trust you are already aware of the multitude of reasons for these opinions.
Science should trump speculation and the voices of concerned citizens must drown out misinformation from untrustworthy developers.

Sincerely.

Subject: Both RGV's EIR and conditional use permit should be denied approval

1. The Idaho-Maryland Mine complex (hereafter referred to as IMM) is a combination of five mines that commenced production in 1863. Active mining operations ceased by 1956. Both the IMM and the Centennial site currently are zoned as Light Industrial (M1). RGV has applied to have the IMM rezoned M1 with Mineral Extraction Combining District. The zoning ordinance describes a “ME” Mineral Extraction Combining District as follows:
The purpose of this District is to allow for surface mining and to provide for **public awareness of the potential for surface mining to occur** where adequate information indicates that significant mineral deposits are likely present. The district shall only be used on those lands that are within any of the compatible Nevada County General Plan designations and which are not in a residential zone (emphasis added).
This description contemplates that the Mineral Extraction Combining District will only be allowed in areas where current residential use has not made mining an incompatible use. This is consistent with Chapter 17 of the General Plan governing Mineral Management Element, which states in its introduction that “Mine development is encouraged in compatible areas **before encroachment of conflicting uses.”** (Emphasis added). It’s also consistent with Section L-II 5.9 of the zoning ordinance entitled Amendments to the Nevada County General Plan and Zoning Ordinance. Part G of that section requires that the Planning Commission and Board of Supervisors make three findings as a prerequisite to allowing an amendment to the zoning ordinance:

1. The proposed amendment is consistent with and furthers the goals, objectives, policies, and implementation measures of the General

Plan and the provisions of this Code;
2. The proposed amendment will not be detrimental to the public interest, health, safety, convenience, or welfare of the County;
3. For General Plan land use map and zoning district map amendments, the site is physically suitable for the requested Plan designation(s) and zoning district(s) and anticipated land use development(s). Factors considered to evaluate suitability shall include access, provision of public facilities and utilities, **compatibility with nearby land uses,** and presence or absence of resources and constraints as found in the Resource Standards (emphasis added).

Putting aside RGV's inability to satisfy the first two of these prerequisites for a zoning change, on its face it fails to meet the third prerequisite as well. Section L-II 3.22(8) defines "Incompatible Land Uses" as "[l]and uses inherently incompatible with mining. . . . Examples of such uses may include, but shall not be limited to residential uses, public facilities,. . .and commercial." The mine abuts land zoned Residential Agriculture on all sides. It's also a short distance from other residential neighborhoods, schools, churches and small businesses. However compatible the location of the IMM may have been in 1956, it clearly is incompatible with the area as it now exists. On this basis alone, RGV's request to amend the zoning ordinance to M1-ME must be denied.

2. As stated at page 1-1 of Nevada County's General Plan, "The role of the General Plan is the County's constitution for the physical use of the County's resources, the foundation upon which all land use decisions are made."

Part 4.10-1 of Rise Grass Valley's Environmental Impact Report (EIR) states that "Generation of a substantial temporary increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies, due to initial construction activities. . . .[E]ven with the implementation of mitigation, the impact would be considered *significant and unavoidable."* This "temporary increase in ambient noise" is estimated to last 18 months. Moreover, the EIR estimates that for at least 5 years, there would be 100 heavy truck round trips between the Brunswick site and the Centennial site. Page 4.10-35.

Goal 9.1 of Chapter 9 of the General Plan, captioned Noise, states as follows: "Provide for the health, safety, and welfare of the people of Nevada County through a set of policies designed to encourage an environment free of unnecessary and annoying noise."

Part 9.1.10 states as follows: "Strongly discourage those General Plan amendments and zone changes that would likely create land use conflicts relative to noise."

Because the noise generated from construction of facilities at Rise Grass Valley would be significant and unavoidable, and because the operation of the mine would create land use conflicts relative to noise, the County must deny approval of both the EIR and Rise's proposed zoning amendment from M1 to M1-ME.

3. Part 4.12-1 of the EIR states as follows: "[E]ven after mitigation, the project's impact to the Brunswick Road/SR 174 intersection would be significant and unavoidable."

When the County considers an application for a mining permit, "[o]f particular importance shall be the impact of the operation on nearby land uses, water quantity and quality, noise and vibration impacts, *and traffic associated with the operation."* (emphasis added). General Plan Chapter 17, Policy 17.15.

Chapter 4 of the General Plan, captioned "Circulation," specifies in Policy LU-4.1.5 that "[w]here it is determined by the County that a County road, road segment or intersection no longer provides the desirable or acceptable level of service as defined in Policy LU-4.1.1 and Policy LU-4.1.2, the County shall take action to ensure compatibility between future growth and the road system. Solutions to local road system problems may include funding of transportation related facilities, transportation management techniques, or *development limitations or restrictions*. (emphasis added)

According to Volume 2 of the General Plan, Section 6, Table 11, the County gives the section of Brunswick Road from Idaho-Maryland Road to Highway 174 the lowest Level of Service grade of "F," meaning that the roadway is already at overcapacity, even without 100 roundtrips by heavy trucks 24 hours a day.

When the significant and unmitigable impact that the mine will have on the Brunswick Road/SR 174 intersection is combined with the congestion on Brunswick Road in this area, both the spirit and letter of the General Plan require that "development limitations" be imposed in the form of a denial of the RGV application.

4. Part 4.1-2 of Rise Grass Valley's Environmental Impact report states as follows: "[E]ven after implementation of mitigation, the impact related to substantially degrading the existing visual character or quality of public views is considered significant and unavoidable."

Goal 18.2 of Chapter 18 of the General Plan, captioned "Aesthetics," directs the County to " [p]rotect and preserve important scenic resources." Because Rise Grass Valley's plan would create a significant and unmitigable impact on public views in violation of the General Plan, its

application for a conditional use permit must be denied.

I urge The Planning Commission to NOT recommend approval of this invasive project to our Board of Supervisors. The applicant has not provided an adequate environmental assessment to date. I feel our community will be negatively impacted by traffic and noise of an underground project operating 24 hours per day. The negatives far out way a few jobs it may create. 84 years approval is ridiculous. Please listen to the majority of citizens who oppose this invasive project and recommend NOT approving it to our Board of Supervisors. Thank you for your service to our community.

Hi, I've been thinking about what other enterprise you can ask to come to Nevada County that would add jobs and enhance our community. The mine would add jobs but would cause you much ill will from a lot of the community and also a lot of inconvenience and environmental impact. Also, I doubt you would be re-elected to guide our community.

What about a Costco? A clean energy business, such as hydroelectric or electric cars? Some sort of sustainability business that can assess all the natural threats to us, such as fire, earthquake, flooding, etc., and help us to mitigate those threats on an ongoing basis, via hiring labor in our community to shore up our infrastructure and to protect us better?

You can get creative and research and bring to us out-of-the-box solutions rather than accepting this company just because they won't leave us alone and keep coming back. We don't want them here; they don't care.

Take a look at these websites to see if you can get assistance in finding new ways to support Nevada County: Community and Economic Development Programs | RURAL.gov & Smart Growth in Small Towns and Rural Communities | US EPA

I realize having the mine approach us is what looks like an easy fix, but the articles I've read about this company show it as ineffectual and inefficient. We don't want a mine here, much less, one with this

track record.

Thank you for taking my email seriously and for being open to other ideas.

Dear Nevada County Supervisors and Planning Commissioners,

My name is Allan Duncan. I live at 10205 Stone Arch Dr, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

We're still living with the pollution of previous mining. The increased traffic will make this area a less desirable place to live.

Sincerely,

Allan Duncan

Dear Nevada County Supervisors and Planning Commissioners,

My name is Brett Bold. I live at 13814 Rhoda rd, Grass valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live off lower colfax on Rhoda Rd and although my address is not one of 378, our well will no dought be affected. I am about 1000 yards from the houses in the study. Our well is spring fed from up stream too. I have lived here 5 years, and am a local business owner. I have 23 employees and growing. If this mine happens, my family will move out of this county and relocate some of
My employees, but ultimately most of them will stay here and be looking for a job. So to say the least, this mine will be losing jobs for citizens of this county, but also would lose a million dollar business and the tax money we pay. Please just say no. None of this makes sense.

