Dear Nevada County Supervisors and Planning Commissioners,

As a concerned citizen, I am asking you to "just say no" to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren't worth the risk.

Since the mine is no longer a viable, relevant, safe, compatible or desirable activity for our increasingly populated area once the permit is denied this land could be purchased by the city and the Bear Yuba Land Trust and developed as a recreational public park for the whole community. We need recreational space for our youth. Let's invest our taxes in our future.

Sincerely,

April 28, 2023

Mine Planning Commission Committee,

We are writing to express our conviction that allowing use of the Brunswick Industrial Site for gold mining is not appropriate, and not in the best interests of the people residing in the area. Since the Brunswick site was last used for industrial purposes over 20 years ago, a considerable amount of residential development has taken place in this area. A mining operation is not compatible with residential living, especially since the proposed mining operation is to be 24 hours a day, 7 days a week.

Our major areas of concern are:

1) Water Tables and Wells. The necessary draining of the mine could drain the aquifer(s) used by most of the homes in the area for water. The loss of well water will make the homes uninhabitable. Even if the mine owners offer to provider water there will not be sufficient construction resources available build the infrastructure needed to bring water in a timely manner to all the homes that will need it if the aquifer is drained. If the aquifer is compromised in any way, it will have a huge negative impact on the values of all the homes in the affected areas; not to mention the quality of life of the inhabitants.
2) Sound Pollution. Mining is an extremely noisy operation, especially stamping machines for crushing rocks. Since mining is to be a 24/7 operation, we feel this use conflicts greatly with residential use of the area, and would be detrimental to the physical and mental health and well-being of the local residents.
3) Ground Vibration and Air Pollution. Vibrations and air pollution from the mining operation, stamping machine(s), heavy equipment, including earth moving equipment, and huge tractor/trailer vehicles constantly traveling back and forth to and from the mine, would certainly create both ground vibrations and air pollution issues.
4) Traffic on Brunswick Road and Highway 174. There are already many large tractor/trailer trucks which haul gravel from the quarry on You Bet Road. The addition of many, many more huge trucks, heavy equipment, and other mine-related traffic, will worsen and increase traffic which is already heavy, and dangerous at times.
5) Reduction in Property Values for Properties Near the Mine. For many people their home is their biggest financial asset. A significant reduction in value or salability of their home would jeopardize their financial security. For all the reasons listed above it is likely the value homes near mine will be impacted. It is fair that people living near the mine should be financially damaged so the owners of the mine can get rich?

Mining was discontinued over 65 years ago! We feel the character of this Grass Valley area has hugely changed since then. Mining is no longer appropriate for this area. Re-opening the Idaho-Maryland Mine would create substantially more noise, ground vibration, air pollution, and traffic congestion; in addiuon to potentially terrifying, and irreversibly dangerous, water availability and water purity disasters along with decreasing property values of home near the mine.

Thank you for your consideration of these critically important issues.

Hello,

I'm not sure what the status of the Idaho Maryland mine project is, but I am a professional botanist and I found some large discrepancies in the rare plant reports in the EIR (appendices F.4 and F.11). These are:

- Timing: the rare plant surveys were conducted in December and July, outside the blooming period of most rare and endangered plants. The surveys therefore did not meet the standard protocols outlined by the California Department of Fish and Wildlife and California Native Plant Society.
- Age of surveys: the rare plant surveys were conducted in 2019. Unless more were conducted this year, they over 3 years old and are out of date and no longer applicable. New surveys would need to be conducted for the EIR to be valid.
- Pine Hill flanelbush: the Pine Hill flannelbush habitat management plan (appendix F.4) found about 60 of these endangered plants in the project area. However, a recent fire may have burned in or near the project area. Since this is a fire adapted species, this may have produced thousands of new seedlings, making this plan obsolete. Also the surveys on which this plan is based are also over 3 years old and obsolete.
- Reference populations: the rare plant survey report states that "a nearby reference population of finger rush was visited on June 24th, prior to commencing field surveys to ensure this species was still detectable, which was confirmed. No other reference sites were required to be visited given the botanists local knowledge of the other target species as part of the survey effort". This does not adhere to rare plant survey protocols since the purpose of reference populations is primarily to confirm that surveys were conducted at the appropriate blooming time for species potentially present in the survey area. Learning what the plants look like is a secondary purpose.

I would be happy to discuss these points more if that would be helpful!

Thank you,
Joe Broberg

Dear Nevada County Planning Commission Members,

First, I want to strongly recommend to the Nevada County Planning Commission that it choose Recommendation A from the EIR report of the Nevada County Planning Department staff on the proposed revival of the Idaho-Maryland Mine by Rise Gold, which provides both no (Recommendation A) and yes (Recommendation B) options for the Planning Commission to choose from starting on pages 5-8 – but then waits UNTIL PAGE 115 (!) to reveal the staff's actual position/conclusion, which is to choose Recommendation A. In either case I also strongly recommend for several reasons that the Planning Commission not accept this flawed Environmental Impact Report for this project proposal.

The arguments for not certifying the EIR are overwhelming. The EIR is legally deficient under CEQA. It fails to adequately disclose and evaluate the mine proposal's significant environmental effects, it does not analyze a reasonable range of alternatives to the mine, and it fails to identify adequate mitigation for the mine.

If there is no project approved, then in any case there is absolutely no need for an EIR. Thus, the County is under no obligation to certify the EIR if the project is denied. Case law is clear on this topic e.g., Las Lomas Land Co., LLC v. City of Los Angeles (2009) 177 Cal.App.4th 83.

Yet even if the present EIR is certified, it could potentially be relied on in the future to fast-track the approval of another mining proposal by Rise Gold or another party.

Thank you for your consideration,

Dr.David Adams

May 4, 2023

Nevada County Board of Supervisors
950 Maidu Avenue
Suite 200
Nevada City, CA 95959

cc. Julie Patterson-Hunter
Clerk of the Board

Dear Nevada County Board of Supervisors and Nevada County Planning Commission,

We are writing to express our implacable objection to the proposed Gold Rise mining operation that is being considered by Nevada County in our neighborhood. We have read both versions of the EIR in addition to the Nevada County Planning Department's Staff Report. Not only is this project likely to negatively effect our property investment, disrupt our environment and the high quality of living in the region, I do not like what I have read about the company making the proposal and its long history of leaving communities like ours holding the environmental clean-up bag, both physically and financially. In addition, Gold Rise's proposals for dealing with the millions of tons of waste, toxic or not, are not economically feasible and their conclusions about toxicity were based on inadequate sampling as noted by SYRCL and the Air and Water Quality Boards:

"For a conclusion to be meaningful, the sample size must be appropriately representative. Of the core samples Rise Gold acquired from Emgold Mining, and the additional 67,500 linear feet of exploratory drilling Rise Gold conducted, they chose to test only 11 feet for potentially hazardous chemicals. Those 11 feet are supposed to accurately characterize more than 25 million tons of waste rock to be produced over the life of the mine. The testing for asbestos represents less than 2/10,000 of the total rock to be mined over the project lifespan. The Air Quality Board and Water Quality Board both state that the samples analyzed are inadequate to accurately characterize the potentially hazardous chemicals which could leach into our ground water, surface water, or be released into the air."

Given that the scars from the devastation of the mining from the not-so-distant past are still with us, we do not understand why the County is even considering this project or partnering with a company of this reputation.

This project will likely create a super-fund site in the middle of our beautiful town, not to mention the unavoidable day-to-day degradation of having a huge amounts of industrial waste impacting our air, roads and streams. I don't see any proven and practical plan for toxic clean up in the long term, I don't even see a mitigation plan (or who will foot the bill) for the day-to-day impacts on roads, air-quality and noise from the trucking required alone. I shudder to think about the impact on Wolf Creek and our watershed.

There is little demand for gold technologically, therefore the sole beneficiaries of this project are investors and jewelers, not the citizens of Nevada County. As for jobs, there are many other ways to invest in the local job market that will support our way of life, our property values and our environment. Forest restoration and climate transition projects leap to mind. Those are projects that will help the entire community into a better future.

Mining is the past. Grass Valley is no longer an industrial town. Let's not be the laughing stock that was duped into re-opening a site generating a massive amount of waste, both toxic and non, in the middle of our beautiful, bedroom community full of children and retirees. Our community doesn't need this project. It deserves much, much better.

Sincerely,

Michael and Heather Llewellyn

Dear planning commission:

I'm writing today to register my vote against the proposed Mine. I'm against this project due to the continuing development - in newspaper articles, research from locals in the area including the film work by Lou Douros. In all of these I see a thread showing the lack of responsibility and real damage caused by the group proposing the mine here in Grass Valley. In short I believe they are misleading the public and the locals. Their flyers and social media posts are exaggerated at best it seems.

Thank you for you thoughtful attention to this matter.

Cheri

Cheri M Flanigan

Good Morning. My name is John Vaughan. I live in District 3.

I'm going to revisit a topic from last week. I noted that the Rise Gold February 2023 Employment Details document has a number of math errors.

RECEIVED
APR 25 2023
NEVADA COUNTY
BOARD OF SUPERVISORS

A few examples include:

- The summary in Table 2 which displays 8 job categories at the mine, shows Underground Miners making $168,000/year while the detail table (Table 3) for Underground Miners shows them making $113,000/year. All job categories except one are higher in the summary table than in the detail tables.
- Additionally, Total Payroll in Table 2 is wrong in all categories except one.
- For example, if you divide Total Payroll for Underground Miners by the 156 miners shown in the table, then annual salaries for Underground Miners are about $25,000/year.
- The same process shows Geologists make $808,000/year
- All clearly incorrect.

I suppose you could write these things off to clerical errors. But given what I've seen in Rise documents, there appears to be a consistent lack of attention to detail and a willingness to spin data vs. publishing facts. If you were a manager doing performance reviews, you would rate their performance as "Needs Improvement".

Think about what that means for regulatory reporting. Most of the regulatory reporting is "self-reporting". Lack of attention to detail and publishing supportive numbers vs. facts is a huge problem for regulatory reporting, especially given the economic study shows no extra labor costs at the County for personnel to monitor the monitors.

Think about the size of this project, with hundreds, if not thousands, of controversial issues and a serious lack of information now vs. information that is promised later.

It defies common sense and basic logic that no environmental issues and none of the negative economic impacts for families, individuals and local businesses will ever occur at any time for 80 years.

I respectfully request you Just Say NO to the Final EIR and the Rise proposal.

Thank you.

John Vaughan, 11793 Lower Colfax Rd, GV, jvaughan1946@gmail.com, 916-807-0430 Cell

Idaho Maryland Mine

Good Morning. My name is Beverly Blake and I have been a Grass Valley resident since 1997. I have been a Realtor here for over 20 years. I wanted to share with you the personal impact that the Idaho Maryland Mine has already had on my husband and myself. I am 76 and my husband, who is a retired professional Firefighter is almost 80. We purchased a home on Little Hill Lane, off Anchor, off Greenhorn with several goals in mind. We planned to live in it for a number of years, improve the home and 3 acres with our own labor, and at the appropriate time, downsize and use the profit to fund our retirement. We have a beautiful home and property that we have worked hard to create our own little piece of Shangri La. We have invested hours of labor ourselves and also thousands of dollars making the property attractive and fire safe. My husband has become disabled and is no longer able to help me maintain the property. Three years ago our home insurance was cancelled and we now have to pay $7000 a year through the Fair (or what we call the Unfair Plan). We would have liked to put the property on the market last summer, but we discovered that with the mine issue hanging over us, no one would even look at it. I have two neighbors who had their properties for sale all summer. As soon as potential buyers heard about the mine, they were no longer interested. These are both very desirable properties and would normally have sold quickly. Now they are waiting for the decision on the mine to proceed. I know that there are many other residents in our situation and we have all been put in limbo by the mine. I personally have

three clients who are waiting for your decision on the mine to decide if they are going to move to Grass Valley or Nevada City. If the mine is approved, they will move to a different foothill town. They have no interest in living in a mining community. Every Realtor I know believes that the mine will negatively affect property values in every part of Western Nevada County, not just the immediate area around the mine. The Economic Report did not include local Realtor's opinions, even though we were surveyed. I believe the probability of diminished property values and taxes would impact the county revenues far more than Rise Gold's inflated promises.

Grass Valley and Nevada City are unique in the Sierra Foothills. No one else has the vast extent of culture, music and the Arts, as well as Sierra College for undergraduate as well as adult education. It seems that every month I read in the paper about a new venue that is being developed to further expand all these resources. I know that our future and many others entirely depends on your decision about the mine. Please do the right thing and just say NO!

Dear Nevada County Supervisors and Planning Commissioners,

My name is Nancy Debra Mckitrick. I live at 14934. Greenhorn Rd., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in the Greenhorn area of Grass Valley. I have lived here for 25 years.

The mine would be devastating to our community . Noise pollution ,environmental effects ,well water loss would be devastating for our community and communities for miles around. .

Let the mines in this community be a historical look into the future. We must head the mistakes of t he past .

I have read about the company that wants to open the mind and they have a very

poor reputation for leaving devastation to areas that they have mined .

Please do not allow this mine to be opened . Continue to encourage other businesses to come to our beautiful county that will not be destructive to our environment .

Thank-you ,

Sincerely,

Nancy Debra Mckitrick

Dear Nevada County Supervisors and Planning Commissioners,

My name is Charles Benner. I live at 17071 Pine Peak Rd., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

If you decide to approve this project the least you should do is create a ballot measure and have the citizens vote to approve your decision. Your decision will create a future for this county that will have tremendous impact for many years to come. As a board of supervisors you cannot take full control of such a important step that will impact the health and well-being of all our citizens.
You must get approval from the voters of this county for any action you take.
There is time to place a ballot measure on the election that is taking place in June of 2024.
In 2016 you created Measure W on the issue of growing cannabis to allow the voters to speak deciding the direction they want this county to go regarding that issue.
This gold mining will have a greater impacts on all of us than the effects of growing cannabis.

You must allow citizens of this county to have a vote and a voice.
And you must follow the will of the voters before you take any steps that will create such an impact on our environment.
Do your job.
You are representatives of the people. Give them a voice.
If you decide this without a ballot measure you will forever be responsible for this decision.
If you do this without getting approval from the voters and the decision creates a disaster for our county you will forever have it on your conscience for acting without guidance from the voters.
Don't take this action on your own. This decision well have a great impact for all of us. You must allow us to decide our own futures. You have no right to decide this on your own.

Sincerely,

Charles Benner

Dear Nevada County Supervisors and Planning Commissioners,

My name is Katherine Wallace. I live at 116 Lone Jack Pl, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hi! I live in district three, specifically in the Timberwood neighborhood. We bought our house one year ago, and it was never disclosed that there might be an active mine beneath our home.

Aside from the environmental impacts, which concern me greatly, I am concerned about quality of life issues, increased traffic on Brunswick (we already need a stoplight here even without the mine traffic) potential for sinkholes, property value, etc. We are a family with young children- not retirees who will never need to sell their house. This is our starter home that we worked hard for. We never thought we would be able to own a home. No one will want to purchase a home above a working mine- what happens when our family expands and we need to sell? Of course, declining property value is always a risk one assumes, but if I can prevent it, I will. Selfish,

perhaps, but I'll say "yes in my backyard" all day to housing and development that provides value to the community. The mine does not. Our community deserves clean water, clean creeks, good health, and high quality of life.

Furthermore the Loma Rica development is in full swing. From the map, it appears that this will also be located on top of the mine. Is it worth it to the city to compromise that development, which will provide much needed homes and businesses, over an unnecessary mining operation?

The high paying jobs the mine will provide are mining engineer jobs. This is no longer an area of expertise for our locals- mining engineers will come from outside the county to work the mine, so it's dishonest to say the mine will pay locals over 100k annually.

I urge the board of supervisors to think critically about the full impact of the mine vs. the benefits of allowing a mining company to operate in our community. There isn't a gold supply shortage, and if there were, it should be mined it in a place where people do NOT live. Rise Gold is historically untrustworthy and a poor partner for Nevada county.

Please consider the long term effects on the community and do not permit Rise Gold to open the mine.

Thank you for your consideration,

Katherine Wallace and Trevor Murphy

Sincerely,

Katherine Wallace

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Domenica Mottarella. I live at 13307 Byron Rd, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in district 4 North San Juan. I have lived in the area for 39 years. I urge you not to let mining happen in our county again. There are so many reasons this is a bad idea. Our community is still damaged from the original mining done here. Water is a precious resource which needs to be protected from toxins at every level. Air quality, noise, property values dropping. It’s just not an environmentally healthy choice for the land, the wildlife and the human population. Please consider other more environmentally sustainable options than mining.

Sincerely,

Domenica Mottarella

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Jennifer Kelly Kellty at je2niferk@att.net

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jennifer Kelly Kellty. I live at 10688 James Ln, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

As a resident of this area, living off Banner Lava Cap road, I am extremely concerned about the possible re-opening of this mine. I entreat you to put aside all thoughts of any profits to be made from this venture. Rise Gold & its predecessors have shown themselves to be untrustworthy and irresponsible, leaving in their wake a trail of mining failures , which the unfortunate residents of those areas are forced to clean up, as far as possible.
The risks attendant upon this ill advised proposal are enormous and irrevocable. We shall certainly suffer dangerously polluted air, increased smog caused by rock dust and diesel fumes from an endless stream of 18 wheelers, destroying our roads and disrupting traffic. Wildlife will lose habitat ,suffer, as the population for miles around will, from noise, loss of potable water and endless disruption. If, as is very likely , any small accident causes toxic pollutants to be released into the water table, not only

local residents but millions of people all over the United States will find their produce tainted or the supply cut off as the contagion flows down creeks into the Central Valley.
The amount of greenhouse gas certain to be released each year immediately destroys any hope of meeting California's goals for combating global warming and the huge quantity of electrical power required by mine operations is completely unsustainable.
The economy of Grass Valley & Nevada City will suffer hugely as home values plummet, visitor attendance at local events dwindles and costs rise.
PLEASE, just say NO

Sincerely,

Jennifer Kelly Kellty

Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Jean and Daniel Gilbert. I live at 18545 Old Coach Way, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We live in District 1 and we are extremely concerned, not just for our own area but for Grass Valley and envrions in general. This mine will NOT bring any kind of substantial jobs for local folks, and it endangers peoples' wells, traffic and the general atmosphere of the area.
The project is based on greed, not anything postive for our area. And we certainly do not want to be railroaded into an industry we do not want and certainly do NOT need.

NO MINE!

Sincerely,

Sincerely,

Jean and Daniel Gilbert

Dear Nevada County Supervisors and Planning Commissioners,

My name is Tim and Sandra Scott. I live at 17077 Cruzon Grade Road, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We have lived in Nevada County for the past 40 years, 35 in our current home on the San Juan Ridge. We own two homes and our adult children and their families also live here and have businesses in this county. We are adamantly opposed to the opening of this mine for several reasons, all based on experience. Siskon Gold tried to reopen an existing mine in our community 20+ years ago. The hype around it at the time was much the same as Rise puts out. It was a disaster for the investors and the community. Wells were dewatered, the local elementary school well system was destroyed, families were forced to move for health reasons, and the attorneys spent years trying to hold the mining company responsible. There is no mine, no jobs, no water on some parcels and the investors lost all of their money.
This will happen again if Rise is allowed to reopen the Idaho Maryland mine but on a

much larger scale. Please do not allow this disaster in the making to proceed any further. The past is about to repeat itself if you vote to approve this.

Sincerely,

Tim and Sandra Scott

Dear Nevada County Supervisors and Planning Commissioners,

My name is Janice and Charles Graff. I live at 23792 Woodhaven Place, Auburn, CA 95602.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We live in District 2, Lake of the Pines.

Rise Gold plans to pump out 3.6 million gallons every day for 6 months and another 1.2 for up to 80 years. Mine dewatering risks depletion of our region’s groundwater. It puts the health of wells and creeks at risk. The Final EIR did not address serious deficiencies identified by expert reviewers. Its claim that impacts won’t be significant aren’t supported.

Sincerely,

Dear Nevada County Supervisors and Planning Commissioners,

My name is Kathleen Madeira. I live at 149 Park Ave, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Mining is our history and should not be our future. We have a large residential community and would do better to not turn our county into a dirty industrial area. The pollution from asbestos laden trucks on our small roads, the 24/7/365 noise and disruptions of electricity and water are not worth it. Our county already has one of the highest rates of particulate pollution and to add to it is madness. Who benefits? It's certainly not our community. This Canadian company has a horrible track record of leaving if there is a problem. Why did they make Rise Grass Valley as a subsidiary? Is it to make our town responsible if and when something untoward happens?
Since our representatives want to make Rise Grass Valley clean up the polluted mess from the Centennial Mine, maybe let the state take it and turn it into a historical monument like the Empire Mine. It would certainly be safer and let us learn from

these polluting industries instead of repeating the mistakes of the past.
As a personal note, I've lived here for 30 years.

Sincerely,

Kathleen Madeira

Dear Nevada County Supervisors and Planning Commissioners,

My name is Susan Weills. I live at 215 Nihell Street, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1
I have a business in District 1
I have lived here 50 years. My family came here in the 1860’s.
My Grandmother born here.

Nevada County is not like it once
was. This is 2023. Not; 1923.
Different needs for every body and everything.

The thought of going back over 100 years is just too difficult to even think about. I find this issue incomprehensible (that this is even on the table)

I have several family members here; and I hesitate to think that we may have to move, if this came to pass. There would be a mass exit to others areas. Myself & my business, included.

I see no pluses, in opening a mine.

I’n certainly hoping you turn this out of date, unnecessary, problematic venture down.

We want to live in a beautiful, quiet, progressive community

Thank you
,

Sincerely,

Susan Weills

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Increased heavy truck traffic 24/7 will not add to our quality of life, nor attract visitors to our area. The chance that this mine will produce in a safe manner has not been demonstrated by the applicant as the principals track record illustrates their intent to do whatever it takes to reap the rewards and leave the environmental damage for others (read our county, our tax payers) to clean-up is too great a gamble. Just say no thank you.

Sincerely,

Peter Mason

My name is Janice Rosner. I live at 11898 Crescent Dr, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 3, specifically off of Lower Colfax nearLaws Ranch Cross Road and have lived in Grass Valley for almost 30 years. My daughter and grandson are graduates of Nevada Union High School and my younger grandson is currently a student there. Approval of this mine means disapproval of me, my family and my property as my well is at risk of contamination and subsequently my property values will be severely threatened. In my opinion, allowing any business that is going to pump out 3.6 million gallons of water everyday for 6 months and another 1.2 million gallons of water for 80 years is unconscionable. Although this has been a good rain year, historically we have been in drought and allowing one company to deplete our water supplies is not a fair distribution of resources regardless of how many jobs they bring into the community.

Families living in the mine's area of influenced will further be impacted by worsening of air quality, exposure to mine waste particles, increase in traffic, underground blasting, and noise pollution. These issues also will have long term effects on health, quality of life and property values.

This company is young, has never turned a profit and has a CEO with a poor track record who is on trial in Canada on charges related to spills at another mine. His prior company went bankrupt and left Canadians with the bill for the cleanup of polluted waters. The mine is right in the middle of an established community which creates an even higher risk when mistakes happen. This is a risk Nevada County can't afford.

A vote for the mine is a vote against the citizens of Nevada County. Please support your constituents and vote NO on this mine.

Sincerely,

Janice Rosner

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Linda Aeschliman. I live at 10971 Monte Vista Court, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

We have lived in district 1 for the past 30 years. We value being part of our thriving and caring community. We feel strongly that the IMM project would cause harm to our community and the environment now and for many generations to come. The impacts on air quality from so many large diesel truck trips; the noise caused by the truck traffic and the mine operations, the millions of gallons of water that will be pumped out of groundwater and thrown into Wolf Creek, the destruction of the natural environment where the mine is located - all of these are priceless, precious resources that can't be mitigated or replaced. It's time for us to approach these resources with restoration and regeneration in mind. Nature is essential for our humanity. Mining is not.

Sincerely,

Linda Aeschliman

Dear Nevada County Supervisors and Planning Commissioners,

My name is Nancy Ruth Chesnut Finlay. I live at 17343 Starduster Drive, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I currently live in District 4, in the Starduster-Mountain Meadows neighborhood. I have lived in Nevada County off and on since 1963, continuously for the past forty years. I fell in love with the natural beauty at first sight. Amazingly, I am still discovering new natural places to explore and enjoy. As a retired pediatric RN my primary concerns are for the health of our precious children and future generations. Please do not gamble with our health!

Sincerely,

Nancy Ruth Chesnut Finlay

My name is Karen Ahrns. I live at 10285 Willow Valley Rd, Nevada City, CA 95959.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in District 1, just outside the city limits of Nevada City. I have lived here most of the last 45 years!
I am a Broker and own a property management co. locally. I am extremely concerned the mine will have a negative impact on our environment and will make Nevada City and Grass Valley far less desirable. Besides noise pollution and exhaust pollution from the trucks, I believe mining this close to our vibrant community will be devastating to the property values locally and quality of life. Please just say No to this uncertain and risky industry!

Sincerely,

Karen Ahrns

Dear Nevada County Supervisors and Planning Commissioners,

My name is Janet Lee-Thearle. I live at 14400 Cherokee Lane, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I object to the mine. Brunswick is a busy street taking us to the hospital, Dr. Appointments and shopping. The addition to 220 trucks and 174 employees will be a big impact on our roadways.
This company coming from Canada has a poor reputation of acting within the codes if safety. We can not anticipate how disturbing asbestos and possible dangerous gasses will have on our health and that of our environment.
My husband I are both California born and want to protect our state and county.
The threat of property value decline is a viable threat.
Please look at the big picture and vote no

Sincerely,

Janet Lee-Thearle

Dear Nevada County Supervisors and Planning Commissioners,

My name is Stan & Erin Thomas-Rose. I live at 16118 Greenhorn Road, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

Hello, I am a 36 year resident of Greenhorn Rd., living with my family on the property which my 65 yrs old husband, Stan, was born and raised. Greenhorn Rd. has become a rather densely packed suburban residential community. It is "landlocked," with no easy egress for the thousands of homes packed onto this road. For years I have feared the outcome of an emergency exodus as the road can poorly sustain that which has already been developed. If the county was considering reopening mining operations, it should have never allowed for the current residential development. Although there is a certain historical charm to the idea of resumed gold mining the toxic legacy of past decades of mining is undeniable. I fear for the added traffic burden of trucks removing gravel, the threat of dewatered mining

tunnels to local wells, the toxic effects of chemicals and the lights and noise pollution associated with an industrial operation so close to our homes. Most of us cherish the rural quality of Nevada county living. Please do not threaten us further by allowing this development.

Sincerely,

Stan & Erin Thomas-Rose

950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Cindy Parker. I live at 10102 HARD ROCK RD, Rough and Ready, CA 95975, USA, CA 95975.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

My name is Cindy Parker. I reside in District 4 near the intersection of Bitney Springs Road and Rough and Ready Highway. My husband and I moved here 28 years ago for quality of life and the beauty of the environment. I believe most Nevada County residents live here for the same reasons.

I have closely followed the County's process to consider reopening the mine and do not support changing the General Plan to allow for the reopening. It is unfathomable to me that the County would risk trading the quality of life of many residents for the speculative projections of jobs and tax revenues, particularly in light of the disastrous experience of the CEO in Canada with another mine which I understand did not pan out and was not cleaned up.

I am optimistic the County will weigh the potential merits and drawbacks of the project and find the drawbacks are much greater.

Sincerely,

Cindy Parker

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Nickolas Hopkins at hoppynyk@aol.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Nickolas Hopkins. I live at 410 Madrone Way, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I live in the Brunswick area of Grass Valley and have lived here for several years. I work and pay taxes in the community and I am witnessing the current influx of growth to the region and we're growing much too fast already.
We need to look at the pattern currently developing, we don't have the infrastructure available to handle the amount of growth we are already experiencing. Already the roads are atrocious and are pot-marked throughout the city and county. And I shudder to think, that you are contemplating adding a working mine to this mix. Traffic is already horrible and now you are considering to further downgrade our quality of air (and life) with the activities and workings necessary to the running of this mine.
We rely on the you to look out for the well-being of this community, and that means looking at the big picture of what this means to the residents already here. We need

you to look at everything involved in this operation, including the track record of the company who is promising the abundance of jobs and tax revenues.
Let's take a closer look at their previous operation and figure out why they are leaving there trying to come here. (To duplicate the devastation they created there?)
And let's be sure to scrutinize the record of the CEO who is currently being prosecuted for his previous mining operation in Canada.
"If it sounds too good to be true, it usually isn't true at all."
And we can't afford a mistake like that here.
Let's not bring that dysfunction and destruction here to Nevada County and Grass Valley.
We beg of you to do the job you were elected to do and look out for all of us, every man, woman, and child of Nevada County.
Thank you in advance for doing the right thing.

Sincerely,

Nickolas Hopkins

This letter is submitted by the CEA Foundation MineWatch Campaign on behalf of Katherine Friedland at amravati_ji@yahoo.com

Nevada County Supervisors and Planning Department
Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My name is Katherine Friedland. I live at 18938 Saint Paul pl., Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I have been living in Chicago Park for over 11 years now. I am totally against the opening of the Idaho Maryland Mine. After doing extensive research I feel it would be detrimental to our whole community.

Sincerely,

Katherine Friedland

Dear Nevada County Supervisors and Planning Commissioners,

My name is Robi Holmen. I live at 744 Annex Avenue, Grass Valley, CA 95945.

As a concerned citizen, I am asking you to “just say no” to re-opening the Idaho-Maryland Mine. It has significant and unavoidable environmental impacts that endanger this community's health and quality of life. A few jobs and uncertain tax revenues just aren’t worth the risk.

I moved here from Roseville because of the livability and the wonderful community that there is here. Do NOT approve the Rise Mine project. It would be an environmental disaster. It is not as much a money maker for Nevada County as it is for the developers of the proposed mine. NO on the Rise Mine Project.

Sincerely,

Robi Holmen

Dear Supervisor Scofield,

Attached please find the CEA Foundation's full comments for the record on the Idaho Maryland FEIR. They have been submitted to the County.
They expand on a number of key technical issues including those in the CEA/Minewatch Coalition (25 groups) summary letter that we sent to you recently.

The comments we are sending you today specifically respond to the often dismissive responses by the EIR consultants to our comments on the DEIR.

Our attorneys' legal comments on the FEIR, which also have been submitted to the County, were emailed by us to you previously.

We are asking that the FEIR not be certified, and that the Mine project be denied. There is ample case law to uphold the rejection of FEIR certification if a project is denied. (1) There is no reason to continue with the EIR. We believe that continuing the EIR will just cost the County in loss of time and energy as well as that of staff and the community. We can better spend this time on critical issues like wildfire safety and climate change. If the EIR is certified as it stands now, even if the project is denied, it will be a flawed EIR in county records that can be used under future applications.

We hope the attachments will assist in your review of the project.

Sincerely,
The Community Environmental Advocates Foundation Board

Dear Board Members,

I write to you today to share my strong support for the Idaho Maryland Mine development. As a resident of Nevada County and father of two students at Seven Hills Middle School it is my sincere wish that you will allow this proposed mine to move forward.

All human activity has an impact both on the environment and people living in it. As supervisors you are tasked with evaluating potential negative impacts against potential positives. I believe the benefits of this development far outweigh the risks. Indeed the potential positive impacts of this proposed development likely represent a generational opportunity to improve the lives of residents in this area. A stable well paying job for too many local residents has become not only more and more elusive but indeed nearly unknowable. This has a detrimental and generationally stressfully impact on both the residents and broader business community in Nevada County. Communities thrive when stability and diverse opportunities are present. In the same way the future residents of an apartment building are faceless and cannot attend a public meeting to advocate for its construction, the future benefits of this development are somewhat opaque and exist only as numbers. These numbers represent hope, optimism and opportunity for many local families and can with your approval help form the base of a diverse, stable, and vibrant local community. On the other side of this we have impacts, some knowable and some theoretical. The gating items on environmental risks and potential mitigation options involve significant science and I'm sure you are learning a great deal. As a community that treasures the outdoors and local environment we are in a unique and appropriate position to ensure that this mine operates in compliance with regulations that understand risks and have tools to make sure mitigation happens if and where it is needed.

I thank you for your consideration on this subject.

Sincerely,

David Rice

This email is on behalf of myself and all our staff at Choquiero Cacao Cafe at 419 Broad Street.

We have been educating the public for many months now on how terrible this mine will be to our underground water systems, air pollution, noise pollution, chemical pollution. We hardcore disagree with this mine and belive it will be a complete sell out of our leaders if they allow such a atrocity to take place in or near our town; anywhere really.

The profits that could come from the mine (depending on how much it takes to repair the future ecological disasters that could affect underground systems for hundreds or thousands of years) are absolutely not worth it.

Hundreds of local people we have talked to are and will be willing to fight, risking going to jail, in several cases possibly leaving their children without fathers and mothers, because the future generations deserve a world they can live in.

The fact that this is even up for consideration is naive, selfish and a complete misrepresentation of what the local community desires. It is an abuse of power. An abuse of responsibility.

We beg that the people in charge of this project come to their senses and listen to the people and community they are supposed to represent.

Dear Nevada County Supervisors and Planning Department,

I am a ten-year Nevada City home owner and resident with children and grandchildren living in Nevada County. I am concerned about their future, the future of all of us living here and maintaining our quality of life.

When I read the Rise Gold propaganda about the benefits of re-opening the mine in and under Grass Valley, I was curious enough to read the Environmental Impact Report and began researching their claims, as well as Rise Gold's history as a business. I found their claims shockingly inaccurate.

You are currently receiving detailed refutation of claims made in the E.I.R. which should convince you not to approve this permit. What a terrible waste of time, human energy and money this poor business scheme has already cost! Please consider the lives and well-being of your constituents over those who would take advantage of us for their own profit.

There are so many better uses of the Idaho-Maryland land that could benefit our growing population through healthy rather than harmful activities. Let's invest in developing recreation in our area rather than in destructive extraction of our resources. Let's clean-up our air and water rather than fouling both. For our present and future well-being, please say no to the mine.

Sincerely,
Yasha Aginsky

Since I am unable to physically attend meetings of the mine May 10th I hope that this letter will be added to those of us whom are opposed to this mine opening.
I fear that the repercussions to our community and downstream, since we all of us are connected, will be disastrous. For a few jobs and money to a few our air quality, water and infrastructure cannot handle this load. The Hansen and other trucks are already too much and as we've seen this winter Nevada county nor for that matter none of us are prepared for the climate change already affecting us.
Please, please vote no to this Idaho Maryland mine. Our previous environment needs us to take care.
Thanks for your time
Sincerely,
Deborah Van Stone-Stapleton

I am, and always have been, against the mine for so many reasons. This proposed mine would change our towns in a very negative way FOREVER. Here are just a few reasons:

Air Pollution; carbon dioxide, diesel fuel, exhaust and other poisons and carcinogens in the air that will threaten our population and especially our young children.

Noise Pollution: Diesel trucks running 24 hours a day, explosions and equipment in the mine that threaten our peace and quiet.

Water Pollution: There is a major threat to both our water and our water tables. There is NO proof these will not be affected.

Traffic: Things have gotten bad enough around here and the neighbors of the mine and surrounding areas, plus our roads, would really suffer.

And then there's asbestos. Don't get me started. This just should have been a no go from the get go.

Sincerely,

Holly Ahrens

> Re: Vote NO on Rise Gold IMM FEIR
>
> Dear Nevada County Supervisors and Planning Commissioners,
>
> This is notice that the Nevada County Board of Supervisors has NO STATUTORY authority to license or permit the Rise Gold corporation for mining operations that will produce, distribute and store toxic waste in the county for several reasons.
>
> First, the Rise Gold funded economic study reveals the actual chemical processing, treatment, and disposal of and with toxic chemicals including toxic residue products will be processed outside of California, most likely in the state of Nevada. This means that toxic waste will be transported through the county, state, and into Nevada.

Second, it is abundantly clear and well settled by law that statutory authority for toxic waste regulating and permitting for the Rise Gold IMM proposal are as follows: In California and Nevada, each state's respective Department of Environmental Protection is responsible for regulating and permitting hazardous waste facilities.

In California, the California Department of Toxic Substances Control (DTSC) is the regulatory authority responsible for issuing permits for hazardous waste facilities. The law that governs the jurisdiction of the DTSC is the California Hazardous Waste Control Act (HWCA). This law gives the DTSC the authority to regulate the generation, transportation, storage, treatment, and disposal of hazardous waste in California. The HWCA is enforced by the DTSC through the **California** Code of Regulations, Title 22, Division 4.5 - Hazardous Waste Control. In **Nevada**, it is the Nevada Administrative Code (NAC) 444.686 et seq. that governs the jurisdiction and permitting of hazardous waste facilities.

The US Environmental Protection Agency (EPA) is the primary federal agency responsible for regulating hazardous waste management. However, under the Resource Conservation and Recovery Act (RCRA), Congress allowed states to develop their own programs for regulating hazardous waste management, as long as their regulations are at least as stringent as the federal requirements. Both California and Nevada have received authorization from the EPA to implement their own hazardous waste programs that are consistent with federal law. As a result, these states have primary jurisdiction over hazardous waste management within their borders, and the DTSC is the regulatory agency for California.

Third, it is clear that Nevada County BoS and NC Planning Department have overstepped their legal authority to permit the Rise Gold IMM for at least those reasons. The same applies to the usurpation of the authority from the California Riparian Courts, which have jurisdiction over all pumping or dumping of the surface and subsurface waters in the state where Nevada County resides.

Last, the IMM FEIR is derelict in analyzing the real hazards mining, having errors of fatal errors of omission as well as commission, as most comments submitted to the DEIR were ignored or waived in the FEIR. In the NC Planning Department's defense, they were never mandated nor have the expertise to provide an adequate EIR for a toxic substance processing, transporting and storing facility. Thus the NC BoS will be spared significant embarrassment and unyielding litigation if they **do not** certify the subject poor excuse for an environmental impact report.

Eric Rood Administrative Center
950 Maidu Avenue
Nevada City, CA 95959

Dear Nevada County Supervisors and Planning Commissioners,

My family lives on Anchor Lane in District 3, about a quarter mile from the proposed Idaho-Maryland Mine and within the mineral rights boundary. We implore you to protect our health and quality of life by voting NO on reopening the mine, as well as voting against certifying the Final EIR.

Having read the FEIR, we do not think that the risks to our well and groundwater have been properly assessed. Spotty baseline data from 15 years ago does not provide a good foundation for a real monitoring system for those of us facing mining and blasting under our homes for the next 80 years. Our family depends on our well for drinking water and are terrified that the proposed mining activities in fractured geology will dewater or contaminate our only source of clean water. Furthermore Rise Gold has not offered any kind of mitigation, monitoring, or guarantee that we would be offered a swift resolution should their mining activities result in loss of our well. Our property, along with those of all our neighbors, would become nearly worthless without a functional water source.

We are raising two children in Nevada County and worry that their future health and safety will be placed at risk by this mine; including diesel exhaust and asbestos in the air, constant noise and traffic from mine operations, and increased risks of climate change. It is a risky project, made even worse by the fact that Rise Gold does not have a solid track record of mining or of compliance with relevant environmental regulations. Rather, their executives have a record of bankruptcy and failing to meet environmental and workplace safety

standards.

Previous generations in Nevada County learned the hard way that mining leaves a toxic legacy for us, their children and grandchildren, to clean up. It would be highly irresponsible for us to repeat that mistake. Please vote NO on the IMM project and the FEIR to protect us from these deadly risks.

Your constituents,

Laina and Matt Levy

Two hugely important points for the council to consider:

One, the city and county have spent many decades trying to clean up the results of mining and remediate the water supply. While there is of course the concern about further pollution, there is also the risk of underground waterways being changed by mining activity and old pockets of toxicity contaminating so much more of our nature and home water. This is 100% unacceptable and the people of Nevada county will not allow a mine to risk their safety.

2, especially evident with the changes on Mill street, tourism is becoming more and more valuable here all the time. Tourism is based upon the natural beauty and tranquility of the area, compromising it would crush the town. There will be no large mining industry truck operations pushed through Grass valley, unacceptable.

Thank you,
Happy Om

Matt Kelley
Senior Planner
Nevada County
Dear Mr. Kelley:
I submitted comments on the Idaho-Maryland DEIR. The Final EIR contained responses to those comments. I realize that Nevada County will not be revising the FEIR, or responding to any comments on the FEIR. However, I am concerned that several of the responses to my comments did not adequately address the issues that I raised, so I would like to submit my comments on FEIR Responses to my DEIR Idaho-Maryland DEIR comments. Those response comments are attached.
Sincerely;
David Chambers

"Technical Support for Grassroots Public Interest Groups"

MEMORANDUM Date: April 12, 2023

Re: Comments on FEIR Responses to CSP2 Idaho-Maryland DEIR Comments

Fm: David M. Chambers, Ph.D., P. Geop.

The EIR Responses to my comments fall into two general categories: (1) they defer addressing the issue to a later date, or defer to another agency/permit; and, (2) they give a technically inaccurate answer.

Environmental Impact Reports/Statements are generally viewed legally as procedural documents. That is, their purpose is to provide information to decision makers and the public that will disclose the potential effects and impacts of a proposed project, but those decision makers are still free to make decisions that are not supported by the information in the EIR/EIS. What I attempted to do with my comments was to show areas where, in my experience reviewing EIRs/EISs, some of the information was either insufficient or absent.

Below are my responses to the EIR Response to my comments on the DEIR. Each has three parts. First, I list short summary of my original DEIR comment. Second, I list a short summary quote from the EIR Response. Third, I attempt to briefly summarize why I believe the EIR Response to be inadequate.

My Grp 7-175 & 176 comment:

This is a rather unusual mine project proposal, a request for an 80-year operating permit, in that most regulatory agencies would consider the level of information presented for this environmental review of the project sufficient only to consider this as a proposal for advanced exploration, not for mine development. This mine development proposal lacks the economic and environmental data necessary to evaluate a full mine development proposal.

EIR Response to Grp 7-175 & 176:

"*As described in Chapter 3 of the DEIR Underground exploration would take place after mine dewatering is complete and throughout the life of the mine and would be done primarily with diamond core drilling throughout the mine area. … The level of testing completed thus far is appropriate for analysis of impacts under CEQA, and additional testing will be required for approval of WDRs.* (Waste Discharge Requirements from the Central Valley Regional Water Control Board)"

Discussion:

It is recognized that Nevada County can decide to issue a permit to develop a mine based on criteria of its choice. In my comments on the DEIR, I am pointing to several widely used standards for evaluating mine proposals. In comparison to these standards, and in my personal experience, this EIR does not contain sufficient information to permit a mine operation for 80 years. This does not imply it is illegal to do so, but it is counter to prevailing practice. Making decisions based on inadequate data and analysis can, and has, led to untended results at mines.

My Grp 7-177 comment:

The water quality of the discharge that will be required by the discharge permit should be disclosed in the EIR so that the public is able to assess and comment on the potential impacts.

EIR Response to Grp 7-177:

"*The water quality discharge standards are disclosed in the EIR, in Table 4.8-2 on page 4.8-44*."

Discussion:

In the DEIR it is noted, "*The proposed project is likely to include* ***construction dewatering to be discharged to land****; thus, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults*." (DEIR, page 4.8-31, **emphasis added**)

The discharge standards in Table 4.8-2 may be reflective of a "*construction dewatering to be discharged to land*", but they are unlikely to reflect the water quality standards for the discharge of treated mine water, which will be too voluminous to discharge to land.

The water quality standards in Table 4.8-2 reflect EPA Technology-based discharge standards, which were not designed to be protective of aquatic life. If the standards in Table 4.8-2 were applied to a discharge of mine water into a stream, aquatic life would not be protected.

The water quality standards listed in Table 4.8-2 should not, and probably do not, reflect the discharge standards that would be applied to a discharge permit issued by the Central Valley Regional Water Control Board for treated mine water, and for water treated during mine operation.

My Grp 7-178 comment:

A Monitoring Plan should be included as a part of the EIR.

EIR Response to Grp 7-178:

"*With regard to water quality mitigation, Mitigation Measure 4.8-1(a) requires the applicant to submit a Notice of Intent (NOI) to the Central Valley Regional Water Quality Control Board (RWQCB) and the Notice of Applicability (NOA) shall be received before initial mine dewatering can begin*."

Discussion:

For mine development, and even for mine dewatering, a monitoring plan would be included in most environmental analyses. The monitoring plan discloses the fundamental parameters of; (1) what constituents will be monitored, (2) how often the monitoring will take place, and (3) where the monitoring will take place. These are simple, but essential, facts that should be disclosed in an EIR.

Developing a monitoring plan is not prohibitively difficult or expensive, but it does require a fundamental understanding of the constituents of concern, the aquatic and human health values at risk, and what can be done to mitigate and monitor any discharges into surface and ground waters.

My Grp 7-179 comment:

It is noted that approximately 500 tons/day of tailings will be backfilled into the mine as cemented paste. The technical details of the process are contained in "Desktop Study of Cemented Paste Backfill, ITASCA Denver, Inc. February 24, 2020." In this report, it is noted that no tests on the leaching characteristics of tailings have been performed, but that testing would be done when a cement had been selected. Even though the backfill is unlikely to turn acidic, the potential for neutral leaching of contaminants like arsenic need to be investigated.

EIR Response to Grp 7-179:

"The "Desktop Study of Cemented Paste Backfill, ITASCA Denver, Inc. February 24, 2020." discusses in detail the tests on leaching characteristics performed for the project and concludes: "Based on the testing results described herein, Idaho-Maryland Mine flotation tailings have low sulfide content, are net acid-neutralizing, have solid-phase metals contents that are comparable to the average crustal abundances, and have leachate concentrations from WET-DI tests that meet all California primary MCLs. Thus, it is likely that the CPB used in the Idaho-Maryland Mine will have very low solute release rates and will be generally environmentally benign.

Discussion:

Because no leach tests have been conducted, we do not know if neutral leaching metals, especially arsenic, or contaminants introduced during the processing of the ore, may leach from the backfill. The EIR Response only address acid drainage metals, which are not the only contaminants with the potential to leach from the backfill. (Note: the issue of testing the cemented backfill is addressed again in Grp 7-199)

My Grp 7-180 comment:

The mine waste that is not backfilled into the mine will consist of 50% tailings (rougher tailings from flotation separation in the mill), and 50% waste rock from the mine. Approximately 4 million tons of waste would be placed at two sites near the mine during the first 11-years of mining. The number of samples utilized in the leach tests of this waste is not sufficient to properly characterize the contaminants that may be leached from the waste. Comparing the number of samples cited in the EIR to the sampling guidelines of the GARD Guide demonstrates the insufficiency of the existing tests.

EIR Response to Grp 7-180:

"*… the DEIR requires that a report of waste discharge (RoWD) be submitted to the Central Valley Regional Water Quality Control Board (CVRWQCB), and approval of Waste Discharge Requirements (WDRs) prior to placement of any mine waste. Significant additional testing of rock material will be required as part of the process of obtaining WDRs from the CVRWQCB.*" (Master Response 8)

Discussion:

The present geochemical testing was conducted on 4 tailings samples, each of different grind size. So the results for 2 million tons of tailings, assuming one of the tested grind sizes is chosen as the final processing choice, is represented by one tailings sample. There are 6 waste rock samples. The waste rock samples should be categorized and collected by waste rock type, with the number of samples relative to the volume of each waste rock type, as recommended in the GARD Guide. The 6 waste rock samples are not sufficient to represent approximately 2 million tons of waste rock of differing types.

The EIR Response does not address using the recommendations from the GARD Guide, the industry standard reference for acid rock drainage testing.

My Grp 7-181 comment:

There is no technical report to provide the detail needed to evaluate the geotechnical viability and safety of the waste rock/tailings facilities described in the EIR.

EIR Response to Grp 7-181:

"*The commenter asserts that there is not sufficient engineering detail to ensure the engineered fill pads will be stable. However, engineering level detail is not required in an EIR. … The new mine waste will not be placed on old mine waste or other existing fill unless the existing mine waste and fill is first reworked as engineered fill pursuant to the* ***geotechnical engineering recommendations***." (**emphasis added**)

Discussion:

I must assume that some level of geotechnical design and engineering work has been done in order to provide the descriptions of the waste rock/tailings facilities described in the EIR. If not, then these facilities would be purely conceptual, with no actual technical assessment of their viability. Technical design reports are typically provided as supporting documentation to an environmental analysis.

As noted in the EIR Response, geotechnical engineering recommendations are necessary to judge the basic viability of the proposed facility design. Lacking this information, there should be a significant level of concern if questions about the facility design exist. If these reports exist, they should be attached to the EIR. If they do not exist, delaying this analysis to some later point in time does not meet the requirements for basic analysis in the EIR.

My Grp 7-182 comment:

Mine waste facilities must be designed to withstand much larger seismic events than required by typical seismic building codes because of the long expected life of the water facilities. The seismic reports discussed in the Geology section of the EIR are not up to date, and even if updated would not meet the requirements for a probabilistic seismic site analysis.

EIR Response to Grp 7-182:

"*Based on our site observations, the geology of the region and our experience in the area,* ***our opinion*** *is that the risk of seismically induced hazards such as slope instability, liquefaction, and surface rupture are remote at the subject site*." (**emphasis added**)

Discussion:

Having an "opinion" about the geotechnical stability of a waste rock/tailings facility that will contain millions of tons of material is not sufficient. Engineering analyses are conducted in order to base decisions on facts and analysis, and to avoid mistakes based on opinions.

My Grp 7-183 comment:

With an equal ratio of tailings to waste rock in the engineered fill, not only is a careful analysis of the geotechnical properties of the tailings important, and currently lacking, but how these two fill sources are mixed is also critical, since the tailings and waste rock have very different geotechnical properties.

EIR Response to Grp 7-183:

"*The commenter asserts that the DEIR does not explain how tailings and waste rock will be blended to create engineered fill pads. However, NV5 provides recommendations for blending of rock and tailings on page 14 of appendix H.1 to the DEIR.*"

Discussion:

Appendix H.1 to the DEIR provides the following guidance for blending of water rock and tailings: "*Onsite blending of blast rock and sand tailings may be performed by earthwork equipment (e.g., windrowing and spreading the rock and sand together in thin lifts). Specific procedures for onsite blending should be developed in conjunction with an NV5 representative during initial fill placement.*"

The EIR Response only confirms that blending guidance has yet to be developed.

My Grp 7-184 & 185 comment:

In the EIR, it is proposed that an alternative for placing the mine waste in the proposed facilities is selling the waste in the local marketplace as fill material. It is seldom possible to guarantee that all mine waste will be contaminant-free. If any of the waste sold as clean fill should cause a problem, the sellers of that material, and the company that produced that material, would likely be legally liable.

EIR Response to Grp 7-184 & 185:

"*As explained in Section 4.4.1 of Appendix K.2, Sample MAA-1, which is the sample cited by the commenter as having 1.78% sulfide, is altered meta-andesite and this type of rock is expected to be a minor component of all materials produced (12 tons per day). … most of the rock produced by the project would not have significant sulfide content and would be suitable for use as construction aggregate.*"

Discussion:

At a very minimum, a rigorous testing plan would need to be initiated to ensure any waste rock being sold does not contain sulfides that could cause contamination. Not doing this would put all parties involved at potential risk for cleaning up any potential contamination. It is for this reason that is highly unusual for a mine to dispose of its waste off-site, and why most potential end users avoid mines as sources of fill material.

Even if testing is required, if the mine cannot sell the waste because of market conditions or potential contamination, where will it put this waste? A contingency site for disposal of the waste must be identified should sale of the waste not be possible.

My Grp 7-186 comment:

Financial Assurances for mine closure runs tens to hundreds of millions of dollars. Because these sums are so substantial, the public should be informed about these costs, and how the costs were estimated.

EIR Response to Grp 7-186:

"*Mine water discharge is not part of the reclamation plan requirements of the California Surface Mining and Reclamation Act (SMARA); however, there will be water quality specific financial assurances for closure and post-closure maintenance of mining units as required by Title 27 section 22510. This may include the need for long-term water treatment of mine-related discharges. This issue will be addressed in the approval of the WDRs required by Mitigation Measure 4.8-1(d) and 4.8-1(e)).*"

Discussion:

Mining companies always calculate the amount of anticipated financial assurance as a part of their basic analysis because it is such a significant amount of money that it affects the fundamental investment decision for a mine.

Taxpayers are ultimately at risk for this amount if the company has not provided it, or if the amount required is not adequate to close and care for the mine should a bankruptcy occur. Financial assurance could have a significant impact on the public, and since the information is available at the planning stage for a mine, it should be included in the analysis of an EIR.

My Grp 7-187 comment:

The EIR notes that the Union Hill Mine will not be dewatered. There is no discussion in the EIR of the potential impacts for the Idaho-Maryland Mine, which includes the Brunswick Mine, if flooding were to occur during mine exploration and operation.

EIR Response to Grp 7-187:

"***The Union Hill mine workings are within 95 feet to 180 feet of workings of the Brunswick Mine at three to four different levels****. … A "conduit" has not formed between the mines in the previous 70 years, which included active mine operations, as evidenced by the different observed water levels. … Any necessary safety procedures or measures relating to flood risk would be regulated by the Mine Safety and Health and Administration (MSHA)." (**emphasis added**)*

Discussion:

It is likely that the Mine Safety and Health Administration will require the Union Hill mine workings to be dewatered along with the Idaho-Maryland/Brunswick mine workings. As noted above, the two mines are very close, and a sudden influx of water from the Union Hill mine to the Brunswick mine could be fatal to workers in the mine. Even if the possibility is remote, allowing the Union Hill Mine to remain flooded is not worth the risk of potential fatalities. Since dewatering of the Union Hill Mine is a reasonably foreseeable requirement, it should be analyzed in the EIR.

My Grp 7-188 & 189 comment:

Approximately 50% of the mine waste, also referred to as "engineered fill", disposed on the surface will be tailings. For the EIR, four samples of tailings are analyzed, and the four samples are of different grind sizes. The size of the tailings particles will have an effect on the rate of leaching.

EIR Response to Grp 7-188 & 189:

"*Engineering level detail is not required in an DEIR. … The mitigation measures identify the steps that must be taken to reduce the potential impacts to less than significant. The engineering details described in this comment would be developed through the mitigation measures.*"

Discussion:

The size of the tailings particles will have an effect on the rate of leaching. As a result, the geochemistry of the tailings is being represented by, at most, one tailings sample. The analysis of several tailings samples, of the appropriate grain size, are required to assess the potential of several million tons of tailings to produce contaminated leachate.

My Grp 7-190 through 7-193 comment:

The method selected for leach testing the tailings and waste rock used distilled water, which is the least aggressive of the various leach-testing methods. For mine waste rock and tailings, short-term tests typically use a weak acid solution for leach testing in order to simulate the generation of some acid in the waste due to sulfide decomposition. Long-term leach testing, which runs for months rather than hours or days, typically uses distilled water, because natural sulfide decomposition and the accumulation of oxidation products has sufficient time to stabilize.

EIR Response to Grp 7-190 through 7-193:

"*Mitigation measures require the applicant to submit a Report of Waste Discharge (RoWD) and received an approved Waste Discharge Requirement (WDR) from the Central Valley Regional Water Control Board (CVRQCB) …" … "… water quality would be thoroughly investigated during the RoWD/WDR process required by Mitigation Measures 4.8-1(d) and 4.8-1(e). Any monitoring requirements would be specified in the approved WDR.*"

Discussion:

The EIR Response defers to requirements of the Central Valley Regional Water Control Board. The results from CVRQCB testing are not available for review in the EIR.

The testing method used to predict contaminated seepage in the EIR would yield the lowest levels of contamination possible from the test material. This may provide the EIR with an overly optimistic view of what potential impacts to water quality may be, and this is the information that Nevada County is using to issue a permit for the long-term operation of the mine.

My Grp 7-194 comment:

Iron and manganese are both known to be present in existing mine water at levels that exceed water quality standards (DEIR Appendix K, Section 4.2), but they are not showing elevated levels in the test data. This strongly suggests that the oxidation-taking place in the mine itself, and in the mine waste on the surface, is more aggressive than that being simulated in the leach tests using distilled water.

EIR Response to Grp 7-194:

"*As discussed on page 116 of Appendix K.2, water currently within the flooded mine workings has low dissolved oxygen (DO) levels, creating reducing conditions (low or no dissolved oxygen present and negative oxygen reducing potential). The low oxygen levels and reducing conditions prevent the oxidation of sulfide minerals, such as pyrite, that are exposed within the surfaces of the underground workings.*"

Discussion:

The EIR Response does not explain why iron and manganese are present at high levels in existing mine water. According to the explanation given in the EIR Response, there should be no iron or manganese present.

As with the response for Grp 7-190 through 7-193, the EIR Response defers to requirements of the Central Valley Regional Water Control Board, which does not supply the EIR with the information necessary to assess the adequacy of the water quality predictions.

My Grp 7-195 comment:

Nitrate, a residual from blasting, will almost certainly be present at levels significantly higher than projected in these tests.

EIR Response to Grp 7-195:

"*… ammonia and nitrate, are very soluble and mobile in water. This means that any blasting residuals would be continually removed from the mine over time through the dewatering system. The proposed WTP is designed to treat ammonia and other blasting residuals that might occur due to incomplete detonation. Thus, when the mine is allowed to flood again following the completion of mining, there is no reasonable potential that residuals from former blasting activities would cause a violation of any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality.*"

Discussion:

My comment addressed nitrate. The EIR Response almost exclusively addresses ammonia. In my experience, ammonia does dissipate relatively rapidly, but leaching nitrate can persist for decades. The EIR Response does not address the original comment.

My Grp 7-197 comment:

An important constituent, sulfide-sulfur, is not reported on a per-sample basis.

EIR Response to Grp 7-197:

"*… the presence of individual sulfur forms for each sample analyzed is shown in Table 4-8 of Appendix K.2.*"

Discussion:

In Table 4-8 there are 6 rock samples listed. 4 of the 6 samples have sulfide-sulfur levels of 0.1% or greater. Acid generation and/or neutral drainage has been documented in rocks containing 0.1% sulfide-sulfur, so these samples should be treated as suspect. Two samples have sulfide-sulfur contents of 1.0% or greater. The samples with 1% sulfide-sulfur warrant humidity cell testing to determine their potential to generate contaminants in the long-term.

6 samples is insufficient to characterize the millions of tons of waste rock to be produced at this mine.

My Grp 7-198 comment:

In the summary of the report (Appendix K.2), EMKO notes that Potential Contaminants of Concern include ammonia, arsenic, hexavalent chromium, iron, manganese, pH, total suspended solids, TDS, and cis-1,2-DCE. To this list, I recommend adding antimony, copper, and nitrate.

EIR Response to Grp 7-198:

"*The CVRWQCB will select the appropriate continents that require monitoring, which may include antimony, copper and nitrate as requested by the commenter.*"

Discussion:

Copper, which is deleterious to aquatic life at low levels, and antimony, which is toxic to humans as low levels, was detected in several of the samples rinsed with distilled water. The EIR Response does not explain why copper and antimony cannot be listed as Potential Contaminants of Concern.

Listing copper and antimony as Potential Contaminants of Concern would require the insertion of two words in a sentence in the EIR, and would provide an informed recommendation to the CVRWQCB.

My Grp 7-199 comment:

Leach tests for the paste backfill also need to be completed. It is not appropriate to grant a mining permit that allows the use of this backfill without evaluating the potential long-term effects on water quality.

EIR Response to Grp 7-199:

"*Mitigation Measure 4.8-1(d) requires the applicant to submit a Report of Waste Discharge (RoWD) and received an approved Waste Discharge Requirement (WDR) from the Central Valley Regional Water Control Board (CVRQCB) prior to the placement of cemented paste backfill, so additional testing will be done as requested by the commenter*."

Discussion:

The purpose of an EIR is to provide basic information to inform the decision making process. Nevada County will be using the information in the EIR to decide whether to issue a permit to mine for a significant period of time. By consistently deferring analysis of water quality issues to the CVRWQCB, the EIR fails to provide essential information to inform the Nevada County decision-making process.

My Grp 7-200 comment:

The mining project as proposed in this EIR has a fundamental lack of information on the economic viability of the mine, and potential environmental impacts related to geochemistry and water quality.

The EIR should analyze an Alternative that provides for dewatering and underground exploration. That is the only Alternative that the information provided in this EIR will support.

EIR Response to Grp 7-200:

"*The proposed alternative would be economically infeasible because all the above costs would be incurred without the ability to produce any valuable minerals to offset that cost. Additionally, the proposed alternative would not meet the first project objective, which is 'Construct a commercially viable, financeable, major underground gold mine operation that will produce 1,000 tons per day (365,000 tons per year) of gold mineralization'*."

Discussion:

The data submitted in support of this EIR is only sufficient to support an application for dewatering the mine, and for underground exploration drilling. This would provide not only the information that will be required to perform a preliminary economic analysis of the orebody, but would also supply the samples needed for geotechnical and geochemical testing, and for water quality modeling.

There is nothing that should preclude analyzing an EIR alternative for exploration only.

CalEPA Environmental Complaint Management System

Attached is information regarding an environmental concern submitted to CalEPA via the statewide Environmental Complaint System. Based on the complaint description entered by the Reporting Party, we are referring this complaint to your agency for response and/or further investigation.

Summary: The State Water Resources Control Board referred COMP-56957 to Nevada County Department of Environmental Health on April 28, 2023 .

When you have completed your investigation, please click here to submit your findings.

To access all complaints referred to your agency, please login to the External Partner Portal . If you do not currently have access to the portal, you may request access by following the instructions listed here: External Agency Users – Requesting Access to the External Partner Portal .

Complaint Number : COMP-56957

Complaint Id : a0g8z0000001moSAAQ

To submit findings without logging into the External Partner Portal, enter the **COMP Number** and **Complaint Id** under the section titled **"Provide Findings Without Logging In"** located on the right side of the External Partner Portal login page.

We appreciate your attention and response to this environmental concern. If you have any questions, please feel free to contact Guy Childs at guy.childs@waterboards.ca.gov . If you need to add new contacts to your agency's account, please contact Hasti Javid at Hasti.Javid@calepa.ca.gov .

Sincerely,

Guy Childs

Complaint Description

Hello, the townspeople of Grass Valley and Nevada City are deeply concerned about this issue regarding Rise Gold Corp attempting to reopen the defunct Idaho-Maryland Mine. The project is predicted to consume 4 million gallons of water every single day, and risks poisioning the groundwater with disastrous effects. The mine's water consumption is predicted to force 40+ residential wells to become dry and unusable for those residents. We seek CalEPA's help opposing this mine. We treasure the local Yuba river for swimming, and we don't want to wait nervously for a disaster to occur and poison our region. We need to be proactive rather than reactive. Send help!!

Nevada County that refuses to create the State General Plan Mandated COUNTY Open Space and Parks program, is still sitting by watching and approving utter land destruction in Western Nevada County. The destruction of (anything but) Hells Half Acre started decades ago with the approval of a mega-church and massive parking lot. It has only continued with the destruction of 14 more acres by PG&E. The site was covered in wetlands. Any other county would have seen this as a wonderful preservation opportunity but despite millions in tax dollars coming into the county, including rising property taxes, Nevada County provides no public amenities, parks, open space, trails, bike paths, recreation centers, to the residents. (Contrast with Placer County). This is in clear violation of the State Mandated General Plan Elements.

Another tragic loss. 14 acres by PG&E. Efforts to obtain their environmental compliance documents have been difficult including State/Fed ESA, 404, 401, Porter-Cologne, CEQA, 1600. HHA was once proposed as a NCCP but this plan was rebuffed and rejected by Nevada County that only see development and tax dollars that again, do not come back to the residents as public amenities or additional services. They have voted in multiple raises for themselves. The near destruction of a world-renowned biodiversity hot spot, the county DEFINITELY knew about (known for DECADES) is the latest abomination. They do not respond to the citizens so please help the citizens of this county. They are also planning even additional development at 49 and Higgins Corner, site of multiple fatal accidents including Bear River High School students and reopening A GOLD MINE that would possibly destroy an entire watershed. Now HHA is nearly gone. We can't stop this on our own. We need the State of CA to assist us hold OUR county accountable.

Additonal Information

Watershed	Squirrel Creek	**Name of Affected Water Source**	Wetlands likely completely destroyed at "Hell's Half Acre" known site of multiple rare plants, wetlands. County has quietly and deliberately approved projects that over time have destroyed this entire ecosystem.

First, let's look at the big picture. Rise Gold claims that this mine will provide jobs, and that all significant impacts can be mitigated. Job provision is not guaranteed, and yet impacts could be huge. This project risks destroying the quality of life in our County. The applicant has a history of getting stuck in litigation about pollution caused by its work. If that pattern repeats here, the County is stuck with expensive costs for monitoring and litigating while very few salaries get paid locally.

One specific problem with the EIR: It admits that impacts to traffic, noise, and aesthetics are unavoidable. Therefore, tourism will suffer, as our reputation for natural beauty and tranquility will be lost. Who in their right mind will come to Grass Valley to sit at an outdoor table on the Mill Street pedestrian mall while gravel and mine waste are constantly rumbling by on local streets and highways? There was no serious comparison of declining tourism income vs. possible new mining jobs. Those mining jobs aren't guaranteed, and could be very short lived.

Similarly, the EIR did not consider local real estate professionals' clear consensus that home values would drop up to 20%. In other words, local folks whose main resource is the equity in their homes suffer immediate financial damage if the project, or even the EIR itself is approved.

If the EIR itself is certified, but the current application is denied, that starts a ticking time bomb because a later applicant could buy the property and later overcome objections and get approved to start mining. Rise Gold's bad reputation might stop the current project, but not a future applicant's proposal.

Finally, the project, if approved, would strain local electric energy resources and would drastically increase greenhouse gases. It's likely that future years will bring more regulation and limits on energy production. Why should the County handcuff our future development by devoting all our energy producing capacity to benefit one project?

Dear Nevada County Board of Supervisors,

I am writing to express my strong opposition to the proposed Idaho Maryland Mine project. As a concerned citizen, I urge you to carefully consider the potential negative impacts this mine could have on the environment, public health, and the economy of our community.

First and foremost, the Idaho Maryland Mine would pose significant risks to our environment. The mine would require extensive excavation and processing of ore, leading to the release of potentially harmful chemicals and pollutants into our air, water, and soil. This could have devastating effects on local ecosystems, wildlife, and natural resources. In addition, the proposed mine would also contribute to climate change by releasing large amounts of greenhouse gases into the atmosphere.

Furthermore, the Idaho Maryland Mine could have serious implications for public health. The release of toxic substances into the air and water could cause serious health problems for those living near the mine, including respiratory and cardiovascular issues, and an increased risk of cancer. This is particularly concerning given that the proposed mine is located in close proximity to residential areas, schools, and other public spaces.

Finally, the Idaho Maryland Mine would likely have negative economic impacts on our community. While the mining industry can provide some jobs and economic benefits, it is often accompanied by environmental degradation and health risks that can harm local economies in the long term. In addition, the proposed mine could discourage tourism and outdoor recreation, which are important drivers of our local economy.

In conclusion, I urge you to carefully consider the potential negative impacts of the Idaho Maryland Mine and to take action to prevent this project from moving forward. We must prioritize the health and well-being of our community and our environment, and ensure that any proposed development is sustainable, safe, and beneficial for all.

Thank you for your time and attention to this important matter.

Sincerely,
Andreas Groos

To whom it may concern, We are so distraught that you are entertaining the idea of the mine reopening. It is clear that all of the residents that live anywhere near the proposed mine sites are against the reopening. We live on little Greenhorn rd. We moved here thinking we had found our perfect forever home, private, quiet, and beautiful. Now everything that we loved about this property will be destroyed if you okay this project. How can you even consider doing this to your community. Please say NO!!! Our happiness, our lives here should matter.

Hi,
My Name is Ofer Kolton,
I own a business in Nevada County, reside here as well as own several properties in the county.

It is travesty that this county will even consider allowing this mine. This entire region (the gold country) still has not recovered from the everlasting environmental damage from previous gold mining. It will take many generation, centuries actually and some of the damage will never be repaired.

Allowing this mine to pollute our waterways, create noise pollution is unethical and works directly against the people who live here. Leave the beautiful county we call home without damaging its present and its future for our children. DO YOUR CIVIL DUTY and DO NOT APPROVE THIS MINE.

On a personal note: If this mine is allowed, I will personally work at and donate money to recall any and all that approve it. Working against the people interest will have its consequences.
Sincerely
Ofer

Ladies and Gentlemen~

Over the years I have visited Nevada City/Grass Valley many, many times. I have lived in Nevada City since 2014. I love the town as well as everything Nevada County has to offer. I would like to state that I vehemently object to the re-opening of the Idaho-Maryland Mine. I believe the re-opening of the Idaho-Maryland Mine would greatly affect the environment as well as the quality of life in Nevada City, Grass Valley and surrounding areas.

In addition, I am totally against the county approving the Final Environmental Impact Report, which has too many omissions and too much lack of evidence to support a decision to re-open the mine.

Please protect the people and environment. Please vote “NO” when considering the FEIR. Please vote AGAINST re-opening the Idaho-Maryland Mine.

Thank you for your consideration.

RE: Objection to the Final Environmental Impact Report SCH # 2020070378 December 2022 (the "EIR") for the Idaho-Maryland Mine Project (the "Project") Pursuant to the Notice from the Nevada County Planning Commission for the May 10, 2023, Special Meeting.

Ladies And Gentlemen:

I appreciate your Notice of this opportunity to continue my objections to the Idaho-Maryland Mine Project, and I attach my objection to the EIR and the Project. This Objection supplements and incorporates, among other things, my previous objections designated by your Department as my Individual Letter Comments Ind. 254 and 255. Since the EIR did not cure the errors, omissions, and noncompliance to which I objected as to the DEIR, this Objection continues those prior objections and advances new objections to address the new errors, omissions, and noncompliance in or from the EIR.

My goal in the attached Objection is to be comprehensive. Some may wonder why I present such an extensive Objection, considering the mass of my prior and continuing objections. Among the various reasons are that I read the more than 7000 pages of the EIR, and my 400 plus pages do not seem disproportionate to that massive, objectionable EIR content. Also, the EIR presented me with three different segments with overlapping and common content to which I had to counter: in the main EIR presentation, in its "Master Responses," and in its "Responses" to my prior Ind. 254 and 255 objections. I regret this burden on you, but my objections are comprehensive, because your Notice warns us that any following court process may only consider issues now raised in connection with this hearing.

One further thought for anyone who may be tempted by approve this objectionable EIR. Despite the many thoughtful and meritorious objections to the DEIR, this EIR still evaded too

many of them and otherwise failed to respond with what the courts instruct us that CEQA requires: a “good faith reasoned analysis” with “common sense.” Ask yourselves, if you were one of the us thousands living on the surface above and around the 2585-acre underground mine that this EIR would reopen and expand, what could you tell your buyer or your mortgage lender are their risks? The EIR is not a place to find those answers, both because we must state the reality, as we do in our objections, and the EIR offers only an “alternative reality” and reveals too little of what we all need and deserve to know.

Thank you for considering my view.

Sincerely,

G. Larry Engel

Further EIR Objections 254 to the Idaho-Maryland Mine Project Final Environmental Impact Report/SCH #2020070378 (12/2022) (the "EIR"), Plus My Disputes Against EIR "Master Responses" And "Responses To Comments Ind. 254-1 through 101" (my "EIR Objection 254").

TABLE OF CONTENTS

I. Introductory Comments And Overview of My Many Objections To The EIR/DEIR. .. 25

A. Scope of My Objections And Incorporations, Exposing EIR/DEIR Format And Failures To Comply with Even Basic CEQA And Essential Information Requirements, Plus Infeasibility, Errors, Omissions, And Deficiencies Creating Credibility Problems With Thousands of Us Potential Local Victims Living On the Surface Above And Around the 2585-Acre Underground Mine. 25

A. 25

1. Some Introductory Comments Illustrating With Examples How the Disputed EIR Both (i) Fails To Reveal And Correct the Errors, Omissions, And Flaws In the DEIR, And (ii) Compounds Such Problems By EIR/DEIR Evasions, CEQA And Other Noncompliance, And Worse, Such As Deficient, Infeasible, Or Illusory Mitigations And Unacknowledged Risks. 25

a. This Objection's Organization And Approach To My (And The Ad Hoc Mine Opposition Group's) Comprehensive Disputes With the EIR/DEIR Throughout This Document..... 25

(i). How The Various Parts Of This Objection Are Designed To Dispute The EIR/DEIR. 25

(A). An Overview of Some Coming Attractions..... 25

(B). Some Introductory Alerts To Objections To EIR "Tactics" And My Counters. 29

(C). Some Miscellaneous Information To Guide The Reader. 32

(ii). The "Ad Hoc Mine Opposition Group" For Whom I May Also Act. 33

(iii). Scope of Opposition And My Terminology, Such as "Noncompliance," And Illustrations With Wells And Other Key Topics. 34

(iv). Incorporated Objections And Some Illustrations of The Failures of The EIR/DEIR to Apply the CEQA Required "Good Faith Reasoned Analysis" And "Common Sense" Needed To Avoid "Alternate Realities" Exposed By Objections, Especially As To Water Related Disputes. 35

(v). Some Hard, Risk Questions For Decisionmakers Not Addressed By The Disputed EIR/DEIR, And the Need For County Staff To Be More Skeptical of This EIR/DEIR..... 38

(vi). Adverse Comments (Or Lack of Pro-EIR Findings) by CEQA "Responsible Agencies" Should Prevent Approval of the EIR. 40

(vii). Some Introductory Rebuttals of the Noncompliant EIR/DEIR's Climate Change Denial And Evasion..... 40

b. Some Basic Authorities And Principles That Can Be Applied To Support the Many Specific Objections That Follow, Including Some CEQA and Guideline Rules. 41

(i). Process Status between the Disputed EIR/DEIR And Objections, And the Failure of the EIR/DEIR To Satisfy Their Burden of Proof. 41

(ii). The Applicable Standards For CEQA Sufficiency Are Being Ignored by the EIR/DEIR..... 43

c. The Ultimate Goal of This Objection Is To Require At Least Revisions And Recirculation of the Disputed EIR..... 45

d. The Disputed EIR/DEIR Ignores Or Dismisses Reality Without the CEQA Required "Good Faith Reasoned Analysis," Even Evading Addressing Its Own Inconsistencies And Rise Admissions, While Defying "Common Sense." 49

(i). The General EIR/DEIR Failure To Comply with CEQA With A "Good Faith Reasoned Analysis" Applying "To the Extent Possible, Scientific And Factual Data" (And What *Gray* calls "Common Sense.")..... 49

(ii). THE DISPUTED EIR/DEIR FREQUENTLY VIOLATES CEQA AND APPLICABLE LAW BY FAILING TO CREATE A COMPLIANT AND SUFFICIENT BASELINE FOR EACH OF THE ENVIRONMENTAL IMPACTS, INCLUDING THE CENTENNIAL SITE, WHICH INCORRECTLY CLAIMS TO BE SEPARATE FROM THIS PROJECT..... 53

(iii). The Disputed DEIR/EIR's Frequently False Claims, As Well As Erroneous And Misleading Omissions And Opinions Masquerading As Purported Facts, Often Present Mere Speculations, Unsubstantiated Opinions, Or Mere Assumptions, Each Lacking The CEQA Required "Common Sense" (G*ray*) And "Good Faith Reasoned Analysis" *(Banning, Vineyard, and Costa Mesa).* 57

(iv). The Disputed EIR/DEIR Cannot Evade The Legal Consequences of Relevant Admissions, Which Should Doom Their Contrary and Inconsistent Claims, Such As Admissions In Rise's SEC Filings That Compare To Those That Prevailed in *Richmond v. Chevron* Illustrated Below And Admissions In DEIR at 6-14 That the Project Is Not Economically Feasible Unless the EIR Receives Permission To Do As It Wishes (e.g., Operate 24/7/365 for 80 Years in Ways Impacted Local Objectors Find Intolerable And Noncompliant.) 59

(v). Future Aspirations of Disputed EIR Mitigations (Which Are Insufficient, Deficient, And Noncompliant) Cannot Excuse Such EIR/DEIR Noncompliant Disclosures And Omissions of Impacts. 63

(vi). This Objection Has A Process For Advancing My Continuing Disputes With the Nonresponsive EIR's Objectionable Tactics And Process, Such As The EIR/DEIR Often Ignoring, Evading, Or Mischaracterizing My Meritorious Objections To Craft the Disputed EIR/DEIR "Alternate Reality" Addressed Throughout My Objections. 64

(vii). Some Illustrations of the Disputed "Alternate Reality" Illusions Created by EIR/DEIR Errors, Omissions, And Objectionable Tactics. 68

(viii). Some Substantive Examples of Such Disputed EIR Efforts To Impose Such "Alternative Reality" With Objectionable Tactics, Like "Hide The Ball," "Bait And Switch," And Other Noncompliant Claims, As Well As Strategic "Rebranding," Such As Incorrectly Calling Waste Rock From Mining "Engineered Fill." 71

2. My Experience And Expertise In Mining Bankruptcies And Abandonments, As Well As In Related Insurance Insolvencies And Similar Situations (e.g., Asbestos, Environmental, and Mass Tort Product Liability Bankruptcies), Some of My Opinions Are Admissible Evidence, Not To Be Ignored By the EIR As Mere "Speculation" Or "Unsubstantiated" Objections. (I Am Also A Witness As A Surface Homeowner Above Or Around The 2585-Acre Mine With Competing Rights, Including To Groundwater, As Discussed Later.) 77

B. The Centennial Activity Is Not A Separate Project, As Previously Demonstrated in My DEIR Objections 254 and 255, But One Can Also Classify It As a Part Or Phase of One Project That Fails In Many Ways To Comply With the CERA Project Description Requirements 78

C. Some CEQA Guidelines And Other Legal Precedents To Apply In Favor of My Objections And Against the Disputed EIR/DEIR 81

1. This Introductory Subsection Provides Some Basic Authorities And Principles That Can Be Applied To Support the Many Specific Objections That Follow 81

a. How This Section Fits Into The Rest of the Objection. 81

b. Illustrations of How CEQA And the Guidelines Apply Contrary To the Disputed EIR/DEIR 82

c. Illustrations of Noncompliance With CEQA And The Guidelines, Such As Regarding Required Investigations 83

2. Contrary To the Disputed EIR/DEIR Misuse of And Noncompliance with CEQA And Its Guidelines To Evade Or Obstruct Objections, Here Are Some EIR/DEIR Overlooked Or Misinterpreted Principles That Should Be Applied To Support My CLIMATE CHANGE And Related Objections To Defeat The EIR/DEIR, Including From the "2018 GUIDELINE AMENDMENT EXPLANATION." 85

a. Some General Guidance And Applications. 85

b. CEQA Guidelines, Like Many Other Laws, Recognize Climate Change And Other Realities The Disputed EIR/DEIR Incorrectly Disregards As "Speculative." 86

c. Correcting the Application of the Guidelines To Groundwater And Related Issues. 88

b. The Guidelines Require CEQA Compliance For All Phases of the Project, Which the Disputed EIR/DEIR Refuses To Do, With Especially Dangerous Impacts on Groundwater And the Environment From 80 Years of 24/7/365 Dewatering And Mining And From the Centennial Activities. 90

c. Some Improper Ways The Disputed EIR Evades Any Sufficient Response Or Compliance 93

d. Environmental Setting And CEQA Lessons from 2018 Guideline Amendments Explanation. 95

e. The Disputed EIR Had Its Chance To Comply, And There Is No Redo Opportunity. 98

D. Some Key Court Decisions And Principles For Applying CEQA And Its Guidelines To Dispute The EIR/DEIR And Support My Objections, Including Those Already Discussed in DEIR Objections 254 And 255. 99

1. My Prior Legal Briefing In DEIR Objection 255 (as well as in DEIR Objection 254 #'s 3.N, 4, and 14) Apply with Even More Force To the Disputed EIR. 99

2. The Disputed EIR/DEIR Fails To Apply Any Compliant Threshold/Standards For Evaluating the Project's Impact on Groundwater Supplies. 100

1. Rebuttal/Impeachment Illustrations In "*Richmond vs Chevron*" And Other Key Counters To EIR Errors, Omissions, And Misleading Claims. 101

E. Key Mitigation Disputes Also Doom the EIR/DEIR, And The Constant DEIR/EIR Attempts To Violate, Evade, Or Defer Mitigation Requirements Cannot Be Tolerated For More Reasons Than Just Those Explained Above in *Richmond v.Chevron.* 103

1. The Disputed EIR/DEIR Fails Even To Attempt To Comply With Applicable Mitigation Requirements, And More And Better Mitigations Are Needed Than Attempted, Partly Because the EIR/DEIR Often Either Understates the Significance Of Environmental Impacts Or Omits Impacts. 103

a. The General Applications of These Principles Expose Noncompliance By The Disputed EIR/DEIR. 103

b. Illustrating the Application of These Guidelines To The Water Disputes, Including How The EIR/DEIR Fails To Comply With Not Just CEQA, But Also the County General Plan 17.12. 106

c. Illustrating How The DEIR/EIR Makes Reassuring Statements That It Knows Or Should Know Are Not Feasible Or Are Contrary To What Regulators Will Require, Especially As To Water And Air Pollution. 106

d. Instead of Using Complying Mitigations To Help Actually Reduce Impacts, Whether Acknowledged Or Not As Significant, the EIR/DEIR Seems to Prefer Using Noncomplying Mitigations To Evade Or Avoid Admitting Significant Impacts And Other Misuses of Purported Mitigations Or Omitted Mitigations 108

2. Purported “Mitigations” Fail For Both Stated And Unstated Impacts. 110

3. The Disputed EIR/DEIR Evaded Its Disclosure Obligations By Improperly DEFERRED ANALYSIS AND MITIGATION Ideas To Which I And Others Properly Have Objected On The Merits..... 111

4. More Examples of Deficient Impact Disclosure, Prohibited Mitigation Deferral, Or Other Noncompliance Are Illustrated by the Disputed EIR/DEIR Dealing with Hazardous Materials And Groundwater Quality Issues. 112

3. Rebuttal/Impeachment using SEC FILINGS In “Richmond vs Chevron” And Other Key Counters To EIR Errors, Especially Regarding Mitigation Needed Even When The EIR Obscured The Significant Impacts. 115

4. Examples of Deficient EIR/DEIR Analysis And Mitigations, For Instance With Respect to the Project’s Noise And Vibration Impacts. 117

5. Additional Examples of Deficient Analysis And Mitigations With Respect to the Project’s Impact on Air Quality. 120

6. Examples of Deficient Analysis And Mitigations With Respect to the Project’s Energy Use. 123

7. Examples of Biological Impacts. 124

8. Examples of Deficient Analysis With Respect to the Project’s “Alternatives.”. 124

F. Some “Headline” Example Issues That Demonstrate Wrongful Patterns And Practices by the EIR/DEIR that Should Both (i) Defeat Some EIR/DEIR Claims On the Merits Or For Noncompliance With CEQA Or Its Guidelines, And (ii) Expose EIR/DEIR Credibility Problems That Should Inspire At Least Strict Scrutiny And An Open Mind To All Objections, Especially In The Many Places Where The EIR/DEIR Fails To Present Any “Good Faith Reasoned Analysis” With “Common Sense,” As Required By Courts Interpreting CEQA. 126

9. The DEIR FAILED TO COMPLY WITH CEQA AND ITS GUIDELINES AS TO ALMOST COVERT HEXAVALENT CHROMIUM USES, AND, INSTEAD OF The EIR PROPERLY RESPONDING TO MY OBJECTIONS BY CORRECTING THAT NONCOMPLIANCE, THE EIR MADE AN OBSCURE AND DEFICIENT COMMENTARY AND ATTEMPTED TO COVER UP THE NEED FOR SUBSTANTIAL REVISIONS AND RECIRCULATION, Including by obscuring the still disputed and deficient Appendix Q, O, and R. 126

a. As described throughout this Objection and detailed in Exhibit C (as well as my DEIR Objection 254), The Hexavalent Chromium Menace Requires Much More CEQA Compliance Than The EIR’s Crafty Evasions So Far. 126

b. My Hexavalent Chromium Objection Ignored Or Concealed By the DEIR Illustrates Not Only the EIR’s Noncompliance with CEQA, But Also The Credibility Problems Created By the Disingenuous Or Worse Way That The EIR Evades Those Objections. See Exhibit C. 132

10. The Disputed EIR/DEIR Groundwater Problems And Proposed Well Mitigation Are Not Only Noncompliant With CEQA, But The EIR/DEIR also Present Weaker Cases Than What Has Been Rejected In Similar Situations, Such As *Gray v. County of Madera* (2008), 167 Cal. App.4th 1099 ("*Gray"),* Even Without Considering Rise's Infeasibility Admissions (Exhibit B) That Also Doom The EIR/DEIR's Deficient And Missing Mitigation Proposals. 137

11. Failure of the EIR/DEIR To Comply With Nevada County General Plan 17.12 And, Therefore, CEQA And Other Applicable Laws, Not Only As To the Well Risks And Needed Mitigations, But Also As To Security For Performance To Make Mitigations Feasible And Protect Surface Owners Property Rights. 142

12. Specialty Mining Risks And Disputes Expose EIR/DEIR Errors, Omissions, And Other Deficiencies, And Those With Experience In Failing Mines Expose How Such Noncompliant EIR/DEIR's Defy "Common Sense" (See *Gray*) And Evade The "Good Faith Reasoned Analysis" Required By CEQA (See *Banning, Vineyards, And Costa Mesa).* 148

a. Some General Mining Rebuttal Data, Warning About Disputed EIR/DEIR Tactics, And Objection Principles/Topics. 148

b. Some Sierra Fund Mining Lessons Exposing EIR/DEIR Noncompliance. 150

c. Some Illustrative Centennial Disputes. 152

d. Misleading EIR/DEIR Terminology (e.g., "Engineered Fill" Rebranded From Mine Waste) And Related Concerns About Waste Dumping Options. 152

e. Some Groundwater And Water Related Mining Risk Illustrations of EIR.DEIR Noncompliance. 153

f. Illustrations of Disputed EIR Mining Practices Threats And Illusions. . 155

13. The Disputed EIR Also Evades My Meritorious Objections In Various Incorrect Or Noncompliant Ways With Meritless Or Worse Excuses Or Unexcused Or Worse Omissions, Lacking Both "Good Faith" And "Reasoned Analysis, " Such As: (i) By Disaggregating/Chopping Up My Integrated DEIR Objections 254 and 255 So As Incorrectly To Claim Inadequate Detail Or Explanations In Such EIR Artificially Selected Fragments (Such As Because the EIR Ignores Cross-References And Incorporations In My Objections); (ii) By Incorrectly Or Worse Rejecting Objections As "Speculation," "Unsubstantiated Opinion, Etc. Contrary To Applicable Law, Whether Substantive, Procedural, Or Evidentiary; (iii) By "Legal Errors" (Including EIR Ignoring the Legal Component In "Mixed Questions of Law And Fact"); And (iv) By Other Improper Tactics/Techniques Creating More Objections By Exposing EIR Credibility Problems That I Cite In My Counter Impeachment And Rebuttals, Such As in Sections II and III Below..... 157

a. How The Disputed EIR Often Evades Any Meaningful, CEQA Compliant "Response" By Frequently Chopping My Objections Into Fragments And Then Complaining About the Insufficiency of Each Fragment by Ignoring Both The Rest

of My Actual Section And My Internal Cross-References And External Incorporations By Reference. See my protests in each such case in section II (my objections to EIR Master Responses) and in section III (my objections to EIR Responses to What It Calls My Individual Comment Ind. 254-1 et seq.) 157

b. The EIR/DEIR Constantly Defies "Common Sense" And Fails And Refuses To Provide the Required "Good Faith Reasoned Analyses" To My Objections, Especially as To My Complaints That the Disputed EIR/DEIR Rarely Justified Their Disputed Mitigation Claims And Wrongly Failed To Reply To Many of My Objections, Incorrectly Claiming That My Objections Were Speculative, Unsubstantiated, Or Not Explained (Which Involved the Disputed EIR/DEIR Ignoring All The Many Cross-References, Incorporations of Other Objections, And Other Disputed And Improper Tactics.) 160

c. Some Illustrations (e.g., Groundwater, Hexavalent Chromium, And Other Significant Impacts Which Are Not Truly Mitigated) of The Disputed EIR's Legal Mistakes And Such Tactics For So Evading Meritorious Objections Incorrectly As Too Speculative, Unsubstantiated, Or Otherwise Deficient. 161

d. Some Additional Illustrations of Legal Errors Besides the Many Addressed In My Objection 254 #'s 3.N, 4, and 14, All of Which Still Apply. 166

14. Some General Rebuttals Of Improper EIR Tactics And Credibility Problems Demonstrated in Greater Detail in Later Commentary Below, As Well As My Use of Damning EIR/Rise Admissions Ignored Or Evaded In the EIR/DEIR, Such As the Disputed EIR Incorrectly Claiming That My Objections Are Too Speculative Or Unsubstantiated To Merit Any Sufficient Response, Even When It Is the EIR/DEIR That Is Speculating Or Unsubstantiated. 169

15. At the Outset I Explained How I Would Conclude With Some Specific Illustrations Of Multidisciplinary EIR Evasions, Tactics And Credibility Problems, And This Example Demonstrates Such Integrated Impact Problems Combining Air And Water Quality/Pollution Threats, Groundwater And NID Supply Risks, Many Toxic Risks, Noncompliant Well And Other Mitigation Issues, Etc. 172

16. The Groundwater Property Rights And Other Issues Illustrate Some of the Many Reasons for the EIR's Lack of Credible And Court Admissible Evidence To Support the Errors, Omissions, And Noncompliance In the EIR And Its Bogus Attempts To Evade The Need For Recirculation By Incorrectly Claiming EIR's Major Revisions To the DEIR Are Only Minor "Clarifications" Or "Amplifications." 175