Sincerely,

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live along the 174 corridor. The pull out from my neighborhood onto 174 is already dangerous. Adding more trucks to 174 will cause more accidents. Someone has died at our pull out.
With all the fire\brush clearing 174 has gotten loader and loader. All the trucks on 174 will take away the peace of our beautiful county. So far we have physical safety, and quality of life. Then there is air quality and environmental health factors. The asbestos and other toxic dust is going to hurt or families and take away from the value of our homes. Who is going to pay for the reduced value in my home?

Sincerely,

Christopher Dobbins

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Emily Ellis. I live at 742 Dorothy Way, Auburn, CA 95603.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Sincerely,

Emily Ellis

Dear Nevada County Supervisors and Planning Commissioners,

My name is Glen & Darcie Little. I live at 13262 Curtis Ln, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

Hello,
I live in Grass Valley about 2 miles south of the fairgrounds in District 4. Our family has lived here since 2002. We say NO on the reopening of the Idaho-Maryland Mine. Too many unknowns for our wonderful community. Keep our community as it is! It's perfect now!

Sincerely,

Glen & Darcie Little

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Gregory Weisswasser. I live at 10938 Bubbling Wells Rd, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

My family and I live in District Three and we operate a natural medicine practice called, "Whitewater Naturopathic Medicine", since 2004. We live in the vicinity of the proposed Mine, off Brunswick Road. We are opposed to dewatering the old mines and the impact on our water table and wells. We are opposed to the crushing of rock and the impact on our air quality and the releasing of debris down Wolf Creek. This community has modernized and diversified since the mines closed and reopening them would have a severely negative impact our on quality of life here. We implore you to say NO to reopening the Idaho Maryland Mine. Thank you for your time and attention. Our future here depends on it.

Sincerely,

Gregory Weisswasser

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Howard Hersh at hhersh@sbcglobal.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Howard Hersh. I live at 13079 Daisy Blue Mine Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

My family has lived in District One, just off of Cement Hill Road, since 1974. We moved here from the Bay Area to homestead our eight acre parcel and raise our children in a safe, clean and beautiful environment.

The attempt to reopen the Idaho-Maryland Mine represents an existential threat to the lifestyle and natural beauty of our county. We are counting on you to protect our community by denying permission to the corporate interests who are willing to gain short-term profit at the expense of the qualities for which our area is celebrated.

For longterm residents and future generations, please vote no on the re-opening.

Sincerely,

Howard Hersh

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is James Moore. I live at 14809 Goldcone Dr, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

My experience as a docent and current Curator of the North Star Powerhouse and Mine Museum on Allison Ranch Rd has educated me on the dangers and long term effects of opening a underground gold mine in a developed area. Clean-up of ground water and contaminated soil continues today. The history of the Rise Gold ownership is suspect at least, and probably criminal. Allowing the project to go forward will likely be catastrophic in the long run, affecting our descendants profoundly.

Sincerely,

James Moore

Dear Nevada County Supervisors and Planning Commissioners,

My name is Laurie Beacock. I live at 214 Mill St, Nevada City, CA 95959.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

I have lived in Nevada County for 32 years. 21 of those years I owned and lived on 450 feet of Deer Creek in Nevada City. I cared for and renewed this historical Nisenan property using ecological principles, leading to the state and county award for Resource Conservationist of the Year. All work was done by hand, never using chemicals, in order to further protect Deer Creek and the environs. I currently own and care for land in the historical Nevada City district 1.

No to the Idaho Maryland Mine is imperative.

Laurie Beacock

Thank you.

Sincerely,

Laurie Beacock

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Linda Evangeline Roberts. I live at 11314 Cedar Ridge Drive, Cedar Ridge, CA 95924.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

I am a fourth generation Nevada County resident with many family members and friends who, like me, call this county home. I own a home in District 3 and have lived there for over 20 years. I won't go into all of the pros and cons of allowing the reopening of the Idaho-Maryland mine. I'm sure you've read all the articles in The Union and letters sent to you (mine was dated 9/6/21). As you drive around Nevada County you can see hundreds of "No Mine" signs. I have only seen two "Yes Mine" signs. No matter what mining operation you review, you never see it leaving the area mined better than before. (We are still cleaning up Empire Mine.)

There are other clean businesses we can invite to our county that would be positive

assets and bring in tax revenues without the thunderous noise level 24/7, deterioration of our roads, contamination of beautiful land, precious water and damage to the whole ecosystem. Also, the mine will decrease property values which will decrease monies paid for property taxes.

You have done an amazing job growing Nevada County in a sustainable manner. I truly believe your decision to allow or not allow the reopening of the Idaho-Maryland Mine will be your forever legacy. How do you want to be remembered? This is a pivotal decision. I implore you, please vote NO.

Sincerely,

Linda Evangeline Roberts

Dear Nevada County Supervisors and Planning Commissioners,

My name is Linda Rouda. I live at 11649 Side Hill Circle, Nevada City, CA 95959.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

I reside on lower Banner Mountain. Everyone on our Street is opposed to the mine.
We rely on wells for our water. The ecosystem is very fragile now.
This area's resources are in danger if the mine is reopened.
Tourism is just starting to rebound after the pandemic. Rivers are a big draw. No one wants to come to a noisy polluted area to vacation. Let mining stay in our past please.
You will not sleep well if you sell out your children's future. No money is worth our clean air and water!

Sincerely,

Linda Rouda

Dear Nevada County Supervisors and Planning Commissioners,

My name is Michelle Davis. I live at 17471 Blum Road, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

This project is just too high risk. The possible additional taxes won't be able to make up for the destruction of our ground water, wells, and lower property values. Reopening the mine puts the agricultural properties at very high risk. Agriculture saved Chicago Park during the River Fire. If it hadn't been for grazed and irrigated areas, the fire would have been much worse. I want good jobs in our county too, but this project isn't good for the community. Please vote no.

Sincerely,

Michelle Davis

Dear Nevada County Supervisors and Planning Commissioners,

My name is Shirley Porter. I live at 12968 Burma Road, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My name is Shirley Porter, I live on Burma Road and am in District 3. MY husband's family moved to this area in 1950. And the family has been coming here ever since and now my husband and I have retired and come back to remodel the original home and live here permanently. He remembers hearing l lot of underground booms over the years the family lived here - 1950 - 1953 and they were quite disruptive! I encourage you to" just say no" to this plan of reopening the Idaho - Maryland mine. E live within the area who could see wells disappearing and would be subject to a lot of pollution due to endless trucks driving near by and also driving issues in his area of Brunswick. Please consider all of the objections to reopening this mine from most of Nevada County citizens! Thanks

Sincerely,

Shirley Porter

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Steve Danner at Danner.steve@gmail.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Steve Danner. I live at 10517 Indian trail, Nevada city, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Here are some reasons why I believe the mine should not be reopened:

Community opposition: Many local residents and community groups have expressed opposition to the reopening of the mine. They are concerned about the environmental and health impacts, as well as the potential disruption to their way of life. There is also a sense that the mine's owner has a history of environmental violations on previous projects.
The Idaho-Maryland mine is located in a sensitive watershed. The mine would use large amounts of water, which could impact the availability of water for other uses, such as drinking water, irrigation, and recreation. The mine would also generate large amounts of waste, which could pollute the water and air.
Basically the Idaho-Maryland mine would have a negative impact on the community.

The mine would generate noise and dust, which would make it difficult to live nearby. The mine would also create traffic congestion and air pollution. The mine would also have a negative impact on the environment, which would harm the quality of life for everyone in the community.
For all of these reasons, I urge you to oppose the opening of the Idaho-Maryland mine.

Sincerely,

Steve Danner

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Suzanne Olive. I live at 15356 Banner Lava Cap Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My family and I have lived and worked in Nevada County for forty-three years. For thirty-three years we have lived on Banner Mountain in District 1. We have raised our family here, worked in education, volunteered for various worthy causes. We are deeply invested in this community. To open a hard-rock, gold-mining operation in the midst of our rural communities is unconscionable. No amount of money is worth the enormous risks to our health and well being. Routes 174 and 49 are barely adequate to handle the increase in automobile traffic. I struggle to imagine how these roads will accommodate up to fifty gravel trucks per day for years. Why not restore this mine as a state park with hiking trails, like the Empire Mine or the North Star Mine? For the sake of the county and those of us who live and work here, please vote "No" on reopening this mine. We have a lot to lose.

Sincerely,

Suzanne Olive

Dear Nevada County Supervisors and Planning Commissioners,

My name is Suzi Kerston. I live at 13233 lost lake rd grass valley, Grass valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have lived in Nevada county for 18 years in both penn valley and grass valley, and planned on staying for the rest of my life. but if that mine open I will be leaving. Due to the risk associated with an active mine in the middle of a populated area. I have a low producing well that is 690 feet deep and suspect that will be affected by the dewatering process. Please don’t make me leave a town I love and the town my parents and brother lives! Mines belong in the desert not in the middle of our beautiful community.

Sincerely,

Suzi Kerston

Dear Nevada County Supervisors and Planning Commissioners,

My name is Tammy Becker. I live at 58 Primrose Lane, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

I live here in Grass Valley near the Nevada County Fairgrounds, in District 3. We have lived in Grass Valley for over 25 years, moving here from the San Francisco Bay Area. We moved to Nevada County for the beauty, peace and relative quiet. We enjoy the light, rural traffic and are the envy of our friends back in the Bay Area. Nevada County is one of the last bastions providing its residents with a unique life style as well as attracting many tourists from all over California and other States. Re-opening the Mine will seriously and negatively impact not just the residents, but also the tourist trade which provides a strong revenue base for Nevada County.

Please do not allow the Mine to re-open and destroy our quality of life and our health, as well as our valuable tourist trade.

Sincerely,

Tammy Becker

Dear Nevada County Supervisors and Planning Commissioners,

My name is Valerie Kack. I live at 10350 Smith Rd, Grass Valley, CA 95949.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in district 2 next Ellen’s Creek which feeds into Wolf Creek. I have lived here for almost 40 years, and I have watched the runoff from the flooding of old mineshaft along the creek, leaving all kinds of toxic blooming chemicals that have an oily surface. I am virtually downstream. From the Empire Mine ‘s runoff and living with the hidden toxins that are not being acknowledged in this debate. If they were, there would be no debate. To consider this equals to disregard that early minors head for the abuse of our waterways and you may think it’s only one person being affected, but it’s happening to everyone that lives along this creek. This morning I saw an eider duck, a fishing heron, and two river otters in Wolf Creek. They represent the animal world that are not being talked about. Finally the proposal this mining company is making has historically been in trouble for their unsafe practices and not cleaning up their messes. I do not believe anybody in this town wants that. And I will

say this again, if this passes, I am leaving the county.

Sincerely,

Valerie Kack

Dear Nevada County Supervisors and Planning Commissioners,

My name is Vicki Stremel. I live at 14696 Oak Ridge Rd, NEVADA CITY, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We are located in District 1 and frequent Brunswick Rd and the intersection of Greenhorn and E. Bennett Rds in our many travels. Having owned property in Nevada County for 12 years and lived here for 6 years, we have enjoyed the beautiful, historic, peaceful surroundings on a daily basis. My husband visited family in Nevada County for 70+ years.
Rise Gold came to our community to reopen a gold mine for their greed, when they haven't taken care of their last project causing environmental damage and having an open lawsuit in Canada. This is a company that shows they are irresponsible and unwilling to follow the rules for the benefit of the community. We can't afford to have them pollute our waterways, causing irreversible damage. Damage our roads, 24/7 noise pollution and only employ a few from the community.
Please, DO NOT approve their request! Please listen to our communities concerns!

Please find other sources of income for our County!

Sincerely,

Vicki Stremel

Dear Nevada County Supervisors and Planning Commissioners,

My name is Vince Faraone. I live at 14351 wilder lane, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

The only way to allow this potential superfund site to go forward would be to require posting of insurance bonds or appropriate protections for the public. I think it was Jamestown that fell for the promises of the foreign interests and when they made their profits, poof gone leaving behind a super fund site. I believe mining laws protect foreign interests over local, you know, old colonial policies.

Sincerely,

Vince Faraone

April 17, 2023

Nevada County Planning Department
950 Maidu Avenue, Suite 170
Nevada City, CA 95959

Dear Sir:

Thank you for the opportunity to comment on the proposed reopening of the Idaho-Maryland Mine. I am writing to express my opposition to this.

I believe that allowing this proposal to go forward would be a serious mistake. While Gold mining was important to the development of Nevada County it needs to be relegated permanently to history, not brought into the present and future of the County.

In the decades since this mine was shuttered, the area has evolved in a way that is incompatible with heavy extraction Industry. I believe that the current zoning is appropriate and should be retained. The past mining practices have left enough damage in their wake.

Ideally, a way should be found to permanently prevent reiteration of attempts to reopen this historic mine. The continuation of this process is enormously wasteful for the County of Nevada and creates ongoing anxiety for the residents of Nevada County, especially for property owners in proximity to the site.

Sincerely,

Robert Erickson

Please say "NO" to the mine. Approval would be a disaster for so many reasons, mainly water, pollution and noise. I would hope we have made more progress than to think the mine needs to reopen! Plus Rise does not have a good record. I researched them!! If it is approved we will regret it I am certain!!

To Whom It May Concern-
I'm not in favor of allowing the Idaho Maryland Mine to reopen and resume mining operations. Unlike the time in the mid 1950s when the mine ceased operation, this area is now populated with many homes and businesses. I feel that the environmental impacts that a 24 hour, 7 day a week mining operation on residents in the area is not worth it. Constant truck traffic will cause wear and tear on the roads which will be a drain on county maintenance resources. Air and noise pollution created by trucks, heavy equipment, drilling and stamping is a given and a step back to a time to when our environment took a back seat to doing business. Dewatering a mine which has remained idle for +65 years and now filled, has the potential to create a geologic catastrophe, causing wells to go dry. Dewatering the mine will also affect the downstream ecology all the way to the Pacific Ocean, not only during the initial draining, but will continue for the mining operation to remain viable.
Our community can't afford to make agreement that would allow for 80 years of mining operations to continue long after most, if not all of us are long gone. Our children, grandchildren and great-grand children would be saddled with this deal. Mining is part of our region's history, but it should not be a part of our future.

Re: Against the Idaho-Maryland Mine – Rise Grass Valley Project

Dear Mr. Kelley,

I have lived in Grass Valley since 1973 when I was in my 20s. I moved here from Sacramento to enjoy the beauty of the area and the small town atmosphere. It was peaceful here. A wonderful place to raise children.

As I learned more about the history of the area, the realities of the mining industry made a deep impression on me. I could see the destruction wrought by the hydraulic mining that was eventually outlawed. I toured the Empire Mine site and was amazed at the extensive honeycomb of tunnels beneath the ground. I learned that the stamp mills ran day and night to process the ore removed from the mines. I couldn't imagine how anyone could endure that constant noise and pounding. I learned of the contamination of water and earth from heavy metals that were a byproduct of the mines. We are still dealing with cleaning up that contamination to this day.

While the new mining project may have differences from past practices, it is still industrial mining. Its daily operations will involve blasting, loading truck after truck with the material being removed from the ground, and transporting that material over our local roads in truck after truck rumbling through our community. The mining company contends that the noise, dust, wear and tear on the roads, and impact on residents won't be that bad. It sounds pretty bad to me. It sounds intolerable.

They promise that they won't deplete or contaminate the aquifer that supplies water to people's wells, or that if they do, they'll do something to make up for

it. That promise sounds iffy to me. The amount of water they will be using daily for their project is astounding, especially while we are suffering through historic drought conditions, even considering our extremely wet winter this year.

The picture they paint of how they will mitigate the impact to our community is too rosy for me to believe. The potential loss to the beauty and peace of our community is too great. The proposed benefit seems to be only for the mining company. The number of jobs they propose to create seems like a very small positive measured against a huge negative. The details of this project that I have read about in The Union seem like a nightmare scenario for my beloved Grass Valley.

We are not a mining community anymore. This mining project will not make people want to move to Grass Valley to work, raise a family, retire, or even to vacation here. It will make them wonder how anyone could live in a place like that. And those of us who already live here will suffer the consequences brought on by this project. The mining company may downplay the negative impact, but I'm not buying it.

We are a community of art, theater, music, schools, families, retirees, technology and invention, clean industry, recreation, and tourism, not industrial mining. This project is a threat to the health and economy of our community.

Please don't send us back to the noise, pollution, and danger of our mining history. Let it remain in the past.

Please reject this project.

Sincerely,

Sharon Wagner

Dear Humans at the Nevada County Planning Department,

My name is Melanie Dixon. I live at 610 Brighton Street in Grass Valley.

As a conscientious citizen, **I am asking you to say no to re-opening the Idaho-Maryland Mine.** As you know, it has **significant and unavoidable environmental impacts that endanger this community's health and quality of life**. The risks are higher than any foreseeable benefits.