17. The Noncompliant EIR Cannot Evade (As It Does) The Competing Rights of Us Surface Owners Above And Around the 2585-Acre Underground Mine (eg, as Owners of the Groundwater Being Flushed Away Down the Wolf Creek in Mine 24/7/365 Dewatering for 80 Years), Which Include Not Only Our Rights To Defeat the EIR/DEIR With Such Objections To Noncompliance With CEQA, But Also With Interactive Claims As To Violations of Our Property Rights. 176

a. As Surface Owners With Competing Property Rights We Have More Rights To Object And Be Witnesses With Evidence Than Ordinary CEQA

Objectors, Especially To Expose The Hoax of Uniformity of Mining And Other Environmental Impacts From Different Parts of the Project (Which Must Include Centennial). 176

b. Among the Remedies of Us Local Victims Is Our Right Proactively To Mitigate In Connection With Our Nuisance, Inverse Condemnation And Other Claims, Including By Drilling Competing Deeper And New Wells, Especially Since Rise's SEC Filings And Other Admissions Prove It Lacks The Current Financial Resources To Accomplish Even the Deficient EIR Required Safety And Mitigation Protections. See Exhibit B and Objection 255. 179

18. Contradictions of the EIR With the County Economic Report Illustrates General EIR Flaws And More, Illustrated by EIR Ignored Or Incorrectly Addressed Well Risks And Its Undercount. See Exhibit A. 182

II. Objections To EIR 2.2 Master Responses. 182

A. Introductory Comments And Principles To Apply In Sharing My Objections To the EIR Master Responses On An Item-By-Item Basis (#1-38). 182

1. An Alert To Noncompliant EIR Tactics, Such As For Evading My DEIR Objections By Incorrectly Dismissing My Such Objections Without Good Faith Reasoned Analysis And Common Sense And Just Sending The Reader Back To the Same DEIR Statement To Which I Had Earlier Objected. 182

a. Some Introductory Guidance As to How To Read These Objections In Relation To Those In Other Sections And Some General Principles. 183

b. A Reminder of the Correct Legal Interpretations That the Noncompliant EIR Ignores, Evades, Or Misconstrues, Including Some Continuing Protests to Inappropriate EIR Tactics And Excuses, Especially the EIR's Objectionable Effort to Shift the Burden of Proof From the EIR To Objectors. 185

2. Objection To EIR's Bogus Claim Of Only "Minor Clarifications"/"Amplifications" To Evade Its Recirculation Obligation. 189

B. Objection To Master Response 1 (part 1): Non-EIR/Administrative Issues. 191

C. Objection To Master Response 1 (part 2)- "Quality of Life" (EIR at 2-3+). 194

D. Master Response 1 (part 3)- Economic Effect on Property Values (EIR at 2-4). See Exhibit A. 196

E. Objections To Master Response 2-Social And Economic Impacts (EIR at 2-4+). 198

F. Objection To Master Response 3—Operator Responsibility (EIR at 2-6+). 199

G. Objections To Master Response 4—Cleanup Project (Centennial) Is A Separate Project Under CEQA (EIR at 2-7). 202

H. Objections To Master Response 5—Evacuation Zones (EIR at 2-10). 203

I. Objections To Master Response 6—Wildfire Impacts (EIR at 2-37). 204

J. Objections To Master Response 7—Location of Future Mining Areas (EIR at 2-43.) 205

1. Introduction And General Rebuttals To Both the EIR/DEIR's Evasion of Objections And Flaws In the Responses To The Portion of the Objections The EIR Purports To Address (But Fails To Do So Correctly Or Sufficiently). 205

2. The EIR/DEIR Erroneously Claims To Have Adequately Evaluated the Groundwater Effects from Underground Mining (EIR at 2-43). 206

3. I Dispute Blasting Vibration And Noise Claims in the EIR/DEIR, Plus There Are More Objections That Are Not Addressed in the EIR/DEIR, Making the Disputed EIR's Grossly Overbroad Statement Into False Claims (EIR at 2-44-45) That DEIR 4.8 and 4.10 "adequately evaluates the potential environmental effects that could result from the project's reasonably anticipated underground mining operations, including effects to groundwater and noise and vibration" that with mitigation become "less than significant." (I also dispute the DEIR/EIR purported mitigations, as do my incorporated objections, and such mitigations are rarely substantiated or even attempted to be supported by any "good faith reasoned analysis" with "common sense" in the disputed EIR/DEIR.) 208

K. Objection To Master Response 8—Mine Waste Characterization (EIR at 2-45). 209

L. Objections To Master Response 9—Historical Mine Waste at Centennial Mine (EIR at 2-48). 211

M. Objections To Master Response 10—Explosives, Reagents, and Brunswick Fill (EIR at 2-56). 211

N. Objections To Master Response 11—Engineered Fill Utilized And Regional Construction Markets (EIR at 2-59). 212

O. Objections To Master Response 12—Chemical Dust Stabilizers (EIR at 2-62). 213

P. Objection To Master Response 13—Historic Hydrogeologic Assessments (EIR at 2-63). 214

Q. Objections To Master Response 14—Adequacy of Groundwater Model (EIR at 2-73). 217

R. Objection to Master Response 15 (part 1) –Adequacy of Groundwater Monitoring Wells Comments (at 2-76): New Additions For EIR Health Risk Assessments for Previously Ignored Hexavalent Chromium As An Air Quality Issue (Like The Newly Added Nitrogen Dioxide Impact) But Still Ignoring The More Serious Water Impacts Raised In My Objection 254 As A Water Impact (Remind Rise To Go See Erin Brockovich Again, Following the Court Case About That Water Pollution Killing The Town of Hinkley, CA. And Many of Its Residents.) 223

1. General Situation Is Not Presented Accurately. 223

2. The New Air Pollution Dispute Triggered by New Data In the EIR, Still Evading the Bigger Toxic Water Pollution Threat. 224

3. The Disputed EIR Also Evades The Hexavalent Chromium Threat by Revealing Discussions of Its Mining Techniques in Volume IX, Appendix Q, That Is Damning

Not Only By Its Errors, But Also By Its Material Omissions That Should Have Been Addressed In Its DEIR Section 4.7 The Hazards And Hazardous Materials And EIR Revisions (at 3-69). 227

a. Illustrating An Example of How the Noncompliant EIR "Hides The Ball" For Hexavalent Chromium Impacts on Groundwater Compounded by Deferred Analysis And Mitigation Prohibited by CEQA (see section I.C and E above). 227

4. Some Further EIR Flaws Exposed By the Updated Itasca Admissions in Vol. IX, Appendix O, Following Up on Its Earlier Appendix Q Report Disputed In the Previous Subsection Above. 233

S. Objections To Further Respond to Master Response 15 (part 2)—Adequacy of Groundwater Monitoring Wells (EIR at 2-76): Additional Comments. 236

T. Objections to Master Response 16: Drought And Climate Change (EIR at 2-92)..... 239

2. The Disputed EIR Again Tries to Evade Objections By Ignoring Whatever The Incorrectly Interprets To Be Outside The Unprecedented CEQA Environmental Impact Boundary the EIR Invents, Even When Objections Are Rebutting False, Misleading, Or Other Noncompliant EIR Claims Outside That Same Disputed CEQA Boundary, And Other Objectionable Tactics To Evade Inconvenient Truths That Expose EIR/DEIR Errors, Omissions, Noncompliance, And Worse..... 240

1. Examples of How Climate Change/Drought Impact Wells And Expose Noncompliant, Omitted, And Illusory EIR Mitigations, Which Include Unconstitutional "Takings" (e.g., Allowing the Miner To Ignore Mitigation of the First 10% of the Impacted Wells' Water.) 241

2. Some Other Climate Change Impacts. 246

U. Objection to Master Response #17—Meterologial Data Used in HRA [Health Risk Assessment for air pollution] (EIR at 2-96). 247

V. Objection to Master Response 18—Air Quality Thresholds (EIR at 2-97). 248

W. Objection to Master Response 19—NSAQMD Criteria Pollution Thresholds During Operations (EIR at 2-102). 249

X. Objection to Master Response 20—Conservativism of Metals Assumptions [in the HRA for Air Pollution] (EIR at 2-104). 249

Y. Objection to Master Response #21—Conservatism of Silica Assumptions (at 2-105).250

Z. Objection to Master Response #22—Conservatism of Asbestos Assumptions (at 2-107). 250

AA. Objection to Master Response 24—Project Construction Schedule (EIR at 2-111). 252

BB. Objection to Master Response 25—Nevada County Energy Action Plan (EIR at 2-112). 255

CC. Objection to Master Response 26—Life Cycle GHG Emissions (EIR at 2-114).... 256

DD. Objection to Master Response 27—Greenhouse Gas Thresholds (EIR at 2-115)... 256

EE. Objection to Master Response 28—Greenhouse Gas Credits (EIR at 2-116)..... 256

FF. Objection to Master Response 29—Near Surface Workings and Subsidence (EIR at 2-121). 256

GG. Objections to Master Response 30—Biological Study Technical Adequacy (at EIR 2-123). 260

HH. Objections to Master Response 31—Rare Plants (EIR at 2-124)..... 260

II. Objections To Master Response 32—Temperature of Mine Water Discharges (EIR at 2-126). 260

JJ. Objections to Master Response #33—Groundwater Dependent Vegetation (EIR at 2-129). 261

KK. Objections to Master Response 34—Resident Fish (EIR at 2-131). 264

LL. Objection to Master Response 35—Discharge to South Fork Wolf Creek (EIR at 2-132). 264

MM. Objections To Master Response 36—Flows in South Fork Wolf Creek (EIR at 2-137). 264

NN. Objections To Master Response 37—Birds and Raptors (EIR at 2-138)..... 265

OO. Objection To Master Response 38—Foothill Yellow Legged Frog and California Red Legged Frog (EIR at 2-143). 265

III. My Objections to Disputed EIR "Responses To Comments Ind. 254-1 through 101" (starting at 2-6003) To My Individual Letter 254 (marked at 2-5843) (my "DEIR Objection 254" to the DEIR)..... 265

A. My Objection to EIR "Response [at 6003] to Comment Ind. 254-1 (i.e., to my meritorious introductory comments in my DEIR Objection 254) at EIR 2-5843, Including To The Disputed EIR's Repeated False And Misleading EIR Attempts, For Example, Both (1) To Evade Disclosures About Groundwater Impacts/Problems, And (2) To Pretend That the DEIR Presented A "Good Faith Reasoned Analysis" With "Common Sense," When Instead the DEIR Evaded Hexavalent Chromium Threats In Water And Air Pollution As To Which the Disputed EIR Repeatedly Added "Significant" "New" Errors, Omissions, And Other Noncompliance That I Further Rebut. 267

1. Beware Objectionable EIR Tactics, Such As Disaggregating, Fragmenting, Or Scrambling An Integrated Section of My Table of Contents Commentary Into Isolated Fragments Mistreated By the EIR Responses, Such As By Each Fragment Ignoring the Others As A Bogus Basis for EIR Complaints..... 267

2. How These Objections Counter Such Disputed EIR Tactics..... 269

3. Some Judicial Precedents And Other Authorities Ignored By the Disputed EIR/DEIR. 271

4. Obscuring the EIR's Belated And Noncompliant Attempt To Address Hexavalent Chromium Air And Water Impacts Without Admitting the Need For Revision And Recirculation For The Necessary "Significant New Information." 272

B. My Objection To Response (at 2-6004) to Comment Ind. 254-3 (EIR at 2-5853). 274

1. This Disputed EIR Response Not Only Suffers From Many Errors, Omission, And Noncompliance, But It Ignores Or Omits To Address Key Objections, Sometimes Citing Erroneous Excuses, But Sometimes Offering No Excuses, Just Evasions Or Nonresponses. 274

2. The EIR Cannot Hide Behind An Erroneous Claim That Objectors' Inconvenient Truths Are Outside the Scope of CEQA Or Otherwise Can Be Ignored As Speculative, Insufficiently Explained, Or Otherwise Excused From Any Duty By the EIR/DEIR To Comment 277

3. Case Law Confirms My Right to Rebut and Impeach the EIR/DEIR And To Debate the "Common Sense," "Good Faith," And "Reasoned Analysis" of the Disputed EIR/DEIR Under These Circumstances, Especially Regarding the DEIR/EIR Cover Up of the Hexavalent Chromium Menace And Other "Hide The Ball," "Bait And Switch," "False Equivalence," And Other Such Tactics (I.A.1.d(viii). 279

4. Brief Summary of Miscellaneous Other Rebuttals And My Other Ind. 254-3 Issues Ignored/Evaded by the Disputed EIR. 281

C. Objection to EIR Response (at 2-6005) to My Comment Ind. 254-4 (marked at EIR 2-5874). 285

D. Objection to EIR Response (at 6005) to Comment Ind. 254-5 (marked at 2-5874)..... 285

E. Objection to EIR Response (at 6005) to Comment Ind. 254-6 (marked in EIR at 5882) 287

F. Objection to EIR Response (at 6006) to Comment Ind. 254-7 (EIR marked at 2-5882). 288

G. Objection to EIR Response (at 2-6006) to My Comment Ind. 254-8 (marked by EIR at 2-5883). 289

H. Objections to EIR Response (at 2-6006) to My Comment Ind. 254-9 (marked by EIR at 2-5885). 289

I. Objections to EIR Response (at 2-6006) To My Comment Ind. 254-10 (marked at EIR 2-5886). 290

J. Objection to EIR Response (at 2-6007) to My Comment Ind. 254-11 (marked in EIR at 2-5888), Including Omissions To Rebut My New Mining/Tunneling Objections. 291

K. Objection to EIR Response (at 2-6007) to My Comment Ind. 254-12 (marked in EIR at 2-5888), Including Issue Evasions. 292

L. Objection to EIR Response (at 2-6007) to My Comment Ind. 254-13 (marked in EIR at 2-5888), Including Issue Evasions. 292

M. Objection To EIR Response (at 2-6008) To Comment Ind. 254-14 (marked at EIR 2-5890), Including False And Misleading Claims And Omissions About HEXAVALENT CHROMIUM I Rebutted Herein (e.g., I.F.1 and Exhibit C), Including in My Objections to EIR Master Responses 15 and 35, and to EIR Response To Comment Ind. 254-1 on Which This EIR Response 254-14 Wrongly Relies. 293

N. Objection To EIR Response (at 2-6008) To My Comment Ind. 254-15 (marked by the EIR at 5890), Which EIR Response Duplicates the Disputed EIR Response To My Comment Ind. 14 Above And ,Therefore, Which Is Subject To The Same Objections..... 296

O. Objection To EIR Response (at 2-6008) To My Comment Ind. 254-16 (marked by the EIR at 2-5892), Which EIR Response Duplicates Overlapping EIR Responses To My Comment Ind. 1 and 15 And, Therefore, Which Is Subject To The Same Objections..... 298

P. Objection To EIR Response (at 2-6008) To My Comment Ind. 254-17 (marked by the EIR at 2-5893)..... 299

Q. Objection To EIR Response (at 2-6009) To My Comment Ind. 254-18 (marked by the EIR at 2-5894)..... 301

R. Objection To EIR Response (at 2-6009) To My Comment Ind. 254-19 (marked by the EIR at 2-5895)..... 302

S. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-20 (marked by the EIR at 2-5897)..... 307

T. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-21 (marked by the EIR at 2-5898)..... 309

U. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-22 (marked by the EIR at 2-5899)..... 311

V. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-23 (marked by the EIR at 2-5900)..... 312

W. Objection To EIR Response (at 2-6011) To My Comment Ind. 254-24 (marked by the EIR at 2-5901)..... 313

X. Objection To EIR Response (at 2-6011) To My Comment Ind. 254-25 (marked by the EIR at 2-5904)..... 315

Y. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-26 (marked by the EIR at 2-5904)..... 316

Z. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-27 (marked by the EIR at 2-5904)..... 317

AA. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-28 (marked by the EIR at 2-5906)..... 318

BB. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-29 (marked by the EIR at 2-5906)..... 319

CC. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-30 (marked by the EIR at 2-5907). 319

DD. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-31 (marked by the EIR at 2-5908). 320

EE. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-32 (marked by the EIR at 2-5909). 321

FF. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-33 (marked by the EIR at 2-5913) And Correctly Entitled: "DEIR Water Depletion Mitigation Ideas Ignore DEIR Errors, Omissions, And Deficiencies And Fail Even Under Their Own Disputed Terms." 324

GG. Objection To EIR Response (at 2-6014) To My Comment Ind. 254-34 (marked by the EIR at 2-5916) And Correctly Entitled: "3. F. One Illustrative Dispute Over Groundwater Depletion by the Mining." 329

HH. Objection To EIR Response (at 2-6014) To My Comment Ind. 254-35 (marked by the EIR at 2-5917) And Correctly Entitled: "3. F. One Illustrative Dispute Over Groundwater Depletion by the Mining." 333

II. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-36 (marked by the EIR at 2-5918) And Correctly Entitled: "#3.G The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?)" 335

JJ. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-37 (marked by the EIR at 2-5919) And Correctly Entitled: "#3.H The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?)" 339

KK. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-38 (marked by the EIR at 2-5919) And Correctly Entitled: "#3.I A Brief Plea For Responsible Government And For Environmental Security And Peace For Our Community." 341

LL. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-39 (marked by the EIR at 2-5923) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." 342

MM. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-40 (marked by the EIR at 2-5924) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." 344

NN. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-41 (marked by the EIR at 2-5924) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." 346

OO. Objection To EIR Response (at 2-6016) To My Comment Ind. 254-42 (marked by the EIR at 2-5924) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." 348

PP. Objection To EIR Response (at 2-6016) To My Comment Ind. 254-43, -44 and -45 (marked by the EIR starting at 2-5926) And FRAGMENTED PARTS OF MY INTEGRATED OBJECTION Correctly Entitled: “3.K Because the DEIR Fails To Comply in Many Ways (see, eg, my #14) The Strange DEIR “Non-CEQA Related Analysis” (#4.3-103*) Is A Reveling Admission About Some of What the DEIR Should Have Disclosed About What Happens When The Mine Starts And Then Stops, Whether From Lack of Funding Or Gold, From Our Local Legal Or Political Resistance And Law Reforms, Or Otherwise.”..... 351

QQ. Objection To EIR Response (at 2-6017) To My Comment Ind. 254-46 (marked by the EIR starting at 2-5929) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: “3.L [and the first part of #3.M] Consider What The DEIR Is Not Disclosing (eg, my #3.E and M and 14) And The Questions That The DEIR Is Not Answering, Because Those Of Us impacted Or At Risk Will Assume Nondisclosures And Answers Require Continuous Resistance To the Mine (See my #’s 3.N, 4, and 14)..... 354

RR. Objection To EIR Response (at 2-6017) To My Comment Ind. 254-46 to 49 (marked by the EIR starting at 2-5930) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: 3.M “Among the Biggest DEIR Disputes Is About the Timing of Facts When Making This Decision About And 80 Year Plus Future Impact, Risk, And Burden, When We Know That The Past Is A Faulty And Largely Irrelevant Guide To Predicting The “New Normal,” Which the Disputed DEIR Fails To Do So Either (i) By Its Almost Exclusive Focus On That Unhelpful Past Data, Or (ii) Its Limitation To (At Most) Occasional And Deficient Looks At The Fantasy The DEIR Imagines In The Next 20 Years (Or Until 2040), Ignoring That the EIR/DEIR is demanding the right without CEQA compliance and evidence for an adequate “good faith reasoned analysis” with “common sense.” 354

SS. Objection To EIR Response (at 2-6017) To My Comment Ind. 254-50 to 53 (marked by the EIR starting at 2-5937) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: 3.N “Political Dynamics, Law Reforms To Protect the Community, And Consequences From Starting the Mine Before We Stop It And More Risks, Impacts, And Harms Occur, Even Some Admitted By The DEIR, Although, As Usual, In An Obscure Place at 4.3-103-04 Called the Non-CEQA Related Analysis.”..... 357

TT. Objection To EIR Response (at 2-6018) To My Comment Ind. 254-54 to 60 (marked by the EIR starting at 2-5941) And FRAGMENTED PARTS OF AN INTEGRATED OBJECTION Correctly Entitled: # “4. There Is No Net Benefit To Justify Approving This Mine Or Its DEIR, Especially Where One Gives Appropriate Weight To the Objections Of The Burdened And Harmed Locals At Risk Of Worse;” And “4 A. A General Discussion of Some of the Many Negatives Decreasing Any Imagined Benefits From the Mine, Applying Some Legal And Political Self-Defense Rights And Counters Expected From Those Of Us At Risk Living Above Or Around the 2585-Acre Underground Mine.” 360

UU. Objection To EIR Response (at 2-6018) To My Comment Ind. 254-61 to 63 (marked by the EIR starting at 2-5949) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: “#4.There Is No Net Benefit To Justify Approving This Mine Or Its DEIR, Especially Where One Gives Appropriate Weight To the Objections Of The Burdened And

Harmed Locals At Risk Of Worse;" And "B. Some Other Ways To Illustrate And Calculate Examples Of The Many Risks, Burdens, And Detriments That Reduce Any Alleged Mine Benefits." 364

VV. Objection To EIR Response (at 2-6019) To My Comment Ind. 254-64 to 65 (marked by the EIR starting at 2-5951) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "4. There Is No Net Benefit To Justify Approving This Mine Or Its DEIR, Especially Where One Gives Appropriate Weight To the Objections Of The Burdened And Harmed Locals At Risk Of Worse;" And 4.C "Why Imagined Mine Benefits Are Less Than Alleged In The Disputed DEIR Or Illusory." 366

WW. Objection To EIR Response (at 2-6019) To My Comment Ind. 254-66 to 70 (marked by the EIR starting at 2-5954) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.A An Introductory Overview Illustrating Some of the Many Water Related Objections To the DEIR That Evade The Real Burdens, Risks, And Harms In Our 'New Normal' By Pretending the Past Is A Reliable Guide To the Future (See my #3.M)" 369

XX. Objection To EIR Response (at 2-6019) To My Comment Ind. 254-71 (marked by the EIR starting at 2-5960) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.B Admitted DEIR Water Data Conceals Massive Unaddressed Issues, Errors, And Omissions, And the DEIR Fails To Reveal The Underlying Assumptions And Artificial Limitations On Which the DEIR Bases Many Flawed Conclusions, Contentions, And Assumptions We Locals Dispute." 371

YY. Objection To EIR Response (at 2-6021) To My Comment Ind. 254-72 (marked by the EIR starting at 2-5964) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water

Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.C" entitled: "Nondisclosures, Errors, and Disputes Regarding Future Risks And Problems From New, Expanded, And Deeper Underground Mining Operations in the 2585-Acre Mine Beneath Our Local Surface Objectors."..... 374

ZZ. Objection To EIR Response (at 2-6021) To My Comment Ind. 254-73 (marked by the EIR starting at 2-5967) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.D" entitled: "Opportunity Costs If the Mine Is Approved And Prevents More Beneficial Community Uses of the Land, Water, And Other Resources, Including New Competing Wells And Air Quality Capacity."..... 378

AAA. Objection To EIR Response (at 2-6021) To My Comment Ind. 254-74 (marked by the EIR starting at 2-5968) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "6. Geology, Soils, And Mineral Resources at DEIR #4.6 Again Ignores the Critical 2585-Acre Underground Mining Issues Over Which Locals Like Me Will Continue to Object." 379

BBB. Objection To EIR Response (at 2-6022) To My Comment Ind. 254-75 (marked by the EIR starting at 2-5970) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "7. The DEIR "Hazards And Hazardous Materials" Discussion at its # 4.7 And Elsewhere Is Deficient, Omitting Entirely At Lease One Serious Hazardous Material (Hexavalent Chromium/CR+6 of *Erin Brockovich* Movie Infamy For Turning Hinkley, CA Into a Ghost Town at Great Cost to Local Victims And Property As Explained In My #'s 3.C. G, and H." See Exhibit C. 381

1. Introduction To the Objections to Hexavalent Chromium Air And Water Pollution Issues (see also Exhibit C)..... 381

2. A New Air Pollution Dispute Is Triggered by "Significant New Information" In the Still Noncompliant EIR, But the Disputed EIR Is Still Evading the Toxic Water Pollution Threat Evaded in the DEIR..... 384

3. The EIR Also Evades The Hexavalent Chromium Threat by Revealing Discussions of Its Mining Techniques in Volume IX, Appendix Q/O, That Is Damning Not Only By Its Errors, But Also By Its Material Omissions That Should Have Been

Addressed In Its Section 4.7 The Hazards And Hazardous Materials Revisions (at 3-69). 388

4. Some EIR Flaws Are Exposed By the Updated Itasca Admissions in Vol. IX, Appendix O. 394

5. Some Other Issues Mentioned in This Disputed EIR Response. 396

IV. Instead of Maintaining the Burdens of Proof And Persuasion Where They Belongs on the Miner Applicant (section I.A.1.b), the Disputed EIR/DEIR Would Incorrectly Shift Them To Us Potential Victims, Especially On the Disputed Theory That Whenever the Data Is Allegedly Uncertain There Can Be No "Speculative" Objections Allowed, So That The Miner Somehow Can Insist On Doing Whatever It Wishes Without Responding to Objections With the Required "Good Faith Reasoned Analysis" And "Common Sense" Required By Applicable Law, Even When It Is The EIR/DEIR Itself Speculating, Asserting Unsubstantiated And Erroneous (Or Worse) Opinions Or Assumptions, Evading Or Contradicting Its Own (Or Rise's) Admissions, Or Otherwise Inviting My Rebuttals Or Impeachment..... 420

V. Rebuttals To Disputed EIR Claims (at 2-1 and elsewhere) That It Does Not Need To Be Revised Or Recirculated, Because The Changes Are Merely "Minor Clarifications Or Amplifications And/or Do Not Constitute Significant New Information." But See Section I.A.1.c, I.C and D, and I.F.8 Above. 422

VI. Some Practical Consideration On Why Any EIR Approval Is So Provocative And Intolerable, Besides All the Environmental Impacts. 424

VII. Concluding Comments. 425

I. Introductory Comments And Overview of My Many Objections To The EIR/DEIR.

A. Scope of My Objections And Incorporations, Exposing EIR/DEIR Format And Failures To Comply with Even Basic CEQA And Essential Information Requirements, Plus Infeasibility, Errors, Omissions, And Deficiencies Creating Credibility Problems With Thousands of Us Potential Local Victims Living On the Surface Above And Around the 2585-Acre Underground Mine.

A.

1. Some Introductory Comments Illustrating With Examples How the Disputed EIR Both (i) Fails To Reveal And Correct the Errors, Omissions, And Flaws In the DEIR, And (ii) Compounds Such Problems By EIR/DEIR Evasions, CEQA And Other Noncompliance, And Worse, Such As Deficient, Infeasible, Or Illusory Mitigations And Unacknowledged Risks.

a. This Objection's Organization And Approach To My (And The Ad Hoc Mine Opposition Group's) Comprehensive Disputes With the EIR/DEIR Throughout This Document.

(i). How The Various Parts Of This Objection Are Designed To Dispute The EIR/DEIR.

(A). An Overview of Some Coming Attractions.

This Objection and others that I incorporate (see my attached Table of Incorporated by Reference Objections and Exhibit D) demonstrate that the disputed EIR has adopted the DEIR without curing any of its material errors, omissions, and noncompliance to which I and others have objected. Indeed, the disputed EIR makes things worse, not better. I have illustrated herein, paragraph by paragraph, how in most cases the nonresponsive EIR is defending the disputed DEIR by evasions, omissions, and mischaracterizations, without meaningful responses to my such objections or others that I incorporate. Such objections (which I make for myself and my "Ad Hoc Mine Opposition Group" described in the next subsection #2) demonstrate how the disputed EIR adds or supports more errors, omissions, and flaws, including (i) by use of improper tactics, all of which fail to comply with the CEQA requirement for a "good faith reasoned analysis," as the courts require (e.g., *Banning, Vineyard, and Costa Mesa*), and (ii) by defying "common sense" (e.g., *Gray v. County of Madera*) and obvious noncompliance with CEQA, its Guidelines, and other applicable law, as I demonstrate below. Stated another way, I dispute the EIR/DEIR on each of the three battlefields chosen by the EIR, which (with exceptions where I am replying to something asserted, evaded, or omitted by the EIR in a different such place) means that I am disputing, questioning, or countering: (i) subject matter topics in objections to the EIR in my opening section I, (ii) errors, omissions, and noncompliance by the EIR in its disputed "Responses" to my DEIR Objection 254 in my section III item-by-item rebuttals, and (iii) errors, omissions, and noncompliance by the EIR in its disputed "Master Responses" which counter what the EIR so asserts, which is generally a mixture of debates on substance and exposing noncompliance and alternative reality claims. This is intended as a supplement, rather than a restatement, of my DEIR Objection 254, which is incorporated herein

for comprehensive objections to the both the disputed EIR and the disputed DEIR which it incorporates. Sometimes I use the term "EIR/DEIR" for emphasis (or "DEIR/EIR" where the main disputed data is in the DEIR that the EIR just ratifies), in which order I place first whichever EIR or DEIR seems most apt as the place to find my most significant objections. In any event, when I refer to the "EIR" by itself, I am still including the DEIR to the extent that the EIR does, so that my objections are equally comprehensive.

What this Objection demonstrates is that **this mining menace involves many cumulative and interactive risks, threats, and harmful impacts** on the thousands of us objectors living above and around the 2585-acre underground mine. Many incorporated and meritorious objections focus intensely on particular such issues (as do I in some cases where I have competence), like groundwater or NID supply or (in the case of NID what groundwater may not be adequately "treated" before its flushed down the Wolf Creek to unsuspecting NID customers downstream) quality, water and air toxins and other pollution, and many other potential hazards and impacts, all of which compounded by generally deficient mitigation both in theory and practice. (I mention practical impacts, since Rise admits in its SEC filings [Exhibit B] that it lacks the financial resources to achieve either its proposed mitigations results or those the EIR omits or evades that also will ultimately be required to comply with applicable laws.) What I try to present here is not just an evaluation of noncompliance as to such individual threat topics, but also to examine such topics from various different angles and how they interact with each other and cumulate to enhance the dangerous impacts. While EIR defenders may complain this objection is often redundant, because it states the same problem many times, that is what the EIR does I am trying comprehensively to counter; i.e., the EIR addresses topics as it chooses, then presents EIR Master Responses from another perspective, and then presents EIR "Responses" (in many cases better described as "nonresponsive" evasions) to the many objections, in my case here what it classified as Individual Comment 254. That means I must address each of the topics in dispute from those same three perspectives for comprehensive objections (as I dispute such EIR Master Responses and Responses item-by-item in sections II and III). The reality is that such inconvenient truths in my objections, which the disputed EIR/DEIR often attempt to "spin," evade, or mischaracterize, need to be examined as the interactive source or contributor to many different objectionable impacts, many cumulative with impactful side-effects. That results in many types of noncompliance that should defeat this EIR, such as such impacts violating many different provisions of CEQA or other applicable law, both directly and indirectly, as well as individually and cumulatively. To rebut such anticipated, incorrect EIR defense claims of redundancy, I offer this example in the next paragraph, which is explained for various such different applications throughout this Objection.

In this Objection, for example, I dispute (and prove noncompliance by the EIR/DEIR with) groundwater supply and quality issues, NID supply issues, and Wolf Creek pollution from groundwater impacting NID surface water customers, well impacts (both for undercounted existing wells and the many future wells that are totally ignored in the DEIR/EIR), air pollution, and many kind of toxic threats, some well-known and deficiently mitigated (e.g., asbestos) and some knowingly ignored/obscured or evaded (e.g., hexavalent chromium; yes, the same air and water toxin that killed Hinkley, CA, and inspired the movie *Erin Brockovich*, which the EIR admits is in the cement paste for underground backfill shoring). How some of those various impacts interact and cumulate is illustrated by one simple comment in the EIR Agency Letter 12 (at 12) of the Northern Sierra Air Quality Management District ("NSAQMD") (emphasis added):

> **The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements.** [i.e., my translation for context: DEIR mitigation had proposed frequent daily watering attempting to suppress toxic fugitive dust from the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less than their fair share of rationed water, contrary to the EIR/DEIR claims (quoted below) to bearing its share of the rationing, because of water wasted on this no net benefit mining.] **Since the dust contains asbestos, silica, and numerous toxic substances** [now, I note, adding hexavalent chromium] **adequate dust control is necessary. There should never be a situation where dust control is compromised because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest.**

What impacts that toxic dust problem causes are supposed to be mitigated (indefinitely? since cleanup/remediation is not certain or assured on schedule) by frequently daily NID water dosing of the dust piles. That creates multiple interactive and cumulative impacts and problems as to which the EIR/DEIR is noncompliant and worse, as I demonstrate in various ways and places throughout this Objection and others in my attached Table of Incorporated by Reference Objections. See the whole NSAQMD objections in Agency Letters 11 and 12, also addressing many related problems with the EIR proposals. For example, (although the disputed DIER/EIR incorrectly denies and ignores climate change as too speculative to consider its impact, but see, for example, my CEQA discussion at section I.C.2 of how the "2018 Guidelines Amendments Explanations" requires recognition of climate change) there will be increasing dry years threatening our community. **In another example of a DEIR/EIR misleading "bait and switch," the DEIR states (and EIR ratifies) that: "This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID." However, that ignores the NSAQMD's Agency Letter 12 (at 12) discussed above, including that quoted, regular demand *priority* for frequent daily NID watering of its toxic (asbestos and more) fugitive dust, "regardless of water use restrictions." This "pick your poison" dilemma should not be imposed on us objectors living on the surface above or around the mine, where our choices seem to be either breathing such toxic air or suffering with less than our fair share of drought rationed water, while we watch the EIR mine constantly watering such fugitive dust in the uncertain quest for speculator shareholder profits at our expense. Whatever the result, that disputed EIR reassurance of shared suffering is false and misleading at best.**

The reality is that this is a "zero sum game," in which every gallon allocated to this "no net benefit mine" (see my DEIR Objection 254 #4 and Exhibit A hereto rebutting the County Economic Report benefit claim) is one less gallon available to us far more deserving locals. I have yet to meet any locals here above or around the mine who are willing to sacrifice anything for the mine. Almost all informed locals will support resisting any EIR approval, creating (if the mine is approved) a massive political problem for the County and NID to add to the inevitable legal, law reform, and political disputes that will surely catch any mine supporting officials in such controversies. See DEIR Objection 255 and 254 (e.g., #4). As the NSAQMD and others correctly foresee with progressive climate change impacts, there will be many and increasing future NID water rationing limitations imposed on our community. New or better wells will be the only practical option (during those 80 years of

24/7/365 EIR dewatering and mining) to save what we can our homes, our forests, and our environment, as we watch this no net benefit mine waste watering its toxic dust with more than any share of water it should be allowed, because controlling the toxic fugitive dust menace is now the EIR mine caused local health hazard.

The County decisionmakers should put themselves in the position of us surface homeowners above and around the 2585-acre underground mine who are outraged at the idea that an EIR could approve creating such toxic dust piles that then must be "mitigated" by taking our shares of rationed water and creating more environmental impacts as to which the EIR ignores or evades our objections. See the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session, following up with the Wells Coalition Group Letter 27/28.

Also, there is no "good faith reasoned analysis" or proof that the disputed EIR "model" applies accurately, reliably, or completely (and with *Gray* "common sense") to the other areas often ignored by the disputed EIR. As demonstrated in that Union article on 12/15/22 Rise is gambling (and forcing us local potential victims to gamble involuntarily) on the unknown and unevaluated physical conditions of the mine that will not be known apparently until after the long flooded mine is dewatered (a huge separate environmental impact problem with noncompliant and objectionable deferrals), relying only on such deficient, pre-1956 mine closure and flooding documents, whose validity, reliability, completeness, and current relevance and accuracy are in dispute here, along with alleged and disputed "comparable" studies of other purported "similar" situations elsewhere that objectors contend are neither comparable nor similar. **The relevant comparable, however, is the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line. Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk and proposing fewer and misplaced monitoring wells, which impacts and risks are now different and larger because of changes over time and climate change, not to mention the deficiently studies effects of new 24/7/365 blasting, tunneling, dewatering, and mining for 80 years. See also the Union discussion of comments by hydrology expert Sol Henson.**

Thus, this Objection addresses this EIR menace from all those and other perspectives, as water and air pollution, as a NID and groundwater supply problem, as an undercounted existing and new well issue, among other things, all with deficient or noncompliant mitigations. At the end of section I in F, I add some highlights for my such multidisciplinary objection comments, before rebutting each of the disputed EIR's both Master Responses in my section II and Responses to my DEIR Objection 254 in my section III. After some initial commentary this section I provides legal and factual examples to use as a foundation to illustrate what the reader should look for in my following more specific rebuttals and counters to the EIR, explaining why each individual EIR mining and related conflict is so irreconcilable and why such EIR

noncompliance is so inexcusable. **First**, I then rebut first each of the EIR's "Master Responses" in section II, and then I rebut each of the particular EIR "Responses To Comment Ind. 254-1 through -101" in section III. For that initial section I foundation, I focus on describing some basic CEQA and other laws and legal authorities and principles, then I follow in the next sections with examples that apply such law and CEQA Guidelines to facts and realities relating to particular impacts and disputes. What follows after that in section II are systematic, point by point summary rebuttals of each disputed EIR "Master Response," and then in section III to each dispute EIR "Response" to my specific DEIR Objection 254 topics. Thus, as a reader, decision-makers can begin with a broad overview, followed by the relevant legal precedents, laws, and guidance by principles, which are then applied to the relevant factual illustrations disputing the EIR/DEIR and supporting my four Objections, followed (based on that foundation) by a systematic rebuttal of the generally nonresponsive EIR "Reponses" and "Master Responses" that too often evade, dispute, or otherwise contest or ignore my still meritorious prior DEIR Objections 254 and 255, as proven with the correct use of the terms "clarifications" and "amplifications" misused by the disputed EIR to avoid having to revise and recirculate the DEIR/EIR. See, e.g., section I.A.1.c.

In this opening section I, after this broad opening overview in subsection I. A.1 that concludes in I.A.2 with my credentials that make my objections worthy of attention, my Table of Contents presents a range of bases and topics for my many defenses and counters against such next disputed EIR Responses and Master Responses. See also my Table of Incorporations by Reference Objections and Exhibit D. For example, I begin in section I.B more details of my disputes against the EIR's claims about the Centennial site that I introduce in subsection 1.A,(1)(d)(ii) below. Then I.C demonstrates some basic CEQA, Guideline, and other legal principles to frame my analysis that follows. I follow that with some detailed illustrations in section I.D of various particular EIR disputes, especially relevant to laying the foundation in section I.E for missing, deficient, or noncompliant mitigations of understated impacts that the EIR incorrectly considers insignificant before or after mitigation. Then, as the EIR attempted (but failed) to do with its disputed "Master Responses," I present in section I. F and following discussions some analyses of various, usually multidisciplinary "highlights" that I consider especially important to illustrate the depth and complexity of the EIR/DEIR's noncompliance before winding up with item-by-item detailed disputes over the EIR Responses and Master Responses.

(B). Some Introductory Alerts To Objections To EIR "Tactics" And My Counters.

Also, before my rebuttals of such EIR Responses and Master Responses, I also present even more substantive analyses in special commentaries on some of the selective topics on which the EIR is most evasive (and worse) and noncompliant exposing specific applications of objectionable EIR tactics that I identified in the foundation (e.g., I.A.1.d(viii) and I.F.5), such as what I call, for example, "hide the ball," "bait and switch," "deny, distract and evade," and "false equivalence." Note also that the disputed EIR "Responses To Comment Ind. 254-1 et seq." are often tactically disaggregated or "cut up" by the EIR for evasion into lesser fragments of my integrated comments. See also section I.F.5. (Fortunately, a reader of my DEIR Objection 254 sections can use my table of contents to track both my such disputes to DEIR errors, omissions, and noncompliance therein, as well as my additional objections herein to those disputed EIR

responses.) However, the disputed EIR Master Response topics are crafted as idiosyncratic issues chosen by the disputed EIR (I suspect for tactical purposes). Each of those illustrated EIR/DEIR tactics is noncompliant with the authorities I cite correctly to interpret and apply CEQA and its Guidelines (see I.C), such as, for example since it is among many key sources the disputed EIR ignores, the 2018 Guideline Amendments Explanation (at I.C.2), explaining why my interpretations are correct and the EIR's are wrong (e.g., confirming climate change impacts are to be addressed not disregarded as "speculative" as the disputed EIR incorrectly claims). See the applicable law discussed at I.A.1.a(viii) and elsewhere (e.g., section I.C and D) prohibiting the EIR's incorrect or worse excuses for evading my objections on the merits.

As a result, my four Objections still include and advance everything I said (or incorporated) in my such DEIR Objections 254 and 255, plus my rebuttals, impeachment, and counters to the disputed EIR in this EIR Objection 254 and my related EIR Objection 255. As acknowledged in the disputed EIR at 1-52, the required County recipients have received **my two lengthy objections to the DEIR that the EIR numbered "Individual Letters 254 and 255"** starting (with the EIR's disputed responses thereto) at EIR page 2-5843 et seq. (**collectively, together with my EIR Objections, called my four "Objections" and sometimes differentiated as "Objections 254" or "Objections 255," each Objection incorporating the others, as well as third party objections incorporated my such Objections, which are now identified in the attached Table of Incorporated by Reference Objections, Exhibit D, and my other incorporated and cross-referenced supporting authorities.).** My DEIR Objections 254 focused on the many substantive errors, omissions, and noncompliance in the DEIR, all of which continue to exist and apply against the disputed EIR, which concedes nothing against the DEIR and thereby fails to be responsive to any of the many objections by me and others regarding the DEIR. My EIR and DEIR Objections 255 are more legalistic disputes, including against the practical and economic feasibility of the disputed DEIR, which also continues to apply to the EIR, which also ignores or evades my such DEIR objections entirely. Therefore, the County decisionmakers should read my objections to those Master Responses after this foundational presentation and then to relate those back to my DEIR Objection 254 sections by considering my cross-references and incorporations in my such Objections that are constantly and improperly ignored in the EIR.

My section I also matches such correct Guidelines with the key court decisions ignored or misconstrued by the EIR/DEIR, such as the similar mining eir dispute in *Gray v. County of Madera* (2008), 167 Cal. App.4th 1099 [see I.F.2 and I.A.1.d](explaining the need for "common sense" and other CEQA principles and precedents it applies to reject a mine's eir similar mitigation for well water depletion), as well as precedents like *Banning, Vineyard, and Costa Mesa,* explaining that CEQA requires much more "good faith reasoned analysis" than usually appears in the disputed EIR/DEIR. Consider, for example, what the noncompliant EIR/DEIR either ignores without mention, disregards with meritless theories, or obviously fails even to attempt to present with such a common sense, good faith reasoned analysis (e.g., instead offering only dubious or worse speculation, unsubstantiated and incorrect opinions, or false assumptions): (i) the competing property rights, claims, and remedies of us surface owners above and around the 2585-acre underground mine (e.g., the Supreme Court's *Keystone* mining decision) that the EIR persists in ignoring, even though I demonstrate how that has environmental impacts also ignored by the disputed EIR (see I.F and the CA Supreme Court decision in *Varjabedian v. Madera* (1977), 20 Cal.3d 285); (ii) the hexavalent chromium threat for water and air pollution (the hazardous substance that killed Hinkley, CA, as dramatized in the movie, Erin Brockovich),

which the DEIR obscured and almost totally failed to discuss and which the EIR tries, and fails adequately, to address without adding the "significant new information" so as (it incorrectly imagines) to avoid more substantive CEQA required analysis that would require recirculation of a revised EIR (see I.G, and my DEIR Objection 255 and my section II and III defenses herein of such 255 authorities); (iii) the rights and remedies available under the Supreme Court's *Keystone* decision and other precedents helpful to surface owners above and around the 2585-acre underground mine that will have environmental impacts (see I.H) and legal consequences (see, e.g., I.D, my DEIR Objections 254 #'s 3.N, 4, and 14, and my DEIR and EIR Objections 255); (iv) some illustrations (explained further in Exhibit A) of the inconsistencies between the disputed County Economic Report and the EIR/DEIR, such as the County (and NID in its Agency Letter 10) agreeing with objectors that there are many more impacted wells than the EIR/DEIR acknowledge or can mitigate (see I.C.2, 1.F, and many incorporated objections, such as the Wells Coalition at Group 27/28); (v) my multidisciplinary analysis (see I.F, of how the asbestos, CR6, and other toxic fugitive dust mitigation by frequent daily watering (even NSAQMD insists be continued as a priority during NID drought rationing) that will inspire many more new wells by those of us living on the surface above or around the 2585-acre underground mine, further complicating the disputes over the 24/7/365 dewatering for 80 years to be flushed down the Wolf Creek to other unsuspecting NID customers and the noncompliance of EIR/DEIR proposed well mitigation that is defeated by the *Gray* decision and by the economic infeasibility of such project and mitigation as admitted in SEC filing discussed next and the DEIR admission at 6-14 that the whole project is infeasible if the miner cannot operate 24/7/365 for 80 years in accordance with its disputed EIR/DEIR proposals; and (vi) Rise's admissions in SEC filings and elsewhere that are contrary to or inconsistent with (and require more disclosures in) the disputed EIR/DEIR, together with the court decisions (e.g., what I call the "*Richmond v. Chevron"* case discussed at length in section I.D(5)) that allow my such rebuttals by such SEC and other admissions, such as to contest economic feasibility as to EIR/DEIR, even as to mitigation and other safety proposals (see I.D, I.A.1.d.(iv), and my DEIR and EIR Objections 255).

Whenever I cite a DEIR provision or topic the reader should automatically consider that I dispute them in my DEIR Objection 254 (and, when applicable there, in my DEIR Objection 255 as well) and incorporate my rebuttals and Objections thereto. Thus, whenever this EIR Objection 254 of mine cites to one of my DEIR Objection 254 section or topic cites, that automatically includes and incorporates a cite to my rebuttal in this EIR Objection 254 to my related cite in section III herein to the corresponding EIR "Response" to my such DEIR Objection 254 i.e., to such EIR Response numbered Ind. 1 to 101 that corresponds to my DEIR Objection 254 section (which can be confusing, as the disputed EIR apparently intended when it persisted in cutting up my integrated table of contents sections with heading titles into arbitrary fragments the EIR re-labeled Ind. 1 to 101 Responses, to which I have objected herein in section I.F.5 and I.A.1.d.(viii).) If I sometimes go to the trouble of matching my DEIR Objection 254 table of contents sections to the disputed EIR's renumbered "Response" fragments it so re-labels Ind. 1 to 101, that is only for emphasis for any reader, and the absence of any such Ind. 1 to 101 cite does not affect my automatic objection references in my system, as distinguished from the EIR's disputed renumbered system. The same automatic objection arrangement applies with respect to the disputed EIR's Master Responses, with even more importance, because such EIR Master Responses use labels that are not fully or even adequately informative about their often-mixed subject topics. It is often not feasible even to try to match those idiosyncratic Master Responses to my Objection topics, except by confirming my objections to such EIR content with my

general, automatic cite to my Objections (including from my Table of Incorporated by Reference Objections). Stated another way, my four Objections (including such incorporations) present the relevant realities, as contrasted with the many alternate realities created by EIR/DEIR errors, omissions, and noncompliance.

In any case, the EIR/DEIR disaggregation of topics in various places requires me to object (as I have) to each such disaggregated part. However, to avoid suffering/rewarding such evasions of EIR/DEIR compliance, I remind the reader of my internal automatic and other cross-referencing among my sections I, II, and III, so that every relevant objection, rebuttal, and counter that I assert (including incorporations) in any section of this or my other Objections also automatically applies everywhere it is relevant. That means I do not have to repeat or specifically cross reference each of my objections to the scores of places where it would be relevant to such scattered EIR/DEIR statements, omissions, and other noncompliance. Because it would be an unduly burdensome nightmare for me to have to link my objections that are disaggregated to match the EIR/DEIR scattered contents, this Objection (and my others) should be read as if the EIR/DEIR had consolidated each of its statements topic by topic in one convenient places so I could match that with my consolidated objections; e.g., each of my well related comments in sections I, II, or III should be read as if they were all consolidated together in one integrated commentary without my having to link specifically each sentence on that topic with every other relevant sentence that I have had to separate to match the EIR/DEIR's disaggregated content on that topic.

Therefore, I object automatically to whatever is contrary to or inconsistent with my such Objections with only one limited exception. As I note in many places DEIR 6-14 admits that the project is economically infeasible unless it can operate 24/7/365 for 80 years in the objectionable way proposed by the EIR/DEIR. I (and other incorporated objectors) agree that the project is economically infeasible, especially for someone with a financial condition like Rise admits its SEC filings (Exhibit A and DEIR Objection 254 #2), although the same would be true for even less prolonged and less intense operations. Apart from that, I consider that DEIR/EIR admission to be a comprehensive confession of economic infeasibility, since there are too many disputed proposals in the DEIR/EIR that must be defeated (or omitted impacts, or added or improved mitigations, that by that DEIR admission, the project cannot be feasible. While the disputed EIR/DEIR claims that CEQA doesn't care about such feasibility (and the County Economic Report mistakenly tolerates that erroneous claim, despite being refuted in Exhibit A and authorities in my Objections), section I.A.1.b and I.C, D, E, and F proving why we objectors must prevail because ultimately the courts will certainly allow our truths to rebut and impeach every false, misleading, and otherwise noncompliant statement and omission in the EIR/DEIR, whether or not within the incorrect boundaries that the EIR/DEIR tries to impose on CEQA objections. See, e.g., section I.C (and my DEIR Objection 255) where I more correctly address the CEQA compliance issues, including by reliance on the 2018 Guideline Amendments Explanation where the CEQA authors explain the meaning and effect of Guidelines that the DEIR/EIR misconstrue, misinterpret, or ignore in favor of their own disputed claims.

(C). Some Miscellaneous Information To Guide The Reader.

Please note that there are compelling reasons why this Objection is so long and complex, which include the disputed EIR tactic of evading my objections by incorrectly claiming that I failed to sufficiently explain or detail my objections and arguing that excused the EIR from

CEQA compliance in its disputed Responses and Master Responses. What I do in sections II and III below is combat that nonsense in item-by-item rebuttals that expose that nonresponsive tactic, thereby proving an independent ground for rejecting the noncompliant EIR. However, since I also wish to prevail on the merits against the EIR/DEIR, I begin with my subject matter rebuttals in this section I, which I incorporate automatically in each relevant objection in this section II to these EIR Master Responses and in section III below to those Responses. My objections here had to track the order of error, omission, and noncompliance in the disputed EIR Master Responses and Responses (like I also had to track those in the disputed DEIR, since the EIR basically adopts the whole DEIR with supplements with "significant new information," but without the badly needed corrections or reforms addressed in many objections by me and others). See Exhibit D and the Table of Incorporated by Reference Objections. That meant the introductory or earlier general sections of the disputed EIR/DEIR required my noting my corresponding objections as errors, omissions, and, worse, each time they occurred in the disputed EIR/DEIR before reaching the major substantive parts disputed later in the sprawling EIR/DEIR, where I then again matched their somewhat more detailed (but still insufficient, noncompliant, and disputed) comments with my more detailed objections. In other words, the EIR/DEIR is responsible for the redundancy and the less detailed "coming attraction" type objections early in the documents with cross-references to my more detailed objections to the major disputed substantive topics later in the document. To try and control that challenge, please note that each of my three sections contains some new objection data not contained in the other sections hereof, so that one needs to consider each of the three sections I, II, and III together for a comprehensive appreciation of the full scope of the impacts and noncompliance by the EIR/DEIR.

In summary, the following sections are some of the legal authorities, guidelines, and principles that both (i) create a foundation for my many, specific compliance, substantive, and technical objections, and (ii) should guide the analysis of decision-makers by revealing the patterns, practices, and tactics by which the disputed EIR/DEIR evades, ignores, and mistreats its disclosure and response obligations. Following that foundation, I thereafter dispute each of the EIR/DEIR "Responses" and "Master Responses" on a point-by-point basis. Please note that additional legal and factual authorities are also incorporated herein (rather than restated) from other objectors' objections listed in the attached Table of Incorporated by Reference Objections (or related document Appendix). However, I also object as I go to such improper tactics with which the disputed EIR attempts to avoid compliance with CEQA and other applicable laws, as well as me generally disputing the EIR's responses to my incorporated third-party objections and authorities, which I generally contend are sufficient in themselves to rebut the EIR and its nonresponsive content. Since the noncompliant EIR (like the DEIR) is full of errors, omissions, and flaws, including by evading or ignoring the key merits of many of my several Objections, I also focus below on rebutting the EIR's disputed excuses and meritless theories (e.g., complaints about objections as too speculative or general) for not responding appropriately to the merits of my and others' concerns, authorities, and evidence. Also, when I incorporate another objector's commentary about the DEIR from my Table of Incorporated by Reference Objections, that should be deemed to include whatever follow up commentary that objector makes to the EIR's Master Responses or Responses to such objector's DEIR commentaries, subject to the general rules governing my incorporations stated in my Table of Incorporated by Reference Objections.

(ii). The "Ad Hoc Mine Opposition Group" For Whom I May Also Act.

As explained in my DEIR Objection 254 #1, I am a bankruptcy lawyer with a half century of experience in representing creditors (aka victims) in bankruptcy cases that are relevant here, including not only bankrupt or abandoned mines (and sometimes the insurers in insurance insolvency proceedings on account of environmental claims), but also relevant environmental and product liability (e.g., asbestos) bankruptcies, as well as cross-border insolvency cases, such as where a foreign based mining company files a "foreign proceeding" and then seeks relief under Chapter 15 of the U.S. Bankruptcy Code to attempt to compel US creditors to defer to that foreign proceeding. In such cases, as well as similar situations where the miner just retreats across the border with its winnings and abandons the US mine (adding to the more than 49,000 abandoned or bankrupt California mines on the EPA list), it is common for victim creditors to form ad hoc groups under Bankruptcy Rule 2019 to protect their interest and enforce rights in such situations, including to share and protect privileged attorney-client work product within such a "joint defense/enforcement group." I have in formation an "Ad Hoc Mine Opposition Group" for which I also may act should that become necessary or useful, and I reserve the right for that group to act from time to time in relevant proceedings as it deems useful. Therefore, I include that group as an objector with respect to my Objections with and for me (in my individual capacity.) For simplicity, however, I will simply speak in my Objections with pronouns (e.g., "I," "we," "us," and "my" and the like) to include both me in my individual (and attorney) capacity and for that Ad Hoc Mine Opposition Group" in formation. What that will involve for that group will depend on the results of these EIR/DEIR and related disputes and the actions or omissions by the miner in the process to come.

(iii). Scope of Opposition And My Terminology, Such as "Noncompliance," And Illustrations With Wells And Other Key Topics.

In my four "Objections" I often refer to what I call "errors." "omissions." "noncompliance" and the like (e.g., flaws, deficiencies, objectionable conduct, incorrect or false claims, etc.) in the EIR/DEIR or with respect to the mine or its condition or activities. These terms overlap (and are intended to do so), to assure comprehensiveness while also reflecting the nature of the focus of such objection. The intent is to give such terms broad interpretations, among other things, because the disputed EIR/DEIR does not reveal everything it should to be compliant with CEQA and other applicable laws and regulations and that makes specific objections difficult, which may be the tactical goal of some omissions, evasions, and obscurities in the EIR/DEIR. In any case, I wish to emphasize that **"noncompliance"** (and related concepts with other phrases, like "failure to comply" etc.) is intended to be broad and comprehensive to apply not only as to "noncompliance" with CEQA and other applicable laws but with what conduct (whether acts or omissions) could create legal or equitable rights or claims for those opposing the EIR/DEIR and such mine or mining.

This expansion beyond CEQA is important for many reasons, including, for example, because the disputed EIR/DEIR has an incorrect interpretation of the scope of CEQA, such as, for instance, in attempting incorrectly to exclude issues and evidence of economic infeasibility into these objections, even when used to rebut false or misleading statements in the disputed EIR/DEIR. Also, as demonstrated herein (and to some extent even admitted in the Rise SEC 10K filings addressed in Exhibit B and elsewhere in my Objections), the environmental impacts arise not just from what the EIR/DEIR mining may do to Rise's property, but also how it may impact

the "surface" properties (including at least 200 feet down) owned by the thousands of us living above and around the 2585-acre underground mine at issue. (As court decisions confirm, CEQA applicable environmental impacts can be direct or indirect.) If and to the extent that the EIR/DEIR mining violates the competing property rights of us surface owners, that has both a direct impact on our surface environment, as well as CEQA applicable indirect impacts as a consequence of how us competing surface owners enforce our remedies and defense rights, such as our right to mitigate our damages from mining impacts, as explained herein and in more detail in my DEIR Objection 254 (e.g., #'s 3.N, 4, and 14) and 255. For example, when and if the mining violates our competing surface owner rights to groundwater, and, as climate change dryness impacts our lives and property, surface owners like me will drill new wells to use the groundwater we own that is being depleted and flushed away by 24/7/365 dewatering for 80 years by objectionable mining. Those new wells, which the disputed EIR incorrectly dismisses and ignores as "speculation," will have a major impact on both the mine and the environment that is not addressed in the EIR/DEIR as it must be. (Whether or not the decisionmakers apply the law of evidence, any court addressing these disputes will rule correctly that climate change dryness is not "speculation" and a surface owner may testify as to his or her right and intent to drill future wells for groundwater use at his home (and to protect his or her trees and vegetation from lethal dryness and the fire hazards from a dead forest.)

Also note how Grass Valley exposed this "hide the ball" terminology tactic as to noise impacts that are alleged by the disputed DEIR/EIR (see DEIR 4.10-1 and 32) to be a "temporary noise impact." Grass Valley explained at in its objection at Agency 8 at 24-27 that such operational noise from 7/16/365 for five years is not "temporary."

(iv). Incorporated Objections And Some Illustrations of The Failures of The EIR/DEIR to Apply the CEQA Required "Good Faith Reasoned Analysis" And "Common Sense" Needed To Avoid "Alternate Realities" Exposed By Objections, Especially As To Water Related Disputes.

This deficient, incorrect, and otherwise flawed EIR admits (e.g., at 2.2) that it is basically a ratification, supplement, and continuation of what I demonstrated were intolerable errors, omissions, and flaws in the disputed DEIR, subject to a few, key EIR exceptions identified herein incorrectly claiming to add just a few "minor" or "insignificant" edits and justifications for "clarification" or "amplification" (all still disputed by me) for ignoring or rejecting my and many other objections to the DEIR. Thus, like the many other objectors (none of whom is satisfied by the disputed EIR), my DEIR Objections 254 and 255 continue as objections now to the EIR/DEIR, and my EIR Objections 254 and 255 clarify, amplify, and supplement them. See both my attached "Table of Incorporated by Reference Objections" (aka referred to herein and, in my four Objections, as among "other objections.") and my Exhibit D hereto that illustrates some of the reasons why I incorporated such others' objections, although in the case of what I collectively call the **"CEA Objections**" (Community Environmental Advocates Foundation, Center for Science In Public Participation, and Shute Mihaly Law Firm for CEA Group Letters 6, 7, 8, 9, and 21), **"Wolf Creek Community Alliance Objections**" (Grp. Nos. 29, 30, 31, and 32), and certain others, I do not attempt to summarize such very comprehensive objections, because, like my four Objections, they are too extensive for any such summary or integration to do them justice, although all my incorporated Objections deserve to be considered fully on their

own excellent merits. The decisionmakers would be well advised to begin by reading the major detailed government and group commentaries, such as the very comprehensive, traditional environmental analyses by or for the CEA, the Wolf Creek Community Alliance, the Bear Yuba Land Trust, the Sierra Fund, The Wells Coalition, the State Dept. of Parks And Recreation, and Grass Valley. Next, the decisionmakers should read my four Objections for a less traditional, but also fairly comprehensive analysis, from my different perspective on the same problems and risks. What do I add to those governmental and group objections? I offer an experienced cynic's unique perspective as a bankruptcy lawyer with a half century disputing with bankrupt or abandoned mines and the insurers who sometimes failed with the mines (or, like my Lloyds of London—Equitas, were forced to restructure). Think of it this way. If one were going to design a safe plane, you would consult the best plane designers (e.g., the CEA and other such objector teams), but you could also consult a lawyer with as much experience as anyone in resolving the disputes about why all those other planes crashed, so as to expose the front-end mistakes and avoid history repeating itself. Because my family and property are being impacted by this mine menace, I have a personal interest in making certain that I am doing everything I can to protect us from this disputed EIR/DEIR mine.

As demonstrated herein, the disputed EIR fails to comply with CEQA and other applicable law for the same material reasons that are cited in my material DEIR Objections 254 and 255, plus additional reasons stated herein as to how the disputed EIR makes such disputed DEIR worse not better, and even fails to address, much less resolve, the harder questions I previously raised against the DEIR, such as in DEIR Objection 254 #15. As I demonstrate below (and in my DEIR Objection 254 at #'s 3.N, 4, and 14 defended herein from the disputed EIR's meritless nonresponsive "Responses," and in my DEIR Objection 255), the courts (see, e.g., ***Banning, Vineyard, and Costa Mesa)*** have interpreted CEQA to require both a **"good faith reasoned analysis" and what *Gray v. County of Madera* called "common sense,"** which is rarely even attempted in the EIR/DEIR. That EIR/DEIR failure is especially common with respect to disputed EIR/DEIR proposed "mitigation measures," which were rarely justified by any such "good faith reasoned analysis" and which is usually just asserted as an unsubstantiated and speculative opinion or assumption that I and others dispute as materially deficient or often even illusory or infeasible. Even when the disputed EIR purports to address a dispute on the merits, such lack of "common sense" and "good faith reasoned analysis" is common, as illustrated regarding both: (i) such groundwater depletion and recharge disputes, and (ii) the evasions, and worse, by the disputed EIR regarding the hexavalent chromium menace the DEIR/DEIR proposes to add to the mine cement paste for shoring (a threat almost entirely ignored or obscured in the disputed DEIR, with the EIR now trying to add some disputed data which it pretends was in the DEIR (it wasn't), so that the disputed EIR could incorrectly claim that it doesn't count as significant "new" information (which it is), thus requiring revision and recirculation of the DEIR, as demonstrated below.

As demonstrated in various places herein (and as proven in my four DEIR and EIR Objections 254 and 255 and partly admitted by Rise in its SEC 10K filing addressed in Exhibit B), the disputed EIR/DEIR entirely ignores the legal property rights and values of those thousands of us owners living above and around (and competing with) the 2585-acre underground mine. This is not just about what the mine does with its own property, but also about what the underground mine does to harm surface property owned by us objectors. Those concerns are especially applicable about our competing ownership of groundwater which we have the right to tap both now with our existing wells and later with future competing wells as

DEIR/EIR ignored climate change dries up our land and wasteful 24/7/365 mine dewatering for 80 years threatens to turn our precious forests into an even greater fire hazard. As my cited Supreme Court case quote demonstrates, depletion of the groundwater under our property is itself subsidence and harm to our legal rights of lateral and subjacent support. ***Keystone Bituminous Coal Association v. DeBeneditis,*** 480 U.S. 470, 475-75 and fn2 (1987) (*"Keystone")* **("Subsidence can also cause the loss of groundwater and surface ponds."**) Thus, unless the County wants to incur "taking"/eminent domain and inverse condemnation liability under the Fifth Amendment and the even more applicable California Constitution as discussed in DEIR Objection 254 #3.N, 4, and 14, no County EIR approval can deprive us of any of our such property rights (including as to our groundwater) as surface owners above and around the 2585-acre underground mine.

While the disputed EIR/DEIR continuously ignores that legal issue, that evasion also creates massive noncompliance by the EIR/DEIR with CEQA, which assumes unrestricted plunder of our such groundwater in its 24/7/365 dewatering for 80 years. See the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session, following up with the Wells Coalition Group Letter 27/28. Nowhere in the disputed DEIR/EIR is there any discussion of the environmental and other impacts of what happens when the courts protect such surface owner property rights with respect to our groundwater and otherwise. These evaded property rights issues are a much more profound dispute than merely what the EIR/DEIR claims are a small number of depleted wells along East Bennett Road, because, for example, us surface owners have the competing right to drill future wells during the 80 years to use our own groundwater property, which competition and conflict are never addressed in the DEIR/EIR. Stated another way, CEQA is about discussing what a miner does with its own property, but not any kind of right to use or harm anyone else's property, a legal reality commonly addressed in inverse condemnation claims, among various other remedies of competing property owners discussed briefly below, in my Exhibit A, and in my DEIR Objection 254 #'s 3.N, 4, and 14 and DEIR Objection 255 .

What I have attempted to do in this Objection (and in my DEIR Objections 254 and EIR and DEIR Objections 255) is to prove: (i) what I can of the adverse environmental impacts, recognizing that the miner (and those EIR/DEIR authors with whom Rise is collaborating) have exclusive control over much of the core, available data and evidence which only becomes available to us potential victims as discovery in any court challenges that become necessary if and after the disputed EIR is mistakenly approved. If necessary (as with the economic feasibility disputes wrongly excluded so far in the DEIR/EIR process –see Exhibit B and DEIR Objection 254 #2 and 255) in such future dispute process circumstances, we potential victims can then use discovery opportunities to further enhance our proofs of what should be obvious to any objective reader: there are massive errors, omissions, evasions, flaws, and worse in the disputed EIR/DEIR, which also fail to present "good faith reasoned analysis" with "common sense" and truth, thereby failing to satisfy CEQA and other applicable law. Thus, nothing in the disputed EIR/DEIR has overcome any of my four Objections, and too often its complaints about my

Objections are properly blamed on the disputed EIR/DEIR for itself creating the issues in its complaints.

For example, as explained below, the disputed EIR complains incorrectly that my Objections are too speculative, too unsubstantiated, or too unclear or unexplained to merit any response, thus failing to comply with CEQA. However, as demonstrated herein, each such disputed EIR and/or DEIR provision, omission, or flaw that my Objection addressed was usually itself either (i) too speculative, too unsubstantiated, too unclear or unexplained (e.g., based on mere implausible [or worse] opinions), (ii) based on false or unstated and incorrect or worse assumptions or guesses, (iii) the result of improperly ignoring my express cross-references or incorporations in my objections (or just willfully ignoring whatever other parts of my integrated objections the EIR/DEIR "chopped up" in its evasion), (iv) the result of the disputed EIR arbitrarily fragmenting and improperly addressing only in isolation what was my unified and integrated comment in a larger designated section of my Objection, or (v) other improper or evasive tactics. Also, note that, as other victim objections in my attached Table of Incorporated Objections (and the related Appendix of related documents) reveal, there are objectionable, common patterns and practices by the disputed EIR/DEIR to use "hide the ball," "bait and switch," and other objectionable excuses, evasions, and claims to dodge and disregard not merely my four meritorious Objections, but also those of many others that I incorporate. See, for example, my many objections below disputing errors, omissions, and flaws in the EIR Response to Comment Ind. 254-3 (addressing my Objection 254 #1.E starting at 2-5864, among others illustrating "hide the ball," "bait and switch," and other disputed tactics). The disputed EIR generally attempts to evade my such Objections by claiming they are insufficiently explained or detailed, but that disputed theory ignores in each case my many cross-references and my incorporated objections (as well as the rest of my integrated commentary that the EIR so tactically cuts up to have something to complain about being deficient.

If the reader has the patience and endurance to compare in detail my Objections to the disputed EIR/DEIR (and its responses to my corresponding objections) that pattern and practice of improper evasion, avoidance, and worse become unmistakable and irreconcilable with the CEQA requirements I explain herein (and in other my other Objections) with cited authorities applied to specific violations in the disputed EIR/DEIR, such as failing to provide a "good faith reasoned analysis" with "common sense" on every impact issue, every mitigation measure, and every objection either required by CEQA or other applicable law or permitted by applicable law as a rebuttal or impeachment of EIR/DEIR errors, omissions, or worse, regardless of what the disputed EIR/DEIR incorrectly contends to be the limited boundaries of CEQA. Stated another way, when the disputed EIR/DEIR makes a false or misleading statement (or assumption underlying incorrect or worse information presented) or omission, for example, one that "opens the door" for my rebuttal or impeachment thereof, CEQA doesn't shield the EIR/DEIR from any truth required to counter such false or misleading information or omissions.

(v). Some Hard, Risk Questions For Decisionmakers Not Addressed By The Disputed EIR/DEIR, And the Need For County Staff To Be More Skeptical of This EIR/DEIR.

Because of the massive omissions, evasions, and other nondisclosures by the disputed DEIR/EIR, I (like other objectors) have asked many hard questions in this and other Objections without any satisfactory responses from the EIR/DEIR. See my DEIR Objection 254 #'s 15 and

4, and Exhibit A. Indeed, the more I study the meritorious objections other experts filed against the DEIR and the disputed and generally nonresponsive EIR "Responses" thereto, the more commonly hard questions arise. Also, as Exhibit A demonstrates, even if the disputed EIR/DEIR were somehow ruled to be correct, overruling all these hundreds of meritorious objections like mine and those I incorporated, no purchaser or mortgage lender appraiser of any surface property above or around the 2585-acre underground mine, aka the stigma zone, will believe or trust their fate to this disputed EIR/DEIR. (That is the real message of the Nevada County Association of Realtors in its Group Letter No. 15, because who would be willing to assume the risk of buying a home above the 2585-acre underground mine under these circumstances at the same price they would have paid if the mine stayed "as is?") In other words, the only tolerable solution to this dispute is just to say "no" to the mine. This is about allocation of risk, and whatever you decisionmakers may conclude about the merits of these many EIR/DEIR and mining disputes, it is incontrovertible that approval of such EIR mining would impose on our local community, especially those of us living in homes on the surface above and around the 2585-acre underground mine, at least intolerable risks (plus certain losses of property rights and values at least from stigmas) for the profit of this Canadian miner's shareholders and no net benefit that any of us impacted locals can imagine to be real.]

[To be clear, my complaints, if any, with any EIR/DEIR participants not affiliated with Rise are about their incorrect approach to these disputes, which so far seems to be incorrectly assuming (rather than evaluating and screening) the accuracy, compliance, and sufficiency of the disputed EIR/DEIR (including as to the County Economic Report I rebut and correct in Exhibit A), as well as applying incorrect limits on required EIR/DEIR disclosures (e.g., ignoring economic infeasibility, even when admitted by Rise in SEC filings [Exhibit B] that *Richmond v. Chevron* prove must be considered as important evidence), thereby mistakenly and uncritically relying on, tolerating, or accepting, the disputed Rise errors, omissions, and misinformation in the EIR/DEIR. I hope that the County decisionmakers do not share that incorrect approach but follow instead the legally correct approach required the courts in the authorities cited herein and in other objections, including by allowing the use of Rise admissions in its SEC filings [see Exhibit B] and elsewhere to impeach the disputed EIR/DEIR claims and omissions, especially showing that Rise lacks sufficient financial resources to accomplish even what safety work and mitigations are proposed in the EIR/DEIR, much less what the courts will ultimately require in challenges if this disputed EIR were approved. See *Richmond v. Chevron* (where SEC filing rebuttals enabled the objectors to defeat that eir, among other things because CEQA does not override the rules of evidence) and sections I.C and D. That and other noncompliance make this disputed EIR/DEIR a dangerous example of what is politely called "alternative reality" to distinguish it from the "true reality" shared by thousands of us objectors living above and around the 2585-acre underground mine.]

We locals believe that this disputed EIR mine is certain to adversely impact our lives, property, and environment in many ways, both directly and indirectly, (e.g., harming our environment, our health and welfare, and our quality of life, while depressing our property values and economy in ways not properly appreciated by the County Economic Report disputed in Exhibit A). Decisionmakers, please ask yourselves this question, if you were one of us thousands owning homes above or around this 2585-acre underground mine and had to explain what the law requires you to disclose to a potential buyer or a mortgage lender's appraiser, what would you say? Stated another way, despite whatever feasibility or other legally important concerns our government may be incorrectly excluding from consideration in the disputed

EIR/DEIR, in the real world where us objectors live, people must consider all the relevant risks, especially those performance and mitigation achievement risks Rise admits in its SEC filings (or even in the DEIR) and those addressed in all these government agency and credible group objections. See, e.g., my objections in section II to the disputed EIR Master Response 1 which it describes in parts as relating to Quality of Life, Property Values, and Social And Economic Impacts.

(vi). Adverse Comments (Or Lack of Pro-EIR Findings) by CEQA "Responsible Agencies" Should Prevent Approval of the EIR.

The disputed EIR evades many meritorious objections with deferrals to future actions by regulators and other governmental agencies and other noncompliant shifts of permissions etc. See sections I.A.1.d, I.E.3, I.F.5 and 6; *Richmond v. Chevron.* CEQA requires any such "responsible agency" to make certain findings with respect to each significant effect and provide a rationale for each finding, especially regarding permits it issues, even if mitigation measures would reduce the effects to an insignificant level. See *We Advocate Through Environmental Review v. City of Mount Shasta* (2022), 76 Cal.App.5th 629. (Here, the disputed EIR's claims of such mitigation reductions to insignificance are incorrect or worse as explained in my objections and those of many others, especially objections proving noncompliant EIR standards and practices that make deficient or omitted or evaded mitigations unable to accomplish a reduction to insignificance. See Table of Incorporated by Reference Objections.) Based on the many Agency Letter objections I incorporate or explain in Exhibit D, it appears that such agencies' findings will not support the EIR and should persuade or block the County as lead agency from approving the EIR. While such conflicts between lead and responsible agencies my involve complex legal issues, the overwhelming objector support for any such adverse responsible agency findings and objections will enable such EIR collective opponents to defeat the EIR in any legal, law reform, and political remedies that may be required to achieve that result.

(vii). Some Introductory Rebuttals of the Noncompliant EIR/DEIR's Climate Change Denial And Evasion.

Throughout the noncompliant EIR/DEIR there is a disputed pattern and practice of evading and omitting climate impacts on various bogus excuses. While I address that issue in section I.C and D as to CEQA and other legal principles, as in I.E and F in applying those rules to the issues in dispute, I offer this reminder to the decisionmakers. Contrary to the wishful thinking of the EIR/DEIR, climate change is not so speculative or uncertain as to excuse the EIR/DEIR from having to subject it to the same "good faith reasoned analysis" with "common sense" as other impacts. See, e.g., *Richmond v. Chevron* and other cases addressed in I.C and D, such as *League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2022), 75.Cal. App. 5th 63 ("**Save Lake Tahoe**") (finding the eir's greenhouse gas **[GHG]** mitigation measure was inadequate because it **deferred** determination to an unknown future time, requiring the applicant to mitigate impacts IF the project conflicted with relevant future emissions targets adopted by the state, relying on performance standards that do not yet exist and may never exist so that any determination of the impact's significance is deferred to an unknown time and where neither the county nor the applicant were committed to mitigating any such impact. Also, the eir **failed properly to consider whether renewables could be incorporated**

into the Project in the energy impact discussions, as noted below.) According to Save Lake Tahoe, to be compliant the CEQA analysis of energy impacts requires both whether renewables can be incorporated into the project, and (if significant impacts) whether renewables would reduce the impact. Also, for significant impacts, the EIR must consider all feasible mitigation measures. The EIR fails these tests, among other things, by such deferrals, by such lack of analysis and denials of such climate change matters, and by ignoring the renewables issues.

As to confirming the "significance" of these energy issues that Grass Valley calculated in its Agency Letter 8-18: "The [IMM] Project's annual energy use would represent an increase of approximately 15 percent in County-wide electric usage for a single industrial use." As Grass Valley said (at Id.): "This energy use should be recognized as a significant impact of the proposed project and mitigation should be incorporated to reduce this impact." That by itself not only defeats the Nevada County Energy Action Plan (EAP), but it depresses any willingness of mine opponents to sacrifice in their own energy usage, because our sacrifices would benefit this objectionable mine instead of our environment. Indeed, as I explain in detail with my rebuttal of the EIR/DEIR on its unrealistic and grossly understated generator use to cover PG&E PSPS, system failures, weather events, and other causes of blackouts increasing with progressive climate change impacts (see, e.g., sections I.E.7 and my objections to EIR Master Response 254-42), the EIR's projected energy use in incorrectly analyzed. See, e.g., my objections in section II to EIR Master Responses 16, 25, and 26-28 and my objections in section III to EIR Response to Ind. 254-84.

b. Some Basic Authorities And Principles That Can Be Applied To Support the Many Specific Objections That Follow, Including Some CEQA and Guideline Rules.

(i). Process Status between the Disputed EIR/DEIR And Objections, And the Failure of the EIR/DEIR To Satisfy Their Burden of Proof.

Acting to process a proposed EIR for the Lead Agency under **"CEQA"** (the California Environmental Quality Act, Pub. Res. Code #21000 et seq.) and its **"Guidelines"** (14 Cal. Regs. #15000 et seq.), the process participants so far have presented a noncompliant and worse draft environmental impact report ("DEIR") drawing hundreds of written objections, including my DEIR Objections 254 and 255. Then they mistakenly chose to "assume away," tolerate, or overlook those massive errors, omissions, and deficiencies in a disputed EIR that makes those problems even more objectionable. Besides mistakenly evading, disregarding, or tolerating what objectors cite as such substantive and procedural errors, omissions, and deficiencies, such process participants made an even worse mistake by incorrectly assuming the proposed EIR was, as it falsely claimed, only "clarifying" or "amplifying" the DEIR in ways that allegedly did not add significant "new information" or otherwise require DEIR revisions and recirculation. I demonstrate those EIR errors below requiring massive revisions and recirculation. See section I.A.1.c below. Moreover, as demonstrated in my attached or incorporated four "Objections" and by others' objections in my Table of Incorporated by Reference Objections, both the disputed EIR/DEIR fail to comply with CEQA requirements both to provide comprehensive "good faith reasoned analysis," applying truth and "common sense," and to lessen or avoid the many significant impacts, whether or not acknowledged by the EIR/DEI, by adopting feasible, timely

and sufficient mitigation measures or alternatives. See section I.C. and D, as to the correct interpretation of CEQA rules, sections I.E and F for examples of the applications of those rules and follow up authorities in my DEIR and EIR Objections 255.

Not only did the disputed DEIR/EIR fail to satisfy their burdens of proof and compliance, but the substantial record clearly now demonstrates that such improper DEIR/EIR approach undermined CEQA's goals of full and timely disclosure of environmental impacts and effects with timely, feasible, and sufficient mitigations and recognition of superior alternatives. Moreover, the disputed EIR accepted, added, and misapplied "significant" "new information" (and more deficient mitigations and disregarded superior alternatives) after public review and objections to the DEIR, especially by improperly deferring analysis and mitigation in key impact areas and with respect to delayed disclosures and factors contemplating future plans, mitigations, and studies only after public review of the DEIR closed and often after project approval, thereby depriving us objectors of our full rights to review, correct, and comment on the application of CEQA and other legal requirements to what the disputed EIR has mischaracterized, added, and changed with respect to the disputed DEIR. Unfortunately, even with this and other massive counters to the disputed EIR, I fear the decisionmakers and public will still be uninformed, puzzled, and dissapointed, because the EIR/DEIR does not adequately engage in the disputes on the merits, but prefers instead to evade, ignore, or mischaracterize them, leaving way too much in dispute about which we objectors had hoped to be able to rebut more specifically. It's as if someone decided on an improper defense strategy to avoid honest debate with facts and law in favor of just disputing our complaints as too speculative, unsubstantiated, or otherwise deficient to entitle our objectives even to be discussed. Even worse, my four Objections and others have demonstrated that the DEIR/EIR needed massive revisions and recirculation to reflect truth, "common sense," and reality, instead of what can only be described as the erroneous or worse "alternative reality" imagined by the EIR/DEIR. In particular, my four Objections demonstrate not just errors, omissions, and deficiencies in the disputed DEIR/EIR, but massive mischaracterizations, evasions, and ignoring of meritorious objections by me and others (see my Table of Incorporated by Reference Objections attached to this EIR Objection 254 and Exhibit D.)

Since the disputed EIR makes no comprehensive, adequate, or (often even) meaningful effort to fairly address any relevant objections on the merits, the EIR strategy seems to be, first, to hope the decisionmakers will mistakenly approve a deficient EIR that so evades, ignores, and mischaracterizes our objections, and then, second, to attempt to defend the inevitable court, law reform, and political challenges by those of us who have no choice but to continue defending our homes and the health, welfare, and environment of our community. Judicial review of CEQA compliance by mandamus action, whether by the Superior Court or at the appellate court, is a *de novo* review of whether the agency failed to proceed "in a manner required by law" (as with such failures here) or whether a determination is not "supported by substantial evidence" (as is also frequently the case since too much of the EIR/DEIR lacks the required "common sense of .) CEQA #21168.5. **The project proponent has the burden and responsibility for that result. *Sierra Club*, 6 Cal.5th at 513-14. As I keep protesting, the constant effort by the disputed EIR/DEIR to shift the burden of proof and demand more explanations and substantiation from me and other objectors, the CEQA burdens for analysis and reporting fall on the EIR applicant, not on the objectors. E.g., Kings County Farm Bureau v. City of Hanford (1990), 221 Cal. App. 5th 814, placing the burden of producing the relevant environmental data on the agency, not the public.**

Also, under **CEQA the EIR/DEIR has the "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.) Again, among the most common deficiencies and worse in the disputed EIR/DEIR are that they "ignore or assume a solution" to a problem or claims that the missing information "will be provided in the future." *Vineyard* at 40 Cal.4th at 429, 431, prohibiting such deferred analysis or mitigation. See my CEQA discussions and authorities below, such as at I.A.1.d.(v), I.C, and I.E.4.**

(ii). The Applicable Standards For CEQA Sufficiency Are Being Ignored by the EIR/DEIR.

That CEQA compliance requires a *de novo* determination of whether the EIR/DEIR discussion is "sufficient or insufficient" and "includes enough detail." E.g., *South of Market Community Action Network v. City and County of San Francisco* (2019), 33 Cal. App. 5th 321, 330-331, citing *Sierra Club v. County of Fresno* (2018), 6 Cal.5th 502, 515-516 ("**Sierra Club**"); *Chico Advocates for a Responsible Economy v. City of Chico* (2019), 40 Cal.App.5th 839, 846-47. In order to satisfy that "adequate discussion" of the required topics that is such proponent's burden and responsibility, ***Sierra Club*** (at Id.) **mandates that the agency must explain "in meaningful detail in the EIR," including its "analytic route" from "evidence to action," which my Objections translate to requiring "good faith reasoned analysis" (e.g., *Banning, Vineyards, and Costa Mesa*) and applying "common sense" (e.g., *Gray v. County of Madera)*.** When (as here) the disputed EIR/DEIR lacks such analysis or omits the magnitude of the environmental impact, such as constantly with a conclusory discussion (or worse, with mere unsubstantiated opinions or speculation) in this disputed EIR/DEIR, the EIR/DEIR is inadequate for CEQA purposes and lacks the required "substantial evidence." *Sierra Club* at Id.

Throughout the disputed DEIR/EIR it cites **CEQA # 21082(c)** to deny "substantial evidence" compliance to most of my and others' objections, wrongly claiming such objections to be merely "argument, speculation, unsubstantiated opinion or narrative" or "which is clearly inaccurate or erroneous," thereby wrongly asserting an EIR/DEIR excuse to ignore my objections (and those of others). CEQA #21082(c). [Note that complaint applies with greater force to the disputed EIR/DEIR than to our objections, many EIR/DEIR errors, omissions, and deficiencies also involve mistakes of law, rather than fact, which need to be corrected for the correct law and Guidelines to be applied to relevant facts, including damning Rise admissions (e.g., SEC filings discussed in Exhibit B) that the EIR/DEIR cannot ultimately evade as it incorrectly attempts to do.] In any event, as my objections demonstrate that same #21082

standard instead applies to defeat the EIR/DEIR (which are the worst and constant such offender), rather than my and other objections. See CEQA # 21100, 21002.1**, and Town of *Atherton v. Cal. High-Speed Rail Authority (*2014), 228 Cal. App.4th 314, 349, no judicial deference allowed for a "clearly inadequate or unsupported study,"** as my objections and others demonstrate frequently occurs in the disputed EIR/DEIR.

Also, I dispute that even any better EIR/DEIR monitoring and mitigation might be legally and practically sufficient and otherwise satisfactory, because it is not feasible for "implementation" and otherwise for many reasons. See, e.g., my attached Exhibit B and citations to my Objections 254 and 255 that use Rise SEC admissions to prove that none of what is promised or contemplated by the DEIR/EIR is affordable or economically feasible for Rise and, hence, is illusory or noncompliant. Indeed, as I have proven, even the insufficient, deficient, illusory, and otherwise unsatisfactory and disputed DEIR/EIR offered mitigation and monitoring is not feasible, as I explained herein and in that DEIR Objection 254 #3.E (VI), as well as its #1.E and F and 2.

Most importantly, the EIR/DEIR fails to perform its **CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)**

Again, among the most common deficiencies and worse in the disputed EIR/DEIR are that they "ignore or assume a solution" to a problem or claims that the missing information "will be provided in the future." *Vineyard* at 40 Cal.4th at 429, 431, prohibiting such deferred analysis or mitigation. See my CEQA discussions and authorities below, such as at I.A.1.d.(v), I.C, and I.E.4. When the EIR/DEIR fails to include the relevant information that precludes our objectors' informed decision making and public participation, as I demonstrate in my Objections commonly occurs in the disputed DEIR/EIR, such omissions defeat the disputed EIR/DEIR and thwart the goals of the EIR process. E.g., *Association of Irritated Residents v. County of Madera* (2003), 107 Cal.App.4th 1383, 1391. Again, **as explained in Kings County Farm Bureau v. City of Hanford (1990), 221 Cal. App. 3d 692, 724, the burden of providing the required EIR information is on the EIR applicant, not the objectors**. **Indeed, I keep protesting the constant, improper effort by the disputed EIR/DEIR to shift their burden of proof, such as by demanding more explanations and substantiation from me and other objectors, when the CEQA burdens for such analysis and reporting fall first and comprehensively on the EIR applicant, not on the objectors. E.g., Kings County Farm Bureau v. City of Hanford (1990), 221 Cal. App. 5th 814, placing the burden of producing the relevant environmental data on the EIR agency, not the public.**

While the EIR/DEIR seems to act as though it need not give serious attention to the future impacts of its 80 years of 24/7/365 disputed mining, **CEQA is clear that it is a comprehensive scheme designed to provide "long term protection to the environment" and must be interpreted to "afford the fullest possible protection to the environment within the reasonable scope of the statutory language." E.g.,** ***Mountain Lion Foundation v. Fish & Game Com.*** **(1997), 16 Cal.4th 105, 112. "Whether an EIR has omitted essential information is a procedural question subject to de novo review."** ***Banning*** **2 Cal. 5th at 935 (also requiring "scrupulously enforc[ing] all legislatively mandated CEQA requirements").** That is what I call a question of law, because it involves the interpretation and enforcement of CEQA. That is also the foundation of most of my Objections, making the EIR/DEIR's erroneous (and worse) attempts to insist on its disputed claims nonresponsive, wrong, and unsubstantiated.

c. The Ultimate Goal of This Objection Is To Require At Least Revisions And Recirculation of the Disputed EIR.

My focus in this comprehensive analysis of so many disputed EIR/DEIR objections is to compel revision and recirculation (if not rejection) of the EIR by demonstrating: (i) many errors, omissions, and other noncompliance with CEQA and applicable law, demanded by the EIR both (a) containing more "significant new information" as defined in Guideline 15088.5(a) and (b) failing to present better and more complaint mitigation; (ii) the failure sufficiently both (a) to address the impacts of such "significant new information" that the disputed and still deficient EIR has added to the disputed DEIR and (b) to respond to my and other objections about more than the disputed, incorrectly labeled "clarifications" or "amplifications" or other data incorrectly alleged by the EIR to be insignificant; (iii) new significant environmental impacts would result from new mitigation measures proposed or required to be better analyzed and implemented in the EIR or that are required but not properly proposed in the disputed EIR; (iv) substantial increases in the severity of many environmental impacts unless sufficient mitigation measures are adopted that truly reduce the impact to a level of CEQA insignificance, which standard the disputed EIR/DEIR never seems to gauge, discuss, or apply correctly; (v) at least two feasible mitigation and alternative measures sufficiently different from those the disputed EIR/DEIR analyzed would clearly lessen the environmental impacts, but the proponents decline to adopt any of them, as discussed below; and (vii) for those reasons and others demonstrated, the disputed EIR/DEIR is so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded. E.g., ***Mountain Lion Coalition v. Fish And Game Com.*** **(1989), 214 Cal. App. 3d 1043, a standard to which the EIR admits (at 1-3), although there are other formulations that apply and that I cite to in various other places in this Objection and others. See my final section on this topic near the end of this Objection, as well as my opening section II.A to my objections to the Master Responses.**

I prove those factors mandate EIR/DEIR revisions and recirculation by various cumulative approaches in this massive compilation of objections (including incorporations) that are designed to meet the ***Mountain Lion test*** **and those other court decisions I cite that are legally and factually similar to this mine, such as** ***Gray v. County of Madera*** **(2008), 167 Cal.App.4th 1099.** I do so by beginning in this section I with some general overviews that identify many principles and guidelines that the EIR/DEIR violates, applying some illustrations

of more detailed commentary to follow up on more specific impacts or violation topics on the basis of subject or legal precedent or authority. See section I.F.8. Then, relying on that foundation, I rebut the disputed EIR's Master Responses in the next section II, and then I rebut each of the disputed, nonresponsive, and deficient EIR's "Responses" to what it calls my "Comment Letters Ind. 254 and 255" (i.e., what I herein call my "DEIR Objections 254 and 255" in this "EIR Objection 254" and my companion "EIR Objection 255." See, e.g., my demonstration in section II.J regarding what the EIR calls "Location of Future Mining," where I demonstrate how EIR Master Response (2-43) [plus related other EIR additions and changes] adds such significant new information requiring revision and recirculation. As I demonstrate there and elsewhere in my four Objections (my prior DEIR Objections 254 and 255 are relevant to those disputed EIR responses because their merits still prevail and I incorporate and support them in my EIR Objections 254 and 255), the EIR Master Responses and Responses relevant to my Objections are all noncompliant in some way or on some issues, typically in one of two ways": either the noncompliant EIR (i) rewrites, recasts, misdirects, or otherwise mischaracterizes (including with strategic omissions) my actual objection with what the EIR preferred to address instead, and then the EIR added new significant data to fit that new story, or (ii) such new information is scattered/obscured by the disputed EIR among the main text, the Master Response, or the individual Responses to the hundreds of agency, group, and individual objections to the DEIR.