Thank you for choosing to work in public service. It takes grit to meet the changing needs of our community. Thank you for devoting your energy and wisdom to this task.

I am a homeowner here in District 3. My husband and I own a landscape maintenance business in Grass Valley. I have a child at Yuba River Charter School, and one who is a graduate of Ghidotti High School. I volunteer time and money to raise awareness of the local Nisenan Tribe, protect the Yuba River watershed and make our community a safer environment for LGBTQIA+ community members. I have lived here 10 years, and value it every day.

The mining history in Grass Valley is one of the most sordid aspects of our past, resulting in the deaths of thousands of Nisenan people. In the Resolution of the Board of Supervisors of the County of Nevada, recognizing Nevada City Rancheria Nisenan Tribe's historical, cultural and continued significance to Nevada County and California and supporting the restoration of federal recognition of the Nevada City Rancheria Nisenan Tribe, it reads**,** "Be it further resolved that the Board of Supervisors of the County of Nevada, State of California, supports future collaboration and agreement between the County and the Tribe that strengthen each of their governments, for their mutual benefit and **to ensure that local land use impacts on tribal and county governments, including their citizenry, services, lands, and infrastructure, are maintained and mitigated for the benefit of all.**"

There is clear evidence that re-opening the mine will cause harm to the land, and thereby the people, including the Nisenan Tribe. I am asking you not to support short-term gain that causes long-term harm. You've attended meetings with Rise Grass Valley representatives. You've read the unsubstantiated EIR reports, claiming minimal environmental impact. It doesn't take deep assessment to see that the results from this company's previous mining extractions resulted in massive environmental devastation, followed by a declaration of bankruptcy and a failure to clean up the land. **Mining of this nature requires explosives, loud and toxic ore processing, heavy, loud trucks on our roads, toxic particulates in our air and sadness in our hearts at having lost sight of how to be real stewards of this community and this land.** It is our job as mindful recipients of information to research the claims of "non-harm" to the environment from such a company as Rise Gold and to see that the results in their track record indicate that our environment and quality of life would be

devastatingly negatively impacted.

This mine would do different harmful things than hydraulic mining of the past. The results though, in the end, would be harmful.

There's not a current lack of jobs in our community. There's work here for skilled laborers, retail, tech and and huge range of services. The high salaried jobs provided by Rise Grass Valley would be filled by specialists moving to Grass Valley for the work. These positions won't go to local people. Labor and services like operating machinery and office management would be filled by local people. That work is no more lucrative or appealing than work already available here.

Let's develop work that has us proudly protect Grass Valley, our groundwater, river, clean air, and future generations, with our wise actions, as a community.

Thank you for listening to the voices of your constituents.

Thank you for your dedicated work as our representatives.

Sincerely yours,

Melanie Dixon

Nevada City, CA 95959

April 15, 2023

Dear Planning Commissioners,

While I wrote this letter Nevada County experienced its 13th Atmospheric River of the rainy season. Roofs have collapsed under the weight of the unprecedented amount of snow. Flooding has devastated much of California and the epic snowpack in the Sierra is yet to melt. A 15-year mega-drought has just ended. We've been through multiple years of devastating wildfires and smoke. As astounding as these events have been, they are not surprising. Climate scientists have been predicting these consequences for years. It is a matter of fact that as the climate changes we in Nevada County will experience longer and deeper droughts, extreme high temperatures in the summer, hotter and larger wildfires and extreme rain and flooding in the winter.[1]

The impacts operation of the Rise Gold/Idaho Maryland Mine will have in the next 80 years will likely be different from the impacts the Mine operation would have had in the past 80 years. To make an informed decision about the project, its impacts must be analyzed against the backdrop of the conditions in which it will operate. The Environmental Impact Report does not make that analysis. The EIR assumes a baseline founded upon past conditions.

For our community to continue to function and thrive in emerging conditions, land use decisions made now can help the County adapt to changing weather patterns and build more resilient infrastructure or ignore the obvious and court catastrophe later.

THE FEIR CLAIMS THAT "CLIMATE CHANGE IS SPECULATIVE" IS DISCREDITABLE

The Environmental Impact Report prepared for the Idaho-Maryland Mine ignores the reality that the impacts of the mining operations will be upon an environment where groundwater, flooding and air quality among other concerns will have been affected by climate change. The EIR assumes the project will be operating in the environmental conditions of the past not the environmental conditions which will occur over the next 80 years the project intends to operate. Therefore, the analysis found in the EIR misleads us about the true environmental impacts the mine will cause. When asked to reevaluate environmental impacts of the mine in the more relevant context of the conditions which are occurring

[1] These predictions are documented in scientific papers attached to the letter I submitted on the DEIR. They were originally omitted from the FEIR but included in the Idaho-Maryland Mine Project Supplement to the Final EIR-Individual Letter 748.

now and predicted to occur in the next 80 years, Raney Planning and Management (RPM) dismissed the request claiming an analysis based on climate change scenarios is too speculative for evaluation.[2]

That climate change is too speculative to consider is no longer an argument that passes the laugh test. The statement brings into question the credibility of the entire document. In fact, a scenario where temperatures, rainfall, drought, and wildfire occur as they have for the past 100 years is a scenario that is speculative and without support. Contrary to the FEIR's assertion, CEQA and case law require an EIR to consider how a project will impact the environment in which the project will be operating.

PROPOSED STORMWATER DRAINAGE INFRASTRUCTURE INADEQUATE

In the FEIR RPM argues that the use of the 100-year, 24-hour event to size stormwater drainage infrastructure is an adequate standard not because it is predictive of the conditions which will occur but because it satisfies Nevada County requirements. As the Supreme Court explained, this approach, using requirements rather than reality, misleads decisionmakers and the public about the full impacts of the project and subverts full consideration of the actual environmental impacts.[3] Beyond administrative requirements, the EIR does not offer any evidence to support its use of the 100-year storm event as a reasonable estimate for drainage and flood control infrastructure.

In fact, in the FEIR RPM confirms drainage calculations and detention basins were specifically designed to respond to Nevada County standards not predicted storm events. They explain that the mine's water treatment pond can accommodate runoff from a 100-year storm. However, in a larger than 100-year storm an emergency spill would occur releasing the iron and manganese stored in the pond. The offhand assurance that such a spill would be diluted by water and be inconsequential is less than reassuring and should be the subject of calculated analysis.

Stormwater detention basins designed to accommodate the historic 100-year flood event will be inadequate in the conditions we will see in the next 80 years. Given the scientific research available, this is not speculation. The EIR does not provide any evidence drainage infrastructure designed to accommodate a 100-year event will be adequate. It merely meets outdated requirements. By not using a realistic baseline, the EIR fails to adequately inform us about the actual impacts the mine will have on the environment when its inadequately designed drainage infrastructure fails.

IMPACTS ON AIR QUALITY ANALYSIS INADEQUATE

Likewise, the DEIR analyzes the impacts on air quality of the project as if existing conditions are constant over the next 80 years, but we know that will not be the case. With increasing heat and increasing wildfire simultaneous exposure to fine particulate matter and ozone increases. Exposure to PM2.5 and

[2] FEIR p.2-7711 and FEIR p.2-7713

[3] "[a]n approach using hypothetical allowable conditions as the baseline results in 'illusory' comparisons that 'can only mislead the public as to the reality of the impacts and subvert full consideration of the actual environmental impacts,' a result at direct odds with CEQA's intent." (Communities for a Better Environment, supra, 48 Cal. 4th at 322 (quoting Environmental Planning & Information Council v. County of El Dorado (1982) 131 Cal. App. 3d 350, 358).)

ozone simultaneously is detrimental to public health and the ecosystem[4]. Mining operations will discharge even more of these pollutants potentially exacerbating the problem. The EIR considers the environmental impacts of operation of the mine assuming historic air quality patterns, not the patterns which are occurring now and predicted to occur going forward, thereby, underestimating the environmental impacts of the mining operation. The DEIR analysis does not adequately inform us about the health risks and the impacts to the ecosystem due to the air pollution which the mine will contribute because incredibly the authors of the EIR think climate change is too speculative to consider.

GROUNDWATER DRAWDOWN ANALYSIS INADEQUATE

Additionally, groundwater drawdown is not adequately analyzed because the DEIR does not consider drawdown during times of increased drought predicted to occur over the next 80 years. The County's independent expert questions the baseline assumptions used to predict groundwater drawdown. West Yost concludes its peer review stating: "Rise should evaluate whether the time frame evaluated in the numerical model adequately addresses the proposed 80-year duration of permitted activities."[5] Use of present and historical conditions as a baseline fail to adequately inform what the environmental impacts of mining will be under the conditions which are likely to occur in the future.