For example, Master Response 7 presents much significant new information under the misdirecting title of "Location of Future Mining," adding significant new information about, for example, about groundwater issues, blasting vibrations and noise, and other things. However, perhaps to reduce the obvious mass and significance of such data, one can find more on such topics disaggregated (what I describe as the "scramble" tactic to attempt to evade recirculation obligations) in other Master Responses, and, even more difficult to find, in "Responses" to individual Agency, Group, and Individual Letters. For example, the only place in the EIR to find an EIR Response to my hexavalent chromium objections (e.g., my DEIR Objection 254 #'s #.D, E, F, M, N, 4, 5, 6, and 15) is in the EIR's general opening Response to Individual Letter Ind. 254-1, which is not marked in any way that would help or inspire anyone else to find it (a classic example of "hide the ball" tactics in I.A.1.D.(viii)).

Another example of such "hide the ball" is adding Appendices Q, O, and R at the end of the more than 7000 pages of the EIR where (again missing clues to the location and content of such data) few will find them. See section I.E and F below. In order to judge the "significance" and extent of "new information" the decisionmakers, if they have the patience, or, if the EIR is mistakenly approved, otherwise the courts, will have to "reaggregate" the new information that the EIR disaggregates (aka scrambles), impact topic by topic from all such scattered places in order to judge the significance and newness of such information in one place. While I offer various examples of that tactic in play throughout this Objection, doing that systematically is too much effort, unless it's necessary for a court trial, because this disputed EIR should be rejected before that becomes necessary.

In some cases, the "significant new information" requiring revision and recirculation can also arise from the courts correcting on a challenge when the disputed EIR is mistakenly approved containing a fatal error. In this case one such example is the incorrect attempt by the DEIR/EIR to treat the Centennial site work as if it were a separate project. See section I.B, among other places where I rebut that EIR claim and demonstrate that such Centennial work is part of the unitary project at issue here. Whenever that reality is recognized, the DEIR/EIR

process must be redone, especially since I suspect the DEIR/EIR's tactical reason for trying to separate Centennial was to avoid having to address the hard questions it ultimately will not be able to evade.

Stated another way, ask yourself this initial question: "significant" or "new" information to whom? (Hint the answer for the application of that standard must be "new" or "significant" to the public and decisionmakers since the whole goal of CEQA is to enable us to make more informed decisions. Indeed, truths omitted from the DEIR are almost always known by the EIR/DEIR applicant, so not much is a new discovery between the DEIR and EIR releases, but rather "new" in terms of what is known by any of the public and decisionmakers who may wish to object. Only that interpretation makes common sense in advancing the CEQA full disclosure goals and discourages the EIR/DEIR applicant from "hiding the ball" by making sure that such applicants cannot benefit from such concealments that result in such alternative realities instead of the required truths.) Thus, as has occurred in these objectionable DEIR/EIRs, when the EIR crafts an "alternate reality" in response to objections (e.g., sections I.A.1.d and I.C and D), that also is adding "significant new information," because it is still evading the objections by withholding some of what we needed to know for additional possible objections. The issue is not judged by what the EIR claims to think as "new" or "significant" (a standard that would hardly ever result in adequate and compliant CEQA disclosures, as this disputed DEIR/EIR demonstrates), but rather as to "new" by whether the objector has been deprived by such changes of the opportunity to make the best objections at the DEIR level, and as to "significant" by whether the objection to that new data or changes could possibly cause a reasonable objector to wish to address them on the merits so as to expose any error, omission, or noncompliance that might make a difference in the evaluating any required disclosure by the CEQA standards, including for requiring "common sense" and "good faith reasoned analysis." Also, this EIR/DEIR is wrong to attempt to evade the disclosure of "new" or "significant" information based on its improper attempt to deny objections what we need for rebuttal and impeachment of statements in the DEIR/EIR when such EIR incorrectly claims those objections address matters outside the scope of CEQA, even though the statements in the EIR/DEIR were also by that disputed standard. See, e.g., section I.C and D.

In terms of the *Mountain Lion* test and others that apply to defeat this EIR/DEIR, my such objections demonstrate not just innocent errors and omissions, but a much more dangerous pattern and practice of objectionable tactics that present an "alternative reality" that cannot be deemed compliant with CEQA or other applicable law. For example, reading my disputes in section III of the 101 EIR "Responses To Individual Letter Ind. 254-1 to 101 makes that objectionable pattern and practice unmistakable, especially if one adds in the more subtle patterns and practices of the Master Responses to which I object in section II. However, even worse than such EIR/DEIR errors, omissions, and deficiencies are the admitted realities in Rise's SEC filings and elsewhere that this miner-applicant (and likely any successor which may be "hiding behind the curtain for a flip") cannot afford to accomplish for even the lesser and still deficient safety and mitigation aspirations imagined in the disputed EIR/DEIR (compared to what applicable law and justice require.) See, e.g., Exhibits B and A herein, section I.A.1.d.(viii) herein, and my DEIR Objections 254 (#2) and 255.

My Objections incorporate many other party objections, such as are listed in the attached Table of Incorporated by Reference Objections. See Grass Valley Agency 8 (e.g., at 21, 45. And elsewhere applying *Laurel Heights* (6 Cal.4th 1121) and #15088.5, 21083 and 21092.1. Despite the disputed EIR choosing to ignore both my external incorporations and my internal cross-

references in its non-responsive "Responses" rebutted in section III, I do that not only so that those objectors with other types of technical expertise than mine can enhance and expand my objections with details to illustrate or prove my concepts, as I commonly would do as a bankruptcy lawyer dealing with bankrupt or abandoned mines, by presenting a compilation of objections from many creditors and experts collaborating for common goals. I do that also to marshal the collective force of the objector community, each examining the disputed EIR/DEIR from such objector's unique experience to demonstrate that from any perspective this disputed EIR/DEIR cannot overcome its many errors, omissions, and deficiencies, especially as to missing and deficient mitigations.

One question in dispute is whether this disputed EIR added "significant new information" to the disputed DEIR. CEQA #21092.1, Guideline # 15088.5(a); *Laurel Heights Imp. Assn. v. Regents of the University of California* (1993), 6 Cal.4th 1112, 1124. Whether or not the County decides to recirculate the EIR, the required revisions to the EIR/DEIR may (and would) still be challenged. Not to require such revisions and recirculation in this case would be an abuse of discretion by the County, triggering legal, political, and law reform consequences. E.g., *Banning*, 2 Cal.5th at 942. My rebuttals below to the EIR demonstrate further reasons for revising and recirculating the EIR/DEIR besides those explained here or earlier in my DEIR Objections 254 and 255. **FOR EXAMPLE, SEE *WE ADVOCATE THROUGH ENVIRONMENTAL REVIEW V. COUNTY OF SISKIYOU* (2022), 78 CAL. APP. 5TH 683, WHERE THE EIR HAD TO RECIRCULATED BECAUSE ITS GHG/CLIMATE CHANGE ANALYSIS HAD "FATAL DEFECTS," SUCH AS INCONSISTENT DATA AND A FINAL EIR IDENTIFYING MORE SEVERE SIGNIFICANT IMPACTS THAN IDENTIFIED IN A DRAFT EIR. SINCE THE DEIR CONTAINED MORE ERRORS, OMISSIONS, AND NONCOMPLIANCE THAT MINIMIZED THE APPEARANCE OF SIGNIFICANCE OR EVADED SIGNIFICANT IMPACTS, EVEN THE MODEST ADDITIONS BY THE EIR INCREASED THAT SIGNIFICANCE AND THAT REQUIRES RECIRCULATION. Accord, *League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2002), 75 Cal. App. 5th 63 (also addressing the stricter "Friant Ranch" standard where the eir did not function sufficiently as an informational document.) FOR INSTANCE, THE DEIR MADE LITTLE AND MASSIVELY DEFICIENT REFERENCE TO THE IMPACT OF TOXIC HEXAVALENT CHROMIUM IN THE MINE CEMENT PASTE FOR SHORING UP THE UNDERGROUND MINE (AND AIR POLLUTION WHEN IT IS MIXED ON THE SURFACE), SO THAT EVEN THE STILL DEFICIENT COMMENTS IN THE EIR EVIDENCE A MUCH MORE SIGNIFICANT IMPACT THAN THE DEIR, THEREBY SO REQUIRING RECIRCULATION. E.g., section I.F.1, Exhibit C, and my many objections to EIR Responses Ind. 254-1 and 36, as well as to what the EIR said in such disputed Responses to my DEIR Objections #'s 3.A, B, C, E, G, H, J, 7, and 10. See also EIR Appendices Q, O, and R, addressing (obscurely at the end of the EIR without linkage to any compliant analysis) admitted impact risks for air and water pollution by hexavalent chromium that are significant new information as demonstrated in section I.A.1.c and I.C and D. While the EIR incorrectly tried in its disputed Response Ind. 254-1 to claim mitigation to reduce the significance of the CR6+ impacts, there was no "good faith reasoned analysis" with "common sense" compliant with CEQA and its subjective standard of "significance" reminds me of how the culpable utility (like asbestos and cigarette companies with their lethal products) tried unsuccessfully to discount the**

significance of its hexavalent groundwater pollution that killed Hinkley, CA, and many of its residents, a problem so severe that decades later they are still trying to clean it up: see www.hinkleygroundwater.com. As demonstrated throughout my four Objections, this EIR cannot avoid the reality of "significant" impacts by incorrectly (or worse) proclaiming an artificial reality in which nothing is "significant" that would obstruct its ambitions.

Although it was not published by the court, for these purposes the County may consider the wisdom of *Protect Our Homes And Hills v. County of Orange*, Cal. App. G054185 filed 10/13/17, because it properly recognized the special circumstances for that subdivision project (as apply here) regarding fire and smoke risks in our local, high fire/smoke risk environment. As with our disputed EIR/DEIR, that deir claimed that all project impacts would be reduced to less than significant levels after implementation of mitigation. As here, there were thousands of objections to that deir, but Orange County nevertheless just approved the deir as the eir without recirculation, using the same incorrect theory alleged here that the changes were merely clarifications, amplifications, elaborations, or minor modifications to the deir. The court required revisions by mandate with respect to the disputed environmental settling, fire hazard mitigation, and water demand and supply. All such eir flaws and noncompliance apply here to this EIR as well. As here, that Orange County project setting description was deficient, such as by ignoring 2300 acres of adjacent CJSP lands and failing to correct the inaccurate and misleading maps so that readers could use them to identify locations at risk. [See here the same concerns and more expressed by the incorporated California Department of Parks And Recreation objection Group 1, regarding the Empire Mine and other State properties adjacent to this EIR mine.] The court also rejected the Orange County eir defense that some maps were "historical," noting that some false maps were created for the FEIR. The same is true here, despite my repeated objections and those of others (e.g., the State Department of Parks And Recreation protesting the map errors and omissions relating to its adjacent property like the Empire Mine Park) to the disputed EIR/DEIR not identifying surface streets and addresses so us surface owners would know where our properties are located in relation to the blasting, tunneling, digging, dewatering, and other mining in the underground mine beneath or near our homes.

d. The Disputed EIR/DEIR Ignores Or Dismisses Reality Without the CEQA Required "Good Faith Reasoned Analysis," Even Evading Addressing Its Own Inconsistencies And Rise Admissions, While Defying "Common Sense."

(i). The General EIR/DEIR Failure To Comply with CEQA With A "Good Faith Reasoned Analysis" Applying "To the Extent Possible, Scientific And Factual Data" (And What *Gray* calls "Common Sense.")

Readers should focus on this key reality to avoid being confused or misled by the disputed EIR/DEIR. As stated herein in cases like *Kings County Farm Bureau* and *Sierra Club*, supra, the burden of proof and persuasion must be on the disputed EIR/DEIR (not on potential, impacted neighbors like me). That compliance requires the EIR to provide such a "good faith reasoned analysis" in accordance with CEQA and other applicable law (e.g., *Banning, Vineyard, and Costa Mesa*) and also to comply with "common sense" (e.g., *Gray v. County of Madera*), which includes consistency with actual reality (i.e., climate change is real), rather than the

"alternate reality" too often presented by the disputed EIR/DEIR (e.g., groundwater dewatered 24/7/365 for 80 years will recharge from the "current" average rainfall between 1967 and 2017 continuing indefinitely). I demonstrate herein that the EIR repeatedly has failed to accomplish such analysis, just as my other DEIR Objections 254 and 255 have demonstrated (or incorporated such errors, omissions, and noncompliance from other authorities or objectors) with respect to the disputed DEIR. See, e.g., my attached Table of Incorporated by Reference Objections. Nothing in the disputed EIR or DEIR has defeated (or more accurately stated in many cases, has properly disregarded) any of my material objections (or those I have incorporated). Indeed, the disputed EIR/DEIR often does not even attempt a meaningful debate on the merits, but simply insists on its insufficient, unsubstantiated, or worse opinions or assumptions without any such "good faith reasoned analysis" that deserves serious consideration and often defying "common sense."

In other words, the disputed EIR cannot be approved while failing to comply with its adequate disclosure obligations, while disregarding and failing to overcome on the merits objections that don't provide and rebut the compliant data that the EIR was required to provide. For example, as demonstrated throughout this Objection where I expose forbidden EIR/DEIR tactics, deficiencies, and evasions (see, e.g., my objections to how the EIR "cut up" into less powerful fragments labeled as Comment Ind. 254- 14 to 33, corresponding to my integrated Objection 254 #3.E that exposed such objectionable tactics.) See also my DEIR Objection 254 #'s 3.M and N, 4, 14 and 15), as well as my section I.F.5 below. The controlling court decisions prohibit much what the disputed EIR/DEIR attempts to do to avoid proper, compliant, and sufficient responses to what I demonstrate herein and elsewhere are my valid objections. E.g., *Banning Ranch Conservancy v. City of Newport Beach* (2017), 2 Cal.5th 918, 940-41 ("***Banning***"); *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007), 40 Cal. 4th 412, 442 ("***Vineyard*"**); and *Concerned Citizens of Costa Mesa, Inc. v. 32d Dist. Ag. Ass'n* (1986), 42 Cal.3d 929 ("***Costa Mesa***"), **each insisting on "common sense" and "a good faith reasoned analysis," rather than referencing inapplicable, deficient, scattered, or otherwise obscured or buried data. I.e., objectors cannot be required to hunt through disputed masses of disputed DEIR/EIR exhibits looking for unspecified data or bases for the assumptions that would be necessary to resolve whether disputed EIR/DEIR cited studies somehow could be relevant and probative, instead of what they appear to objectors to be: deficient, irrelevant, or inapplicable on the merits.**

Especially when the EIR/DEIR fails or refuses to provide such a "good faith reasoned analysis," I am not required to prove any substantive contrary environmental impacts or the contrary truths rebutting the disputed EIR/DEIR claims. I should be entitled to defeat the EIR/DEIR merely by proving (as my Objections and others do) that the disputed and noncompliant EIR/DEIR has failed to satisfy such disclosure and analysis requirements of CEQA, without me or others needing to prove in technical detail the reverse of what the EIR/DEIR incorrectly alleges or evades or omits. I can also do that by demonstrating (as I do in my rebuttals and impeachment) either that the disputed EIR/DEIR is so noncompliant, such as where the EIR/DEIR lacks the required "good faith," reasoned analysis, or "common sense" in its statements, such as by showing how such EIR/DEIR claims are untrue, preposterous, evasive, misleading, deficient, or otherwise noncompliant. By analogy, when the EIR/DEIR claims (by analogy) that the Earth is flat or the sun orbits the Earth, it should be sufficient to prove that is wrong without having to prove what instead is correct.

Stated another way, the legal standards for judging the disputed EIR/DEIR allegations are wrongly defined or applied by the EIR/DEIR, such as for "significance," "reasoned analysis," "good faith," and "common sense." Even worse, the EIR rarely makes any meaningful attempt at a sufficient response to my Objections or those of others. For example, many disputed EIR/DEIR cited studies are based on disputed and false, inapplicable, or unsubstantiated assumptions, such as that: (i) dissimilar, inapplicable, and irrelevant situations or conditions are incorrectly claimed, without any substantiation or "good faith reasoned analysis," by the disputed EIR/DEIR to be similar, applicable, and relevant, or (ii) obsolete, superseded, or otherwise revised data is still incorrectly claimed to be current and correct (e.g., such as the DEIR/EIR incorrectly claiming that the groundwater dewatered 24/7/365 for 80 years [somehow without the required reasoned analysis or proof] will recharge from the imagined continuation of what is falsely labeled as the "current" average rainfall between 1967 and 2017, ignoring not just climate change drying, but also the dry years after 2017 required to be part of what is "current." Incidentally, that is an example of EIR/DEIR "tactics," lacking "good faith reasoned analysis" and "common sense," that I dispute elsewhere as "hiding the ball" and "bait and switch.")

In effect, the EIR/DEIR claims the right to say whatever it wants, while barring not just full disputes beyond such EIR alleged CEQA boundaries, but also my rebuttal and impeachment of EIR/DEIR errors, omissions, and falsehoods, even when they are admitted by Rise, such as in its SEC filings. For example, how can Rise spin one disputed story to the County, while reporting and admitting inconsistent and contrary facts, conditions, and circumstances to the SEC and investors, many making clear that such high risk, speculative investments in Rise are too risky for any but the most avid gamblers? How can Rise claim that it can omit to disclose to the County (and evade objections by potential victims like me), while Rise is revealing many of those high risks, threats, and flaws to the SEC to scare off unwary investors? How many times can such "hide the ball tactics" and noncompliance with applicable law occur in the EIR/DEIR before that becomes proof of willful noncompliance and intentional evasion? Considering the massive extent of the omissions and other objectionable commentary in the DEIR, this EIR non-responsiveness itself is grounds for rejecting the EIR/DEIR. See my illustrations of some of the many reasons (besides those in the next following paragraph) why credibility problems prevent any reasonable reliance on the EIR/DEIR, especially as to its many unsubstantiated claims that are just disputed and non-credible opinions.

The EIR/DEIR incorrectly complains about, and tries to hold us objectors to, a different and higher legal standard than it applies to itself, when the higher CEQA standard is only applicable for the EIR/DEIR. Such disputed EIR/DEIR tactics and evasions are doubly wrong, since both (i) the correct legal/CEQA etc. standard/burden of proof is much higher on the EIR/DEIR/miner than on us objectors, which makes sense because those EIR/DEIR parties have exclusive control over the sources of key information (e.g., the objectors have no access to the closed and flooded mine that Rise has not adequately evaluated, presumably because it doesn't want to risk the likely bad news about the condition of the mine and prefers to assume the correctness of its unsubstantiated speculations), and because the miner and its EIR authors have not yet been exposed to litigation discovery and cross-examination by us objectors, and, as demonstrated throughout this document, (ii) the disputed EIR/DEIR cannot argue an excuse under CEQA Guideline #15384 for not responding to our objections when it is itself frequently guilty of worse noncompliance by presenting such a deficient EIR/DEIR that so often lacks

"good faith reasoned analysis," "common sense," and other CEQA requirements compliance (e.g., irresponsibly speculating and otherwise asserting errors, omissions, and noncompliant data as the EIR/DEIR do with their own speculations, unsubstantiated opinions, incorrect or worse assumptions, and other prohibited tactics, such as "hide the ball," "bait and switch," reliance on unstated and false assumptions, false comparisons or equivalences, etc.).

Consider, for example, false EIR reliance on disputed studies that would be legally inadmissible or irrelevant as evidence because such EIR/DEIR's often cited Appendices relate to situations too dissimilar and inapplicable to the conditions and circumstances of this EIR mine, such as, for instance, the disputed "Itasca study" (note such "modeling" is based on disputed and unproven assumptions, disputed theories, and speculations, not on relevant facts and, in any event, allegedly "similar" conditions elsewhere are not sufficiently proven by substantial evidence to be comparable, relevant, and applicable to those in and around the 2585-acre underground mine. Likewise, objectionable EIR/DEIR tactics may defeat their attempts to rely on obscured or unexpected data in exhibits for which there is no proper foundation (e.g., the DEIR/EIR obscuring of the hexavalent chromium menace by not addressing it properly, or at all, in the DEIR's Hazards and Hazardous Materials section with little else revealed elsewhere in the main DEIR text.) Even worse, when caught by my DEIR Objection 254 (e.g., #'s 3.A, B, C, E, H, 7, and 12) in that hexavalent chromium evasion, the disputed EIR attempted a more objectionable coverup attempt, falsely pretending its deficient responses were already properly disclosed in the DEIR.). Besides what I countered on that inappropriate conduct with in my such DEIR Objection 254 #3.E, I protested that kind of EIR/DEIR tactic both herein and in my other Objections, such as against "bait and switch," "hide the ball," false comparisons, hidden and incorrect or worse assumptions, etc. See the Table of Incorporated by Reference Objections, showing this to be part of an objectionable pattern and practice by the EIR/DEIR that is inconsistent with the good faith reasoned analysis compliance mandates.

Besides the courts (e.g., *Banning, Vineyard, and Costa Mesa*) requiring such a "good faith reasoned analysis" (consistent with what *Gray* calls "common sense") for the EIR/DEIR to satisfy and comply with CEQA and other laws (a test I demonstrate that EIR "Response" fails item by item in sections II and III below on most of my Objection issues), evaluating an impact's "significance" must be based "to the extent possible on scientific and factual data," which means truthful, relevant, and applicable data regarding the issue. E.g., CEQA section 15064(b). However, not only does the disputed EIR/DEIR often fail to comply with that requirement, on many issues the EIR/DEIR instead merely asserts disputed, speculative, and unsubstantiated opinions or claims (often based on flawed or erroneous assumptions, often unstated and only implied). Reading the incorrect EIR "Responses" to my DEIR Objection 254 that I rebut item by item in section II below, decisionmakers will note that the most common EIR "Response" is, in effect, to restate in a disputed way the nature of some of my objections, while disregarding others, and then simply citing it prior comment in its DEIR that I already disputed and defeated in my DEIR Objection 254 to which the EIR claimed to be responding.

Stated another way, each of my four Objections demonstrates that the disputed EIR/DEIR too often lacks "common sense" and fails to present the kind of "good faith reasoned analysis" required to comply with CEQA and other applicable law. To see the pattern and practice of evasions in the EIR/DEIR from such wrongful disaggregation (i.e.,

rebuttal evidence of falsehoods), please consider the way that I have responded below in Section III in succession to the disputed EIR Responses to its "cut up" segments labeled Comment Ind. 254 -1 et seq. See also section I.F.5 below. Each such EIR labeled part of my DEIR Objection 254 has an integrated relationship to exposing collectively the errors, omissions, and noncompliance that the disputed EIR inappropriately reaffirms and deficiently defends in such disputed DEIR. When one reads all my such rebuttals herein to those repeated artificial EIR "Response" fragment cuts of my such integrated objections, the disputed EIR tactical patterns of evasions and noncompliance become clearer. That is why, among other things, at the outset of many of my such successive segment objections herein, I remind the reader of my incorporation of my prior objections. In any event, as demonstrated at length herein and earlier in my anticipatory legal briefing in Objection 254 #'s 3.N, 4, 14, and 15), there will be more such objections against the EIR/DEIR to come, now that the disputed EIR has asserted bogus excuses for evading objections that should have been addressed by the EIR on the merits. That is especially important, because both the EIR's misinterpretation of such CEQA Guideline #15384 and other disputed EIR excuses are subject to the condition precedent that the EIR/DEIR first comply with CEQA and other applicable law, which it often fails to do.

Whatever else the courts may decide the applicable law to be as applied to the actual facts in this case if the decisionmakers mistakenly approve the EIR, the courts must (and the County decision-makers should) apply CEQA only as an obligation on the miner and County seeking to impose these EIR mining miseries on us potentially impacted objectors. EIR/DEIR complaints about the quality or sufficiency of objections to the EIR/DEIR can only be relevant for contesting our compliance with the requirements of the law of evidence for our rebuttals and impeachment counters and objections, not for having to satisfy the same burden of proof CEQA imposed on the EIR/DEIR miner and approving County. Thus, when the court considers such disputes and correctly decides that the disputed EIR/DEIR failed to respond appropriately to what the court determines to be my sufficient and proper objections to the EIR/DEIR's noncompliance with CEQA and other applicable law, the result of such disputed EIR/DEIR's noncompliance must be its rejection and defeat. That failure of the disputed EIR/DEIR satisfactorily to respond to objections must also consider the need for truth, "common sense," "good faith reasoned analysis," consistency, and a level playing field, which things rarely occur sufficiently in this disputed EIR/DEIR.

(ii). THE DISPUTED EIR/DEIR FREQUENTLY VIOLATES CEQA AND APPLICABLE LAW BY FAILING TO CREATE A COMPLIANT AND SUFFICIENT BASELINE FOR EACH OF THE ENVIRONMENTAL IMPACTS, INCLUDING THE CENTENNIAL SITE, WHICH INCORRECTLY CLAIMS TO BE SEPARATE FROM THIS PROJECT.

As explained in my more comprehensive discussion of CENTENNIAL disputes in section I.B below and by the requirements of Guideline #15125(a), an EIR is deficient and noncompliant when (as often here) it "completely fails to properly establish, analyze, and consider an environmental baseline. As explained in *Communities for a Better Environment v. City of Richmond (2010), 184 Cal. App.4th 70, 89,* "When an EIR omits relevant baseline environmental information, the agency cannot make an informed assessment of the

project's impacts." Accord, *Save Our Peninsula Com. v. Monterey County Bd. Of Supervisors* (2001), 87 Cal.App.4th 99, 119; *County of Amador v. El Dorado County Water Agency* (1999), 76 Cal.App. 4th 931, 953; *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994), 27 Cal. App.4th 713, 729. Many other incorporated objections agree with my prior DEIR Objection 254 in demonstrating (as with the Centennial Project discussed below, which is not a separate CEQA "project," but instead is merely part of the one EIR/DEIR project) that disputed DEIR/EIR ignores, evades, or fails to comply for tactical reasons with the need for starting baselines in compliance with CEQA. See, e.g., CEA Objections (Grp Letters 21 and 6 to 9), the California Dept. of Parks and Recreation Agency Letter 1, the Grass Valley Agency Letter 8, the Bear Yuba Land Trust Group Letter 2, the California Native Plant Society Group Letter 5, the South Yuba River Citizens League Group Letter 25, the Sierra Fund Group Letter 27, the Wolf Creek Community Alliance Group Letters 29-32, as well as others in my Table of Incorporated by Reference Objections or in my Exhibit D hereto. The same applies, for example, to my many objections to the DEIR/EIR incorrectly ignoring climate change and falsely assuming that the average "current" rainfall between 1967 and 2017 can be a "current" baseline for future groundwater recharge for 80 years of 24/7/365 dewatering (noting that stopping that average in 2017 is not "current" and ignores the dry years thereafter that represent the "new normal" as climate change is beginning to have increasingly more impacts.)

Note, for example, how in Grp Letter 5 (at 5-3) this disputed EIR/DEIR fails to comply with such baseline needs when it asserts an "adjusted baseline" (another objectionable EIR/DEIR term that attempts to evade calling itself what it is: a noncompliant "future baseline" that to be considered at all would have to satisfy the strict CEQA limits thereon, which it cannot do). That disputed future baseline **(inappropriately trying to rebrand itself an** "**adjusted baseline")** "is speculative, improper, and hides from the public the true environmental impacts to the Centennial site" (e.g., burying a protected wetland without any compliant EIR good faith reasoned analysis" misusing the main EIR mine's waste rock it tries to rebrand as "engineered fill") or "obfuscat[ing] the actual impacts of both the cleanup and the IMM on plants and habitats at both sites" without assessment or management plans that satisfy applicable protocols and standards for such botanical and aquatic resources. The DEIR's disputed misuse (at 4.4.2) of such a future "adjusted baseline," set after the cleanup has theoretically been completed, is a clear CEQA violation (e.g., 15125, 1512) under the standard set in *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013), 57 Cal.4th 439, 452, because there can be no substantial evidence that using an existing baseline would be "misleading" or "uninformative," and, in any event, such a baseline must be set "before project implementation."

For many possible reasons even the DEIR admits that the Centennial cleanup may never be approved or, if approved, may still never occur. In that case deferral of the baseline becomes a disaster for the project if it were allowed to proceed without a proper baseline, leaving unresolved impacts such as what to do with such massive excess waste rock (inappropriately calling itself "engineered fill") that cannot be dumped at the Centennial site (and contrary to the DEIR/EIR's wishful thinking is unlikely to be attractive to buyers in a market properly cautious about the liability exposures in buying waste rock from a controversial mine with such a toxic history in such public debates. The disputed EIR/DEIR cannot assume what seems unlikely and to defy "common sense," i.e., that the Centennial is somehow approved and completed, especially since Rise has admitted in its SEC filings that it has insufficient resources to accomplish much of anything in its expensive EIR/DEIR plan that will become more expensive if this EIR is somehow approved and its disputes progress into court, law reform, and political

disputes demanding more meaningful and expensive protections and mitigations. See Exhibit B hereto and my DEIR Objection 254 #2. See also my objections in section II to EIR Master Response 4. The disputed EIR/DEIR here seems to wish to avoid such truths because they could be "inconvenient" for the miner's ambitions. Also, Grp Letter 5 (at 5-9), among others, exposes the disputed EIR/DEIR flaws in deferring plant surveys. For example, deferring such environmental assessments to a future time is contrary to CEQA, as held in *Sundstom v. County of Mendocino* (1988), 202 Cal. App. 3d 296, 307, because such environmental "problems should be considered at a point in the planning process 'where genuine flexibility remains…'"

There are many other examples throughout this Objection and others citing similar disputed EIR/DEIR noncompliance, errors, omissions, and deficiencies with respect to required baselines for various issues. I will not attempt to summarize them all here. See my Table of Incorporated by Reference Objections and Exhibit D. But I note that there are many in the disputed DEIR, and the disputed EIR at most purports (and then still fails) to correct few of them. Therefore, one can only assume this disputed EIR/DEIR illustrates a willful or reckless/uncaring disregard of the CEQA obligations for a "good faith reasoned analysis," which must begin with an honest and "common sense" baseline that is consistently lacking. See my item-by-item rebuttals in sections II and III below to the disputed EIR "Master Responses" and "Responses." Consider, for example, the Bear Yuba Land Trust Group Letter 2 (noncompliance with Guideline #'s 15125, 15124, and others) stating (at 2-7) that:

> No baseline surface water quality is included in the DEIR and therefore, the background concentrations of basic water quality parameters such as inorganic cations and ions, metals, total suspended solids, pH, dissolved oxygen (DO), and water temperature in South Fork Wolf Creek are currently unknowns. When the mine begins operation and begins pumping water into the creek to dewater the mine shafts, the change in water chemistry will be unknown because there is no baseline data to compare to the Project conditions [and no sufficient mitigation].

Also, that incorporated objection notes (at 2-8) that what samples were used for the disputed DEIR/EIR water treatment planning came from the long flooded [with, I wonder, condition altering or stagnant water?] Brunswick shaft, not the more relevant and appropriate drains for groundwater "off of Idaho Maryland Road." Again, it's as if the disputed EIR/DEIR may avoid CEQA expected evaluations because it may prefer not to know the most relevant and accurate information to avoid any "inconvenient truths." See also, Friends of Banner Mountain Group Letter 12 on those and related issues, such as noting (at 12-6 to 13) outflow data concerns and, worse, as to inflow data: ("Mine water inflow analysis is based on sparse mine water level data from the New Brunswick shaft and only 12 water level measurements were taken between 2003 and 2007, and three measurements in 2018-2019. Please note that these measurements could be incorrectly interpreted; the water level reaches a limit when it exceeds the level of the drains from which the mine water flows and doesn't reflect would [sic: what] could be substantial inflow. [And] Without a measurement of the outflow, the amount of inflow cannot be determined by the water level in the New Brunswick shaft.")

Note, all this, among other objections, makes the disputed DEIR/EIR's speculative and unsubstantiated claims (DEIR 3-18, rebutted in 2-8 of that objection, and disputed elsewhere in my Objections) that project groundwater will be "at least as good or better quality" as the existing creek water, not just misleading and false, but irresponsible. That is especially true on

account of the disputed DEIR/EIR's evasion of my many Objections as to the hexavalent chromium mine paste cement added to the mine shoring and potentially leaching into the water being flushed away downstream after whatever disputed treatment is given to such a toxin not properly evaluated or mitigated in the EIR/DEIR. (Again, the EIR/DEIR does not prove its wishful thinking about such mitigations and risks are correct, but rather just assumes [incorrectly] that its contested opinions and claims are correct and not in need of any justification or defense in a largely evaded and obscured EIR debate lacking "good faith reasoned analyses" with "common sense" compliance with applicable laws and relevant evidence.) Also, the disputed DEIR's insufficient discussion of the Centennial work never provides what CEQA requires to support the disputed and uncertain assumption that the Centennial site will be cleaned up at all or in any particular way, and it would be both inappropriate and reckless to guess the regulatory outcome in the pending environmental clean-up proposed process before it happens, if it ever does. See Guideline 15125(a)(2), prohibiting such future, speculative baselines, and there is no DEIR/DEIR evidence to qualify for any future baseline, even one less speculative and unsubstantiated having the required, substantial evidence and even if the regulatory outcome were not so comprehensively uncertain. Indeed, the disputed DEIR/EIR proposes a fallback Alternative 2, but also claims to assume the cleanup will be as it wishes when the project becomes operational, which is totally uncertain and admittedly may never happen.

Indeed, the DEIR/EIR constructs a hypothetical Centennial "house of cards" crafted based on a chain of incorrect, unreliable, or uncertain assumptions, speculations, and unsubstantiated opinions, all disputed by the potential victims living on the surface above or around the 2585-acre underground mine or the Centennial site who will suffer when unhappy reality exposes such DEIR/EIR errors and worse. For example, as demonstrated elsewhere herein, the disputed EIR/DEIR assumes insignificant biological impacts, because it assumes a timely and sufficient Centennial cleanup that is neither approved nor known in any detail, with impacts changing with design details yet to be determined, much less approved. See DEIR admissions on this at 4.4-3. As the Group Letter 20 details at Grp. 20-7 to 11, the DEIR/EIR is "riddled with inconsistencies," such as, for example, the geology analysis assumes away erosion concerns because everything supposedly will be revegetated after remediation in accordance with the assumed, but unapproved, final RAP. Also note that in the related biology analysis the disputed DEIR/EIR assumes the vegetated areas are gone in the process. It's no wonder so many objectors complain about undercounting of CEQA impacts.

Similarly, the disputed DEIR assumes all contamination at the Centennial site will somehow be cleaned up at the start of the mine project impacts (despite Rise admitting in its SEC filings that it lacks the resources that would be required to afford that work, see Exhibit B), thereby falsely concluding (DEIR at 4.7-3), without any basis in law or fact and without any regulatory approvals or designs, that the potential contaminants "do not exist under the adjusted baseline conditions." Among the more outrageous "hide the ball" and "bait and switch" tactics in the disputed DEIR/EIR is the failure then to include this highly toxic Centennial site as part of the cumulative impact analysis required by CEQA for the main mining Project. See Guideline #15355. How does the disputed EIR/DEIR dodge that duty to analyze the cumulative impact of the Project, when added to such other closely related past, present, and reasonably foreseeable probable future projects? It simply assumes away the (at least partly) admitted Centennial problems without any "good faith reasoned analysis" and defying "common sense" (e.g., *Gray, Banning, Vineyards, and Costa Mesa*) by assuming that its desired RAP design is somehow timely approved and accomplished, even though Rise has no such regulatory approval and

admits lacking resources sufficient to fund that work, all to avoid identifying potentially significant and unavoidable cumulative biological, air quality, hazards, and other impacts that threaten our community, as the many objections reveal in my Table of Incorporated by Reference Objections and Exhibit D.

(iii). The Disputed DEIR/EIR's Frequently False Claims, As Well As Erroneous And Misleading Omissions And Opinions Masquerading As Purported Facts, Often Present Mere Speculations, Unsubstantiated Opinions, Or Mere Assumptions, Each Lacking The CEQA Required "Common Sense" (G*ray*) And "Good Faith Reasoned Analysis" *(Banning, Vineyard, and Costa Mesa).*

My four Objections identify many such bases for disputing the DEIR/EIR, such as with respect to the water related issues I discuss as illustrations herein. As later demonstrated in my rebuttals below to the disputed EIR "Responses" (section III) and "Master Responses" (section II), the disputed EIR continually ignores my cross-references and incorporations of others' objections, then claiming incorrectly (and worse) that my objections lack sufficient details or explanations (which are often to be found in my such cross-referenced or incorporated objections improperly ignored by the EIR/DEIR.) Consider, for example, the following example of what I incorporated into my DEIR Objection 254 (as well as in this EIR Objection 254 and my two other DEIR and EIR Objections 255). The disputed EIR ignored my incorporated "#4. Hydrology and Water Quality/Water Supply/Well Impacts" section of my local collaborating Friends of Banner Mountain Group Letter 12 (at Grp 12-8 to 13.) See also my Exhibit D and Table of Incorporated by Reference Objections hereto for other such situations. For example, when I objected to the lack of reliable mine records with evidentiary admissibility and sufficient foundation and EIR/DEIR "cherry-picking" those which suit their agenda, I meant to include, as part of my such rebuttal proof, such Group Letter 12 evidence and data, such as these, for example (at 12-6 to 8):

> The groundwater model that predicted impact of the proposed long-term and sustained dewatering effort was calibrated based on pumping rates from the historical Idaho Brunswick Mine and only one 1956 water level measurement was collected from the flooded and inactive [i.e., closed] Union Hill shaft. We believe that using only one water level measurement from 64 years ago to calibrate the analysis for a complex bedrock aquifer system over a large region introduces a significant amount of uncertainty to the model, thereby making the model results inaccurate.
>
> Data for the wells analysis came from private wells within a limited area and the data are old and cover just a few years. No usage data is provided, and critical data such as reduction in groundwater recharge from precipitation fails to include the 75 acres of low-permeable mine waste on the two sites. The groundwater model does not include the new access shaft, which would create a local area of groundwater drawdown and based on our review it looks like the other existing mine features within a few hundred feet of the surface were also not evaluated in the groundwater model. These mine features would contribute to the downward transmission of ground water from the near surface fractured rock area. In addition, the groundwater model report

assumes the geology in the area to be mined is homogeneous. Modeling that relies upon uniform rock, which is consistent from place to place, behaves in a more predictable fashion than rock that in bedrock systems having multiple faults and irregularities.

***

The DEIR relies on fifteen monitoring wells to estimate impacts on water supply wells but does not explain how it arrived at this number of wells or their location, nor is an explanation provided as to why fifteen monitoring wells would be sufficient to estimate the impacts on all water supply wells around the mine area. In complex fractured rock spread out over thousands of acres, monitoring water levels at fifteen locations could not provide the needed data to ensure that groundwater impacts to hundreds of existing water supply wells in the project vicinity are identified and mitigated. Groundwater monitoring networks should be established in advance of the project, and the resulting monitoring information should be included in the FEIR.

***

The DEIR does not adequately characterize the current mine water chemistry. [As others have done, noting that the disputed DEIR Appendix K.2 Table 4-10, p.120 inappropriately relies on insufficient and less relevant data from the Brunswick shaft instead of the drains along Wolf Creek.

See also my discussion later where I apply some "common sense" against the disputed EIR/DEIR, such as by my challenging the EIR/DEIR's assumption of uniformity, where there would be new EIR mining into unevaluated areas along a new 72-mile tunnel in the mineral boundary below our surface homes and forests above and around the 2585-acre underground mine. As a matter of even just "common sense," I ask that decisionmakers drive 72 miles in every direction in that area and then ask themselves if they would assume uniformity of such underground conditions compared to those alleged (but not sufficiently proven or even analyzed) at the Brunswick site or the wells along East Bennett Road. The "common sense," reality assumption is for nonuniformity (or at least for material exceptions or variances), not ever for uniformity. Since there is no reliable evidence of such implausible uniformity for the disputed EIR/DEIR model, and because the applicant has the burden of proof to provide a "good faith reasoned analysis" with "common sense," the disputed EIR/DEIR cannot prevail based on such incorrect assumptions, speculations, and unsubstantiated opinions. The same applies for my many other objections to the DEIR/EIR, such as the EIR/DEIR incorrectly ignoring climate change and their false assumption that the average rainfall between 1967 and 2017 can be a "current" baseline for future groundwater recharge for 80 years of 24/7/365 dewatering (noting that their stopping that averaging at 2017 is not "current" and ignores the dry years thereafter that represent the "new normal.")

Thus, the EIR/DEIR fails to perform its **CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must**

undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.) Again, among the most common deficiencies and worse in the disputed EIR/DEIR are that they "ignore or assume a solution" to a problem or claims that the missing information "will be provided in the future." *Vineyard* at 40 Cal.4th at 429, 431, prohibiting such deferred analysis or mitigation. See my CEQA discussions and authorities below, such as at I.A.1.d.(v), I.C, and I.E.4.

(iv). The Disputed EIR/DEIR Cannot Evade The Legal Consequences of Relevant Admissions, Which Should Doom Their Contrary and Inconsistent Claims, Such As Admissions In Rise's SEC Filings That Compare To Those That Prevailed in *Richmond v. Chevron* Illustrated Below And Admissions In DEIR at 6-14 That the Project Is Not Economically Feasible Unless the EIR Receives Permission To Do As It Wishes (e.g., Operate 24/7/365 for 80 Years in Ways Impacted Local Objectors Find Intolerable And Noncompliant.)

In my objections and those of others it is legally appropriate (and common evidentiary practice) to rebut or impeach the disputed EIR/DEIR by citing inconsistent and contrary Rise admissions. Such rebuttal evidence is addressed, for example, in Exhibit B to and elsewhere in this EIR Objection 254, as well as in my DEIR Objection 254 #2. However, the EIR/DEIR incorrectly rejects and ignores any of my such Rise admission rebuttal evidence as if it were somehow irrelevant, citing its incorrect interpretation of CEQA "boundaries" (which are regularly exceeded by the disputed EIR/DEIR in its own content]. If the County decisionmakers decline to consider such admission truths to rebut contrary claims in the disputed EIR/DEIR, it should be clear to them that the courts will nevertheless find such admissions key evidence admissible for defeating the EIR/DEIR. For example, in ***Communities for a Better Environment v. City of Richmond (2010), 184 Cal.App.4th 70, 82-90 ("Richmond v. Chevron"),*** there was a critical dispute over the issue of whether that project included any equipment changes that would facilitate the future processing of heavier crudes [oil] at the refinery. The court stated that "there was conflicting information developed during the EIR process [**including SEC filing admissions**] that cast serious doubt on these assertions [by Chevron's EIR] "in conclusory terms that the proposed Project will not result in an increased capacity to process lower quality, heavier crude, and that Chevron seeks only the ability to refine crude with higher sulfur content." That appellate court agreed with that trial court that **"the EIR is inadequate as a matter of law because it does not adequately address the [admitted] issue [in such rebuttal conflict] of whether there are any equipment changes that would facilitate the future processing of heavier crudes…" (emphasis added) The key to that ruling was the court's discussion of conflicting or contrary admissions "in Chevron's SEC form 10K," and (as here with Rise SEC filings Exhibit B and DEIR Objection 254 #2) the EIR applicant told its investors a different story in the SEC filings than it told the public in its EIR/DEIR.**

Such Chevron admissions then led to more from questioning at a public meeting (not yet part of this disputed EIR process). As that *Richmond v. Chevron* court noted from such impeachment data from such admissions: "'By giving such conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading.' (*San Joaquin Raptor Rescue Center v. County of Merced* (2007), 149 Cal.App.3d 663, 655-656 …)" That *Richmond v. Chevron* court then stated (what also applies here): "Far from being an informative document, the EIR's conclusions call for blind faith in vague subjective characterizations. (*See Berkeley Keep Jets Over the Bay Com. V. Board of Port Cmrs.* (2001) 91 Cal. App. 4th 1344, 1371… ["[t]he conclusory and evasive nature of the response to comments is pervasive, with the EIR failing to support its many conclusory statements by scientific or objective data"); *San Joaquin Raptor,* supra, 149 Cal. App. 4th at 659 ["decision makers and general public should not be forced to … ferret out the fundamental baseline assumptions that are being used for purposes of the environmental analysis"].) That is also the situation here as my Objections demonstrate.

My Objections often also use quotes and other evidentiary admissions from the DEIR or EIR or from Rise SEC filings (eg, Exhibit B and A, and DEIR Objection 254 #2) to prove my points. Because I assume it's "awkward" for the EIR to openly contradict itself or the DEIR, the disputed EIR usually attempts incorrectly (or otherwise in noncompliance with CEQA and other applicable law) to evade those admissions by ignoring or mischaracterizing them where cited in my Objections and others, as if somehow (incorrectly) irrelevant or as insufficiently explained. However, as a legal matter (e.g., under the applicable law of evidence that this EIR applicant cannot ultimately avoid in any court challenges that become necessary), I don't have to provide (as the EIR incorrectly alleges) an "explanation" or other background support for using any such admission rebuttals. Such admissions (especially those in SEC filings) are always admissible as relevant and powerful evidence to rebut or impeach any conflicting or contradictory provisions of the disputed EIR/DEIR. As the *Richmond v. Chevron* court ruling confirms, truth does matter (at least in such court challenges), so that such material conflicting admissions can defeat the disputed EIR/DEIR by themselves. That is "common sense" since if the pressure from the threat of SEC law enforcement inspires Rise to admit to its investors how speculative, unevaluated, and risky this EIR/DEIR mine truly is, then the County decisionmakers would be irresponsible to approve for our community the inconsistent optimism and other noncompliant error, omissions, and deficiencies objectors cite in the EIR/DEIR.

While there are many "fatal flaws" in the EIR/DEIR demonstrated herein and in other objections, these Rise admissions cannot be evaded, ignored, or tolerated. Such admissions are among the most powerful arguments against these disputed EIR/DEIR's claims, assumptions, and opinions alleged to be factual. **AMONG THE MANY EXAMPLES HEREIN, THIS IS ONE OF THOSE I FIND MOST COMPELLING: THE DEIR AT 6-14 ADMITS THAT THE PROJECT IS NOT ECONOMICALLY FEASIBLE UNLESS THE MINE IS ALLOWED TO OPERATE AS DEMANDED BY THE DEIR 24/7/365 FOR 80 YEARS. STATED ANOTHER WAY, THE DEIR/EIR ADMITS THAT THE ONLY WAY THE EIR/DEIR CAN BE CORRECT IS IF THE MINER IS PERMITTED TO DO EVERY DISPUTED THING IT SEEKS TO ACCOMPLISH IN THE STILL NONCOMPLIANT EIR/DEIR, MOST OF WHICH IS INTOLERABLE TO US LOCAL OBJECTORS COMMITTED TO RESISTING THOSE MINING IMPACTS ON US, WHETHER ACKNOWLEDGED OR NOT IN THE EIR/DEIR. THAT ADMISSION ALSO**

CONFIRMS NEW RISKS FROM MINING IMPACTS (E.G., FROM VULNERABILITY WHEN THE MINE SHUTS DOWN PREMATURELY, SUCH AS BECAUSE THE MINER CANNOT AFFORD TO ACCOMPLISH REQUIRED MITIGATIONS AND OTHER EIR/DEIR PLANS, WITH SIGNIFICANT ADVERSE ENVIRONMENTAL CONSEQUENCES THE EIR/DEIR REFUSES TO REVEAL, MUCH LESS ANALYZE.

Please note that my objections herein and in (or incorporated in) my Objections 254 and 255 call attention to DEIR (and now EIR) admissions, which (while still deficient, insufficient, and disputed for various reasons) excuse me as a matter of law at having to prove what is stated in those admissions, thereby allowing me to expose greater and other EIR/DEIR errors, omissions, and flaws from that admitted foundation. Thus, when, for example, the EIR makes its common (and always disputed, incorrect, and noncompliant) complaints that my objections are too nonspecific, unexplained, unsubstantiated, speculative, or otherwise defective, the disputed EIR never addresses the admissions I quote that are, even if understated, a sufficient foundation for my uses of them, especially because I support them with further and other related objections. For example, in my DEIR Objection 254 #3.E (VI) at 61 (which the EIR marked as Comment Ind. 254-33 at its 2-5913) I quoted the DEIR concluding (at 4.8-66, capitalization emphasis added): WITHOUT IMPLEMENTATION OF A GROUNDWATER MONITORING PROGRAM AND WELL MITIGATION PLAN, THE PROJECT COULD RESULT IN A SIGNIFICANT IMPACT TO GROUNDWATER SUPPLIES." See also the rest of my DEIR Objection 254 #3.E, properly entitled: "'Hiding the Ball' in the DEIR Is Not Compliance With CEQA And Other Applicable Laws, And That Practice, Especially As To Water and Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DIER Tries To Obscure By Distracting Attempts To Limit the CEQA 'Project' And The Related Water Issues." [I quote this one example of many, because this section of the objection referenced other substantive sections of DEIR Objection 254 for many details besides examples that illustrate such objectionable evasions by the disputed DEIR, as my objections in section III herein illustrate to how my integrated objections were fragmented for individual debate by disputed EIR Responses to Comment Ind. 254-14 to 33.]

FOR EXAMPLE, THE EIR/DEIR OPERATES ON THE DISPUTED THEORY THAT SUCH EVENTS ADMITTED CAUSING ECONOMIC INFEASIBILITY ARE TOO "SPECULATIVE" TO HAVE TO DISCUSS SUCH RISKS IN THE EIR/DEIR FOR POTENTIAL VICTIMS, BUT SOMEHOW NEVERTHELESS ADMITTEDLY NOT TOO SPECULATIVE TO SHARE WITH THE SEC AND INVESTORS SEEKING TO PROFIT AT THE EXPENSE AND RISK TO US LOCAL NEIGHBORS.
NOTE THAT SUCH DISPUTED DEIR/EIR PERMISSIONS (E.G., DEWATERING AND MINING 24/7/365 FOR 80 YEARS) ARE NOT COMMONLY ALLOWED EVEN FOR BENEFICIAL AND DESIRABLE BUSINESSES BECAUSE OF THE MANY HARMS SUCH INTENSITY CAUSES. SEE THE GRASS VALLEY OBJECTION ON THIS TOPIC IN ITS AGENCY LETTER 8, REVEALING SUCH CONFLICTS WITH ITS ORDINANCES AND, THEREFORE, WITH THE COUNTY'S GENERAL PLAN. ALSO, THE EIR/DEIR REFUSES TO RESPOND TO MY ECONOMIC FEASIBILITY OBJECTIONS, EVEN WHEN I USE FATAL RISE ADMISSIONS IN ITS SEC FILINGS PROVING A LACK OF ESSENTIAL WORKING CAPITAL AND FINANCIAL

RESOURCES THAT, COMBINED WITH SUCH DEIR ADMISSIONS AT 6-14, DOOM THE PROJECT. SEE, E.G., EXHIBIT B HERETO AND MY OBJECTION 254 #2. That disputed EIR evasion by refusal to engage on the merits about this issue is noncompliant with the need for truth, is improper as a tactic, and is extraordinarily unprecedently in law, especially as rebuttal or impeachment (eg, such admissions prove that the mine is unlikely to afford to accomplish its asserted, but unpriced and expensive, safety measures and mitigations. See, e.g., Exhibit B and my DEIR Objection 254 #'s 3.N, 4, and 14, and my DEIR and EIR Objections 255.

Among other things, that preceding discussion and others herein about EIR/DEIR, Rise, or other admissions mean, for example, that all my complaints about groundwater supplies, monitoring, and mitigation must be addressed in EIR responses and cannot be evaded by the disputed EIR/DEIR as they now are. What remains to be debated is that, based on that admitted (and now beyond EIR dispute) foundation of the danger of groundwater supply impacts from the project, whether the groundwater monitoring and well mitigation plan is compliant, feasible, sufficient, and otherwise satisfactory (which it is not, for many reasons, including that it ignores all future wells and many existing wells [even those other 300 admitted by the County Economic Report to exist; see Exhibit A hereto], and many other areas in need of water monitoring. See also my incorporated objection of the Wells Coalition in Group Letters 27 and 28. While the EIR wrongly dismisses future wells as too speculative, that incorrectly ignores me and my neighbors as competent witnesses for many potential additional competing wells that will be drilled as needed above and around the 2585-acre underground mine by us surface owners and users to tap into the groundwater we own, for example, to save our homes as well as our forests from becoming a dead fire hazard for lack of water. See, e.g., the Supreme Court's *Keystone* decision cited above and my DEIR Objection 254 #'s 3.N, 4 and 14, including my legal authority counters herein to the disputed EIR Response To Comment Ind. 254-54 to 60, as well as many incorporated objections addressing the significant EIR/DEIR impacts on wells, groundwater depletion, and related noncompliant mitigation proposals.

While the EIR incorrectly disputes or ignores my and other claims about the undercount of existing impacted wells and such projections of future wells, that EIR ultimately cannot escape in court (if a challenge becomes necessary) my and other witnesses' offers of proof, as well as cited case studies of how groundwater is being tapped and used throughout the State to combat surface dryness from climate change that the disputed DEIR/EIR incorrectly refuses to address as "speculative" and on other disputed theories.] If any County decisionmaker thinks more wells in the future is speculative, just ask anyone living above or around the 2585-acre underground mine who can afford a well, whether they would abandon their homes and let their trees and other vegetation die for lack of water or whether they will create a well to reach the groundwater they own beneath them. Also ask them if they are willing to sacrifice their homes and forest for the 24/7/365 dewatering of this no net benefit to them mine for the profit of this Canadian miner's shareholders. You will find many more certain witnesses for those obvious answers than the court will need to confirm that reality. Also, I dispute that even any better EIR/DEIR monitoring and mitigation might be legally and practically sufficient and otherwise satisfactory, because it is not feasible for "implementation" and otherwise for many reasons. See, e.g., my attached Exhibit B and citations to my Objections 254 and 255 that use Rise SEC admissions to prove that none of what is promised or contemplated by the DEIR/EIR is affordable or economically feasible for Rise and, hence, is illusory or noncompliant. Indeed, as I have proven, even the insufficient, deficient, illusory, and otherwise unsatisfactory and disputed

DEIR/EIR offered mitigation and monitoring is not feasible, as I explained herein and in that DEIR Objection 254 #3.E (VI), as well as its #1.E and F and 2.

A similar EIR admission attempts to cover up the disputed DEIR omissions of the hexavalent chromium water and air pollution threats that I addressed in Objection 254 #'s 3.C, F, G, H, and M, 5 and 7. I continue so to object as to the new additions in the EIR Responses and its added Appendices at the end of that massive document without sufficient integration with the EIR text. E.g., **Town of *Atherton v. Cal. High-Speed Rail Authority* (2014), 228 Cal. App.4th 314, 349, no judicial deference allowed for a "clearly inadequate or unsupported study,"** The facts remain as I have stated them in my Objections, including as so admitted by the EIR/DEIR or Rise, despite EIR trying to evade such toxic threats without any "good faith reasoned analysis" or "common sense" in the DEIR. Indeed, the DEIR fails to address that impact at all in DEIR's "Hazards And Hazardous Materials" discussion and only vaguely mentioned that threat in passing in the DEIR's separate discussion of mining techniques, as I have demonstrated them both in my DEIR Objection 254 and my objections herein as to such noncompliant discussion of that hexavalent chromium menace made worse by what "significant" but still deficient "new information" the EIR added on the subject, as explained in my objections thereto herein (e.g., my objections to disputed EIR Master Comments and disputed EIR Responses To Comment Ind. 254-1 and others).

(v). Future Aspirations of Disputed EIR Mitigations (Which Are Insufficient, Deficient, And Noncompliant) Cannot Excuse Such EIR/DEIR Noncompliant Disclosures And Omissions of Impacts.

The EIR seems incorrectly to contend that somehow all the EIR has to do is announce any mitigation, however, unsubstantiated, illusory, infeasible, or otherwise noncompliant, to eliminate any need for compliance with CEQA and applicable law about required impacts. That is worse than wrong as a matter of law and public policy. See, e.g., my detailed discussion below of such mitigation disputes (e.g., sections I. D and E below) and my Exhibits A, B, C, and D. By that absurd, disputed EIR logic, all the EIR implicitly claims it needs to do to entirely evade CEQA and reality is to claim (incorrectly), in effect, (i) the impacts and other problems about which potential victims may complain are too speculative, unsubstantiated, or otherwise outside the alleged, narrow CEQA boundaries, but still, even if CEQA were recognized by the EIR to require a response from objections, (ii) those objections to such impacts may be ignored by the disputed EIR, because the EIR will somehow mitigate them in the future in ways to be determined to be not "significant" by future regulatory approvals, and (iii) that such future EIR/DEIR mitigation "aspirations" somehow cannot be disputed in the EIR approval process, even by the miner's own admissions in its SEC filings and elsewhere showing that the miner cannot afford much mitigation. See, e.g., As to admissions, see *Richmond v. Chevron* above, and my Exhibit B and my DEIR Objection 254 #2. (Note that Rise's accountants have qualified its financial statements by doubts as to whether the miner will even remain a "going concern." Id. (I use the term "aspirations," because the EIR rarely makes any legally enforceable such commitments, but instead simply expresses a willingness to engage in a future mitigation process in which it expects to achieve its approval goal. The objectionable EIR tactical trick in this disputed approach is that, once the EIR is approved without any current or meaningfully assured mitigation, the EIR then has, in effect, evaded CEQA public comment and created a situation where the miner can deal with governmental officials without the more effective public scrutiny

and opposition required by CEQA's EIR process.) See, e.g., section I.D.1 to 5, providing a comprehensive rebuttal of that disputed tactic in various EIR contexts.

Clearly, such disputed EIR evasions and noncompliance by its incorrect assumptions, speculations, and unsubstantiated opinions about future mitigation aspirations are not permitted by the applicable law. No approval of any such disputed, "blank check," "just trust me" disputed EIR/DEIR safety and mitigation measures is an option available to decisionmakers under applicable law. That is especially true since there are many demonstrated reasons in my and others' objections (including such Rise SEC and other admissions) not to trust such speculative, dubious, and unsubstantiated opinions, assumptions, and claims by the EIR lacking "common sense" and "good faith reasoned analysis." Indeed, authorities cited in my Objections and those of others should defeat, distinguish, and otherwise overcome the lesser, inapplicable, and otherwise flawed authorities cited by the disputed EIR/DEIR (e.g., based on an incorrect claim of dissimilar or inapplicable situations or conditions somehow being "similar" and applicable). However, in many cases the disputed EIR/DEIR does not even compete by citing judicial precedents or the most applicable statute or Guideline, but instead the EIR/DEIR attempts to evade compliance just based on their idiosyncratic and disputed interpretations of some Guideline that should not determine the outcome.

(vi). This Objection Has A Process For Advancing My Continuing Disputes With the Nonresponsive EIR's Objectionable Tactics And Process, Such As The EIR/DEIR Often Ignoring, Evading, Or Mischaracterizing My Meritorious Objections To Craft the Disputed EIR/DEIR "Alternate Reality" Addressed Throughout My Objections.

As demonstrated in my Objections, the disputed EIR (like the disputed DEIR) (i) fails to provide the CEQA required "good faith reasoned analysis" with "common sense" (discussed herein) about many environmental impacts and mitigations, and (ii) ignores my rebuttals that many EIR/DEIR safety promises and mitigation claims are illusory, deficient, or infeasible, including because Rise's SEC filings are damning admissions that it lacks the funding and resources needed to accomplish such "aspirations." I must be allowed to rebut and impeach such disputed DEIR/EIR claims, and the decisionmakers would make a serious mistake to continue their staff's incorrect exclusion of such important rebuttal evidence. See, e.g., Exhibit B herein and my Objection 255. While the DEIR/EIR incorrectly disputes my such objections, especially my DEIR and EIR Objections 255 about their need to prove economic feasibility, the disputed DEIR/EIR continuously misses the point of my legal objection that any such reality can be proven, especially on account of Rise's own admissions, such as in its SEC filings (see Exhibit B and DEIR Objection 254 at #2), to rebut such a false "alternate reality" in the EIR/DEIR. More problematic and devastating to any disputed EIR claim of compliance or credibility, is the EIR/DEIR's unsuccessful effort to resist my objections and others, whereby the disputed EIR both (i) adds therein new errors, omissions, and deficiencies, while claiming such EIR adds nothing to the disputed DEIR but a few "clarifications" or "amplifications," thereby claiming incorrectly to escape the need for revision and recirculation, and (ii) tries to coverup the DEIR flaws by improperly rewriting and minimizing my objections to which the disputed EIR purports to respond, while instead evading, minimizing, and misdirects the focus of the disputes (e.g., by the disputed EIR pretending it was not adding significant new information to the disputed DEIR

that had obscured or omitted discussion of the menace from the toxic hexavalent chromium it would add to the mine cement paste for shoring support in a replay of the "*Erin Brockovich"* movie dramatizing how that toxin killed Hinkley, CA, and many of its citizens). See Exhibit C, other objections herein (e.g., I.E.1 and 7 and G), and DEIR Objection 254 #'s 3.A, B, C, E, G, and H, 7, and 12.

Even worse, the disputed EIR ignores reasonable demands in my Objections for even basic CEQA disclosures, such as a street map or addresses identifying readily recognized surface boundaries to inform us surface owners and users where we are located in relation to both the 2585-acre underground mine and its new mining areas. The vague maps offered in the DEIR/EIR do not allow most of us to calculate the risks we confront at our individual locations above or around the mine. Why does the EIR/DEIR not accommodate us with that basic CEQA location disclosure, especially since I and others told them in our DEIR objections that we must have the answer to that question to share with any buyer of our property, any mortgage lender, or even for our peace of mind? The obvious reason for such EIR/DEIR concealment appears to be to avoid riling up those of us at risk, but ignorant, until after such victims miss their objection deadlines. Such disputed tactics (and much worse conduct exposed herein) do not comply with CEQA and cannot succeed in any court and political/law reform challenges that will inevitably follow any mistaken approval by the County decision-makers. Note also that this disputed DEIR/EIR practice is the subject of meritorious complaints by others as well, such as the State Dept. of Parks and Recreation in Agency Letter 1 and Grass Valley in Agency Letter 8.

Worse still, the disputed EIR often blatantly and improperly omits any meaningful response to my most serious complaints, apparently because it has no sufficient or credible response. Instead, the disputed EIR/DEIR evades with objectionable tactics, such as incorrectly claiming lack of CEQA relevance, and incorrectly arguing that my objections are too speculative or unsubstantiated or lack sufficient detail, or the like. See my complaints herein about such tactics (see, e.g., I.E.5, 6, and 7), which I also addressed in my DEIR Objection 254 #3.E. In most cases, the EIR/DEIR is even more guilty of what same flaws it alleges against me (e.g., substantiation, speculations, evasion, etc.), since, when (as is often the case) the disputed EIR/DEIR itself presents speculation or unsubstantiated or unexplained opinion (mislabeled as facts), those flaws limit my ability to do more than expose those flaws and reveal counter data that demonstrates their lack of compliance, credibility, or applicability. Controlling court cases cited in this and my prior DEIR objections (e.g., *Banning, Vineyards, and Costa Mesa*) require a **"good faith reasoned analysis"** in the EIR/DEIR and applying "common sense" (e.g., *Gray),* that never rarely occurs there. For one typical example, as illustrated in the disputed EIR Response To Comment Ind. 254-40 regarding air pollution (which objectionable tactic is repeated in many disputed responses throughout the EIR/DEIR), the disputed EIR's answer was: "The DEIR determined these impacts to be less than significant after mitigation." However, there was no "good faith reasoned analysis" as to how or why the DEIR made that such disputed "determination," contrary to "common sense." Also, such disputed, deficient, noncompliant, and often illusory mitigations are rarely proven or credible, and many are omitted entirely by the EIR/DEIR incorrectly alleging that an impact was not "significant" or omitting the impact entirely or (like hexavalent chromium threat, in substantial part). In such cases, I cannot be expected to rebut such unexplained, disputed, and deficient EIR theories or imagined infeasible, deficient, or noncompliant mitigations. Instead, I can only denounce them, in turn, casting them back at the EIR/DEIR, because they are the ones which are noncompliant, speculative, unsubstantiated, and contrary to my superior data on the issue.

Consistent with the applicable law I cite, I also dispute such inappropriate, evasive, or noncompliant attempts by the disputed EIR/DEIR to excuse itself from acquiring important and available knowledge that it does not wish to know regarding its impacts (i.e., "inconvenient truths" that would impair its quest for EIR approval that it should never receive on the merits). Such willful or reckless disregard of essential and available data by the EIR/DEIR is not tolerable, especially when it arises from a refusal to investigate and inform itself about mining conditions, groundwater depletion and insufficient recharge/balancing, climate change, hexavalent chromium hazards, and other impacts, particularly as to the risks Rise admits in its SEC filings to warn its investors, but those admitted facts should all be added to the EIR/DEIR, since they should be of even more concern to our public officials who are supposed to protect us impacted local objectors. See, e.g., *Richmond v. Chevron*, supra; Exhibit B hereto and my Objections 254 #2. Such bogus EIR/DEIR claims that ignore or evade such risks and impacts are often based on the disputed theory that the EIR/DEIR only has to do "what is reasonable feasible" for purposes of CEQA Guidelines #15364, but the DEIR/EIR still fails such tests, as shown in cases such as *Sierra Club v. County of Fresno* and others discussed in my Objection 254 #14. Stated another way, when the EIR/DEIR announces its often incorrect interpretations of CEQA or the Guidelines, as to what is reasonable feasible, it applies a false measurement standard without any adequate basis for doing so. For example, the disputed DEIR/EIR fails adequately to investigate or evaluate the conditions of this mine that has been closed and flooded since 1956, perhaps because either or both (a) it cannot afford to do so (which is its own fault and not an acceptable legal excuse, when someone like Rise irresponsibly undertakes such a massively expensive and speculative project with long delays in any possible returns (all uncertain) on insufficient working capital resources from the start), and (b) it prefers not to know the inconvenient realities before it obtains its approvals and, sooner or later, will be challenged on any inconsistencies between the realities of such mine conditions and its wishful thinking EIR/DEIR simply announcing its "best case" (but likely incorrect and, in any case, deficiently substantiated and speculative) assumptions.

Most importantly, the EIR/DEIR fails to perform its **CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura* (1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)** These disputes are questions of law (or mixed question of law and fact) on which us objectors insist the disputed EIR/DEIR was wrongly resisting investigating what is reasonably feasible to avoid having to combat our objections on the merits. Rise knows the importance investigating of those risks, because it lists many such related risks for its investors in its SEC 10K and 10Q filings that it does not even attempt to address responsively in the DEIR/EIR. See Exhibit B and Objection 255. In any case notice that the disputed EIR/DEIR

constantly evades my Objections on the grounds that my concerns are speculative and unsubstantiated (see the EIR Master Responses rebutted by me in section II below and the Responses rebutted by me in section III below), but the reality is that the disputed EIR/DEIR to which I am objecting are even more speculative, unsubstantiated, and lacking in credibility and common sense, thereby handicapping any more extensive rebuttals.

Again, the disputed EIR (like the DEIR) is full of the same errors, omissions, and flaws, as well as new ones, including by evading or ignoring without meritorious excuses not only the key merits of many of my Objections, but ignoring some objections entirely, apparently because the EIR could not rebut them on the merits. **While I (and others) constantly disagree with the EIR/DEIR claims and contentions to the extent they are expressed to combat or conflict with my and other incorporated objections on the merits, too often the disputed EIR/DEIR evasions fail to be expressed or even addressed on the merits.** See my rebuttals to the EIR "Master Responses" in section II and "Responses" in section III. Instead, such EIR/DEIR evasions either (a) incorrectly recharacterize my and other such objections into something less difficult that they prefer to debate (eg, typically something lacking my core facts and logic [i.e., common sense and good faith reasoned analysis) and essential legal components for prevailing on the merits], (b) incorrectly claim that my objections are too speculative, unsubstantiated, or unexplained to deserve any reply (which is never true, as I demonstrate item by item in my sections II and III below, especially because when the disputed EIR/DEIR makes such allegations it always wrongly ignores my cross-references, integrated related objections, or incorporations by reference), or (c) even entirely omitting to respond to some of my issues, pretending they didn't exist. in hopes of their being overlooked. Typically, while the disputed EIR/DEIR attempts to distract the readers with such other objectionable responses, it simultaneously attempts to limit, fragment, or ignore the objections they apparently fear to confront.

Without repeating my incorporated Objections (rebutting the DEIR's disputed attempt to cite its incorrect interpretation of CEQA's scope as an excuse for ignoring my objections to the DEIR's flawed allegations that themselves exceed CEQA's scope), those same Objections apply with equal force to EIR attempts to prevent rebuttals of what the EIR incorrectly claims to be outside the scope of CEQA and its Guidelines. As explained herein, even as to CEQA and its Guidelines, not only does the admitted lack of sufficient current Rise financial resources (see Exhibit B and Objection 254 #2) enable rebuttal of the EIR/DEIR's illusory (eg, unaffordable and untimely) safety and mitigation assertions, but that inability to accomplish timely even such deficient and incomplete EIR mitigation entitles us locals to proactively mitigate our damages in our proactive self-defense among our remedies for nuisance, inverse condemnation, trespass, and other claims addressed herein. See, e.g., sections 1.E.5(d), F, and H herein, and my Objection 254 #'s 3.N, 4, and 14, as well as my legal authority counters herein to the disputed EIR Response To Comment Ind. 254-54 to 60. **Please remember that CEQA is an obligation of the miner and its approving authority, but not a burden, limit, or restriction on us objecting potential victims. I and the other objectors are entitled to expose errors, omissions, evasions, and other noncompliance applying any and all applicable law, including without limitation both as to CEQA and to other applicable laws requiring the truth and clarity from whatever the DEIR/EIR states, whether within or beyond the correct CEQA boundary or the disputed boundary alleged by the DEIR/EIR that it frequently exceeds in its own disputed commentaries. See generally my Objection 254 # 3.K (and my objections herein to corresponding EIR Responses To Comment Ind. 254-43 to 45), my such # 3.N**

(and my objections herein to corresponding EIR Responses To Comment Ind. 254-50 to 53), my such # 12 (and my objections herein to corresponding EIR Responses To Comment Ind. 254-81 to 86), my such # 14.C (and my objections herein to corresponding EIR Responses To Comment Ind. 254-92), and 15.E (and my objections herein to corresponding EIR Responses To Comment Ind. 254-101).

(vii). Some Illustrations of the Disputed "Alternate Reality" Illusions Created by EIR/DEIR Errors, Omissions, And Objectionable Tactics.

What the Final EIR improperly does is to create as to various environmental and other relevant issues an "alternative reality" in which serious and disqualifying environmental impacts and risks are being overlooked, incorrectly evaluated, or otherwise incorrectly handled or not complied with as required by applicable law, including but not limited to CEQA. That alternate reality of the disputed EIR/DEIR strays from fundamental truths because of material errors, omissions, and other noncompliance, not just because of what is stated or omitted to fail to present "truth" and "common sense" with "good faith reasoned analysis," but also because of a flawed EIR process in which disputed Rise provided, noncompliant information, opinions, speculations, and allegations are somehow incorrectly assumed by the EIR/DEIR reviewers (so far) to be correct, complete, and sufficient, often by creating rules that incorrectly limit the scope of meritorious, relevant, and dispositive objections that the EIR/DEIR reviewers (so far) allow to be considered. See, e.g., my DEIR Objection 254 #3.E and 255. Since (as explained in my such prior Objections to the DEIR and to my objections herein), in any challenge of any mistaken EIR approval the courts will allow my and other evidence and objections that so far incorrectly have been excluded from consideration by the County staff incorrectly applying the disputed Rise claim that CEQA excludes any consideration of economic feasibility and certain other realities. I urge that the County decision-makers at least be apprised of these realities in dispute for which they ultimately will be accountable if they mistakenly approve this flawed EIR without realizing the full and proper scope and extent of such realities rebutting the noncompliant and false EIR claims, especially when I use Rise and other admissions in such rebuttals. For example, CEQA seeks truth and compliance with applicable law, and my and others' objections demonstrate that the disputed EIR (and its incorporated DEIR) often fail to meet that standard. For instance, announcing mitigations that are unfeasible, as well as insufficient, deficient, or incomplete, is not simply a dispute over the standard for adequacy (and for admissibility of qualified, competent, and relevant evidence against the EIR/DEIR's many noncompliant, speculative, and unsubstantiated assertions that are incorrectly assumed to be correct or sufficient, but are not). That reality also applies to the question of whether disputed EIR/DEIR alleged mitigations are compliant, feasible, and achievable, which must include that they are affordable to this miner considering the insufficient financial resources admitted in its SEC filings that *Richmond v. Chevron,* supra, proves not only are admissible evidence but can prevail in such disputes. See also Exhibit B and my DEIR Objection 254 #2.

The incorrect position of the EIR is that any specific "aspiration" (usually less than a meaningful promise or condition, and commonly just a vague, anticipated concept or fantasy) for mitigation is sufficient, even if it is infeasible, unaffordable by Rise, or

otherwise illusory in the real world. By that false EIR/DEIR logic (contrary to CEQA, the Guidelines and applicable law as properly interpreted by the court precedent cited herein and in other Objections) all this miner (without sufficient financial or other capacity to achieve even such deficient, proposed EIR mitigation) must do is simply make an illusory EIR proposal with no credibility, and somehow that disputed and noncompliant approach is claimed to defeat our objections supporting the whole purpose of mitigation, which is, applying the comprehensive and sufficient truths to solve the many underappreciated environmental impact problems. This disputed EIR approach defies "common sense" required in *Gray,* because it would be the functional equivalent of allowing an admittedly, financially incapable miner a EIR authorized use permit for reopening a massive, long closed and flooded mine (likely full of unevaluated, hazardous conditions) based on a simple declaration of the miner's intent to do whatever some governmental agency later decides is necessary to mitigate any significant environmental impact that may be discovered as it proceeds, despite the continuous and meritorious objections of the impacted locals. In the real world where us surface owners live above and around the 2585-acre mine, no one would rely on such a miner's illusory "aspiration" because such an EIR approval and permissions would risk the health, welfare, property, and environment of that entire community which the County is supposed to protect. And us objectors will not rely on this disputed EIR.

What follows throughout this Objection demonstrates again (as I did in my prior DEIR Objections 254 and 255) how often those kinds of noncompliance, among many others, appears in the EIR/DEIR. See, e.g., for example, my Objection 254 # 's 3.N, 4, and 14, and as well as my rebuttals to the EIR Master Responses in section II below and my rebuttals to the EIR Responses in section III below), including my legal authority counters herein to the disputed EIR Response To Comment Ind. 254-54 to 60. Stated another way, this Objection (like my earlier DEIR Objections 254 and 255) constitutes a comprehensive rebuttal to every contested EIR/DEIR contention, not only the portions of my objections that EIR/DEIR choose to notice and confront. However, sooner or later, if necessary for court challenges, each such EIR/DEIR error, omission, and other flaw must be permitted to be considered comprehensively on the merits based on the law of evidence applying the full sets of such disputes, counters, and rebuttals, whether or not within the disputed scope of CEQA, whether as correctly interpreted or as incorrectly interpreted by the disputed EIR/DEIR. Otherwise, **both** such objectionable EIR/DEIR contentions or claims and my related objections must be excluded together, in which case the EIR must still be rejected, because it has the burden of proof. In any case, there is no possibility that a court applying the law of evidence would allow a disputed statement in the contested EIR/DEIR to be considered without also allowing such evidence, especially the EIR/DEIR itself "opened the door" for rebuttal, particularly as to Rise and EIR/DEIR admissions. If such courts will consider the full reality in dispute before them, if this matter proceeds on the customary course for such EIR disputes, so should the County decisionmakers now.

Stated another way, this and my other Objections dispute the EIR/DEIR's erroneous idea that somehow CEQA allows a one-sided, erroneous or worse claim or contention to be made in the disputed EIR/DEIR on its own chosen terms without full consideration of, or "good faith reasoned analysis" with "common sense" of such Objections like mine. The disputed EIR/DEIR incorrectly argues that CEQA bars my corrections or rebuttals to such EIR/DEIR's own errors, omissions, or noncompliance, because somehow only the EIR/DEIR authors can allege such

errors, risks, and threats beyond what they claim to be the scope of CEQA, thereby allegedly barring my meritorious objections beyond that mischaracterized "border." These dynamics are demonstrated in painful detail in my section II counters below to the disputed EIR "Master Responses" and my section III rebuttals to the disputed EIR "Responses" to my DEIR Objection 254. Even worse, the EIR's such purported "responses" are often evasive, incomplete, and address EIR rewritten versions of parts of my objections, so as to become misleading or worse (i.e., to miss the core point of my objections by recasting them as the EIR wished my objections were instead of what I actually said or incorporated.) Also, even when the EIR does state an objection as I intended it, the disputed EIR typically misjudges my objection as mere "speculation" or unsubstantiated opinions that it (incorrectly) claims to be entitled by CEQA to ignore.

In such cases, the EIR/DEIR fails to perform their **CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)**

Moreover, as cited above, the burden of proof should be on the EIR, and it fails to meet that burden as my objections and others demonstrate. That means, among other things, that even if I did not present expert evidence at this pre-litigation stage to counter the EIR/DEIR noncompliance, errors, and omissions, the disputed EIR/DEIR must fail on the merits for their own noncompliance with that burden to prove their cases on the merits. Indeed, the disputed EIR/DEIR often present far worse speculations (eg, false assumptions, false equivalences, and worse) and unsubstantiated opinions (eg, citing to studies or data that are not comparable to the 2585-acre underground mine and new mining conditions to which the Objections apply), it is only fair and proper both to expose them as not meritorious and sufficient compliance and to illustrate with such counters why those EIR/DEIR errors and worse must be rejected. In summary, the foregoing illustrates how the disputed EIR/DEIR crafts such an alternative reality, so that, as I dispute below the individual errors, omissions, and noncompliance, the reader can see them as examples of a pattern and practice that obscures the true reality on which us potential victims insist in these disputes to save our health, welfare, and property from this mining menace. See generally, my DEIR Objection 254 #3.E (and my objections herein to corresponding EIR Responses To Comment Ind. 254-22 to 33**),** my such #13 (and my objections herein to corresponding EIR Responses To Comment Ind. 254-87 to 89), my such #14.D (and my objections herein to corresponding EIR Responses To Comment Ind. 254-93), and my such #15 (and my objections herein to corresponding EIR Responses To Comment Ind. 254-95-101).

(viii). Some Substantive Examples of Such Disputed EIR Efforts To Impose Such "Alternative Reality" With Objectionable Tactics, Like "Hide The Ball," "Bait And Switch," And Other Noncompliant Claims, As Well As Strategic "Rebranding," Such As Incorrectly Calling Waste Rock From Mining "Engineered Fill."

Even more shocking than the EIR process ignoring admissions and other such competent evidence is the way that the disputed EIR/DEIR here entirely **evades climate change** and related reality (e.g., calling it speculative, despite all the state and Federal programs and laws recognizing the need to battle climate change). See, e.g., 2018 Guidelines Amendments Explanation and section I.C; section I.A.1.a.(vii). See also section I.F.5 and 6, I.E.1-5, and DEIR Objection 254 #3.E. Too often in the disputes over consideration of climate change realities in the EIR/DEIR, us objectors encounter objectionable "bait and switch," "hide the ball," and similar tactics, resulting in many EIR/DEIR errors, omissions, deficiencies, and worse, as well as many deficient or even illusory claims for mitigation in the disputed EIR/DEIR. When **I objected to the DEIR's carbon offsets (DEIR at 4.3-96 plus) as claimed mitigation, the EIR response was: "climate change is a global issue, and unlike criteria pollutant effects, is not localized. Thus, offsetting GHG emissions elsewhere in California is an entirely appropriate an industry standard approach to mitigating GHG emissions."** See objections to EIR Master Responses 16, 25, 27, and 28. **FIRST,** mitigation is never based on "mining industry standards," which is not ever the legal standard, and, in my considerable relevant experiences, such mining standards are among the worst and least environmentally appropriate of all industries to allow to so self-regulate. If such mining "industry standards" were the legal standard for this or other compliance issues, most environmental laws would be ineffective. **SECOND**, **this kind of flawed policy is, in effect, asking permission to create a problem locally here (e.g., the climate change dryness and drought that make all the EIR/DEIR groundwater recharge and balancing theories illusory, like ignoring climate change as "speculative" and, instead, relying on average rain between 1967 and 2017 to set the "current" baseline for future "recharge/balancing" predictions, incorrectly ignoring the more current drought years after 2017, and assuming that such nonpredictive past will be replicated for the next 80 years of 24/7/365 dewatering abuses) because the miner (incorrectly) claims to improve someone else's problem in some other distant place down the Wolf Creek. As demonstrated in my discussions of court precedents herein like Varjabedian v. Madera (1977), 20 Cal.3d 285 (allowing nuisance and inverse condemnation claims by locals downwind of a new sewer plant approved to benefit the larger area. See, e.g., my DEIR Objection 254 # 3.N, 4, and 14), there are legal consequences and rights to compensation when locals are forced to suffer for what some officials consider the greater good in a larger area. THIRD**, the air pollution at this EIR mine is admitted to involving more than GHG omissions, such as asbestos and other toxins, even finally (although deficiently) with the EIR admitting the air pollution by hexavalent chromium it buried at the end in EIR Appendix R. See also the CR6 water pollution issues in EIR Appendices Q and O.

Many false, misleading, or otherwise noncompliant claims in the EIR/DEIR are not only unsubstantiated and themselves speculative, but they are also contrary to "common sense" (as applied in the similar *Gray* decision), such as the disputed claim that this EIR miner can blast new mine tunnels for more than 76 miles, plus the mining off of those tunnels, all without disturbing the "fractured rock" the EIR/DEIR incorrectly claims somehow will reliably preserve

our groundwater recharge/balancing without depletion, despite 24/7/365 dewatering for 80 years. See, e.g., the groundwater realities discussed in more detail herein and in many of the other objections cited in my Table of Incorporated by Reference Objections, such as Group Letters 2, 5, 6-9 and 21, 25, 26, 27 and 28, and 29-32, as well as Agency Letters 1, 3, 4-5, 8, and 10. As shown in my EIR objections here and in my DEIR Objection 254, the comprehensively disputed EIR/DEIR evades, mischaracterizes, or ignores many meritorious objections, especially dodging the hard questions pointing to inconvenient truths. E.g., Objection 254 #15. For example, the disputed EIR/DEIR attempts to distinguish depletion of groundwater from an "open basin" from what they contend is our allegedly more reliable for recharge "fractured rock." Of course, their disputed comparison ignores the difference in risk when one is just sinking a well versus when a miner is so blasting, tunneling, mining, dewatering and otherwise changing the uncertain underground conditions 24/7/365 for 80 years. However, whether a bucket is full of nothing but water or is mixed with fractured rock, the bucket still leaks when one punches a hole in the side or bottom. (Consider, for example, how this concentrated water depletion and pollution exhausts the margin of error for water use and pollution by more beneficial land uses locally, especially for those of us living on the surface above or around the 2585-acre underground mine, who all have competing property rights against the mine for groundwater, lateral and subjacent support to prevent subsidence, and etc., as well as to develop competing new wells to tap the groundwater that we own. See, e.g., my Table of Incorporated by Reference Objections, especially those of or for the CEA (including Group Letters 9 and 21), the Bear Yuba Land Trust (#2), the Friends of Banner Mountain (#11-12), the Rudder Law Group(#20), the South Yuba Citizens League (25), the Sierra Fund (#26), the Wells Coalition (#27-28), the Wolf Creek Community Alliance (#'s 29-32), the State Dept. of Parks And Recreation (Agency #1), the California Dept. of Fish And Wildlife (Agency #3), and Grass Valley Community Development Dept.(#8).

Therefore, I urge the County decisionmakers to notice which of my objections (and cross-references and incorporations therein) are most ignored, evaded, or mistreated by the disputed EIR that seems afraid to address them on the merits as required by CEQA, especially my objections discussed below and these "highlights" regarding (i) **groundwater impacts**, including, for example, by incorrectly using obsolete history (e.g., average rainfall between 1967 and 2017 to purport to set the "current" baseline for future projections, while both ignoring climate change and ignoring the dry years after 2017 in that "current" calculation) to assume/predict/speculate the future sufficient "recharge" of 24/7/365 dewatering for 80 years [see my Table of Incorporated by Reference Objections cited Id], (ii) **unreliable pre-1956 closure and flooding mining records** as well as disputed EIR cited **studies of dissimilar mine conditions,** instead of relevant and applicable investigations, (iii) all of the relevant wells and legal rights in peril (e.g., avoiding dealing with many **existing and future impacted wells and the property rights** of thousands of us owners of the surface down at least 200 feet above and around the 2585-acre underground mine) [Id. and noting even the County Economic Reports addressed in my Exhibit A, incorporated objection Group Letters 27-26 (the Wells Coalition), Group 6-9 and 21(CEA), Group 29-32 (Wolf Creek Community Alliance), and Agency 10 (NID)], and (iv) as illustrated, for example, in section I.F.1 and Exhibit C, and in section II.R below (rebutting the disputed EIR's Master Response 15 with exposure of such improper tactics), the EIR mine's dangerous **use of hexavalent chromium (an EPA proven human carcinogen you may remember from the movie, *Erin Brockovich,* mourning how it caused the death of Hinkley, CA, and many residents, yet which was not mentioned at all in the**

DEIR "Hazards And Hazardous Materials" section, but only mentioned obscurely in passing later in the DEIR, apparently inspiring the EIR to add a deficient and worse attempted cover up by pretending what the disputed EIR added to its disputed "Response" to my individual objection it labeled Response to Comment Ind. 254-1 was already in the DEIR [i.e., not the new, disputed data] so that the EIR did not have to correct, revised, and recirculate the DEIR. See my sections I.E.1 and 7, plus I.F.1 below, Exhibit C, my DEIR Objection 254 #'s 3.A, B, C, E, G, and H, 7, and 12 and my corresponding objections below to the disputed EIR's "Responses" thereto (especially EIR Response Ind. 254-1 and Ind. 254-36) and Master Responses, as well as various related legal issues in my DEIR and EIR Objections 255. See also my further objections to the other EIR "Responses" to such DEIR Objection 254 #'s 3.A [i.e., Ind. 254-6-10], B [i.e., Ind. 254-11-13], C [i.e., Ind. 254-14-15], E [i.e., Ind. 254-20-33], G [i.e., Ind. 254-36], H [i.e., Ind. 254-37], 7 [i.e., Ind. 254-75], and 12 [i.e., Ind. 254-81-86].

Many such examples are spread throughout my Objections, but consider this summation by the California Dept. of Parks And Recreation (Agency 1 at 1-2) after it addressed correctly a portion of such dangerous noncompliance: "Water quantity and quality, air quality, noise and vibration, hazardous materials, and wildfire dangers are crucial issues for CSP, and we find the DEIR to be inadequate in mitigations … [C]umulatively and individually these potential significant issues could negatively affect the natural resources, recreational values, health and safety of [that adjacent] Park['s] visitors and employees and the general well-being of Empire State Historic Park…" See, for example, its expressed concerns about the DEIR/EIR's noncompliance with the California Water Code 13050(f) for failure to protect beneficial uses and the plans of the Central Valley Regional Water Quality Control Board and the Nevada County General Plan.

Consider for example, the NSAQMD Agency Letter 12-1 at 11-12, stating: "The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements [i.e., DEIR mitigation proposed frequent daily watering attempting to keep toxic dust out of the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less water because of water wasted on this no net benefit mining]. Since the dust contains asbestos, silica, and numerous toxic substances [now adding hexavalent chromium] adequate dust control is necessary. There should never be a situation where dust control is compromised because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest." Again, we locals will be competing against a no net benefit mine for the water we need during droughts, which is one of many reasons why I keep focused on full protections for all existing and future wells, because, if we have to suffer the loss of precious water in the climate changed future for 80 years of 24/7/365 dewatering, the last thing we need is our NID water supply to be wasted on dust suppression to avoid lethal air pollution. **In another example of a DEIR/EIR misleading "bait and switch," the DEIR states (and EIR ratifies) that: "This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID." However, that ignores the NSAQMD's Agency Letter 12 (at 12) discussed below, where that regulator's demand *priority* for frequent daily NID watering of its toxic (asbestos and more) fugitive dust, and, rather than breathe such toxic air, us locals may have to suffer with less than our fair share of drought rationed water. Whatever the result, that disputed EIR reassurance of shared suffering is false and misleading at best. The reality is that this is a "zero sum game," in which every gallon allocated to this no net**

benefit mine is one less gallon available to the far more deserving locals. I have yet to meet any locals here above or around the mine who are willing to sacrifice anything for the mine almost all informed locals oppose, creating (if the mine is approved) a massive political problem for the County and NID to add to the inevitable legal disputes that will surely catch them in the cross-fire. See DEIR Objection 255 and 254 (e.g., #4), *Varjabedian, Keystone.*

I note these tactics are not just about what is so omitted or obscured, but also what is confused by misleading data. A prime example is the NSAQMD objection in Agency 11 (at 1) referring to the shared concern of the California Air Resources Board (CARB) where it concluded that "it is not appropriate to determine risk from rock samples … the PCM conversion factor was developed for air monitoring samples, not rocks. … Since there is no approved method for calculating risk from rock samples comparison with the NSDQMD's AB 2588 toxic significance threshold based on rock composition carries some uncertainty." This is classic "bait and switch," also known as "false equivalence."