FUTURE ENVIRONMENTAL CONDITIONS ARE RELEVANT TO THE BASELINE ANALYSIS

In its response labelled Ind 748-7, RPM uses CEQA Guidelines section 15125 to justify not using conditions predicted to occur due to climate change as a baseline from which to analyze the environmental impacts of the mine. The justification is unsupported. The response ignores the revision in 2018 of CEQA Guidelines Section 15125 clarifying the purpose of baseline analysis "is to give the public and decisionmakers the most accurate and understandable picture practically possible of the project's likely near-term and long-term impacts." The explanation for the changes in Section 15125 clarify how future environmental conditions are relevant to baseline analysis and how hypothetical baseline conditions based on regulatory requirements are not relevant.

Section 15125.(a)(1) provides:

> "…where necessary to provide the most accurate picture practically possible of the project's impacts…a lead agency may define existing conditions by referencing…conditions expected when the project becomes operational…"

The California Natural Resource Agency in its" Final Statement of Reasons for Regulatory Action/ Amendments to the State CEQA Guidelines" states:

> "The final addition clarifies that ***a lead agency should consider not just existing hazards, but the potential for increasing severity of hazards over time. This change is necessary because certain types of hazards are expected to be more severe in the future due to our changing climate. Examples include increased flooding (resulting from more precipitation falling as rain instead of snow as well as from rising sea levels) and more intense wildfires. These types of climate***

[4] Kalashnikov, et al; Increasing co-occurrence of fine particulate matter and ground-level ozone extremes in the western United States. Idaho-Maryland Mine Project Supplement to the Final EIR-Individual Letter 748.
[5] West Yost Peer Review of Groundwater Hydrology and Water Quality Analysis and Ground water Model Reports for the Idaho-Maryland Project, p.19

change impacts may worsen a proposed project's direct, indirect, or cumulative environmental effects in the future." (emphasis added)

That Nevada County will experience increasing temperatures, drought, flooding and wildfire is not speculation. It is backed up by rigorous scientific study universally accepted by local, state, national and international policymakers and the courts. That Nevada County can rely on historic rates of temperature, drought, flooding and wildfire, however, is speculation without any evidence. The EIR presents no evidence why speculation based on historic patterns should be relied upon rather than evidence-based modeling. Meeting requirements based on historic rates of flooding will not adequately mitigate the impacts mining operations will have on the environment in which it will be operating for the next 80 years.

As an informational document, the EIR fails. The project may increase the hazards from flooding, drought, temperature increase and wildfire. The full extent of the increased hazard has not been adequately disclosed in the EIR because the authors of the EIR assert climate change is too speculative to consider and ignore CEQA requirements to consider the impacts of a project in the actual environment they will occur.

THE ECONOMIC REPORT IS FLAWED

The economic report prepared for the project is equally uninformative. The surveys never asked residents of the area impacted by mine operations if they would consider leaving the area if the mine was approved. Visitors to the area were not asked if they would continue spending vacation time in the area. That real estate values are expected to decrease though indicates allowing the mine to operate may blight an entire community. The possibility of blight was overlooked.

CONCLUSION

Please recommend the Board of Supervisors deny certification of the Environmental Impact Report (EIR) for the project and deny approval of the project.

Sincerely,

Stevee Duber

To the County decision makers:
I wish to express my opinion regarding the Idaho Maryland Mine. Please reject it!

There are many negative variables in the proposal of this project regarding effects on a large swath of Nevada County land it will use for its business, and adjacent to their proposal.

This includes less-than-responsible consideration of residences such as constant noise, dust, traffic and very possible damage to long-existing wells on local and adjacent residential and business properties. This 24-hour business will effect our entire county negatively and is not comensurate with any other business in either Grass Valley nor Nevada City. This proposed business is not compatible with the needs of Nevada County.

Further, this company is not well regarded in the industry as it includes a lack of responsible behavior in the in previous projects of this companyelsewhere because there are current legal actions against them; Rise Gold has repeatedly shown a lack of accountability to communities where they have been in business for years. In addition, it has been less-than-straight-forward to the public so far in our Nevada County.

Please reject this project because it is not a positive addition to Nevada County.

Re: Vote NO on Rise Gold IMM FEIR

Dear Nevada County Supervisors and Planning Commissioners,

This is notice that the Nevada County Board of Supervisors has NO STATUTORY authority to license or permit the Rise Gold corporation for mining operations that will produce, distribute and store toxic waste in the county for several reasons.

First, the Rise Gold funded economic study reveals the actual chemical processing, treatment, and disposal of and with toxic chemicals including toxic residue products will be processed outside of California, most likely in the state of Nevada. This means that toxic waste will be transported through the county, state, and into Nevada.

Second, it is abundantly clear and well settled by law that statutory authority for toxic waste regulating and permitting for the Rise Gold IMM proposal are as follows: In California and Nevada, each state's respective Department of Environmental Protection is responsible for regulating and permitting hazardous waste facilities.

In California, the California Department of Toxic Substances Control (DTSC) is the regulatory authority responsible for issuing permits for hazardous waste facilities. The law that governs the jurisdiction of the DTSC is the California Hazardous Waste Control Act (HWCA). This law gives the DTSC the authority to regulate the generation, transportation, storage, treatment, and disposal of hazardous waste in California. The HWCA is enforced by the DTSC through the **California** Code of Regulations, Title 22, Division 4.5 - Hazardous Waste Control. In **Nevada**, it is the Nevada Administrative Code (NAC) 444.686 et seq. that governs the jurisdiction and permitting of hazardous waste facilities.

The US Environmental Protection Agency (EPA) is the primary federal agency responsible for

regulating hazardous waste management. However, under the Resource Conservation and Recovery Act (RCRA), Congress allowed states to develop their own programs for regulating hazardous waste management, as long as their regulations are at least as stringent as the federal requirements. Both California and Nevada have received authorization from the EPA to implement their own hazardous waste programs that are consistent with federal law. As a result, these states have primary jurisdiction over hazardous waste management within their borders, and the DTSC is the regulatory agency for California.

Third, it is clear that Nevada County BoS and NC Planning Department have overstepped their legal authority to permit the Rise Gold IMM for at least those reasons. The same applies to the usurpation of the authority from the California Riparian Courts, which have jurisdiction over all pumping or dumping of the surface and subsurface waters in the state where Nevada County resides.

Last, the IMM FEIR is derelict in analyzing the real hazards mining, having errors of fatal errors of omission as well as commission, as most comments submitted to the DEIR were ignored or waived in the FEIR. In the NC Planning Department's defense, they were never mandated nor have the expertise to provide an adequate EIR for a toxic substance processing, transporting and storing facility. Thus the NC BoS will be spared significant embarrassment and unyielding litigation if they **do not** certify the subject poor excuse for an environmental impact report.

Matt Kelley,

Please find attached in pdf form the letter from Wolf Creek Community Alliance (WCCA) with regard to the upcoming Planning Commission meeting to consider project recommendations for the proposed Idaho-Maryland Mine project. A text version of the letter is also found below.

Thank you for considering our letter and including it in the public record.

To: Matt Kelley, Senior Planner Nevada County Planning Department 950 Maidu Avenue, Suite 179 Nevada City, CA 95959

Dear Mr. Kelley, Commissioners, and Supervisors,

Thank you for the opportunity to comment on this project, once again. Wolf Creek Community Alliance (WCCA) has previously submitted comment letters to the Planning Department since the time of the project's Application for Conditional Use Permit, through the NOP, and the draft EIR. We have also joined the CEA Coalition letter of 25 agencies and organizations that shares in some detail common concerns about the project, which you will find in your packets. Further, we are in full support of the legal submittals that you have received from Shute, Mihaley & Weinberger LLP. Taken together, our previous comments to the DEIR (please see Comment Letters 30 & 31 in particular), those of the

CEA Coalition, and its lawyers, lay out the technical insufficiencies of this Final EIR. Here, we would simply like to highlight the general deficiencies of the DEIR, and the concerns we see still not being addressed, as they relate specifically to our mission as a watershed organization.

In reviewing the FEIR response to our comment letters, we find that our concerns are addressed only through

- The repetition of unsubstantiated assertions already in the DEIR
- Technical reasoning itself based on selective and inadequate data
- The addition of very selective and inadequate additional data
- Avoidance of the need to collect the data needed to substantiate the assertions in the Environmental Impact Report

We find that the FEIR still does not adequately address crucial impacts to the hydrology and biological resources of Wolf Creek, and in particular the South Fork of Wolf Creek and its watershed, in the following regards:

1) **Impacts to the Brunswick site & South Fork Wolf Creek**.

a) **Connectivity of the Creek.** The FEIR continues to ignore the connectivity of South Fork Wolf Creek, from its source above the Brunswick property, flowing as a perennial stream from that point though the site, through private and public (State Park) property to its confluence with Wolf Creek. Discounting this connectivity ignores potential impacts to its biological resources.

b) **Daylighting the Creek.** The Nevada County Land Use and Development Code clearly states that the goal in any development should be “To preserve stream corridors and riparian habitat, ensure adequate protection of stream values, and protect stream corridors for wildlife movement and foraging” unless “avoidance is not possible.” Sec. L-II 4.3.17 Watercourses, Wetlands and Riparian Areas. The FEIR ignores this mandate and does not consider as an alternative or a preferred option the restoration and daylighting of the section of South Fork Wolf Creek that was put into an underground culvert by previous development. WCCA continues to assert that avoidance IS possible. The site covers 118 acres, and a redesign of the project would allow Nevada County to achieve the purposes spelled out in this Section of our Land Use and Development Code.

c) **Loss of forest habitat.** The FEIR does not adequately characterize the biological importance of the 31 acres of forested land that would be destroyed, which have a high value for the connectivity it provides for wildlife, in particular for threatened California Spotted Owls known to be in the adjacent State Park.

d) **The aquatic ecosystem of the pond.** The abandoned mill pond, constructed out of an area that hydrologically has always been an area of wetlands, has long ago reverted to a vibrant aquatic ecosystem, with a distinct riparian zone, and frequent

visitation by waterfowl and migratory birds. The EIR seeks to disregard its legal status as a Federal or California protected body of water, (without formal justification), and thus ignore the impact of destroying that biological resource.

e) **Mine Water discharged into the creek.** Testing of rock samples and mine water continues to be inadequate. Impacts to South Fork Wolf Creek of increased year-round streamflow 24/7 have not been adequately addressed as to the potential for erosion, loss of aquatic habitat, and impacts to the riparian zone. Speculative conclusions are presented without a sufficient body of data to create an accurate hydrography or incorporate variation in stream flow over a period of years. Impacts of increased temperature in the creek are similarly based largely on speculation without sufficient evidence.

f) **Impacts to BMI and Trout**. The
FEIR submits no data whatsoever regarding aquatic stream habitat and ecology other than a single walk-through by a biologist looking for amphibians, and a single, limited fish survey. Not a single survey for benthic macroinvertebrates (BMI), an essential metric for aquatic stream health, is included in order to create a baseline for future impacts. Sensitive BMI species indicators, such as stoneflies, an important food source for trout, are not considered for the impacts changes in water composition, due to unintended releases of heavy metals, increased temperature, decreased dissolved oxygen, or increased stream velocity could have on these key species. The trout survey, similarly, is limited, both in its coverage of stream reaches and its single date of survey, giving an incomplete and inaccurate picture of salmonid populations.

2) **Impacts to the Centennial site**
a) **Loss of Federal Wetlands.** The FEIR seeks to exclude impacts of the second site involved in the proposed IMM project, the Centennial Site. Nonetheless, the DTSC RAP, still not approved, and unreasonably separated from consideration from the FEIR, identifies 5.3 acres of federally protected wetlands, rich with biodiversity, and with essential milkweed habitat for endangered Monarch Butterflies. As the DTSC RAP is simply concerned with remediation, not future uses, there is no justification for destroying these wetlands, simply to supply “clean soil.” If the purpose is to use the land for mine waste, as the IMM project description makes clear, then the impact of the destruction of these wetlands in the FEIR is not adequately considered.

b) **Inadequate Management Plan for Pine Hill Flannelbush.** The FEIR recognizes the status of the Fremondodendron sp. on the Centennial site as potentially *Fremontodendron decumbens*, as endangered species found elsewhere only in one location in Placer County. Its management plan for this species, however, is inadequate to ensure its survival. Many plants would be transplanted, a practice with no history of success, and a regime for introducing prescribed burns, essential for the ongoing viability of the species, is also poorly laid out.

3) Disregard for Adequacy of Management Plans and Monitoring. The successful avoidance of considerable negative impacts from this project is dependent not only upon

the analysis of the FEIR, which, unfortunately is inadequate, but also upon the many listed management plans, listed but not detailed, referred to but not yet approved, as well as a number of procedures for oversight or financial compensation that are vague, too infrequent, subject only to the actions of the applicant, hampered due to the lack of resource of county or state agencies, or simply absent. A FEIR should fully disclose the likelihood of avoiding negative impacts, not leave essential details about water quality monitoring for example, subject to details given after approval. The project is too large, and given its size and duration too likely to violate expected or optimistically presented outcomes, to not have a full explanation of the details that will assure compliance with environmental and health standards.

4) **Failure to consider Cumulative Impacts.** In the end, the FEIR discounts the cumulative impacts of this proposed 80 year project, seemingly suggesting that there is no increased potential for impacts over the life of the project. The history of industrial mining projects such as this one, actually suggests increased risk over time, unexpected catastrophes, and cumulative impacts of what might be judged to be insignificant impacts becoming considerable impacts over time. This is particularly the case with impacts related to noise, air quality, groundwater depletion, and the contribution to increased impacts of climate change due to the large increase in GHG and energy the project proposes. It is a fundamental failing of the FEIR that it refuses to honestly or adequately consider these cumulative impacts.

A project with such a large industrial impact, proposed to operate over an 80 year period, 24 hours a day, 7 days a week, needs justification through comprehensive study, one that addresses impacts instead of ignoring them, does not try to explain them away, and supports its reasoning with adequate data. This DEIR fails to do that. Regardless of its length, it is a failed document, inadequate, misleading, and incomplete.

As concerned citizens of Nevada County, we ask that this Environmental Impact Report NOT be approved, and the project denied.

Hello,

Attached, for your digital records, are a copy of the public comments we made at this morning's Board of Supervisors meeting regarding the Wells Coalition's position on the Idaho-Maryland Mine.

This PDF includes:
- The combined comments from Christy Hubbard and Gary Pierazzi
- "Understand the Gaps" - An at-a-glance handout showing key FEIR claims for well owner protection vs the gaps
- A preview of the full Wells Coalition group comment letter to be delivered on May 10 - with citations.

Thank you,

Christy Hubbard for the Wells Coalition

Subject: Final EIR for the Idaho-Maryland Mine Unacceptable for Well Owners

The Wells Coalition is a group of property/well owners and residents near the Idaho-Maryland Mine. Our purpose is to protect our only source of water, our wells.

We shared our concerns with you about the mine during public comment on December 13th. This was just a few days before the Final EIR was released. All the arguments we shared with you then are all still valid – but there is more to say now.

Today, we're here to formally ask you to REJECT the FEIR and VOTE NO on the project. Huge risks are not being addressed, posing a very real threat to our local groundwater resources and property values.

The Final EIR asserts that stronger mitigations and/or financial assurances are *"not necessary because no significant impact to domestic water wells are predicted".*

But a "prediction" is only an educated guess – NOT a certainty. And in this case, it is based on an analysis that has serious flaws.

The stakes are too high to get this wrong. The County's Economic Impact Report revealed this mine proposal is unprecedented in its proximity to so many homes. Pumping over a million gallons a day from an area with hundreds of wells is a huge risk. If "predictions" are wrong, it could cost the County, NID, and individual homeowners tens of millions of dollars – and years or decades – to connect a permanent water supply to each property.

Claiming "no significant impact" defies both science and common sense.

In Draft EIR comments, multiple hydrology experts confirmed that groundwater models in fractured bedrock like ours can NOT deliver 100% certainty. They also revealed numerous defects in the groundwater model. The Final EIR dismissed these concerns, but then – in contradictory fashion – agreed that more data is needed for validating the model.

Without current well monitoring data, the FEIR's "threshold of significance" is invalid. The FEIR lacks *current* well performance baseline data and is inadequate under CEQA. The FEIR relies only on sparse patches of data from 15 years ago.

Baseline data is needed to assess potential impacts to groundwater and well owners *prior* to determining mitigations. It is also the lynchpin in determining what threshold should be used to determine the measure of "significance". The FEIR sets that threshold at a 10% drawdown in water level, but legal experts call that number "arbitrary" and "invalid".