My four Objections identify (including in the Table of Incorporated by Reference Objections) many such bases for disputing the DEIR/EIR objectionable tactics, such as "**hiding the ball," "bait and switch," and other misleading assumptions, speculation, unsubstantiated opinions**, and other noncompliance purporting (incorrectly) to present applicable facts, such as demonstrated in my rebuttals below to the disputed EIR "Responses" (my section III) and "Master Responses" (my section II). See more examples in my section I.E below. The disputed EIR continually ignores my cross-references and incorporations of others' objections, claiming incorrectly (and worse) that my objections somehow lack sufficient details or explanations to deserve any response (e.g., I rebut those EIR claims as explained below; sometimes that's just self-serving nonsense by the EIR, sometimes my objections are less detailed because the disputed EIR/DEIR statements I target are even more deficient, sometimes such EIR claims are just tactical and based on the arbitrary way the EIR cut up/fragmented my integrates Objections sections, and most commonly the EIR simply ignores my cross-referenced or incorporated objections that contain what the EIR incorrectly claims is missing or deficient.) See my Exhibit D and my Table of Incorporated by Reference Objections, as well as my point-by-point rebuttals in sections II and III below to the disputed EIR's "Master Responses" and "Responses." Consider also, for example, what I cited on this topic in my DEIR Objection 254 #3.E, among others to which the EIR offered no substantive and sufficient excuse or defense, instead generally evading by pretending that my explanations were insufficient or lacked enough detail to merit a response. As provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an objection as "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)**

All such things and more errors, omissions, and noncompliance are demonstrated in this Objection, which proves many ways in which the disputed EIR/DEIR fails (i) to overcome my 150-page Objection 254 and extensive (more legalistic) Objection 255 (not counting my many citations to EPA website validated studies and other incorporated objections and supporting materials), (ii) to comply with CEQA, its Guidelines, and applicable law, and (iii) to provide the required "good faith reasoned analysis" with "common sense" as required in *Banning, Vineyard, Costa Mesa, and Gray*. See generally, my DEIR Objection 254 #3.E (and my objections herein to corresponding EIR Responses To Comment Ind. 254-22 to 33**),** my such DEIR Objection #13 (and my objections herein to corresponding EIR Responses To Comment Ind. 254-87 to 89), my such DEIR Objection #14.D (and my objections herein to corresponding EIR Responses To Comment Ind. 254-93), and my such DEIR Objection #15 (and my objections herein to corresponding EIR Responses To Comment Ind. 254-95-101).

In this case, unless it's just an unfortunate coincidence that frustrates objecting victims, there is also another kind of "hide the ball" tactic that is about exploiting complexity by scrambling the data to confuse and obstruct systematic objections, as illustrated in the EIR Master Responses addressed in my section II objections below. The EIR Master Responses are divided up in ways that make the DEIR revisions and other responses appear as if they are less CEQA "significant" and less obviously not "new information" in hopes of evading CEQA mandated recirculation (see my discussions elsewhere on that CEQA topic of **"significant new information"** requiring revisions and recirculation, e.g., I.A.1.c.), than if all the new and significant groundwater matters were consolidated together in the EIR so their critical mass and combined importance was more visible. (This is a common trick of debaters, politicians, and litigators who attempt to minimize key, integrated issues on which they are vulnerable by fragmenting them in smaller parts so that each incorrectly seems separate and less important, thus forcing the adversary to reaggregate what was a consolidate issue that must be aggregated (e.g., groundwater is one such issue that must be addressed as one integrated whole. Impact.)

When such disputed environmental impact reports are litigated, many such tactics are defeated by objectors' procedural motions and other litigation techniques requiring clarification of the disputes in a more logical matter, where related issues are resolved together rather than by the way the miner **scrambled** them. That is, among other things, because courts have little patience for having, in effect, to relitigate the same overlapping and common labels many times (as would be the case regarding groundwater here) if the miner or governmental approval authority were allowed to split up the dispute in such a dysfunctional manner for its tactical advantage. Here that means, for example, reading together such "direct" Master Responses to my and other groundwater objections as well as such "indirect" related groundwater responses to my EIR/DEIR objections and those of others, as one consolidated and integrated environmental impact. **As *Vineyard* explained (at 443), "Ultimately, [t]he question is … not whether the project's significant environmental effects can be clearly explained, but whether they were" in a proper manner. That standard is informed by this principle: "The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build consequences and, equally important, that the public is assured those consequences have been taken into account." (at 449). The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. [i]nformation 'scattered here and there in EIR appendices or a report "buried in an**

appendix" is not a substitute for "a good faith reasoned analysis.'" (at 442). Moreover, "[c]onclusions are not the reasoned explanation CEQA requires." [See, e.g., Laurel Heights Improvement Assn v. Regents of University of California (1988), 47 Cal.3d 376, 404; North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. Of Directors (2013), 216 Cal. App.4th 614, 639-640.] This EIR/DEIR fails to meet any of these requirements, as I demonstrate in my four Objections.

As the court noted in *Richmond v. Chevron* from similar impeachment data to what is at issue in my Objections: "'By giving such conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading.' (*San Joaquin Raptor Rescue Center v. County of Merced* (2007), 149 Cal.App.3d 663, 655-656 …)" The court then stated (what also applies here): "Far from being an informative document, the EIR's conclusions call for blind faith in vague subjective characterizations. (*See Berkeley Keep Jets Over the Bay Com. V. Board of Port Cmrs.* (2001) 91 Cal. App. 4th 1344, 1371… ["[t]he conclusory and evasive nature of the response to comments is pervasive, with the EIR failing to support its many conclusory statements by scientific or objective data"); *San Joaquin Raptor,* supra, 149 Cal. App. 4th at 659 ["decision makers and general public should not be forced to … ferret out the fundamental baseline assumptions that are being used for purposes of the environmental analysis"].) After a considerable review of the flaws in the EIR process and admissions and rebuttals not addressed in the EIR, the court said: **"'[T]he ultimate decision of whether to approve a project, be that decision right or wrong, is a nullity if based upon an EIR that does not provide the decision-makers, and the public, with the information about the project that is required by CEQA.' (Santiago Water Dist. v. County of Orange (1981), 40 Cal.4th at 443**…["That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR … is irrelevant, because the public and decision makers did not have the briefs available at the time the project was reviewed and approved."]) (emphasis added) **The court also rejected the late "battle of experts" as "too little and certainly too late, to satisfy CEQA's requirements. (See Save Our Peninsula, supra, 87 Cal. App. 4th at 124 [information about baseline "occurred at the very end of the environmental review process, thus avoiding public scrutiny and precluding meaningful comparison of preproject and postproject conditions required by CEQA'].)" (emphasis added**

As other objectors and I have complained, for example, the disputed DEIR/EIR invents terms or assigns "unusual" (or misleading) meanings to terms (or "rebrands" less appealing terms) as if the EIR were communicating something scientific or factual when it's not. Consider, for example, the problem of the "waste rock" from the new (or corrective old) mining or tailings. See the CEA Objections. The disputed EIR/DEIR proposes to dump massive waste rock on the Centennial site it claims incorrectly to be a separate CEQA project and (when it needs more storage space) on the Brunswick site, while the miner cements into mine shoring underground other waste rock **with toxic hexavalent chromium cement paste.** The EIR also proposes its unlikely **fantasy to sell other waste rock as "engineered fill**," assuming gullible buyers will take the risk of the hazardous substances in waste rock from this already notorious project (which includes the already confirmed to be toxic Centennial site), As I explain, calling such "waste rock" "engineered fill," whether for governmental approvals or permits or for imagined sale is (as someone said) like trying to put "lipstick on a pig" and "rebrand" it a cozy pet. Under the circumstances, as many objectors have noted to be more challenging (or worse) than the DEIR/EIR admits, we all expect that the EIR/DEIR's imagined market for that suspect rock sales

is more selective and suspicious about the many risks of buying such "engineered fill." What we assume is that this is a disputed EIR/DEIR excuse and tactic both (i) to defend Rise's admitted lack of financial resources compared to the mining costs (see my Exhibit B discussion of Rise's SEC filing admissions and my DEIR Objection 254 #2) with imagined income from waste rock sale, as well as saving costs from having to pay to dump such waste, and (ii) to explain why that extra rock waste will not be dumped on the Brunswick or Centennial surface to compound related objections or leaving more waste in the mine as shoring requiring even greater use of toxic hexavalent chromium paste cement.

Speaking of the lack of good faith and "hiding the ball," my DEIR Objection 254 repeatedly also complained about the failure of the DEIR/EIR to reveal the visible commonly identifiable surface boundaries (i.e., at least street names and addresses) above the 2585-acre mine and especially the new mining areas. We need that data for many reasons, including so we can accurately describe to buyers of our properties (and others with a need to know) about the mining threats and problems they may encounter. Since the EIR ignored this obviously required data after I emphasized it in my DEIR Objection 254, I assume the EIR/DEIR is hiding the "bad news" from those less vigilant locals at risk so they do not realize the need to join in our opposition. **Note, for example, that the DEIR/EIR even is misusing its maps against the impacted governments. See, e.g., the objection of the California Dept. of Parks And Recreation complaining in Agency 1 (at 1-5) about the inaccurate and insufficient mapping of its adjacent state and park lands and the consequent errors on impacts on the Empire Mine Park and other State property. See also the Bear Yuba Land Trust concerns (Group 2) about map and other descriptions of its sensitive environmental areas, as well as Grass Valley's concerns in Agency 8.**

2. My Experience And Expertise In Mining Bankruptcies And Abandonments, As Well As In Related Insurance Insolvencies And Similar Situations (e.g., Asbestos, Environmental, and Mass Tort Product Liability Bankruptcies), Some of My Opinions Are Admissible Evidence, Not To Be Ignored By the EIR As Mere "Speculation" Or "Unsubstantiated" Objections. (I Am Also A Witness As A Surface Homeowner Above Or Around The 2585-Acre Mine With Competing Rights, Including To Groundwater, As Discussed Later.)

Why should the County give any special attention to my EIR/DEIR objections, as one of thousands impacted like my neighbors living on the surface above and around the 2585-acre underground mine? See some answers about me a competent witness to various disputed issues, as explained in sections I.F.8 and 9 and elsewhere throughout this Objection, as well as in my discussion of *Keystone, Varjabedian,* and other applicable cases that deal not merely with CEQA disputes but also with the potential disputes between surface owners and underground miners. See also DEIR Objections 254 #'s 3.N, 4, and 14 and my objections in section III below to those EIR "Responses" thereto. However, my focus in this subsection relates to my relevant knowledge and experience as a professional, as earlier described in my DEIR Objection 254 # 1. Before I retired from Morrison & Foerster, my national, and cross-border bankruptcy practice, as well as my insurance insolvency practice, (beginning in 1972) enables me to speak as an expert on failing and bankrupt mines and similar other relevant mass tort insolvencies (e.g., those resulting from environmental pollution, asbestos, and other product liability exposures, etc.). I mention insurance insolvency as well as mining bankruptcies because those environmental and

other disasters have resulted in the liquidation, whether in or out of court proceedings, of even leading insurers, such as Lloyds of London (e.g., the Equitas restructuring) and Industrial Indemnity (the AAA rated California insurer with most of the mine reclamation surety bond exposure in the US at that time during the savings and loan crisis). While I was involved such cases, among others, my mining lessons were expanded by my experiences as the former Chair of the ABA Insurance Insolvency Task Force that the Business Law Section created to reform the insurance insolvency laws and better reconcile them with our bankruptcy laws, as well as my dealing with leading players in the US and cross-border insolvency practices in cases and "club" events (e.g., the American College of Bankruptcy, the International Insolvency Institute, and the American College of Commercial Finance Lawyers.)

One debate among the players in such failing mining cases is whether (like many plaintiffs' tort lawyers advocate) it is better to focus on a few core complaints, or (like other committed victim lawyers who intend to press their claims until they prevail or exhaust their remedies) it is better comprehensively to identify many major claims and narrow them down over time in accordance with how the case plays out, such as when divisions of labor can be arranged in joint defense groups, like what may arise from the "Ad Hoc Mine Objection Group" discussed herein. As one can tell from the comprehensiveness of my objections, I find the latter approach preferrable because it allows for the either the "Al Capone" gambit (i.e., an analogy where that infamous mobster was finally jailed for tax fraud when too many witnesses were murdered to catch him on his more serious crimes) or the "serious chess game" approach, where you use all your pieces because in the end it could be your pawn, rather than your queen, that prevails at the end. Here I am most focused on three types of objections, without prejudice to my others: the many groundwater related impacts, the scandalous evasion of the hexavalent chromium and other toxic threats, and the objectionable maneuvers, errors, and omissions that are used in the EIR/DEIR to evade inconvenient truths, thus creating massive credibility problems for the disputed EIR/DEIR. That last type includes, for example, the many relevant and other risks and financial infeasibility of Rise's "mitigation" "aspirations" and other safety "assurances," such as those admitted by Rise (and its accountant's "going concern qualification" to Rise's financial statements) in its SEC filings (see Exhibit B hereto, as to the SEC, and Exhibit A as to the errors, omissions, and flaws in the County Economic Report incorrectly assuming that it could rely on the DEIR for its data without considering the many errors, omissions, noncompliance, and meritorious objections thereto.)

B. The Centennial Activity Is Not A Separate Project, As Previously Demonstrated in My DEIR Objections 254 and 255, But One Can Also Classify It As a Part Or Phase of One Project That Fails In Many Ways To Comply With the CERA Project Description Requirements.

As explained in my introductory comments on this Centennial dispute at section I.A.(1)(d)(ii) above, in my objections in section III below to EIR Master Response 4, and in various incorporated objections from my Table of Incorporated by Reference Objections, Guideline #15378(a) defined "project" broadly as "the whole of an action of an action" for the purposes of CEQA. That is a question of law to be reviewed de novo by the courts. E.g., *Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007), 155 Cal. App. 4th 1214. In *Laurel Heights* (1976), 47 Cal.3d 376, the court set aside an EIR for failing to analyze the impacts of the reasonably foreseeable second phase of a multiphase project (here

filling up a new building over time). See also *Bozung v. Local Agency Formation Com*. (1975), 13 Cal.3d 263, 283-284 ("environmental considerations do not become submerged by chopping a large project into many little ones…") The *Laurel Heights* test (at 396) is: "An EIR must include an analysis of the environmental effects of future expansion or other action if: (1) it is a reasonably foreseeable consequence of the initial project, and (2) the future expansion or action will be significant in that it will likely change the scope of nature of the initial project or its environmental effects." Some courts have also concluded a proposed project is part of a larger project, such that, without it, the larger project could not proceed. E.g., *San Joaquin Raptor*, supra, (residential development project EIR was inadequate because it failed to include the expansion of the essential sewer system); *Tuolumne County*, supra (Lowe's home improvement center and planned and county required realignment of the adjacent road were improperly separated as two separate projects). See also my objections to EIR Master Responses 4 and 9.

Many other incorporated objections join my prior DEIR Objection 254 in demonstrating many errors, omissions, and flaws in the CEQA required project description, and I concur as described in various of my Objections. See, e.g., the discussion of the Conditional Use Permit issues and earlier expirations than the 80-year mining and the disputed EIR/DEIR limiting its "base case" mining discussion to 2045 instead of the full 80 years, plus unexplained additional potential future exploration, and mining in the 2585-acre underground mine below the surface owned by us objectors living above and around that mine. However, for various reasons, among the most strategic failures in the project description that creates the biggest credibility problem for the disputed EIR/DEIR is its bogus claim that the Centennial Project a separate project. Therefore, I will use this Centennial error as one example of many such tactical wrongs by the disputed EIR/DEIR to illustrate what is a part of a more comprehensive pattern and practice attempting to evade CEQA. For a broader sampling but merely part of the one project that the DEIR/EIR ignores for tactical reasons, such as the CEA Objections (Grp Letters 21 and 6 to 9) and the California Native Plant Society Group Letter 5. See my Table of Incorporated Objections and my Exhibit D hereto. The EIR cannot be approved if, as here, it does not contain a correct determination of the nature and scope of the whole project. E.g., *County of Inyo v. City of Los Angeles* (1977), 71 Cal. App. 3d 185.193. See also the State Dept. of Toxic Substance Control Agency Letter 7 expressing concern about obscured joint work regarding Centennial.

Various other objections do an effective job of revealing how the disputed DEIR/EIR is internally contradictory and inconsistent in many ways that seem designed to minimize project impacts, as if different impact descriptions and purported mitigations were written by different authors whose focus was not coordinating for consistent truth, but just asserting excuses and evasions to exposing noncompliance with CEQA obligations. E.g., *Preserve Wild Santee v. City of Santee* (2010), 210 Ca. App. 4th 260, 284. See, e.g., CEA Objections in generally and each other incorporated objection where a specialist commentary exposes particular impacts that were not correctly described in the DEIR/EIR, as illustrated in Exhibit D. What my Objections add are more such specifics as well as rebuttals using Rise admissions against its disputed EIR/DEIR claims. For example, such disputed EIR/DEIR errors, omissions, and evasions attempting to separate Centennial from the single project, but they also "open the door" for my counter rebuttal evidence using Rise's admissions in its SEC filings (e.g., Rise's 10Q's and 10K's) that treat all of its property as a single integrated project, as shown in this EIR Objection 254, my Exhibit B hereto, and my DEIR Objection 254 #2.) The EIR/DEIR tries to present one story to the County and public of a separate Centennial project, while the Rise SEC 10K and other filing present a unified project to the investors and SEC. The problem with that tactic for Rise is that, while it

has listed and warned its investors and the SEC of many serious risks relating to this single project (many of which are not included in the EIR/DEIR as they should be), Rise has not warned in the SEC 10K or other filings about the consequences of this splitting off of Centennial from the unified project presented in those SEC filings. If and when that becomes a securities law compliance issue and controversy, the County should consider how the courts will deal with that confusion during the continuing disputes over the EIR, if the County mistakenly approves the disputed EIR based on the incorrect separation of the Centennial work from the single, EIR "project."

Notice, for example, that, even though the EIR mining project (e.g., such as waste rock dumping as wannabe "engineered fill" on the Centennial with Brunswick as the overflow backup) adds to the noise and vibration at the Centennial site (and, if there is overflow, more noise and vibration at Brunswick), there is no analysis of noise impacts or what results from remediation of the Centennial site. How can it be possible that the EIR mining can have such an impact on adjacent land and then claim that Centennial is a separate project that has no EIR to address such impacts? Again, the incorporated Grp Letter 5 (at 5-1 to 2) makes the California Native Plant Society's Redbud Chapter CNPS a useful witness as well as advocate on this Centennial part of this one dispute with the EIR/DEIR. As that meritorious objection complained, "The DEIR has excluded the cleanup of the Centennial site and improperly defined the Idaho Maryland Mine 'project' as everything **but** cleanup plan that is currently under review by the Department of Toxic Substances Control (DISC). This is contrary to CEQA." Citing to 15378 and numerous cases, led by *Nelson v. County of Kern* (2010), 190 Cal.App.4th 252, 272 (where the BLM has conducted an environmental review and issued a surface mining permit, the CEQA project review by the County could not be limited to the reclamation plan for that mine, but had to include the mining operations as well, especially when the reviewed project legally compels or presumes completion of another action, like the sewer expansion for the residential subdivision in *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994), 27 Cal.App.4th 713, 732.) As noted in Grp Letter 5 and in *McQueen v. Board of Directors* (1988) 202 Cal. App.3d 1136, 1144, the deir or eir cannot just focus on "isolated parts of the whole" of the project, overlooking and distorting it cumulative impacts and failing to inform the public and decision-makers of significant environmental impacts. See also, *Christward Ministry v. Superior Court (1986), 184 Cal. App.3d 180, 193; Sensible Development of Bishop Area v. County of Inyo* (1985), 172 Cal.App.3d 151, 165-66.

As so admitted in the DEIR and "Notice of Preparation" (NOP), the contaminated Centennial site (after cleanup) is expected to receive at least 1.6 million tons of additional mine waste (rebranded as "engineered fill") and, ultimately, to be reclaimed for use or sale after the mine closes, burying 44 acres of the 56-acre site and "conveniently wip[ing] the [Grp Letter 5] wetlands off the map [See DEIR 4.4. p. 4.4-12 Figure C showing a 28 acre blank area called "Clean-up Area—DTSC Project 'Attachment B.'] Likewise, as demonstrated by the CEA Objections (especially Grp Letter 21), the Centennial "RAP" itself proves that Centennial work is part of the integrated single project, as does the DEIR call for a "Reclamation Plan" for Centennial remediation, consistent with the Central Valley Regional Water Quality Control Board's reported plan for consolidating the Centennial RAP with the EIR on account of such interactions, including not just the mine dumping more waste on the Centennial site, but also the idea of imagining an eventual "pad" for future industrial use as a political cover story for the dumping.

This Centennial tactic is not presented as a "good faith reasoned analysis" by the disputed EIR/DEIR because, among other things, "if the DEIR and RAP are approved in their current forms, the protected Centennial aquatic resources will be destroyed without any evaluation of environmental impacts." [and a " piecemeal" review will occur that is prohibited by CEQA and *Tuolumne County Citizens for Responsible Growth, Inc. v. City of Sonora* (2007), 155 Cal.App. 4th 1214, 1222.] However, as explained in Grp Letter 5 this splitting of the EIR/DEIR with the DRSC's use of a Mitigated Negative Declaration (MND) for the clean-up plan is prohibited by CEQA. E.g., *Farmland Protection Alliance v. County of Yolo* (2021), 71 Cal. App.5th 300, and Pub. Res. Code #21064.5, as applied to the facts in Grp Letter 5. See also the Group Letter 2 for the Bear Yuba Land Trust and Gold Country Avian Studies Grp Letter 13. Why is this conduct so suspicious? Consider the intended effects of so isolating Centennial work: preventing a full environmental analysis of the combined impacts of the Centennial RAP and subsequent mine waste dumping, for example, impacting the Centennial wetlands discussed above.

In any event, **that Notice of Preparation (NOP) originally identified the Centennial cleanup (at p.7) as an essential "part of the proposed project." That admission remains evidence against the EIR/DEIR, especially since the NOP also confirmed that the cleanup would be reviewed as part of this CEQA document.** Indeed, the DEIR (at 3-11-12) still (without meaning to) admits the Centennial cleanup as at least two essential parts of the stated Project Objectives (increasing the future industrial land use site size; minimizing certain impacts "located on the Brunswick and Centennial Industrial sites.") While neither the EIR applicant nor the County explains why the NOP changed its position (a key question for discovery if a court challenge becomes necessary to resolve this legal question on which the County's approval is not determinative), the proper procedure would have been to revise the NOP for public comment. As noted elsewhere herein, the Rise SEC filings still treat the Centennial work as part of an integrated project. See Exhibit B hereto. See also Water Board Comment Letter to DTSC on the Centennial IS/MND, Sept. 25, 2021, at 5 (attached to various objections, including Rudder Law Group Letter 20 Attachment A ("the cumulative impacts to water quality [by the project] should be considered in a single environmental document. This seems particularly relevant considering the potential use of the Centennial Property for management and reuse of mine waste generated by the proposed Idaho-Maryland Mine-Rise Grass Valley project.")

C. Some CEQA Guidelines And Other Legal Precedents To Apply In Favor of My Objections And Against the Disputed EIR/DEIR

1. This Introductory Subsection Provides Some Basic Authorities And Principles That Can Be Applied To Support the Many Specific Objections That Follow.

a. How This Section Fits Into The Rest of the Objection.

What follows next from that prior overview and general foundation are some of the more specific legal authorities and principles that should guide the analysis of decisionmakers and support my many specific objections and defeat the disputed EIR/DEIR here and then in its "Responses" and "Master Responses" below on a point-by-point basis. Please note that additional authorities are also incorporated herein (rather than restated) from other objectors'

objections listed in the attached Table of Incorporated by Reference Objections. Also, see my legal authorities and principles cited in my DEIR Objection 254 #'s 3.N, 4, and 14 and in my DEIR and EIR Objections 255. As a general matter, my concept here is to describe such legal authorities and principles in this subsection, then to follow in the next sections with examples that apply them to particular facts and disputes. What follows after that are a systematic, point by point summary rebuttal in section II of each disputed EIR "Master Response" and then in section III to each dispute EIR "Response" to my specific DEIR Objection 254. Thus, as readers, decisionmakers can begin in this section I with a broad overview, followed by the relevant legal precedents, laws, and guidance by principles, which are then applied to the relevant facts disputing the EIR/DEIR and supporting my Objections, followed (based on that foundation) by a systematic rebuttal in sections II and III of each attempt by the EIR to evade, dispute, or otherwise contest or ignore my meritorious DEIR Objection 254 or 255 or what it may anticipate in these objections, as I counter what reactions I expect from the disputed EIR.

b. Illustrations of How CEQA And the Guidelines Apply Contrary To the Disputed EIR/DEIR

Acting as the Lead Agency under **"CEQA"** (The California Environmental Quality Act, Pub. Res. Code #21000 et seq.) and its **"Guidelines"** (14 Cal. Regs. #15000 et seq.), the County staff managed the production of a draft environmental impact report ("DEIR") and then mistakenly chose to "assume away," tolerate, or overlook massive errors, omissions, and deficiencies thereto documented by many objectors like me to allow the disputed "EIR" to proceed further in the approval process. See my discussion below of the **2018 Guideline Amendment Explanations** that correct misinterpretations and misapplications of the Guidelines by the disputed EIR/DEIR. Besides mistakenly tolerating objectors' such substantive and procedural errors, omissions, deficiencies, and noncompliance such EIR processor made a bigger mistake by incorrectly assuming the EIR was, as it falsely claimed, only "clarifying" or "embellishing" the DEIR in ways that allegedly did not add "significant" "new information" or otherwise require DEIR revisions and recirculation. *See Laurel Heights Imp. Assoc. v. Regents of the University of California* (1993), 6 Cal. 4th 1121 and the Grass Valley Agency Letter #8 and CEA Group Letter #21. However, as demonstrated in my attached or incorporated four "Objections" and others' objections in my Table of Incorporated by Reference Objections, the disputed EIR/DEIR failed to perform their CEQA requirements both to provide comprehensive "good faith reasoned analysis," applying truth and "common sense," and to lessen or avoid any significant impacts by adopting feasible mitigation measures or alternatives. Not only did the disputed DEIR/EIR fail to satisfy their burdens, but the record clearly demonstrates that such improper DEIR/EIR approach undermined CEQA's goals of full and timely disclosure of environmental impacts and effects and mitigations.

Moreover, contrary to its disputed denial and claims, the disputed EIR changed, accepted, and misapplied "significant" "new information" after public review and objections to the DEIR, especially by improperly deferring analysis and mitigation in key impact areas and factors contemplating future plans and studies only after public review of the DEIR had closed and after project approval, thereby depriving us objectors of our full rights to review and comment on the application of CEQA requirements to what the EIR has added to and changed in the DEIR. Even worse, my four Objections and others have demonstrated that the disputed DEIR/EIR needed massive revisions and recirculation to reflect truth, "common sense," and reality, instead of what

can only be described as an erroneous or noncompliant "alternative reality" imagined by the EIR/DEIR. In particular, my four Objections demonstrate not just errors, omissions, and deficiencies in the DEIR/EIR, but many mischaracterizations, evasions, and ignoring of meritorious objections by me and others. See section I.A.1.c regarding the need for EIR revisions and recirculation, section I.D, E, and F applying the CEQA law and Guidelines addressed herein to applicable EIR/DEIR disputes, and my Table of Incorporated by Reference Objections at the end of this EIR Objection 254 and Exhibit D.

Since the EIR makes no comprehensive (or often even adequate) effort to fairly address my objections on the merits, the EIR strategy seems to be to hope the decision-makers will mistakenly approve a deficient and noncompliant EIR and then try to defend the inevitable court challenges, law reform efforts, and political remedies. Judicial review of CEQA compliance by mandamus action, whether by the Superior Court or at an appellate court, is a *de novo* review of both whether the agency failed to proceed "in a manner required by law" (as here), or whether a determination is not "supported by substantial evidence" (as is also frequently the case.) CEQA #21168.5. **The project proponent has the burden and responsibility for that result. *Sierra Club,* 6 Cal.5th at 513-14.** That requires a *de novo* determination of whether the EIR/DEIR discussion is "sufficient or insufficient" and "includes enough detail." E.g., *South of Market Community Action Network v. City and County of San Francisco* (2019), 33 Cal. App. 5th 321, 330-331, citing *Sierra Club v. County of Fresno* (2018), 6 Cal.5th 502, 515-516 ("**Sierra Club**"); *Chico Advocates for a Responsible Economy v. City of Chico* (2019), 40 Cal.App.5th 839, 846-47. In order to satisfy that "adequate discussion" of the required topics that is such proponent's burden and responsibility, ***Sierra Club*** (at Id.) **mandates that the agency must explain "in meaningful detail in the EIR," including its "analytic route" from "evidence to action," which my Objections translate to requiring "good faith reasoned analysis" (e.g., *Banning, Vineyards, and Costa Mesa*) and applying "common sense" (e.g., *Gray v. County of Madera)*.** When (as here) the disputed EIR/DEIR lacks such analysis or omits the correct magnitude of the environmental impact, such as constantly with merely a "conclusory" discussion in this disputed EIR/DEIR, the EIR/DEIR is inadequate for CEQA purposes and lacks the required "substantial evidence." *Sierra Club* at Id.

Throughout the disputed DEIR/EIR it cites **CEQA # 21082(c)** to deny and evade "substantial evidence" compliance to most of my objections, wrongly claiming such objections to be merely "argument, speculation, unsubstantiated opinion or narrative" or "which is clearly inaccurate or erroneous," thereby wrongly asserting a disputed EIR/DEIR excuse to ignore my objections (and those of others). CEQA #21082(c). [Note that, while many EIR/DEIR errors, omissions, and deficiencies involve mistakes of law, rather than fact, which need to be corrected for the correct law and Guidelines to be applied to relevant facts, including applying damning Rise admissions that the EIR/DEIR cannot ultimately evade as it incorrectly attempts to do.] However, as my objections demonstrate that same standard instead applies more aptly to defeat the EIR/DEIR (which are the worst and constant such offenders), rather than my objections. CEQA #'s 21100, 21002.1. **See, Town of *Atherton v. Cal. High-Speed Rail Authority (*2014), 228 Cal. App.4th 314, 349, no judicial deference allowed for a "clearly inadequate or unsupported study,"** as my objections and others demonstrate frequently occurs in the disputed EIR/DEIR.

c. Illustrations of Noncompliance With CEQA And The Guidelines, Such As Regarding Required Investigations.

As demonstrated throughout this Objection and others incorporated herein, the EIR/DEIR fails to perform its CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation, especially mitigations, which are almost always deficient or worse. See section I.A.1.c regarding the need for EIR revisions and recirculation, section I.D, E, and F applying the CEQA law and Guidelines addressed herein to applicable EIR/DEIR disputes, and my Table of Incorporated by Reference Objections at the end of this EIR Objection 254 and Exhibit D. By admittedly failing to investigate the admittedly uncertain conditions in the mine closed and flooded since 1956, as well as failing to investigate the new areas to be mined, the disputed EIR/DEIR not only violates that basic duty, but it obstructs the information us objectors need for exposing the impacts hidden or obscured behind the dubious or worse assumptions, unsubstantiated opinions, and speculations by the EIR/DEIR, none of which are tolerable without compliant investigation and disclosure. What we do know is that Rise has warned its investors in its SEC filings (see Exhibit B and DEIR Objection 254 #2) of many material risks, uncertainties, and problems inconsistent with or contrary to the EIR/DEIR's inappropriate, speculative, unsubstantiated, and noncompliant optimism. Moreover, by so choosing ignorance to keep "hiding the ball" from impacted surface owners like me living above and around the 2585-acre mine, the disputed EIR/DEIR obstructs the data we wish for our objections and especially to assure mitigations can be improved too at least be more adequate. Even more provocative, the disputed EIR/DEIR misuses its own noncompliant lack of investigation and disclosure as a basis to challenge our objections as speculative, unsubstantiated, or otherwise deficient (when any deficiency can be blamed on the initial EIR/DEIR noncompliance and deficiencies.

Indeed, as provided in **Guidelines #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g.*, Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)**

Again, among the most common errors, omissions, deficiencies, and noncompliance in the disputed EIR/DEIR are that they "ignore or assume a solution" to a problem or claims that the missing information "will be provided in the future." *Vineyards* at 40 Cal.4th at 429, 431, prohibiting such deferred analysis or mitigation. When the EIR/DEIR fails to include the relevant information that precludes our objectors' informed decision making, objections, and public participation, as I demonstrate in my Objections commonly occurs in the disputed DEIR/EIR, such omissions defeat the disputed EIR/DEIR and thwart the goals of the EIR process. E.g., *Association of Irritated Residents v. County of Madera* (2003), 107 Cal.App.4th 1383, 1391. Again, **as explained in *Kings County Farm Bureau v. City of Hanford* (1990), 221 Cal. App. 3d 692, 724, the burden of providing the EIR information is on the EIR applicant, not the objectors**. **Indeed, I keep protesting the constant, improper effort by the disputed EIR/DEIR to shift their burden of proof, such as by demanding more explanations, details, and substantiation from me and other objectors, when the CEQA**

burdens for such analysis and reporting fall first and comprehensively on the EIR applicant, not on the objectors. E.g., *Kings County Farm Bureau v. City of Hanford* (1990), 221 Cal. App. 5th 814, placing the burden of producing the relevant environmental data on the agency, not the public.

While the EIR/DEIR seem to act as though they can ignore climate change, science, and the need to give serious attention to the future impacts of its 80 years of 24/7/365 disputed dewatering and mining, **CEQA is clear that it is a comprehensive scheme designed to provide "long term protection to the environment" that must be interpreted to "afford the fullest possible protection to the environment within the reasonable scope of the statutory language." E.g., *Mountain Lion Foundation v. Fish & Game Com.* (1997), 16 Cal.4th 105, 112. "Whether an EIR has omitted essential information is a procedural question subject to de novo review [by the courts]." *Banning* 2 Cal. 5th at 935 (also requiring "scrupulously enforc[ing] all legislatively mandated CEQA requirements").** That is what I call a question of law, because it involves the interpretation of CEQA, the Guidelines, or other applicable law. That is also the foundation of most of my objections, making the EIR/DEIR's erroneous (and worse) attempts to insist on its disputed claims nonresponsive, noncompliant, wrong, and unsubstantiated.

2. Contrary To the Disputed EIR/DEIR Misuse of And Noncompliance with CEQA And Its Guidelines To Evade Or Obstruct Objections, Here Are Some EIR/DEIR Overlooked Or Misinterpreted Principles That Should Be Applied To Support My CLIMATE CHANGE And Related Objections To Defeat The EIR/DEIR, Including From the "2018 GUIDELINE AMENDMENT EXPLANATION."

a. Some General Guidance And Applications.

Among the many disputes that the courts may have to resolve, unless the County ceases to defer to incorrect positions by the EIR applicant, are the correct interpretation and application of CEQA and its Guidelines, as well as other laws when applicable and must determine the issues. See the applications of such rules in relevant context throughout the rest of this Objection, as well as in Exhibit D and other objections identified in my Table of Incorporated by Reference Objections. For example, the disputed EIR insists incorrectly on a narrow CEQA boundary to justify ignoring objections to the EIR/DEIR, even when (as here) the EIR/DEIR far exceeds its own such asserted boundaries, in effect, obstructing rebuttals, disputes, and impeachment of EIR/DEIR errors, omissions, and other false or misleading claims. Stated another way, we objectors always have the right to rebut and dispute whatever the disputed EIR/DEIR claims, even both are outside of any real or EIR/DEIR imagined CEQA boundary. Other examples of inconsistency include the disputed EIR/DEIR misapplying to objections certain Guidelines that are instead more applicable to the noncomplying EIR/DEIR itself. Also, many CEQA provisions and Guidelines that should be applied are misconstrued, ignored, or evaded by the EIR/DEIR, while they inconsistently misapply different standards and interpretations to the objections, when the courts will apply the same standards and interpretations in both cases for a level playing field. Some of such disputes exist in almost every EIR "Response" or "Master Response" to my DEIR Objections 254 and 255, as well as those of other party objections that I incorporate.

That said, consider this guidance about interpreting the CEQA Guidelines from the creators of the Guidelines in their most recent, comprehensive **"2018 Guideline Amendment Explanation"** in hopes of reducing the need for the courts to sort out such conflicts created on a massive scale by the disputed EIR/DEIR. That commentary is the guideline to those amended Guidelines. I especially focus on those Guidelines that the EIR/DEIR misuses to attempt to evade or overwhelm the "law of evidence" that will certain apply in any court challenges to defeat the EIR/DEIR, particularly the laws allowing me to rebut and impeach any false, incorrect, or misleading statement in the EIR/DEIR with contrary evidence, especially by using Rise or other admissions against contrary or inconsistent EIR/DEIR claims and by demonstrating a lack of good faith and other objectionable tactics in the EIR/DEIR. E.g., ***Communities for a Better Environment v. City of Richmond (2010), 184 Cal.App.4th 70, 82-90, discussed herein as "Richmond v. Chevron" or the "Richmond case,"*** stating: **"Whether an EIR has omitted essential information is a procedural question subject to de novo review."** ***Banning*** **2 Cal. 5th at 935 (also requiring "scrupulously enforc[ing] all legislatively mandated CEQA requirements").** That is what I call a "question of law" because it involves the interpretation of CEQA, and that is the foundation of most of my objections, making the EIR/DEIR's erroneous (and worse) attempts *to insist on its disputed claims that are nonresponsive, noncompliant, wrong, and unsubstantiated. Communities for a Better Environment v. City of Richmond* (2010), 184 Cal.App.4th 70: "Abuse of discretion is established 'if the agency has not proceeded in a manner required by law or if the determination is not supported by substantial evidence. (CEQA #21168.5)' Substantial evidence in this context means 'enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached.' (Guidelines #15384, subd. (a).)" Here there often is a lack of sufficient such evidence in the EIR/DEIR (as well as the lack of "good faith reasoned analysis" and "common sense"), and much of what is provided by the disputed EIR/DEIR is not correct, complete (e.g., free of material omissions), compliant, relevant (e.g., claiming incorrectly and without a good faith reasoned analysis consistent with common sense that some other mining situation is "similar" or applicable when its different and irrelevant), or otherwise applicable (e.g., false comparisons, obsolete data or studies, etc.) Moreover, such EIR/DEIR "inferences" are not "reasonable" and their related "argument" is not "fair" in supporting a conclusion that, usually, is speculative, unsubstantiated, or otherwise deficient or noncompliant.

b. CEQA Guidelines, Like Many Other Laws, Recognize Climate Change And Other Realities The Disputed EIR/DEIR Incorrectly Disregards As "Speculative."

Because the disputed EIR/DEIR consistently evades or ignores the impacts and inconvenient truths of climate change that contradict their optimism and worse false claims, I note that the **2018 CEQA Amendment Explanation stated (at 47-50) the following (among other things, at 47-48) in explaining the purpose of Guideline # 15155: "Even so, climate change is expected to increase long-term variability in California water supplies. (Esther Conrad, "Preparing for New Risks: Addressing Climate Change in California's Urban Water Management Plans" (June 2013)." That Guideline commentary added that the "Department of Water Resources has identified several climate change effects that could affect water supplies, including: * Water Demand—Hotter days and nights, as well as a**

longer irrigation season, will increase landscaping water needs, and power plants and industrial processes will have increased cooling water needs; * Water Supply and Quality—Reduced snowpacks, shifting spring runoff to earlier in the year..., increased potential for algae bloom, and increased potential for seawater intrusion—each has the potential to impact water supply and water quality; * Sea Level Rise …; * Disaster—Disasters are expected to become more frequent as climate change brings increased climate variability, resulting in more extreme droughts and floods. This will challenge water supplier operations in several ways as wildfires are expected to become larger and hotter, droughts will become deeper and longer, and floods can become larger and more frequent. (Department of Water Resources, "Guidebook to Assist Urban Water Suppliers To Prepare a 2010 Urban Water Management Plan," (March 2011) at G-3.) These risks are now being incorporated into long-term water supply planning." And, of course, as stated (at 48) "California Courts have long recognized CEQA's requirement to analyze the adequacy of water supplies needed to serve a proposed project," citing *Santiago County Water Dist. v. County of Orange* (1981), 118 Cal.App.3d 818, CEQA Guidelines, App. G, #XVII(d), and various other statutes adding water supply assessment and verification requirements.

As a consequence of such referenced and other **official recognition of climate change impacts on water supplies and quality,** and the State Supreme Court's decision in *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007), 40 Cal.4th 412 ("***Vineyard***"), the CA Natural Resources Agency added **section 15155**, which the EIR/DEIR acts like it never read, considering how it continues wrongly to defy "common sense" contrary to *Gray* and incorrectly to refuse to consider climate change impacts as "too speculative" or "unsubstantiated." See, e.g., the frequent disputes between my four Objections and the EIR/DEIR over its bogus and worse attempts to evade the climate change and other mine harms and risks to groundwater supplies and quality being impacted by 24/7/365 dewatering for 80 years, clinging to the disputed EIR/DEIR illusion that our such depleted groundwater can be predicted to "recharge" by endless repetition of the "current" average rainfall between 1967 and 2017 (which the EIR/DEIR sets as the "current" baseline even though it obviously is not "current" and ignores the dry years after 2017 when the climate change impact began to be undeniable). See also discussion about the disputed DEIR/EIR cut off of water supply/recharge data in 2040, leaving us impacted neighbors to deal with uncertainties thereafter for the rest of the 80 years of 24/7/365 mine dewatering and other impacts and CEQA noncompliance.

As discussed in my climate discussion in section I.A.1.a(vii), this project has a significant adverse impact on energy use and GHG, and by itself obstructs the County's goals and plans. See, e.g., *Richmond v. Chevron* and other cases addressed in I.C and D, such as *League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2022), 75.Cal. App. 5th 63 ("**Save Lake Tahoe**") (finding the eir's greenhouse gas **[GHG]** mitigation measure was inadequate because it **deferred** determination to an unknown future time, requiring the applicant to mitigate impacts IF the project conflicted with relevant future emissions targets adopted by the state, relying on performance standards that do not yet exist and may never exist so that any determination of the impact's significance is deferred to an unknown time and where neither the county nor the applicant were committed to mitigating any such impact. Also, the eir **failed properly to consider whether renewables could be incorporated into the Project in the energy impact discussions,** as noted below.) According to Save Lake Tahoe, to be compliant the CEQA analysis of energy impacts requires both whether renewables can be incorporated into

the project, and (if significant impacts) whether renewables would reduce the impact. Also, for significant impacts, the EIR must consider all feasible mitigation measures. The EIR fails these tests, among other things, by such deferrals, by such lack of analysis and denials of such climate change matters, and by ignoring the renewables issues.

As to confirming the "significance" of these energy issues that Grass Valley calculated in its Agency Letter 8-18: "The [IMM] Project's annual energy use would represent an increase of approximately 15 percent in County-wide electric usage for a single industrial use." As Grass Valley said (at Id.): "This energy use should be recognized as a significant impact of the proposed project and mitigation should be incorporated to reduce this impact." That by itself not only defeats the Nevada County Energy Action Plan (EAP), but it depresses any willingness of mine opponents to sacrifice in their own energy usage, because our sacrifices would benefit this objectionable mine instead of our environment. Indeed, as I explain in detail with my rebuttal of the EIR/DEIR on its unrealistic and grossly understated generator use to cover PG&E PSPS, system failures, weather events, and other causes of blackouts increasing with progressive climate change impacts, the EIR's projected energy use in incorrectly analyzed. See, e.g., my objections in section II to EIR Master Responses 16, 25, and 26-28 and my objections in section III to EIR Response to Ind. 254-84.

c. Correcting the Application of the Guidelines To Groundwater And Related Issues.

For our purposes here I focus on what the 2018 CEQA Guideline Amendment Explanations commentary states about why it added **subdivision (f) to 15155**, not as new requirements, but as Guideline clarifications and to be consistent with *Vineyard* and other court decisions. The opening # (f) sentences (at 48-50) of such 2018 CEQA Guideline Amendment Explanations emphasize that **"the level of certainty regarding water supplies will increase as the analysis moves from general to specific;" i.e., the burden and necessary degree of confidence of identifying water sources is for a project are higher at the permit stage than at the conceptual plan stage."** That is reconciled for consistency with Guideline forecasting rules to the court requirements (e.g., **#15144, "an agency must use its best efforts to find out and disclose all that it reasonably can;" 15146, the degree of specificality required in an EIR will correspond the degree of specificity involved in the underlying activity which is so described). (emphasis added)**

However, because the Guidelines do not address the current groundwater owner competition between (a) us objecting surface owners, versus (b) the 2585-acre underground mine, the decisionmakers should look to the court decisions cited in my four Objections and to the Rise admissions I cite from the Rise SEC filings (e.g., Exhibit B hereto and in my DEIR and EIR Objections 255 and 254 #2, some of which are addressed herein and none of which can be overcome by some inapplicable or misinterpreted Guidelines cited by the EIR/DEIR; i.e., *Gray* and *Sierra Club* are more important for this analysis than some vague quote from a Guideline designed for a housing project on applicant owned land. Consider, for example, the question of how #15155 is applied (i) here, where the question is taking groundwater from our community (including from us surface owners whose property rights include that depleted groundwater beneath our homes above or around the 2585-acee underground mine) to be exposed to hexavalent chromium cement paste added to the mine shoring and other hazards, purportedly

treated, and then flushed away somewhere else down the Wolf Creek to some unsuspecting NID customers, as distinct from (ii) the more common #15155(f)(2) problem about where homeowners in a new subdivision are going to find the water they need.

Fortunately, the 2018 CEQA Amended Guidelines Explanation adds: "the focus of this subdivision [(f)(2)] should be on the environmental impacts associated with a particular water supply," citing *Vineyard,* 40 Cal.4th at 434 (the "ultimate question under CEQA… is not whether an EIR establishes a likely source of water, but whether it adequately addresses the reasonably foreseeable impacts of supplying water to the project.") "For example, after establishing the amount of water a project will need [or, I believe any court addressing our challenge would say, will deplete], the analysis might examine whether supplying that amount from groundwater might lead to subsidence or unsafe yield, or whether diverting that amount from surface flows might adversely affect fish and wildlife." See the Supreme Court's *Keystone* decision and discussions herein of subsidence authorities in my DEIR Objection 254 #3.N, 4, and 14. That is what we risk here for no net benefit to our local community (Id. #2), and none of us impact victims will tolerate this disputed EIR/DEIR's approach to what it incorrectly calls "mitigation" for the harmful impacts of this disputed EIR mining and dewatering, forcing us surface owners above and around the 2585-acre mine to defend our health, welfare, property rights and values, our forests and environment, and our way of life, by enforcing our obvious, competing, legal, political, and law reform remedies.

The absurd EIR/DEIR answer to these problems it creates seems to be incorrectly to evade the whole problem by falsely calling our objections too "speculative" to merit any "common sense," "good faith reasoned analysis" required by CEQA as stated in *Gray, Banning, Vineyard, and Costa Mesa.* The right answer is to focus not just on what the mine does with our groundwater, but rather also to begin with the fact that it is massively and continuously depleting our groundwater 24/7/365 for 80 years, thus impacting us surface owners and our property and forests above and around the 2585-acre mine, as well as our whole community. Notice the different incentives. The real estate developer and its customers want the water for beneficial uses, whereas the exploitive miner just wants to drain and flush away somewhere else downstream all our precious groundwater to prevent it from flooding the mine, so (but for any enforceable and fully funded or secured well replacement obligations the miner cannot evade or ignore when it has finished its mining; i.e., assurance the mine won't follow the objectionable, but common, miner tradition and retreat to Canada with its accumulated gold and profits when the mine is no longer profitable) the disputed EIR/DEIR somehow imagines that more long term depletion is good for the mine by reducing its dewatering costs and risks and ultimately, later watering other downstream communities of no benefit to us owners losing our owned groundwater for miner shareholder profits also to be exported. See, e.g., Varjabedian v. Madera (1977), 20 Cal.3d 285 (the impacted locals downwind of the new sewer plant project had nuisance, inverse condemnation, and other claims because they could not be required to suffer disproportionately for what some official considered the common good for a community most of whom were not impacted but benefitted.) However, since the mine will be legally and politically accountable for its depletion of our groundwater one way or another (i.e., either by failing CEQA compliance and denied approval, or, if the project is approved, as such disproportionately impacted citizens with such claims), it is essential that the EIR/DEIR address where it gets the water to replace what it has depleted, because in that sense it is like the real estate developer in the Guidelines who needs a water supply for its project. As my objections note, but the disputed EIR/DEIR disregards as "speculative," climate change will inspire many more of us impacted

surface owners above and around the 2595-acre mine to develop new competing wells to use our groundwater to save our property, our forests, and our way of life, creating environmental impact issues not addressed as required by the EIR/DEIR.

b. The Guidelines Require CEQA Compliance For All Phases of the Project, Which the Disputed EIR/DEIR Refuses To Do, With Especially Dangerous Impacts on Groundwater And the Environment From 80 Years of 24/7/365 Dewatering And Mining And From the Centennial Activities.

More important, such 2018 Guideline Amendment Explanation's discussion of 15155 subdivision (f)(2) insists that the analysis of environmental effects of supplying water to the project "must account for all phases of the project", following the mandate of *Vineyards*, 40 Cal.4th at 431: "an adequate environmental impact analysis for a large project to be built and occupied over a number of years, cannot be limited to the water supply for the first stage or the first few years." (emphasis added) Thus, for example, the disputed EIR/DEIR comments regarding the 24/7/365 dewatering and mining and related activities for **80 years** fail not only by various other noncompliance, but also because the disputed EIR/DEIR makes no attempt to provide the required "common sense", "good faith reasoned analysis" for the long term, especially after 2040. In effect, unlike the thousands of us potential victims living above and around the 2585-acre mine demanding scientific data with climate change factored into the analysis, the disputed EIR/DEIR demands instead that decisionmakers just assume/speculate/guess that the EIR/DEIR's incorrect, deficient, and noncompliant data and assumptions from the period before 2040 be someone treated as continuing without change for the rest of the 80-year project. **CEQA GUIDELINE #15155(F)(2) SPECIFICALLY REJECTS THE CLAIM ASSERTED BY THE DISPUTED EIR/SEIR THAT IT ONLY NEEDS TO CONSIDER 20 YEARS IN THE FUTURE, STATING IN THAT EXPLANATION OF THIS 2018 GUIDELINE AMENDMENT EXPLANATION UPDATE: "THIS [I.E., REQUIRING ANALYSIS FOR THE ENTIRE PROJECT PERIOD, I.E., HERE 80 YEARS] IS AN IMPORTANT CLARIFICATION BECAUSE THE WATER SUPPLY ASSESSMENT AND VERIFICATION STATUTES ONLY REQUIRE LOOKING TWENTY YEARS INTO THE FUTURE," WHEREAS "[S]OME [CEQA PROJECTS MAY HAVE A LIFESPAN OF FIFTY YEARS OR MORE. IN THAT CIRCUMSTANCE, SOME DEGREE OF FORECASTING MAY BE REQUIRED," CITING # 15144. (EMPHASIS ADDED) IN OTHER WORDS, THIS IS ANOTHER EXAMPLE OF A "BAIT AND SWITCH" TACTIC BY THE DISPUTED EIR/DEIR, WHERE INSTEAD OF COMPLYING WITH CEQA AND APPLICABLE LAW, THE EIR/DEIR DEMANDS THAT EVERYONE INCORRECTLY FOCUS ON THE INAPPLICABLE WATER CODE ISSUES DESIGNED FOR OTHER KINDS OF PROJECTS (NOT MINING) AND THAT DO NOT EXCUSE OR SUPERSEDE THE CEQA OBLIGATIONS THAT STILL APPLY HERE, AS THAT EXPLANATION EXPRESSLY STATES.**

The Centennial part of this project may also be properly considered a phase, because I correctly refute the incorrect attempt by the EIR/DEIR to treat Centennial work as a separate project. See section I.B.

In addressing the circumstances affecting the likelihood of water supplies, 15155 subdivision (f)(3) requires acknowledging "any circumstances that might affect the availability of water supplies identified for a project, citing *Vineyard.* 40 Cal. 4th at 432 requiring the eir to "address the impacts likely future water sources, and the EIR's discussion must include a reasoned analysis of the circumstances affecting the likelihood of the waters availability" as well as "the magnitude of variability" and uncertainty. The similar *Gray* mining case adds "common sense" to that rule. While this Guideline suggests some examples of circumstances that might potentially affect water supplies, my four Objections illustrate how the disputed EIR/DEIR consistently and improperly evades, ignores, and fails to comply, including by refusing to consider climate change as too speculative or just by unjustified omissions and evasions. Note that, as my and other objections demonstrate and cases like *Gray* require, the issue is not just the disputed EIR/DEIR's failure correctly and sufficiently address the recharge of this mine's 24/7/365 dewatering depletion of our groundwater for 80 years, but also the question of how much water will be required by (or to replace) the **existing and future wells** above and around the underground mine when us surface owners above and around the 2585-acre mine develop our competing wells for our owned groundwater and/or insist on replacement supplies as required by County General Plan 17.12 (see section I.E.3 below). The ultimate fact finder here, whether county decisionmakers or the courts (or voters enacting law reforms and voting for better environmental and other enforcement), will ultimately follow *Gray* and insist on full water restoration on the same usage as before the mine depletion. See section I.E.3 below and other incorporated objections in my Table of Incorporated Objections, such as by the CEA (including Group Letters 9 and 21), the Bear Yuba Land Trust (#2), the Friends of Banner Mountain (#11-12), the Rudder Law Group(#20), the South Yuba Citizens League (25), the Sierra Fund (#26), the Wells Coalition (#27-28), the Wolf Creek Community Alliance (#'s 29-32), the State Dept. of Parks And Recreation (Agency #1), the California Dept. of Fish And Wildlife (Agency #3), and Grass Valley Community Development Dept.(#8).

As in the similar mining eir dispute in *Gray,* the only compliant and feasible solution in this case would be to create a new, compliant water system for replacing the depleted groundwater for everyone impacted now or in the future, including all of us living on the surface above and around the 2585-acre underground mine. However, as in *Gray*, that possible solution is not addressed in the disputed EIR/DEIR and would require another EIR/DEIR process. The absence of such a feasible, sufficient, and compliant mitigation solution must defeat the EIR for the same reasons the mine was defeated in *Gray*, especially since the Rise SEC filing admissions prove that it cannot afford any meaningful mitigation, much less something sufficient and compliant. See Exhibit A and my DEIR Objection 254 #2. **In any case, the more fundamental deficiency is that the disputed EIR/DEIR does not acknowledge or even propose any theoretically possible mitigation for all the existing wells, much less all the competing future wells climate change (not to mention the mine) will inspire from us surface owners above and around that underground mine. See Exhibit A, where the County Economic Report admits more than 300 existing wells at risk, still a lower number than actually exist. See also the Wells Coalition Group Letters 27-28, the CEA Group Letters 6-9 and 21, the South Yuba Citizens League Group Letter 25, and other incorporated objections addressing this issue.**

More importantly, consider this reality about the possible sources of replacement water to what precious groundwater is so depleted and flushed away by the disputed EIR/DEIR 24/7/365 dewatering for 80 years. (Note, as my Objections prove, contrary to the disputed EIR/DEIR, it is

irrelevant to our objecting community that some other community downstream along the Wolf Creek receives our diverted groundwater, since as stated in cases like **Varjabedian v. Madera** (1977), 20 Cal.3d 285, based on the US and California Constitutions, nuisance, inverse condemnation, and other claims arise for local victims downwind of sewer plant stench disproportionately impacted for the real or imagined benefit of the larger population not so impacted.) Nothing in the EIR/DEIR attempts to deal with the scale and timing of the environmental impacts of such dewatering and the mitigation replacements that the law will require one way or another. **First, the existing and future well impacts will be determined to be massively larger than the disputed DEIR/EIR claims, and us surface owners have property rights to that groundwater that cannot continue to be ignored by the EIR/DEIR; e.g., although the disputed EIR/DEIR continues wrongly to ignore such realities, "subsidence" is not just the depression or collapse of the surface caused by the mining support failing, but also by the depletion of the groundwater support, not to mention our competing surface owner rights to access our groundwater for our surface uses. See the Supreme Court's *Keystone* decision**. **Second,** the only two options to keep the mine project from flooding (besides such massive depletion that the water table drops below the deep mining, an environmental catastrophe which I cannot imagine the EIR/DEIR would wish to argue): (1) to build some disputed and non-feasible water system to recycle (i.e., treat and transport) the depleted groundwater the miner has just polluted by exposing it to the hexavalent chromium and other mine toxins, of which (as *in Gray*) there has been no CEQA compliant discussion in the EIR/DEIR (Indeed, even the disputed, lesser water treatment process insufficiently described in the EIR/DEIR is noncompliant.), or (2) access massively more NID water than contemplated by the EIR/DEIR without any practical or affordable way to deliver it to us thousands of mine victims. See these same issues dooming the mine in *Gray.* Would the miner, even if it could afford to do so, which Rise's SEC filings admit it lacks the resources to do (See Exhibit B), even try to propose to speculate overcoming the impossible? Could the miner even imagine, for example, attempting to arrange all the easements and other deals that would be needed regarding objectors' surface properties for any such disputed solutions from the very objectors who are committed to resisting the mine menace with all possible legal, political, and law reform remedies to save our properties and our communities' health, welfare, forests, and environment?

As so explained herein and in the similar *Gray mining case*, there can be no feasible mitigation alternative for this water issue once the reality is exposed and addressed as required by CEQA and other applicable laws with which the disputed EIR/DEIR is not compliant. See #15155(f)(4) addressing example alternatives and mitigation, with its fall back of modifying the project to require less water or reducing the duration of the mining, neither of which seems likely to be practical, feasible, or acceptable to the impacted local objectors in this case. As in *Gray*, this EIR/DEIR must be disapproved, when the objectors expose the realities either to decisionmakers who care about reality and the rights, welfare, and needs of our local community living on the surface above and around the 2585-acre underground mine or, if approved, to the courts who will care about the rights of us impacted victims. **While the EIR responses to DEIR noncompliance consistently evade, ignore or incorrectly dismiss the relevant objections, consider the relevant rebuttals with better comparables, for example as to groundwater disputes, the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater**

the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change. See also the Union discussion of comments by hydrology expert Sol Henson.

Even worse, consider our "pick your poison" dilemma addressed in sections I.A.1.d(viii), and throughout I.F (especially 5 and 6), discussing or illustrating objectionable tactics (e.g., "hide the ball" and "bait and switch") where we will either have to suffer either (i) the loss of precious water during our many coming climate change droughts, including both from NID water restrictions and from the depletion of our groundwater by 24/7/365 dewatering for 80 years, or (ii) health risks from toxic asbestos and other fugitive dust requiring frequent daily watering suppression as the NSAQMD demands be a priority in its Agency Letters 11 and 12:

> The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements [i.e., DEIR mitigation proposed frequent daily watering attempting to keep toxic dust out of the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less water because of water wasted on this no net benefit mining]. Since the dust contains asbestos, silica, and numerous toxic substances [now adding hexavalent chromium] adequate dust control is necessary. There should never be a situation where dust control is compromised because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest.

As explained in many applications throughout these objections, if the County decisionmakers mistakenly approve the EIR, the only practical solution to this intolerable dilemma while we enforce our remaining judicial, law reform, and political remedies for us objectors living above and around the 2585-acre underground mine to enforce our groundwater rights (see, e.g., *Keystone* and *Varjabedian*) with better existing wells and new wells. That competition for water with the mine, which the EIR/DEIR dismisses as speculative, even though it causes the problems that require such competitive solutions and counters, cannot be ignored if there is to be any adequate compliance with CEQA and other applicable laws.

c. Some Improper Ways The Disputed EIR Evades Any Sufficient Response Or Compliance .

As shown in section III below, the EIR Responses To Comments Ind. 254 and 255 are usually nonresponsive, wrong, and evade of the duty to respond fairly and fully in accordance with the Guidelines, including 15088, and applicable law such as by objectionable tactics demonstrated throughout my Objections. See, e.g., section I.A.1(d) above and I.F. 5 and 6 below, my DEIR Objection 254 #3.E, and the many other places where the disputed EIR/DEIR fails to provide the "good faith reasoned analysis" and "common sense" required by *Gray, Banning, Vineyard, Costa Mesa,* and other authorities. See Exhibit D and my Table of Incorporated by Reference Objections. For example, while a response may be "general" to a "general comment," the disputed EIR cannot (as it has frequently done) chop up or fragment many of my integrated, and detailed section grouped comments and then declare them to be "general," so that the EIR can dismiss them without adequate responses. Likewise, the disputed EIR evades meaningful responses by incorrectly claiming that my comments (especially as chopped up into fragments) fail to

"explain" the "relevance" of information or to provide sufficient detail in my comments, often totally and wrongly ignoring not only adjacent comments in my text but also my cross-references and incorporations by reference.

That disputed EIR/DEIR tactic is another version of refusing to respond to objections that the disputed EIR/DEIR incorrectly brands as speculative or unsubstantiated. See, e.g., **Guidelines #15145**, discussing how **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)**

My objections typically have at least multiple consequences, especially when integrated with others that I incorporate. For example, when I demonstrate a significant impact that the disputed EIR/DEIR has failed to recognize and address with the required common sense (e.g., *Gray*) and a good faith reasoned analysis" (e.g., also *Banning, Vineyards, and Costa Mesa*), that triggers both a need for complaint EIR revisions on the issue, plus a need for compliant mitigations to address the evaded or overlooked significant impacts. Whenever there is a potentially significant impact, the lead agency "must propose feasible mitigation measures." CEQA #'s 21002, 21080(c)(2), 21100(b)(3). And that EIR formulation of mitigation measures cannot be deferred under any circumstances that are applicable in this EIR case. E.g., *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal. App. 4th 70, 92; Richmond v. Chevron; Guidelines #15126.4(a)(1)(B), following case law and principles discussed in the 2018 Guideline Amendments Explanations at 43.

The 2018 Guideline Amendments Explanations (at 44) discuss how amended #15126.4, following some court decisions allowing in rare cases certain types of mitigation deferrals of "some of the **details** of mitigation measures" under certain circumstances, such as where "practical considerations preclude development of detailed mitigation plans at the time of project consideration," "provided that the **[lead] agency** commits itself to mitigation and analyzes the different mitigation alternatives that might ultimately be incorporated into the project." (emphasis added). [Note here **the County** (as distinguished from the miner) is not committing itself to any mining related mitigation, since this is a private benefit project **only for Rise** and for the profit of this Canadian miner's shareholders, although I would not consider the disputed EIR mitigations to be qualified commitments, and none of those noncompliant, purported mitigations are economically or other otherwise feasible or sufficient. This explains, for example, why NID's Agency Letter 10 properly insists that Rise must post surety bonds to assure performance, a credit risk topic on which I am a competent witness. See also the Grass Valley Agency Letter 8 and Nevada County Association of Realtors Group 15.]

Among the notable Guideline amendments (explained starting at p. 44) were (i) clarification in subdivision (a)(1)(B) follows stated cases ruling that "the **lead agency** [since deferral is **not a miner** option] '**shall'** not defer **identification** of mitigation measures" [which

has happened every time the disputed EIR/DEIR has failed to appreciate each of the many objected to matters requires compliant mitigation that the EIR/DEIR fails to provide] (emphasis added with "shall" replacing "should" to end any arguments that this is discretionary, because it's mandatory); (ii) the only thing deferred, if and when any deferral is permitted, are the "**specific details"** and only then when the **lead agency** demonstrates **why it is "impractical or infeasible to fully formulate the details of a mitigation measure at the time of project approval and the agency commits to mitigation**." (emphasis added), citing as authority followed, among others, Preserve Wild Santee (2012), 210 Cal.App.4th 260 (deferral of mitigation details was improper where performance standards were not specified and lead agency did not provide an explanation for why such standards were impractical or infeasible to provide at the time of certification of the EIR.); (iii) the "**lead agency** should **adopt specific performance standards** and **provide a list of the types of possible mitigation measures that would achieve the standard**," citing *Rialto Citizens for Responsible Growth v. City of Rialto* (2012), 131 Cal. App. 4th 777 (emphasis added) to remind us that **the required specific performance standards could not be "so open ended that they allowed potential impacts to remain significant"** (emphasis added, which, like the others, this requirement defeats those attempts by this EIR/DEIR to claim deferred mitigation in this case); and (iv) **when deferral is permitted on account of another regulatory agency issuing another permit with its own mitigation requirements, the eir lead agency must still itself commit to mitigation with such required performance criteria. Since I cannot imagine the County would be guaranteeing or substantively supporting any such private project, considering the legal and political consequences, including the laws against such gifts of public funds for such private projects, I do not foresee any way this EIR/DEIR could satisfy those requirements for such deferred mitigation. As to the effects of concerns by other CEQA "responsible agencies," see section I.A.1.a (vii) and *We Advocate Through Environmental Review v. City of Mount Shasta* (2022), 76 Cal.App.5th 629.**

d. Environmental Setting And CEQA Lessons from 2018 Guideline Amendments Explanation.

The 2018 Guideline Amendments Explanations to Guideline #15125 are often intended to accomplish or implement what the courts have also required, but which this EIR/DEIR insists on evading: to clarify that the purpose of defining the "environmental setting" is to give decisionmakers and the public an "accurate picture of the project's likely **impacts, both near-term and long-term**." (emphasis added) "Cal. Nat. Resources Agency Final Statement of Reasons For Regulatory Action Amendments To the State CEQA Guidelines" Nov. 2018 ***("2018 Guidelines Amendments Explanations"***) at 34-36. That commentary follows *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013), 57 Cal. 4th 439, 455 (requiring "the most accurate information on the project impacts practically possible, and the choice of a baseline must reflect that goal.") Accord *Communities for a Better Environment v. South Coast Air Quality Management Dist.* (2010), 48 Cal. 4th 310. The EIR/DEIR often flunks that test, for example, when it sets the groundwater recharge baseline rate based on average "current" rainfall from 1967 to 2017, disputed and ignoring the more current and dry years after 2017 as well as emerging climate change impacts that are beginning the new normal. See the climate change Guideline recognition and applications at my section I.C.2.

As such 2018 Guidelines Amendments Explanations said, "When in doubt, lead agencies should choose the baseline that most meaningfully informs decision-makers and the public of the project's possible impacts." And subject thereto, the new 15125 subdivision (a)(1) declares that the normal rule is that "normally, conditions existing at the time of the environmental review should be considered the baseline" and "the lead agency must expressly justify its decision not to use existing conditions as the baseline for environmental analysis…[supported by] substantial evidence in the record." Id. [That discussion reminds us that substantial evidence does not include 'speculation…or… evidence that is clearly inaccurate or erroneous," as the disputed EIR/DEIR often does.] The disputed EIR/DEIR does the opposite of both such normal and special rules in an obnoxious effort to avoid "significance" and reality about our drier, climate change future and the "common sense" harms from 24/7/365 dewatering for 80 years of groundwater owned by those of us on the surface above and around the 2585-acre underground mine. **Note also, that, consistent with the *Neighbors'* decision and the concerned that predictive modeling may not be readily understood by the public (at 455-456 and CEQA 21003(b)) documents must "be organized and written in a manner that will be meaningful and useful to decision-makers and the public."**

The EIR/DEIR also violates (a)(3), prohibiting using "hypothetical conditions as a baseline…As the Supreme Court explained in its CBE decision: '[a]n approach using hypothetical allowable conditions as the baseline results in 'illusory' comparisons that 'can only mislead the public as to the reality of the impacts and subvert full consideration of the actual environmental impacts,' a result at direct odds with CEQA's intent." Communities for a Better Environment, supra, 48 Cal. 4th 322 (quoting Environmental Planning & Information Council v. County of El Dorado (1982), 131 Cal.App. 3d 350, 358).)"

Also, that 2018 amendment commentary 9at 38-42) implements the Supreme Court's holding in the CBIA case, 62 Cal. 4th at 377 ('when a proposed project risks exacerbating those environmental hazards or conditions that already exist, an agency must analyze the potential impact of such hazards on future residents or users').)" ["similar to an 'indirect' effect" in Guidelines #15064(d)(2).] Also, the amendments clarify that a project's direct and indirect and cumulative effects may affect the hazardous condition," requiring CEQA evaluation. That is illustrated by a coastline example, but it also applies here where it's appropriate to regard this ancient mine, closed and flooded since 1956, to be such a hazard, although the disputed EIR/DEIR inappropriately avoided that analysis to evade dealing with inconvenient truths that might be discovered.

MOST IMPORTANTLY, the Guideline's "final addition clarifies that a lead agency should consider not just existing hazards, but the potential for increasing severity of hazards over time. This change is necessary because certain types of hazards [citing "more intense wildfires" and "increased flooding"] are expected to be more severe in the future due to our changing climate" [which the EIR/DEIR incorrectly and worse refused to do on the incorrect theory that it was too "speculative" to worry that, for example, 24/7/365 dewatering of our groundwater for 80 years would be made worse by climate change's increasing dryness.] These types of climate change impacts may worsen a proposed project's direct, indirect, or cumulative environmental effects in the future…. Focus on both short-term and long-term effects is also necessary to implement express legislative policy," citing CEQA 21001(d) and (g) and 21083(b)(1.).

As to the Guideline amendments for mitigation measures, note (at 43-44) that when there is a "potentially significant environmental impact," the EIR must propose feasible mitigation

measures," citing CEQA #'s 21002, 21080(c)(2), 21100(b)(3). "The formulation of mitigation measures cannot be deferred until after project approval [as our dispute EIR/DEIR often does]. Communities for a Better Environment v. City of Richmond (2010), 184 Cal. App. 4th 70, 92 ('reliance on tentative plans for future mitigation after completion of the CEQA process significantly undermines CEQA's goals of full disclosure and informed decision making; and consequently, these mitigation plans have been overturned on judicial review as constituting improper deferral of environmental assessment.')" Because of many cases on this subject, the Guidelines amended 15126.4.

The EIR/DEIR generally fails to provide an adequate and accurate baseline and environmental setting especially by deficiently addressing the 2585-acre underground mine and its impact on us surface owners above and around the mine. To accomplish the fundamental goal of any eir, it must inform decision makers and the public of any significant adverse effects a project is likely to have on the physical environment. To make that assessment the EIR must delineate the environmental conditions prevailing absent the project, defining a baseline against which predicted effects can be described and quantified. E.g., *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority* (2013), 57 Cal. 4th 439, 447. This includes providing a description of the physical environmental conditions in the vicinity of the project at the time the notice of preparation is published or … the analysis is commenced…" Id. at 448; Guidelines #15125(a). "Without accurate and complete information pertaining to the setting of the project and surrounding uses, it cannot be found that the FEIR adequately investigated and discussed the environmental impacts of the development project." E.g., *San Joaquin Raptor/Wildlife Rescue Center v. County of Stanislaus* (1994), 27 Cal. App. 4th 713, 729. Indeed, "[w]ithout accurate and complete information pertaining to the setting of the project and surrounding uses, it cannot be found that the FEIR adequately investigated and discussed the environmental impacts of the …project." Id. at 729. Stated another way, there is no harmless error excuse that will save a deficient eir on this criterion. Assuming (especially incorrectly as it does) that the conditions for the limited areas described in the DEIR/EIR are the same for the rest of the mining area and surrounding areas is insufficient and worse and requires the rejection of the EIR/DEIR. (There is no area "surrounding" the mine more in need of honest, common sense, good faith reasoned analysis than the surface and at least 200 feet below it and our shared groundwater above and around the 2585-acre underground mine.) *Banning* at 942.

Here, many fear, Rise has not adequately evaluated either the 2585-acre underground mine (closed and flooded since 1956) because it seems not want to have to deal with inconvenient truths and realities or litigation exposures (and it may not be able to afford the required analysis, see Exhibit B SEC filing admissions by Rise). Also, it ignores threatened wells that exist now or are likely to exist in the future, as well as the competition between us surface owners and the underground mine. Furthermore, such disputed omissions tend to be tactical, such as the refusal of the EIR/DEIR to map the underground mine against the surface properties in a reasonably identifiable way, apparently to avoid awakening opposition by surface owners mistakenly imagining from the disputed and vague maps that they are beyond the impact zone of the mine. Instead, the disputed EIR/DEIR offers its unsubstantiated opinions, assumptions, and speculations about those mine conditions, which means there is no meaningful baseline as required. Therefore, the EIR/DEIR cannot comply with CEQA, since "the description of the environmental setting of the project site and surrounding area is inaccurate, incomplete, or misleading." E.g., *Cadiz Land Co. v. Rail Cycle* (2000), 83 Cal. App. 4th 74, 87. As Guideline #15125 explains: Knowledge of the regional setting is critical to the assessment of environmental

impacts," which requires enough detail to allow analysis of a project's potential impacts, since the primary purpose of CEQA is to inform government decision-makers and the public about significant environmental effects of proposed projects before approving or denying them. *Citizens of Goleta Valley v. Board of Supervisors* (1990), 52 Cal.3d 553, 564; *San Joaquin Raptor*, 27 Cal. App.4th at 729; *Cadiz*, 83 Cal. App. 4th at *87; Galante Vineyards v. Monterey Peninsula Water Management Dist.* (1997), 60 Cal. App.4th 1109, 1122. A stable and accurate description of the surrounding area is not less crucial than a correct description of the project. E.g., City of Irvine v. County of Orange (2015), 238 Cal. App. 4th 526, 542 fn. 8 (A "stable and accurate description of a project is the 'sine qua non' of an EIR").

e. The Disputed EIR Had Its Chance To Comply, And There Is No Redo Opportunity.

More importantly, the lead agency cannot, as the County is asked to do here by the EIR/DEIR, "make up for the lack of analysis in the EIR through post-EIR analysis," especially because the lead agency has the critical "burden to investigate" such potential environmental impacts. E.g., *League to Save Lake Tahoe Mountain v. County of Placer* (2022), 75 Cal. App.5th 63, 107. Notice, for example, that the disputed Centennial site is already a recognized toxic mess, and the disputed EIR mistakenly (or worse) treating it as a separate site seems to be designed to avoid discussing the risks of "mobilizing existing contaminants" and even adding to them. In any event, as Guideline # 15125 explains, the EIR/DEIR is required to provide the most accurate and understandable picture practically possible of the project's likely near-term and long-term impact. In any event, as Guideline # 15125 explains, the EIR/DEIR is required to provide the most accurate and understandable picture practically possible of the project's likely near-term and long-term impact. However, despite asking for the right to impose 80 years of risk and misery on those of us living above and around the 2585-acre mine, the DEIR/EIR cuts off its disputed NID data in 2040, well before the 80-year term ends offering nothing beyond that that deserves anything besides contempt.

As *Vineyard* explained (at 443), "Ultimately, [t]he question is … not whether the project's significant environmental effects can be clearly explained, but whether they were" in a proper manner. That standard is informed by this principle: "The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build consequences and, equally important, that the public is assured those consequences have been taken into account." (at 449). The data in an EIR must not only be sufficient in quantity, but it must also be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. [i]nformation 'scattered here and there in EIR appendices or a report "buried in an appendix" is not a substitute for "a good faith reasoned analysis.'" (at 442). Moreover, "[c]onclusions are not the reasoned explanation CEQA requires." [See, e.g., Laurel Heights Improvement Assn v. Regents of University of California (1988), 47 Cal.3d 376, 404; North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. Of Directors (2013), 216 Cal. App.4th 614, 639-640.] This EIR/DEIR fails to meet any of these requirements, as I demonstrate in my four Objections.

D. Some Key Court Decisions And Principles For Applying CEQA And Its Guidelines To Dispute The EIR/DEIR And Support My Objections, Including Those Already Discussed in DEIR Objections 254 And 255.

1. My Prior Legal Briefing In DEIR Objection 255 (as well as in DEIR Objection 254 #'s 3.N, 4, and 14) Apply with Even More Force To the Disputed EIR.

My DEIR Objection 255 (as well as my new EIR Objection 255 rebutting the disputed EIR "Responses" and "Master Responses thereto) contain ample legal precedent for defeating the EIR/DEIR on the merits both on the applicable law and on the true facts, circumstances, and conditions, including by using the Rise admissions to rebut, impeach, and defeat the EIR/DEIR claims about economic and other feasibility. Indeed, the similar quarry mining case of ***Gray v. County of Madera*** (2008), 167 Cal. App.4th 1099 ("***Gray,"***) by itself is sufficient to defeat the EIR/DEIR, especially as to the water depletion, quality, and mitigation issues. See also ***Sierra Club v. County of Fresno*** (2018), 6 Cal.5th 502 ("**Sierra Club**"), which interprets and applies CEQA and the Guidelines with clear rules that the dispute EIR/DEIR constantly violates, such as by failing to provide the required disclosures consistent with its standards for "adequacy, completeness, and a good faith effort at full disclosure." Rather than repeat my detailed analysis of those precedents and cited laws and Guidelines, I incorporate herein my such DEIR and EIR Objections 255, as well as my DEIR Objection 254 #'s 3.N, 4, and 14. Since I have already proven the various key disputes in my DEIR Objection 255, which is incorporated herein for issues such as, for example, demonstrating the economic infeasibility of this EIR/DEIR mine and why it is not legally possible for the EIR/DEIR to escape the Rise SEC filing and other admissions that rebut the disputed DEIR/EIR claims, I will focus here on other issues and approaches to defeating the DEIR/EIR.

As *Vineyard* explained (at 443), "Ultimately, [t]he question is … not whether the project's significant environmental effects can be clearly explained, but whether they were" in a proper manner. That standard is informed by this principle: "The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build consequences and, equally important, that the public is assured those consequences have been taken into account." (at 449). The data in an EIR must not only be sufficient in quantity, but it must also be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. [i]nformation 'scattered here and there in EIR appendices or a report "buried in an appendix" is not a substitute for "a good faith reasoned analysis.'" (at 442). Moreover, "[c]onclusions are not the reasoned explanation CEQA requires." [See, e.g., Laurel Heights Improvement Assn v. Regents of University of California (1988), 47 Cal.3d 376, 404; North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. Of Directors (2013), 216 Cal. App.4th 614, 639-640.] This EIR/DEIR fails to meet any of these requirements, as I demonstrate in my four Objections or incorporate herein from my Table of Incorporated Objections. See my Exhibit D hereto.

2. The Disputed EIR/DEIR Fails To Apply Any Compliant Threshold/Standards For Evaluating the Project's Impact on Groundwater Supplies.

Any CEQA compliant analysis of any environmental impact, such as groundwater supplies, begins with a satisfactory threshold of significance, since once a "significant" effect is identified, the agency must explore implementing feasible mitigation measures or alternatives to avoid or reduce that effect. See Guidelines #'s 15067.7, 15064, and 15002. E.g., **Berkeley Keep Jets Over the Bay Com. v. Bd of Port Comrs**. (2001), 91 Cal. App.4th 1344, 1373. This disputed DEIR/EIR fails to contain any such threshold, much less to support one as required with substantial evidence. Although not stated as a threshold, the disputed DEIR uses a 10% reduction in well water columns as a trigger, that is neither rational or appropriate, since, for example, if a struggling well loses 5% and goes dry, that is significant for that well. (Also, as my DEIR Objection 254 and others notes, consistent with the admissions in the Rise SEC 10K filings, us surface owners above and around the 2585-acre underground mine own that groundwater, with a right to its lateral and subjacent support, that the DEIR/EIR flushes away downstream in massive dewatering. Thus, any such give away of 10% of our groundwater is a Fifth Amendment taking, inverse condemnation, and nuisance, as described herein and in my DEIR Objection 254 #'s 3.N, 4 and 14.)

As discussed above and elsewhere (such as the Baseline expert report addressed in CEA Objection Grp. Letter 21 at Grp 21-30- 31), the disputed DEIR/EIR groundwater model is hopelessly flawed and invalid. See, e.g., ***Gray v. County of Madera.*** Without any rational basis, much less the common sense, "good faith reasoned analysis" required by *Gray, Banning, Vineyards, and Cost Mesa*, the disputed DEIR/EIR claims that only 30 wells will be impacted along East Bennett Road, ignoring the existing and future well rights of thousands of us objectors living above or around the 2585-acre underground mine based a bogus, theoretical water "model" and an even more deficient, unsubstantiated, and arbitrary Groundwater Monitoring Plan (GMP) that installs 15 monitoring wells in mostly incorrect or irrelevant locations to such threatened objectors. See my objections in section I.E and F on this topic as well as my related rebuttals to the disputed EIR's Master Responses in my section II and to the disputed EIR's Responses in my section III.

Furthermore, my four Objections each address major concerns with disputed DEIR/EIR impacts on water quality and supply not just for CEQA compliance, but also to protect the groundwater property ownership rights of those of us living on the surface above and around the 2585-acre underground mine. See section I.F.8 and 9, as well as DEIR Objection 254 #3.N, 4, and 14. Because it was ignored and evaded in the DEIR and then subject to a disputed coverup attempt in the EIR addressed in this objection, I have also suggested special focus on the hexavalent chromium being added to the cement paste for shoring up the mine. See, e.g., section I.F.1 and my objections in section III to EIR Response Ind.254-1. However, as I noted and the CEA Objections (especially Grp. Letter 21 supported by the David M. Chambers' Report), there are many other water quality threats that are not adequately described, much less mitigated. As noted in many cases, including as cited herein, and in other such incorporated objections, purported compliance with existing policies and regulations of relevant agencies is not an excuse for noncompliance with CEQA and other applicable law. **First**, those will change over 80 years, as illustrated by the pending upgrade on the limits of hexavalent chromium (see Exhibit C). **Second**, environmental effects may be significant despite compliance with such requirements, as

shown in *Gray* and *Protect the Historic Amador Waterways v. Amador Water Agency* (2004), 116 Cal,App.4th1099, 1108-09.

1. Rebuttal/Impeachment Illustrations In "*Richmond vs Chevron*" And Other Key Counters To EIR Errors, Omissions, And Misleading Claims.

In my objections and those of others it is common to rebut or impeach the disputed EIR/DEIR by citing inconsistent and contrary Rise admissions to rebut and impeach such EIR/DEIR claims. Such rebuttal evidence is addressed, for example, in Exhibit B to the attached EIR Objection 254 and in my DEIR Objection 254 #2, but the EIR/DEIR incorrectly rejects any such Rise admission rebuttal evidence as somehow irrelevant, but, if the County declines to consider such truths, it should be clear that the courts will find such admissions key evidence for defeating the EIR/DEIR. For example, in ***Communities for a Better Environment v. City of Richmond (2010), 184 Cal.App.4th 70, 82-90 ("Richmond v. Chevron"),*** there was a critical dispute over the issue of whether the project includes any equipment changes that would facilitate the future processing of heavier crudes [oil] at the refinery. The court stated that "there was conflicting information developed during the EIR process [**including SEC filing admissions**] that cast serious doubt on these assertions [by Chevron's EIR "in conclusory terms that the proposed Project will not result in an increased capacity to process lower quality, heavier crude, and that Chevron seeks only the ability to refine crude with higher sulfur content." The appellate court agreed with the trial court that "the EIR is inadequate as a matter of law because it does not adequately address the issue of whether there are any equipment changes that would facilitate the future processing of heavier crudes…" **The key to that was the court's discussion of conflicting or contrary admissions "in Chevron's SEC form 10K," and (as here with Rise SEC filings Exhibit B) the EIR applicant told its investors a different story in the SEC filings than it told the public in its EIR. And such admissions then led to more from questioning at a public meeting. As the court noted from such impeachment data: "'By giving such conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading.' (*San Joaquin Raptor Rescue Center v. County of Merced* (2007), 149 Cal.App.3d 663, 655-656 …)" The court then stated (what also applies here): "Far from being an informative document, the EIR's conclusions call for blind faith in vague subjective characterizations. (*See Berkeley Keep Jets Over the Bay Com. V. Board of Port Cmrs.* (2001) 91 Cal. App. 4th 1344, 1371… ["[t]he conclusory and evasive nature of the response to comments is pervasive, with the EIR failing to support its many conclusory statements by scientific or objective data"); *San Joaquin Raptor,* supra, 149 Cal. App. 4th at 659 ["decision makers and general public should not be forced to … ferret out the fundamental baseline assumptions that are being used for purposes of the environmental analysis"].)**

After a considerable review of the flaws in the EIR process and admissions and rebuttals not addressed in the EIR, the court said: **"'[T]he ultimate decision of whether to approve a project, be that decision right or wrong, is a nullity if based upon an EIR that does not provide the decision-makers, and the public, with the information about the project that is required by CEQA.' (Santiago Water Dist. v. County of Orange (1981), 40 Cal.4th at 443**…["That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR … is irrelevant, because the public and decision makers did not have the

briefs available at the time the project was reviewed and approved."]) (emphasis added) **The court also rejected the late "battle of experts" as "too little and certainly too late, to satisfy CEQA's requirements. (See Save Our Peninsula, supra, 87 Cal. App. 4th at 124 [information about baseline "occurred at the very end of the environmental review process, thus avoiding public scrutiny and precluding meaningful comparison of preproject and postproject conditions required by CEQA'].)" (emphasis added)**

Also, in *Communities for a Better Environment v. City of Richmond (2010), 184 Cal.App.4th 70, 89-96,* there was (as here) a critical dispute over the issue of whether (as the trial court ruled) the project improperly deferred greenhouse gas mitigation measures to a future, post-EIR process, creating both a failure to proceed as required by law and an abuse of discretion in approving the EIR and project, citing CEQA #21168.5 and fn6. "Instead [of addressing the significance of the project's "contribution to climate change"], the Final EIR state that making a significance determination for greenhouse gas impacts of the project would be too "**speculative."** However, even back then, there were too many **governmental confirmations of climate change** to ignore them, such as starting with the court citation of a 2010 CEQA "white paper" and the California Global Warming Solutions Act (Health & Saf. Code 38500 et seq. and later cited new Guidelines #15064.4, 15183.5). For more recent confirmation see section I.C.2 above and the 2018 Guideline Amendments Explanation explaining why climate change is now required by the Guidelines, like 15155. See also current Guideline 15064.4, 15155, 15183.5; CEQA 21083. Under pressure of reality the city revised the EIR to admit certain emissions with a significant effect prior to mitigation. That then triggered an obligation to mitigate (CEQA #21002.1, Guidelines 15126.4(a) and 15091), so the EIR proposed mitigation that the project "shall result in no net increase in GHG emissions over the baseline," and a requirement within one year after approval to submit for city approval a plan for achieving complete reduction of GHG emissions up to the maximum estimated increase over the baseline, validated by an independent expert and listing "a menu" of various possible mitigation measures. See generally section I.A.1.a(vii) above and my objections to EIR Master Responses 16, 25-28 and others.

However, the ***Richmond v. Chevron*** court (like the trial court) found: **"Formulation of mitigation measures should not be deferred until some future time. (Guidelines #15126.4(a)(1)(B).) An EIR is inadequate if '[t]he success or failure of mitigation efforts … may largely depend upon management plans that have not yet been formulated and have not been subject to analysis and review within the EIR.'** (*San Joaquin Raptor*, supra, 149 Cal. App.4th at 670.)" (emphasis added) **The court also objected to such future studies even subject to administrative approval as "analogous to the sort of post hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA" citing many cases including *Sundstrom v. County of Mendocino* (1988), 202 Cal.App. 3d 296, 307 (all incorporated herein and rejected or distinguished the various city arguments and cites. The court added: "In our opinion, the novelty of greenhouse gas mitigation measures is one of the most important reasons 'that mitigation measures timely be set forth, that environmental information be complete, and that environmental decisions be made in an accountable forum," with citations including *Oro Fino Mining Corp. v. County of El Dorado* (1990), 225 Cal. App. 3d 872, 885. (emphasis added)**

While the EIR/DEIR ignores, misinterprets, or misapplies Guidelines to suit its evasion tactics, the 2018 Guideline Amendment Explanation adds helpful support for my rebuttals, such as against EIR **Master Response D.15 at 89-91, by Guidelines insisting on the feasibility of mitigation even If deferred.** After discussing the court decisions limiting deferral of mitigation

details, that 2018 Guideline Amendments Explanation commentary [what I quoted before requiring that the agency commits and adopts specifics and identifies] explains the ***Rialto*** decision and the updated Guidelines: "In sum, 'it is sufficient to articulated specific performance criteria and make further [project] approvals on finding a way to meet them.' [citation] **Essentially the rule prohibiting deferred mitigation prohibits loose or open-ended performance criteria. Deferred mitigation measures must ensure that the applicant will be required to find some way to reduce impacts to less than significant levels. If the measures are loose or open-ended, such that they afford the application a means of avoiding mitigation during project implementation, it would be unreasonable to conclude that implementing the measures will reduce impacts to less than significant levels." (emphasis added)**

Furthermore, that Explanations' section further explains that **(1) "the agency [must] commit to implementing the measure," [which is "essential to support a finding that project impacts have, if fact, been mitigated," (2) the agency [must] identify performance standards" consistent with the rigorous requirements of the court decisions I have specified, without which there can be no "substantial evidence that impacts will in fact be reduced to less than significant level," and (3) "the measures must be feasible," which requires in turn that there must be identification of the types of measures that could achieve the standard," citing to follow the rulings in *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal. App. 4th 70, rejecting a general "net zero standard" for eliminating greenhouse gas emissions because "there was no discussion of what measures could feasibly attain that net-zero standard." (emphasis added)**

E. Key Mitigation Disputes Also Doom the EIR/DEIR, And The Constant DEIR/EIR Attempts To Violate, Evade, Or Defer Mitigation Requirements Cannot Be Tolerated For More Reasons Than Just Those Explained Above in *Richmond v.Chevron.*

1. The Disputed EIR/DEIR Fails Even To Attempt To Comply With Applicable Mitigation Requirements, And More And Better Mitigations Are Needed Than Attempted, Partly Because the EIR/DEIR Often Either Understates the Significance Of Environmental Impacts Or Omits Impacts.

a. The General Applications of These Principles Expose Noncompliance By The Disputed EIR/DEIR.