The FEIR's addition of a Domestic Well Monitoring Program for 378 properties is a feeble attempt to address the issue, but it's too little, too late, too short, and it's not even a mitigation.

The Final EIR states that the applicant is in compliance with the County General Plan requirement that "*provides for protection of domestic water wells from potential mining impacts" and " to guarantee a comparable supply of water to such homes or businesses"* but the FEIR does not demonstrate or even discuss how or if the Applicant can meet the County requirements.

Other than the proposed 30 NID connections along East Bennett Rd,

THERE IS NO MITIGATION PLAN IN THE FEIR FOR CONNECTING IMPACTED WELLS TO NID WATER SERVICE.

That means:

- No additional wells identified as needing mitigation
- No water supply assessment
- No infrastructure design plans
- No permitting, acquiring easements, or rights-of-way
- No timetable

But most importantly, No financial assurances for design construction and bringing service to impacted well owners.

NID has asked for a $14 million dollar bond but the FEIR dismisses the request, stating

“A bond for construction of water supply infrastructure in this area is not necessary”.

This is a recipe for disaster. Today’s NID projects take many years to complete, but a failure in this project could create a large-scale crisis for NID, the County, and especially homeowners. People will scream “where’s my water?”. And a property with no permanent water supply is worthless.

The FEIR is also striking in its absence of accountability. It describes steps for fixing wells or providing temporary water, but all decisions are left solely up to the mine operator, who would take action only if the 15 monitoring wells in the official Groundwater Monitoring Plan flag an impact.

This is especially concerning because the complexity of the fractured bedrock geology in the area may mask impacts. With the impact threshold arbitrarily set at a 10% drawdown, homeowners with marginal wells may lose water long before they get a call from the mine operator.

What’s missing here is a separate oversight committee or commission authorized to make decisions. They would make determinations of impact to well owners, resolve disputes, provide professional analysis and reporting of data regarding the monitoring, assure timely execution of mitigations, and administer fines or corrective notices.

The bottom line is that well owners are being told to trust that nothing will go wrong with their water supply for 80 years based on assumptions and speculation. The Wells Coalition is asking the County to REJECT the FEIR and VOTE NO on the project.

Thank you,

Christy Hubbard (District 3) and Gary Pierazzi (District 3)

WELLS COALITION

Understand the Gaps

Attachment 24

Nevada County's Final Environmental Impact Report (FEIR) on the Idaho-Maryland Mine claims there will be no "significant" or "unavoidable" impacts on local well owners. These claims are based on a flawed groundwater analysis that expert reviewers say has serious deficiencies. The FEIR includes a short list of "mitigations" and a supplemental well monitoring program, but ***well owners are getting the shaft!***

Groundwater Analysis

"The FEIR's groundwater analysis is deeply flawed, lacking a current and accurate baseline, which is required in order to assess the project's impacts, alternatives, and mitigation measures. In addition, it failed to define a valid threshold for determining impacts on well owners."

Ralph Silberstein, President, Community Environmental Advocates Foundation

Claims	Gaps

"Zero risk to well owners"
• **No "significant" impact.**
• Groundwater modeling shows risk to only 7 homes, but **30 properties will be offered NID service** as a "precautionary measure."
• Estimated water drops will be from **1 to 10 feet for 152 wells.**
• "Threshold of significance" set at a **10% drop in water levels.**
	The groundwater analysis can't be trusted
	• Per expert reviewers, **threshold of significance at 10% drop in water level** is arbitrary / invalid. [1]
	• **Not compliant with** the California Environmental Quality Act (**CEQA**), which requires collection of current baseline data prior to evaluating impacts. [2]
	  ○ **The computer model used only sparse patches of data from over 15 years ago** - before the drought.
	  ○ Did not gather *current* well monitoring data for private wells in the area before finalizing the FEIR.
	• We live on top of "fractured rock" geology. Per hydrology experts, groundwater modeling cannot be done with high a degree of accuracy. 100% certainty is not possible.[3]

Well Monitoring

Why it matters:

Well monitoring characterizes the performance of a well over time. It can be used as an early warning system if problems occur. It can also be used in a court of law to prove that impacts have occurred. Data on multiple wells can be combined and used in computer models to try to predict potential impacts of major hydrological events - such as dewatering a mine or drilling new mine tunnels – but modeling can't be done with 100% certainty.

3389

Well Monitoring			
	Impact Group	**Claims**	**Gaps**
1	**30 properties on Bennett Road** [4]	• Opt-in to **connect to NID** before mine dewatering. • **Mine pays NID bill** until property is sold or annexed by City of Grass Valley. • Mine pays to shut down well if desired.	• Water quantity limit may be a burden for some: **400 gal/day.** • Water quality: "**NID Treated**" vs well water. • If a well is not shut down, the well owner **pays monthly fee for double-check valve** to prevent backflow. [4] • No property damage insurance for any NID installation damages.

2	**378 properties** qualify for the **"supplemental" domestic well monitoring program** [5]	• "By request". Well owners can opt in to the **supplemental domestic well monitoring program** before mine dewatering.
		  ○ **Baseline data collection:** 12 months of quantity tracking; 1 water quality sample.
		  ○ The program **ends 5 years after mine is dewatered.**
		• **Note:** The 378 parcels **exclude** properties in **NID served neighborhoods** - even though some of these parcels are within the "1' drawdown isopleth" of the groundwater analysis.
			• **Inadequate baseline data collection timeline** (only 12 months). Experts say a minimum of 3 years is needed to collect valid data. [6] E.g., due to seasonal variations.
			• **Insufficient water quality sampling.** Experts say 2x year is needed on an ongoing basis. (April & October) [6]
			• **No protection beyond 5 years** if accidents happen as mine operation expands.
			
			With no monitoring, there is no individual well history - hence NO way to legally argue that a negative impact happened - or could be the result of mine operations.

3	**Everyone other than the 30 properties** [7]	Official mitigation: **Uses 15 monitoring wells to predict impact** on all domestic wells (called the Groundwater Monitoring Plan, or GMP)
		• **During/after dewatering:** Mine operator takes action if GMP monitoring wells show impact that meets a defined threshold.
		• Mine operator reaches out to the well owner, **pays costs of fixing if needed**. E.g., flow adjustment, drilling new well.
		• Mine operator **will provide temporary water if water supply is disrupted for an "appreciable" amount of time** (think water trucks).
			• **No financial bond or plan for connecting to NID if wells fail.**
			  ○ FEIR rejected NID request for $14M bond.
			  ○ No plan for design, construction, permitting, easements.
			  ○ No water assessment to determine feasibility of NID service.
			  ○ No timeline commitments if NID service is required - typical NID projects take years to complete.
			• **The decision to fix wells or bring in water trucks lies with the mine operator.**
			  ○ No independent liaison to facilitate between mine operator, well owner, and NID. This was required the last time an operator tried to reopen the Idaho-Maryland Mine.
			  ○ Mine operator takes action only if their 15 monitoring wells show impact w/10% drawdown as threshold.
			  ○ There are no specific timeline commitments for providing temporary water or fixing wells.
			
			Homeowners with marginal wells may see impacts before the mine operator's threshold gets triggered.
			
			Property values would plummet if the only source of water is a water truck.

Subject: Protection for Well Owners in the Final EIR for the Idaho-Maryland Mine is Unacceptable

Dear Mr. Kelley:

The Wells Coalition is a group of property/well owners and residents near the Idaho-Maryland Mine. Our purpose is to protect our only source of water, our wells.

We, the undersigned members of the Wells Coalition, respectfully ask that the County REJECT the Final Environmental Impact Report (FEIR) for the Idaho-Maryland Mine and VOTE NO on the project. Huge risks are not being addressed, making this project completely unacceptable for well owners in the area.

100% certainty is a myth.

The Final EIR asserts that stronger mitigations and/or financial assurances are *"not necessary because no significant impact to domestic water wells are predicted".*

But a "prediction" is only an educated guess – NOT a certainty. And in this case, it is based on an analysis that has serious flaws.

The stakes are too high to get this wrong. A review of the County's Economic Impact Report revealed this project is unprecedented in its proximity to so many homes [1]. Pumping over a million gallons a day from an area with hundreds of wells is a huge risk. If "predictions" are wrong, it could cost the County, NID, and individual homeowners tens of millions of dollars – and years or decades – to connect a permanent water supply to each property.