The disputed EIR/DEIR must identify and focus on the significant environmental effects of the proposed project. E.g., Guideline #15126.2(a); *Laurel Heights Imp. Assn. v. Regents of U of Cal.* (1993), 6 Cal.4th 1112, 1123 ("Laurel Heights 2"); *Richmond v. Chevron* above. Also, the EIR must then identify feasible mitigation measures to mitigate such impacts. See Guideline # 15126.4 and CEQA # 21002, 21061, forbidding approval when there are feasible alternatives or feasible mitigation measures available that lessen such impacts and requiring enforceability as a condition of development that feasible mitigation measures cannot be adopted and ignored. *City of Marina v. Bd. of Trustees of the Cal. State Univ.* (2006), 39 Cal.4th 341, 359, 368-69, and *Federation of Hillside And Canyon Assns. v. City of Los Angeles* (2000), 83 Cal. App. 4th 1252, 1261.That requires facts and analysis (that means applying "common sense" to a "good faith

reasoned analysis," as demonstrated in my applications of *Gray, Banning, Vineyard, and Costa Mesa)*, not just an agency's bare conclusions, especially when (as is often the case here) they're just disputed speculation and unsubstantiated opinions that obscure extraordinary environmental harms. See my four Objections and others that I have incorporated to reveal such noncompliance by the disputed EIR/DEIR.

Whenever the EIR/DEIR does acknowledge the need to address a significant impact, it often repeatedly and improperly attempts (a) to evade its duty to apply "common sense" and "good faith reasoned analysis" and to report environmental impacts, by (b) simply proposing disputed mitigation measures, even if they were not (as they usually are here) deficient and infeasible and especially because they are often improperly deferred. See *Richmond v. Chevron*; *San Joaquin Raptor Center v. County of Merced* (2007), 149 Cal. App. 4th 645. 663-664, explaining how "a mitigation measure cannot be used as a device to avoid disclosing project impacts." As I have demonstrated and as illustrated herein (as with *Richmond v. Chevron* above and section I.C.2 discussing how the 2018 Guidelines Amendments Explanation tighten the rules against such problematic deferrals of analysis and mitigation), the EIR/DEIR cannot defer mitigation of impacts until after project approval, especially without committing to a specific performance standard. That means specific, not generalized, standards.

Also, by deferring the mitigation details until after the CEQA process has concluded, the EIR/DEIR precludes the essential, informed public participation and fact checking to improve decision-making, which is essential especially in this case because of the massive errors, omissions, and deficiencies in this EIR/DEIR can be expected to continue into deferred future processes where they may hope for less scrutiny. See *Cleveland Nat'l Forest Foundation v. San Diego Assn. of Governments* (2017), 17 Cal. App.5th 413, 443; *Richmond v. Chevron*. The disputed theory of the EIR/DEIR deferrals can by illustrated by the logical conclusion of its disputed reasoning: if the EIR/DEIR can get away with its disputed approach, CEQA could just be evaded or defeated by a project applicant simply claiming that the project involved no significant environmental impact, but, if there were any such impacts, applicant would do timely do in the future whatever the regulators might require in the future permit process as mitigation. However, that would not be compliance with CEQA, the Guidelines, or applicable law. **Moreover, "a mitigation measure cannot be used as a device to avoid disclosing project impacts." E.g., *San Joaquin Raptor Rescue,* Ctr. at 149 Cal. App. 4th at 663-664. That should eliminate many of the disputed EIR/DEIR excuses and evasions and leave the resulting EIR/DEIR noncompliant and full of "gaps" lacking any pretense of required disclosure of impacts.**

Even where the EIR/DEIR acknowledges significant impacts that would be unavoidable after mitigation, that does not end the need for a more detailed analysis of the magnitude of the adverse impacts. E.g., *Galante Vineyards v. Monterey Peninsula Water Management Dist. (1997*), 60 Cal. App. 4th 1109, 1123. More importantly, CEQA requires (e.g., 21061, 21068) the EIR to analyze all significant or potentially significant environmental impacts, which means that this disputed DEIR/EIR has already failed to provide hydrological evidence for the whole geographic area where one might reasonably expect such impacts. E.g., *Kings County Farm Bureau v. City of Hanford* (1990), 221 Cal. App.3d 692, 721-23. That clearly includes, at a minimum, the groundwater owned by us surface owners above and around the 2585-acre underground mine, as to which we have not only CEQA rights, but also actual competing property rights of lateral and subjacent support by such groundwater. See the Supreme Court's Keystone decision about such

groundwater property rights. See also the DEIR's admission at 4.8-58 that "drawdowns of the water table are generally within the mineral rights boundary." However, since our surface owner groundwater depletion is likely being recharged, if at all, from other adjacent areas as well, the disputed EIR/DEIR cannot escape (as it has attempted to do) having to analyze where the drawdowns will come from in this complex hydrological environment of fractured bedrock systems. See section I.C.2 and my Table of Incorporated by Reference Objections, such as by the CEA (including Group Letters 9 and 21), the Bear Yuba Land Trust (#2), the Friends of Banner Mountain (#11-12), the Rudder Law Group(#20), the South Yuba Citizens League (25), the Sierra Fund (#26), the Wells Coalition (#27-28), the Wolf Creek Community Alliance (#'s 29-32), the State Dept. of Parks And Recreation (Agency #1), the California Dept. of Fish And Wildlife (Agency #3), and Grass Valley Community Development Dept.(#8).

This disputed EIR/DEIR repeatedly evades its obligations by stating its nonresponsive, infeasible, and worse "aspirations" for future developed permits or compliance with laws and regulations as a means to pretend its hazard and other related impacts will be less than "significant." This also is not compliance with CEQA. E.g., *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal. App. 4th 70, 92 (even "if the study is subject to administrative approval, it is analogous to the sort of post-hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA"). Furthermore, the EIR/DEIR may not defer mitigation to an existing regulatory scheme to avoid fully analyzing environmental impacts. E.g., *Californians for Alternatives to Toxics v. Dept. of Food & Ag.* (2005), 136 Cal. App. 4th 1 (an agency's sole reliance on another agency's pesticide registration program for mitigation is inadequate without its own evaluation of the impacts of its proposed pesticide use.) My four Objections cite many of those improperly deferred mitigation measures. For example, e.g., *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal.App.4th 70 (sometimes called the "*CBE*" or "*Richmond v. Chevron"* case), relying, among other things on the CEQA principle that: "Abuse of discretion is established "if the agency has not proceeded in a manner required by law or if the determination is not supported by substantial evidence. (#21168.5) Substantial evidence in this context means 'enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached.' (Guidelines #15384, subd. (a).)" (emphasis added) **Here there is a lack of sufficient such evidence and much of what is provided is not relevant (e.g., claiming incorrectly and without a good faith reasoned analysis consistent with common sense erroneous things, such as that some other mining situation is "similar" or applicable when its different and irrelevant.) Moreover, such EIR/DEIR "inferences" are not "reasonable," and the related "argument" is not "fair" in supporting a conclusion that is usually speculative, unsubstantiated, or otherwise deficient.**

As explained in **Mission Bay Alliance v. Office of Community Investment & Infrastructure** (2016), 6 Cal. App.5th 160, 198 n.26, that *CBE* case rejected the sponsor's proposal to submit to the City Council within a year a plan for achieving a complete reduction of GHG emissions up to the estimated emissions over the baseline. Among other things, that *CBE* court found (at 93) **that improperly deferred formation of mitigation to be merely a "generalized goal" with a "handful of cursorily described mitigation measures for future consideration," all (at 95) without offering any "assurances that the plan…was feasible and**

efficacious" and without any "objective criteria for measuring success." (emphasis added) Accord *POET, LLC v. State Air Resources Board (2013), 218 Cal. App. 4th 736, 739-40; Golden Door Properties, LLC v. County of San Diego (2020), 50 Cal. App.5th 467, 520; King & Gardiner Farms LLC v. County of Kern (2020), 45 Cal. App.5th 814, 858.*

b. Illustrating the Application of These Guidelines To The Water Disputes, Including How The EIR/DEIR Fails To Comply With Not Just CEQA, But Also the County General Plan 17.12.

As to groundwater depletion disputes, the **disputed EIR/DEIR Mitigation Measure 4.8-2(b) purports to comply with Nevada County General Plan Policy 17.12 by providing a "comparable supply of water to such homes or businesses whose wells are significantly impacted" more than such 10% addressed in the prior subsection.** As demonstrated elsewhere and by cases like *Keystone* and *Varjabedian*, that first 10% depletion (as well as others) is a "taking" contrary to the Fifth Amendment and the CA Constitution, as well as creating inverse condemnation, nuisance, trespass, and other claims in favor of us surface owners above and around the 2585-acre underground mine. In addition, note **first**, the DEIR/EIR does not address many existing wells (or any new/future wells) or threatened locations as addressed in my and other objections (especially the existing and **future** wells of us living on the surface above or around the 2585-acre underground mine who own that depleted groundwater with rights to its lateral and subjacent support.) See Exhibit A (my rebuttal to the County Economic Report where the County counts over 300 hundred impacted wells but there are more than exist and more to come.) See also data incorporated from my Table of Incorporated by Reference Objections, such as objections by CEA (including Group Letters 9 and 21), the Bear Yuba Land Trust (#2), the Friends of Banner Mountain (#11-12), the Rudder Law Group(#20), the South Yuba Citizens League (25), the Sierra Fund (#26), the Wells Coalition (#27-28), the Wolf Creek Community Alliance (#'s 29-32), the State Dept. of Parks And Recreation (Agency #1), the California Dept. of Fish And Wildlife (Agency #3), and Grass Valley Community Development Dept.(#8). **Second**, as *Gray v. Madera County* demonstrated in rejecting such deficient mitigation for wells in that mining case, the announced EIR/DEIR mitigation is neither compliant, sufficient, nor feasible. **Third,** Rise admits that it lacks the financial resources to perform any such mitigation, as disclosed in its SEC filings addressed in Exhibit B hereto and my DEIR Objection 254 #2.

Moreover, as discussed above and elsewhere (such as the Baseline expert report addressed in CEA Objection Grp. Letter 21 at Grp 21-30- 31), the disputed DEIR/EIR groundwater model is hopelessly flawed and invalid. Again, as addressed in the next subsection, we locals will be competing against a no net benefit mine for the water we need during droughts, which is one of many reasons why I keep focused on full protections for all existing and future wells, because, if we have to suffer the loss of precious water in the climate changed future for 80 years of 24/7/365 dewatering, the last thing we need is our NID water supply to be wasted on dust suppression to avoid lethal air pollution.

c. Illustrating How The DEIR/EIR Makes Reassuring Statements That It Knows Or Should Know Are Not Feasible Or Are Contrary To What Regulators Will Require, Especially As To Water And Air Pollution.

In another example of a DEIR/EIR misleading "bait and switch," the DEIR states (and EIR ratifies) that: "This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID." However, that ignores the NSAQMD's Agency Letter 12 (at 12) discussed herein, where that regulator demands *priority* for frequent daily NID watering of EIR toxic (asbestos and more) fugitive dust, and, rather than breathe such toxic air, locals may have to suffer with less than their fair share of drought rationed water. See, for example, its expressed concerns about the DEIR/EIR's noncompliance with the California Water Code 13050(f) for failure to protect beneficial uses and the plans of the Central Valley Regional Water Quality Control Board and the Nevada County General Plan. Consider for example, the NSAQMD Agency Letter 12-1 at 11-12, stating:

> "The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements [i.e., DEIR mitigation proposed frequent daily watering attempting to keep toxic dust out of the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less water because of water wasted on this no net benefit mining]. Since the dust contains asbestos, silica, and numerous toxic substances [now adding hexavalent chromium] adequate dust control is necessary. There should never be a situation where dust control is compromised because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest."

Consider that example of competing a "pick your poisons" dilemma between lethal asbestos and other toxic air pollution versus the waste of precious water to suppress toxic mine dust during NID water restrictions and other climate change drought situations. Begin with this summation by the California Dept. of Parks And Recreation (Agency 1 at 1-2) after it correctly addressed a portion of such dangerous noncompliance:

> Water quantity and quality, air quality, noise and vibration, hazardous materials, and wildfire dangers are crucial issues for CSP, and we find the DEIR to be inadequate in mitigations … [C]umulatively and individually these potential significant issues could negatively affect the natural resources, recreational values, health and safety of [that adjacent] Park['s] visitors and employees and the general well-being of Empire State Historic Park…"

Whatever the result, that disputed EIR reassurance of shared suffering is false and misleading at best. The reality is that this is a "zero sum game," in which every gallon allocated to this no net benefit mine is one less gallon available to the far more deserving locals. I have yet to meet any locals here above or around the mine who are willing to sacrifice anything for the mine that almost all informed locals oppose, creating (if the mine is approved) a massive political problem for the County and NID to add to the inevitable legal disputes that will surely catch them in the cross-fire. See DEIR Objection 255 and 254 (e.g., #4). Consider the reactions of locals during increasingly common droughts and NID rationing having to suffer water losses while the mine they dislike for cause (and are still resisting) wastes their local residents share of limited water suppressing toxic fugitive dust frequently every day for the profit of the Canadian miner's speculator/shareholder. What

choice do we have but to drill new wells for adequate water supplies, because (i) the noncompliant and worse mine mitigation proposal ignores many existing wells and all future wells, and (ii) considering the Rise's admitted financial condition in its SEC filings, who would trust their future to the questionable feasibility and compliance of such EIR mitigations?

Again, we locals will be competing against a no net benefit mine for the water we need during droughts, which is one of many reasons why I keep focused on full protections for all existing and future wells, because, if we have to suffer the loss of precious water in the climate changed future for 80 years of 24/7/365 dewatering, the last thing we need is our NID water supply to be wasted on dust suppression to avoid lethal air pollution. See the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session, following up with the Wells Coalition Group Letter 27/28.

As to the air pollution dispute over operational emissions from generations, for example, the EIR/DEIR underestimates the amount of time that the generators would operate, including by forgetting that, unlike the other dissimilar businesses they seem to use for their modeling, this mine operates intensively 24/7/365 for 80 years, and this mine area is in the high fire risk area where PG&E will cut power to avoid starting fires with its outdated equipment from its "run it until it breaks" operating practices exposed in its latest chapter 11 case and probation Judge Alsup's proceedings in the San Francisco District Court. **The bogus analysis in the DEIR/EIR is also contrary to CEQA #21082.2(c) and defies "common sense" (e.g., *Gray*) and is not supported by any "good faith reasoned analysis" (e.g., *Banning, Vineyards, and Costa Mesa*). Accord, Town of Atherton v. California High Speed Rail Authority 2014, 228 Cal. App.4th 314, 349 (when the EIR conclusion is "clearly inadequate or unsupported" it is entitled to no deference.) See also *Communities for a Better Environment v. City of Richmond*, 184 Cal.App.4th 70, 95, rejecting a "no net increase" standard, despite use of such short cuts in some streamlined approval statutes for particular special projects, as explained in Mission Bay Alliance v. Office of Community Investment & Infrastructure (2016), 6 Cal. App.5th 160, 198 n.26.** Accord POET, LLC v. State Air Resources Board (2013), 218 Cal. App. 4th 736, 739-40; Golden Door Properties, LLC v. County of San Diego (2020), 50 Cal. App.5th 467, 520; King & Gardiner Farms LLC v. County of Kern (2020), 45 Cal. App.5th 814, 858.

d. Instead of Using Complying Mitigations To Help Actually Reduce Impacts, Whether Acknowledged Or Not As Significant, the EIR/DEIR Seems to Prefer Using Noncomplying Mitigations To Evade Or Avoid Admitting Significant Impacts And Other Misuses of Purported Mitigations Or Omitted Mitigations

The EIR/DEIR repeatedly and improperly attempts to evade its duty to analyze and report environmental impacts by simply proposing disputed mitigation measures, even though they are

often deficient and infeasible and especially because they are often improperly deferred. See **Richmond v. Chevron**; *San Joaquin Raptor Center v. County of Merced* (2007), 149 Cal. App. 4th 645. 663-664, explaining how "a mitigation measure cannot be used as a device to avoid disclosing project impacts;" 2018 Guideline Amendments Explanations, as discussed in section I.C.2. As I have demonstrated and as illustrated herein, the EIR/DEIR cannot defer mitigation of impacts until after project approval, especially without the County committing to a specific performance standard. That means specific, not generalized, standards. Id. Also, by deferring the mitigation details the EIR/DEIR until after the CEQA process has concluded precludes the essential, informed public participation and fact checking to improve decision-making, which is essential especially in this case because of the massive errors, omissions, and deficiencies in this EIR/DEIR that can be expected to continue into deferred future processes where the applicant may hope for less scrutiny. See *Cleveland Nat'l Forest Foundation v. San Diego Assn. of Governments* (2017), 17 Cal. App.5th 413, 443. The disputed theory of the EIR/DEIR can by illustrated by the logical conclusion of its disputed reasoning: if the EIR/DEIR can get away with its disputed approach, CEQA could just be defeated by a project applicant simply claiming that the project involved no significant environmental impact, but, if there were any such impacts, applicant would do timely do in the future whatever the regulators might require as mitigation. However, that would not be compliance with CEQA, the Guidelines, or applicable law. **Moreover, "a mitigation measure cannot be used as a device to avoid disclosing project impacts." E.g., San Joaquin Raptor Rescue, Ctr. at 149 Cal. App. 4th at 663-664.**

Even where the EIR/DEIR acknowledges significant impacts that would be unavoidable after mitigation, that does not end the need for a more detailed analysis of the magnitude of the adverse impacts. E.g., Galante Vineyards v. Monterey Peninsula Water Management Dist. (1997), 60 Cal. App. 4th 1109, 1123.

More importantly, the lead agency cannot, as the County is asked to do here by the EIR/DEIR, "make up for the lack of analysis in the EIR through post-EIR analysis," especially because the lead agency has the critical "burden to investigate []such potential environmental impacts. E.g., *League to Save Lake Tahoe Mountain v. County of Placer* (2022), 75 Cal. App.5th 63, 107. Notice, for example, that the disputed Centennial site is already a recognized toxic mess, and the disputed EIR mistakenly (or worse) treating it as a separate site seems to be designed to avoid discussing the risks of "mobilizing existing contaminants" and even adding to them. In any event, as Guideline # 15125 explains, the EIR/DEIR is required to provide the most accurate and understandable picture practically possible of the project's likely near-term and long-term impact.

In any event, as Guideline # 15125 explains, the EIR/DEIR is required to provide the most accurate and understandable picture practically possible of the project's likely near-term and long-term impact. However, despite asking for the right to impose 80 years of risk and misery on those of us living above and around the 2585-acre mine, the DEIR/EIR cuts off its disputed NID data in 2040, well before the 80-year term ends offering nothing beyond that that deserves anything besides contempt. See *Richmond v. Chevron*; sections I.C.2, including how the 2018 Guideline Amendment Explanations discussed limitations and prohibitions on deferral of analysis of impacts and mitigation, and D.

As *Vineyard* explained (at 443) "Ultimately, [t]he question is … not whether the project's significant environmental effects can be clearly explained, but whether they were" in a proper manner. That standard is informed by this principle: "The preparation and

circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build consequences and, equally important, that the public is assured those consequences have been taken into account." (at 449). The data in an EIR must not only be sufficient in quantity, but it must also be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. [i]nformation 'scattered here and there in EIR appendices or a report "buried in an appendix" is not a substitute for "a good faith reasoned analysis.'" (at 442). Moreover, "[c]onclusions are not the reasoned explanation CEQA requires." [See, e.g., Laurel Heights Improvement Assn v. Regents of University of California (1988), 47 Cal.3d 376, 404; North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. Of Directors (2013), 216 Cal. App.4th 614, 639-640.] This EIR/DEIR fails to meet any of these requirements, as I demonstrate in my four Objections.

2. Purported "Mitigations" Fail For Both Stated And Unstated Impacts.

This disputed EIR/DEIR repeatedly evades its obligations by stating its nonresponsive, infeasible, and worse "aspirations" for future developed compliance with laws and regulations as a means to pretend its hazard related impacts will be less than significant. This also is not compliance with CEQA. E.g., *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal. App. 4th 70, 92 (even "if the study is subject to administrative approval, it is analogous to the sort of post-hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA"). Furthermore, the EIR/DEIR may not defer mitigation to an existing regulatory scheme to avoid fully analyzing environmental impacts. E.g., *Californians for Alternatives to Toxics v. Dept. of Food & Ag.* (2005), 136 Cal. App. 4th 1 (an agency's sole reliance on another agency's pesticide registration program for mitigation is inadequate without its own evaluation of the impacts of its proposed pesticide use.) My four Objections cite many of those improperly deferred mitigation measures. For example, e.g., *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal.App.4th 70 (sometimes called the "*CBE*" case), relying, among other things on the CEQA principle that: "Abuse of discretion is established "if the agency has not proceeded in a manner required by law or if the determination is not supported by substantial evidence. (#21168.5) Substantial evidence in this context means 'enough relevant information and reasonable inferences from this information that a fair argument can be made to support a conclusion, even though other conclusions might also be reached.' (Guidelines #15384, subd. (a).)" Here there is a lack of sufficient such evidence and much of what is provided is not relevant (e.g., claiming incorrectly and without a good faith reasoned analysis consistent with common sense that some other mining situation is "similar" or applicable when its different and irrelevant.) Moreover, such EIR/DEIR "inferences" are not "reasonable" and the related "argument" is not "fair" in supporting a conclusion that is usually speculative, unsubstantiated, or otherwise deficient. (emphasis added)

As explained in **Mission Bay Alliance v. Office of Community Investment & Infrastructure** (2016), 6 Cal. App.5th 160, 198 n.26, that *CBE* case rejected the sponsor's proposal to submit to the City Council within a year a plan for achieving a complete reduction of GHG emissions up to the estimated emissions over the baseline. Among other things, that *CBE*

court found (at 93) **that improperly deferred formation of mitigation to be merely a "generalized goal" with a "handful of cursorily described mitigation measures for future consideration," all (at 95) without offering any "assurances that the plan…was feasible and efficacious" and without any "objective criteria for measuring success."** (emphasis added) Accord *POET, LLC v. State Air Resources Board (2013), 218 Cal. App. 4th 736, 739-40; Golden Door Properties, LLC v. County of San Diego (2020), 50 Cal. App.5th 467, 520; King & Gardiner Farms LLC v. County of Kern (2020), 45 Cal. App.5th 814, 858.*

As to the air pollution dispute over operational emissions from generations, for example, the EIR/DEIR underestimates the amount of time that the generators would operate, including by forgetting that, unlike the other dissimilar businesses they seem to use for their modeling, this mine operates intensively 24/7/365 for 80 years and this mine area is in the high fire risk area where PG&E will cut power to avoid starting fires with its outdated equipment from its "run it until it breaks" operating practices exposed in its latest chapter 11 case and probation Judge Alsup's proceedings in the San Francisco District Court. **The bogus analysis in the DEIR/EIR is also contrary to CEQA #21082.2(c) and defies "common sense" (e.g., *Gray*) and is not supported by any "good faith reasoned analysis" (e.g., *Banning, Vineyards, and Costa Mesa*). Accord, Town of Atherton v. California High Speed Rail Authority 2014, 228 Cal. App.4th 314, 349 (when the EIR conclusion is "clearly inadequate or unsupported" it is entitled to no deference.) See also *Communities for a Better Environment v. City of Richmond,* 184 Cal.App.4th 70, 95, rejecting a "no net increase" standard, despite use of such short cuts in some streamlined approval statutes for particular special projects, as explained in Mission Bay Alliance v. Office of Community Investment & Infrastructure (2016), 6 Cal. App.5th 160, 198 n.26.** Accord POET, LLC v. State Air Resources Board (2013), 218 Cal. App. 4th 736, 739-40; Golden Door Properties, LLC v. County of San Diego (2020), 50 Cal. App.5th 467, 520; King & Gardiner Farms LLC v. County of Kern (2020), 45 Cal. App.5th 814, 858.

3. The Disputed EIR/DEIR Evaded Its Disclosure Obligations By Improperly DEFERRED ANALYSIS AND MITIGATION Ideas To Which I And Others Properly Have Objected On The Merits.

Most of the EIR/DEIR mitigation claims violate the prohibition in Guidelines #15126.4(a)(1)(B), which prohibits "formulation of mitigation measures" until some "future time." See *Richmond v. Chevron*. The only circumstances where CEQA allows specific mitigation details to be developed after project approval is when it is impractical or infeasible to include such details in the EIR and only if the lead agency commits itself to the mitigation, adopts "specific performance standards that must be achieved, and identifies potential actions that can feasibly achieve compliance with that standard. Id. As the courts have confirmed that lead agency cannot simply require the project applicant to obtain a report and then comply with any of its recommendations. E.g., League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer (2022), 75 Cal. App. 5th 63; *Endangered Habitats League, Inc. v. County of Orange* (2005), 131 Cal.App.4th 777, 793. Also, the deferral is only permissible where mitigation is known to be feasible and the agency commits itself to measures that will satisfy specific performance criteria stated at the time of project approval. E.g., *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal. App. 4th 70, 94 (a list of potential methods of mitigation for later

selection without "specific and mandatory performance standards" are improper.) Accord *Endangered Habitats League, Inc. v. County of Orange Habitats* (2005), 131 Cal. App. 4th 777, 794 (requiring a report without "specific and mandatory performance standards" is improper deferral); Defend the Bay v. City of Irvine (2004), 119 Cal. App.4th 1261, 1275 (requiring biological report and compliance with any recommendations is an impermissible mitigation).

My four Objections cite many of those improperly deferred mitigation measures. For example, DEIR Objection 254 #2, 3.E, 8, and 9, as well as EIR Objection 254 to EIR Response Ind. 254-12, fail under that standard to mitigate feasibly and effectively the breaking of our two lane road by 100 daily heavy trucks use 24/7/365 for 80 year where there will be constant repairs to our main roads (e.g., limiting traffic usage to one lane and with illusory aspirations for a mutual agreement with the County for reimbursement of the mine's share of expenses). See, e.g., Guidelines #15126.4(a) requiring that the EIR must identify and describe good faith, "feasible" mitigation measures that must be legally enforceable and at least partially effective to be deemed feasible. E.g., *Sierra Club* at 6 Cal.5th 524-525. Also, the project can fail to meet that standard when the project requires approvals from other agencies outside of the lead agency's control. E.g., *City of Maywood v. LA Unified School Dist.* (2012), 208 Cal. App. 4th 362, 371-72, 376-395.

As discussed in other places, for example, objecting to EIR energy policy harms (e.g., I.E.8) , climate change denials (e.g., I.C.2.b) , and other misuses of deferrals to evade admitting significant impacts, see also *League To Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2022), 75 Ca. App. 5th 63, where the court prohibited the EIR's determination of greenhouse gas mitigation measures and the significance of impacts until some unknown future date if the project conflicted with a relevant future emission target adopted by the state under performance standards that do not exist (and may never exist) and without any sufficient commitment by the county and the applicant to mitigating the impacts.

In any event, any circumstances where deferred mitigation might be tolerated are few, narrow, and not relevant to our disputed EIR/DEIR for the foregoing and other reasons. In any case, as *Banning* explained 2 Cal. 5th at 937) "Evaluation of project alternatives and mitigation measure is '[t]he core of an EIR.'" As described in the CEA Objections, particularly Grp. Letter 21 at 21-32 to 36 and the Baseline expert report, the disputed DEIR Mitigation Measures 4.8-2(a), 4.8-2(b), and 4.8-2(c) are fundamentally flawed and invalid. See, e.g., my Gray and other Objection cites, including *Cleveland Nat. Forest Foundation v. San Diego Assn. of Govs* (2017), 17 Cal.App.5th 413, 442-43.

4. More Examples of Deficient Impact Disclosure, Prohibited Mitigation Deferral, Or Other Noncompliance Are Illustrated by the Disputed EIR/DEIR Dealing with Hazardous Materials And Groundwater Quality Issues.

While the disputed EIR/DEIR at least offered a flawed model for water supply issues (e.g., falsely speculating/assuming the average rain fall from 1967-2017 was "current" [despite ignoring dry years after 2017] and would be sufficient, despite climate change, to recharge groundwater depleted 24/7/365 for 80 years, without any useful data after 2040 and disputed data before that), the EIR/DEIR does not even attempt a suitable

model for water quality impacts, hazards like hexavalent chromium, or convincing water treatment processes. More importantly, the lead agency cannot, as the County incorrectly is asked to do here by the EIR/DEIR, "make up for the lack of analysis in the EIR through post-EIR analysis," especially because the lead agency has the critical "burden to investigate" such potential environmental impacts. E.g., ***League to Save Lake Tahoe Mountain v. County of Placer*** **(2022), 75 Cal. App.5th 63, 107. Notice, for example, that the disputed Centennial site is already a recognized toxic mess (see sections I.A.1.d and I.B), and the disputed EIR mistakenly (or worse) treats it as a separate site. That disputed claim/tactic seems to be designed by the EIR/DEIR to avoid having to discuss the impact risks of "mobilizing existing contaminants" and even adding to them. In any event, as Guideline # 15125 explains, the EIR/DEIR is required to provide the most accurate and understandable picture practically possible of the project's likely near-term and long-term impact. See my CEQA and Guideline commentary and illustrations in sections I.A.1.a.(iv), b.(ii), d.(ii), and C.**

Furthermore, Guideline # 15125 requires the disputed EIR/DEIR to provide the most accurate and understandable picture practically possible of the project's likely near-term and long-term impact is critical for this 80-year project. Id. The disputed DEIR/EIR clearly cannot succeed in its bogus, but favorite, argument that it can win approval by ignoring long term impact as too uncertain or speculative to address, in effect making all of us neighbors suffer such future harms while the EIR miner profits at our expense and harm. Id. For example, despite asking for the right to impose 80 years of risk and misery on those of us living above and around the 2585-acre mine, the disputed DEIR/EIR cuts off its disputed NID data in 2040, well before the 80-year term ends offering nothing beyond that that deserves anything besides contempt. See *Gray* and other court decisions addressed herein and in my EIR and DEIR Objections 255 rebutting that claim, as well as my section II and III water related rebuttals to EIR "Responses" and "Master Responses."

Experts supporting the CEA Objections (e.g., Grp. Letters 6-9 and 21 and its exhibits, including the Baseline Environmental analysis) and others that I incorporate prove what I contend is also "common sense" and so profoundly obvious as to demand far more "good faith reasoned analysis" than is offered in the disputed DEIR/EIR. The DEIR admits substantially lowering the groundwater levels (DEIR at 4.5-55) beneath surface properties of objectors like me living above or around the 2585-acre underground mine, as well as dropping the surface water table. See the DEIR admissions at Mitigation Measure 4.8-2(a) at 4.8-67 as to future plans to being a projected, estimated, and seasonally adjusted water level for its deficiently identified wells and conditions for developing a future, deficient baseline. My Objections (see, e.g., my disputes over the related water baselines), for example, also apply that admission (and others) to the absurd attempt by the disputed DEIR/EIR to ignore climate change and reality, to omit the needed description of existing and future hydrological conditions, and to allege (at best, speculation and unsubstantiated opinion) that the "current" average rainfall from 1967 to 2017 [which ignores the more current dry years] will somehow "recharge" my local groundwater for 80 years, despite massive 24/7/365 dewatering, especially when the EIR/DEIR ignore many relevant existing wells and all the many new wells to come in the future in defense of our properties and vegetation from predictable lack of water. Note that the County Economic Report itself reported over 300 wells at risk, which is still a massive undercount and ignores future wells by surface owners drilling for their owned groundwater. See Exhibit A and sections I.C.2, D.2, E.1b., and E.2.

Also, the disputed EIR/DEIR incorrectly claims (at 2-78, 3-15 to -18, 4.8-28) that it will be allowed to operate under the State Water Board's General Permit for Limited Threat Discharge Permit R5-2016-0076; NPDES No. CAG995002, to claim that its hydrology impacts from discharges will be less than "significant." As usual the subjective standard of "significance" that the disputed EIR/DEIR applies to environmental impacts is consistently wrong, unrealistic, and noncompliant. That error defeats the existing false EIR/DEIR claim of mitigation, as is demonstrated by my four Objections and incorporated objections from Exhibit D and my Table of Incorporated by Reference Objections, such as Group Letters 6-9 and 21, Group Letter 29-32, Group Letters 27/28, Group Letters 26, Group Letter 25, Group Letter 20, Group Letter 2, and Agency Letters 1, 3, 8 and 10. The DEIR/EIR must better address the need for individual Waste Discharge Requirements (WDR) under the California Porter-Cologne Act for such discharges and mitigations thereunder. While my hexavalent chromium and other objections complain about the local impacts of the EIR mining on us surface residents above and around the 2585-acre underground mine, including our groundwater, I simply note that someone should warn those Wolf Creek water users downstream of what risks the mining related activities (and the uncertain and vaguely described water treatment) will cause them with the added dewatering groundwater, I incorporate the concerns of those downstream potential victims expressed by the Nevada County Food Policy Council (NCFPC) in their Group Letter 19.

As discussed elsewhere herein, the disputed DEIR/EIR does not provide any required description of the hazardous conditions or any satisfactory "baseline" for the hazards and hazardous materials impacting the mine, including the Centennial mine which adds a cumulative impact even if it were treated as separate from the EIR/DEIR CEQA project (which separation I and others contend dispute, leaving the courts to decide that separation as a question of law [i.e., the County decision is not determinative at all], as discussed herein.) As admitted (to some insufficient extent) in the DEIR/EIR (at 4.3-79/4.7-3-4 and -32/3-26) and proven in other objections and their expert reports (e.g., the Baseline report to CEA Objection Group Letter 21), existing rock waste/tailings from the historical mining before the mine closed and flooded in 1956 created massive hazardous conditions that cumulated on the surface at the Centennial site, including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, selenium, and vanadium. Despite that result from historical experience, the disputed DEIR/EIR provides no "common sense," "good faith reasoned analysis" to justify its assumption that somehow the new waste rock and tailings (and whatever is done to restore the existing underground mine to functionality) will somehow be different and hazard free for treatment as what the EIR/DEIR incorrectly rebrands as "engineered fill." The only "common sense" and "good faith reasoned analysis" is to the contrary of that bogus EIR/DEIR theory, i.e., that the chemical composition of such future waste rock will repeat those historical toxic conditions and hazards. As demonstrated herein elsewhere, CEQA and applicable law forbids the disputed DEIR/EIR attempt improperly to claim mitigation by vaguely aspiring to comply with RWOCB regulatory requirements. See my CEQA and Guideline commentary and illustrations in sections I.A.1.a.(iv), b.(ii), d.(ii), and C.

Also, as analyzed elsewhere herein (e.g., sections I.A.d.(ii) and B) I dispute the improper Centennial baseline evasion of CEQA (and such "hide the ball"/"bait and switch" tactics; e.g., sections I.A.d.(viii) and E.5 and 6) falsely claiming the future imagined conditions of the theoretically remediated Centennial property (which the DEIR admits may not ever be approved or accomplished, e.g., 3-26), instead of applying a compliant baseline for the existing impacts and hazardous conditions as required by law and court decisions I have cited. See, *Richmond v.*

Chevron; sections I.A.1.d, C.2, and I.E.3 When the Centennial dump scheme fails, that same hazardous waste rock (masquerading as "engineered fill") will end up at the Brunswick site or another dump somewhere, creating toxic impacts there. As noted, the cumulative and dangerous impacts of such disputed transport, storage, and use of such hazardous materials from the Project, together with the Centennial RAP, especially if, as admitted even by the DEIR/EIR to be possible at 4.7-37, the Centennial cleanup is not accomplished before the mine reopens. After filling the Brunswick site, much more hazardous rock (1.6 million tons) will need to be trucked somewhere else. DEIR at 1-3, 3-32 to 33 and 36. While the EIR/DEIR imagines selling that waste as "engineered fill," most buyers will not be so gullible as to assume such significant liability and other risks. See sections I.A.d.(ii) and B.

Also, the CEA Objection Group Letters (especially at Grp 21-57; See Exhibit D) and supporting expert analyses better addressing such impacts than the evasive EIR provides about the project's supersaturated air creating a "continuous plume cloud" or fog at the airport. Since that airport is essential to our local and area wildfire protection, this is a more serious problem that also needs to be addressed as a fire risk impact.

Of course, the disputed DEIR/EIR adding toxic hexavalent chromium to the mine paste cement for shoring (another "hide the ball" objection I address elsewhere herein and in my other Objections) provides new hazard threats without adequate disclosure or mitigation.

3. Rebuttal/Impeachment using SEC FILINGS In "Richmond vs Chevron" And Other Key Counters To EIR Errors, Especially Regarding Mitigation Needed Even When The EIR Obscured The Significant Impacts.

My objections and those of others are entitled to apply the common and appropriate objector practice of rebutting or impeaching the disputed EIR/DEIR by citing inconsistent and contrary Rise admissions to rebut and impeach such EIR/DEIR claims. Accord *Richmond v. Chevron.* Such rebuttal evidence is addressed, for example, in Exhibit B to the attached EIR Objection 254 and in my DEIR Objection 254 #2, but the EIR/DEIR incorrectly rejects any such Rise admission rebuttal evidence as somehow irrelevant. Nevertheless, if the County declines to consider such truths, it should be clear that the courts will find such admissions to be key, admissible evidence for defeating the EIR/DEIR. For example, in ***Communities for a Better Environment v. City of Richmond (2010), 184 Cal.App.4th 70, 82-90 ("Richmond v. Chevron"),*** there was a critical dispute over the issue of whether the project includes any equipment changes that would facilitate the future processing of heavier crudes [oil] at the refinery. The court stated that "there was conflicting information developed during the EIR process [**including SEC filing admissions**] that cast serious doubt on these assertions [by Chevron's EIR "in conclusory terms that the proposed Project will not result in an increased capacity to process lower quality, heavier crude, and that Chevron seeks only the ability to refine crude with higher sulfur content." The appellate court agreed with the trial court that "the EIR is inadequate as a matter of law because it does not adequately address the issue of whether there are any equipment changes that would facilitate the future processing of heavier crudes…" **The key to that was the court's discussion of conflicting or contrary admissions "in Chevron's SEC form 10K," and (as here with Rise SEC filings in Exhibit B) the EIR applicant told its investors a different story in the SEC filings than it told the County and public in its EIR. And such Chevron admissions then led to more from questioning at a public meeting. As the *Richmond v. Chevron* court held from such impeachment data: "'By giving such**

conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading.' (*San Joaquin Raptor Rescue Center v. County of Merced* (2007), 149 Cal.App.3d 663, 655-656 …)" The court then stated (what also applies here): "Far from being an informative document, the EIR's conclusions call for blind faith in vague subjective characterizations. (*See Berkeley Keep Jets Over the Bay Com. V. Board of Port Cmrs.* (2001) 91 Cal. App. 4th 1344, 1371… ["[t]he conclusory and evasive nature of the response to comments is pervasive, with the EIR failing to support its many conclusory statements by scientific or objective data"); *San Joaquin Raptor,* supra, 149 Cal. App. 4th at 659 ["decision makers and general public should not be forced to … ferret out the fundamental baseline assumptions that are being used for purposes of the environmental analysis"].)

After a considerable review of noncompliance in the EIR process and admissions and rebuttals not addressed in the EIR, the *Richmond v. Chevron* court ruled: **"'[T]he ultimate decision of whether to approve a project, be that decision right or wrong, is a nullity if based upon an EIR that does not provide the decision-makers, and the public, with the information about the project that is required by CEQA.' (Santiago Water Dist. v. County of Orange (1981), 40 Cal.4th at 443**…["That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR … is irrelevant, because the public and decision makers did not have the briefs available at the time the project was reviewed and approved."]) (emphasis added) **The court also rejected the late "battle of experts" as "too little and certainly too late, to satisfy CEQA's requirements. (See Save Our Peninsula, supra, 87 Cal. App. 4th at 124 [information about baseline "occurred at the very end of the environmental review process, thus avoiding public scrutiny and precluding meaningful comparison of preproject and postproject conditions required by CEQA'].)" (emphasis added)**

Also, in *Communities for a Better Environment v. City of Richmond (2010), 184 Cal.App.4th 70, 89-96,* there was a critical dispute over the issue of whether (as the trial court ruled) the project improperly deferred greenhouse gas mitigation measures to a future, post-EIR process, creating both a failure to proceed as required by law and an abuse of discretion in approving the EIR and project, citing CEQA #21168.5 and fn6. "Instead [of addressing the significance of the project's "contribution to climate change"], the Final EIR stated that making a significance determination for greenhouse gas impacts of the project would be too "**speculative."** However, even back then, there were too many governmental confirmations of climate change to ignore them, such as the court citation of a 2010 CEQA "white paper" and the California Global Warming Solutions Act (Health & Saf. Code 38500 et seq. and later cited new Guidelines #15064.4, 15183.5). See current Guideline 15155,15064.4,15183.5; CEQA 21083, as interpreted in the 2018 Guideline Amendment Explanation addressed herein at section I.C.2. Under pressure of reality the city revised the Chevron EIR to admit certain emissions with a significant effect prior to mitigation. That then triggered an obligation to mitigate (CEQA #21002.1, Guidelines 15126.4(a) and 15091), so the Chevron EIR proposed mitigation that the project "shall result in no net increase in GHG emissions over the baseline," and a requirement within one year after approval to submit for city approval a plan for achieving complete reduction of GHG emissions up to the maximum estimated increase over the baseline, validated by an independent expert and listing "a menu" of various possible mitigation measures. However, the court (like the trial court) found: **"Formulation of mitigation measures should**

not be deferred until some future time. (Guidelines #15126.4(a)(1)(B).) An EIR is inadequate if '[t]he success or failure of mitigation efforts … may largely depend upon management plans that have not yet been formulated and have not been subject to analysis and review within the EIR.' (*San Joaquin Raptor*, supra, 149 Cal. App.4th at 670.)" (emphasis added) **The court also objected to such future studies even subject to administrative approval as "analogous to the sort of post hoc rationalization of agency actions that has been repeatedly condemned in decisions construing CEQA" citing many cases including *Sundstrom v. County of Mendocino* (1988), 202 Cal.App. 3d 296, 307 (all incorporated herein and rejected or distinguished the various city arguments and cites. The court added: "In our opinion, the novelty of greenhouse gas mitigation measures is one of the most important reasons 'that mitigation measures timely be set forth, that environmental information be complete, and that environmental decisions be made in an accountable forum," with citations including *Oro Fino Mining Corp. v. County of El Dorado* (1990), 225 Cal. App. 3d 872, 885. (emphasis added)**

While the EIR/DEIR misinterprets or misapplies Guidelines to suit its evasion tactics, the 2018 Guideline Amendment Explanation adds helpful support for my rebuttals (at section I.C.2), such as from countering **Master Response D.15 at 89-91, and insisting on the feasibility of mitigation even If deferred.** After discussing the court decisions limiting deferral of mitigation details, that commentary [what I quoted before requiring that the agency commits and adopts specifics and identifies] explains the *Rialto* decision and the updated Guidelines: "In sum, 'it is sufficient to articulated specific performance criteria and make further [project] approvals on finding a way to meet them.' [citation] **Essentially, the rule prohibiting deferred mitigation prohibits loose or open-ended performance criteria. Deferred mitigation measures must ensure that the applicant will be required to find some way to reduce impacts to less than significant levels. If the measures are loose or open-ended, such that they afford the application a means of avoiding mitigation during project implementation, it would be unreasonable to conclude that implementing the measures will reduce impacts to less than significant levels." (emphasis added)**

Furthermore, that court further explains that **(1) "the agency [must] commit to implementing the measure," [which is "essential to support a finding that project impacts have, if fact, been mitigated," (2) the agency [must] identify performance standards" consistent with the rigorous requirements of the court decisions I have specified, without which there can be no "substantial evidence that impacts will in fact be reduced to less than significant level," and (3) "the measures must be feasible," which requires in turn that there must be identification of the types of measures that could achieve the standard," citing to follow the rulings in *Communities for a Better Environment v. City of Richmond* (2010), 184 Cal. App. 4th 70, rejecting a general "net zero standard" for eliminating greenhouse gas emissions because "there was no discussion of what measures could feasibly attain that net-zero standard." (emphasis added)**

4. Examples of Deficient EIR/DEIR Analysis And Mitigations, For Instance With Respect to the Project's Noise And Vibration Impacts.

This Objection and my other Objections, including incorporated objections, each expose noncompliance and many errors, omissions, and other deficiencies in the disputed EIR/DEIR, including in their "Responses" and "Master Responses" (especially 7 and 10) rebutted in sections

II and III below. See, e.g., the California Dept. of Parks And Recreation Agency Letter 1 (at 4-5); Grass Valley Agency Letter 8 (at 24-27), and Gold Country Avian Studies Group 13. See also as to traffic and noise the Nevada County Association of Realtors Group Letter 15, the Grass Valley Agency Letter 8 (24-33), including its reminder of its local noise ordinance barring such noisy operations between 7pm and 7am and on Sundays, despite the DEIR's admission at 6-14 that such operating limits would make its whole project economically infeasible (i.e., implying it's got to be 24/7/365 for 80 years or nothing, so please give us nothing.) Some highlight examples here are useful in illustrating the application of CEQA and case law to the actual facts and realities and exposing disputed attempts in the DEIR/EIR to craft a disputed "alternate reality." By any relevant legal standard, the noncompliant EIR/DEIR claims, "analysis" (too often just speculations, unsubstantiated and disputed opinion, and baseless or worse assumptions), and purported mitigation measures are each severely deficient.

Consider, for example, some of those arising from noise and vibration impacts from 24/7/365 mining for 80 years, especially underneath our surface community above and around the 2585-acre underground mine. [I choose that noise/vibration example, rather than the more harmful toxins, groundwater depletion and quality, and other menaces, because those others are already more thoroughly addresses in my and other objections, but potential home buyers and mortgage lender appraisers always want to know about noise and vibrations.] The disputed DEIR/EIR attempts to rely on the County's general noise standards, but those standards create no CEQA immunity or standard, especially since the real issue is not only the relative or absolute amount of noise from the project, but whether any additional amount of noise should be considered significant in light of existing conditions. It's both the increase in the noise level and the absolute noise level that must be considered. *Keep Our Mountain Quiet v. County of Santa Clara* (2015), 236 Cal. App. 4th 714, 733. See, e.g., *Los Angeles Unified School Dist. v. City of Los Angele*s (1997), 58 Cal. App. 4th 1019, 1025-26; *Oro Fino Gold Mining Corp. v. County of El Dorado* (1990), 225 Cal.App.3d 872, 881-82. As a matter of law, courts have resolved that significant noise impacts can occur even with conformity with the County general plan or ordinance. *King and Gardiner Farms*, 45 Cal.App.5th 814, 887. See the expert Salter Report with the CEA Objection Group Letter 21 that addresses such local conditions. See also section Vi below

More importantly, the disputed EIR/DEIR mostly focuses noise and vibration on the 175-acre Brunswick and Centennial sites, generally ignoring the old and proposed new tunneling, blasting, mining, and other activities in the 2585-acre underground mine below thousands of us surface objectors living above or around that 24/7/365 activity for 80 years. There are disputed speculation and unsubstantiated assumptions about how the depth of the mining in this fault impacted, fractured rock underground will somehow cushion the noise and vibrations. (That's what the less scrupulous realtors say when selling houses above faults or above fracking in Oklahoma, Pennsylvania, and elsewhere where such oil fracking activities are causing tremors that are for this purpose in terms of the impacts on surface owners the functional equivalent of earthquakes.) The EIR/DEIR's unsubstantiated opinions and speculations about what noise and vibration impacts will occur there cannot satisfy CEQA and in any event, do not provide immunity for the nuisances or worse we fear that we will suffer on the surface above that mine. See *Kings County Farm Bureau*, 221 Cal. App. 3d at 721-23.

Remember that, besides everything else producing noise or vibration, especially at night during 24/7/365 mining for 80 years, what can a seller of a home above or around the 2585-acre mine tell a buyer (or a mortgage lender's appraiser) about noise and vibration from below, not to

mention all the other and even more serious impacts revealed in my and other objections? Clearly, anyone will be concerned who is informed that there will be such continuous blasting, tunneling, mining, waste removal, dewatering, and other impactful activities underneath their homes. That concern is awareness of risk that creates a stigma and fear, all of which discourages buyers and lenders and depresses real estate values, thereby impacting all the local building trades, remodelers, home builders, hardware and building material suppliers, and other businesses that depend on a viable real estate market. See the discussion of the Salter report in a following paragraph. Whatever the answer, it cannot be to rely on the EIR approval because I don't know any responsible local who believes it or who will accept that decision, assuring that objectors' legal, law reform, and political remedies, unfortunately, will continue awareness of the risks. So, to answer my earlier question about what to tell a buyer, one possible answer is to predict (hope?) that the combination of legal, law reform, and political remedies will end the menace before too much harm can be done by the miner.

Another "hide the ball" or "bait and switch" tactic of the disputed EIR/DEIR seems to be at play by its incorrect attempt to rely on a County noise exception of "construction" work, as if 24/7/365 EIR mining activities for 80 years were constant "construction." **First,** even if that were true (which it is not since such mining is not the short-term home or building construction for which that county standard was intended) much more would still have to be provided about "construction" impacts in the DEIR/EIR. **Second,** that construction evasion based on the county standard cannot justify or excuse such noncompliance with CEQA, as discussed above and in Protect Amador Waterways, 116 Cal. App. 4th at 1110-11. **Third,** this desperate DEIR/EIR gamble on what it claims to be a loophole in CEQA suggests strong reasons for strict scrutiny of such impacts to evaluate what the DEIR/EIR seems trying to hide. See section I.A.1.d for other examples of such disputed tactics that make this Eir/DEIR pattern and practice even more suspicious, especially when combined with the tactics used by the EIR to evade meritorious objections, as discussed throughout this Objection, especially in my rebuttals to EIR "Master Responses" and "Responses" in sections II and III. For example, the EIR/DEIR ignored my objection about how the constant use of heavy trucks on our key two lane roads would break down those roads and require constant repairs that, in effect, would convert our key roads to single lanes while crews repaired the other lanes, that reality is confirmed by the State Dept. of Transportation at Agency Letter 2 (at 1 to 6, noting the EIR failure to analyze the impact on "the lifespan of the road structure"), which will add to the noise, including at night when the road repair crews tend to work to reduce traffic impacts of their repairs.

Another EIR/DEIR tactical evasion appears where the disputed DEIR/EIR assumes (without any enforceable or other commitment) that upgrades in equipment and improvements will moderate or mitigate the noise and vibration. See ***Richmond v. Chevron*** challenging such unsubstantiated assumptions about future mitigations by improved equipment. That upgrade solution seems doubtful because Rise admits in its SEC filings (e.g., Exhibit B and DEIR Objection 254 #2) that it lacks the financial resources to afford such things. See the CEA Objection Group Letter 21 Salter Report, explaining various technical issues and how the DEIR/EIR underestimates the noise and vibration, including from blasting beneath our surface homes above and around the 2585-acre underground mine. Likewise, as noted in my Centennial complaints (e.g., section I.A.1.d and B), the DEIR/EIR failed to address the remediation noises for the Centennial work or their mitigation. The same is true for the main part of the project operations.

That CEA Objection Group Letter 21 Salter Report also explains the errors, omissions, and deficiencies all of us living above and around the underground mine fear. While the DEIR cites a disputed USHM document that only 8% of us victims will complain about their disputed calculation of blasting as "clearly perceptible and borderline unpleasant," that is contradicted by a better Caltrans Manual, expecting the vibration to be "strongly perceptible" and "borderline unpleasant" impacts 24/7/365 for 80 years is significant misery. Also, what do you imagine the impact of that on our home sale values when the buyer (or mortgage lender appraiser) is told about that. What is the discount for such strongly perceptible misery or even lesser complaints? Won't any buyer or appraiser assume the worst case to protect themselves, in effect making us surface owners suffer from that stigma for years regardless of the ultimate reality. Again, this isn't just about CEQA reporting and mitigation, this is about the surface owners' competing legal remedies for such impacts and lose of property values. See, e.g., ***Varjabedian v. Madera*** (1977), 20 Cal.3d 285, and my DEIR Objection 254 #'s 3.N, 4, and 14.

Also, the disputed EIR/DEIR is unclear about the hours when such 24/7/365 mining noise and vibrations occur, which is obviously even more of an issue at night. Because there is no reason to trust timing assumptions in modeling in DEIR/EIR Appendices as any kind of effective protection limits on noise and vibration, we impacted neighbors must assume the general 24/7/365 operation will be creating constant noise and vibration, including both underground and from the Centennial and Brunswick sites. For the sake of civic responsibility and the need for our community to be unified in confronting threats to our health, welfare, and environment, consider the impacts reported in Group Letter 10 by the First Church of Christ Scientist, Grass Valley.

5. Additional Examples of Deficient Analysis And Mitigations With Respect to the Project's Impact on Air Quality.

This Objection and my other Objections, including incorporated objections, each expose noncompliance and many errors, omissions, and other deficiencies in the disputed EIR/DEIR, including in their "Responses" and "Master Responses" (especially 12, 15, 17,18, 19, 20, 21, and 22) rebutted in sections II and III below. Some highlight examples here are useful in illustrating the application of CEQA and case law to the actual facts and realities and exposing the disputed DEIR/EIR failure to comply with CEQA and applicable law with respect to the project's impact on air quality and the needed mitigation. [I choose that air pollution example, rather than the more harmful toxins, groundwater depletion and quality, and other menaces, because those others are already more thoroughly addresses in my and other objections, but potential home buyers and mortgage lender appraisers always want to know about noise and vibrations.]

Whether or not the EIR/DEIR proposed Centennial cleanup is ever approved, delayed, or accomplished (as discussed in sections I.A.1.d, I.B, and elsewhere), the air quality impacts are not (but must be) properly analyzed and mitigated as required, including with "common sense" *(Gray)* and "good faith reasoned analysis" (*Banning, Vineyard, Costa Mesa*). See, e.g., my earlier discussion of *Banning,* 2 Cal.5th at 941-42, *County of Inyo,* 172 Cal.App.3d at 165-66, and *Nelson,* 190 Cal.App. 4th at 271. The Centennial RAP describes many activities that should have been disclosed (instead of evaded) in the DEIR/EIR, but were not, whether or not the courts ultimately decide that Centennial is either (i) separate but used as a dump for the EIR mining, as the disputed EIR claims, or (ii) as part of the CEQA project, as many objectors and I contend in section I.A.1.d and I.B. In any event, there are many adversely impacts on air quality that require true mitigation (e.g., impacts such as mixing contaminated soil with massive cement, clearing

vegetation, excavating, and grading, and other activities all "mobilizing" the Centennial toxins, one reason for the EIR/DEIR's massive plan for constant watering to control the lethal "fugitive dust." The air impacts from the failure timely (or at all) to start or complete the Centennial cleanup (see sections I.A.1.d and I.B) are not adequately disclosed or mitigated, because the disputed DEIR/EIR for the present incorrectly and (undisputedly) prematurely assumes the timely future approval and completion of the Centennial RAP remediation, notwithstanding the miner 's admitted economic feasibility challenges in affording any such cleanup, as admitted in the Exhibit B SEC filings by Rise (so far, like my DEIR Objection 254 #2, ignored in this disputed EIR/DEIR process) and by the DEIR itself admitting (at 6-14) that the project is not feasible unless the mine can operate 24/7/365 for 80 years in accordance with the EIR (which means somehow defeating all the many objections not just with the County decisionmakers, but, if the EIR were mistakenly approved in the court, law reform, and political processes that would follow.) See disputed DEIR 4.3-50, -53 to -54, -67 to -68 and -93 versus the contrary objections herein and by the Baseline expert's analysis in CEA Objections like Group Letter 21 at Grp 21-61 and other incorporated objections. Even putting the Centennial issues aside, the disputed project construction assumptions vary from 18 to 12 months with air quality variable in confusion without any competent explanation of such discrepancies, another CEQA flaw as discussed earlier in applying authorities, such as *Preserve Wild Santee*, 210 Cal. App. 4th at 284.

Again, presumably for disputed tactical reasons, the disputed DEIR/EIR combines (at 4.3-65) into a deficient, aspirational discussion, **first,** of disputed "emission reduction measures" (not either (i) called mitigations, which, according to Guideline #15370, they are, or (ii) assured as conditions) contrary to CEQA requirements for first determining significant impacts, and then, **second,** failing to identify enforceable and CEQA compliant "mitigations" that address those impacts. E.g., *Lotus*, 223 Cal. App. 4th at 656. While one can speculate on many reasons why the disputed DEIR/EIR might attempt such disputed, "bait and switch" tactics, among the pattern of many disputed EIR/DEIR tactics discussed herein (e.g., I.A.1.d(viii)), one is that the disputed DEIR/EIR calculation of "unmitigated" air emissions assumes that such unlabeled "mitigation" reductions have been achieved, thereby obscuring, and making theoretical, the baseline impacts that CEA requires to be calculated before mitigation. See *Lotus,* supra at 656, 658. Also, similar problems arise with respect to operational emissions of ROB, NOx, and PM10 and other admitted toxic hazardous, as to which the disputed DEIR/EIR offers no mitigation, except for its deficient construction mitigation proposals that are not adequate or even relevant to operational emissions. See the CEA Objections and others incorporated herein. Also, such measures for reducing fugitive dust (DEIR 4.3-81) still ignore the hexavalent chromium menace when making the cement paste for the mine shoring on the surface, as partly admitted in the obscure (and still deficient) Appendix R added at the end of the EIR without adequate discussion in the EIR text, apparently to compromise between improper total omission of such known air pollution not discussed in the DEIR and admittedly adding significant new information to the EIR requiring recirculation after more revisions. See my many hexavalent chromium concerns discussed throughout this (e.g., section I.E.4) and other objections.

Rather than attempt to integrate my other air quality concerns with respect to noncompliant GHG emissions and omitted or deficient mitigations, I just incorporate CEA Objections in Group Letter 21 at Grp. 21- 68 to 92. I also incorporate the expert analysis in Group Letter 16 on behalf of the Nevada County Chapter of Citizens' Climate Lobby/Education (CCL), addressing various climate change and air quality issues, exposing many errors, omissions, and deficiencies in the DEIR/EIR. Another expert analysis of those issues, especially

including the cement which also involves my concerns about hexavalent chromium in cement paste, is incorporated from the Nevada County Climate Action Now Group Letter 17. See many incorporated others addressing air quality and related issues in my Table of Incorporated by Reference Objections and Exhibit D. Notice all the many unanswered questions on this subject posed by the NSAQMD at Agency Letters 11 and 12, as well as the California Department of Parks And Recreation Agency Letter 1 (e.g., at 18-20) and Grass Valley Agency Letter 8 (e.g., at 16-21).

For example, the disputed EIR complains that I do not explain why its speculative, 100 hour a year emergency generator use is a gross underestimate. See also my related objection in my DEIR Objection 254 #3.K (i.e., Ind. 254-43 to 45.) However, I explain in detail in that objection why I know that number to be at least 5 times higher, including by my own experience in tracking my own emergency gas generator in the same area plus my supporting citations to PG&E power losses from PSPS power cuts, from wildfire risks, from weather or falling trees, and from other predictable causes from experience. I support my detailed commentary with a specific offer of proof by citing to the specific record with which (as a bankruptcy lawyer) I am personally familiar of the relevant PG&E admissions, hearings, and events from the relevant (i) CPUC proceedings, (ii) the PG&E Chapter 11 case, and (iii) the PG&E criminal probation case, each of which informs blackout threats from my specified causes, including human error, ancient and defective equipment and infrastructure, defensive or dysfunctional PG&E practices to reduce exposure to liability for staring fires, and other things. As explained in that record, for example, PG&E's deficient compliance and worse with respect to vegetation practices in our high fire risk County has resulted in massive forest growth in our foothills near more than 10,000 miles of wires where no such vegetation is allowed by law within six feet, especially not the 50 foot plus trees that PG&E claimed to the probation judge will require a decade to remove. There is no possible good faith basis for the EIR to dismiss my such reasoned analysis without the "good faith reasoned response" and common sense required by CEQA under cases *like Gray, Banning, Vineyard, and Costa Mesa.* See also my objections to EIR Master Response 33.

As an attorney intensely involved in the PG&E bankruptcy case, I also offer to so proof that the EIR/DEIR underestimates use of air polluting mine generators that the EIR/DEIR claims must keep electricity on 24/7/365 for 80 years whenever power service ceases for any reason including the PSPS blackouts added to the increasing bad weather and old equipment failures which are an indisputably much bigger problem than the DEIR/EIR acknowledges. I can prove from the following relevant public records which I incorporate herein (and to which I can cite from my experiences in): the dockets in (i) the pending PG&E Chapter 11 Case No. 19-30088 (DM) bankruptcy commenced in 2019 in the Northern District of California, including what was cited in my PSPS related proof of claim disputes with PG&E, (ii) the various related CPUC proceedings dealing with the PG&E issues during that pending bankruptcy, including all PSPS related proceedings, and (iii) Judge Alsup's criminal probation proceedings, including what was cited to that docket in my PSPS related proof of claim disputes with PG&E. PG&E's service problems clearly will disrupt the mine more often than history would suggest both as a result of climate change, increasingly bad weather threats, illegal vegetation still growing in dangerous proximity to uninsulated PG&E gear and more than 10,000 miles of dangerous fire risk wires, the "run it until it breaks" PG&E use of dangerous gear, and other causes of greater blackouts than

in the past. What is speculative and false is the EIR/DEIR theory that the past predicts the future as to those risks and threats, which are progressive and cumulative, both because of increasing fire risks, worsening climate change impacts, and chronic and cumulative PG&E operating difficulties, such as ancient equipment that cannot be replaced, upgraded, and made safe quickly enough to counter such threats.

6. Examples of Deficient Analysis And Mitigations With Respect to the Project's Energy Use.

Whether or not the Centennial cleanup is approved and accomplished, there is unanalyzed and unmitigated energy use with impacts to be addressed in the disputed DEIR/EIR. See my objections to EIR Master Responses 25, 26, 27, and 28, as well as related climate change discussions in sections I.A.1.a(vii) and elsewhere. There are also other examples (like with air quality above) about confusion and noncompliance (i) between the EIR "construction" timelines, and (ii) regarding assumed impact "reduction measures" not admitted being the "mitigation measures" that they are. Again, see the application of *Preserve Wild Santee,* 210 Cal.App.4th at 284. The Centennial RAP energy use (or extra main EIR project use if the Centennial RAP is not approved or accomplished) must be included in the analysis, again as required by *County of Inyo,* 172 Cal. App.3d at 165-66, and *Nelson,* 190 Cal. App. 4th at 271. See my Table of Incorporated by Reference Objections and Exhibit D. Notice all the many unanswered questions on this subject posed by the NSAQMD at Agency Letters 11 and 12.

Everyone who cares about the environment, or who at least cares about their ability to use energy for useful/beneficial business (as contrasted with this "no benefit mine," as discussed in Exhibit A hereto and my DEIR Objection 254 at #4), must read the powerful and profound commentary in the Grass Valley objection on this topic at Agency Letter 8 at 18, where it's revealed that this one disputed and exploitive EIR mine would exhaust 15% of the whole County's electric usage goal, thereby defeating the County's energy conservation goals, since many will be discouraged from sacrificing on their energy use to empower such energy waste by this objectionable mine. See the Nevada County Association of Realtors objections in Group Letter 15. Stated another way, how can the County rally our citizens and businesses to conserve energy when its simultaneously allowing the no net benefit mine to waste such massive energy in this manner, not for any material benefit of our community, but for the profit of this Canadian miner and its shareholders?

As discussed in my climate discussion in section I.A.1.a(vii) and I.C.2.b, this project has a significant adverse impact on energy use and GHG, and by itself obstructs the County's goals and plans. See, e.g., *Richmond v. Chevron* and other cases addressed in I.C and D, such as *League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2022), 75.Cal. App. 5th 63 ("**Save Lake Tahoe**") (finding the eir's greenhouse gas **[GHG]** mitigation measure was inadequate because it **deferred** determination to an unknown future time, requiring the applicant to mitigate impacts IF the project conflicted with relevant future emissions targets adopted by the state, relying on performance standards that do not yet exist and may never exist so that any determination of the impact's significance is deferred to an unknown time and where neither the county nor the applicant were committed to mitigating any such impact. Also, the eir **failed properly to consider whether renewables could be incorporated into the Project in the energy impact discussions,** as noted below.) According to Save Lake Tahoe, to be compliant the CEQA analysis of energy impacts requires both whether renewables can be

incorporated into the project, and (if significant impacts) whether renewables would reduce the impact. Also, for significant impacts, the EIR must consider all feasible mitigation measures. The EIR fails these tests, among other things, by such deferrals, by such lack of analysis and denials of such climate change matters, and by ignoring the renewables issues.

As to confirming the "significance" of these energy issues that Grass Valley calculated in its Agency Letter 8-18: "The [IMM] Project's annual energy use would represent an increase of approximately 15 percent in County-wide electric usage for a single industrial use." As Grass Valley said (at Id.): "This energy use should be recognized as a significant impact of the proposed project and mitigation should be incorporated to reduce this impact." That by itself not only defeats the Nevada County Energy Action Plan (EAP), but it depresses any willingness of mine opponents to sacrifice in their own energy usage, because our sacrifices would benefit this objectionable mine instead of our environment. Indeed, as I explain in detail with my rebuttal of the EIR/DEIR on its unrealistic and grossly understated generator use to cover PG&E PSPS, system failures, weather events, and other causes of blackouts increasing with progressive climate change impacts, the EIR's projected energy use in incorrectly analyzed. See, e.g., my objections in section II to EIR Master Responses 16, 25, and 26-28 and my objections in section III to EIR Response to Ind. 254-84.

7. Examples of Biological Impacts.

My incorporated objections explain well many of the bird, animal, fish, and other biological impacts of the disputed EIR/DEIR mining. See my Table of Incorporated Objections, including Agency Nos. 1, 3, and 8 and Group Nos. 2, 3, 5, 6-8 and 21, 11 and 12, 13, 16, 17, 19, 20, 21, 22, 23, 24, 25, 26, and 29-32. See also my objections in section II to the EIR's Master Responses 30, 33, 34, 37, and 38. I am especially impressed by the objections on this subject by the California Dept. of Parks And Recreation at Agency 1 (pp. 21-28), the California Dept. of Fish And Wildlife Agency 3 (see 3-13 and discussion of the impacts of EIR/DEIR ignored water temperature impacts and the 10 foot groundwater drawdown admission [which we all assume is underestimated] impacting vegetation and, therefore, the rest of us living things), as well as the Bear Yuba Land Trust Group 2, the California Native Plant Society-Redbud Chapter Group 5, the CEA Objections Group 6-9 and 21, Gold Country Avian Studies Group 13, and the Wolf Creek Community Alliance Group 29-32.

There is no need for me to restate these, except to say that, because of the particular errors, omissions, and non-compliance by the disputed DEIR/EIR exposed in such objections, likely impacts may be worse than many such objecting commentators may imagine. That is one risk in this CEQA process when impacts and mitigations are either inadequately discussed with the required "common sense" (*Gray*) and "good faith reasoned analysis" (*Banning, Vineyard, Costa Mesa)* or not even generally and adequately disclosed (e.g., like the hexavalent chromium exposed in the new mine shoring to the dewatered groundwater ultimately flushed into Wolf Creek).

8. Examples of Deficient Analysis With Respect to the Project's "Alternatives."

Besides my other objections stated in this Objection and elsewhere as to "alternatives," also consider the following, applying the CEQA requirements (e.g., #21002/Guideline #'s

15002(a), 15021(a)(2), and 15126(b),(d)) forbidding approval of such a disputed project if, as here, a feasible alternative exists that would meet the project's objectives and diminish or avoid its environmental impacts. [Note that the project's "objectives" must be properly and more broadly defined (i) to exclude its extraordinary profit goals that are not such a CEQA project "objective" [such profits are undisclosed but extrapolated from my profession experience with the returns expected by such speculators on such risky investments] and (ii) to include what the disputed EIR/DEIR attempts to apply to achieve a self-fulfilling prophecy.] E.g., *Kings County Farm Bureau*, 221 Cal.App.3d at 731; *Citizens for Quality Gro*wth, 198 Cal. App.3d at 443-45. **See, e.g., the Grass Valley objections in Agency 8 at 41-44 (which exposes many examples of EIR/DEIR noncompliance but suggests some compromises not acceptable to most of us objecting homeowners living above or around the 2585-acre underground mine.)** Because CEQA (e.g., Guideline #15126.6(b)) does not require such an alternative to meet all of the project's even legitimate objectives (which especially do not have to include such Rise profit ambitions for this speculative gamble and other disputed EIR "objectives" none of which are disclosed for common sense and good faith reasoned analysis and other compliance purposes), DEIR admits (at 6-42) that Alternative 2 (eliminating Centennial and expansion of the Brunswick fill pile, for which expansion the EIR/DEIR is woefully deficient, speculative, and noncompliant) is superior and thereby defeats this EIR. **[Note that the EIR mistakenly, or worse, by insisting that all alternatives must assume the remediation of the Centennial site, which is a per se admission that the EIR would have to consider the Centennial cleanup part of the main project, which would by itself require massive revisions and recirculation of the EIR/DEIR. In any event, the disputed EIR/DEIR cannot have this both ways, i.e., making Centennial essential for some purposes and then claiming it's not for other purposes.]**

Despite being prohibited by CEQA, which requires sufficiently broad project objectives to allow the evaluation of alternatives that are meaningly different, this noncompliant EIR eliminated the relevant and better alternatives, like the recent case involving Crystal Geyser reopening a water bottling plant involving wastewater discharge issues. *We Advocate Through Environmental Review v. County of Siskiyou* (2022), 78 Cal. App. 5th 683, explaining that, because the project objective mirrored the project proposal itself, that transformed the EIR's alternative section [the "core of the EIR"] "into an empty formality" and such impermissibly narrow project objective prevented the county for the same reasons for accepting the "no project alternative."

When the disputed EIR must be revised and recirculated, whether as required by the County or the courts, law reforms, or political changes, the County should eliminate the often protested DEIR/EIR claim that other industrial alternatives are too "INTENSE," since "common sense" and any "good faith reasoned analysis" (e.g., *Gray, Banning, Vineyards, and Costa Mesa*) must consider this EIR mining the most intense possible alternative, especially since it operates 24/7/365 for 80 years with continuing opposition from almost all of its neighbors, especially those thousands of us living on the surface above or around the 2585-acre underground mine whose misery intensity impacts are proven, among other things, by the extent of our objections in this record and the EIR mine's depression of property values merely by its stigmas even before the physical impacts begin. See Exhibit A, my DEIR Objection 254 #2, and the Nevada County Association of Realtors Group Letter #15. In any event, there is no EIR/DEIR good faith reasoned analysis of why industrial alternatives (e.g., the warehouse proposal) are more intense, and that

unsubstantiated and speculative EIR/DEIR claim about "intensity" defies "common sense" under the *Gray* standard. (The most objective test of "intensity" and worse for alternatives is that mining has the most horrific effect on buyers and mortgage lender appraisers, which is reflected by us potential sellers.) See, e.g., *Laurel Heights I,* 47 Cal.3d at 404 (requiring a "reasonable range" of alternatives, because courts will not "countenance a result [on alternatives] that would require blind trust by the public, especially in light of CEQA's fundamental goal that the public be fully informed as to the consequences of action by their public officials."); *Citizens for Quality Growth v. City of Mount Shasta* (1988), 198 Cal. App.3d 433, 443-45.

F. Some "Headline" Example Issues That Demonstrate Wrongful Patterns And Practices by the EIR/DEIR that Should Both (i) Defeat Some EIR/DEIR Claims On the Merits Or For Noncompliance With CEQA Or Its Guidelines, And (ii) Expose EIR/DEIR Credibility Problems That Should Inspire At Least Strict Scrutiny And An Open Mind To All Objections, Especially In The Many Places Where The EIR/DEIR Fails To Present Any "Good Faith Reasoned Analysis" With "Common Sense," As Required By Courts Interpreting CEQA.

9. The DEIR FAILED TO COMPLY WITH CEQA AND ITS GUIDELINES AS TO ALMOST COVERT HEXAVALENT CHROMIUM USES, AND, INSTEAD OF The EIR PROPERLY RESPONDING TO MY OBJECTIONS BY CORRECTING THAT NONCOMPLIANCE, THE EIR MADE AN OBSCURE AND DEFICIENT COMMENTARY AND ATTEMPTED TO COVER UP THE NEED FOR SUBSTANTIAL REVISIONS AND RECIRCULATION, Including by obscuring the still disputed and deficient Appendix Q, O, and R.

a. As described throughout this Objection and detailed in Exhibit C (as well as my DEIR Objection 254), The Hexavalent Chromium Menace Requires Much More CEQA Compliance Than The EIR's Crafty Evasions So Far.

My four Objections each address various parts of the water and air pollution impacts and risks of hexavalent chromium (aka CR6, CR6+, or CR VI), none of which are properly addressed by the noncompliant EIR/DEIR, as my objections demonstrate. See section I.F.1, I.E.1-4, and Exhibit C, as well as my objections in section III to EIR's Response to my DEIR Objection 254 at what it calls Ind. 254-1 and 36. My focus in this subsection is a high-level alert to an objectionable EIR/DEIR tactic that should create a credibility problem for them and a reason to strictly enforce against the EIR/DEIR its burden of proof, as demonstrated in section I.A.1.b above and elsewhere herein. E.g., Exhibit C hereto and my DEIR Objection 254 #'s 3.A, B, C, E, G, H, 7, and 12, and my objections below to the disputed EIR's "Responses" thereto (especially EIR Response Ind. 254-1 and Ind. 254-36) and Master Responses, as well as various related legal issues in my DEIR and EIR Objections 255. See also my further objections to the other EIR "Responses" to such DEIR Objection 254 #'s 3.A [i.e., Ind. 254-6-10], B [i.e., Ind. 254-11-13], C [i.e., Ind. 254-14-15], E [i.e., Ind. 254-20-33], G [i.e., Ind. 254-36], H [i.e., Ind. 254-37], 7 [i.e., Ind. 254-75], and 12 [i.e., Ind. 254-81-86].

It is indisputable and well known that hexavalent chromium is a dangerous carcinogen, as proven in my such Objections and Exhibit C and all my cites to the EPA and California EPA websites. Perhaps because too many people saw and appreciated the movie, *Erin Brockovich*, about that toxin killing of the town of Hinkley, CA and many of its residents by hexavalent chromium groundwater pollution, the DEIR treated CR6 with even less mention than the other hazardous substances, not even mentioning the name hexavalent chromium in the DEIR "Hazards And Hazardous Materials" discussion when it mentioned asbestos or others (also subject to dispute as to noncompliance, but at least there was a deficient mention there). Instead, there were just a few passing DEIR references to hexavalent chromium elsewhere in other sections as an ingredient in the cement paste to be used to shore up the underground mine. This toxin causes both water pollution threats and (when the cement is being mixed on the surface for injections into the underground mine shoring) air pollution, much like and as dangerous as asbestos. See again my DEIR Objection 254 incorporating and discussing the threats revealed by many studies on the EPA website (like those in Exhibit C) and noted above and in my section III rebuttals to the EIR "Responses," especially my rebuttals to EIR Response 254-1.

There is no excuse for that "oversight" (i.e., evasion) and noncompliance with CEQA as to hexavalent chromium. Indeed, one wonders whether (if the disputed EIR were mistakenly approved) there would be Prop 65 notices posted about the hexavalent chromium threats as required (CR6 is on the Prop 65 cancer and reproductive harms lists), or whether the DEIR was just an "oversight" the miner will correct to avoid liability and other consequences under Prop 65. Failure to respond properly to such objections in the EIR suggests this is intentional evasion. In any case, there was no attempt at any "good faith reasoned analysis" at all anywhere in the DEIR, as if (we'll only know later from discovery in any court challenges to EIR approval, if required) someone doing those other non-hazard sections of the DEIR wasn't coordinated in others' attempts to evade DEIR discussion of CR6. But for my skeptical reading of every word of the DEIR, few might have realized we even had a CR6 threat. (That creates a Prop 65 Notice exposure for the miner and embarrassing questions for anyone who approves this EIR without the full CEQA data required for an informed decision to risk the health and welfare of our community for the benefit of a Canadian miner's shareholders' profits, since hexavalent chromium is on the Prop 65 cancer causing substances list for mandatory alerts. See Exhibit C.)

Once confronted with my DEIR Objections 254 and 255 on this CR6 threat, the EIR had a choice: either (i) the EIR could do the only right and proper thing and comply with the required "good faith reasoned analysis" of the hexavalent chromium threat, realizing that would require revisions and recirculation for "significant" "new information" under CEQA and its Guidelines (see discussion of the law on this in section I.A.1.c, I.E.4, and elsewhere), or (ii) (as it appears to have done) the EIR could try and evade its disclosure and analysis obligations and battle with objectors over whether somehow the EIR could escape the consequences of DEIR noncompliance. What the EIR reveals is that it refused to do the right thing and chose that last, wrong option. What the EIR did was just add some insufficient and disputed hexavalent chromium data in its Response To Comment Ind. 254-1 (i.e., to my specific DEIR Objection 254, rather than in some proper place where someone might actually discover and read it buried starting on page 2-6603). See my rebuttal below in section III to that EIR "Response 254-1." Is this hexavalent chromium threat so really so insignificant that no one but me needs to know they're adding a carcinogen (and reproductive harm agent) to our groundwater (requiring special remediation treatment after our such precious groundwater is drawn through the mine, past these

hexavalent chromium shoring columns, for flushing down the Wolf Creek to unsuspecting NID customers elsewhere)?

In any case, there is no "reasoned analysis" in the EIR (but see my surprise qualification at the end of this discussion), and, therefore, under these circumstances no "good faith" either on the subject. What little data exists is unsubstantiated disputed opinion that lacks credibility and "common sense," since this EIR's partial "cover up" (plus one more revealed below) cannot be considered CEQA compliance, especially since the EIR falsely claims it was mere "clarifying" and embellishing what it incorrectly claims was disclosed in the DEIR (that only mentioned CR6 in passing in obscure places single sentences in a list with other hazards.) See my DEIR Objection 254 #'s 3.A, B, C, E, G, H, 7, and 12. Obviously, if the EIR added any kind of substantiation for its claims, it would weaken that disputed claim that it was not adding "significant" "new information" requiring revision and recirculation. See section I.A.1.c. So, the EIR itself just offered no "substantial evidence" for its disputed opinions, just what I rebutted in section III below to the EIR's Response 254-1 and not even a cross reference to an innocuously labeled Appendix Q (as to CR6 water pollution) and Appendix R (as to CR6 air pollution) at the very end of the EIR, apparently as an endurance test for us readers.

Interestingly, however, and perhaps because different people edited different parts of the EIR/DEIR, the EIR added such "new information" with an Appendices Q and O (at the very end of the massive EIR with an air pollution comment at Appendix R) consisting of an Itasca "Technical Memorandum dated 2/24/2020, entitled "Desktop Study of Cemented Paste Backfill" [that means they didn't study the actual site or the EIR/DEIR details, but simply gave a general lecture on the cemented paste backfill subject in the abstract.]. See Exhibit C to support the obvious conclusion that adding to the mine groundwater this known carcinogen (also causing reproductive harms) is also "significant" for such :new information."

Note that the Appendix Q heading did not even identify hexavalent chromium, but used the term "cemented paste backfill" ("CPB") first used to identify the hexavalent chromium risks and threats on page 3 of 8, where it states that the presence of chromium in cement has been identified as a potential water-quality concern related to the use of CPB, because it leaches into the groundwater in variable, more or less dangerous amounts depending on various factors addressed in the report **and admitted to being studied by Rise**. Based on such Rise data, future expected studies, and other things, there is a qualified conclusion (at p. 7 of 8, emphasis added): "**Based on the available data,** the use at the IMM of the CPB composed of …[selected things] The CPB…is not **anticipated** to negatively affect groundwater as a result of solute leaching because of the low metals component, low sulfide content, and net neutralizing character of the IMM CPB materials." However, just before that Itasca conclusion it warned of many essential conditions that had to exist and things that had to go right or there could be serious problems. For example, after explaining how this use of cement and tailings is a desirable strategy for mine shoring to avoid having to remove and dispose of waste/tailings by hauling them to the surface and away, the Appendix Q "Conclusion" begins (on p. 6 of 8): "However, it is clear from case studies and theoretical behavior of CPB that there are a variety of site-specific factors that could affect the potential for water quality Impacts. Some important factors to consider in designing and using CPB include the following: [a list of variables and conditions that I'll address elsewhere that the EIR/DEIR did not address at all. but that the Appendix study carefully mentions as precautions before reaching it qualified conclusion.] As I read this Appendix Q, I kept thinking that the EIR was acting like some proponent of building nuclear plants for power saying, in effect, everything will be safe as long as everyone at the plant follows this instruction

book and nothing goes wrong. Even if that were true, which many will dispute, it is hard to imagine that someone would seek government approval of such a project without addressing the risk of the things "going wrong" at least by a "good faith reasoned analysis" in the main text of the "Hazards And Hazardous Materials" section of the EIR, rather than buried in an unheralded Appendix at the end of an almost 7000-page report that even a motivated reader like me struggled to endure.

As *Vineyard* explained (at 443) "Ultimately, [t]he question is … not whether the project's significant environmental effects can be clearly explained, but whether they were" in a proper manner. That standard is informed by this principle: "The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build consequences and, equally important, that the public is assured those consequences have been taken into account." (at 449). The data in an EIR must not only be sufficient in quantity, but it must also be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. [i]nformation 'scattered here and there in EIR appendices or a report "buried in an appendix" is not a substitute for "a good faith reasoned analysis.'" (at 442). Moreover, "[c]onclusions are not the reasoned explanation CEQA requires." [See, e.g., Laurel Heights Improvement Assn v. Regents of University of California (1988), 47 Cal.3d 376, 404; North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. Of Directors (2013), 216 Cal. App.4th 614, 639-640.] This EIR/DEIR fails to meet any of these requirements, as I demonstrate in my four Objections.

Here are some problematic things to consider. **First,** this may be about greed for profit for this Canadian miner's shareholders, i.e., not ever about a fondness for using hexavalent chromium, but rather about the means for avoiding the high cost of removing and disposing of the undesirable waste rock tailings from the mine in a way that "appears" (again there is no complaint "good faith reasoned analysis" of either the CR6 threats or even this proposed/unannounced mitigation of subsidence risks) to prefer leaving the mine waste cemented in place. If the miner can just cement the debris tailings into columns with hexavalent chromium where they were blasted, the miner improves its profit by lowering its cost. **Second,** this Appendix Q is dated 2/24/2020, so that all this (and probably more) data was known to Rise (and perhaps others in the DEIR process) well before preparing the DEIR in 2022. Why did Rise choose only to reveal Appendix Q (or other such data it might have) in connection with the EIR? Why did the EIR added that Appendix Q at the end of the EIR without any cross reference to that Appendix? Why bury the EIR Response to my hexavalent chromium related DEIR Objection 254 in an isolated Response to Comment Individual Letter 254-1? How could the EIR expect anyone to find this debate? [Again, as *Vineyards* explained (at 442): "The data in an EIR must not only be sufficient in quantity, but it must also be presented in a manner calculated to adequately inform the public and decision-makers, who may not be previously familiar with the details of the project. [I]nformation 'scattered her and there in EIR appendices or a report 'buried in an appendix' is not a substitute for a good faith reasoned analysis."]

For example, see my objections herein about how my Objection 254 highlighted the mine's hexavalent chromium water pollution threat in integrated explanations with ample details with table of contents headlines that the EIR divided into Comment Ind. 254 fragments thereof designed to scramble my analysis so the EIR could complain that within that fragment there was an insufficient description of inadequacy. E.g., compare my Objection 254 section headline at

#3.C at pages 38-40 (EIR at 5890 marked and split as Ind. 254-14 and 254-15), entitled "Admitted (But Obscured) Use of Hazardous Chromium Without Warning Of Analysis [see more detailed discussion in later subsections G and H below]" (see also my internal cite therein to my #7), which section 3.C the EIR split for no legitimate reason between its EIR Comment Ind. 254-14 versus 254-15, so in each paragraph it could (incorrectly) complain that my explanation of DEIR inadequacy was insufficient. Moreover, before my such #3.C discussion the EIR split up my introductory lead ins (e.g., 3.A and B) to that discussion so that it could complain about such insufficient discussion of such inadequacy at what the EIR labelled as Comment Ind. 254-6 to 254-13.

See also my details and quotes in the subsections below (as a preview of more details, for example, in my DEIR Objection 254 #3.G. and H rebutted in the following subsections of this introduction as well as in what the EIR labeled for its disputed Responses as my Comments Ind. 254-1, 36 and 37. For example, the disputed DEIR almost entirely obscured the hexavalent chromium menace (contradicting itself by calling the mine paste using it in shoring up the mine "environmentally benign," despite an obscure DEIR reference to the toxin in a list of future toxins to be addressed by the state water discharge regulator after dewatering the mine and our impacted groundwater there has supposedly been treated before being flushed away down the Wolf Creek. The EIR tries to redeem those DEIR omissions by pretending that the disputed, unsubstantiated, and speculative EIR additions on hexavalent chromium were already in the DEIR when they are not (presumably a cover up to avoid having to admit new data requiring correction and recirculation). But worse, the disputed EIR falsely a lack of supporting details and data (as I show, for example below and in its bogus complaints that my objections to its Responses to my Comments it marked Ind.254-1, 36, and 37 had no substantive basis), when my Objection 254 contains massive, incorporated evidence, such as from the EPA website validated studies and cited experts. Note, for example, the inconsistent discussion of DEIR dewatering at 4.8-42 to 52, especially at 46-49 (emphasis added), about the miner using "CEMENTED-PASTE BACKFILL" THAT IS INCORRECTLY DESCRIBED [without sufficient proof, analysis or rebuttal of my contrary cited EPA validated science] AS "ENVIRONMENTALLY BENIGN," BUT WHICH IS TOXIC HEXAVALENT CHROMIUM. CONTRARY TO THE DISPUTED EIR'S COMPLAINT ABOUT MY OBJECTIONS LACK OF SPECIFICS ANY READER WOULD LEAN FAR MORE FROM WHAT I STATE AND INCORPORATE THAN FROM THE DEIR/EIR, SUCH AS I CITE IN THIS PART OF MY OBJECTIONS THAT THE EIR LABELS IND. 254-37 AT 2-5920 TO 5922. See, e.g., the ERPA report I cited "Evaluation of the Potential Carcinogenicity of Chromium And Hexavalent Chromium Compounds" plus my citations to the other 29,368 such studies and reports on the EPA website denouncing hexavalent chromium when you type in those words, out of which I specifically recommended the work of experts such as Wendy Wagner (at the University of Texas Law School), Steve Gold (at Rutgers University), and Kyla Bennett (who shares my experienced opinion about industry influenced regulators who recognize the science but as with lead, asbestos, cigarettes, and many other obvious toxins are slow to ban them, assuming the chemicals to be innocent until proven guilty until so many successful civil suits overwhelm the companies and force them into bankruptcies, a subject on which my Objection 254 demonstrated my expertise to support my many offers of proof as a potential witness to rebut the EIR/DEIR.); provided that to save time my such Objection 254 suggested a focus on the EPA "TRI Program" by searching for the EPA's "toxic release inventory" which begins in relevant part" "hexavalent chromium compounds are human carcinogens, classified as weight-of-evidence Group A … under the EPA Guidelines for

Carcinogen Risk Assessment [EPA 1986a] … all the hexavalent chromium compounds are assigned a "High" hazard rating for the proposed RQ adjustment." Note that the DEIR buried an admission of the hexavalent chromium not by analysis in the DEIR "Hazards And Hazardous Substances" or other relevant threat discussions themselves, but obscured in DEIR Mitigation Measure 4.8-1(a) at 4.8-52, where it states: "The NOI [to the Central Valley Regional Water Quality Control Board under the Limited Threat Discharge permit] shall include evaluation of potential constituents of concern, including ammonia, arsenic, HEXAVALENT CHROMIUM [emphasis added by capitalization], iron, manganese, pH. total suspension solids, TDS and cis-1.2-DCE." Even if this is some innocent "mistake" (which I suppose is possible even though the EIR does not claim any excuse but instead enhanced the cover up after I exposed the problem by pretending the DEIR provided such a deficient, purported, and disputed partial analysis that was only added by the EIR).

To a cynic this appears as if someone intended to address hexavalent chromium as the problem it is and then someone else decided to cut out that analysis in hopes no one would notice, but either failed to delete all these references or decided to leave them in vaguely in obscure places in case someone like me actually read the fine print and recognized that obscured danger. However, pushing this off without any after EIR approval to the future regulator of water DISCHARGES does not comply with CEQA, especially since mine shoring with in the underground mine occurs BEFORE discharge, and the disputed EIR's new claim is unsubstantiated opinion, speculation, and worse that the toxic addition to the water only flows out of the mine to the treatment plant that it never proves is prepared to eliminate hexavalent chromium it didn't even analyze and report as a hazard in the DEIR (and which the EIR just claims will somehow be at a safe level without any good faith reasoned analysis or evidence at all, presumably because the EIR does not want to admit what it is doing: adding new data requiring correction and then recirculation of the DEIR. See my other objections to the way the DEIR/EIR deals with hexavalent chromium issues, especially in Objection 254 #3.G and H and 7 and to all EIR's disputed Responses thereto herein at, for example, what the EIR labeled as my Comments Ind. 254-1, 36, and 37.

There may be many explanations for that EIR's continuing refusal to do the right things, but was this some "fig leaf" the EIR could try and use later as an excuse if it were to "get caught" obscuring this threat in such a noncompliant and provocative way, especially if the mine is approved and then posts a Prop 65 notice? (Remember, someone like me would have to know of and find the couple of hexavalent chromium mine paste sentences in the DEIR, know to read the EIR "Response" "Ind. 254-1" to my DEIR Objection 254, notice and be curious about the title of this Appendix Q, and then add this to the bedtable reading to evaluate all this. Because the responsible person or persons might doubt that many people would read all this material and understand its significance (and he or she/they might be correct about that), did someone decide both gamble and to hedge that bet with this obscured Appendix Q in case they got caught?)
Third, as a legal matter the buried data in disputed EIR's disputed Appendix Q cannot save the EIR, nor can the disputed EIR's Response To Comment Ind. 254-1 on the subject. At worst, this is clearly at least "significant new information" requiring revision and recirculation. CEQA #21092.1, Guideline 15088.5(a), and *Laurel Heights Imp. Assn. v. Regents of the University of California* (1993), 6 Cal.4th 1112, 1124; my section I.A.1.c.

As to the EIR/DEIR's lack of good faith, I note that the DEIR buried an admission of the hexavalent chromium not by analysis in the DEIR "Hazards And Hazardous Substances" or other relevant threat discussions themselves, but obscured in DEIR Mitigation Measure 4.8-1(a)

at 4.8-52, where it states: "The NOI [to the Central Valley Regional Water Quality Control Board under the Limited Threat Discharge permit] shall include evaluation of potential constituents of concern, including ammonia, arsenic, HEXAVALENT CHROMIUM [emphasis added by capitalization], iron, manganese, pH. total suspension solids, TDS and cis-1.2-DCE." Even if this is some innocent "mistake" (which I suppose is possible even though the EIR does not claim any excuse but instead enhanced the cover up after I exposed the problem by pretending the DEIR provided such a deficient, purported, and disputed partial analysis that was only added by the EIR), to an cynic this appears as if someone intended to address hexavalent chromium as the problem it is and then someone else decided to cut out that analysis in hopes no one would notice, but either failed to delete all these references or decided to leave them in vaguely in obscure places in case someone like me actually read the fine print and recognized that obscured danger. However, pushing this off without any after EIR approval to the future regulator of water DISCHARGES does not comply with CEQA, especially since mine shoring with in the underground mine occurs BEFORE discharge, and the disputed EIR's new claim is unsubstantiated opinion, speculation, and worse that the toxic addition to the water only flows out of the mine to the treatment plant that it never proves is prepared to eliminate hexavalent chromium it didn't even analyze and report as a hazard in the DEIR (and which the EIR just claims will somehow be at a safe level without any good faith reasoned analysis or evidence at all, presumably because the EIR does not want to admit what it is doing: adding new data requiring correction and then recirculation of the DEIR. See my many other detailed objections to the way the DEIR/EIR deals with hexavalent chromium issues, especially in my objections to the EIR Response To Comment Ind. 254-1.

More importantly, I contend this issue is one of many grounds presented or incorporated for now rejecting the EIR/DEIR and so requiring them to start over. **Notice the same noncompliance and other objectionable issues exist for Appendix R as to the hexavalent chromium air pollution issues.** This is also ample reason to take seriously the other protested EIR/DEIR tactics and evasions in my Objections (I.A.1.d herein, and my rebuttals in sections II and III to the EIR Responses and Master Responses to my DEIR Objection 254 [e.g., #'s 3.A, B, C, E, G, H, 7, and 12]), especially when the EIR ignores my cross-references and claims I failed to explain sufficiently my objections (see section III below), or when the EIR incorrectly claims it can ignore my objections as "speculative" when it's the EIR I was rebutting that was first speculating (see section I.A.1.d. and C.2). While I deal with these issues more broadly elsewhere for general application, consider: Why would the EIR team take such risks about hexavalent chromium (creating more for objectors to complain about than even the asbestos and other toxins at issue) and then hedge their bets with uncited (e.g., Appendix Q), noncompliant, or misplaced or obscured, insufficient data? Since there are sufficient, aroused victims objecting to prevail in the legal, political, and law reform challenges that approval of the EIR would incite, the decisionmakers should not just consider the inappropriateness of such conduct, but also the questionable judgment evidenced by this EIR/DEIR.

b. My Hexavalent Chromium Objection Ignored Or Concealed By the DEIR Illustrates Not Only the EIR's Noncompliance with CEQA, But Also The Credibility Problems Created By the Disingenuous Or Worse Way That The EIR Evades Those Objections. See Exhibit C.

Among the many other reasons that the EIR/DEIR has fatal credibility problems is that it has omitted essential data or obscured data, as well as frequently misstating, understating, or otherwise diminishing objections and negative data to evade inconvenient truths or realities and then overgeneralizing about how it has broadly overcome all concerns, including those that it so omitted addressing. See Exhibit C. **One serious/lethal is my EIR rebuttal below (despite my DEIR Objection 254 revelations), exposing the EIR refusal to comply with CEQA and other applicable law as to the impact and risks on water quality of using toxic hexavalent chromium in the mine shoring cement paste, despite the many EPA website studies warning against that hazardous material (still not listed in the EIR Hazards And Hazardous Materials section as required by CEQA, which after being entirely ignored in the DEIR, it is but merely evaded in the disputed EIR air pollution discussion buried at Vol. IX at Appendix R.) and the infamous case study of how similar settling ponds with hexavalent chromium in Hinkley, CA, killed that town and many of its residents as exposed in the movie "Erin Brockovich.")** Simpler examples include the Maps in EIR Appendix A and other vague and insufficient descriptions of the locations of the underground mining and ground water depletion in relations to the surface properties owned and used by objecting locals, i.e., no street or other clear landmarks are shown for impacted and risk, even though the EIR adds addresses where it considered that to be to its advantage. Since the miner and County has focused on inappropriately dodging the objectionable impacts of the mining on such properties above and around the 2585-acre underground mine, which mining will depress our property values (see Exhibit A and other objections), it is essential that **every** affected potential victim know precisely by street address where their property is in relation to the underground mine boundaries and mining activities. Consider that the first question any buyer will ask any seller is where the property in relation to the mine and each type of operation. No buyer (or its mortgage lender) will be satisfied with the Maps or other evasive data provided in the EIR/DEIR, but the EIR/DEIR apparently prefers to keep potential impact victims ignorant until it is too late for them to act to protect themselves. But even those who are objecting and trying to figure out our risks cannot do so easily, like my neighbors and I on Banner Mountain above (and on one slope adjacent to) Idaho-Maryland Road and impacted by Evacuation Route and other mine traffic on our only main corridor of Banner Lava Cap Road. We all must have a clear idea where we are in relation to those risky or worse mining operations and impacts.

I demonstrated in my objection (see my Objection 254 marked Ind. 254-1 and -14) to the disputed EIR deficient, erroneous, and otherwise evasive attempt in its Response to Comment 254-1, 14, and -17 (and Appendix R) to cover up the inexcusable almost total omission of any mention of the hexavalent chromium problems in the disputed DEIR, much less the anything satisfying the "good faith reasoned analysis" standard of court decisions like Banning, Vineyards, and Costa Mesa I discuss in my Objection 254 #'s 4 and 14. See, e.g., my Objection 254 at #'s 3.A.II, entitled "Some Key Illustrations of Mining Disputes, Water Depletion, And Quality, Toxic Substances (e.g.,, Hexavalent Chromium, Asbestos, Arsenic, Etc., And Related Issues, Including Financial Feasibility;" 3.C, entitled "Admitted (But Obscured) Use of Hazardous Chromium Without Warning Or Analysis (see more detailed discussion later in subsections G. and H. below);" 3.H, entitled, "'Hiding the Ball' in the DEIR Is Not Compliance with CEQA And Other Applicable Law, And That Practice, Especially As To Water And Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk Of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DEIR Tries To

Obscure By Distracting Attempts To Limit the CEQA "Project" And The Related Water Issues;" 3.F entitled, "One Illustrative Dispute Over Ground Water Depletion By Mining;" 3.G entitled, "Some Technical Comments About Hexavalent Chromium, Since the Disputed DEIR Fails to Even Discuss the Existence of Controversy, Much Less the Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like me) Who Fear Us Becoming Another 'Hinkley' As Mourned By The *Erin Brockovich* Movie;" 3.H entitled, "The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?);" 3.J entitled, "Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." See what the EIR buried at the end of Appendix R regarding admitted but flawed discussion of air (as distinct from water) pollution by hexavalent chromium; 5 (at the place the EIR labeled at Ind. 254-72); 7 entitled, "The DEIR 'Hazards And Hazardous Materials" Discussion at its #4.7 And Elsewhere Is Deficient, Omitting Entirely At Least One Serious Hazardous Material (Hexavalent Chromium/CR+6 of Erin Brockovich Move Infamy For Turning Hinkley, CA Into a Ghost Town at Great Cost To Local Victims And Property As Explained In My #'s 3.C, G and H);" 10 entitled, "Some Air-Quality Errors And Omissions To Consider From DEIR #4.3 And Elsewhere." See what the EIR buried at the end of Appendix R regarding admitted but flawed discussion of air (as distinct from water) pollution by hexavalent chromium. See also my many rebuttals and objections on the subject of hexavalent chromium herein, beginning with my objections herein to EIR Response To Comment Ind. 254-1 and to each of the EIR Responses to my such cited DEIR Objections of mine of this topic. The only way that the EIR could claim all that data of mine was deficient under the applicable legal standard the EIR misconstrues, misstates, and misapplies, would be to ignore (as I illustrate the EIR frequently doing) my cross-references and incorporated authorities. For example, I incorporate the many EPA website studies detailing the hexavalent chromium hazards (as well as even more on Google), such as those explaining why the EU has banned that substance entirely as having no safe limit, contrary to the unsubstantiated EIR opinion about illusory safe limits with no foundation or evidence and failing (almost as badly as the DEIR it seeks to support without admitting that it is adding new material, which it does admit by so doing since there is nothing material discussed on this topic in the DEIR) to meet the standard the CEQA standard of "good faith reasoned analysis" in court decisions I cite in my Objection 254 #'s 4 and 14.

I also note the following examples about what details were stated even in that part of Ind. 254-37 by itself, even without consulting those cross-references and many other sections addressing this hexavalent chromium menace, although I do not intend these examples to be comprehensive since it should not be necessary to keep repeating myself about what the EIR chooses to ignore or worse of my DEIR objections. As so shown throughout my Objection 254 and confirmed in court decisions cited in #'s4 and 14 therein, the DEIR did not provide any "good faith reasoned analysis" of the hexavalent chromium menace at all, as required by CEQA and court decisions like *Banning, Vineyards, and Costa Mesa.* Note the inconsistent discussion of DEIR dewatering at 4.8-42 to 52, especially at 46-49 (emphasis added), about the miner using "CEMENTED-PASTE BACKFILL" THAT IS INCORRECTLY DESCRIBED [without sufficient proof, analysis or rebuttal of my contrary cited EPA validated science] AS "ENVIRONMENTALLY BENIGN," BUT WHICH IS TOXIC HEXAVALENT CHROMIUM. CONTRARY TO THE DISPUTED EIR'S COMPLAINT ABOUT MY OBJECTIONS LACK OF SPECIFICS ANY READER WOULD LEAN FAR MORE FROM WHAT I STATE AND

INCORPORATE THAN FROM THE DEIR/EIR, SUCH AS I CITE IN THIS PART OF MY OBJECTIONS THAT THE EIR LABELS IND. 254-37 AT 2-5920 TO 5922. See, e.g., the ERPA report I cited "Evaluation of the Potential Carcinogenicity of Chromium And Hexavalent Chromium Compounds" plus my citations to the other 29,368 such studies and reports on the EPA website denouncing hexavalent chromium when you type in those words, out of which I specifically recommended the work of experts such as Wendy Wagner (at the University of Texas Law School), Steve Gold (at Rutgers University), and Kyla Bennett (who shares my experienced opinion about industry influenced regulators who recognize the science but as with lead, asbestos, cigarettes, and many other obvious toxins are slow to ban them, assuming the chemicals to be innocent until proven guilty until so many successful civil suits overwhelm the companies and force them into bankruptcies, a subject on which my Objection 254 demonstrated my expertise to support my many offers of proof as a potential witness to rebut the EIR/DEIR.); provided that to save time my such Objection 254 suggested a focus on the EPA "TRI Program" by searching for the EPA's "toxic release inventory" which begins in relevant part" "hexavalent chromium compounds are human carcinogens, classified as weight-of-evidence Group A … under the EPA Guidelines for Carcinogen Risk Assessment [EPA 1986a] … all the hexavalent chromium compounds are assigned a "High" hazard rating for the proposed RQ adjustment."

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR EVASION OF MY OBJECTIONS BY COMPARING: (1) MY TWO PAGE OBJECTION 254 #3.G (paired with my adjacent three page Objection 254 #3.H entitled there and in my Table of Contents as: "Some Technical Comments About Hexavalent Chromium, Since the Disputed DEIR Fails to Even Discuss the Existence of Controversy, Much Less the Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like me) Who Fear Us Becoming Another 'Hinkley' As Mourned By The *Erin Brockovich* Movie.") TO (2) HOW THE DISPUTED EIR (AT 2-5919) IGNORED THAT ADJACENT, RELATED OBJECTION 254 #3.H WHEN ADDRESSING #3.G AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR RESPONSE TO COMMENT IND. 254-36 PRESENTED A FLAWED SUMMARY OF MY COMMENTS, AND THEN, IGNORING MY RELATED OBJECTION 254 #3.H, THE EIR LABELED RESPONSE TO COMMENT TO IND. 254-36 IGNORED ALL MY CROSS-REFERENCES, INCORRECTLY STATING: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE MY OBJECTIONS ARE SUFFICIENT AS IS, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE FURTHER DESCRIBED IN MY #3.H THAT THE EIR IGNORED IN THAT IND. 254-37, AGAIN INCORRECTLY STATING: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." THUS, INSTEAD OF ADDRESSING MY THREE PAGE EXAMPLE AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT MY SUCH RELATED OBJECTIONS IND. 254-36 AND -37 SO THAT THE EIR COULD MANUFACTURE AN OBJECTIONABLE EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH" HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS, MAKING THIS BAD FAITH TACTIC IMPOSSIBLE TO EXCUSE AS AN ACCIDENT OR OVERSIGHT. IN FACT, ANY TRUTH SEEKER SHOULD RUN A WORD SEARCH

IN SUCH EIR RESPONSES FOR THOSE WORDS (EG, "COMMENTER DOES NOT STATE"), BECAUSE EVERY SUCH EIR RESPONSE IS DISPUTED IN SECTION I, II, AND III HEREIN, BOTH FOR THE SAME REASONS AND ON THE MERITS. IT IS REVEALING WHICH OF MY OBJECTIONS THE DISPUTED EIR/DEIR CONSIDERED SO DANGEROUS THAT THEY CHOSE TO SO GAMBLE ON EVADING ANY RESPONSE ON THE MERITS IN HOPES THE COUNTY DECISION-MAKERS WOULD NOT NOTICE THIS NONCOMPLIANCE WITH CEQA AND OTHER APPLICABLE LAW.

I demonstrated in my objection (see my Objection 254 marked Ind. 254-1 and -14) to the disputed EIR deficient, erroneous, and otherwise evasive attempt in its Response to Comment 254-1, 14, and -17 (and Appendix R) to cover up the inexcusable almost total omission of any mention of the hexavalent chromium problems in the disputed DEIR, much less the anything satisfying the "good faith reasoned analysis" standard of court decisions like Banning, Vineyards, and Costa Mesa I discuss in my Objection 254 #'s 4 and 14. See, e.g., my Objection 254 at #'s 3.A.II, entitled "Some Key Illustrations of Mining Disputes, Water Depletion, And Quality, Toxic Substances (e.g., Hexavalent Chromium, Asbestos, Arsenic, Etc., And Related Issues, Including Financial Feasibility;" 3.C, entitled "Admitted (But Obscured) Use of Hazardous Chromium Without Warning Or Analysis (see more detailed discussion later in subsections G. and H. below);" 3.H, entitled, "'Hiding the Ball' in the DEIR Is Not Compliance with CEQA And Other Applicable Law, And That Practice, Especially As To Water And Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk Of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DEIR Tries To Obscure By Distracting Attempts To Limit the CEQA "Project" And The Related Water Issues;" 3.F entitled, "One Illustrative Dispute Over Ground Water Depletion By Mining;" 3.G entitled, "Some Technical Comments About Hexavalent Chromium, Since the Disputed DEIR Fails to Even Discuss the Existence of Controversy, Much Less the Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like me) Who Fear Us Becoming Another 'Hinkley' As Mourned By The *Erin Brockovich* Movie;" 3.H entitled, "The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?);" 3.J entitled, "Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." See what the EIR buried at the end of Appendix R regarding admitted but flawed discussion of air (as distinct from water) pollution by hexavalent chromium; 5 (at the place the EIR labeled at Ind. 254-72); 7 entitled, "The DEIR 'Hazards And Hazardous Materials" Discussion at its #4.7 And Elsewhere Is Deficient, Omitting Entirely At Least One Serious Hazardous Material (Hexavalent Chromium/CR+6 of Erin Brockovich Move Infamy For Turning Hinkley, CA Into a Ghost Town at Great Cost To Local Victims And Property As Explained In My #'s 3.C, G and H);" 10 entitled, "Some Air-Quality Errors And Omissions To Consider From DEIR #4.3 And Elsewhere." See what the EIR buried at the end of Appendix R regarding admitted but flawed discussion of air (as distinct from water) pollution by hexavalent chromium. See also my many rebuttals and objections on the subject of hexavalent chromium herein, beginning with my objections herein to EIR Response To Comment Ind. 254-1 and to each of the EIR Responses to my such cited DEIR Objections of mine of this topic. The only way that the EIR could claim all that data of mine was deficient under the applicable legal standard the EIR misconstrues, misstates,

and misapplies, would be to ignore (as I illustrate the EIR frequently doing) my cross-references and incorporated authorities. For example, I incorporate the many EPA website studies detailing the hexavalent chromium hazards (as well as even more on Google), such as those explaining why the EU has banned that substance entirely as having no safe limit, contrary to the unsubstantiated EIR opinion about illusory safe limits with no foundation or evidence and failing (almost as badly as the DEIR it seeks to support without admitting that it is adding new material, which it does admit by so doing since there is nothing material discussed on this topic in the DEIR) to meet the standard the CEQA standard of "good faith reasoned analysis" in court decisions I cite in my Objection 254 #'s 4 and 14.

Consider my analysis of the DEIR admissions at 4.8-51 (emphasis added) that (in abbreviated part, so readers should study my whole such objection marked Ind.254-37): "The water … from the underground mine workings IS ANTICIPATED [by whom? on what basis?] to have similar quality to the water that currently discharges from the existing drains [why, when the mine has been fully flooded already since 1956 and there is no proof or analysis to show where the drain water comes from?]… Therefore, the condition after mining would be like the existing, or baseline, conditions, such that seeps … would not represent a potentially significant impact under CEQA…[this is unsubstantiated speculation that ignores the addition of hexavalent chromium and , for example, any analysis of the competing water flows and sources, especially from changes since 1956 and after the new and deeper mining start again now.]" Note the inconsistent discussion of DEIR dewatering at 4.8-42 to 52, especially at 46-49 (emphasis added), about the miner using "CEMENTED-PASTE BACKFILL" THAT IS INCORRECTLY DESCRIBED [without sufficient proof, analysis or rebuttal of my contrary cited EPA validated science] AS "ENVIRONMENTALLY BENIGN," BUT WHICH IS TOXIC HEXAVALENT CHROMIUM. CONTRARY TO THE DISPUTED EIR'S COMPLAINT ABOUT MY OBJECTIONS LACK OF SPECIFICS ANY READER WOULD LEAN FAR MORE FROM WHAT I STATE AND INCORPORATE THAN FROM THE DEIR/EIR, SUCH AS I CITE IN THIS PART OF MY OBJECTIONS THAT THE EIR LABELS IND. 254-37 AT 2-5920 TO 5922. See, e.g., the ERPA report I cited "Evaluation of the Potential Carcinogenicity of Chromium And Hexavalent Chromium Compounds" plus my citations to the other 29,368 such studies and reports on the EPA website denouncing hexavalent chromium when you type in those words, out of which I specifically recommended the work of experts such as Wendy Wagner (at the University of Texas Law School), Steve Gold (at Rutgers University), and Kyla Bennett (who shares my experienced opinion about industry influenced regulators who recognize the science but as with lead, asbestos, cigarettes, and many other obvious toxins are slow to ban them, assuming the chemicals to be innocent until proven guilty until so many successful civil suits overwhelm the companies and force them into bankruptcies, a subject on which my Objection 254 demonstrated my expertise to support my many offers of proof as a potential witness to rebut the EIR/DEIR.); provided that to save time my such Objection 254 suggested a focus on the EPA "TRI Program" by searching for the EPA's "toxic release inventory" which begins in relevant part" "hexavalent chromium compounds are human carcinogens, classified as weight-of-evidence Group A … under the EPA Guidelines for Carcinogen Risk Assessment [EPA 1986a] … all the hexavalent chromium compounds are assigned a "High" hazard rating for the proposed RQ adjustment."

10. The Disputed EIR/DEIR Groundwater Problems And Proposed Well Mitigation Are Not Only Noncompliant With CEQA, But The EIR/DEIR

also Present Weaker Cases Than What Has Been Rejected In Similar Situations, Such As *Gray v. County of Madera* (2008), 167 Cal. App.4th 1099 ("*Gray"),* Even Without Considering Rise's Infeasibility Admissions (Exhibit B) That Also Doom The EIR/DEIR's Deficient And Missing Mitigation Proposals.

As demonstrated throughout this Objections in the many places citing *Gray* or applying its rulings, as in my DEIR Objection 255 (e.g., #3), in order to have any chance of surviving the many legal challenges that would follow any mistaken approval of the EIR, the EIR must somehow prove either that *Gray v. County of Madera* doesn't mean what it says, or that somehow it can be overcome as a leading precedent on groundwater, wells, mitigations, and many other issues applicable here. That somewhat similar application of CEQA to the quarry mining project in *Gray* should by itself defeat this EIR/DEIR. For many reasons so explained herein (as well as detailed at length in my DEIR Objection 255 #3 and not overcome by EIR Responses and Master Responses that I rebut in sections III and II below) that *Gray* case illustrates and supports my objections to this *EIR*/DEIR. The EIR tries (and fails) to evade or distinguish or ignore or misconstrue the various damning parts of *Gray* in its Responses to Comment Ind. 255-19 to 28 (which I rebut in section III), but I defeat those EIR arguments and evasive tactics in my EIR Objection 255, as well in many less systematic applications herein supporting the use of *Gray* against this EIR/DEIR. See the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session, following up with the Wells Coalition Group Letter 27/28.

While the EIR responses to DEIR noncompliance consistently evade, ignore or incorrectly dismiss the relevant objections, consider the relevant rebuttals with better comparables, for example as to groundwater disputes, the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change. See also the Union discussion of comments by hydrology expert Sol Henson. See also my objections in section I.F.8 and 9, I.F.2, 3, 5 and 6, I.E.1-4, and in section II to EIR's Master Responses 13, 14, 15, 16, 32, 33, 35, and 36, as well as my objections in section III to the EIR's "Responses" to my DEIR Objections 254 #'s 3.D, E, F, M, N, 4, 5, 6, and 14.

I mention this now as a headline for coming attractions on this precedent, because the facts and disputes at issue for this EIR/DEIR are even more powerful for applying *Gray* rulings against them in this case than in the mine eir in the *Gray* case, as I illustrate in my EIR Objection 255. Those include similarities favoring the facts of this case over the Gray case itself, include, for example: (a) the smaller (86 acre) quarry in *Gray* was a proposed open surface mine, unlike

here where thousands of us objectors live as competing owners and user of the "surface" (down at least 200 feet) above and around the 2585-acre underground mine (e.g., that adds and enhances classic, competing property rights disputes, as well as CEQA disputes, which issues I have repeatedly raised in my Objections and to which this EIR/DEIR has not offered any coherent response); (b) the quarry in *Gray* was in a rural, "cattle country" area with few neighbors, rather than in the midst of a significant suburban community with literally thousands of people living above and around the 2585-acre underground mine (not to mention the town of Grass Valley hospital, airport, shopping centers and other business structures, churches, parks, and other suburban infrastructure), (c) the quarry in *Gray* was locally beneficial (i.e., for locally needed gravel ingredients for local roads), as distinguished from gold extracted for shareholder profits of a Canadian mining company with no net benefit locally (see my DEIR Objection 254 #4 and Exhibit A, countering the disputed County Economic Report's false assumption based incorrectly on the assumed merits of the disputed DEIR), (d) the *Gray* quarry was economically feasible and would certainly have produced needed gravel for public roads, but Rise's SEC filings (see Exhibit B to this EIR Objection 254) admit that this mine is a speculative and risky investment (e.g., no proven gold reserves or sufficient investigations of the mine's conditions) and that Rise does not have the present resources to afford to accomplish even the disputed EIR's insufficient aspirational safety work and mitigations (much less the much greater work and mitigations that would be required when all significant impacts are recognized and addressed om compliance with applicable law, including those which Rise and the EIR/DEIR so far evade as irrelevant, but which will be a key part of the feasibility and other rebuttals allowed at any trial challenging any approval of this EIR, as demonstrated in other sections herein and in my other Objections, and (e) the quarry in *Gray* was a new mine, supported with many current studies and ample information on which to rely, as compared to this largely speculative and significantly unsubstantiated EIR/DEIR for what even Rise's Exhibit B SEC filings describe as a speculative mining adventure with limited information and investigation, especially with uncertainties about many conditions in the massive underground mine closed and flooded since 1956 with only minor (and disputed) more recent studies of limited areas and issues and the never adequately explored new mining areas that the disputed EIR/DEIR largely assumes are the same as the largely assumed conditions in the old mine. [e.g., Consider that the new mining is off of more than 72 miles of new and deeper tunnels into unevaluated areas with uncertain conditions. Then consider a drive of 72 miles in any direction from the Brunswick site, and ask yourself: is everything you pass in that trip the same as what you see at the start? See, my important ruling for "common sense" required in the *Sierra Club v. County of Fresno* precedent also addressed at length in DEIR Objection 255 #2.C and herein.

Consider this example as one of the many possible bases on which my DEIR Objection 255 #3 (and EIR Objection 255, rebutting the disputed EIR Responses 19 to 28 to my DEIR Objection 255, as well as this Objection's rebutting in sections III and II below disputed EIR Responses and Master Responses to my DEIR Objection 254) demonstrated how ***Gray v. County of Madera*** and other authorities rejected proposed **well mitigation proposals** similar to the disputed, infeasible, and deficient well mitigation proposed in the EIR/DEIR. [I will address elsewhere the failures of the noncompliant DEIR/EIR to consider all of the impacted wells and all relevant locations for monitoring, as well as other monitoring and mitigation deficiencies, which are recognized [although insufficiently] even by NID's insufficient count and locations in its Agency Letter 10 and by the County Economic Report's 300 well undercount described in Exhibit A.] That *Gray* precedent by itself should doom this disputed EIR on that one issue alone.

While a smaller (86 acre) and more rural cattle grazing zone area mine (with only "dozens of residences and 55 domestic wells within one mile of the project), the *Gray* operation was also similar because it included the removal of 900,000 tons of aggregate (gravel) per year for 50 years, involving 320 round trips by truck per day and consuming 72,000 gallons of water per day and threatening the neighboring wells. As with this EIR, the *Gray* eir required mitigation for depleting neighboring water wells. Sound familiar? While the disputed EIR attempts to evade that well mitigation precedent, most of those efforts fail on their face as lacking what *Gray* calls "common sense" and what others (e.g., *Banning, Vineyard, Costa Mesa*) insist on for "good faith reasoned analysis." Also, like *Gray* and other authorities discussed above demonstrate is forbidden in such situations, the disputed EIR/DEIR is noncompliant with CEQA by trying improperly to defer required mitigation to the future (e.g., a vaguely imagined future water system). The only possible distinction about *Gray* that might be argued by the EIR (a dispute about nonpotable vs potable water) is both (i) not determinative by itself, even if the disputed EIR were correct, i.e., the EIR still fails, and (ii) disputed on the merits by Objections as to the "potability" of groundwater dewatered and purportedly treated by the EIR mine (e.g., such alleged "treatment" is not adequately described in a CEQA compliant way, including because of its insufficiently described "treatment" of pollution by mine shoring cement with hexavalent chromium).

Thus, as so discussed, *Gray* concluded: "We are rejecting the County's conclusion on the water issues because we have concluded that the mitigation measure that were proposed to address the potentially significant adverse impacts on the water levels of private wells of neighboring landowners are not viable or effective." That same conclusion, and the reasoning for it addressed below, apply even more forcefully to this disputed EIR/DEIR. Consider the application of the Gray "common sense" test, concluding (at 1117-1118): "We agree with RWQCB [California Regional Water Quality Control Board] that providing replacement water through bottled water is not a viable or effective mitigation measure. It defies common sense for the County to conclude that providing of bottled water is an effective mitigation measure. [continuing with an explanation of factors that also apply here but are addressed in detail elsewhere.] An EIR water truck type solution here suffers those same deficiencies and worse. After demonstrating that the quarry mitigation measures were (as here with this EIR/DEIR) not "feasible or effective in remedying the potentially significant problem of decline in water levels of neighboring wells," *Gray* announced (at 1116-1117) its "common sense" test for this issue:

> "In order to mitigate this problem …[the miner] must present a viable solution that can effectively replace the decline in the water available to neighboring residents….[W]e decline to …[defer to the Board's findings because they] are not supported by substantial evidence or defy common sense. LAW IF NOT REQUIRED TO ABANDON COMMON SENSE. HERE, OUR COMMON SENSE INFORMS US THAT THE MITIGATION MEASURES WILL NOT EFFECTIVELY REPLACE THE WATER THAT COULD BE LOST BY NEIGHBORING LANDOWNERS. IT IS TRUE THAT THE MITIGATION MEASURES WILL PROVIDE A REPLACEMENT FOR THE LOST AMOUNT OF WATER. HOWEVER, NEITHER MITIGATION MEASURE … WILL PROVIDE THE NEIGHBORING RESIDENTS WITH THE ABILITY TO USE WATER IN SUBSTANTIALLY THE SAME MANNER THAT THEY WERE ACCUSTOMED TO DOING IF THE PROJECT HAD NOT EXISTED

AND CAUSED A DECLINE IN THE WATER LEVELS OF THEIR WELLS. (emphasis added.)

For example, in rejecting the *Gray* eir proposed mitigation measure to "rehabilitate or deepen the neighboring wells to provide additional water, the court (at 1117): "But there is no substantial evidence to conclude that the neighboring wells would provide additional potable water… However, of more concern is that there is no substantial evidence to conclude that the aquifer that supplies water to the Project and neighboring wells, which is currently confined would remain confined for over the [50 year] operating life of the Project. Thus, the neighboring landowners could become subject to regulatory oversight in the future …Therefore, [that] Mitigation Measure … is not viable because it does not replace the lost water from private wells with a substantially similar quality of water." Thus, *Gray* also supports my arguments about the need for this EIR/DEIR's evasion of the future impacts of what is approved now during the 80-year future of massive 24/7/365 dewatering (e.g., the EIR/DEIR not providing even the prior, deficient kind of data after 2040). Gray also rejects the false reliance on the disputed EIR/DEIR argument, in effect, that it excused from "speculating" about the future, so that it is free to do as it wishes in the future.

As the disputed EIR/DEIR does here, the *Gray* eir attempted to defer certain mitigation measures (see my general dispute elsewhere above on that noncompliant deferral tactic by the EIR/DEIR), but the court refused (at 1119) to allow that evasion, because, among other things, of a lack of County "commitment" to "a specific performance target," stating that the County had instead only committed itself to the replacement of water lost because of the mining operations. "However, this [deficient] goal is not a specific performance standard, such as the creation of a water supply mechanism that would place the neighboring landowners in a situation substantially similar to their situation prior to the decline in the water levels of their private wells because of the mining operations, including allowing the landowners to use water in a substantially similar fashion to how they were previously using water. Moreover, the listed mitigation alternatives must be able to remedy the environmental problem [and the new water system was "never studied or examined"]. Thus, the County is improperly deferring the study of whether building such a system is feasible until the impact occurs." [i.e., when it's too late for effective and timely relief].

Among many of those objectionable errors, omissions, and noncompliance, is the disputed EIR/DEIR's self-serving insistence both on (i) over-generalizing and assuming uniformity where it does not exist throughout the Project, and (ii) failing/refusing to limit such disputed EIR/DEIR claims to the only parts of the Project to which they could possibly apply or for which some proof is cited in the EIR/DEIR. [Note because I and other objectors dispute that Centennial is a legally separate "Project," all reference in objections the Project should be interpreted to include Centennial.] Rarely does the disputed EIR/DEIR distinguish properly what should apply to only one part of this nonuniform Project, but instead confuses everyone by either incorrectly assuming or asserting that the EIR/DEIR claims apply uniformly to the whole, or making general statements as if they applied to the whole when there is no reliable, credible, or competent evidence to prove, for example, that what could be said (and disputed) about Brunswick or East Bennett areas somehow also applies equally (without sufficient proof) to the 2585-acre underground mine (with many different or uniquely objectionable conditions). Thus, for example, so called Master Responses often miss the point of the objections entirely, because the counter by us potential victims continues to be, for example, that whether or not the objection

is correct as to Brunswick, Centennial, or the East Bennett areas (generally downhill and distinguishable for CEQA compliance and other analysis), that the 2585-acre underground mine is different and subject to its own objections to which there is no sufficient EIR/DEIR responses that apply there. (The implicit and disputed EIR/DEIR claim that it's so called CEQA compliance as to those generally downhill areas with different conditions applies to the underground mine with different.)

Incidentally, (briefly shifting from water to traffic to illustrate reasons for disapproving EIR deferrals of mitigation), as discussed in more length in my objections herein to the disputed EIR "Response" to my DEIR Objection 254 on the traffic topic, I noted the 100 heavy trucks a day 24/7/365 for 80 years would continuously break down our key two lane roads, requiring constant, expensive, and extensive maintenance, and repair that in effect reduced traffic to one lane. (The California Dept. of Transportation Agency Letter 2 [at 1-6] agrees with my concerns, noting the failure to analyze the impact for "lifespan of the road structure," among other objectors' complaints incorporated herein.) After its usual evasion efforts, the disputed DEIR/EIR mitigation vaguely proposed without details the "aspiration" for a "fair" cost sharing arrangement to be negotiated in the future after approval of the EIR. Facing a similar impact, the *Gray* court ruled such mitigation measures relating to traffic impacts are inadequate" "generally agree[ing]" with objectors that: "such mitigation (1) … is not enforceable; (2) …illegally defers development of the details and performance standards; (3) no substantial evidence supports the conclusion that the "fair share fee" will actually be spent on mitigation…[various additional complaints and then:] Finally, the County made no finding regarding the limitation or feasibility of the county guaranteeing the funding for the roadway improvements."

11. Failure of the EIR/DEIR To Comply With Nevada County General Plan 17.12 And, Therefore, CEQA And Other Applicable Laws, Not Only As To the Well Risks And Needed Mitigations, But Also As To Security For Performance To Make Mitigations Feasible And Protect Surface Owners Property Rights.

In various other places in this and other incorporated objections, including the previous section applying *Gray* to this disputed EIR/DEIR and the incorporated Well Coalition Group Letter 27/28, I challenge many errors, omissions, and deficiencies in the disputed EIR/DEIR, including for many impacts on undercounted existing wells, any future wells, and failure even to adequately define the area of probable well impacts. **E.g., I.F.2, I.E.1.b and d, I.E. 3 and 4, I.D.2, I.C.2, etc. As the Wells Coalition explains, the prior May 1995 DEIR (at 4.3-5) admitted its conclusion (see Grp. 28-4): "Based upon the significance criteria established on page 4.3-4, the risk to all wells within the study area, regardless of risk category, represent a potentially significant impact." The disputed EIR/DEIR fails in many ways to comply with the County's General Plan 17.12, although the DEIR/EIR falsely claims compliance, as demonstrated by my Objections and those of others I incorporate, especially the Wells Coalition's Group Letter 28 (also 27, since they are the same) and the experts it cites. See also objections with various water related rebuttal to the EIR/DEIR by the California Dept. of Parks & Recreation in Agency 1, the California Department of Fish And Wildlife in Agency 2, Grass Valley in Agency 8, NID in Agency 10, the Bear Yuba Land Trust in Group 2, the California Native Plant Society-Redbud Chapter in Group 5, the CEA Objections in Group 6-9 and 21, Friends of Banner Mountain in Group 11 and 12, Gold**

Country Avian Studies in Group 13, the Nevada County Association of Realtors Group 15, the Rudder Law Group in Group 20, the Sierra Streams Institute in Group 24, the South Yuba River Citizens League in Group 25, and the Sierra Fund in Group 26, the Wells Coalition in Group 27/28, and the Wolf Creek Community Alliance in Group 29-32. Not only is that noncompliance itself a violation of CEQA, but it prevents the necessary mitigations to be properly judged. Even if somehow the EIR/DEIR were considered sufficient on those disputed grounds, **the disputed EIR/DEIR position is based on non-feasible illusions of assurances that Rise admits it lacks the financial resources to afford compliance as required by General Plan 17.12. See, e.g., my Exhibits B and A and my DEIR Objection 254 # 2. Moreover, independent of CEQA, the EIR/DEIR consistently ignores my objections that this is also a dispute between us competing surface owners above and around the 2585-acre mine versus the EIR mining beneath us with respect to our owned groundwater and property rights, including our surface owner rights of lateral and subjacent support, with such groundwater as demonstrated with court precedent herein (e.g., the Supreme Court's *Keystone* decision) and in DEIR Objection 254 #3.N, 4, and 14.**

Begin with the minimum to which us surface owners above and around the 2582-acre mine are entitled under General Plan 17.12, even if somehow the disputed EIR/DEIR were correct: "1) The County shall require the operator to guarantee a comparable supply of water to such homes or businesses through accessible forms of security or alternate sources of water." and "2) Where water quantity and quality problems occur, an immediate water supply shall be provided by the operator until the source of the problem is determined [in this case that includes the obvious, i.e., 24/7/365 dewatering for 80 years in defiance of climate change and dryness issues…]" The EIR fails to do that (and cannot demonstrate any nonspeculative and compliant possibility of affording or accomplishing that), and the vague and unsatisfactory comments in the EIR/DEIR on such issues (apart from a few wells along East Bennett Road that the disputed DEIR/EIR falsely pretends are the only wells at risk) provide no such compliant mitigation, as demonstrated by the fact that it misses or fails to appreciate many significant impacts that must be mitigated, as well as the rulings on this compliant mitigation topic in G*ray v. County of Madera* discussed herein, in my DEIR Objection 255 and 254, and such incorporated objections from my Table of Incorporated by Reference Objections. **FIRST, the number and location of affected existing AND POTENTIAL FUTURE WELLS are not correct or accurately subjected to "common sense" in accordance with *Gray* or "good faith reasoned analysis" in accordance with Banning, Vineyards, and Costa Mesa. See my objections herein (including Exhibit A) and in my DEIR Objections 254 #'s 3.D, G, E, F, M, and N, 5, 6, 14, and 15. SECOND, the General Plan applies not only to existing wells, but also to the future wells that us surface owners will enforce with our property rights to create new wells to deal with climate change and the actual harms of 24/7/365 dewatering for 80 years as ignored or evaded by the disputed DEIR/EIR on various bogus theories, such as the false and unsubstantiated theory that "current" average rainfall it uses as a disputed baseline from between 1967 and 2017 will continue to apply to accomplish such imagined recharge for the whole 80 years (ignoring the dry years after 2017, so that baseline is not "current" and is incorrect from the start). Id. THIRD, as Rise has admitted in its SEC filings (see my Exhibits B and A and my DEIR Objection 254 # 2) and in admitting (at 6-14) that the whole Project is economically infeasible unless it can operate 24/7/365 for 80 years in accordance with its disputed EIR/DEIR (which legal, law reform, and political remedies of impacted objectors will**

prevent, unless the mine shuts soon for lack of funding, disappointing gold or other conditions, or other causes), the EIR miner cannot afford that "security" or mitigation for all those wells, or even the undercounted 300 admitted to exist by the County Economic Report disputed in my Exhibit A. See the incorporated objections cited above.

Next, focus on the General Plan 17.12 requirement that "3) The burden of proof shall be on the operator to show that the mining operation did not create the water problem." The disputed EIR/DEIR incorrectly claims from purported "expert opinion" that there is "no threat to water quality" and "All potentially impacted wells are located in the E. Bennett Road area," while "wells outside this area will not be impacted." Relying inappropriately on the disputed (and here overstated) Appendix K.9 "Idaho Maryland Well Mitigation Plan" pp. 1 and 3 (Dec. 2021) and the EMKO Environmental Ind (2020) "Groundwater Hydrology and Water Quality Analysis Report for the Idaho-Maryland Mine Project…" **Among the grounds for rejecting such disputed EIR/DEIR claims and interpretations are contrary admissions in the DEIR Appendix K.7 West/Yost Peer Review (Aug. 27, 2020) at pp. 8-9, 18, reacting to the Itasca and EMKO reports with concerns, such as (See Grp. 28-2):**

> **"…[I]t is possible that mining activities, including blasting, backfilling with CPB [which I contend creates an obscured and unmitigated hexavalent chromium threat], and sealing of drains or areas of underground workings, could activate leaching and groundwater flow in new subsurface areas, potentially resulting in impacts to neighboring wells, and discharges to surface water of groundwater with water quality exceeding applicable standards. These impacts could potentially occur during the mining or post-mining periods. Because of the uncertainty inherent in the bedrock fracture flow system, monitoring will be needed, as mining activities progress, to assess potential impacts. These efforts should be addressed in monitoring and mitigation requirements for the mining and post-mining phases of the Proposed Project."**
>
> **"… A major assumption underlying the [EMKO] procedure is that flow contributions from the workings are distributed uniformly across the mining areas after correcting for depth. However, the subsurface distribution and orientation of bedrock fractures is not uniform and is subject to uncertainty. Discussion of uncertainty and the overall uncertainty of the analytical and numerical model predictions with respect to groundwater level impacts on individual wells should be provided, expanded to include an assessment of the uncertainty in the conclusions developed by Todd Engineers."**

Moreover, the location and number of existing and future impacted wells is also in massive dispute, requiring more and better placed monitoring sites. If (as now, see, e.g., Grp 28-3) the DEIR/EIR misplaces and evades the correct risk monitoring, it will be (as now) impossible to ever satisfy its burdens of proof under General Plan 17.12 or CEQA. Note, as the Wells Coalition demonstrates, the continued comments of the foregoing study and Todd Engineers (2007) "Final Report Hydrological Assessment Idaho-Maryland Mine" (prepared for Rise's predecessor) at pp. 22, 25, and 26.

…[S]everal complexities in the groundwater system could potentially result in a larger or smaller radius of influence. Although larger impacts seem unlikely, it is difficult to prove that aberrations in the system do not exist.

Uncertainties in the analysis indicate that monitoring should occur of a slightly larger area than where impacts are predicted. In addition, the monitoring program should consider adjustments specifically for geological faulting.

Monitoring locations should also include areas outside the predicted impact zone to account of uncertainties in the analysis. Id.

Also, as Itasca itself admits in disputed DEIR Appendix K.3 "Groundwater Model Report Nov. 2020 at 31: "It is expected that the actual mining areas will change from the modeled mining area due to vein geometry and discoveries, which will only be known after extensive underground exploration is completed in the future." As the Wells Coalition explains, the 2008 DEIR also admits (at 4.7-34): "Due to uncertainties regarding the complex geology, groundwater flow, flow dynamics in the mine, and the presence of faults, dewatering impacts to domestic water supply wells cannot be accurately predicted." Accord Revised Project Description (May 2021) Appendix N-T-3: "The geologic formation in which the mine is located is fractured bedrock whose hydrogeology is difficult to predict."

In other words, us potential surface victims living above and around the 2585-acre underground mine are not only at risk for unsubstantiated speculation and guessing by this self-interested miner with many credibility problems illustrated in my and others' objections, but the subject of those guesses can change in ways they cannot now even predict. As discussed elsewhere, risk management multiples risks, so that the more dubious assumptions/guesses the disputed EIR/DEIR makes the greater the cumulative risk. Ask yourself, decisionmakers, if you were trying to sell a house (or convince a mortgage lender's appraiser to support a loan) how would you expect this to affect your property value? See my rebuttal to the County Economic Report at Exhibit A and herein. E.g., I.F.2, I.E.1.b and d, I.E. 3 and 4, I.D.2, I.C.2, etc.

In any case, as the Well Coalition stated correctly at Grp. 28-8: "The DEIR's analysis of groundwater impacts is so fundamentally deficient that those of us who rely on groundwater wells [I would say now or in the future, as climate change dryness leaves us no other option to save our property and forests from becoming dead wildfire fuel] for our drinking supply [and I would add for our vegetation] do not have the fundamental information necessary to fully account for the severity and extent, including the geographic magnitude, of the Project's impacts. Until the EIR accurately discloses the Project's groundwater impacts, it is not possible to determine whether the mitigation the DEIR relies on would even be close to sufficient to protect our wells." Also, the DEIR acknowledges (at 4.8-67) that more groundwater level data is needed to assess the potential impacts on groundwater levels. (I would add, however, that Rise's lack of financial resources admitted in its SEC filings [Exhibit B and DEIR Objection #2] makes it clear that, even if Rise knew what was required and was willing to mitigate adequately, it does not seem able to afford to do so timely. See *Richmond v. Chevron,* rebutting the incorrect refusal of the EIR/DEIR to consider such admissions.**)**

As a result, and considering the many problems illustrated herein and in other objections, I agree with the Wells Coalition (Grp. 28-8) that: "The overwhelming consensus of the experts listed above is that the project '…may threaten the existing quality or quantity of surface or subsurface water which supply adjacent homes and businesses' per County Policy 17.12(1), and therefore the applicant is not in compliance with that policy. In light of the uncertainty present in the hydrology predictions, the DEIR Well Mitigation Plan is inadequate." [And I would say, worse] "because it does not satisfy the conditions of the County Policy, and it has no means of even determining whether those conditions will be met." (Of course, since Rise admitted its lack of resources to fund this highly speculative and risky project in its SEC filings [e.g., Exhibits B and A hereto], it has ample knowledge of how little it can afford of what its EIR/DEIR proposes to do, even given its evident attempts to evade knowledge that would require it to do even more, such as by not adequately investigating the conditions of the mine and proposed mining and groundwater depletion. See *Richmond v. Chevron,* rebutting the incorrect refusal of the EIR/DEIR to consider such admissions.**)**

Consider the following Wells Coalition evidence of uncertainty that rebuts and defeats the disputed EIR/DEIR claims for approval, such as (i) inconsistent or contrary admission by Houmau Liu, Itasca's hydrologist speaking to the NID board 2/9/2022: "With fractured rock there will always be uncertainty and during my career there won't be any 100% confidence in predictions;" and (ii) "The study area has not been monitored by an approved groundwater system designed to observe the dynamics associated with subsurface hydrology. Therefore, many of the initial unknown hydrological and geologic parameters located within the earth between the well and mine elevations still exit." This admission is even more damning (in the prior October 2008 DEIR #4.8 and 4.7-29 addressed at Grp. 28-5): "The groundwater in this particular area is contained in and flows through fractures in near surface bedrock and because of this fracture flow regime, the groundwater flow in quantity varies considerably with location and cannot be predicted with certainty. Furthermore, complete hydraulic separation between the deeper groundwater within the underground mine workings and the shallow groundwater within fractures and supplying the domestic wells cannot be assumed."

Other experts add to these uncertainties, as noted in Wells Coalition Grp. 28-5. Consider the comments of June Oberdorfer, PhD. to the Minewatch Virtual Community Meeting Video Presentation (Oct. 2021) addressing the disputed EMKO Groundwater Hydrology Report: "Even a well calibrated model has a large uncertainty to it, in its predictions. It turns out that this model is not well calibrated, so the uncertainties are almost certainly larger. It's not well calibrated because it tries to make predictions of what will happen in the shallow aquifer without historical shallow well water levels to calibrate to." Accord, Steve Baker (certified hydrogeologist) Response Comment Letter to 2008 Idaho Maryland Mine DEIR: "The fracture systems existing in buried bedrock beneath Grass Valley are not map-able within the resolution needed to predict specific dewatering effects. Technology and state-of-the-art hydrogeology have not developed to a level that fracture mapping is possible. Due to this limitation, hydrogeology modeling is attempted by making an assumption on fracture connectivity." Id.

What does all this and my other groundwater and surface water objections mean for the EIR decisionmakers? E.g., I.F.2, I.E.1.b and d, I.E. 3 and 4, I.D.2, I.C.2, etc.

FIRST, these commentaries and admissions are irreconcilable with many overstated and unjustified expressions or implications of optimism in the EIR/DEIR, whose purported commentaries and "responses" to meritorious objections are, at best, (if not ignored entirely) just disputed speculations, and unsubstantiated opinions, as well as errors, omissions, and other deficiencies often lacking in common sense (*Gra*y) and "good faith reasoned analysis" (*Banning, Vineyards, and Costa Mesa).* SECOND, these commentaries and admissions defeat any credible claim by the disputed DEIR/EIR for compliance with the General Plan, CEQA, or applicable law, and the miner's admitted lack of financial resources (e.g., SEC filings addressed in Exhibits B and A) make the EIR/DEIR plans illusory. THIRD, how is it possible under these circumstances for the EIR to accomplish its goals over the resolute and meritorious objections of those of us living on the surface above or around the 2585-acre underground mine not just under CEQA, but also as competing owners with property rights (e.g., the Supreme Court's *Keystone* decision) claims addressed elsewhere for inverse condemnation, nuisance, loss of lateral or subjacent support (including by groundwater), conversion of groundwater, etc.? See, e.g., Varjabedian v. Madera (1977), 30 Cal.3d 285 (confirming such claims by homeowners downwind of the new sewer plant.) Stated another way, how could any responsible official risk the welfare, health, and property of our community by imposing on us the downside of the EIR's speculative and risky gamble against uncertainties, dangerous mining history, and drying climate change future impacts for this "no net benefit mine" for the profit of this Canadian miner's shareholders? See my DEIR Objection 254 #4 and all the objectionable impacts explained by those objectors listed in my Table of Incorporated by Reference Objections.

As discussed elsewhere, there is another obscured competition for water during climate change dryness and drought that will inspire better and new wells to preserve our way of live, especially during NID water rationing. Consider the following "pick your poison" dilemma into which the disputed EIR/DEIR would force us. Begin with the California Dept. of Parks And Recreation (Agency 1 at 1-2) after it correctly addressed a portion of such dangerous noncompliance:

> Water quantity and quality, air quality, noise and vibration, hazardous materials, and wildfire dangers are crucial issues for CSP, and we find the DEIR to be inadequate in mitigations … [C]umulatively and individually these potential significant issues could negatively affect the natural resources, recreational values, health and safety of [that adjacent] Park['s] visitors and employees and the general well-being of Empire State Historic Park…"

See, for example, its expressed concerns about the DEIR/EIR's noncompliance with the California Water Code 13050(f) for failure to protect beneficial uses and the plans of the Central Valley Regional Water Quality Control Board and the Nevada County General Plan. Consider for example, the NSAQMD Agency Letter 12-1 at 11-12, stating:

> "The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements [i.e., DEIR mitigation proposed frequent daily watering attempting to keep toxic dust out of the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less water because of water wasted on this no net benefit mining]. Since the dust contains asbestos,

silica, and numerous toxic substances [now adding hexavalent chromium] adequate dust control is necessary. There should never be a situation where dust control is compromised because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest."

Again, we locals will be competing against a "no net benefit mine" (my DEIR Objection 254 #4) for the water we need during droughts, which is one of many reasons why I keep focused on full protections for all existing and future wells, because, if we have to suffer the loss of precious water in the climate changed future for 80 years of 24/7/365 dewatering, if our NID water supply to be wasted on dust suppression to avoid lethal air pollution, wells are our last option. Stated another way, if we cannot stop the dust watering because we must save ourselves from such asbestos and other lethal mine air pollution, our competing wells at least will be safe for us, whatever their impact on the mine's dewatering scheme, a mystery ignored by the disputed DEIR/EIR because (to them) this can all be disregarded as "speculative." It's not.

12. **Specialty Mining Risks And Disputes Expose EIR/DEIR Errors, Omissions, And Other Deficiencies, And Those With Experience In Failing Mines Expose How Such Noncompliant EIR/DEIR's Defy "Common Sense" (See *Gray*) And Evade The "Good Faith Reasoned Analysis" Required By CEQA (See *Banning, Vineyards, And Costa Mesa).***

a. Some General Mining Rebuttal Data, Warning About Disputed EIR/DEIR Tactics, And Objection Principles/Topics.

I commend the Sierra Fund, among other technical commentators whose objections I incorporate, for its excellent analysis in Group Letter 26 and for its worthy mining reality comments. E.g., I.F.2, I.E.1.b and d, I.E. 3 and 4, I.D.2, I.C.2, etc. I also echo such concerns, because as a bankruptcy lawyer with significant failed mine experience I can ratify such application of the specialized knowledge one acquires dealing with abandoned mine and reclamation issues, especially regarding the hydrology and water quality and supply problems that will be made worse in this disputed EIR mining and may continue to haunt our community long after the mining stops for any of many possible reasons. The County decisionmakers should ponder the lesson of history illustrated by the reasons more than 40,000 abandoned or bankrupt California mines are on the EPA list. As my and other cited objections have demonstrated that this disputed EIR/DEIR generally ignores or evades its CEQA obligations regarding the end-game impacts, mitigation issues, and remediation whenever the mining stops for any reason, including if and when this miner exhausts what Rise admits in its SEC filings to be limited resources for this highly speculative gamble. See Exhibit B and DEIR Objection 254 #2 regarding Rise's SEC admissions evidencing feasibility rebuttals to the disputed EIR/DEIR. See *Richmond v. Chevron,* rebutting the incorrect refusal of the EIR/DEIR to consider such admissions. Such end game outcome risks will increase for everyone once this disputed EIR/DEIR mining begins, and that history proves how too few miners ever clean up their messes when they abandon their mines. See, e.g., my objections in section III to the EIR's Master Responses 3, 7, 8, 11, 24, and 29. That risk is especially worrisome in the cases of financially limited speculators who begin expensive projects without the resources required to accomplish

much of anything they proclaim in their EIR's in hopes that they find enough gold (or financing bases on some increased prospect of gold) before their deficient funds are exhausted.

Consider how this process began already with so many reasons for my and others' objections and concerns, such as disputed EIR/DEIR errors, omissions, and objectionable claims, speculations, and unsubstantiated opinions masquerading as "facts," especially as part of "hide the ball," "bait and switch," and other noncomplying tactics illustrated in my and others' objections. See section I.A.1.d, DEIR Objections 254 #3.E, and my section II and III rebuttals herein to the disputed EIR Responses and Master Responses to that latter objection. The County should give special attention to such technical objections of experts, like the CEA, the Sierra Fund, and others who I have identified in my Table of Incorporated by Reference Objections or Exhibit D. Decisionmakers should also give attention to those like me and Sierra Fund who have substantial experience in evaluating the reasons why so many mines predictably failed, leaving a legacy of misery for the communities they exploited with unremedied impacts. See, e.g., my incorporated objections from my such Table at Agency 1, 10, 11, 12, and 15, as well as my objections in section III to the disputed EIR's "Responses" to my DEIR Objections 254 #'s 3.D, E, F, M, N, 4, 5, and 6.

Those who manage risk properly by considering the odds (including insurers) multiply the likelihood of the harm by the magnitude of the harm if it happens. Here, my and other objections demonstrate that both of those numbers are large, resulting in a substantial risk factor calculation. What that history teaches, among other things, is that this is not just a battle of "experts," because experienced people like me and some other objectors can and do here support our objecting experts by demonstrating how such a proposed mine, especially a proposed restart of a previously abandoned and flooded mine like this one, whose underground conditions are uncertain and insufficiently evaluated, and the EIR/DEIR speculations and unsubstantiated assumptions or opinions defy "common sense" and evade its EIR obligation to provide a "good faith reasoned analysis" of even obvious risks and threats, as required by *Gray, Banning, Vineyards,* and other authorities.

Throughout these objections and such others, **the EIR/DEIR has failed to do sufficient current and relevant investigation and evaluation comprehensively, as distinct from using outdated data and irrelevant studies or opinions (e.g., incorrectly claimed to be "similar"), as if the DEIR/EIR preferred the mystery to (it claims) avoid what it calls "speculation," thereby attempting to force us locals to suffer the EIR/DEIR many repeated gambles on unknowns or uncertainties that should not, and need not, exist if the EIR/DEIR were on a reasonable search for the relevant truths, rather than maneuvering to create what it incorrectly considers a sufficient case for the mining. The EIR/DEIR repeatedly has refused to disclose CEQA and other necessary information that is readily available to it (and is essential to potential local victims), even to simple things, such as the street addresses or other identifying surface landmarks revealing where all the victims are in relation to the 2585-acre underground mine below and around us thousands of surface owners and users, as well as other particular operations, nuisances, risks, and threats.** Also, the EIR/DEIR acts as if this were a game where a "tie goes to the offensive player" (the newly reopened mine) instead of the defenders (the existing resident potential victims objecting and trying to preserve their existing rights, property values, and way of life.) That is backwards, wrong, and certain to be disputed by us victims until we prevail or all our remedies are legal and political exhausted, since these are our homes and fundamental rights and economic values we are defending in contrast to this Canadian miner's private gamble for its shareholders' profits at

our risk and expense. If the EIR/DEIR cannot convince those who live above or around the 2585-acre underground mine that this project is safe, not harmful, and of some benefit to them, then no responsible government should approve it over the massive and meritorious objections here in the record, few, if any of which, are persuasively overcome on their merits, as opposed to being ignored, evaded, or resisted with resolute uncertainties under disputed models or theories without sufficient evidence on the merits that would prevail in court or in the political arena.

The Sierra Fund correctly explained why the starting condition of the existing mine, closed and flooded since 1956, is grossly under-evaluated. Those technical objections reveal massive risks to the welfare, health, and safety of our community and our property (and values). Objections like mine apply to such risks the legal authorities, "common sense" (illustrated in *Gray)*, and "good faith reasoned analysis" (e.g., *Banning, Vineyards, and Costa Mesa*) that should defeat any attempt by this disputed EIR/DEIR to satisfy its burden of proof. **The project proponent has the burden and responsibility for that result. *Sierra Club,* 6 Cal.5th at 513-14. As I keep protesting about the constant effort by the disputed EIR/DEIR to shift the burden of proof and demand more explanations and substantiation from me and other objectors, the CEQA burdens for analysis and reporting fall on the EIR applicant, not on the objectors. E.g., *Kings County Farm Bureau v. City of Hanford* (1990), 221 Cal. App. 5th 814, placing the burden of producing the relevant environmental data on the agency, not the public.** While so far in this DEIR/EIR process the applicable law seems to have been overlooked by incorrectly giving Rise the benefit of massive doubts as expressed in many meritorious objections, that evasion cannot survive the legal, law reform, and political challenges that would follow any mistaken approval of this disputed EIR/DEIR. See my Table of Incorporated by Reference Objections. While I deal with many topics with more force in other comments in this Objection and others, my purpose now it to illustrate some examples of those coming attractions that reveal the kinds of errors, omissions, and deficiencies that discredit the noncompliant EIR/DEIR from any approval.

b. Some Sierra Fund Mining Lessons Exposing EIR/DEIR Noncompliance.

As to omissions, about which there should be no serious debate on merits as to the noncompliance by the disputed EIR/DEIR, consider the following examples on which there seems a broad consensus among objectors, as Sierra Fund summaries (Group Letter 26): (i) my and other objections demonstrate there is a general, inadequate evidentiary foundation on which the EIR/DEIR is based for the required environmental review and mitigation measures; (ii) in the ultimate illustration of false equivalence defying "common sense" and "good faith reasoned analysis," the critical for CEQA "geochemical characterization of the 2 million tons of waste rock produced during the 11 years of mining and nominally the waste rock production from the entire 80 year life of the proposed permit" (sometimes falsely rebranded in the DEIR/EIR as misleading "engineered fill" as many of us have protested) is represented for predictive analysis of "approximately 96% of … [such] waste rock by these two samples which come from a total of 11 feet of drill core" cited at Grp 26-4 as "one 10-foot interval drill core ['Sample MA-2 from 3959.7' to 3969.7'] and one 1-foot sample [MA-3 from 3265' to 3266']" selected by Benchmark Resources from six drill core samples. As such objecting experts correctly contend, and consistent with "common sense" and "good faith reasoned analysis," such drilling cores are not sufficient to provide such required geochemistry of the waste rock and tailings and, therefore, to adequately assess the EIR mining impacts. (The also fatal omissions in surface and groundwater

quality and quantity data, such as test data on the leachate from that waste, compound that problem and prevent modeling of potential impacts, as I explain elsewhere. Asbestos and hexavalent chromium menaces are among others not properly assessed, as demonstrated elsewhere herein.) Since there are many ways miners have learned to "game the system" in testing, any adequate, compliant, and revised EIR must "do this right," such as by requiring water sampling to be done during storm events and using EPA certified laboratories to do trace hazardous materials detection, including for the hexavalent chromium in the mine cement paste being added, although, as this Objection demonstrates, the DEIR/EIR has obscured and incorrectly assessed that threat; (iii) Another such example is that, while admitting some historical collapses (DEIR at 574-576), the applicant propounds (at Id. and 542) unsubstantiated and disputed claims (a) that the underground mine workings focused on "removal of quartz vein materials that are generally narrow," so "the collapse of a deep (e.g., 100 feet bgs) mine feature is not likely to be expressed at the ground surface" and (b) that "they believe in all areas where the separation equals or exceeds 100 feet there is no chance that ground water drawdown could affect surface structures." [Note, that is what frackers in Oklahoma and Pennsylvania said about before they caused huge numbers of earthquakes and problems where none previously occurred.] Why will history not repeat itself or worse, especially as the disputed EIR mining dewatering depletes the groundwater 24/7/365 for 80 years? What proof do they offer? Also note that, as my objections demonstrate elsewhere (e.g., herein below and in my DEIR Objection 254 #'s 3.N, 4, and 14 and *Keystone*), us surface owners above and around the 2585-acre underground mine own that groundwater that is providing us with lateral and subjacent support as a property right, not just an environmental right; (**iv) Under the applicable regulations (27 CCR 22510(h)) the Regional Water Board can require satisfactory financial assurances from the miner to cover closure and post-closure mining activities that continue until the Board is satisfied that reclamation is complete and the waste no longer threatens water quality;** (v) While my objections address elsewhere many other noncompliance examples relating to hazards and hazardous materials, including the hexavalent chromium menace the disputed DEIR omitted and obscured, and the EIR also tried to evade and obscure to a lesser but still noncompliant extent, the Sierra Fund at Grp/ 26-7 identified an interesting and generally overlooked example of DEIR omissions regarding the mining operation's **mineral assays**, with deficiently disclosed environmental impacts due to five days a week assaying (DEIR 199, Table 3-8), emitting lead fumes and disposal of lead-contaminated crucibles and cupets without disclosure or mitigation; and (vi) Besides my other objections to omissions, errors, and worse noncompliance involving hydrology and water quality, focus here on noncompliance with Title 27 of the California Code of Regulations # 22470 et seq. that the Central Valley Regional Water Quality Control Board applies in regulating "mining waste" discharges (# 22480) pursuant to its Land Disposal Program.

Here, the Sierra Fund explains how 350,000 tons of ore removal a year/28 million tons during the 80-year permit period will create under-evaluated impact problems. Not only does the disputed DEIR/EIR fail to prove its incorrect classification of waste rock as Group C (a classification not yet accepted by the CVRWQCB), but the Water Board tests (e.g., ASTMD 5744) over the required period (e.g., 40 weeks) may confirm objectors' classification of such waste as Group A or B, consistent with the historical waste findings at Centennial. (Again, the disputed EIR/DEIR never adequately proves that we must expect a better/safer result from this mining than was suffered from the Centennial mining.) The same problems occur with the tailings the disputed DEIR/EIR proposes to use for mine shoring (exposed to 24/7/365

dewatering for 80 years) incorporated into hexavalent chromium cement paste backfill. The Sierra Fund not only exposes key omissions, but also explains more reasons (besides those others I cite) for denouncing the 2/24/2020 Itasca Desktop Study of Cemented Past Backfill that misleads people into imaging that its acid base accounting is even relevant, much less determinative, of the unexplained Group A or B versus C classification issues.

c. Some Illustrative Centennial Disputes.

As to the many examples of improper tactics, such as "hide the ball" and "bait and switch" (see, e.g. I.A.1.d. and DEIR Objection 254 #3.E) that I address in this and my other Objections, **note that the Centennial site (which must be considered part of this integrated project as I demonstrate elsewhere; e.g., I.B, and I.A.1 d.(ii)) evades the admittedly toxic conditions existing at the Centennial site improperly instead by "adjusting the environmental baseline for Centennial Industrial Site to use the above described post-remediation condition instead of existing conditions at the Centennial Industrial Site (DEIR Page 1-4)." See my objections to EIR's Master Response 9 in section III below.** As demonstrated elsewhere, there is no approved such Centennial remediation plan, and such remediation may never occur for many reasons, including because Rise admits in its SEC filings that it lacks the financial resources to accomplish much of any such important things it claims to aspire to do in the disputed EIR/DEIR. See Exhibit B and my DEIR Objection 254 #2.

d. Misleading EIR/DEIR Terminology (e.g., "Engineered Fill" Rebranded From Mine Waste) And Related Concerns About Waste Dumping Options.

Another example, besides the misleading use of terminology (e.g., calling waste rock "engineered fill," despite occasionally admitting that it's the same at DEIR p.653, and other disputed tactics in section I.A.1.a (iii)), is the disputed, misleading, and unsubstantiated claim that the EIR doesn't have to disclose impacts of waste disposal when its local Centennial and Brunswick dumps fill up (assuming the miner even obtains the regulatory approval for that dumping, which threatens not only the Wolf Creek and related areas, but also our groundwater, see, e.g., California Dept. of Parks And Recreation in Agency 1, Bear Yuba Land Trust in Group 2, and many others in my Table of Incorporated by Reference Objections). See my objections to EIR's Master Responses 8 and 11 in section III below. The disputed EIR/DEIR imagines implausibly selling on some market that likely toxic waste as rebranded "engineered fill," assuming/speculating that buyers will be as gullible as whoever believes this disputed excuse for failing to address the impacts of the likely inability timely to sell this (at best) controversial waste. Note that the DEIR admits (at 534) the obvious (i.e., the tailings, waste rock, and soil at the Centennial site contain "lead, arsenic, mercury, and other metals at concentrations exceeding …regulatory benchmarks…"), thus creating a presumption that new waste rock piles will also contain such hazardous materials.

That problem of waste rock disposal is magnified when the hexavalent chromium cement mine paste toxins become a cause for stopping the cement paste backfill-shoring plan in the disputed DEIR/EIR under the aforementioned Title 27 regulations, as the dewatering washes past them 24/7/365 for 80 years for disputed treatment and flushing away downstream to unsuspecting NID customers. In any case, the biggest omission that makes everything else in the

EIR/DEIR misleading or worse is that any of the various permits the miner manages to get from the Water Board over objections all expire long before the 80 years of mining (e.g., NPDES permits for discharges to surface water expire unless renewed every five years under the Clean Water Act, after public comment), which means many replays of this current community opposition on at least the same basis plus every other noncompliance discovered in the interim.

e. Some Groundwater And Water Related Mining Risk Illustrations of EIR.DEIR Noncompliance.

By denying the "significant" groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for many such "significant," overlooked, understated, or noncompliant impacts. Besides my incorporated water related objections in section II. P, Q, R, S, T, AF, AJ, AL, and AM herein rebutting EIR Master Responses, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. My objections in the relevant sections rebutting EIR Master Responses to groundwater depletion, quality and other harms, and other adverse impacts (e.g., #'s 13-16, 29, 33, 35, and 36) are incorporated here to minimize duplication, although the disputed EIR's substantial duplication merits some responses here. See also objections to other Master Responses which mix groundwater and other issues, such as #'s 1-3, 6-11, 17, 20, 24, 29, and 35.

Also, despite my extensive discussion of such legal, environmental, and other issues in my DEIR Objection 254 from the perspective of potential victims with violated property rights to become at issue for us owners and users of surface lands (at least down to 200 feet) above and around the 2585-acre underground mine, the disputed EIR ignores those issues and rights entirely. See section I.F.9 and 8. As stated in various such objections, those objections cannot be limited by the disputed EIR/DEIR interpretations of CEQA (see my corrections in section I.C and D), and they must be considered compliantly, analyzed, and mitigated, because such EIR property rights violations will trigger many legal property disputes regarding surface owners' and users' competing and shared rights to the groundwater and other environmental impacts at issue, as well as to rights of lateral and subjacent support to prevent "subsidence," which as the Supreme Court explains in Keystone, includes support from our groundwater. As so described and as demonstrated herein, the disputed EIR/DEIR fails to overcome my objections and those of others in my Table of Incorporated by Reference Objections.

Remember this Project is not to start a new mine using modern analysis, tools, techniques, and other methods, but rather to reopen, expand (e.g., with 76 miles of new blasted tunnels and related mining and dewatering), and presumably shore up (using toxic hexavalent chromium cement paste without proper CEQA and Prop 65 warnings and analyses) a mine flooded and closed in 1956, which is in an unknown (e.g., what is imagined is based on unreliable, complete, and disputed historical records), uninvestigated, and untested condition, because (I suspect) the miner may not have wanted to know the inconvenient truths, but preferred the disputed EIR/DEIR's abstract theories, models, and comparisons to supposedly "similar" mines (which we dispute as false equivalence tactics.) Even if the EIR/DEIR wanted to claim some analysis of the existing mine that was closed and flooded in 1956, it did not analyze the actual conditions there to achieve useful knowledge, but instead sifted through incomplete, unreliable, and often erroneous historical records about the mine to support its chosen narrative.

As noted elsewhere, that house of cards would not long survive evidentiary motions in court where evidence must comply with rules to assure credibility, accuracy, and admissibility.

There is an extensive body of law that has been developed over many years as to the competing rights in disputes between surface owners and users versus underground miners beneath or near them. See, e.g., *Keystone*; *Gray*. While my DEIR Objection 254 addressed such issues (at #'s 3,N, 4, and 14) because they will also have impacts on the mine's environmental compliance, mitigation, and feasibility, the EIR erroneously (and apparently willfully) ignores that here by reducing our many disputes down to a different, but related, dispute where I begin, which is dewatering causing "subsidence," i.e., the use of groundwater to support the surface and protect the surface owners' and users' property there. See *Keystone*. This could be the scene in the old Clint Eastwood/Lee Marvin movie "Paint Your Wagon" about Nevada City (therein called No Name City), where the miners digging under the saloons and stores for gold dust falling between the cracks in the floorboards caused the whole town to collapse into the mining holes. However, one does not need to cause that kind of crisis or even earthquakes (e.g., like well depletion of groundwater in the Central Valley dropping the surface and breaking the surface infrastructure in the process, or like the fracking depletion of groundwater is doing to cause earthquakes in Oklahoma, Pennsylvania, and elsewhere where they never existed before) to trigger surface owner remedies. It is enough that surface infrastructure is so damaged, as one now sees throughout our central valley (e.g., Bakersfield) where, for example, tree farmers are pumping groundwater to save their trees, and dropping the surface level as much as six feet (so far), and thereby harming homes, roads, utility pipes, and other infrastructure by resulting, differential settlement of such surface areas. That threat was enough to inspire disputed EIR Mitigation Measure 4.6-3(c) "to close six near surface mine features," as if somehow that solved the problem, which it does not do. The deeper mining can still have adverse surface consequences, and no persuasive case is made in this EIR Master Response to the contrary with common sense and good faith reasoned analysis; the disputed EIR just asserts that this is a "near surface work" risk, because that is all they reportedly had NV5 study in its disputed "Geotech Review of Near Surface Features" (Table 1 of Appendix H.6 cited in the EIR at 2-122). (Again, the EIR is focused on the Brunswick shaft area, rather than our objectors' surface above and around the 2585-acre underground mine where thousands of us live.)

The US Supreme Court has addressed in objectors' favor such surface owner versus underground miner disputes in cases I address here and in my DEIR Objection 254 #3.N (as well as in my #'s 4 and 14), such as ***Keystone Bituminous Coal Ass'n v. DeBeneditis,*** 480 U.S. 470 (1987)(rejecting "taking claims by miners against laws protecting surface owners' property rights to lateral and subjacent support, including by groundwater, to prevent "subsidence," including loss of groundwater support), where surface owners were allowed to require underground miners to preserve their surface rights of subjacent and lateral support (and protect against subsidence, which includes leaving groundwater support) by leaving 50% of the coal to support the surface. *Accord*, ***Smith v. County of LA*** (1986), 214 Cal. App. 3d 266 (essential county road repairs created landslide conditions destroying local homes, triggering nuisance, inverse condemnation, and other claims, both for damages for diminution in the value of real property and for annoyance, inconvenience, and discomfort, including mental distress as part of the loss of quiet enjoyment rights as a property owner.) **As noted herein, the admitted lack of currently available financial resources by the miner to perform its EIR safety, mitigation and other obligations (see Exhibit B and Objection 255, addressing discussed Rise admissions in SEC filings, and in the DEIR, e.g., at 6-14 admitting to financial infeasibility**

unless the EIR is approved "as is") is not just a CEQA problem, but it also enables us victims to take proactive defensive mitigation actions on our own at the expense of the miner (and, depending on the facts, the County). See, e.g., my DEIR Objection 254 #' 4 and 14, including my legal authority counters herein to the disputed EIR Response To Comment Ind. 254-54 to 60

Instead of sufficient testing and analysis for the actual 2585-acre underground mining threat, both deep and shallow, the disputed EIR gambles (once again) us surface owners' fates on **the EIR's highly qualified and disputed general theories, usually qualified with subjective (therefore, vulnerable to misleading extreme interpretations) words like "generally" or "likely."** For example (with emphasis added), our surface owner and user property rights are vulnerable whenever we're an exception to the EIR/DEIR's general, unverified and disputed assumptions, such as (EIR at 2-122): (1) "near- surface features are **GENERALLY** more susceptible to subsidence and collapse than deeper mine workings, because the near-surface features **MAY BE l**ocated in weaker materials (soil and weathered rock); whereas the deeper mine workings are **COMMONY LOCATED** in competent bedrock; (2) "underground mine workings focused on removal of quartz vein materials that are **GENERALLY** narrow, so the collapse of a deep (100 feet bgs) mine feature is NOT LIKELY to be expressed at the ground surface;" and (3) being conservative and considering 100 feet below ground surface (bgs") to be "deep," [but the property rights of us surface owners to the "surface" is admitted in the Rise SEC 10K filing to be 200 feet down; see Exhibit B and DEIR Objection 254 #2] "NV5 believed that collapse of features even closer than 100 feet **ARE UNLIKLEY** to be expressed on the surface." [But, again, that surface is legally at least 200 feet down] Despite all those qualifications (with such disputed, subjective standards giving exaggerated effects) and our many objections somehow, despite lacking the data needed for more reliable data, the disputed EIR then incorrectly and misleadingly concludes that: "therefore underground working that have potential to cause subsidence at the surface have been thoroughly analyzed in the DEIR."

The County decision makers should ask how a surface owner can expect to sell a house or protect its property values with such disputed "general" qualifications, lack of sufficient study/investigation, and exaggerated, subjective "latitude" for dangerous exceptions. (Literally a surface seller would have to tell the buyer or its mortgage lender or appraiser, in effect: "don't worry, disputed experts have produced a widely disputed EIR full of demonstrated errors, omissions, and objectionable tactics that says you GENERALLY don't have to worry about 'subsidence and collapse' of the surface improvements and land as a LIKELY result of the 24/7/365 blasting, dewatering, tunneling, mining, and other protested activities beneath your house.") Also, one of many signs that this disputed overstatement (lacking any of those qualifications in the cited premises on which such conclusion is based) applies to the wholly owned Brunswick site, but not to the 2585-acre underground mine below our surface, is that our surface ownership above and around that underground mine goes down at least 200 feet, so there is no mining at all above that 200 feet of our "surface" property, or, if you believe the disputed EIR's self-restraint plan, 500 feet.

f. Illustrations of Disputed EIR Mining Practices Threats And Illusions.

When the EIR addresses the new underground mining activity in its section explaining the tunneling and mining methods (citing DEIR 3-19), consider the following examples of where the EIR chooses to miss the point of even the "subsidence" part of our many EIR ignored

objections. Here, for example, the EIR leaps incorrectly to the unproven, false, and disputed assumption that only "near surface" mining causes dangerous subsidence (in the only portion of the mining it chooses to discuss, whatever that is, because the EIR/DEIR is never clear about that location, consistently using false equivalence assumptions that everything is the same as whatever part it considered specifically). With some unsubstantiated, "aspirational," not enforceable (or affordable/feasible considering Rise's SEC filed financial distress admissions in Exhibit B and DEIR Objection 254 #2), everyone should be at least skeptical comments about future aspirations to use "best mining practices" which is a low bar standard, sort of like saying "best hockey practices" (an analogy chosen because rule breaking and penalty box time are accepted parts of that sport, sort of like tamer "best cage fighting practices.") Nothing in such disputed EIR/DEIR aspirations are reliable, compliantly described/analyzed, or proven, which recall involves new blasting, tunneling, dewatering, and mining into unknown and uninvestigated conditions underground that Rise has not explored or evaluated (i.e., this is the kind of "best mining practices" to be expected from such speculating gamblers at the risk of us surface owners above or around the mine.)

The result of this disputed EIR discussion is this additional, unsubstantiated, unproven, and disputed conclusion (at 2-122, emphasis added): **"Therefore, it is UNLIKELY that any new underground openings would produce a fall of ground or collapse that would affect the integrity of the mine." Notice that it only speaks to the "integrity of the mine," but not to subsidence or the safety of the thousands of us living on or using the surface (and the next at least 200 feet) above and around the 2585-acre mine (a clever "bait and switch" evasion/nonresponse too common in this disputed EIR/DEIR). And again, this qualified (i.e., UNLIKELY) subjective standard will never satisfy any buyer or its lender or appraiser, even if they trusted the source of the opinion and the basis for that conclusion, both of which are doubtful insufficient at this point, especially considering all the credibility issues with the widely EIR/DEIR.** See my Table of Incorporated by Reference Objections.

Likewise, the overall EIR "Conclusion" also does such a "bait and switch" by opining (at 2-123, emphasis added) with this even less reassuring and disputed opinion: "**The DEIR's evaluation of the potential for dewatering to result in collapse of surface materials is legally adequate" (a disputed reference to the EIR's disputed and incorrect CEQA standard (see, e.g., sections I.C and D), not the legal standard for protecting surface owner and user rights from such underground mining (see, e.g., *Keystone* and similar authorities.) Stated another way, the disputed EIR is NOT ASSURING US OF SAFETY, but rather claiming that the EIR miner claims it has a credible legal defense when the mine causes harm. First,** notice that dewatering is only one possible cause of loss of the required lateral and subjacent support resulting in subsidence, and blasting in the wrong place or conditions and others also can be causes for violations of surface rights to be free of subsidence, e.g., changing the course of underground water flows. **Second,** the subsidence violations can still exist from property/environmental harms much less severe and dramatic than "collapse," although mine cave-ins are not uncommon events. **Third,** the vague and ambiguous "legally adequate" standard is subject to dispute, because I am certain us surface owners and users above the 2585-acre mine will disagree with the miner about what is and is not "legally adequate." See my Supreme Court *Keystone* decision above and others.

13. The Disputed EIR Also Evades My Meritorious Objections In Various Incorrect Or Noncompliant Ways With Meritless Or Worse Excuses Or Unexcused Or Worse Omissions, Lacking Both "Good Faith" And "Reasoned Analysis, " Such As: (i) By Disaggregating/Chopping Up My Integrated DEIR Objections 254 and 255 So As Incorrectly To Claim Inadequate Detail Or Explanations In Such EIR Artificially Selected Fragments (Such As Because the EIR Ignores Cross-References And Incorporations In My Objections); (ii) By Incorrectly Or Worse Rejecting Objections As "Speculation," "Unsubstantiated Opinion, Etc. Contrary To Applicable Law, Whether Substantive, Procedural, Or Evidentiary; (iii) By "Legal Errors" (Including EIR Ignoring the Legal Component In "Mixed Questions of Law And Fact"); And (iv) By Other Improper Tactics/Techniques Creating More Objections By Exposing EIR Credibility Problems That I Cite In My Counter Impeachment And Rebuttals, Such As in Sections II and III Below.

a. How The Disputed EIR Often Evades Any Meaningful, CEQA Compliant "Response" By Frequently Chopping My Objections Into Fragments And Then Complaining About the Insufficiency of Each Fragment by Ignoring Both The Rest of My Actual Section And My Internal Cross-References And External Incorporations By Reference. See my protests in each such case in section II (my objections to EIR Master Responses) and in section III (my objections to EIR Responses to What It Calls My Individual Comment Ind. 254-1 et seq.)

My such EIR/DEIR objection format is often to state my objection with a few examples or background for clarity or context, with details provided both (i) in specific cross-references to other parts of my long, point by point and subject by subject objections, and (ii) in other cited support (e.g., incorporated EPA websites etc. or third-party objections, such as in my Table of Incorporated by Reference Objections). The disputed EIR constantly also chooses to create such defective and wrongful excuses to evade my such **integrated** section objections (with such cross-references and incorporations). CEQA and applicable law do not permit such continuous EIR **isolation in fragments by cutting up my organized sections and then judging the EIR's chosen fragments as if they were all that was stated, thus ignoring my cross-references and incorporations.** See sections I.A.1.d, I.C, I.D. and I.E. I cannot perceive any logical pattern besides evasion tactics for how some of my objections are fragmented and others are not, as anyone can confirm by reviewing my section III rebuttals below. For a quick survey of such evasions please compare the following sections of my DEIR Objection 254 to their EIR cuts and my corresponding objections in section III. E.g., my Objection 254 # 3.A (EIR cuts 254-6 to 10), my such #3.B (EIR cuts 254-11 to 13), my such #3.C (EIR cuts 254-14 to 15), my such #3.D (EIR cuts 254-16 to 19), my such #3.E (EIR cuts 254-20 to 31), my such #3.F (EIR cuts 254-34 to 35), my such #3.J (EIR cuts 254-39 to 42), my such #3.K (EIR cuts 254-43 to 45), my such #3.L and M (EIR cuts 254-46-49), my such #3.N (EIR cuts 254-50 to 53), my such #4.A (EIR cuts 254-54 to 60), my such #4.B (EIR cuts 254-61 to 63), my such #4.C (EIR cuts 254-64 to 65), my such #5.A (EIR cuts 66 to 70), my such #9 (EIR cuts 254-78 to 79), my such #13 (EIR cuts 254-87 to 88), and my such #15.B (EIR cuts 96 to 99).

For example, as repeatedly demonstrated in my rebuttals in sections II and III below to the disputed EIR's nonresponsive Responses to my Comments Ind. 254-1 et seq, the EIR wrongfully chops up my integrated arguments so that it can complain that its cherry picked parts lack sufficient details or examples that actually appear (or are incorporated by reference) elsewhere in my integrated objections (e.g., among the worse examples is the EIR's chopping up of my DEIR Objection #3.E, ironically focused on how the EIR/DEIR wrongfully "hides the ball," deploys "bait and switch" tactics, and otherwise evades objections to DEIR/EIR errors, omissions, and other flaws, such as, for example, regarding my water and hexavalent chromium issues in Objection 254 #3.E, into many artificially segregated parts in Comment Ind. 254- 20 to 22 to which the EIR responds as if each such disconnected/disaggregated segment were my entire objection and contained no cross-references or incorporations by reference and were not part of my integrated composite objection. See my rebuttal above at section I.F.5. My #3.E is only one of many such examples, illustrating (and cross-referencing and incorporating) places in my DEIR Objection 254 that expose water and hexavalent chromium related errors, omissions, and noncompliance in the DEIR. I use that simple #3.E (and I.A.1.d and I.F.5 above) example, because it was intended to expose some EIR credibility problems with illustrative examples of the many substantive rebuttals in my Objection 254 to such errors, omissions, and noncompliance spread out in the DEIR, since such water and hexavalent chromium issues are a common problem to many of the DEIR/EIR claims, bogus theories, speculations, unsubstantiated opinions, and worse.

Throughout my DEIR Objections 254 and 255 and my Objections to the EIR, I often expose EIR/DEIR errors, omissions, or noncompliance by using rebuttal or impeachment quotes and other **admissions** from the EIR/DEIR or from Rise SEC filing that are contrary to other disputed claims in the EIR or DEIR. See, e.g., my DEIR Objection 254 #'s 1.A. and 3.A (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-6), my such #2 (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-5 and -6), my such #'s 3.E (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-20 to 33), my such #3.F (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-34 to 35), my such #3.K (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-43 to 45), my such #3.M (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-46 to 49), my such #3.N (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-50 to 53), much such #5.B (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-74), and my such #13 (and my section III objections herein to counter the corresponding EIR Responses To Comment Ind. 254-87 to 89).

Among the other common, disputed EIR tactics (and CEQA noncompliance) that I demonstrate, is incorrectly claiming that the disputed EIR can ignore or dismiss (as it frequently does) my meritorious objections (even the evasive way the EIR has so divided my integrated analyses to seem less coherent) by incorrectly alleging they somehow have deficient explanations or lack sufficient detail. However, that bogus evasion by the disputed EIR is too obvious and by itself requires rejection of the EIR by the County decisionmakers, as also does the substance of my objections, which are all sufficient on their merits. Note that many of the disputed EIR's nonresponsive "responses" complain about my objections not providing sufficient details or explanations, but such disputed EIR claims entirely disregard my cross-

references and incorporations by reference in my such objections. Moreover, my objections have often been more detailed than the DEIR/EIR statement to which I was objecting, so that where the disputed EIR alleged my objections to be deficient (eg, lacking sufficient detail, clarity, or explanation), the DEIR/EIR comment which I was disputing always had even more such flaws. That demonstrated fact in section III excuses my such alleged deficiencies, because, as I have demonstrated above, (i) the primary CEQA burdens are on the miner, not the victims like me, and (ii) CEQA requires the EIR/DEIR to provide a "good faith reasoned analysis" applying "common sense" as in *Gray* (see my DEIR Objection 254 #'s 3.N, 4, and 14 and my objections herein defending against the disputed EIR responses thereto, citing to ***Banning, Vineyards, and Costa Mesa***). Impacted victims like me should be able to defeat the disputed EIR/DEIR merely by demonstrating that errors, omissions, and noncompliance therein fail to present the CEQA required such "common sense," "good faith reasoned analysis," since the burden of proof is on the miner and its approving authority. **The project proponent has the burden and responsibility for that result. *Sierra Club*, 6 Cal.5th at 513-14. As I keep protesting about the constant effort by the disputed EIR/DEIR to shift the burden of proof and demand more explanations and substantiation from me and other objectors, the CEQA burdens for analysis and reporting fall on the EIR applicant, not on the objectors. E.g., *Kings County Farm Bureau v. City of Hanford* (1990), 221 Cal. App. 5th 814, placing the burden of producing the relevant environmental data on the agency, not the public.**

I object to the disputed EIR so evading my Objections by treating each of its artificially selected cuts of my integrated arguments as if it was a self-contained argument that could be compressed and discarded without considering its connections to the rest of my long DEIR Objection 254 (and what it incorporates and offers to prove at trial (e.g., with witnesses, impeachment, and rebuttals), which was necessarily spread out in DEIR Objection 254 to match the many different sections of the long DEIR containing the same or related spread out errors, omissions, and other noncompliance.) By analogy, this wrongful DEIR/EIR technique is the equivalent of a EIR applicant chopping up an opposing movie documentary into still photos, so that it can then attempt to complain that each such individual photo does not reveal what the movie maker claimed in a summary of the movie, but which is actually in the movie elsewhere than in that one photo. A review of my unmolested DEIR Objection 254 #3.E example (i.e., what is not so improperly disaggregated by the EIR) comprehensively already has not only rebutted this nonresponsive, disputed Response, but proven that this disputed EIR/DEIR cannot be approved as credible or compliant with CEQA or other applicable law. See section I.A.1.d and many others above.

I have highlighted examples of in EIR Responses To [my] Comments Ind. 254-1 et seq. of evasions by both omission of whole topics or issues or paragraphs in my Objection 254, as well as omissions of key reasons and bases of my such objections to something which the EIR/DEIR ignores. I have labeled some (not all) of my objections to the titles of disputed EIR Responses to My Comments Ind. 254, and other things to which I object. Those objection labels enable me to identify for readers certain illustrations of certain types of errors, omissions, and flaws. (I address separately similar evasions, omissions, and other flaws in the Master Responses, because such Master Response debates are more complicated to expose, since the EIR advocates may attempt to argue that they can choose whatever part of a disputed idea they wish in the Master Response, except that the same kind of evasions, omissions, and flaws appear in Master Responses when they are examined as applied to my Objection 254 by cross reference in EIR Responses to (my) Comments Ind. 254 to which I have objected. In effect, they too often

claim "1 plus 1 equal 3;" i.e., "1" in the EIR Master Response plus "1" in the EIR Response to (my) Comment Ind. 254-1 et seq. equals 3, which is wrong, whether whichever part of that disputed formula is wrong.) See, e.g., examples below of such disputed Master Responses with such evasions, omissions, and flaws exposed by my objections thereto. Consider, for example, the following illustrations how (without even any attempted excuse) **such disputed EIR/DEIR Responses To Ind. 254-1 et seq totally ignored certain of my objections,** as my corresponding objections below demonstrate. Also, consider the various other EIR/DEIR evasion tactics I expose herein, where in such disputed EIR Responses to my Comment Ind. 254-1 et seq. and Master Responses it either "hides the ball" or addresses too narrowly in an improper "rewrite" in what I addressed more broadly in my actual objection, often because of the way the EIR sliced up my integrated Objection 254 arguments into smaller parts that were less informative and persuasive, as I explained above and demonstrate below in such instances.