Claiming "no significant impact" defies both science and common sense.

The FEIR is inadequate and provides well owners with very limited assurances for at least the following three reasons:

PREVIEW

1) Predictions of the groundwater model have limited reliability.

In DEIR comments, the Wells Coalition provided many quotes from hydrology experts confirming that groundwater models in fractured bedrock like ours can NOT deliver 100% certainty. [2] There are also numerous defects in the groundwater model [3]. Even the FEIR agrees that additional data is needed for validating the model.

2) FEIR provides no current well baseline data / Domestic well monitoring program is too little, too late, and too short.

The FEIR lacks *current* well baseline data and is inadequate under CEQA. The FEIR relies only on sparse patches of data from 15 years ago.

Baseline data is needed in order to assess potential impacts to groundwater and well owners *prior* to determining mitigations. Current well performance data is key to establishing what current conditions are – e.g., establishing water quality or determining when a well has gone down or doesn't recharge as quickly. It is also the lynchpin in determining what "threshold" should be used to determine whether an impact is "significant". Legal experts call the FEIR's choice of setting the significance threshold at a 10% drawdown in water level arbitrary and invalid. [4]

The Final EIR's addition of a Domestic Well Monitoring Program (DWMP) for 378 properties does little to ease the concerns of well owners within the designated area or beyond (it does not include properties with wells in NID-served areas). It is included as a condition of approval, but it is not mitigation.

Instead of collecting data before evaluating the project, as CEQA requires, this program takes place after the fact. It won't collect the well performance data NID or the County needs. Monitoring is scheduled for only 12 months and takes just one water quality sample, which doesn't account for seasonal variations. A minimum of three years are needed to collect valid water quantity data and water quality should be tested twice a year. The program also expires five years after dewatering, but that provides no protection for accidents that could occur in future years as the mine operation expands. [5]

3) The proposed mitigations, which are not technically valid under CEQA, are deeply flawed.

Without accurate data on groundwater conditions and data from the actual domestic wells, valid mitigations cannot be determined. What constitutes a significant impact must be based on real data, not arbitrary ideas created by the applicant. For example, even the current groundwater model shows groundwater level drops over a large area. But it is unknown how that may affect well owners.

In other words, well owners are being told to trust that nothing will go wrong with their water supply for 80 years based on assumptions and speculation. The FEIR compounds this uncertainty with a dizzying array of feeble mitigations and "peace of mind" programs stitched together with vaguely worded promises.

This statement in the FEIR Mitigation and Monitoring Program seemingly assures everyone that the applicant would mitigate potential well impacts – *"pursuant to Nevada County General Plan Policy 17.12, the project applicant shall be responsible for providing a comparable supply of water to such homes and businesses whose wells are significantly impacted"* – but the rest of the FEIR does not demonstrate how the applicant would meet these requirements.

PREVIEW

Key concerns for members of the Wells Coalition include:

a. No financial bond or plan for connecting to NID if wells are damaged (beyond 30 parcels) NID asked for a $14M bond to cover the costs of providing service to three neighborhoods in the event of unrecoverable well damage or failure [6]. The FEIR dismissed it, insisting NID needs nothing.

At the same time, the FEIR expanded the area of potential impact with the addition of the supplemental Domestic Well Monitoring Plan (which defined the area of impact as within the 1' drawdown isopleth in the groundwater model) – suggesting that even more money is needed. There is no plan for connecting impacted wells beyond the 30 properties along Bennett Road. For example: no additional wells identified as needing mitigation; no water assessment to determine the feasibility of NID service, no plan for design, construction, permitting, or easements; and no timeline commitments if NID service is required.

This is a recipe for disaster. Even under the best of circumstances, today's NID projects take many years to complete, but a failure in this project could create a large-scale crisis. Neither the County nor NID want citizens screaming "where's my water?" for years on end. And property owners connected to unsightly water trucks will be faced with plummeting home values. A property with no water is worthless.

b. Promises to Fix Wells or Provide Water Trucks Won't Cut It

One of the most significant gaps in the FEIR is the absence of accountability. Its most concrete promise about providing potable water for impacted well owners is this: *"If water supply to a property is disrupted for an appreciable amount of time (greater than a day) a temporary water supply will immediately be provided to the property using water tanks…".* [7] These words fall short of holding the mine operator accountable for specific or reasonable timelines – for either fixing wells - or providing a permanent water supply replacement.

Even more concerning, all decisions about fixing wells or replacing water are left solely up to the mine operator, who would take action only if the 15 monitoring well locations in the official Groundwater Monitoring Plan flags an impact. It makes no commitment to use the data from the individualized measurements in the supplemental Domestic Well Monitoring Program to flag an impact. This is especially concerning because the complexity of the fractured bedrock geology in the area may mask impacts and the threshold for triggering that impact is arbitrarily set at a 10% drawdown.

For homeowners with marginal wells, much smaller drawdowns may make their wells useless long before they get a call from the mine operator. For all well owners in the area, the described approach opens the door to unending debates about whether damage to a well was caused by the mine or some other condition.

If the mine were to reopen, a separate oversight committee or commission must be required. Such a committee would be authorized to make determinations of impact to well owners, resolve disputes, provide professional analysis and reporting of data regarding the monitoring, assure timely execution of mitigations, and administer fines or corrective notices.

PREVIEW

c. E. Bennett Road Well Owners Forced to Make Compromises

For the 30 well owners who live along E. Bennett Road, connecting to NID is a compromise compared to their current situation. These wells typically cost very little to operate each year and produce sweet water without quantity restrictions, the need to add heavy chemical treatments, or fear of microplastic contaminants.

The fact that the mine is offering to pay the bills for a new service they don't currently need has little value – and it comes with a list of compromises. The property owner will be responsible for paying for NID water usage over 400 gallons a day (gpd), which may be a burden for some. There has been no measurement of existing gpd usage at any of these 30 properties. If they don't shut down their well, they'll need to pay monthly fees for a double-check valve to prevent backflow. And if the property is annexed to Grass Valley or sold to anyone else, they'll get stuck with the full water bill - which increases the cost of maintaining their home.

Conclusion

The FEIR's assertion that there will be no significant impact to wells defies both science and common sense. The groundwater model is questionable. The FEIR provides no current well baseline data and tries to make up for it with a flimsy domestic well monitoring program that is too little, too late, and too short. And the proposed mitigations, which are not technically valid under CEQA, are deeply flawed.

This alarmingly inadequate FEIR provides no procedure, no funding guarantees, and no independent oversight of the means by which the replacement of a permanent water source could be provided in a timely fashion for well owners. Ultimately, it does not provide a mechanism by which we can concretely say whether or not a well has been impacted by mine dewatering. Without such information there is no way to hold the mine accountable for lost domestic wells and the cost of replacement water services.

Please REJECT the Final Environmental Impact Report for the Idaho-Maryland Mine and VOTE NO on the project. This project is completely unacceptable for well owners in the area.

Sincerely,

Subject: Re: Statement about Well Monitoring

Christy,

Groundwater monitoring is key to identifying, in real time, aquifer and well impairments during mine operation. Monitoring will require, at a minimum, three to five years to begin to understand the well vulnerabilities associated with domestic groundwater wells before mine dewatering begins and continue this groundwater monitoring program throughout the life of the mine plus five additional years after the mine operation has terminated. Ultimately, groundwater monitoring data will be used to identify groundwater and wells influenced by the mine operation. Criteria for making this decision and the analysis of data must be completed by an unbiased group or person not associated with Rise Gold Mine, the County and the well owners.

The above recommended monitoring is reasonable, feasible, and economic with respect to the risks and liabilities associated with developing a gold mine under domestic groundwater supplies.

1. Develop a domestic groundwater network at residential properties that the current EIR suggests and additional domestic wells according a qualitative rating based on the location, depth, geology, well completion, productive fracture depths, proximity and/or association to all projected mine workings during the life of the project, surface water and water diversion locations.
2. Complete an aquifer pumping test for quantifying the well's sustained pumping rate (before first rain of the subsequent water year (October)).
3. Collect and analyze groundwater samples in April and October before the project begins and during all mining activities thereafter (as defined by the schedule for mine working expansion and well location depth).
4. Document pre-groundwater level behavior at a high temporal resolution. Continue groundwater level monitoring during all mining activities.

The above recommendation has been developed from a ten-year domestic groundwater study completed between 2006 and 2016, a demonstration property that has incorporated this approach to their community groundwater management program and land developers in rural residential areas.