Thus, the disputed EIR frequently cuts up into artificial fragments my integrated objection comments in its selectively labelled fragments instead of my such sections that match my detailed Table of Contents, and then the EIR wrongly treats each such EIR designated fragment (called an EIR "Response To Comment Ind. 254- 1" et seq.) as if the EIR's such selected cuts each had to stand on its own without considering the cross-references and incorporations therein. For coherence my objections had to track the corresponding order of errors, omissions, and noncompliance in the disputed EIR (like also in the disputed DEIR, since the EIR basically adopts the whole, disputed DEIR without any of the badly needed corrections or reforms). That means that the introductory or general sections of the disputed EIR/DEIR required my noting my objections as errors, omissions, and worse occurred in the disputed EIR/DEIR before reaching the major substantive parts disputed later in the sprawling EIR/DEIR, where I matched their more detailed comments with my more detailed objections. In other words, such EIR/DEIR's artificial fragmentation of my Objection sections is responsible for the redundancy (and the less detailed "coming attraction" type objections) early in such document fragments, with cross-references to my more detailed objections to the major disputed substantive topics coming later in the document (eg, for example, my objection to the DEIR "Hazards And Hazardous Materials" section 4.7 [e.g., noting the total omission of hexavalent chromium analysis] is what the EIR here partly calls its "Response To Comment Ind. 254-1"). That cannot be avoided or blamed on me, since I am matching the disputed EIR/DEIR in sections II and III disputed sentence by sentence.

b. The EIR/DEIR Constantly Defies "Common Sense" And Fails And Refuses To Provide the Required "Good Faith Reasoned Analyses" To My Objections, Especially as To My Complaints That the Disputed EIR/DEIR Rarely Justified Their Disputed Mitigation Claims And Wrongly Failed To Reply To Many of My Objections, Incorrectly Claiming That My Objections Were Speculative, Unsubstantiated, Or Not Explained (Which Involved the Disputed EIR/DEIR Ignoring All The Many Cross-References, Incorporations of Other Objections, And Other Disputed And Improper Tactics.)

Like the disputed DEIR, the disputed EIR is noncompliant with CEQA and other applicable law, among other things addressed throughout this Objection document, because the EIR improperly disregarded meritorious objections based upon either the EIR's mistaken or

worse assumption that it can ignore or reject such objections on such incorrect grounds that such objections provide insufficient detail, are too speculative, contain unsubstantiated opinions or narratives, or are otherwise outside the alleged boundaries of CEQA (even though in many cases what I have objected to in the DEIR/EIR is itself contrary to its own standards for what is too speculative, unsubstantiated, or otherwise outside its disputed CEQA boundary claims.)

While my DEIR Objection 254 objected to many such tactics that failed to meet that "good faith reasoned analysis" standard (e.g., Objection 254 #3.E; *Banning, Vineyard, and Costa Mesa*) and the *Gray* "common sense standard in DEIR Objection 255, this disputed EIR did much worse in evading my meritorious objections time after time as I explain in section III protesting almost every one of the many disputed and nonresponsive EIR Responses, often so claiming that they are excused from any response where they incorrectly claim that my objections were speculative, unsubstantiated, or not sufficiently explained, even when those disputed EIR charges were even more applicable to the DEIR/EIR they were covering up or evading. See, e.g., DEIR Objection #3.D, E, G, and K, and 12. For example, when the DEIR/EIR makes an unsubstantiated speculation, it is not my burden to provide more than an exposure of that noncompliance with the CEQA "good faith reasoned analysis" and "common sense" required to satisfy the EIR/DEIR burden of proof, although my practice was to provide the best analysis I could. As provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)**

Note, however, how it was often challenging when the DEIR/EIR provided no substantiation or reasoning, but just asserted a disputed opinion, assumption, or speculation. Indeed, as I show in my section III rebuttals, the most common EIR response to my DEIR Objections 254 and 255 was to restate my objections incorrectly or insufficiently and then simply to repeat what the EIR or DEIR previously stated, rather than attempt a "good faith reasoned analysis." Since the DEIR was demonstrated to be noncompliant and worse by my DEIR Objections 254 and 255, the EIR accomplished nothing when it just repeated what they said before in the DEIR and ignored my meritorious disputes and issues with what the DEIR said (and did not say). Indeed, while I have asked many hard and important questions in my DEIR Objections 254 (e.g., #'s 15 and 1.F and G) and throughout 255, the EIR does not attempt any meaningful response. See my hard questions at section VI below.

c. Some Illustrations (e.g., Groundwater, Hexavalent Chromium, And Other Significant Impacts Which Are Not Truly Mitigated) of The Disputed EIR's Legal Mistakes And Such Tactics For So Evading Meritorious Objections Incorrectly As Too Speculative, Unsubstantiated, Or Otherwise Deficient.

In many cases these EIR/DEIR mistakes or worse are also the result of legal errors that cause this nonresponsive, disputed, and flawed EIR to fail to comply with CEQA and other applicable law, with the result that the disputed EIR cannot be approved. Such EIR/DEIR "legal errors" often include more than misinterpretations or misapplications of the applicable law to the applicable facts, such as, for example, incorrectly claiming that the Centennial site is separate and not part of this disputed "Project," (an issue that allows objectors to contest with discovery not only what the law is, but also what the real facts may be contrary to the EIR/DEIR's disputed allegations). See section I.B and I.A.1.d above.

Now that the foregoing subsections set the foundation for my such objection, please consider these specific examples applying those rules. **CONSIDER THIS TYPICAL EXAMPLE OF SUCH EIR BAD FAITH EVASION OF MY DEIR OBJECTIONS BY COMPARING (1) MY THREE PAGE OBJECTION 254 #3.F (entitled there and in my Table of Contents as: "One illustrative Dispute Over Groundwater Depletion by the Mining.") TO (2) HOW THE DISPUTED EIR (AT 2-5916) CHOPPED MY SUCH OBJECTION IN HALF AND THEN SUCCESSIVELY IGNORED EACH OTHER HALF WHEN ADDRESSING THE FIRST HALF AS ALLEGEDLY DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR RESPONSE TO COMMENT IND. 254-34 PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR QUOTES (INCLUDING DEIR ADMISSIONS EVIDENCING NONCOMPLIANCE), BUT THEN, IGNORING THE REST OF MY OBJECTION 254 #3.F, THE EIR's CUT LABELED RESPONSE TO COMMENT TO IND. 254-35 INCORRECTLY STATED: "HOWEVER, THE COMMENTATER DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR QUOTES ARE SUFFICIENT, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE SECOND HALF OF MY #3.F THAT THE EIR CUT OFF AS RESPONSE TO COMMENTS IND. 254-35, AGAIN INCORRECTLY STATING: "HOWEVER, THE COMMENTATER DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." THUS, INSTEAD OF ADDRESSING MY THREE PAGE EXAMPLE AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT MY ANNOTATED EIR QUOTES IN IND. 254-34 FROM MY DETAILED REBUTTALS OF THOSE QUOTES IN IND. 254-35, SO THAT THE EIR COULD CLAIM AN FALSE EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS. THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENED SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS, MAKING THIS DISPUTED TACTIC IMPOSSIBLE TO EXCUSE AS AN ACCIDENT OR OVERSIGHT. IN FACT, ANY TRUTH SEEKER SHOULD RUN A WORD SEARCH FOR SUCH EIR RESPONSES FOR THOSE WORDS (EG, "COMMENTER DOES NOT STATE"), BECAUSE EVERY SUCH EIR RESPONSE IS DISPUTED BOTH FOR THAT SAME REASON AND ON THE MERITS. IT IS REVEALING WHICH OF MY OBJECTIONS THE DISPUTED EIR/DEIR CONSIDERED SO DANGEROUS THAT THEY CHOSE TO SO GAMBLE ON EVADING ANY RESPONSE ON THE MERITS IN HOPES THE COUNTY DECISION-**

MAKERS WOULD NOT NOTICE THIS NONCOMPLIANCE WITH CEQA AND OTHER APPLICABLE LAW.

ALSO, CONSIDER CLOSELY ANOTHER EXAMPLE OF SUCH DISPUTED EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY TWO PAGE OBJECTION 254 #3.G, ENTITLED "THE DEIR'S DISPUTED ERRORS, OMISSIONS, AND DEFICIENCIES ALSO INCLUDE WATER QUALITY, ESPECIALLY RELATING TO HEXAVALENT CHROMIUM (REMEMBER ERIN BROCKOVICH?) paired with (2) my adjacent three page Objection 254 #3.H entitled there and in my Table of Contents as: "Some Technical Comments About Hexavalent Chromium, Since the Disputed DEIR Fails to Even Discuss the Existence of Controversy, Much Less the Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like me) Who Fear Us Becoming Another 'Hinkley' As Mourned By The *Erin Brockovich* Movie.") THAT COMPARISON EXPOSES HOW THE DISPUTED EIR (AT 2-5919) IGNORED THAT ADJACENT, RELATED OBJECTION 254 #3.H WHEN ADDRESSING #3.G AS DEFICIENT, AND VICE VERSA. SPECIFICALLY, THAT DISPUTED EIR RESPONSE TO COMMENT IND. 254-36 PRESENTED A FLAWED REFERENCE TO MY COMMENTS, AND THEN, IGNORING MY RELATED OBJECTION 254 #3.H, THE EIR LABELED "RESPONSE TO COMMENT TO IND. 254-36" IGNORED MY ADJACENT OBJECTION LABELED BY THE EIR AS "IND. 254-37," PLUS ALL MY OTHER CROSS-REFERENCES, INCORRECTLY STATING: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY INDIVIDUAL OBJECTIONS ARE SUFFICIENT, AS I HAVE EXPLAINED. SECOND, THOSE DETAILS ARE FURTHER DESCRIBED IN MY #3.H THAT THE EIR IGNORED IN THAT IND. 254-37, AGAIN INCORRECTLY STATING: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." THUS, INSTEAD OF ADDRESSING MY INTEGRATED WHOLE OBJECTIONS, THE DISPUTED EIR SPLIT MY SUCH RELATED OBJECTIONS IND. 254-36 AND -37 SO THAT THE DISPUTED EIR COULD INCORRECTLY CLAIM AN EXCUSE TO EVADE BOTH OF MY MERITORIOUS OBJECTIONS. THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH." THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS, MAKING THIS DISPUTED TACTIC IMPOSSIBLE TO EXCUSE AS AN ACCIDENT OR OVERSIGHT. IN FACT, ANY TRUTH SEEKER SHOULD RUN A WORD SEARCH IN SUCH EIR RESPONSES FOR THOSE WORDS (EG, "COMMENTER DOES NOT STATE"), BECAUSE EVERY SUCH EIR RESPONSE IS DISPUTED BOTH FOR THE SAME REASONS AND ON THE MERITS. IT IS REVEALING WHICH OF MY OBJECTIONS THE DISPUTED EIR/DEIR CONSIDERED SO DANGEROUS THAT THEY CHOSE TO SO GAMBLE ON EVADING ANY RESPONSE ON THE MERITS IN HOPES THE COUNTY DECISION-MAKERS WOULD NOT NOTICE THIS NONCOMPLIANCE WITH CEQA AND OTHER APPLICABLE LAW.

As discussed in my Objection 254 #'s 3.G and H (and rebutted below in my objections to EIR Responses Ind. 254-1, -36 and -37), I remind readers about the EIR/DEIR's lack of "good faith reasoned analysis" and "common sense" shown therein. I

repeat that the DEIR buried an admission of the hexavalent chromium not by such analysis in the DEIR "Hazards And Hazardous Substances" or other relevant threat discussions themselves, but obscured in a mere sentence in DEIR Mitigation Measure 4.8-1(a) at 4.8-52, where it states(emphasis added): "The NOI [to the Central Valley Regional Water Quality Control Board under the Limited Threat Discharge permit] shall include evaluation of potential constituents of concern, including ammonia, arsenic, HEXAVALENT CHROMIUM [emphasis added by capitalization], iron, manganese, pH. total suspension solids, TDS and cis-1.2-DCE." Under the circumstances I suspect this is not some innocent "mistake," since the EIR does not claim any such excuse, but instead enhanced the cover up after I exposed the problem in DEIR Objection 254 by the EIR pretending that the DEIR had already provided a compliant analysis (but which such EIR was "significant new information" and still a deficient, purported, and disputed partial analysis that was only added by the EIR). To a cynic this appears as if someone intended to address hexavalent chromium as the problem it is, and then someone else decided to cut out that analysis, perhaps in hopes no one would notice, but either failed to delete all these brief and noncompliant references or decided to leave them in vaguely in obscure places in case someone like me actually read the "fine print" and recognized that obscured hexavalent chromium danger. E.g., Exhibit C hereto and my DEIR Objection 254 #'s 3.A, B, C, E, G, H, 7, and 12, and my objections below to the disputed EIR's "Responses" thereto (especially EIR Response Ind. 254-1 and Ind. 254-36) and Master Responses, as well as various related legal issues in my DEIR and EIR Objections 255. See also my further objections to the other EIR "Responses" to such DEIR Objection 254 #'s 3.A [i.e., Ind. 254-6-10], B [i.e., Ind. 254-11-13], C [i.e., Ind. 254-14-15], E [i.e., Ind. 254-20-33], G [i.e., Ind. 254-36], H [i.e., Ind. 254-37], 7 [i.e., Ind. 254-75], and 12 [i.e., Ind. 254-81-86].

However, pushing this off without any after EIR approval to the future regulator of water DISCHARGES also does not comply with CEQA, especially since mine shoring within the underground mine occurs BEFORE the water's discharge. Also, the disputed EIR's "new information" claim is unsubstantiated opinion, speculation, and worse that the toxic addition to the water only flows out of the mine to the treatment plant that it never proves is prepared to eliminate hexavalent chromium it didn't even adequately analyze and report as a hazard in the DEIR (and which the EIR just claims will somehow be at a safe level without any "good faith reasoned analysis" or evidence at all (except buried at the end of the EIR in the unreferenced Appendix Q disputed herein), presumably because the EIR does not want to admit what it is doing: adding "significant new data" requiring correction and then recirculation of the DEIR. See section I.A. 1.c above. See also my other objections to the many ways in which the EIR/DEIR evades or violates its CEQA obligations to present a "good faith reasoned analysis" with "common sense" (applying court rulings I cite like *Banning, Vineyards, Costa Mesa, and Gray*) in response to my expressed concerns.

As to the EIR/DEIR's lack of "good faith," I note that the DEIR buried an admission of the hexavalent chromium not by analysis in the DEIR "Hazards And Hazardous Substances" or other relevant threat discussions themselves, but obscured in DEIR Mitigation Measure 4.8-1(a) at 4.8-52, where it states: "The NOI [to the Central Valley Regional Water Quality Control Board under the Limited Threat Discharge permit] shall include evaluation of potential constituents of concern, including ammonia, arsenic, HEXAVALENT CHROMIUM [emphasis added by capitalization], iron, manganese, pH. total suspension solids, TDS and cis-1.2-DCE." Even if this is some innocent "mistake" (which I suppose is possible even though the EIR does

not claim any excuse but instead enhanced the cover up after I exposed the problem by pretending the DEIR provided such a deficient, purported, and disputed partial analysis that was only added by the EIR), to an cynic this appears as if someone intended to address hexavalent chromium as the problem it is and then someone else decided to cut out that analysis in hopes no one would notice, but either failed to delete all these references or decided to leave them in vaguely in obscure places in case someone like me actually read the fine print and recognized that obscured danger. However, pushing this off without any after EIR approval to the future regulator of water DISCHARGES does not comply with CEQA, especially since mine shoring with in the underground mine occurs BEFORE discharge, and the disputed EIR's new claim is unsubstantiated opinion, speculation, and worse that the toxic addition to the water only flows out of the mine to the treatment plant that it never proves is prepared to eliminate hexavalent chromium it didn't even analyze and report as a hazard in the DEIR (and which the EIR just claims will somehow be at a safe level without any good faith reasoned analysis or evidence at all, presumably because the EIR does not want to admit what it is doing: adding new data requiring correction and then recirculation of the DEIR. See my many other detailed objections to the way the DEIR/EIR deals with hexavalent chromium issues, especially in my objections to the EIR Response To Comment Ind. 254-1.

In any case, the following example illustrates an even less debatable health and welfare menace from this mine that the DEIR/EIR refused adequately to address. Consider this summation by the California Dept. of Parks And Recreation (Agency 1 at 1-2) after it correctly addressed a portion of such dangerous noncompliance:

> Water quantity and quality, air quality, noise and vibration, hazardous materials, and wildfire dangers are crucial issues for CSP, and we find the DEIR to be inadequate in mitigations … [C]umulatively and individually these potential significant issues could negatively affect the natural resources, recreational values, health and safety of [that adjacent] Park['s] visitors and employees and the general well-being of Empire State Historic Park…"

See, for example, its expressed concerns about the DEIR/EIR's noncompliance with the California Water Code 13050(f) for failure to protect beneficial uses and the plans of the Central Valley Regional Water Quality Control Board and the Nevada County General Plan. Consider for example, the NSAQMD Agency Letter 12-1 at 11-12, stating:

> "The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements [i.e., DEIR mitigation proposed frequent daily watering attempting to keep toxic dust out of the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less water because of water wasted on this no net benefit mining]. Since the dust contains asbestos, silica, and numerous toxic substances [now adding hexavalent chromium] adequate dust control is necessary. There should never be a situation where dust control is compromised because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest."

Again, we locals will be competing against a no net benefit mine for the water we need during droughts, which is one of many reasons why I keep focused on full protections for all existing

and future wells, because, if we have to suffer the loss of precious water in the climate changed future for 80 years of 24/7/365 dewatering, the last thing we need is our NID water supply to be wasted on dust suppression to avoid lethal air pollution.

Speaking of the lack of "good faith" and "hiding the ball," my Objection 254 repeatedly also complained about the failure of the DEIR/EIR to reveal the visible commonly identifiable surface boundaries (i.e., at least street names and addresses) above the 2585-acre mine and especially the new mining areas. We need that data for many reasons, including so we can accurately describe to buyers of our properties (and others with a need to know) about the mining threats and problems they may encounter. Since the EIR ignored this obviously required data after I emphasized it in my Objection 254, I assume the EIR/DEIR is hiding the "bad news" from those locals at risk so they do not realize the need to join in our opposition.

d. Some Additional Illustrations of Legal Errors Besides the Many Addressed In My Objection 254 #'s 3.N, 4, and 14, All of Which Still Apply.

Such disputed EIR/DEIR "legal errors" also include without limitation: **(a) refusal to address the legal component of issues that the law considers "mixed questions of law and fact,"** many examples of which are addressed throughout this Objection; **(b) evidentiary questions,** such as what objection is sufficient, especially when the problem is that the EIR/DEIR is failing to prove its CEQA case, since it has the burden of proof (with "common sense" and "good faith reasoned analysis" see, e.g., *Gray, Banning, Vineyard, Costa Mesa*). The DEIR/EIR cannot complain and refuse to respond as CEQA requires when the objector exposes errors, omissions, and flaws in the EIR/DEIR as appropriate or as best such objector can under the circumstances where the EIR/DEIR noncompliance obstructs the ability to be more specific or details, especially when impeaching and rebutting the EIR/DEIR speculations, unsubstantiated opinions, or assumptions which are no more (and often less) specific or detailed.

Indeed, such EIR/DEIR speculation, unsubstantiated opinions, assumptions, or other failures to comply with CEQA, refuse even to apply EIR's own disputed standards to itself for what is speculative, unsubstantiated, or otherwise subject to being disregarded. For example, my objections disputing as such false EIR/DEIR assumptions (i.e., unsubstantiated speculation) should be sufficient to require a CEQA response from the DEIR/EIR, such as where I contend that : the average "current" rainfall between 1967 and 2017 is either (i) the "current condition" now (more than five dry years after that cut off) that we're beginning to feel the harsh impacts of climate change, (ii) whatever the correct past average rainfall will be sufficient recharge the groundwater to maintain the status quo for 80 years during such dewatering and climate change, or (iii) any such obsolete history can predict the future impact of groundwater "recharge" from 24/7/365 dewatering for the next 80 years, especially when the DEIR/EIR cites no credible data beyond inapplicable NID's projections and only through 2040 (e.g., confusing NID's surface water focus with this EIR groundwater impact), i.e., only part of that 80 years (which I also do not accept as correct for such mining applications even before the end of 2040).

Thus, the EIR/DEIR fails to perform its **CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of***

Supervisors **(2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g.,** ***Citizens to Preserve the Ojai v. County of Ventura (*****1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin** ***Raptor/Wildlife Rescue Ctr. V. County of Stanislaus*** **(1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.) Again, among the most common deficiencies and worse in the disputed EIR/DEIR are that they "ignore or assume a solution" to a problem or claims that the missing information "will be provided in the future."** ***Vineyard*** **at 40 Cal.4th at 429, 431, prohibiting such deferred analysis or mitigation. See my CEQA discussions and authorities below, such as at I.A.1.d.(v), I.C, and I.E.4.**

Apart from noncompliance on the merits, the EIR/DEIR also fails to comply with CEQA as to all or most of my (and others') procedural/evidentiary objections to such EIR/DEIR evasions as are illustrated point-by-point in my section III specific counters to such noncompliant EIR "Responses" to my DEIR Objections 254 and 255. Whatever the County decision makers may decide, the courts have the last word on interpreting what are the CEQA and other legal standards (e.g., the law of evidence allowing my rebuttals and impeachment to any of the many challenged false or misleading statements in the DEIR, regardless of debates about the scope of CEQA or the disputed EIR's attempt to enforce one-sided boundaries against objectors that the EIR itself violates). As demonstrated on an item-by-item basis in section III and II below, I am confident the courts will find the amount and nature of detail or explanations in my Objections to be sufficient to compel proper CEQA responses in the EIR.

In any case, the EIR/DEIR will not be excused from having to respond to my and other objections on the merits consistent not just with CEQA, but also in accordance with the rules of evidence and civil procedure (e.g., the Cal. Code of Civil Procedure and Evidence Code). **E.g.,** ***Mountain Lion Foundation v. Fish & Game Com.*** **(1997), 16 Cal.4th 105, 112. "Whether an EIR has omitted essential information is a procedural question subject to de novo review [by the courts]."** ***Banning*** **2 Cal. 5th at 935 (also requiring "scrupulously enforc[ing] all legislatively mandated CEQA requirements"). The project proponent has the burden and responsibility for that result.** ***Sierra Club,*** **6 Cal.5th at 513-14.** That requires a *de novo* determination of whether the EIR/DEIR discussion is "sufficient or insufficient" and "includes enough detail." E.g., *South of Market Community Action Network v. City and County of San Francisco* (2019), 33 Cal. App. 5th 321, 330-331, citing *Sierra Club v. County of Fresno* (2018), 6 Cal.5th 502, 515-516 ("**Sierra Club**"); *Chico Advocates for a Responsible Economy v. City of Chico* (2019), 40 Cal.App.5th 839, 846-47. In order to satisfy that "adequate discussion" of the required topics that is such proponent's burden and responsibility, ***Sierra Club*** (at Id.) **mandates that the agency must explain "in meaningful detail in the EIR," including its "analytic route" from "evidence to action," which my Objections translate to requiring "good faith reasoned analysis" (e.g.,** ***Banning, Vineyards, and Costa Mesa*****) and applying "common sense" (e.g.,** ***Gray v. County of Madera)*****.** When (as here) the disputed EIR/DEIR lacks such analysis or omits the correct magnitude of the environmental impact, such as constantly with merely a "conclusory" discussion in this disputed EIR/DEIR, the EIR/DEIR is inadequate for CEQA purposes and lacks the required "substantial evidence." *Sierra Club* at Id. That is even

more true when the EIR/DEIR is responding to objections impeaching or rebutting the false, omitted, misleading, or noncomplying statements in the EIR/DEIR.

For example, whether it is sufficient (i.e., not so "inadequate" to excuse the EIR from responding on the merits as required) to consider anything stated or incorporated in my Objection 254 (as my Objection 254 has done with its detailed Table of Contents and express cross-references throughout its 150 pages of objections, not counting what I have properly incorporated by reference), such as (i) admissions in Rise SEC filings exposed in my Objections 254 and 255 and Exhibit B hereto [eg, admitting to many risks not properly or adequately addressed in the DEIR/EIR as required by CEQA and other law and to a Rise financial condition that reveals many DEIR/EIR safety assurances and mitigations to be unaffordable or otherwise illusory. See also DEIR admission at 6-14, conceding that the project is financially infeasible unless it can operate 24/7/365 for 80 years in accordance with the disputed DEIR.]; (ii) EPA website studies and data, as well as attached Exhibit C [e.g., demonstrating the toxic horrors of the hexavalent chromium inspiring the EU to ban it entirely and illustrated in how that water pollution killed the town of Hinkley, CA, and many of its residents as shown not just in the movie, "Erin Brockovich," but also in the related litigation merits resulting in a then massive settlement; (iii) rebuttals and impeachment, including credibility challenges to dubious or worse DEIR/EIR claims, especially those where the EIR/DEIR incorrectly claims that what I contend are dissimilar and noncomparable situations, conditions, or studies are somehow relevant and probative), to expose errors, omissions, and other noncompliance or to reveal why a dubious or worse contention by the EIR/DEIR will convince no one who is at risk, such as us residents living on the surface above and around the 2585-acre mine; and **(iv) "offers of proof" by me as to myself and other competent witnesses** who can substantiate objections to the disputed EIR/DEIR, so that both (a) the County decision makers will not be surprised by what they will become embarrassed to defend later, if they mistakenly approve this disputed EIR, and (b) the miner and other defenders of the EIR cannot later complain to the court that we should have raised such issues earlier in the dispute process.

Stated another way, how else will us objectors be able to achieve the due process to which we are entitled in such a deficient, pre-trial EIR dispute process that, according to the disputed EIR/DEIR, will not allow for our full witness testimony supporting objections (three or five minutes commentary to rebut 7000 pages is not due process), discovery to test the EIR/DEIR errors, omissions, and flaws, and other essentials to expose the truths, and proof of rebuttal or impeachment realities in our objections? Due process requires that I and other objectors be able to expose the disputed EIR/DEIR rhetorical or tactical tricks (e.g., the EIR's above illustrated chopping up my objections into fragmented segments it then incorrectly demands have to be independently complete in themselves without regard to that disaggregation of my integrated objections and even ignoring my cross-references and incorporations, all of which contain the evidence, details, and data that the EIR claims such objection fragments lack and, thereby, allow the EIR to disregard. In effect, the EIR seems to expect something absurdly impossible: that every sentence in my DEIR Objection 254 regarding any issue somehow must repeat in text everything I have said or incorporated anywhere in my Objection on that subject. I doubt the EIR would be satisfied (as they should be) even if I added words expressly to every sentence reminding the reader of what are already implied or expressed by cross-references and incorporations by reference (and by my detailed Table of Contents), such as "plus all the other details, evidence and data I have provided or incorporated into my Objections 254 and 255 or in my Table of Incorporated by Reference Objections." Indeed, to satisfy the disputed EIR's

incorrect demands for "sufficiency" of detail and explanations in my Objections, they seem to expect more than offers of proof and illustrations (which I already provide or incorporate in abundance, as I demonstrate in section II and III below in each such dispute), such as also what would later be expected in my detailed trial brief, supported by my witness affidavits and other evidence, including my expert reports, which is only required to come later during trial long after any disputed County approval of the EIR and after the benefit of prior discovery to expose the many more errors, omissions, and other noncompliance in the disputed EIR/DEIR.

14. Some General Rebuttals Of Improper EIR Tactics And Credibility Problems Demonstrated in Greater Detail in Later Commentary Below, As Well As My Use of Damning EIR/Rise Admissions Ignored Or Evaded In the EIR/DEIR, Such As the Disputed EIR Incorrectly Claiming That My Objections Are Too Speculative Or Unsubstantiated To Merit Any Sufficient Response, Even When It Is the EIR/DEIR That Is Speculating Or Unsubstantiated.

Besides other EIR Responses (and Master Responses) for reasons disputed on the merits in sections II and III below, the EIR often also tries (and fails) to rebut my Objections by incorrectly dismissing them as mere "speculation," incorrectly relying on CEQA Guideline 15384 (which the EIR erroneously claims ignores "argument [eg, bogus theories], speculation, unsubstantiated opinion or narrative," disqualified evidence (i.e., "clearly erroneous or inaccurate," or "of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment"). I have provided some rebuttal and counter authorities to that tactic above in various places, such as I.A.1.d and I.C. Among the many flaws in that EIR/DEIR argument exposed herein (and in the preceding subsection complaining about how the EIR chopped up my integrated objections, using my DEIR Objection 254 #3.E as an illustration versus the disputed EIR's disaggregation of that section in Ind. 254-20 to 33, by analogy like the EIR chopping a documentary objection movie into selected still photos, so that it can complain about each photo not containing data elsewhere in the movie) are that: (1) it ignores that the EIR/DEIR statements I am disputing are themselves worse such speculation, argument, bogus assumptions, "unsubstantiated opinion or narrative," and "clearly erroneous or inaccurate," which means that I can properly respond as I have by so exposing that flaw in the DEIR/EIR and by countering/rebutting/impeaching as best I can, whether it's with my wiser "speculation" and better opinions for contrast with rebuttals to explain those DEIR/EIR flaws [Stated another way, my rebuttals and disputes exposing such DEIR/EIR errors, omissions, and speculations etc. must be allowed, since it is absurd and worse for the EIR to claim, in effect, as it does here, that somehow objectors must use what the disputed EIR calls CEQA qualified evidence to counter what such objections show to be the EIR's worse such speculation, argument, bogus assumptions, unsubstantiated opinion or narrative, or clearly erroneous or inaccurate statements. (Besides as proven above in I.A.1.d and I.F.5, the EIR/DEIR cannot shift its burden of proof and disclosure from the EIR to objectors in any event); (2) what the EIR mislabels as speculation about its overlooked and potential, such as, for example, my predicting more new or deeper competing wells is not "speculation," since my objections (e.g., Exhibit A and incorporated Wells Coalition Group Letter 27/28) have exposed existing wells the EIR overlooked in my local area (eg, comparing what is stated in the EIR/DEIR to what I can see and what my neighbors with wells tell me) and I have proven above the need for new wells to deal with climate change, 24/7/365 dewatering for 80 years, and, even during water rationing during droughts, wasting

NID water on suppression frequently every day of fugitive asbestos/toxic fugitive dust to avoid health hazards. As provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g.,** ***Citizens to Preserve the Ojai v. County of Ventura (*****1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.)**

Also, I can produce myself and other local witnesses who are interested at the appropriate time (e.g., if the EIR is mistakenly approved, that is when and if we decide the well will be necessary, as we predict, before we can achieve our first to occur judicial, law reform, or political remedy thereafter to stop the mine) in competing for groundwater we own beneath our homes against the 2585-acre underground mine with new or deeper wells (either individually or collectively), and expecting to hold the miner accountable for any violation of our groundwater ownership rights. See the Supreme Court case *Keystone*, the California Supreme Court case *Varjabedian v. Madera, and other authorities* discussed above in I.F. 2, 3, and 5. [Stated another way for such example, the disputed EIR/DEIR incorrectly argues that it is "speculation" when my objections expose what vast case study experience and legislative studies reveal as to how surface owners compete for groundwater is used to save homes and crops (in our case, preserving our forests so that they do not become dead tree fire hazards), but it cannot be "speculation" when us potential victims of such dewatering depletion of our groundwater advise the County in DEIR/EIR objections that we will enforce our groundwater rights as necessary to prevent the harms we consider to be inevitable from 24/7/365 dewatering for 80 years]; and (3) much what the DEIR/EIR cites in support of its false, erroneous, or noncompliant (e.g., omitting essential data) claims will (if necessary) be challenged (eg, the subject of massive "motions in limine") in any court follow-up to exclude such disputed EIR/DEIR claims as inadmissible, rebutted, or noncredible (i.e., we will prove such EIR claims not to be supported by CEQA sufficient "substantial evidence," as discussed in case law above), and the County decision-makers must take that into account as they evaluate this situation. That evaluation must include the "pick your poison" dilemma created by the unevaluated in the DEIR/EIR dilemma (contrary to the DEIR's pretense claiming to suffer NID drought rationing just like the rest of us locals) that the DEIR/EIR claims fugitive toxic dust (e.g., asbestos, CR6, etc.) must be watered frequently to suppress such dangerous air pollution regardless of any NID water rationing. As discussed above in I.F.2 and 3, the NSAQMD explains (Agency Letters 11 and 12):

> The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements [i.e., DEIR mitigation proposed frequent daily watering attempting to keep toxic dust out of the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less water because of water wasted on this no net benefit mining]. Since the dust contains asbestos, silica, and numerous toxic substances [now adding hexavalent chromium] adequate dust control is necessary. There should never be a situation where dust control is compromised

because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest."

Again, we locals will be competing against a no net benefit mine for the water we need during droughts, which is one of many reasons why I keep focused on full protections for all existing and future wells, because, if we have to suffer the loss of precious water in the climate changed future for 80 years of 24/7/365 dewatering, the last thing we need is our NID water supply to be wasted on dust suppression to avoid lethal air pollution. See the Wells Coalition Group Letter 27/28, the CEA Group Letters 6-9 and 21, the South Yuba Rover Citizens League Letter at 25, the Sierra Fund Group Letter 26, the Wolf Creek Community Alliance Group Letters 29-32, the California Dept. of Parks And Recreation Agency Letter 1, and the Grass Valley Agency Letter 8. No one can possibly impose that kind of water sacrifice on our objecting community (e.g., our waterless misery and dying forests/vegetation while the EIR miner daily waters its land) to save us from the asbestos dust menace the Canadian EIR miner created for its shareholders/speculators' profit without creating claims in favor of us impacted locals. See, e.g., ***Varjabedian v. Madera*** (1977), 20 Cal.3d 285 (allowing nuisance, inverse condemnation, and other claims for homeowners suffering downwind of the new sewer plant.)

Since this County EIR process is not yet a court trial, but rather a limited process in which we objectors have unduly limited time to state our many objections to the thousands of pages of this EIR/DEIR that we dispute, what else can we do now but make our objections with admissions and as offers of proof for consideration by the County decision-makers? If the EIR/DEIR incorrectly ignores or fails to respond appropriately to our such meritorious objections, the noncompliant EIR will fail in that court process, as my cited authorities above demonstrate. What is the record to show for that process? The ultimate, objector evidence will prove both (i) the failure of the noncompliant EIR/DEIR to satisfy its burden of proof with sufficient admissible evidence, and (ii) the failure of the EIR/DEIR to somehow explain away its damning admissions that the courts will consider even if the County declines to do so. See my Exhibit B (Rise SEC filing admissions the County has so far refused to consider) and *Richmond v. Chevron*, where such SEC filing admissions won the EIR dispute for the objectors. Among many other things, such County decision-makers should see what we objectors are offering to prove, if necessary, in the post-approval court challenge process, and how much the disputed EIR/DEIR has failed to address properly with sufficient competent evidence, including by the EIR incorrectly refusing to address such things incorrectly dismissed by the EIR/DEIR as "speculation" (even when it rebuts the disputed EIR/DEIR's worse speculation etc.), as the court decisions above require by the EIR/DEIR.

My four Objections have revealed many errors, omissions, and inconsistencies in the DEIR/EIR that were revealed by Rise admissions in its SEC filings. See Richmond v. Chevron, where such SEC admissions enabled the EIR objectors to prevail. While those SEC filings have been updated since my DEIR Objections 254 and 255, the current ones, excerpted for this purpose in **Exhibit B**, continue that meritorious basis for my Objections that I illustrate herein with a few examples. It cannot be legally possible or permissible that Rise can say, in effect, "Don't worry, assume everything is fine" in the disputed EIR (as in the DEIR), while listing many risks, problems, and inconsistent facts in the SEC filings. See Exhibit B and DEIR Objection #2. If Rise admits that it must expose such risks and impacts to investors to comply with the SEC disclosure requirements, Rise cannot justify ignoring those risk and impacts in the EIR, where the risks and consequences to us local victims will be much worse and more likely

(e.g., since our misery is more enduring less possible to correct) than the Canadian miner's speculator investors losing their gambles.

15. At the Outset I Explained How I Would Conclude With Some Specific Illustrations Of Multidisciplinary EIR Evasions, Tactics And Credibility Problems, And This Example Demonstrates Such Integrated Impact Problems Combining Air And Water Quality/Pollution Threats, Groundwater And NID Supply Risks, Many Toxic Risks, Noncompliant Well And Other Mitigation Issues, Etc.

Throughout this Objection above I have provided evidence and legal authorities demonstrating much of my case against the EIR/DEIR, which the EIR/DEIR has often refused to address or evaded, usually without any of the CEQA (and cited court decisions') required "good faith reasoned analysis" applying "common sense" as interpreted by cases **like *Gray, Banning, Vineyard, and Costa Mesa***. I have also incorporated many other impacted party objections to add their evidence and details they know better than I do. See, e.g., my Table of Incorporation by Reference Objections. All of that supports the conclusion which the California Dept. of Parks And Recreation has reached in its Agency Letter 1(at 1-2):

> Water quantity and quality, air quality, noise and vibration, hazardous materials, and wildfire dangers are crucial issues for CSP, and we find the DEIR to be inadequate in mitigations … [C]umulatively and individually these potential significant issues could negatively affect the natural resources, recreational values, health and safety of [that adjacent] Park['s] visitors and employees and the general well-being of Empire State Historic Park…"

See, for example, its expressed concerns about the DEIR/EIR's noncompliance with the California Water Code 13050(f) for failure to protect beneficial uses and the plans of the Central Valley Regional Water Quality Control Board and the Nevada County General Plan. Consider for example, the NSAQMD Agency Letter 12-1 at 11-12, stating:

> "The NSAQMD is concerned that the water budgeted for the project might not be adequate to meet the dust control requirements [i.e., DEIR mitigation proposed frequent daily watering attempting to keep toxic dust out of the air, so that in water shortages NID and local voters will have to choose between breathing toxic air or suffering less water because of water wasted on this no net benefit mining]. Since the dust contains asbestos, silica, and numerous toxic substances [now adding hexavalent chromium] adequate dust control is necessary. There should never be a situation where dust control is compromised because of water use restrictions, particularly in the summer months when the potential for dust generation is greatest."

Again, we objecting locals will be competing against a no net benefit mine for both the groundwater and NID water we need during droughts, which is one of many reasons why I keep focused on full CEQA protections for all existing and future wells, because, if we local objectors have to suffer the loss of precious groundwater in the climate changed future for 80 years of

24/7/365 dewatering, the last thing we need is our NID water supply to be wasted on dust suppression to avoid lethal air pollution.

In another example of a DEIR/EIR misleading "bait and switch," the DEIR states (and EIR ratifies) that: "This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID." However, that ignores the NSAQMD's Agency Letter 12 (at 12) discussed below, where that regulator's demand *priority* for frequent daily NID watering of its toxic (asbestos and more) fugitive dust, and rather than breathe such toxic air, us locals may have to suffer with less than our fair share of drought rationed water. Whatever the result, that disputed EIR reassurance of shared suffering is false and misleading at best. The reality is that this is a "zero sum game," in which every gallon allocated to this no net benefit mine is one less gallon available to the far more deserving locals. I have yet to meet any locals here above or around the mine who are willing to sacrifice anything for the mine almost all informed locals oppose, creating (if the mine is approved) a massive political problem for the County and NID to add to the inevitable legal disputes that will surely catch them in the cross-fire. See DEIR Objection 255 and 254 (e.g., #4), *Varjabedian, Keystone.*

I note these tactics are not just about what is so omitted or obscured, but also what is confused by misleading data. A prime example is the NSAQMD objection in Agency 11 (at 1) referring to the shared concern of the California Air Resources Board (CARB) where it concluded that "it is not appropriate to determine risk from rock samples … the PCM conversion factor was developed for air monitoring samples, not rocks. … Since there is no approved method for calculating risk from rock samples comparison with the NSDQMD's AB 2588 toxic significance threshold based on rock composition carries some uncertainty." This is classic "bait and switch," also known as "false equivalence."

There is already a sufficient such record to prove those conclusions and others stated in my four Objections and the others they incorporate from my Table of Incorporated by Reference Objections. See sections herein: I.F.6, 5, 4, 3, and 2, I.E.4, 3, 2, and 1, I.D, I.C.2, and I.A.1.d. I offer some more examples here before beginning my item-by-item rebuttal of the disputed EIR's Master Responses and Responses in section II and III below. As an objector/potential victim at risk from this EIR mine menace, I do not always need to prove with expert evidence what is the true comprehensive reality (although I provide or incorporate sufficient amounts), because the EIR has the burden of proof, and, therefore, I must be able to defeat the EIR merely by exposing as I have done in my four Objections (and others I have incorporated have done) such EIR/DEIR's own errors, omissions, and noncompliance. Moreover, because many disputed EIR/DEIR claims are themselves just worse examples of speculation, unsubstantiated opinion or narrative, argument, or other erroneous or inaccurate claims, I also have exposed that noncompliance by providing more credible competing theories, even if they were mere better speculation, opinions, arguments, etc. (which I do not concede).

For example, since the disputed DEIR/EIR is largely focused on its speculations, unsubstantiated opinions, and other bogus (e.g., inapplicable theories, false comparisons, selective exclusions of inconvenient truths, wishful thinking, especially about what the EIR would like the facts and law to be, instead of what is real, and other constituents of "alternative reality," etc.) thinking about the uncertain conditions in a mine closed and flooded since 1956, which the EIR parties have not properly or sufficiently investigated or evaluated directly in a competent manner. Thus, much of the disputed EIR/DEIR noncompliance with CEQA and other

applicable law is just that kind of unreliable speculation, unsubstantiated opinions, and false assumptions about which they incorrectly accuse us critics. But that too is a false equivalence, since the burden of proof is on the EIR, but the adverse consequences of the EIR's many mistakes, omissions, and noncompliance will harm to us locals, while the consequences to the Canadian EIR miner and its speculating investors is just the loss of their small gambling "ante" which they willingly put at risk. By contrast, none of us local objectors wanted the mine, and we victims are the ones with the most to lose and defend. In such circumstances those of us at risk are entitled to express our rational concerns about such flawed bases for imposing those risks on us and to remind those who harm us of our legal, law reform and political remedies. E.g., ***Varjabedian v. Madera*** (1977), 20 Cal.3d 285 (allowing nuisance, inverse condemnation, and other claims for homeowners suffering downwind of the new sewer plant.)

The disputed EIR/DEIR keeps asserting the inapplicable here CEQA Guideline 15384, but that does not prevent us from exposing errors, omissions (including evasions), and other flaws in the EIR/DEIR, such as by exercising our rights impeachment and rebuttal to defeat the errors, omissions, and noncompliance in the EIR/DEIR, especially using the Rise and other admissions that doom the EIR/DEIR. See Exhibit B and D; section I.A.1.d.(iv); ***Richmond v. Chevron (applying the applicant's SEC filing admissions to defeat the EIR.*** None of that is contrary to #15384 and is consistent with the more applicable CEQA laws and Guidelines, as explained in the 2018 Guideline Amendments Explanation in sections I.C.2 and elsewhere, especially if my objections were correctly (see section I.F.5) addressed as they were written in an integrated manner, rather than so improperly cut up by the EIR team into less comprehensive or convincing parts. See my item-by-item rebuttal of such disputed EIR Responses in my section II. That is especially true when the EIR mischaracterizes and evades my and other objections as to the consequences of mine dewatering and NID water misuse, as discussed above, even using the EIR's own words (and its cited NID water supply data) against it. See the Wells Coalition Group Letter 27/28, the CEA Group Letters 6-9 and 21, the South Yuba Rover Citizens League Letter at 25, the Sierra Fund Group Letter 26, the Wolf Creek Community Alliance Group Letters 29-32, the California Dept. of Parks And Recreation Agency Letter 1, and the Grass Valley Agency Letter 8. Also, as I keep reminding the EIR authors, evidence can be provided by my neighbors and I with ourselves and others as witnesses for what I have said, making this an offer of proof which has to be sufficient for now, since there is no other practical need or way now to provide my and others trial testimony in the EIR process before we challenge any approval in the usual court process that would follow. Instead of refusing to respond to or evading such objections as demonstrated in this and other objections, (if necessary) in that court challenge part of the process, the court will require disputed EIR to address the objections on the merits as required by applicable law with "common sense" and "good faith reasoned analysis," instead of ignoring or evading them, which such objections prove the disputed EIR/DEIR too often does. Again, the DEIR/EIR's own admissions (and Rise's SEC filing admissions in Exhibit B and DEIR Objection 254 #2) are sufficient to defeat the EIR, since, as *Richmond v. Chevron* demonstrated, such admissions are among the most lethal kinds of evidence against the EIR. See, e.g., DEIR 6-14, admitting that the project is not economically feasible unless the miner can operate 24/7/365 as proposed in its disputed DEIR/EIR, which is hard to imagine under the circumstances considering the merit of the many objections as to which the courts will apply de novo review with more concern about the legal and factual merits of objectors than has been shown so far in the disputed DEIR/EIR process.

16. The Groundwater Property Rights And Other Issues Illustrate Some of the Many Reasons for the EIR's Lack of Credible And Court Admissible Evidence To Support the Errors, Omissions, And Noncompliance In the EIR And Its Bogus Attempts To Evade The Need For Recirculation By Incorrectly Claiming EIR's Major Revisions To the DEIR Are Only Minor "Clarifications" Or "Amplifications."

Contrary to the EIR's Master Response 7—Location of Future Mining Areas and other EIR evasions disputed herein, the EIR is not ever completely, sufficiently, or properly responsive to my Objections or other objections to the DEIR. The EIR plays the old trick they used to teach in debate classes: when the doomed side cannot overcome the merits of the adversary's correct position, just convert his or her argument into a "straw man" mockery version that the doomed side can overcome without exposing the flaws in his or her argument to the meritorious side's truths that must otherwise prevail. That objectionable and worse technique is constantly misused by the EIR (and, in anticipation of some predictable counters by truths, in the DEIR). See, for example, my illustration in my objection below to the EIR's Master Response 7. See also, as some more examples of such unworthy evasion efforts in my objections below to other EIR Master Responses. See also the section below (just before my conclusion) where I illustrate examples of how the County is gambling with the health and welfare of us local potential victims, including us owners and users of the surface property (admitted by Rise to include the first 200 feet down) based on admitted and other uncertainties, including those which only exist at such high risk levels because Rise chose not to investigate adequately or claimed that it was not required to "speculate" on the potential risks, threats, and harms, especially as to us surface owners and users above and around the 2585-acre underground mine whose individual property rights may be violated (an issue that cannot be evaded by claims that is beyond CEQA's scope or evaded by incorrectly claiming that disputed uncertainty must be endured by us potential victims). In effect, for net benefit to the local community above and around the underground mine (and, we contend, the whole County, which will end up suffering for any approval when the mine causes violations and harms as we predict), the County is being asked by this financially risky miner (see Exhibits B and A, as well as Rise's admissions of financial incapacity in its SEC filings) to choose between the health and welfare of its residents (and consequently the financial wellbeing of the County) and the Canadian miner's shareholder profits plus some new jobs that are fewer than those that would be lost if the mine were approved, especially in businesses relating to the real estate impacts from depressed property values above and around the underground mine and the rest of its operations.

I note that the County's disputed economic study itself contains data in contradiction to the DEIR (and now the EIR) which has not been corrected in or by the EIR. See Exhibit A. For example, while (as my Objections complained) the DEIR (and now the EIR) generally ignores or incorrectly addresses us surface owners' problems above and around the 2585-acre underground mine (a clear example of noncompliance with the CEQA Guidelines for describing the Project), the County Economic Report addresses some useful facts evaded or ignored by the DEIR (and now EIR). Id. See, e.g., my Objection 254 demonstrating how the DEIR only worried about the few wells along East Bennett, while ignoring the many wells above or around the underground mine as if they somehow were not material, the County economic study understated those wells at 99. See also the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on

the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session.

That Union article illustrated another part of the common problem in the DEIR (and now EIR) that they have not addressed at all the actual condition of the long-flooded mine, but instead gamble from old or incomplete and unreliable documents before the mine shut down in 1956. In effect (and contrary to CEQA), Rise is gambling (and forcing local victims to gamble involuntarily) on the unknown physical conditions of the mine that will not be known apparently until after the flooded mine is dewatered (a huge separate problem), relying only on such deficient, old documents whose validity and current relevance and accuracy are in dispute and alleged and dispute "comparable" studies of other situations elsewhere. **The relevant comparable, however, is the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change. See also the Union discussion of comments by hydrology expert Sol Henson.**

In any future litigation victims will argue that the burden of proof should be and remain on Rise (and the County if it sides against the local victims) on the many matters on which there is insufficient admissible and relevant evidence as a foundation to support approval of the EIR and DEIR allegations. See section I.A.1.b. Stated another way, if the County decides to rely on the EIR as is, with allegations and statements that are wrong either as a matter of law or not supported by sufficient competent evidence (see section I.C), the County will lack a sufficient legal basis to approve the EIR and ignore our meritorious objections. Id. As one of many examples, the EIR cannot claim allege as if it were a fact that there are no groundwater problems, when the EIR lacks sufficient credible and admissible evidence. If the County were to approve that erroneous and deficiently substantiated EIR claim, it would be making a reversible error in the litigation. By failing properly to evaluate the mine issues and objections, the EIR cannot transform its guesses and irrelevant "comparables" into facts and competent evidence or shift the burden of proof.

17. The Noncompliant EIR Cannot Evade (As It Does) The Competing Rights of Us Surface Owners Above And Around the 2585-Acre Underground Mine (eg, as Owners of the Groundwater Being Flushed Away Down the Wolf Creek in Mine 24/7/365 Dewatering for 80 Years), Which Include Not Only Our Rights To Defeat the EIR/DEIR With Such Objections To Noncompliance With CEQA, But Also With Interactive Claims As To Violations of Our Property Rights.

a. As Surface Owners With Competing Property Rights We Have More Rights To Object And Be Witnesses With Evidence Than Ordinary CEQA Objectors, Especially To Expose The Hoax of Uniformity of

Mining And Other Environmental Impacts From Different Parts of the Project (Which Must Include Centennial).

The disputed EIR (as did the noncompliant DEIR) continues to misdescribe conditions in the entire Project (including I and others contend must include Centennial) as if the parts were uniform when they are not. What EIR claims may apply to one part of the Project has never been proven by the EIR/DEIR with the required "common sense" (e.g., Gray) and "good faith reasoned analysis" (Banning, Vineyard, and Costa Mesa) to apply to the rest of the project; i.e., such parts are at least the Brunswick site, the Centennial site, the specially addressed area around East Bennett Road, and the 2585-acre underground mine are more likely to be different than (as the EIR/DEIR speculates and assumes) to be the same or uniform. Thus, while project EIR/DEIR (including I contend Centennial) suffer many common or similar errors, omissions, and other noncompliance, there are also differences for both significant impacts and essential mitigations. For example, as demonstrated elsewhere in this and other objections, the lower/downhill East Bennett Road areas where the EIR/DEIR focuses its water well mitigation gestures is different than other areas above and around the 2585-acre mine, so that the EIR/DEIR misplaced monitor wells and uncounted impacted wells fail to be addressed correctly in the EIR/DEIR. More importantly, whatever the actual condition of the Brunswick and Centennial mine sites, the EIR/DEIR flawed and noncompliant speculations and insufficiently substantiated evaluations of those wholly owned area do not necessarily determine the impacts of the 2585-acre underground mine on us objecting surface owners, especially as to such surface conditions and environment, groundwater, and other variables which lack compliant analysis by the disputed EIR/DEIR. For example, the disputed EIR/DEIR is backward, since those deficient commentaries of such wholly owned mine areas have many times greater evaluations than any analysis directly relevant to us thousands of surface owners above and around the 2585-acre mine, which is the reverse of what must be required for the protection of the health, welfare, and property in our such most impacted community.

Stated another way, many of my Objections, both herein and in my DEIR Objections 254 and 255, are focused on the 2585-acre mine below the surface on or around which thousands of us objectors live. However, the EIR incorrectly responds (often in ways we dispute) to my such objections and those of other potential victims by continually asserting their also noncompliant analysis that is mostly applicable only to the different situation and conditions that may apply at most to the Brunswick or Centennial site or the area along East Bennett Road, as distinguished from that underground mine, which most threatens many of us and our competing property rights where we are living above or around that underground mine. As admitted in Rise's SEC 10K filing (see Exhibit B and DEIR Objection 254 #2), our "surface" rights all comprehensive for at least the first 200 feet down plus forever deeper as to anything not permitted as part of "mineral" mining and even then, subject to many legal rights of us surface owners, such as for lateral and subjacent support, including by our owned groundwater that must support our surface legal estate. See, e.g., *Keystone Bituminous Coal Ass'n v. DeBeneditis*, 480 U.S. 470 (!987). As discussed above and below, when so threatened or impacted by such EIR/DEIR mining and related activities we surface owners have legal rights and remedies, including rights to mitigate our damages, which include, for example, rights to improve existing wells and create new wells, none of which competing activities are evaluated or discussed in the

noncompliant EIR/DEIR. While the EIR/DEIR incorrectly dismisses all these matters as too speculative to merit any response, I note that such surface property owners are competent witnesses to such matters and their evidence includes the rights to rebut and impeach every false assumption, erroneous speculation, unsubstantiated opinion, and other noncompliance in the EIR/DEIR, especially Rise of DEIR/EIR admissions. See, e.g., Richmond v. Chevron discussed in my section I.D. above and elsewhere as well as my item-by-item rebuttals in sections II and III to EIR allegations and omissions.
Especially consider that this EIR/DEIR dispute is not just over what the EIR miner does with its own property, it's also about how that 2585-acree underground mine (with different conditions and often uphill of those other sites) violates the rights of us surface owners and users (again, remember when the DEIR/EIR wrongly plans to lower our surface water table and confiscate 10% of our well water before mitigation, that our "surface" goes down at least 200 feet where Rise has no rights, but many duties). See Rise SEC admissions in Exhibit B and Objection 255, which the EIR/DEIR incorrectly dismisses without response as irrelevant, but which SEC and other admissions won the case for EIR objectors in *Richmond v. Chevron*. In any event, that is one of the many reasons that CEQA and applicable law require the EIR to be revised and recirculated to distinguish and separately address both (i) when it's disputed statements or "evidence" purports to apply only to one part of the Project, and (ii) when and how the EIR/DEIR purports to apply to the whole. See also, e.g., the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session. See the Wells Coalition DEIR objection at Group Letter 27/28. **The relevant comparable is the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line. Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change.**

If the noncompliant EIR/DEIR wants to claim that a disputed study or opinion regarding the Brunswick, Centennial, or East Bennett areas regarding some disputed condition should also apply to the 2585-acre underground mine, it should say so expressly and present the required "common sense," "good faith reasoned analysis." If the disputed EIR/DEIR wants to assume that its disputed approval somehow overrides the surface owners' rights (down at least 200 feet and as to groundwater generally) above and around the 2585-acre underground mine, the EIR/DEIR mine must say so, especially since then the County would be liable for a "taking" of our property rights as well as for a forbidden public gift for this Canadian miner and its shareholders' profit. See *Varjabedian*, supra. Not just CEQA, but also other applicable laws, apply to the disputes between competing owners of the surface versus underground mines relying on deeper mineral rights, as well as regarding the management of the groundwater in which they share legal rights. See *Keystone*, supra. This should be important to the County, because of such consequences if it participates in violating such property rights of us surface owners and users, such as to take our

groundwater for abusive 24/7/365 dewatering for 80 years. See DEIR Objection 254 #'s 3.N, 4, and 14, and DEIR Objection 255, and my section II and III rebuttal below to the EIR's responses thereto. **The County should refrain both from forcing us surface owners to suffer (and resist) a dangerous EIR mining gamble on such environmental and other harms, and also from impacting our property rights above and around the 2585-acre underground mine, including as to groundwater and our rights of subjacent and lateral support. My DEIR Objections 254 and 255 explain in some detail with controlling case law the legal perils affecting both the miner and the County for such disputed EIR/DEIR underground mining, including disputes regarding Fifth Amendment takings or inverse condemnation, trespass, conversion of groundwater, violation of lateral or subjacent rights (eg, to prevent subsidence), and many other property rights related claims. See, e.g., *Varjabedian v Madera* (1977), 20 Cal.3d 285 (relying on the Fifth Amendment holding in *Richards v. Washington Terminal Co*., 233 U.S. 546 (1914), and the broader California Constitution to allow nuisance and inverse condemnation claims for victims downwind of the new sewer plant, who suffered a disproportionate, direct and peculiar burden for that public benefit [and here this is a private project with no net public benefit mine]).** Also, there are consequences to imposing a disproportionate burden on us locals for some imagined broader public benefit to those safely distant from the mining (which net benefit I dispute even exists) (**Consider, for example, how this concentrated pollution exhausts the margin of error for pollution by more beneficial land uses locally.)**

Stated another way, the disputed EIR/DEIR assumes that it will be permitted to do as it wishes once its EIR is approved by the County, but as to some things expected legal remedies will cause that aspiration not to be legally feasible, and, if the approval prevents such remedies against the mine, then the County Economic Report will be deficient (see Exhibit A hereto) for not anticipating such consequences. (See my DEIR Objections #255 and 254 #'s 3.N, 4, and 14). As to the miner, such problems also make its necessary (but ignored or deficient) mitigation infeasible, not just because Rise admits in its SEC filings that it lacks sufficient funds to afford to fully, timely, or properly mitigate its impacts (see *Richmond v. Chevron*, my DEIR Objection 254 #2, and Exhibits B and A hereto), but also because the noncompliant EIR/DEIR falsely assumes without any "common sense," "good faith reasoned analysis" that the EIR can treat the 2585-acre underground mine in too many disputed ways as if Rise owned more than the limited, deep mineral rights and somehow could become entitled to violate surface owner and user property rights as well. CEQA needs to address such competing property rights and disputes, but the EIR/DEIR entirely fails to do so.

b. Among the Remedies of Us Local Victims Is Our Right Proactively To Mitigate In Connection With Our Nuisance, Inverse Condemnation And Other Claims, Including By Drilling Competing Deeper And New Wells, Especially Since Rise's SEC Filings And Other Admissions Prove It Lacks The Current Financial Resources To Accomplish Even the Deficient EIR Required Safety And Mitigation Protections. See Exhibit B and Objection 255.

The US Supreme Court has addressed in objectors' favor such surface owner versus underground miner disputes in cases I address herein, as well as in my DEIR Objections 254

#3.N (as well as in my #'s 4 and 14) and 255, such as ***Keystone Bituminous Coal Ass'n v. DeBeneditis,*** 480 U.S. 470 (1987)(rejecting "taking claims by miners as to laws protecting surface owners' property rights to lateral and subjacent support, including support by groundwater, to prevent "subsidence," which includes loss of groundwater support), where surface owners were allowed to require underground miners to preserve their surface rights of subjacent and lateral support (and protect against subsidence, which includes leaving groundwater support) by leaving 50% of the coal to support the surface. *Accord*, ***Smith v. County of LA*** (1986), 214 Cal. App. 3d 266 (essential county road repairs created landslide conditions destroying local homes, triggering nuisance, inverse condemnation, and other claims, both for damages for diminution in the value of real property and for annoyance, inconvenience, and discomfort, including mental distress as part of the loss of quiet enjoyment rights as a property owner.) **As noted herein, the admitted lack of currently available financial resources by this miner to perform its EIR safety, mitigation, and other obligations is not just a CEQA problem (see Exhibit B and DEIR Objections 254 (#2) and 255, addressing Rise admissions in SEC filings and in the DEIR (e.g., admitting (at 6-14) the project is economically infeasible unless it can operate 24/7/365 for 80 years in accordance with its EIR proposal subject to mine and many other objections). It also enables us victims to take proactive defensive mitigation actions on our own at the expense of the miner (and, depending on the facts, the County).** See, e.g., my DEIR Objection 254 #'s 3.N, 4 and 14, including my legal authority counters herein to the disputed EIR Response To Comment Ind. 254-54 to 60.

The same principles apply to what "law reforms" locals here can achieve, which will be in conflict with the DEIR admission above at (6-14) that the mine's feasibility depends on 24/7/365 mining for 80 years on EIR terms subject to massive objections that will continue as voting remedies. Given the admitted fragile financial condition of the miner (eg, Exhibit B and Objection 254 #2 regarding SEC filings allowed to prevail in *Richmond v. Chevron)* and the environmental impacts of suspending safety and mitigation efforts (an issue incorrectly ignored by the EIR/DEIR as too "speculative"), that issue is essential for CEQA consideration, even if only as rebuttal to errors, omission, and worse noncompliance by the DEIR/EIR. While such new local victim legal protections could have significant impacts on the EIR mining (even at the overly generous level proposed by Grass Valley in its Agency Letter 8), it is essential to remember that this is more than about how the miner uses the property it owns. This is about us surface owners and users protecting our own property and groundwater rights we own at least down 200 feet above the underground mine that has been closed and flooded since 1956, as admitted by Rise in its SEC 10K. See Exhibit B. If the County approves anything that harms our surface owners' property rights for the benefit of this disputed mine, such as the disputed EIR/DEIR plan to deplete 10% of our owned well water before the (illusory/not economically feasible EIR well depletion mitigation replacement kicks in on the small portion of the total existing and future wells so impacted recognized by the EIR/DEIR for required mitigation; see County General Plan 17.12 discussed in I.F.3 above), that is certain to trigger law reforms and claims for Fifth Amendment and California Constitutional taking, inverse condemnation, nuisance, trespass, conversion, and other claims. See, e.g., *Varjarbedian*, supra; ***Vaquero Energy, Inc. v. County of Kern*** (2019), 42 Cal. App, 5th 312, allowing surface owner legal protections against underground oil and gas miners.

While the EIR/DEIR constantly misuses in deficient and disputed ways the concept of mitigation to purport to cure objectionable environmental impacts, typically without any

"common sense" "good faith reasoned analysis" of the adequacy/sufficiency, feasibility, or likelihood of being able timely to afford and accomplish such asserted mitigation. Not only do those disputed EIR/DEIR mitigation claims fail to comply with CEQA and other applicable law, but those failures trigger a right by us victims to undertake our own mitigation to minimize our damages for our such nuisance, inverse condemnation, and other claims. *Varjabedian*, supra. My such DEIR Objection 254 #4.A objections include an example of our such local victim mitigation (Comment to Ind. 254-58) that is ignored in the disputed EIR Response, which involves us surface owners competing for our owned groundwater with deeper and new wells and watering systems and charging the mine and County for that mitigation cost as allowed by many controlling court decisions. Eg, ***Ahlers v. County of LA*** (1965), 62 Cal.2d 250 (road construction caused landslides, entitling the threatened property owners to recover, among other things, the mitigation costs of constructing 25 shear pin caissons to hold back the landslide); ***Shefft v. County of LA*** (1970)(3 Cal. App.3d 720, 741-42 (when water diversion from subdivision and road construction caused damages, the victims were entitled to recover the costs of protecting their property with mitigation infrastructure.)

As to my DEIR Objection 254 #4.A (EIR labelled as Ind. 254-54 to 60) I note that I apply court precedents to the facts of this disputed EIR/DEIR in important ways that are totally ignored without any "common sense" "good faith reasoned analysis" in those disputed EIR Responses I refute in section III. While I suppose the EIR evaded my many such #4.A issues to avoid drawing the County decision makers' attention to such important legal problems for the mine and for the County, if it mistakenly approves the EIR, I urge those County decisionmakers to consider those legal objections and claims, because approval means legal, law reform, and political challenges on those same bases among many others. Among the many flaws in the County Economic Report (see my Exhibit A and my Objection 255 rebuttals) the County should consider its own exposure for enabling this harmful mine by approving this flawed EIR. E.g., ***Uniwill v. City of LA*** (2004), 124 Cal. App. 4th 537 (both the private party and the approving government can be jointly liable in inverse condemnation). See generally ***Varjabedian v. Madera*** (1977), 20 Cal. 3d 285 (explaining inverse condemnation and nuisance rights of homeowners downwind of the new sewer treatment plant). For example, please read my EIR ignored analysis of ***County of San Diego v Bressi*** (1986), 184 Cal. App. 3d 112, where an aviation easement was imposed on homes at the end of a runway with approved authority for hugely abusive (although unlikely) uses (eg, not only jumbo jets, but also "any other contrivance yet to be invented for flight in space"), the court rejected the defense claim to limit liability to the current use burden of small planes, ruling that "just compensation" for such taking is based on what the owner/victim has lost, rather than on what the taker gained, and that the jury must "once and for all fix the damages, present and prospective, [and the jury] must consider the most injurious us of the property reasonably possible … consider[ing] the entire range of used permitted…", which there included jumbo jets and space craft. See also ***Coachella Valley Water District v. Western Allied Properties*** (1987), 190 Cal. App. 3d 969 (refusing to limit the "before condition" valuation to the government' desired plan and allowing the jury to consider the value of the victim's property without being limited to the defendant's idea of solutions or consequences of doing things the defendant's way.) Consider the higher victim compensation the more abuse we surface owners and users could have to endure from the EIR on such a theoretical, "worst case" basis 24/7/365 for 80 years (eg, 24/7/365 dewatering, groundwater and [existing and future] well depletion, vegetation loss from dryness and lowered water tables, and fire risk from dryness killing our forests, hexavalent chromium and other toxic water and air

pollution, and all the other nuisances, risks, and harms to which I have objected (or incorporated from others' objections) that depress such victim property values (and inflict pain and suffering on us). In this case, if the EIR is approved it is not speculative to expect many victims not only drilling new wells, but also seeking to recover the "mineless" value of their homes plus other damages on such claims .

18. Contradictions of the EIR With the County Economic Report Illustrates General EIR Flaws And More, Illustrated by EIR Ignored Or Incorrectly Addressed Well Risks And Its Undercount. See Exhibit A.

Since the County's separate (and) disputed economic analysis by Robert D. Niehaus, Inc is addressed in the noncompliant EIR, this Objection notes that I also offered questions and comments on that disputed "Report on the Economic Impact of the Proposed Idaho-Maryland Mine Project" (the "County Economic Report") in my rebuttal attached hereto as **Exhibit A**. I do so, despite the EIR's (and DEIR's) incorrect claims that it can ignore (or not treat seriously on the merits) objections outside of its disputed description of the scope of the CEQA Guidelines, such as (EIR advocates incorrectly argue) SEC filing admissions allowed and prevailing in Richmond v. Chevron. **As my commentary in DEIR Objections 255 and 254 demonstrates with case authority, once the DEIR and now the EIR add their own disputed data and commentary that (by their own standard) is outside the scope of the CEQA Guidelines, that must allow my and other Objections to rebut those false, deficient, and worse extra statements, especially those labeled in such a heading calling them "Non-CEQA Related Analysis" (DEIR Objection 254 #3.K). As demonstrated in many such objections, not only has the disputed EIR/DEIR incorrectly ignored many wells at risk, but the EIR/DEIR entirely ignore the certain creation of new and deeper competing wells by us owners of surface property above and around the 2585-acre underground mine, as we battle both climate change and mine dewatering to save our homes and forests.**

In other words, in the litigation that will come if the disputed EIR is approved, whatever is stated in the DEIR or EIR must be subject to our objection and rebuttal. Otherwise, there would be no level playing field, and Rise (or the County, if it sides with Rise against its resident voting victims) could argue that the County could rely on what the EIR and DEIR stated. Since we would be challenging the entire EIR and DEIR, we must be allowed to respond and counter each error, omission, and noncompliance stated therein, as my four Objections attempt to do. The mine proponents cannot use the CEQA Guidelines to tell an incorrect, one-sided story in which they can address matters outside the Guidelines without us local victims being allowed to counter/rebut such errors, omissions, and noncompliance. See section I.C, including my use of the 2018 Guideline Amendment Explanation to rebut the many EIR/DEIR misinterpretations of the Guidelines.

II. Objections To EIR 2.2 Master Responses.

A. Introductory Comments And Principles To Apply In Sharing My Objections To the EIR Master Responses On An Item-By-Item Basis (#1-38).

1. An Alert To Noncompliant EIR Tactics, Such As For Evading My DEIR Objections By Incorrectly Dismissing My Such Objections Without Good

Faith Reasoned Analysis And Common Sense And Just Sending The Reader Back To the Same DEIR Statement To Which I Had Earlier Objected.

a. Some Introductory Guidance As to How To Read These Objections In Relation To Those In Other Sections And Some General Principles.

Consider the legal authorities, guidelines, and principles in that preceding section I as both (i) a foundation for my many, specific compliance, substantive, and technical objections, and (ii) a guide for analysis by decision-makers that reveals objectionable patterns, practices, and tactics by which the disputed EIR/DEIR evades, ignores, and mistreats its disclosure and response obligations. For reasons described below, I am not going to waste my time trying to clarify more than I have herein of the confusing scramble and tactical mess the disputed and noncompliant EIR/DEIR has made to evade meritorious objections. Stated another way, this Objection exposes the objectionable EIR/DEIR tactical patterns and practices, with sufficient item-by item rebuttals in both this section II (as to so-called "Master Responses") and the next section III (as to "Responses" to fragments it chopped up from my DEIR Objection 254 integrated sections, as shown in sections III, I.F.5, and I.A,1.d(iv)). For reasons shown herein, I suggest the best course for the reader is to focus on the substance of what is in dispute, while discounting the EIR/DEIR noncompliant tactical approach to evading my objections and those of others. However, the EIR must fail on both kinds of noncompliance: (i) errors, omission, and other deficiencies in what the EIR/DEIR attempts to present substantively, and (ii) its evasive, concealing, and nonresponsive tactics that fail to provide the required common sense and good faith reasoned analysis on everything required by CEQA, the Guidelines, and other applicable law.

Following my substantive and procedural foundation in section I, I now dispute below each of the EIR/DEIR "Responses" and "Master Responses" on a point-by-point basis. However, as demonstrated throughout this EIR Objection 254, the disputed EIR/DEIR generally just makes a deficient and evasive "Response" summarily denying my DEIR Objection 254 and just referring the reader back to the earlier disputed DEIR statements and omissions, which my DEIR Objection 254 had already correctly demonstrated were erroneous, deficient, or otherwise noncompliant. Please note that additional legal and factual authorities are also incorporated herein (rather than restated) from my and other objectors' objections listed in the attached Table of Incorporated by Reference Objections (or related document Appendix). While I may add herein some legal and factual rebuttals to the EIR/DEIR, please also see my more extensive legal authorities and principles discussed in more detail above and, on selected issues, in my DEIR Objection 254 #'s 3.N, 4, and 14 and in my DEIR and EIR Objections 255. Thus, as a reader, decisionmakers can apply the foregoing section I and other Objection citied legal precedents, laws, and guidance to disputing the EIR/DEIR (and supporting my Objections) by a systematic rebuttal of the following, generally nonresponsive, EIR "Reponses" and "Master Responses" that too often evade, dispute, or otherwise contest or ignore my meritorious DEIR Objections 254 and 255.

Whenever I cite a DEIR provision or topic the reader should automatically consider that I dispute them in my DEIR Objection 254 (and, when applicable there, in my DEIR Objection 255 as well) and incorporate my rebuttals and Objections thereto. Thus, whenever this EIR Objection 254 of mine cites to one of my DEIR Objection 254 section or topic cites, that automatically includes and incorporates a cite to my rebuttal in this EIR Objection 254 to my related cite in

section III herein to the corresponding EIR "Response" to my such DEIR Objection 254 i.e., to such EIR Response numbered Ind. 1 to 101 that corresponds to my DEIR Objection 254 section (which can be confusing, as the disputed EIR apparently intended when it persisted in cutting up my integrated table of contents sections with heading titles into arbitrary fragments the EIR re-labeled Ind. 1 to 101 Responses, to which I have objected herein in section I.F.5 and I.A.1.d.(viii).) If I sometimes go to the trouble of matching my DEIR Objection 254 table of contents sections to the disputed EIR's renumbered "Response" fragments it so re-labels Ind. 1 to 101, that is only for emphasis for any reader, and the absence of any such Ind. 1 to 101 cite does not affect my automatic objection references in my system, as distinguished from the EIR's disputed renumbered system. The same automatic objection arrangement applies with respect to the disputed EIR's Master Responses, with even more importance, because such EIR Master Responses use labels that are not fully or even adequately informative about their often-mixed subject topics. It is often not feasible even to try to match those idiosyncratic Master Responses to my Objection topics, except by confirming my objections to such EIR content with my general, automatic cite to my Objections (including from my Table of Incorporated by Reference Objections and Exhibit D). Stated another way, my four Objections (including such incorporations) present the relevant realities, as contrasted with the many alternate realities created by EIR/DEIR errors, omissions, and noncompliance.

Therefore, I object automatically to whatever is contrary to or inconsistent with my such Objections with only one limited exception. As I note in many places DEIR 6-14 admits that the project is economically infeasible unless it can operate 24/7/365 for 80 years in the objectionable way proposed by the EIR/DEIR. I (and other incorporated objectors) agree that the project is economically infeasible, especially for someone with a financial condition like Rise admits its SEC filings (Exhibit A and DEIR Objection 254 #2), although the same would be true for even less prolonged and less intense operations. Apart from that, I consider that DEIR/EIR admission to be a comprehensive confession of economic infeasibility, since there are too many disputed proposals in the DEIR/EIR that must be defeated (or omitted impacts, or added or improved mitigations, that by that DEIR admission, the project cannot be feasible. While the disputed EIR/DEIR claims that CEQA doesn't care about such feasibility (and the County Economic Report mistakenly tolerates that erroneous claim, despite being refuted in Exhibit A and authorities in my Objections), section I.A.1.b and I.C, D, E, and F proving why we objectors must prevail because ultimately the courts will certainly allow our truths to rebut and impeach every false, misleading, and otherwise noncompliant statement and omission in the EIR/DEIR, whether or not within the incorrect boundaries that the EIR/DEIR tries to impose on CEQA objections. See, e.g., section I.C (and my DEIR Objection 255) where I more correctly address the CEQA compliance issues, including by reliance on the 2018 Guideline Amendments Explanation where the CEQA authors explain the meaning and effect of Guidelines that the DEIR/EIR misconstrue, misinterpret, or ignore in favor of their own disputed claims.

Please note that there are compelling reasons why this Objection is so long and complex, which include the disputed EIR tactic of evading my objections by incorrectly claiming that I failed to sufficiently explain or detail my objections and arguing that excused the EIR from CEQA compliance in its disputed Responses. What I do here is combat that nonsense in item-by-item rebuttals that expose that nonresponsive tactic, thereby proving an independent ground for rejecting the noncompliant EIR. I do the same thing with the EIR's disputed Responses to which I objected below, since these disputed EIR Master Responses often cite to those section III disputed Responses (and vice versa). However, since I also wish to prevail on the merits against

the EIR/DEIR, I began with my subject matter rebuttals in section I, which I incorporate automatically in each relevant objection in this section II to these EIR Master Responses and in section III below to those Responses. My objections here had to track the order of error, omission, and noncompliance in the disputed EIR (like I also had to track those in the disputed DEIR, since the EIR basically adopts the whole DEIR with supplements with "significant new information," but without the badly needed corrections or reforms addressed in many objections by me and others). See Exhibit D and the Table of Incorporated by Reference Objections. That meant the introductory or earlier general sections of the disputed EIR/DEIR required my noting my corresponding objections as errors, omissions, and, worse, each time they occurred in the disputed EIR/DEIR before reaching the major substantive parts disputed later in the sprawling EIR/DEIR, where I then again matched their somewhat more detailed (but still insufficient, noncompliant, and disputed) comments with my more detailed objections. In other words, the EIR/DEIR is responsible for the redundancy and the less detailed "coming attraction" type objections early in the documents with cross-references to my more detailed objections to the major disputed substantive topics later in the document.

Since I have proven the need for EIR/DEIR revisions and recirculation both as a matter of law and fact above throughout section I (not only in section I.A.1.c,), I will not repeat my such proofs in these rebuttal sections II and III, which instead serve to illustrate further the specific errors, omissions, and noncompliance in the EIR's Master Responses in this section II and the EIR Responses in section III. This section (like section III) relies upon everything that I said in section I and that I incorporated from my Table of Incorporated by Reference Objections. Because among the objectionable tactics I expose herein is a wrongful refusal by the disputed EIR to consider such cross references within my Objections and my incorporations to other party objections, which I frequently must dispute herein, I flag this problem at the outset and note the EIR's hypocrisy because the EIR/DEIR is full of the same kinds of incorporations and cross references for its own use that it refuses (inconsistently) to accept from objectors (as the law requires). To be clear, everything I state in section I is a legal and factual foundation incorporated (with or without specific cross references, which when I use them are for emphasis, not because they are necessary) into everything I state in section II and III. The various reasons that I have section II and III rebuttals as well, since section I should be sufficient, include both (i) my desire to avoid more meritless and distracting arguments with the EIR/DEIR on such issues, and my use of these item-by-item rebuttals to expose in these sections II and III the wrongful patterns and practices used in the EIR's "Master Responses) and "Responses." That reality, combined with the many other objectionable tactics used by the EIR/DEIR, should be an independent basis both for rejecting the EIR/DEIR and for discrediting the alleged credibility of the EIR/DEIR as to the "good faith" half of the "reasoned analysis" and "common sense" that CEQA and other applicable law requires. See, e.g., *Gray, Banning, Vineyard, and Costa Mesa and section I.A,1,d(viii).*

b. A Reminder of the Correct Legal Interpretations That the Noncompliant EIR Ignores, Evades, Or Misconstrues, Including Some Continuing Protests to Inappropriate EIR Tactics And Excuses, Especially the EIR's Objectionable Effort to Shift the Burden of Proof From the EIR To Objectors.

In that analysis below it is essential to remember that **a project proponent has the burden and responsibility for proving its disputed DEIR/EIR claims. *Sierra Club*, 6 Cal.5th at 513-14. As I keep protesting, the constant effort by the disputed EIR/DEIR to shift the burden of proof and demand more explanations and substantiation from me and other objectors, the CEQA burdens for analysis and reporting fall on the EIR applicant, not on the objectors. E.g., Kings County Farm Bureau v. City of Hanford (1990), 221 Cal. App. 5th 814, placing the burden of producing the relevant environmental data on the EIR agency, not on the public.** There are many overlaps as to both (i) the disputed EIR Master Responses versus my objections to them, and (ii) the EIR Responses To Comment Ind. 254-1 et seq. versus my Objections to them. Rarely, if ever, do any such latter "Responses" correct any of the errors, omissions, and noncompliance in such "Master Responses." While I may cross cite in one section or subsection of my objections to another one of my objections or incorporate others' objections, that usually is not necessary, because each of my such objection commentaries is incorporated by reference into the others to reduce duplication and excessive and burdensome cross cites in this and the next rebuttal sections. While the disputed EIR objects to that, the EIR is even more guilty of constantly doing that same thing, making that EIR hypocrisy disqualifying either to both sides for "a level playing field" (which would leave the EIR defeated for an even more obvious failure of its burden of proof) or only to the disputed EIR/DEIR as the one with that burden of proof.

Also note, for example, how the EIR chooses to **"scramble"** its "Master Responses" relating to objections to groundwater errors, omissions, and abuses (and some others as well) without a unifying Table of Contents at the Master Response (or Responses in the next section) level, rather than consolidating them in a more coherent manner. See my discussions in section I (e.g., I.A.1.d(viii) and I.F) about "hide the ball" and other objectionable tactics, as well as in my DEIR Objection 254 #3.E. Such tactics are usually signs in eir disputes of a miner seeking to evade confronting serious problems for which the absence of a persuasive response is too obvious, so an exhausting, *scrambled* confusion is often the chosen tactic to obscure omissions, instead of consolidated clarity that better reveals those errors, omissions, and noncompliance. See, e.g., the common and overlapping groundwater issues addressed in scattered, disputed, **direct** Master Responses 13 (Historic Hydrologic Assessments (with deficient maps), 14 (Adequacy of Groundwater Model), 15 (Adequacy of Groundwater Monitoring Wells (with deficient maps and addresses), 16 (Drought and Climate Change), 29 (Near Surface Workings And Subsidence), 33 (Groundwater Dependent Vegetation), 35 (Discharge to South Fork Wolf Creek), and 36 (Flows in South Fork Wolf Creek) or disputed, indirect Master Responses where groundwater issues were mixed with other issues, such as Master Response 1 (Quality of Life), 2 (Social and Economic Impacts), 3 (Operator Responsibility), 6 (Wildfire Impacts), 7 (Location of Future Mining Areas, e.g., mixing "Potential Groundwater Effects From Underground Mining" with "Blasting, Vibrations, and Noise), 8 (Mine Waste Characterization, e.g., mixing Water Code and 80 year dewatering issues with various others), 9 (Historical Mine Waste at Centennial Site), 10 (Explosives, Reagents and Brunswick Fill, e.g., mixing toxic materials and mineral processing issues with others), 11 (Engineered Fill Utilized in Local And Regional Construction Markets, e.g., mixing mine waste arguments with erroneous discussions of Water Code compliance), 17 (Meteorological Data Used in HRA, e.g., diverting hexavalent chromium water pollution issues into air pollution issues, but with unintended useful admissions in Vol. IX, Appendix R, which buries or ignores what should have been disclosed in #'s 17—19 water pollution discussions), 20 (Conservatism of Metal Assumptions, e.g., "fugitive dust" not

consistent with #'s 17—19 and Appendix , which should deal with hexavalent chromium as a key water pollution issue), 24 (Project Construction Schedule (mixing dewatering with other issues), 29 (Temperature of Mine Water Discharges) and 39 (Discharge to South Fork Wolf Creek. See Exhibit D for data about incorporated objections.

In this case, unless it's just an unfortunate coincidence to frustrate objecting victims, I suspect the EIR Master Responses are divided up to make the DEIR revisions and other responses appear as if they are less CEQA "significant" and not "new information" in hopes of evading CEQA mandated recirculation (see my discussions elsewhere on that topic, including section I.A.1.c), than if all the new and significant groundwater matters were consolidated together in the EIR so their critical mass and combined importance was more visible. (This is a common trick of debaters, politicians, and litigators who attempt to minimize a key, integrated issue on which they are vulnerable by fragmenting and scattering the issue data in smaller parts, so that each part incorrectly seems separate and less important, thus forcing an adversary like me both to reaggregate (as I tried to do somewhat in section I) what should be a consolidated issue that is best aggregated (e.g., groundwater is one such issue that must be addressed as one integrated whole, even though it has multiple impacts, such as the EIR/DEIR scattering discussion of dewatering, wells, water pollution, climate change denial, biological impacts, vegetation impacts, quality of life impacts, etc.) When such disputed environmental impact reports are litigated in court, many such tactics are defeated by objectors' procedural and evidentiary motions and other litigation techniques requiring clarification of the disputes in a more logical matter, where related issues are resolved together rather than by the way the miner **scrambled** them for tactical confusion (as it also did when the EIR chopped up my integrated objections into less persuasive fragments in its Responses rebutted item-by-item in section III below and, for example, in section I.A.1.d (viii) and I.F.5 above.) That is, among other things, because courts have little patience for having, in effect, to relitigate the same overlapping and common core impact with different topic labels many times (as would be the case regarding, for example, such groundwater issues here) if the miner or governmental approval authority were allowed to split up the dispute in such a dysfunctional manner for its tactical advantage.

Throughout my objections to the noncompliant EIR "Master Responses" I complain that the EIR keeps evading my objections here and elsewhere by claiming incorrectly that they are too speculative, insufficiently explained or details, or otherwise unworthy of a response on the merits. My consistent rebuttals to such bogus excuses are based on legal principles articulated in section I, in my DEIR Objection 254, and in my EIR and DEIR Objections 255, such as, for example, the following. The EIR/DEIR fails to perform its **CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the**

disputed raptor issues.) Again, among the most common deficiencies and worse in the disputed EIR/DEIR are that they "ignore or assume a solution" to a problem or claims that the missing information "will be provided in the future." *Vineyard* at 40 Cal.4th at 429, 431, prohibiting such deferred analysis or mitigation. See my CEQA discussions and authorities below, such as at I.A.1.d.(v), I.C, I.D, and I.E.4.

As *Vineyard* explained (at 443), "Ultimately, [t]he question is … not whether the project's significant environmental effects can be clearly explained, but whether they were" in a proper manner. That standard is informed by this principle: "The preparation and circulation of an EIR is more than a set of technical hurdles for agencies and developers to overcome. The EIR's function is to ensure that government officials who decide to build consequences and, equally important, that the public is assured those consequences have been taken into account." (at 449). The data in an EIR must not only be sufficient in quantity, it must be presented in a manner calculated to adequately inform the public and decision makers, who may not be previously familiar with the details of the project. [i]nformation 'scattered here and there in EIR appendices or a report "buried in an appendix" is not a substitute for "a good faith reasoned analysis.'" (at 442). Moreover, "[c]onclusions are not the reasoned explanation CEQA requires." [See, e.g., Laurel Heights Improvement Assn v. Regents of University of California (1988), 47 Cal.3d 376, 404; North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. Of Directors (2013), 216 Cal. App.4th 614, 639-640.] This EIR/DEIR fails to meet any of these requirements, as I demonstrate in my four Objections.

As the court noted in *Richmond v. Chevron* from similar impeachment data to what is at issue in my Objections: "'By giving such conflicting signals to decision makers and the public about the nature and scope of the activity being proposed, the Project description was fundamentally inadequate and misleading.' (*San Joaquin Raptor Rescue Center v. County of Merced* (2007), 149 Cal.App.3d 663, 655-656 …)" The court then stated (what also applies here): "Far from being an informative document, the EIR's conclusions call for blind faith in vague subjective characterizations. (*See Berkeley Keep Jets Over the Bay Com. V. Board of Port Cmrs.* (2001) 91 Cal. App. 4th 1344, 1371… ["[t]he conclusory and evasive nature of the response to comments is pervasive, with the EIR failing to support its many conclusory statements by scientific or objective data"); *San Joaquin Raptor,* supra, 149 Cal. App. 4th at 659 ["decision makers and general public should not be forced to … ferret out the fundamental baseline assumptions that are being used for purposes of the environmental analysis"].) After a considerable review of the flaws in the EIR process and admissions and rebuttals not addressed in the EIR, the court said: **"'[T]he ultimate decision of whether to approve a project, be that decision right or wrong, is a nullity if based upon an EIR that does not provide the decision-makers, and the public, with the information about the project that is required by CEQA.' (Santiago Water Dist. v. County of Orange (1981), 40 Cal.4th at 443**…["That a party's briefs to the court may explain or supplement matters that are obscure or incomplete in the EIR … is irrelevant, because the public and decision makers did not have the briefs available at the time the project was reviewed and approved."]) (emphasis added) **The court also rejected the late "battle of experts" as "too little and certainly too late, to satisfy CEQA's requirements. (See Save Our Peninsula, supra, 87 Cal. App. 4th at 124 [information about baseline "occurred at the very end of the environmental review process, thus avoiding public scrutiny and precluding meaningful comparison of preproject and postproject conditions required by CEQA'].)" (emphasis added**

Here that means, for example, reading together both such "direct" Master Responses to my and other groundwater objections, as well as such "indirect" related groundwater impact responses to my EIR/DEIR objections and those of others, as one consolidated and integrated environmental impact. What that means here is reading my section I topics for basic foundations and then applying that data to the item-by-item rebuttals of these Master Responses (and, even worse, Responses in the next section). Again, as to my complaint about the disputed EIR chopping up my integrated DEIR Objection 254 sections for its so-called separate "analysis," which is really just an unsubstantiated and incorrect opinion (lacking the CEQA required "good faith") that just refers the reader of the EIR "response" back to the same deficient, erroneous, omitted or otherwise noncompliant DEIR statements to which I was objecting. As the reader will see if he or she matches my DEIR Objection 254 (or 255) to the nonresponsive and noncompliant EIR "Responses" and my rebuttals in section III to those disputed Responses, those EIR Responses usually add no substance, but just refer back to the already rebutted DEIR statements to which my such DEIR Objection 254 had already objected (starting at 2-5843). While I rebut those inconsequential and noncompliant EIR recycled "Responses" in section III, item-by-item, if I were a reader seeking clarity, I would ignore those inconsequential and noncompliant EIR recycled "Responses," as well as most of the "Master Responses," so rebutted in this section (and in my legal, CEQA, Guideline, and procedural objections to these disputed EIR/DEIR tactics), in favor of just comparing the limited substance of the EIR/DEIR's purported CEQA comments to my many substantive objections to them.

Please note that there are compelling reasons why this Objection is so long and complex, which include the disputed EIR tactic of evading my objections by incorrectly claiming that I failed to sufficiently explain or detail my objections and arguing that excused the EIR from CEQA compliance in its disputed Responses. What I do here is combat that nonsense in item-by-item rebuttals that expose that nonresponsive tactic, thereby proving an independent ground for rejecting the noncompliant EIR. I do the same thing with the EIR's disputed Master Responses to which I objected above, since these disputed EIR Responses often cite to those disputed Master Responses. However, since I also wish to prevail on the merits against the EIR/DEIR, I began with my subject matter rebuttals in section I, which I incorporate automatically in each relevant objection in section II to those EIR Master Responses and in this section III to those Responses. My objections here had to track the order of error, omission, and noncompliance in the disputed EIR (like I also had to track those in the disputed DEIR, since the EIR basically adopts the whole DEIR with supplements with "significant new information," but without the badly needed corrections or reforms addressed in many objections by me and others). See Exhibit D and the Table of Incorporated by Reference Objections. That meant the introductory or earlier general sections of the disputed EIR/DEIR required my noting my corresponding objections as errors, omissions, and, worse, each time they occurred in the disputed EIR/DEIR before reaching the major substantive parts disputed later in the sprawling EIR/DEIR, where I then again matched their somewhat more detailed (but still insufficient, noncompliant, and disputed) comments with my more detailed objections. In other words, the EIR/DEIR is responsible for the redundancy and the less detailed "coming attraction" type objections early in the documents with cross-references to my more detailed objections to the major disputed substantive topics later in the document.

2. Objection To EIR's Bogus Claim Of Only "Minor Clarifications"/"Amplifications" To Evade Its Recirculation Obligation.

The disputed EIR attempts to evade the required revisions and recirculation (see section I.A.1.c above) with its erroneous (and worse) claim that the EIR involves "only minor clarifications/amplifications" that "do not constitute significant new information." EIR at 2.2 p. 2-1. That disputed EIR claim is both unsubstantiated and lacking the "good faith reasoned analysis" and "common sense" required by CEQA and courts cases discussed above. See *Gray, Banning, Vineyards, and Costa Mesa cited above.* My DEIR Objections 254 and 255, this Objection, and others' incorporated objections prove those DEIR/EIR flaws, errors, and omissions require revision, recirculation, and more, since the DEIR/EIR not only fails to comply with CEQA, but also fails to provide an opportunity to us potential local victims to rebut the entirety of the DEIR and EIR because of its nonresponses, omissions, evasions, and other noncompliance. See section I.C above, including many CEQA legal precedents supporting my position and revealing how the EIR/DEIR misapplies and exaggerates the applicable standards (e.g., what is legally "significant" for requiring revisions and recirculation is much less in real world practice than the monumental change that the EIR/DEIR incorrectly claims would have to occur before any revision and recirculation is required), as well as the 2018 Guidelines Amendment Explanation, where the Guideline authors expose and correct such EIR misinterpretations. See section I.C above. Likewise, "new information" does not mean what the EIR/DEIR's disputed standard claims by a practical translation where the information would have to be almost unimaginable, since according to the disputed EIR/DEIR standard in practice, almost everything is a "clarification" or "amplification," rather than what it really is: "new." Since the interpretation and application of the CEQA standards for what is "new" versus "clarifications" or "amplifications or what is "significant" or not are legal questions for the court de novo and on which the bare, incorrect, and unsubstantiated opinions of the EIR/DEIR carry no more weight than my objections thereto (and the disputed EIR/DEIR should carry less power because they have the burden of proof and offer no support for their erroneous opinions, while I offer significant substantiation, even though [contrary to the EIR/DEIR erroneous claim] all the law requires of me is to counter their opinion with my own.)

Thus, to illustrate one example of the many that occur with respect to most of my and others' objections to many types of noncompliance, when I objected that the (still incorrect, deficient, and noncompliant) hexavalent chromium data the EIR adds that was almost entirely ignored by the DEIR, I correctly called that "significant" "new" information in my DEIR Objections 254 and 255, thus requiring recirculation of a compliant document. Then the self-serving EIR incorrectly called its additional commentary and Appendices (e.g., Q and R added at the back of the EIR without compliant integration with the EIR itself) mere "clarification" or "amplification" and dismissed my objection as lacking sufficient clarity or detail to prove them wrong, all of which errors my Objections refute comprehensively. **Also, first**, I did provide clear and sufficient detail and cited correct authorities (e.g., sometimes by proper cross-references and incorporations) in my Objections in many places the EIR just refused to look. See, e.g., DEIR Objection 254 #'s 3.D. E, F, M, and N, and 4, 5, 6, and 15, as well as in sections I.D, E.4, F.1, and Exhibit C. **Second**, this standard dispute with the noncompliant EIR is backwards, because the disputed EIR has the burden of proving it's data is not "new" or "significant," but instead the noncompliant EIR merely pronounces its incorrect, deficient, and unsubstantiated opinion, falsely and improperly demanding without substantiation that I do more to prove its opinion was wrong (and mine was right, which I repeatedly do appropriately, but not ever it seems the way the EIR incorrectly insists my rebuttals must be presented.) **Third**, stated another way, because

the EIR does not attempt to justify its positions with any "common sense" or "good faith reasoned analysis" (as required by *Gray, Banning, Vineyard, and Costa Mesa*, among other authorities), the disputed EIR's constant complaints about the sufficiency, clarity, or relevance of my objections must also fail to prevent the EIR/DEIR from benefiting from their wrongful "hiding of the ball," "bait and switch," false equivalents, and other improper tactics. See my general "good faith" challenge against such disputed tactics above (e.g., I.A.1.d(viii) and I.E.1-5), DEIR Objection 254 #'s 3.E and N, 4, and 14, and EIR and DEIR Objections 255. See also my Table of Incorporated by Reference Objections and Exhibit D illustrations therefrom.

Again, since I have proven the need for EIR/DEIR revisions and recirculation both as a matter of law and fact above throughout section I (not only in section I.A.1.c, and other incorporated objections), I will not repeat my such proofs in these rebuttal sections II and III, which instead serve to illustrate further the specific errors, omissions, and noncompliance in the EIR's Master Responses in this section II and the EIR Responses in section III. This section (like section III) relies upon everything that I said in section I and that I incorporated from my Table of Incorporated by Reference Objections or Exhibit D. Because among the objectionable tactics I expose herein is a wrongful refusal by the disputed EIR to consider such cross references within my Objections and my incorporations to other party objections, which I frequently must dispute herein, I flag this problem at the outset and note the EIR's hypocrisy because the EIR/DEIR is full of the same kinds of incorporations and cross references for its own use that it refuses (inconsistently) to accept from objectors (as the law requires). To be clear, everything I state in section I is a legal and factual foundation incorporated (with or without specific cross references, which when I use them are for emphasis, not because they are necessary) into everything I state in section II and III. The various reasons that I have section II and III rebuttals as well, since section I should be sufficient, include both (i) my desire to avoid more meritless and distracting arguments with the EIR/DEIR on such issues, and my use of these item-by-item rebuttals to expose in these sections II and III the wrongful patterns and practices used in the EIR's "Master Responses) and "Responses." That reality, combined with the many other objectionable tactics used by the EIR/DEIR, should be an independent basis both for rejecting the EIR/DEIR and for discrediting the alleged credibility of the EIR/DEIR as to the "good faith" half of the "reasoned analysis" and "common sense" that CEQA and other applicable law requires. See, e.g., *Gray, Banning, Vineyard, and Costa Mesa and section I.A.1.d(viii).*

B. Objection To Master Response 1 (part 1): Non-EIR/Administrative Issues.

At present, the disputed EIR incorrectly claims that the EIR can say whatever it wants, whether within the scope of CEQA or not, while the EIR/DEIR incorrectly argue that such local victims like me can only complain about the portion of the disputed EIR/DEIR that is incorrectly claimed to be within their misinterpreted, narrow scope of CEQA. See my debates on this subject above at #I.A.1.b, noting, for example, in my DEIR Objection 254 #3.K how that disputed EIR approach would permit the disputed DEIR to present noncompliant and worse comments in its "Non-CEQA Related Analysis," but the EIR falsely claims the right refuse to respond to my objections thereto on the bogus theory that such objections (even using DEIR or Rise admissions) are irrelevant, because, they are somehow outside its misinterpretation of the scope of CEQA. (Legal hint: rebuttal and impeachment of such errors, omissions, and noncompliance are always relevant and admissible evidence.) Thus, if the EIR is approved, the County will be compelling the courts certainly to reverse them in my favor not just on the substantive merits, but

also on these many disputes over the scope of CEQA and our objector/victim rights to rebut/impeach the EIR/DEIR as I have done, whether or not within the true scope of CEQA. To oversimplify, CEQA requires truth, "common sense," and "good faith reasoned analysis" for every statement the EIR and every response to my and others' objections. E.g., *Gray, Banning, Vineyard, and Costa Mesa, as discussed in section I.A.1.d and as illustrated in each objection to which there was no responsive and compliant EIR response.* That means that us objectors must be able to counter all the falsehoods, errors, omissions, and other noncompliance in the EIR without being restrained by any incorrect "border limits" for CEQA compliance claimed by the EIR, but never applied to itself (i.e., hypocrisy, and worse tactics). As I explain elsewhere, including in my four Objections 254-255, when the EIR/DEIR propounds false or erroneous descriptions of the applicable law (or fails to apply correctly, or at all, applicable law), the EIR/DEIR must be corrected, as my and other objections do, despite such EIR/DEIR resistance or evasions.

Moreover, the generally nonresponsive EIR incorrectly claims that it is "responding" to all the objections, at comparable levels of detail to those objections, e.g., misreading CEQA Guideline #15088 about general responses to general objections. However, when, as often is the case in the flawed EIR/DEIR, our general objections are to their omissions, evasions, or noncompliance with respect a required CEQA or other disclosure, the only proper response is full disclosure; not the general evasion as the disputed EIR often does by failing to provide the required details. Note that the burden of proof and compliance is on the EIR/DEIR, not on us objectors. As explained in the prior subsection and elsewhere above, CEQA also demands such compliance by the EIR with respect its responses to our objections.

As its disputed Master Response 1 illustrates, for example, the EIR grossly and repeatedly fails to comply with the CEQA and other disclosure requirements, presumably for the improper tactical purposes explained herein. In this case that may occur for many reasons. One is that the EIR wrongly and consistently applies a double standard, including by refusing to perform and disclose themselves in the same way they insist that we comment. More importantly, the EIR misinterprets, misapplies, and wrongly argues the meaning and application of CEQA and other laws to this dispute. See, e.g., section I.C and D above. For example, the EIR miscites CEQA Guidelines (like #15204) by assuming (incorrectly) that the disputed EIR is complete, correct, and compliant when it is often none of those things. Therefore, (the EIR claims) that objectors are supposed to focus on "specific alternative or mitigation measures," a task that is impractical when the disputed EIR/DEIR is so full of errors, omissions, and other noncompliance. Similarly, the EIR (at 2-2) wrongly forbids (and, therefore, disregards) us potential victims from offering "opinions on whether the Project should be approved," but what we are doing is countering the contrary, unsubstantiated, speculative, and provoking DEIR/EIR "opinions" about the merits of the Project. Again, we objectors always must be allowed to counter every false, misleading, and otherwise incorrect or deficient statement in the EIR or DEIR, whether concerning an environmental impact or any other disputed claim or content. Either our rebuttals to the disputed EIR/DEIR "non-environmental factors" must be allowed, or else the County must disregard both "non-environmental" opinions from each side (in which case we objectors must prevail because the burden of proof is on the disputed EIR/DEIR). Stated another way, if the EIR/DEIR claims that all its statements qualify as within CEQA scope environmental impacts, then our rebuttals must also be treated the same way. Note that, however, as demonstrated in my objections, even the DEIR admits that it sometimes exceeds CEQA's

scope, such as for example the DEIR section labelled "Non-CEQA Related Analysis." See my DEIR Objection 254 #3.K.

Consider that this mine has been flooded and closed since 1956, and Rise admits in its SEC filings (eg, See Exhibit B hereto and my Objection 255) having no reliable and sufficient data regarding the current conditions of the project mine. For example, the DEIR/EIR seeks to profit from its ignorance as to various important matter about how its massive, 24/7/365 dewatering for 80 years will impact us competing and objecting surface owners of properties like me above or around the 2585-acre underground mine (with at least 300 existing wells by the County Economic Report count overlooked by the DEIR/EIR, but still undercounted as discussed in my Exhibit A hereto and elsewhere), plus many more future wells to come in response to climate change realities ignored by the EIR/DEIR as too speculative despite offers of proof by me and other objector/witnesses, as well as the "2018 Guidelines Amendments Explanation" affirming CEQA inclusion of climate change (see section I.C.2 above). See the Rise SEC admissions as to many such risks in Exhibit B and my DEIR Objection 254 #2, which the disputed EIR/DEIR (and, so far, the County) refuse to consider, despite such SEC admissions prevailing for objectors in ***Richmond v. Chevron,*** discussed at section I.D above. Therefore, there cannot be a burden on us neighboring mine victims to do what the EIR so fails to do, and, even if we wished to do so, it is impractical for anyone else to do EIR's compliance job without access to what information sources Rise and its EIR author have available but refuse adequately to investigate. The fact is that Rise prefers its such admitted ignorance on the mine realities, so that it can argue instead from disputed, irrelevant, incomplete, and otherwise unreliable supposedly historical mine records and allegedly (but not) comparable studies of other, unrelated properties the disputed EIR wishes to use instead of current facts; illustrating one of the many evidentiary disputed the courts may have to resolve if the County mistakenly accommodates the EIR mine.

To illustrate further just one of many such EIR flaws, assume that dangerous conditions exist below the long-flooded waters in the depths of the 2585-acre underground mine, contrary to the EIR's uninformed gamble, assuming/speculating, opining without substantiation that no uninvestigated problems exist. (Although the disputed EIR/DEIR refuses to reply to many of my objections because it incorrectly complains that they are too "speculative" or "unsubstantiated," it's instead the EIR/DEIR that is speculating etc. without substantiation about the conditions of the long flooded and closed mine Rise and the EIR/DEIR have refused adequately to investigate. Either both sides' positions must be considered or neither can be, so that there is a level playing field. There can be no such thing as "giving the benefit of the doubt" to the disputed EIR, especially because it has the burden of proof to apply common sense good faith reasoned analysis in compliance with the other CEQA requirements.) When those mine condition problems become known when they impact us local victims and such victims pursue their legal, law reform, and political remedies [i.e., when the harms become obvious to us locals (eg, dry or toxic wells, mine groundwater polluted by hexavalent chromium, etc.], it is already then too late to save us victims from harm. My extensive experience in such bankrupt mining situations discussed above (section I.A.2), and in my DEIR Objections #254-255, will prove that, when these kind of miner gambles harm people, such miners (especially foreign miners) often abandon the no longer profitable mines, leaving a mess for the impacted community to clean up. See the more than 49,000 abandoned California mines on the EPA list. When such foreign miners retreat across the border, with or without US bankruptcies to evade accountability (or they use US Chapter 15 cases to block US creditor remedies for the benefit of a foreign insolvency

proceeding), the US victims are invariably disappointed in their practical remedies. As here with Rise, usually the abandoning miner typically is a financially unresponsible entity (often foreign) whose only available material asset is the dangerous mine, which is not an asset, but rather a liability. See DEIR Objection 254 #1.

C. Objection To Master Response 1 (part 2)- "Quality of Life" (EIR at 2-3+).

As my four Objections and others demonstrate, including by cited EIR/DEIR rebuttal court decisions, the disputed EIR/DEIR often misreads Public Resources Code 21000—21002 as well as the Guidelines, as exposed, for example, in the 2018 Guideline Amendments Explanation at section I.C.2 above (e.g., where the authors themselves explain why the EIR/Deir is wrong, e.g., about climate change they dismiss as too speculative to have to address in response to my wells, water supply, and other objections) and elsewhere. The EIR incorrectly claims (at 2-3) that our "environmental needs" must be "secondary to economic and social needs" in this case, which is absurd for this "no net benefit mine" (DEIR Objection 254 #4) that will, if approved, become a liability by application of *Varjabedian v. Madera* and other authorities. However, the EIR/DEIR erroneously prohibits our economic and social rebuttals to those alleged miner needs (and the disputed County Economic Report incorrectly assumes without sufficient analysis the merit to the disputed mine claims, while ignoring the errors, omissions, and noncompliance of the disputed DEIR [see my Exhibit A] and even the lack of feasibility of the Rise's deficient mitigation and other performance of its DEIR promises [see Exhibit B and DEIR Objection 254 #2].)

Such EIR/DEIR mistakes or worse are especially serious, since, unlike public benefit projects where some are such casualties for general public good with Constitutional rights to compensation as in *Varjabedian,* this exploitive private mine for the profit of Canadian miner's shareholders has no net public benefit to us impacted local victims. See DEIR Objection 254 #4. There is no net "economic or social need" to justify this mine, as the disputed EIR/DEIR incorrectly claims, and, if the County gambles against the risks and problems that Rise itself admits in its SEC filings (eg, Exhibit B and my DEIR Objection 254 #2) and imposes this EIR menace us objecting locals to suffer the consequences over our meritorious objections, the paramount economic and social needs instead will become a much higher cost for the County to clean up the mine mess and try to remedy the wrongs done to us local victims. I use the "net" concept of weighing purported benefits minor jobs for shorter time, and less tax income than projected (see my Exhibit A and DEIR Objection 254 #4), against our objector proofs of harms to us and our whole community See, eg, Exhibit A, rebutting the disputed County Economic Report that incorrectly assumes the merit of the DEIR/EIR without considering our local victim objections. See also, besides my Objections the harms described by each of the other cited objections in my Table of Incorporated by Reference Objections or Exhibit D.

More importantly, the disputed DEIR/EIR incorrectly assumes that Rise is somehow entitled to dictate extraordinary and harmful operating rights 24/7/365 for 80 years (to which Grass Valley also joins me in objecting in its Agency Letter 8), but that claim is worse than wrong on the merits, i.e., Rise is wrong that it can choose how it wishes to operate, no matter how inappropriate, to set the standard for judging impact comparisons and illusory or deficient mitigations. For example, as my Objections (and Grass Valley Agency 8) demonstrate, not even beneficial public projects and useful businesses (as distinguished from this exploitive private project) are not allowed to so impose on the objecting public. The obvious, true mitigations,

include limiting the mining operations at most to normal businesses hours during a period when it can prove it does no harm (which is not 80 years but I say should end at the earliest of its expiring permits [no longer than 5 years as I understand the regulatory incorporated filing, or at worst ending in 2040 at the latest, when its last disputed DEIR/EIR water data (misapplied from NID) stops, making anything else a speculative and unsubstantiated miner bet [with our futures at stake] against, for example, climate change, such that the disputed "current" average rainfall between 1967 and 2017 [ignoring the dry years after 2017 so it's wrong to call it "current"] consistently recharges our groundwater for 80 years, despite massive 24/7/365 dewatering flushing our groundwater away down the Wolf Creek.) Nothing in CEQA favors Rise when it comes to such dueling speculations, especially since when we're proven correct by events us unwilling victims risk losing everything, while the mine speculator/investors just lose their modest "ante" in what they knew was a high-risk bet. See Exhibit B, where Rise SEC filings warn its investors of their high risks and lack of information and investigation to support that speculation. Any wise and careful government official should follow the first rule of medicine and "first, do no harm." Attempting to imposing any such involuntary mining gamble will incite a protracted resistance by us impacted locals living above or around the mine, who will be defending our health, welfare, and property against our risks about which we are warned by all those experts in my Table of Incorporated by Reference Objections (or Exhibit D) and by our own experiences and common sense. Where is the CEQA required "good faith reasoned analysis" that is required for the EIR/DEIR (and that is generally missing) to prove the case for the mine? Why is it in the best interest of the County to trigger such irreconcilable legal and political conflicts, especially when the EIR/DEIR fails even to make a good faith effort to convince those of us it impacts? Stated another way, who makes the better case: the disputed EIR/DEIR or the massive objections in my Table of Incorporated by Reference Objections and Exhibit D? In any case, why is it that the County would gamble for this speculator/miner against us objecting local voters who are convinced we in peril by our own good faith reasoned analysis and common sense that this can only end badly for us? The benefit of any doubt must favor us objectors, because the EIR/DEIR has made no convincing case why anyone should bet on their disputed and noncompliant EIR/DEIR and the burden of proof is on the miner.

Contrary to the incorrect DEIR/EIR arguments, Public Resources Code #21002 (and other laws and court decisions cited in objections) prohibits approval when there are "feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects." The only reason the DEIR/EIR gives for not operating for a proven, safer times during normal business hours is that Rise claims/admits (DEIR at 6-14) the mine production is not economically feasible on that basis, because profitability requires that extraordinary 24/7/365 burden for 80 years. First, there is no proof submitted for that proposition, and that is contrary to what is stated in Rise's SEC filings (see Exhibits B and A) which admit the whole project is speculative, and that there is no evidence that it could ever be profitable even on that extraordinary DEIR/EIR 24/7/365 for 80 years basis. Thus, Rise and the DEIR/EIR themselves put the economic feasibility of the mine at issue/in dispute without any credible or competent evidence favoring the EIR/DEIR as pure speculation on the condition of a mine closed and flooded since 1956 without any sufficient updated exploration or investigation. See my Objections herein, in DEIR Objections 254 and 255, and in EIR Objection 255. Second, Rise's SEC filings admissions (Exhibit B, which Richmond v. Chevron and other cases confirm must be considered and, indeed, are what won that case for the objectors) demonstrate that it cannot afford to do what is required by the EIR even on its own

disputed terms, making the whole Project and its proposed mitigations illusory. See also my rebuttal at Exhibit A as to the absurd idea that it does not matter who does the mining and that if Rise fails someone else will replace it.

D. Master Response 1 (part 3)- Economic Effect on Property Values (EIR at 2-4). See Exhibit A.

While the disputed County Economic Report had many flaws, in part because of its untested and incorrect assumption as to the correctness, completeness, and sufficiency of the DEIR (see my questions and concerns in Exhibit A and B hereto), even that Report admitted facts supporting concerns about the impact of the DEIR/EIR mine on local property values. See also my Objections and Nevada County Association of Realtors Group Letter 15. Speaking of admissions, which Richmond v. Chevron and applicable law make irresistible (see section I.D above), despite the failure to consider or include them in the disputed EIR/DEIR or in the County Economic Report. See Exhibits B and A. Part of the problems are that many mine impacts ignored by the DEIR/EIR (and that Report) will depress property values, and even the threat of possible mining creates a value depressing stigma impact that will endure consistently while us homeowners above and around the 2585-acre underground mine, among others, resist with our legal, law reform, and political remedies. Id. For example, even the risk factors admitted by Rise in its SEC filings, but ignored in the DEIR, EIR, and County Economic Report (see Exhibit B hereto), will substantially harm property values, and thereby will both depress property and other taxes, as well as depressing our local economy, particularly businesses dependent on a vibrant real estate, such as local home construction, remodeling and repair, building supplies and hardware, among other things, as well as our tourist industry for which such chronic local conflicts about the mine menace are not helpful to our hard earned environmental image. Look what happened to Benicia when the refinery moved in, soon joined by other undesirable polluters looking for a tolerant place to exploit. Also consider the fate of Martinez and other adjacent towns who suffered from both the stigma and the fowl air and odors. As noted above and elsewhere in my Objections and those of other victims in my Table of Incorporated by Reference Objections or Exhibit D, we must be allowed to rebut all the errors, omissions, and other noncompliance in the DEIR/EIR, whether our issues are deemed (a matter in dispute, including because every single sentence in the EIR/DEIR must be subject to rebuttal and impeachment, regardless of any alleged CEQA boundary) neither direct nor indirect "significant effects on the environment" for purposes of CEQA Guidelines #15131(a). See, e.g., section I.A, C, D, E, and F. (This is also true of the County Economic Report, as rebutted in Exhibit A.)

My Objections and applicable law and court cases ignored or misdescribed by the EIR counter those alleged in the EIR, especially because the economic impacts will cause changes to the physical environment addressed even under the DIER/EIR's disputed interpretation of CEQA and its Guidelines. See my discussion in section I.C.2 of the 2018 Guidelines Amendment Explanation, where Guideline authors rebut the incorrect EIR/DEIR interpretations of CEQA and the Guidelines. Consider, among many examples in my Objections and others and elsewhere herein, the following counter application of CEQA Guidelines #15131(a) misapplied in the EIR at 2-4. There are thousands of people like me living above and around the 2585-acre underground mine whose property rights and reactions are generally and improperly ignored in the DEIR/EIR (and County Economic Report-see Exhibit A), in contrast to the DEIR/EIR attention concentrated on the small subset addressed downhill along East Bennett Road**. See, eg,**

the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session. See the Wells Coalition DEIR objection at Group Letter 27/28. The relevant comparable is the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line. Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change. See NID Agency 10 as to its WSA and my objections to EIR "Responses Ind. 254-16 and 17.

Many of us owning surface properties above or around the mine and have a co-equal and competing right to the same ground water that the DEIRE/EIR plans to flush away down the Wolf Creek in their disputed mine dewatering plan for constant 24/7/365 depletion for 80 years, all without reliable proof that abuse is sustainable or tolerable. Not only does the EIR/DEIR underestimate the number of wells presently at risk, but it also ignores our surface owner rights to drill new and deeper wells to save our homes and forests from the climate change impacts made worse by such mine dewatering. When the mine makes such physical changes affecting such disputed ground water, it is not just misusing its own or public water, the mine is depriving those surface owners above and around the mine of their court confirmed rights to lateral and subjacent support that includes such shared ground water being essential to avoid the risk of *Keystone* "subsidence" and well as drying up and killing of surface trees and other vegetation and adding massively to wildfire risks. Such risks and harms to the surface owner's property rights and value is caused by physical impacts at the mine, eg, dewatering and changing in water flow and quality. Moreover, as demonstrated earlier the DEIR/EIR falsely assumes, without any CEQA compliant "common sense," "good faith reasoned analysis" as required by *Gray, Banning, Vineyard, and Costa Mesa and ignoring climate change as speculative contrary to the 2018 Guideline Amendments Explanation (at section I.C.2 above),* that our groundwater will somehow recharge from the "current" average rainfall between 1967 and 2017 being repeated for 80 years, despite 247//365 dewatering and despite the fact that such average ignores the more "current" dry years data after 2017.

Thus, the disputed EIR is wrong to claim (at 2-4) that: "There is no evidence that physical effects to other properties would occur that could result in reduction of property values." See Exhibit A. To the contrary see the Nevada County Association of Realtors Group Letter 15 and many others in the record, including my four. Worse, the burden of proof should be on the EIR/DEIR (not the potential victims) to prove there could be no harm to that local environment and such surface properties, but Rise admits having made no sufficient investigation of the underground condition of the long-flooded mine and ground water supplies for 80 years with such constant dewatering abuse. See my Objections and others and Exhibit A and B, including Rise admissions in its SEC filings which, contrary to their incorrect exclusion must be considered rebuttal evidence as shown in Richmond v. Chevron discussed in section I.D

above. As to mitigation, as discussed above and elsewhere, for example, cutting back the operations at the mine to normal business hours would help, and Rise claiming and admitting (DEIR at 6-14) that it needs 24/7/365 drainage for 80 years to maintain its desired profitability is not a tolerable reason to justify that abuse of the environment that depresses property values. Accord Grass Valley Agency Letter 8 and others I incorporate.

E. Objections To Master Response 2-Social And Economic Impacts (EIR at 2-4+).

As demonstrated above and elsewhere in this and other Objections by me and others, the EIR incorrectly cites Pub. Res. Code #21060.5 and Guideline #15360, 15064(e), 15131(a) and (b), and 15382 because it misapplies them. See my Table of Incorporations by Reference Objections, Exhibit D, and my CEQA and Guideline analysis in section I.C and elsewhere, including the 2018 Guidelines Amendments Explanations, where the Guideline authors rebut the kinds of misinterpretations in the EIR/DEIR. For example, the EIR claims (at 2-5) that "the scope of an EIR is limited to a local agency's evaluation of potentially significant environmental impacts of a project, which by definition are limited to physical conditions, rather than social and economic conditions" (including, the EIR claims harm to property values, which I address above in II.C and elsewhere) citing distinguishable, debatable, or otherwise rebuttable cases. That is the point. When their authors and approvers (or those for the County Economic Report) try so to limit, exclude, or evade objections which they claim are outside the scope of CEQA/Guidelines (or the arbitrary and dysfunctional limits of that economic report), they are ignoring the fact that I and other objector/victims are rebutting and impeaching what is also asserted in such disputed EIR/DEIR outside that same asserted scope (and that our rebuttals show is erroneous, deficient, noncompliant or worse, including by Rise and DEIR or EIR admissions we are entitled by law to use to counter and present the truth and reality).

Nothing in CEQA or other applicable law blocks objectors from exposing, rebutting, and countering such EIR/DEIR (and County Economic Report) errors, omissions, and other noncompliance. See my doing such rebuttals and impeachment herein (including Exhibit A) and in my Objections, including by using both Rise admissions in Exhibit B and my DEIR Objection 254 #2 as well as DEIR or EIR admissions such as DEIR at 6-14, where it admits the whole project is economically infeasible if it were not able to operate 24/7/365 for 80 years in accordance with its disputed EIR/DEIR plans, ignoring what I and others note that its operating permits will not last that long, with some expiring as soon as five years. That rebuttal right is especially applicable where such disputed data asserted by the EIR/DEIR is contrary to or fails to address contrary data in Rises SEC filings (see Exhibit B) and even in the County Economic Report (see Exhibit A). As noted above, for example, the EIR/DEIR and County Economic Report cannot incorrectly brag about the mine's cited economic benefits (i.e., minor tax revenue and several hundred jobs of uncertain duration while the resistance to any approval proceeds with legal, law reform, and political remedies) and not allow us objectors to counter those errors, omission, and noncompliance (eg, showing property value declines, which reduce property tax revenue, surface property related jobs [construction, remodeling, repair related work, hardware, building supplies, tourism, etc.] and other economic harms. See Exhibit A and DEIR Objections 254 #4 demonstrating the no net benefit from the mine.

As one of many examples of how the EIR (at 2-5) misapplies cited cases, while ignoring other precedents and distinguishing factors and creating legal errors, as discussed above at I.C and D and in my Objection 254 #'s 3.N, 4, and 14. Consider the EIR's disputed reliance on ***Gray***

v. County of Madera (2008) (167 Cal. App. 4th 1099, 1120-21, on which I also rely as supporting my Objections and not the DEIR/EIR (which attempted DEIR/EIR application I distinguish and can rebut with both using that case and others. See my DEIR Objection 255 #3 (and 254, see, e.g., #'s 3.N, 4, and 14) (i) where I address regarding the distinguishing *Gray* case factors even more favorable to us objecting surface owners above or around the 2585-acre mine (not present in the open quarry *Gray* mine) with our competing property rights to the same groundwater, as well as rights to lateral and subjacent support (including by such groundwater) as described in the US Supreme Court in ***Keystone Bituminous Coal Ass'n v. DeBeneditis,*** 480 U.S. 470 (1987)(rejecting "taking claims by miners as to laws protecting surface owners' property rights to lateral and subjacent support, including by groundwater, to prevent "subsidence" [defined to include depletion of groundwater] and loss of groundwater support), where surface owners were allowed to require underground miners to preserve their surface rights of subjacent and lateral support (and protect against subsidence, which includes leaving groundwater support) by leaving 50% of the coal in the mine to support the surface. *See also*, ***Smith v. County of LA*** (1986), 214 Cal. App. 3d 266 (essential county road repairs created landslide conditions destroying local homes, triggering nuisance, inverse condemnation, and other claims, both for damages for diminution in the value of real property and for annoyance, inconvenience, and discomfort, including mental distress as part of the loss of quiet enjoyment rights as a property owner) and other cases I discuss elsewhere above in detail, because the 24/7/365 dewatering for 80 years will not just devastate the local environment, but also violate our surface owners' property rights, triggering inverse condemnation, nuisance and other claims pursuant to *Varjabedian v. Madera*, supra, and other authorities, (ii) where I address the same issues but rebut the EIR/DEIR with more accurate quotes and correct "good faith reasoned analysis," as noted herein, and (iii) where I counter the incorrect EIR "Conclusion" (at 2-6) on its own terms by showing how such objections by me and others do show how "potential social or economic effects of the project" do "contribute to" or are "caused by a physical change to the environment." See generally, my objections herein to EIR Master Responses 13, 14 15, 16, 29, and for further background 7, 8, 33, 35, and 36. See also my section I.C above and the 2018 Guideline Amendments Explanations.

F. Objection To Master Response 3—Operator Responsibility (EIR at 2-6+).

This common objection is not just about Mr. Mossman, but it is more about the credibility problems of Rise (and those who blindly accept and support all those disputed EIR/DEIR and County Environmental Report errors, omissions, and worse without proper proof, "good faith reasoned analysis," or sufficient investigation) and the failure to properly address the objections to the many flaws in the EIR/DEIR and such Report. As this (including Exhibits A and B) and my other Objections demonstrate and expose, there are too many errors, omissions, and worse deficiencies too ignore, such as, for example, the fact that the EIR/DEIR doesn't even address inconsistencies with the Rise SEC filings or address the risks they admit to the SEC but ignore in the EIR/DEIR data. These concerns are magnified by the fact that the EIR/DEIR claims and mitigation promises are financially infeasible for Rise (or the kind of gambler to whom it may flip this project the Rise SEC filings admit being high risk), as I demonstrate in my four Objections and Exhibits A and B. And that is the key point these mine proponents and EIR/DEIR keep missing from the many objections in the record (see my Table of Incorporated by Reference Objections): this mine Project is a dangerous and speculative gamble without adequate proof and

information assuring us potential victims of environmental and other safety and feasible mitigation, and that at least puts the entire local community at risk (and more, we contend, since, for example, all that dangerous dewatered mine water goes somewhere else down the Wolf Creek with hexavalent chromium and anything else not eliminated by the questionable and insufficiently proven DEIR/EIR "treatment.")

Anyone who so admits such risks of the unknown to the SEC, but omits or misstates them in the DEIR/EIR, should not be trusted and approved for such hazardous and impactful mining in our suburban community, and, where (as here) the EIR/DEIR fails its burden of proof with common sense and good faith reasoned analysis, they especially should not be given the benefit of a massive doubt, particularly on top of the risks inherent for anyone reopening this long abandoned and flooded mine about which too little reliable data is known and lacking sufficient investigation and evaluation to avoid inconvenient truths that might obstruct their noncompliant speculations, false assumptions, and other wishful thinking. Stated another way, as admitted in the Rise SEC filings (see Exhibit B), this Project is a massive gamble with huge risks to the locals that are not identified or mitigated in the EIR/DEIR, and there is no reason for anyone to trust Rise or any other gambler who is waiting behind the curtain to replace Rise (or control Rise with the funding Rise lacks to do what it states in the DEIR/EIR data). That reality is one reason why so many local realtors join us locals is rejecting the DEIR/EIR and doubting Rise and its official approvers, not just because of disbelief or dispute of the environmental impacts, but as to the whole of the DEIR/EIR and its many omissions and lack of sufficient, reliable, or credible proof to counter the massive objections by us local potential victims and others. See Exhibit A and the Nevada County Association of Realtors Group Letter 15. We potential victims advocate the old saying that applies here: "better to be safe than sorry," especially on such a wild, uninformed gamble on an. at best, admittedly financially unreliable miner (e.g., SEC filings in Exhibit B) with such a credibility problem for not adequately both such admitted risks and our many unaddressed objections. See, e.g., my objections above to EIR/DEIR tactics like "hide the ball," "bait and switch," and false equivalences. See, e.g., section I.A.1, d(viii) and I.F above.

For example, at 2-6 the EIR asserts (and we dispute) that "the possibility of non-compliance with the conditions of approval or mitigation measures is not considered an environmental impact under CEQA. (But see my objections above and elsewhere that we must be allowed to counter and rebut errors, omissions, and noncompliance in the EIR/DEIR, not just because of CEQA but also because those incorrect and worse assertions and omissions cannot be allowed to stand unrebutted as a false basis for approval, especially under these circumstances and considering the failure by Rise to address in the DEIR/EIR what even it admits in its SEC filings, as noted in Exhibit B.) See, e.g., Richmond v. Chevron, directly countering that incorrect EIR/DEIR claim, as discussed in section I. D above. **First,** no local property owner at risk, and no neutral/reality based buyer, broker, appraiser, or mortgage lender, will accept the DEIR/EIR or County Economic Report as correct, complete, or credible against either the objections or "common sense" (see, eg, Exhibits A and B), since, for example, the surface owners cannot expect buyers to assume the risk of even admitted 24/7/365 blasting, tunneling, and other mining beneath the 2585-acre underground mine, toxic chemical use (e.g., hexavalent chromium) through constant dewatering to be flushed down the Wolf Creek with unproven and disputed cleaning process, ground water depletion 24/7/365 for 80 years, and many other objectionable activities, not to mention the risks admitted in the Rise SEC filings that are not addressed adequately (or often at all) in the DEIR/EIR, such as its inability to afford to accomplish

proposed mitigations, even its proposed well mitigation when applied to the actual number of existing wells and new wells at risk. That reality is certain to depress property values and market conditions, especially above or around the mine, as well as elsewhere (eg, wherever the polluted dewatering water goes to unsuspecting NID customers when it is flushed down the Wolf Creek), just as a matter of *Gray* case "common sense" (which is generally lacking in the DEIR/EIR and so far in its approval process.) **Second,** as described above and in many objections, there is no adequate legal or even equitable remedy for us local victims when the obvious predicted realities are exposed by the intolerable and uncorrectable harms we reasonably expect to suffer, as described in all the many objections. *Keystone and Varjabedian* recognize our rights and claims, but how could we expect to recover for actionable conduct by a Canadian miner with such admittedly uncertain (at best) financial resources revealed in its SEC filings (Exhibit B). **Third,** this is a private project for the profit of a foreign miner and its speculator/investors with no net local benefit to justify these risks and problems. See Exhibit A and DEIR Objection 254 #4. Stated another way, why would our local government risk gambling away our community health, welfare, property values, environment, and way of life without more reasonable assurances of safety and legal compliance with applicable law and more sufficient, reliable, and feasible mitigations?

Speaking of a lack of "common sense" (*Gray*), the disputed EIR/DEIR answer to such objections is even more absurd. The EIR claims (at 2-6) (without citing any authority) that we victims should tolerate noncompliance with "approval or mitigation measures," permits, or applicable law, then trusting the County to revoke the use or other permits for various reasons, including those which our many objections contend would exist at the start of the EIR's contemplated operations and mining. My long experience with bankrupt or failed underground mines (section I.A.2 and DEIR Objection 254 #1) demonstrates that such noncompliance and violations only become visible when there is a visible crisis (or a whistle blower) impact that expose them when it's too late for the local victims except to enforce legal claims for damages, which recovery prospect are likely disappointing for a miner with the Exhibit B financial condition and the ability, if it chooses to do so, to abandon the mine retreat to Canada, as many others have done before, which is why there are so many abandoned California mines on the EPA clean up list. In such other cases, history and my experience teach that, when and if the government finally does the right thing to stop what it should never have permitted in the first place, such other miners have either (i) used bankruptcy in the US or in its home country (e.g., seeking Chapter 15 in the US to require deference to that foreign insolvency proceeding) to disappoint its creditors and stall or evade its obligations, or (ii) abandoned mining and fled to its homeland to defend against victims on a more favorable basis than would be likely in the US. The naïve and disputed view of the EIR is that somehow stopping the mining solves the local victims' problems, which is absurd when the miner's only "valuable" asset is that doomed mine. The inevitable result of allowing financially irresponsible miners to gamble at the local victims' risk is to leave the victims and their community devastated without any meaningful remedy, adding another toxic mess to the more than 40,000 such abandoned California mines om the EPA cleanup list.

On page 2-6 the EIR lists six alternative grounds for revoking the mine's permits under County Code L-II 5.11, most of which the many meritorious objections demonstrate already will either exist at the start of the mining or which seem inevitable during the operations. Why approve a project that begins in violation? The least shameful of those six grounds for revoking a permit (#6: changing circumstances that would have prevented the permit from being granted at

the outset) is the one that the County should insert in the permits to protect serious predictable threats and impacts from becoming actual disasters. Wise officials gambling on reopening such dangerous, (at best) uncertain, and disputed mines approved without reliable data, investigation, and "good faith reasoned analysis" and "common sense," should require independent inspections and re-evaluations comprehensively as a condition to the commencement of mining after the flooded mine is dewatered and prepared for operation. If as the objections predict, that reality check proves the EIR/DEIR wrong and noncompliant and the mine too dangerous to "public health, safety, and welfare." Also, the official "monitoring" of the mine cannot just be for the few wells and property along East Bennett (as now) but must involve monitoring of the whole 2585-acre underground mine for the protection of the thousands of surface residents above and around that underground mine with either exiting wells or future wells, as is our property right. See sections I. C, D, E, and F and DEIR Objection 254 #'s 3.D, E, R, M, and N, 5 and 6. See NID Agency 10 as to the WSA and my objections to EIR Responses Ind.254-16 and 17.

G. Objections To Master Response 4—Cleanup Project (Centennial) Is A Separate Project Under CEQA (EIR at 2-7).

My four Objections cite contrary authority, evidence, and arguments that distinguish and dispute the arguments cited in this EIR Master Response. See, e.g., sections I.A.1.d and I.B, as well as my Table of Incorporations by Reference Objections and Exhibit D, also proving that Centennial is part of the project. Even though the Centennial site work may have been designed to be separable, it is part of the same CEQA project. Id. That is a legal argument, but apparently the EIR has only considered (as is too often the case) the disputed Rise side of that argument lacking sufficient authority. County approval of that EIR Centennial mistake would just means that a court will have to correct that incorrect EIR/DEIR position, leaving whatever happens in the meantime to be a mess that the County ultimately will have to correct. Also, as admitted by Rise in its SEC filings (see Exhibit B and DEIR Objection #2), it is not economically feasible for Rise to accomplish the Centennial site clean-up, and it is hard to imagine anyone else assuming that obligation. The disputed and noncompliant EIR does not even attempt to answer the key question: What happens to the environment when Rise begins the clean-up, makes a mess, and then abandons the clean-up when it has achieved what it can from the adjacent underground mine? According to the NSAQMD Agency Letters 11 and 12, once the disputed Centennial work begins not even NID water rationing in droughts can stop the frequent daily watering of fugitive dust full of asbestos and other dangerous air pollution toxins, as discussed in section I above, including as reasons for more new wells by us surface owners above and around the 2585-acre underground mine, since during NID water rationing the mine's wasteful water needs priority to save us from its asbestos and other air pollution. In my long experience, such failed clean-ups tend to make things worse for the neighbors, not better.

More importantly, it is irrefutable and admitted by Rise and the EIR (eg, at 2-7) that the Centennial mine toxins for clean-up include lead, arsenic, mercury, and other dangers. It is also irrefutable and admitted by Rise in its SEC filings (Exhibit B) that no one really knows the dangerous conditions that now exist in the long flooded underground mine or in the new proposed 76 miles of tunneling and mining. One of many key flaws in the DEIR/EIR is why do they assume and gamble (without proof) that the underground mine is not also contaminated with similar toxins as came from the Centennial site? Stated another way, what happens when Rise dewaters the mine, and it proves to have such toxins? If they cannot dump the mine waste on the

Centennial site (making that part of the single Project, if it wasn't already) or dump it on Brunswick (making it into another toxic mess like Centennial, or keep it in the mine as hexavalent chromium cemented shoring, so those toxins mix with the dewatered groundwater flushed down the Wolf Creek, who is going to accept that toxic debris and at what cost? Note, the DEIR/EIR incorrectly assumes that there is a third-party market for such massive debris (eg, 100 trucks daily for 24/7/365 for 80 years). However, no third party that is not a toxic waste dump in commercially viable locations which will accept that toxic debris, much less risk paying for it as so-called "engineered fill," and the EIR/DEIR falsely assumes that even such waste dumps could handle that volume. In any case, the disputed EIR/DEIR economic assumptions assume revenue from such mine waste debris rebranded as "engineered fill," but any such dumps will charge huge prices. See, e.g., section I. E and F above and my objections to EIR Master Responses 8 and 11. Since the DEIR/EIR admit that this Project is not financially viable or feasible if it cannot operate 24/7/365 for 80 years in accordance with its proposed EIR/DEIR manner (which objectors intend to resist), the poor EIR/DEIR admitted financial margins are also not likely to be able to afford toxic dump costs for all those 100 trucks a day 24/7/365 for 80 years and mining cannot continue without some permitted place to dump the mine waste. (Hint: the real reason for using Centennial as the dump part of this single unified Project is that only Centennial won't be charging Rise for dumping. Brunswick expects to absorb some overflow waste, but that is based on the unproven assumption that such waste is not toxic, which seems unlikely given the history and what already exists at the Centennial toxic dump.) See my objections to Master Responses 4 and 9.

As explained in my section I.C above and elsewhere, the EIR's Master Response 4 is not only incorrect, insufficient, and otherwise noncompliant on the merits, but it also is a classic example of the EIR falsely minimizing and misstating objections to evade their merit. However, even by dealing with part of such objections, the EIR makes "significant" major (not minor) additions and other changes (not mere clarifications or amplifications) from the DEIR, although many further changes and additions are still required by CEQA and other applicable law. My due process rights to counter all the false, erroneous, and otherwise deficient statements and omissions in the DEIR/EIR prohibit approval of the EIR without prior compliant revisions and recirculation. Some of the many applications of that reality are illustrated herein, although I do not attempt to restate here all such relevant objections, referring to others as well in my Objections or other objections I incorporate. See my Table of Incorporated by Reference Objections and Exhibit D that also address Centennial impacts, noncompliance, and its integration into the single project. See my objections to EIR Master Responses 4 and 9 and section I.B above.

H. Objections To Master Response 5—Evacuation Zones (EIR at 2-10).

Banner Lava Cap Road is a narrow road (lined with massive trees and with no shoulders) through a substantially populated suburb on Banner Mountain (more than 2500 residents) flagged on all the high fire risk maps. That is the only viable entrance and exit road for much of the Banner Mountain area. When heavy trucks break the road, shutting down constantly to one lane for repairs (for which there is no assured, adequate cost contribution by the mine), that means it becomes one narrow lane already lined with huge trees and dangerous/vulnerable PG&E wires, few through street exits, and no shoulders. Everyone living in those neighborhoods worries, as the fire authorities have confirmed, that we are already exposed to excessive risk of

another Paradise type fire disaster where the jammed single exit route traps us. One of those massive mine trucks stalled or broke down on that narrow single lane could kill hundreds. More trucks would make that worse. Also, fleeing mine workers would make that already bad situation worse. The EIR/DEIR analysis is just ignoring an obvious risk. I believe similar problems exist for many of the relevant roads, but I illustrate this problem with the road I use every day.

As is true for Banner Lava Cap Road, the massive abuse of the other relevant roads also not constructed for such heavy truck traffic 24/7/365 for 80-years will result in frequent closures for repairs. Should a fire or other problem also arise there during such repairs, the evacuations will be seriously impaired and, as in the similar Paradise fire tragedy, people will die. And for what? More profit for Rise shareholders from this private exploitive project that provide no net benefit to our community is not a tolerable justification. See Exhibit A and DEIR Objection 254 #4. I incorporate the many other objections above and in my Table of Incorporated by Reference Objections and Exhibit D dealing with this and related traffic issues, such as the Grass Valley Agency Letter 8, the California Dept. of Transportation Agency Letter 2, and the CEA Objections Group Letters 6-9 and 21.

I. Objections To Master Response 6—Wildfire Impacts (EIR at 2-37).

See my objection to Master Response 5 above and my incorporation of other related objections to counter and dispute this EIR Master Response, including DEIR Objection 254 #7. More importantly, my Objections deal with the risks and impacts from the 24/7/365 dewatering for 80-years, which include, besides subsidence, property value depression, and other threats (also not adequately addressed in the EIR/DEIR), the dangers of such dewatering lowering the ground water level needed for the surface trees and other vegetation owned by thousands of people living above and around the 2585-acre underground mine. See my objections to EIR Master Response 33, where such EIR analysis fails. When such problems happen, the local fire risk is increased substantially (see DEIR Objection 254 #11), and the surface owners and community need to deal somehow with all those dead trees and other vegetation, slain for wasteful 24/7/365 dewatering for 80 years for speculator mining profits. See DEIR Objection 254 #4, describing reasons why I describe this as a no net benefit mine, and further elaborate on that reality throughout section I above. As my Objections show, citing the *Keystone* Supreme Court and other cases (e.g., sections I.E and F; DEIR Objection 254 #'s 3.D, E, F, M, and N, 4, 5, 6 and 14), that depletion of the groundwater for our wells and our surface uses will create a massive liability for the mine in favor of those surface owner victims. See, e.g., Varjabedian v. Madera and other cited authorities. That liability and harm would stop the mine, creating not just another "I told you so mess" for which the approving government will be accountable and burdened for the clean-up, because, by its own admissions (see, e.g., Exhibit B), Rise does not appear to be able to afford to pay for the damages it causes or to remediate the mine when the day of reconning comes for it, especially before it is able to produce gold on a profitable basis, if ever. Indeed, the disputed EIR/DEIR consistently refuse to address objections about its refusal to address what impacts happen to the environment and our health, welfare, and property when the mining stops, as seems likely given the Rise SEC admissions of lacking financial resources (Exhibit B) and the DEIR/EIR's admission (see, e.g., DEIR at 6-12, explaining why the mine is infeasible if it cannot operate 24/7/365 for 80 years as it proposes in the EIR/DEIR, admitting to vulnerability to infeasibility whenever the EIR does not "get its way," which is the resistance

goal of objecting neighbors in protecting their health, welfare, environment, and property from this objectionable mine.

J. Objections To Master Response 7—Location of Future Mining Areas (EIR at 2-43.)

1. Introduction And General Rebuttals To Both the EIR/DEIR's Evasion of Objections And Flaws In the Responses To The Portion of the Objections The EIR Purports To Address (But Fails To Do So Correctly Or Sufficiently).

As explained in my section I.C and I.A.1.c and d. above and elsewhere, the EIR's Master Response 7 is not only incorrect, insufficient, and otherwise noncompliant on the merits, but it also is a classic example of the EIR falsely minimizing and misstating objections to evade their merit, including, **first,** by an incorrect, nonresponsive, and incomplete rewrite/recast/misdirection of my actual objections, leaving material omissions from my objections with no EIR response (and no meritorious excuse for not so responding), and, **second,** by a response still containing errors, omissions, and other noncompliance. However, even by dealing with part of such objections, the EIR makes "significant" major (not minor) "new" additions and other changes (not mere "clarifications" or "amplifications" as the EIR incorrectly claims) from the DEIR. (Many further changes and additions are still required by CEQA and other applicable law.) My due process rights to counter all the false, erroneous, and otherwise deficient statements and omissions in the DEIR/EIR prohibit approval of the EIR without prior compliant revisions and recirculation, which, among other things, requires reaggregation in one place of what the disputed EIR disaggregated and scattered through the main text, Master Responses in this section II (based on my foundation of law and facts in section I), and individual Responses (see my counters in section III below). Some of the many applications of that reality are illustrated herein, although I do not attempt to restate here all such relevant objections, referring to others as well throughout my four Objections or other objections I incorporate through my Table of Incorporated by Reference Objections.

At the most general level, my Objections (including Exhibits A and B) and those of others I incorporate complain correctly that the bulk of the DEIR is focused on the problems associated with Rise's wholly owned property (i.e., the Brunswick and Centennial sites) and the few wells downhill in the small, also impacted area along East Bennett Road. Those many DEIR objections (so improperly diminished by the EIR) largely omit any serious attempt to comply with CEQA as to the 2585-acre underground mine itself and, more importantly, the impact of the DEIR/EIR mining on the surface area owned by thousands of objecting potential victims like me living on or using the surface above and around that 2585-acre underground mine. (From the perspective of what is EIR "significant new information" requiring revision and recirculation of the DEIR, almost everything added by the EIR fits that standard (as properly interpreted), although such data is often scattered/disaggregated among text on different topics and in different Master Responses and Responses, where in isolation it may be less obvious as to its newness and significance. Instead of dealing with all of those ignored victim objections, the inadequate and worse EIR reduces those objections to being instead narrowed complaints about (i) the failure of the DEIR to "evaluate the project's proposed underground mining operations within the entire mineral rights area," (ii) the inadequate DEIR "groundwater modeling," and

(iii) the underestimated "vibrations" "associated with underground mining." But see my DEIR Objection 254 (e.g., 3.D, E, F, M, N, 4, 5, 6, 14 and 15), for example, which addresses, including with court case discussions ignored by the DEIR/EIR. Among such many other environmental impact objections and other DEIR rebuttals and objections are, for instance: (i) the violation of the surface owners' competing rights to that same dewatered groundwater flushed away down the Wolf Creek 24/7/365 for 80 years, such as by drying up and polluting undercounted existing wells (noting our expected new wells anticipate the same risks, threats, and impacts) and killing (with dryness) our trees and other surface vegetation (and magnifying local fire hazard and depressing property values), (ii) the violation of such surface owners' rights to "lateral and subjacent support," such as to avoid "subsidence," which requires maintenance of our supporting groundwater (a huge problem already seen in the Central Valley subsidence from groundwater depletion destroying public infrastructure by over-pumping of the groundwater for irrigation), and (iii) the pollution of the groundwater, such as by adding hexavalent chromium to the mine shoring (e.g., Exhibit C and other objections citing many EPA studies and the case study of the poisoning of Hinkley, CA, made infamous in the "Ellen Brockovich" movie). E.g., the Supreme Court's *Keystone* decision affirming our surface owner rights against the underground miner, and the California Supreme Court's decision in *Varjabedian v. Madera*, explaining the application of nuisance, inverse condemnation, and other rights to those like us who are compelled to suffer the kinds of misery which would result from the mistaken EIR approval. See DEIR Objections 254 (e.g., 3.N, 4, and 14) and 255, as well as Exhibit A and other section I authorities. Also see my Exhibit A and Objection 255 addressed how this EIR mining menace depressed surface property values, and explaining how this is not just about a miner's misuse of its own property, like the Brunswick and Centennial sites, but rather is a blatant violation of the surface owners' competing property rights, noting authorities confirming that such underground mining rights are for minerals, not the groundwater that the mine wastes in dewatering, even during unprecedented climate change droughts and chronic dryness ignored by the DEIR/EIR (still incorrectly denying climate change and drought threats as too speculative to merit any response, ignoring 2018 Guidelines Amendments Explanation and other authorities discussed in section I.C above. Indeed, as my four Objections note, it is worse than absurd for the DEIR/EIR to seek credit for objectionable dewatering on the theory that it is bringing such ground water to the surface, since that offers no local benefit because that water is flushed away somewhere else down the Wolf Creek. As the court explained in *Varjabedian*, such disproportionate impacts on victims like us for real or (as here) imagined general civic benefits creates inverse condemnation, nuisance, and other claims, even without considering our applicable surface property rights as acknowledged by *Keystone*.

2. The EIR/DEIR Erroneously Claims To Have Adequately Evaluated the Groundwater Effects from Underground Mining (EIR at 2-43).

To make major (but still deficient changes) without public scrutiny and debate before County approval hearings, the EIR cites what it claims to be "an enforceable condition of approval that will limit the area of permitted underground mining to a smaller area within the mineral rights area (shown on deficient maps A101, A201, and A202, which do not show the surface streets or other landmarks we need to locate our homes and businesses above and around the 2585-acre underground mine) and will also prohibit blasting closer than 500 feet below ground. [Note that the Rise SEC 10K filing admits our

exclusive surface property rights extend down 200 feet with other rights, such as to groundwater, going all the way down. See DEIR Objection 254 #2 and Exhibit B hereto.] The disputed EIR (at 2/44) also requires a deficient and noncompliant Project "Ground Water Monitoring Plan (GMP) from "project groundwater monitoring wells collected on a quarterly basis and reported to the Nevada County [but not to us surface owners and other potential victims!] in accordance with the hugely disputed Mitigation Measure 4.8-2(b) if and when there is a determination of a significant impact pursuant to Nevada County General Plan Policy 17.12 (again a trust and credibility debate). See massive objections in the record from many parties to such EIRDEIR provisions and deficient mitigation (e.g., undercounted existing wells, no mitigation for new wells, misplaced monitoring sites, etc.) See my Table of Incorporated by Reference Objections, such as for these impact disputes the California Dept. of Parks And Recreation, Agency 1, the California Dept. of Fish And Wildlife Agency 3, the Grass Valley Agency 8, NID Agency 10, Bear Yuba Land Trust Group 2, the California Native Plant Society-Redbud Chapter Group 5, the CEA Objections Group 6-9 and 21, Friends of Banner Mountain Group 11 and 12, the Rudder Law Group- Group 20, the South Yuba River Citizens League Group 25, the Sierra Fund Group 26, the Wells Coalition Group 27/28, and the Wolf Creek Community Alliance Group 29-32, as well as in other objections the record many impacted individual like me seeking to protect their health, welfare, property, environment, and way of life.

Even worse, even if Rise (or its successor in a flip transfer) admits to a problem, the EIR mitigation solution in Mitigation Measure 4.8-2(a) to is trust Rise (or its successor hiding behind the curtain) to do what its SEC filings admit that it does not have the financial capacity to do, even if it were willing and trusted to do so: provide replacement water to "significantly impacted" well users. For all the reasons cited in the controlling *Gray* mining decision rejecting a similar EIR for comparable, deficient mitigation of well groundwater impacts, this significant new mitigation is material, unclear, deficient, insufficient, and otherwise noncompliant. Therefore, at a minimum the disputed DEIR must be revised and recirculated and subject to debate, not just as usual about what Rise is doing wrong with its property to harm others (see *Varjabedain*), but what Rise is doing to what us surface owners and users themselves own. See *Keystone.* Also note that, besides being economically infeasible for Rise (and thus unreliable) and objectionable in many other ways as insufficient, unreliable, and a noncompliant mitigation, this disputed EIR only addresses a portion of the existing well problems, not the other environmental impacts, such as our surface owners' rights to drill new wells to compete for the groundwater that we own, hoping, for example, to avoid the death of our trees and vegetation by lowering the water table and depriving them of groundwater owned by those impacted surface users (and consequent fire hazards from killing our forest for the benefit of the shareholder profits of a Canadian miner whose SEC filings [e.g., Exhibit B] admit it cannot afford even the insufficient mitigation the EIR now proposes.) This is not just a factual dispute, this also is a legal dispute that the impacted surface owners have unique rights to enforce, since it is also their groundwater, rights, and property at issue and their rights to access their groundwater with new wells. See, e.g., section I.C, D, E, and F .

Besides the fact that such mitigation is deficient, unreliable, and legally impermissible (eg, a taking of surface owner groundwater and violation of other surface owner rights and property, depressing property values by inverse condemnation, nuisance, conversion, and worse), the proposed, objectionable, and deficient Groundwater Mitigation

Plan is unclear, uncertain, and not sufficient or adequately enforceable by us impacted surface victims. Does the County really want to force the thousands of impacted surface owners to exercise legal, law reform, and political remedies to protect their rights and create a better and more compliant mitigation plan (assuming, for the sake of argument, that somehow, we cannot stop the mining and compel remediation)? See the *Gray mining* case study for what to expect here. While some might argue about whether the County can lawfully "take" and give away to Rise (or its successor), as the EIR/DEIR well mitigation proposes, at least the first 10% of our relevant well groundwater owned by the public, a proposition we would dispute, there is no legal basis for the County to give away the groundwater owned by us surface owners and users above and around the 2585-acre underground mine, whether for existing wells the EIR recognizes, the many uncounted existing wells ignored by the EIR, or even more new wells that should be expected as a defense to the foreseeable climate change droughts and NID rationing, which the EIR mining makes worse by having to waste NID water frequently every day 24/7/365 to suppress lethal fugitive dust, according to the NSAQMD Agency 12 at 12, without regard to NID drought rationing, because it is more important to avoid breathing asbestos and other toxins than to have our fair share of NID water (therefore, assuring many victims will drill new wells to compensate for what the EIR mining is allowed to waste supposedly to save us from the menace the EIR mining created to threaten us. See my Objections and as to the property values Exhibit B, as well as the issues for nuisance, inverse condemnation, and other applicable causes of action that property owners may assert. See section I.E and F above, as well as my discussion of the County General Plan 17.12. Also, such realities are contrary to the County Economic Report's incorrectly assuming the correctness, completeness, and sufficiency of the DEIR (see Exhibit A), which assumption is contrary not only to this disputed EIR provision but also to the County's own adverse consequences.

The time and place for the full surface owner rights' battle over this undisclosed Groundwater Monitoring Plan (and noncompliant Mitigation Measure 4.8-2(a)) may best done when it is finalized, because no potential local victims can possible delegate that critical protection to the official who until now (despite massive objections to the DEIR) insisted on ignoring the relevant rights and interests of us surface owners and users above and around the 2585-acre underground mine. At present, for example, we do not know the number, location, depth, and other monitoring protections. Also, we do not know the consequences of concentrating the blasting, mining, and other operations 24/7/365 for 80 years in the smaller mapped area described above (i.e., A101, A201, and A202). It is not legally possible under these circumstances for the County not to insist on all the relevant terms and conditions of such a GWP in the EIR, especially since nothing about this vague mitigation is even affordable by Rise as admitted in its SEC filings (see Exhibit B and my Objection 254 #2). See generally, my objections herein to EIR Master Responses 13, 14 15, 16, 29, and for further background 7, 8, 33, 35, and 36 as well as to the disputed Responses to my relevant DEIR Objection 254 sections below.

3. **I Dispute Blasting Vibration And Noise Claims in the EIR/DEIR, Plus There Are More Objections That Are Not Addressed in the EIR/DEIR, Making the Disputed EIR's Grossly Overbroad Statement Into False Claims (EIR at 2-44-45) That DEIR 4.8 and 4.10 "adequately evaluates the potential environmental effects that could result from the project's reasonably**

anticipated underground mining operations, including effects to groundwater and noise and vibration" that with mitigation become "less than significant." (I also dispute the DEIR/EIR purported mitigations, as do my incorporated objections, and such mitigations are rarely substantiated or even attempted to be supported by any "good faith reasoned analysis" with "common sense" in the disputed EIR/DEIR.)

I incorporate the aforementioned objections and others which apply with at least equal force to these unsubstantiated and disputed claims of the EIR/DEIR, which again miss or evade many specific objections, while also unfairly misstating or minimizing broader and more fundamental objections. See I.E.6 above, my DEIR Objection 254 #9, my objections in section III below to EIR's Ind. 254-77-78 "Responses" thereto, and relevant Table of Incorporated by Reference Objections. Note, for example, that there are many noise and vibration issues not addressed by the EIR or DEIR. For example, they ignore that such blasting and mining is implicated in the groundwater depletion and subsidence arguments of the surface owners and users above the 2585-acre underground mine, not to mention adding to even the stigma creating property value depression when prospective buyers learn about the blasting, dewatering, tunneling, mining, and other mining activities underneath their homes. Here, as elsewhere, the EIR cannot credibly claim adequate mitigation of risks, threats, and harms that it does not even acknowledge or attempt to analyze in compliance with CEQA and other applicable law. For example, Rise admits in its SEC filings (Exhibit B and DEIR Objection 254 #2) many relevant uncertainties and lack of adequate study of the long flooded and closed mine (1956). See *Richmond v. Chevron* allowing such SEC admissions to enable objectors to defeat that eir. That means the disputed EIR/DEIR is just speculating (with unsubstantiated assumptions/opinions) and gambling at us surface owner neighbors' risk on the conditions that exist in and around the 2585-acre underground mine. It is not responsible for government to gamble on the adequacy of mitigation guesses about unknown conditions. Moreover, as demonstrated above in my DEIR Objection 254, the surface and surrounding surface properties have personal rights to subjacent and lateral support as well as to groundwater to prevent subsidence and other problems ignored by the EIR/DEIR. See the *Supreme Court's above discussed Keystone* decision, my Objections 254 #'s generally, my objections herein to EIR Master Responses 13, 14 15, 16, 29 (and for further background my objections to 7, 8, 33, 35, and 36.)

K. Objection To Master Response 8—Mine Waste Characterization (EIR at 2-45).

Once again as disputed herein (e.g., this section #'s 1(b), (c), (d), 2, 3, and 4, section I.A.1.d(viii) and I.F.5, and DEIR Objection #3.E and my section III objections to the EIR's "Responses" thereto, including at Ind. 254-20 to 33), the noncompliant EIR attempts to evade objections by mischaracterizing them and only dealing with parts of objections to attempt to leap to unsubstantiated and overbroad conclusions that are disputed and false. For example, the mine waste issues are not just about water quality, but include many other things, such as asbestos and other air pollution threats that require frequent daily watering of toxic fugitive dust (see NSAQMD Agency Letters 12 and 11 discussed above at section I.E.7 and elsewhere) and water sufficiency in the local community, including for us surface owners above and around the 2585-acre underground mine. Also, as disputed above, the EIR attempts to start the mine and test compliance afterwards, improperly deferring CEQA compliance when it will be too late to cure

any risks, threats, or harms already done in the process. See section I.C and D discussing the authorities preventing such deferrals. The goal of CEQA and the requirements of applicable law are not to force us potential victims to guess about such dangers, but to know them in advance of the commencement of the project. See many supporting authorities in my four Objections and others proving that point. For example, the EIR's disputed concept of mitigation is to dewater and otherwise prepare the mine in advance of such initial mitigation for the "engineered fill and cemented paste backfill" (see the disputed toxic hexavalent chromium menace discussed at e.g., Objection 254 #'s 3.B, C, E, G, H, 5, and 7), which itself creates objectionable problems, and then (when much harm is already done) to "submit RoWD and receive an approved Waste Discharge Requirement (WDR) from the CVRWQCB" prior to Mitigation Measure DEIR 4.8-1(d) and (e). **See disputed plan at DEIR 2-46 that "underground exploration would take place after the mine dewatering is complete."** But see section I.E,4 and authorities forbidding such deferred analysis, such as, e.g., *Richmond v. Chevron and Gray.*

Once again, the EIR (like the DEIR) ignores risks and objections to make the disputed claim (at 2-47) that "the DEIR demonstrates that the engineered fill and cement paste backfill will likely be considered Group C mining waste" (i.e., what complies with water quality plan standards, as distinguished from Group A hazardous waste posing a significant threat to water quality or Group B hazardous waste with lower risks). See such relevant objections to these disputed allegations, which are not proven and also ignore the hexavalent chromium issues, including my objections before to EIR Response to Comment Ind.254-1 below and others cited (e.g., DEIR Objection 254 #'s 3.A, B, C, E, G, H, 7, and 15, and above sections I.F.1 and E.4). Again, the DEIR/EIR credibility question arises again, since the admitted lack of sufficient investigation (e.g., Rise SEC filings in Exhibit A and DEIR Objection 2544 #2) could be a dodge or evasion to enable the EIR/DEIR to allow them to speculate without having to deal with the facts that would be shown by an adequate investigation. Also consider the discussion in section I.A,1.a(iii) above and elsewhere in objections demonstrating that such "engineered fill" is often just "mine waste" rebranded and that is problematic in many ways. Once again, the EIR/DEIR is forcing us potential victims to suffer what amounts to a self-interested gamble by the EIR miner (and whoever in government supports that impact) against us local resident voters who will suffer when the harmful reality becomes irrefutable as the harms become clearer. See DEIR Objection 254 #4 discussing the no benefit mine issues and my objections to the EIR Response thereto at Ind. 254-54 to 65. Instead of following the old wisdom of it being better to be safe than sorry, it seems the EIR/DEIR is forcing the risk of the unknown (or insufficiently proven) on the local victims so that this Canadian miner can reward its shareholders with profits at no net benefit to us local victims, who would suffer involuntarily for their undeserving benefit for any predicted impacts or mitigation failures.

As to the EIR subsection (at 2-47) addressing testing and reporting to CVRWQCB on a continuing basis for 80 years as mining causes changes, we again demonstrate another reason why the character and quality of the miner matters. See also the issues discussed above, but not in the DEIR/EIR, of key regulatory permits expiring long before the 80 years (e.g., some as soon as 5 years), as explained in incorporated objections from the Table of Incorporated Objections or Exhibit D. If, for example, to consider the most favorable possible case for the miner, the miner's testing and reporting is deficient as a matter of "human error" (or worse) that is just careless or negligent (and only coincidentally in favor of the miner's economic interest), not only will everyone locally suffer above and around the mine and along the Wolf Creek path of the flushed dewatering water, but so will the buyers of the toxic material sold by the miner (and their

customers or other victims). Again, mining history (as I can attest) shows that where there is a financial benefit from avoiding Grade A or B admissions, such "human error" (or worse) is too common, and it only is discovered when it is too late, because the victims realize their injuries and the cause. See, eg, the Hinkley, CA/"Erin Brockovich" example and my hexavalent chromium concerns. Since the EIR here cross references to Master Response 11, please also see my and other objections to that part of the EIR as well.

In any event, for many reasons and especially where so little serious investigation and sufficient and quality evaluation admittedly has been done on this long closed and flooded mine, the character and competence of the miner is crucial, and the EIR/DEIR is irresponsible to ignore that issue. Most dangerous occupations with the potential for mass harms like this mining require licenses and background checks (e.g., like the blasting). While that isn't happening here, at least the government decision makers can consider how much benefit of the doubt to allow this miner for what it chooses to refuse to evaluate and investigate properly to assure the safety of its operations and the accuracy and feasibility of its promises and claims. Again, better to be safe than sorry, especially as illustrated in the next subsection addressing some of the toxins present or suspected at the Centennial site, and, because they are present there, which are also expected by potential local victims at the underground mine project as well.

L. Objections To Master Response 9—Historical Mine Waste at Centennial Mine (EIR at 2-48).

As rebutted in my objections to Master Response 4 and elsewhere, Centennial in NOT A SEPARATE PROJECT. See also section I.B and I.A.1.d above. While the disputed EIR adds additional data to the DEIR Objections 254 and 255 on these points, creating again the need for recirculation and new rebuttals by objectors that the EIR seeks to evade (see section I.A.1.c above), the EIR does not cure the problems stated in my Objections and others. See Table of Incorporated by Reference Objections and Exhibit D that address these Centennial issues. I again rely on those objections as to this legal question as to which the EIR is just wrong. The disputed EIR's proposed mitigation also remains insufficient.

M. Objections To Master Response 10—Explosives, Reagents, and Brunswick Fill (EIR at 2-56).

While the EIR adds additional, "significant new information" to the DEIR on these points, creating again the need for revision and recirculation (and new rebuttals by objectors) that the EIR seeks to evade (see section I.A.1.c), the EIR does not cure the problems stated in my Objections and others I incorporate. I again rely on those objections. The proposed mitigations remains insufficient, including because, by omitting and misjudging impacts, the disputed ERI/DEIR cannot possibly mitigation what it ignores in whole (e.g., many feasibility rebuttals, and the right of us surface owners above and around the 2585-acre underground mine to drill and defend new wells that must be mitigated by the EIR) or in significant parts (e.g., hexavalent chromium water and air pollution; and the competing property rights of us surface owners above and around the 2585-acre underground mine.)

However, I note in particular that, instead of doing adequate testing (eg, as to arsenic: "the sampling of these areas of the Brunswick Site is not necessary"; query: says who? On what "good faith reasoned analysis?), the noncompliant DEIR/EIR makes unsubstantiated, self-

interested, and not credible assumptions/opinions about why there is "likely" not a problem with this mine like at the other adjacent mines. See, e.g., DEIR Objection 254 #'s 3.A, B, C, E, G, H, 3.N, 4, 7, and 14; sections I.D, E, and F above; and incorporated objections, such as, for example, the California Dept of Parks And Recreation Agency 1, the CEA Objections Group 6-9 and 21, and the Sierra Fund Group 26. Such disputed EIR/DEIR judgments are wrong (as many objectors contend), and it seems more likely that our community will suffer from arsenic and other toxins disregarded by the miner for the profit of its shareholders. Among the other disputed and insufficient bases for such noncompliant EIR/DEIR speculations, assumptions, and opinions are likely incomplete, unreliable, inaccurate, and unsubstantiated historical records from the period before the mine was closed and flooded in 1956. Should this be litigated, there should be no way that those records should be admissible evidence able to justify the risks the miner (and, if it approves this EIR, the County) can responsibly impose on our local community in such a reckless gamble for no net benefit to our impacted locals. As is usually true with regard to the disputed EIR/DEIR, the proposed mitigation is also insufficient, noncompliant, or worse (e.g., as noted one cannot imagine adequate mitigation for impacts the EIR/DEIR refused to address as required by applicable law.)

N. Objections To Master Response 11—Engineered Fill Utilized And Regional Construction Markets (EIR at 2-59).

Again, the disputed EIR needs to be revised and recirculated (section I.A.1.c) because of material changes (including significant new information, although still disputed, deficient and otherwise noncompliant) to address implicitly admitted flaws in the DEIR and noncompliance as to relevant, significant impacts, such as limiting the "engineered fill" (actually rebranded mine waste; see I.A.1.a(iii)) imagined to be sold as Group C waste (disputed above, such as in my objections to Master Response 8, and, when properly tested and evaluated, just as likely argued to be instead Group A or B, with toxins). See e.g., I.E, and F. While the noncompliant EIR/DEIR chooses to dismiss objections as speculative, unsubstantiated, or otherwise deficient, those standards are far more applicable to the disputed EIR/DEIR than to the objections, and the CEQA disclosure burdens are on the DEIR/EIR, not on the objections, as explained in I.C and D above, and as illustrated in I.E and F. **As explained above (see I.A.1.a(iii)) and in incorporated objections, calling this rebranded "engineered fill" anything but what it is – mine waste—is misleading or worse and not credible.** Again, there is insufficient "good faith reasoned analysis," "common sense," and proof in support of the EIR's disputed speculations, unsubstantiated opinions, assumptions and gambles, Worse, again the disputed EIR attempts to evade revision and recirculation for its material changes by its erroneous argument that they are not "significant new information," but only "clarifications" or "amplifications" (applying a flawed and misinterpreted standard so broad that no one using it would ever have to recirculate such an incorrect EIR again, because any such material change would be magically transformed incorrectly or worse into such a "clarification" or "amplification" just by the EIR asserting that false claim to be true.) See section I.A.1.c. Again, also the disputed EIR (at 2-61) pushed off/deferred to the future another plan (here a "Waste Characterization Plan") instead of dealing with those issues in the disputed EIR where they can be evaluated and disputed by objectors under circumstances forbidden by CEQA. See *Richmond v. Chevron* (discussed at I.D.3) and sections I.C, D, E, and F. The disputed EIR's approach is too often saying, in effect, "there're some objections, so in the future we'll do a plan to resolve those objections in ways that the

regulators will find sufficient (i.e., 'trust us' until later, as the saying goes, "when we're asking for forgiveness more than for permission"). Therefore, the EIR seeks approvals now based on our unsubstantiated its aspirations for disputed, noncompliant, and deficient mitigations that the EIR defers but expects to reduce impacts (many ignored or noncompliantly addressed) to be less than "significant" (by the disputed EIR interpretation). See *Richmond v. Chevron* (discussed at I.D.3) and sections I.C, D, E, and F. Also, note that even the admitted mitigations are often infeasible both on the merits and because of all the many reasons to doubt Rise could accomplish even its admitted mitigations (as distinct from others that should be required) based on its admitted lack of sufficient financial resources. See, e.g., Exhibit B and Objection 254 #2.)

As to the technical issues, I defer to the more expert objectors who have made persuasive arguments against the disputed claims in the DEIR/EIR on this topic. See, e.g., Table of Incorporated by Reference Objections and those specific ones cited throughout section I. However, I note that, just as the sellers of property impacted by the mine must disclose to potential buyers such risks, threats, and problems, mine customers offered such disputed "engineered fill" (aka mine waste) from the uncertain conditions in the mine may also have disclosure concerns, especially if they fear having to deal with their own customers and local governments more cautious and careful than the EIR and anyone mistakenly approving it. The EIR incorrectly just assumes the miner can sell such disputed fill, because the noncompliant EIR/DEIR imagines that it is "likely" to be "clean" and in compliance with all applicable laws and regulations. If there are unresolved questions being litigated on that subject and if the mine customers decline to assume such risks that any experts and credible objectors refuse to accept, where will the miner dump such suspect, toxic mine waste/debris rebranded as "engineered fill"?

If, as many (like me) may assume, the miner will ultimately have to dispose of waste in a toxic waste dump, then the EIR miner will be not paid for the waste, but instead will have to pay the dump, changing the mine's vulnerable economics, as admitted at DEIR 6-14, where the whole project becomes economically infeasible if the mine cannot operate as it wishes 24/7/365 for 80 years, which many objecting neighbors are committed to resisting. As discussed in Exhibit B and DEIR Objection 254 #2, Rise's SEC filings admit a financial conditions where such chronic payments for toxic waste dumping do not seem feasible. In the short term, Rise no doubt would continue to attempt to obtain permission it still lacks to add to the toxic burdens at the Centennial site, but that too may be challenged and that dependence undercuts its disputed claim for Centennial to be treated as a separate project. See section I.B. Stated another way, what the disputed EIR/DEIR incorrectly imagines in is a market for "clean" "engineered fill," but the EIR/DEIR does not address (or mitigate) the risks, impacts, and mitigations in a market that is not so receptive to such risks (like objectors' fear) that this may not be such "clean engineered fill." The EIR/DEIR's noncompliant answer to all such disputes is to dismiss the objections as "speculation" or otherwise deficient, but it's the EIR/DEIR that is far more guilty of speculation, unsubstantiated opinions, and false assumption, which must be a bigger problem for the EIR/DEIR, since they have the burden of proof (section I.A,1.b) with "common sense" "good faith reasoned analysis" (**e.g., Gray, Banning, Vineyard, and Costa Mesa**) generally lacking in the EIR/DEIR.

O. Objections To Master Response 12—Chemical Dust Stabilizers (EIR at 2-62).

As to the technical issues, I defer to the more expert objectors who have made persuasive arguments I incorporate against the disputed claims in the DEIR/EIR on this topic.

See my Table of Incorporated by Reference Objections and Exhibit D, such as NSAQMD Agency 12 and 11, and CEA Objections Group 6-9 and 21, section I.E.7 above, as well as DEIR Objection 254 #3.J and 10. I see no sufficient EIR "good faith reasoned analysis" or "common sense," and nothing as convincing in the EIR claims as in such more persuasive objections. See *Gray, Banning, Vineyard, and Costa Mesa.* Also, again it is better to be safe than sorry, especially since there is not net benefit from the mine to us local potential victims to justify imposing any such risks on us. Also, note how the toxic hexavalent chromium dust not addressed in the DEIR appears without an adequate explanation at the end of the disputed EIR in Appendix R.

P. Objection To Master Response 13—Historic Hydrogeologic Assessments (EIR at 2-63).

By denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such overlooked, understated, or noncompliant impacts. Besides my incorporated water related comments in sections P, Q, R, S, T, AF, AJ, AL, and AM, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. As demonstrated in my Objections and others (as well as even the insufficient area addressed by the EIR/DEIR, which generally ignores the massive impacts and risks confronting us surface owners and users above and around the 2585-acre underground mine in favor of pretending this is just an East Bennett Road issue that the EIR can mitigate), these disputed EIR/DEIR "models" and other conflicting but still deficient "models" are unacceptable and insufficient. See my Table of Incorporated by Reference Objections and Exhibit D, such as California Dept. of Parks And Recreation Agency 1, California Dept. of Fish And Wildlife Agency 3, Grass Valley Agency 8, NID Agency 10, Bear Yuba Land Trust Group 2, CEA Objections Group 6-9 and 21, Friends of Banner Mountain Group 11 and 12, Sierra Steams Institute Group 24, South Yuba River Citizens League Group 25, the Sierra Fund Group 26, the Wells Coalition Group 27/28, And the Wolf Creek Community Alliance Group 29-32, section I.C, D, E and F above, as well as DEIR Objection 254 # 3.D, E, F, M, and N, 4, 5, and 6. especially when applied to the untested and unevaluated areas above or around the 2585-acre underground mine when thousands of us objectors and potential victims live. Also see my objections to the related EIR Master Response 14 below regarding such models. Note that the County Economic Report itself admits there are at least 300 such exiting well properties so at issue, but inadequately even considered by the EIR/DEIR. See Exhibit A, NID Agency 10, and the Wells Coalition Group at 27/28. Likewise, there will be more new and deeper wells drilled by us surface owners above and around the 2585-acre underground mine, which is not speculation or unsubstantiated because I and others are witnesses with evidence of ample motivations caused by this disputed EIR/DEIR.

As a result, the problems here are bigger than the EIR pretends, as such objections demonstrate (see, eg, Exhibit A and my Objections), even before we address elsewhere the many water quality (as distinct from water sufficiency) problems. Again, as a consistent flaw in the disputed DEIR/EIR, instead of properly testing in all the right places, the EIR/DEIR "cherry picks" fewer than necessary locations to study, does some insufficient, deficient, and otherwise flawed studies, produces a disputed and overbroadly applied "model" based on false and

unreliable "assumptions" about the underground conditions that are not directly analyzed, especially in the areas in and around the 2585-acre underground mine which cannot be assumed to be the same as the few areas actually studied and cannot even be assumed to be the same as in the unreliable and incomplete records before the mine closed and flooded in 1956. See what CEQA expects in my section I.C and D, as illustrated in I.E and F.

Recall also that such historical records are incomplete, unsophisticated, and unreliable. Even when the mine shut down and flooded in 1956, there was little concern or knowledge about the environmental impacts at issue and little accountability for those keeping the mining records for indulging their fantasies and wishful thinking instead of sufficient and honest reporting. Rise's SEC filings admit(Exhibit B and DEIR Objection 254 #2) that almost everything in the disputed EIR/DEIR, especially regarding groundwater dewatering, depletion, and quality issues in and around the 2585-acre underground mine, is a speculative gamble with little investigation and reliable data in which this Canadian miner is betting our local groundwater (including water owned by us objectors on the surface) against such unevaluated and unknown conditions and climate change for 24/7/365 dewatering for 80 years, even though the disputed EIR lacks even such flawed data after 2040. Consider, for example, the admissions by Rise in its SEC filings (see, eg, Exhibit B) about how little is known and how much is just a speculative guess by a miner who seems reluctant to investigate because it prefers not to know the inconvenient truths of our objections.

Even as to the smaller mine area addressed by the disputed EIR/DEIR, many disqualifying problems remain, and as to the technical issues on which there is actual data to debate (as distinct from the disputed EIR/DEIR's speculative "models," I also defer to the more expert objectors who have made persuasive arguments I incorporate against the disputed claims in the DEIR/EIR on this topic. I see none of the required "good faith reasoned analysis" or common sense, and nothing as convincing in the disputed EIR claims than in the more persuasive objections, especially since our objections are supported by Rise's own SEC filings. See Exhibit B. Also, again it is better to be safe than sorry, especially since there is no net benefit from the mine to us local potential victims to justify imposing any such risks on us. See also my Objection 254 #4.

As to all of these issues throughout both the inadequately analyzed mine property and 2585-acre underground mine largely ignored in the disputed DEIR/EIR, the deficient and worse mitigation solutions are unsatisfactory or inadequate for many reasons addressed in my and other objections. See disputed DEIR 4.8-2a-c and Appendix G. (Xb). Because the disputed DEIR/EIR fails to provide "good faith reasoned analysis" with "common sense" comprehensively, sufficiently, and correctly, the risks, threats, and harms for that whole relevant area (especially the generally ignored 2585-acre underground mine area), the disputed EIR mitigations must be inadequate and noncompliant with CEQA and other applicable law. i.e., How can the EIR credibly claim to mitigate a problem it chooses to ignore or even to attempt to investigate adequately? Even as to such deficient mitigation aspirations, there is no reason to expect Rise could afford even such flawed mitigation, not to mention the much greater mitigation required to protect the surface owners and users above and around the 2585-acre mine. See section I. C and E, Exhibit B, and Objection 254 #2.

Clearly, in these respects and many others addressed in my and other objections, the disputed DEIR/EIR creates massive credibility issues for itself by pretending this is just an East Bennett Road issue, **especially when even the disputed County Economic Report admits (see Exhibit A) there are at least 300 such other well properties not studied or addressed by the**

DEIR (or, as I and other contend, the EIR) and when it is certain that us surface owners will drill new and deeper wells to protect our homes and forests from climate change and dewatering impacts. The unreliable, deficient, and noncompliant mitigation EIR/DEIR aspirations to provide replacement water are meaningless or worse to a victim when it comes from someone in the financial condition admitted by Rise in its SEC filings (see, eg, Exhibits A and B and my earlier Objections and other incorporated objections). Also see my and other objections to all the many disputed EIR/DEIR groundwater claims, including without limitation Master Responses 14 and 33. See my Table of Incorporated by Reference Objections, such as for these impact disputes the California Dept. of Parks And Recreation, Agency 1, the California Dept. of Fish And Wildlife Agency 3, the Grass Valley Agency 8, NID Agency 10, Bear Yuba Land Trust Group 2, the California Native Plant Society-Redbud Chapter Group 5, the CEA Objections Group 6-9 and 21, Friends of Banner Mountain Group 11 and 12, the Rudder Law Group- Group 20, the South Yuba River Citizens League Group 25, the Sierra Fund Group 26, the Wells Coalition Group 27/28, and the Wolf Creek Community Alliance Group 29-32, as well as in other objections the record many impacted individual like me seeking to protect their health, welfare, property, environment, and way of life.

Among the many disqualifying risks, threats, and harms that would be triggered by the disputed EIR, such groundwater depletion and quality problems pose are among those that cause the worst harm to property values, not just from fear and stigma, but also from direct interference with the property rights of the surface owners above and around the 2585-acre underground mine, whose own groundwater is being flushed away down Wolf Creek 24/7/365 for 80 years of likely climate change dryness and drought. See, e.g., my DEIR Objection 254 (e.g., #'s 3.D, E, F, M, N, 4, 5 and 6) and those incorporated from my Table of Incorporations by Reference Objections, demonstrating how the DEIR only worried about the few wells along East Bennett, while ignoring the many wells above or around the underground mine as if they somehow were not material, the County Economic Report understated those wells at 99 as described in Exhibit A. See also the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session. See the Wells Coalition Group 27/28 objection.

That Union article illustrated another part of the common problem in the DEIR (and now EIR) that they have not addressed at all the actual condition of the long-flooded mine, but instead gamble from old or incomplete and unreliable documents before the mine shut down in 1956. In effect (and contrary to CEQA, see, e.g., section I.C and D, illustrated in I. E and F), Rise is gambling (and forcing us local potential victims to gamble involuntarily) on the unknown and uninvestigated physical conditions of the mine (see Exhibit B and DEIR Objection 254 #2) that will not be known apparently until after the flooded mine is dewatered (a huge, separate environmental impact problem), relying only on (i) such deficient, old documents whose validity, reliability, completeness, and current relevance and accuracy are in dispute, and (ii) alleged and disputed "comparable" studies of other "similar" situations elsewhere that are neither comparable nor similar. **The relevant comparable, however, is the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon**

Gold operations ruined many wells by breaching a water bearing fault-line Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change. See also the Union news discussion of comments by hydrology expert Sol Henson.

As noted in my introduction the disputed EIR chooses to scramble its "Master Responses" relating to objections to groundwater errors, omissions, and abuses (and some others as well) without a unifying Table of Contents at the Master Response level, rather than consolidating them in a more coherent manner. That is usually a sign in eir disputes of a miner seeking to evade confronting serious problems for which the absence of a persuasive response is too obvious, so an exhausting, scrambled confusion is the chosen tactic, instead of consolidated clarity that better reveals those errors, omissions, and flaws and is the only way to attempt the required "good faith reasoned analysis." See, eg, the common and overlapping groundwater issues addressed in scattered, disputed, **direct** Master Responses 13 (Historic Hydrologic Assessments (with deficient maps), 14 (Adequacy of Groundwater Model), 15 (Adequacy of Groundwater Monitoring Wells (with deficient maps and addresses), 16 (Drought and Climate Change), 29 (Near Surface Workings And Subsidence), 33 (Groundwater Dependent Vegetation), 35 (Discharge to South Fork Wolf Creek), and 36 (Flows in South Fork Wolf Creek) or disputed, indirect Master Responses where groundwater issues were mixed with other issues, such as 1 (Quality of Life), 2 (Social and Economic Impacts), 3 (Operator Responsibility), 6 (Wildfire Impacts), 7 (Location of Future Mining Areas, eg, mixing "Potential Groundwater Effects From Underground Mining" with "Blasting, Vibrations, and Noise), 8 (Mine Waste Characterization, eg, mixing Water Code and 80 year dewatering issues with various others), 9 (Historical Mine Waste at Centennial Site), 10 (Explosives, Reagents and Brunswick Fill, eg, mixing toxic materials and mineral processing issues with others), 11 (Engineered Fill Utilized in Local And Regional Construction Markets, eg, mixing mine waste arguments with erroneous discussions of Water Code compliance), 17 (Meteorological Data Used in HRA, eg, diverting hexavalent chromium water pollution issues into air pollution issues, but with unintended useful admissions in Vol. IX, Appendix R, which buries or ignores what should have been disclosed in #'s 17—19 water pollution discussions), 20 (Conservatism of Metal Assumptions, eg, "fugitive dust" not consistent with #'s 17—19 and Appendix , which should deal with hexavalent chromium as a key water pollution issue), 24 (Project Construction Schedule (mixing dewatering with other issues), 29 (Temperature of Mine Water Discharges), 33 (Groundwater Dependent Vegetation), and 39 (Discharge to South Fork Wolf Creek.) See also my Objection 254 #'s 3.D, E, F, M, and N, 5, and 6.

Q. Objections To Master Response 14—Adequacy of Groundwater Model (EIR at 2-73).

By denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such overlooked, understated, or noncompliant impacts. Besides my incorporated water related comments in sections P, Q, R, S, T, AF, AJ, AL, and AM, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute.

I begin here by incorporating sections I.F.2, 3, 4, 5, 7, and 8 and 9, I.E.1 and 4, I.C and D, and I.A.1.d, the foregoing objections to the EIR's Master Response 13, as well as other groundwater objections in this or my other three Objections, incorporated others from my Table of Incorporated by Reference Objections, such as the California Dept. of Parks And Recreation, Agency 1, the California Dept. of Fish And Wildlife Agency 3, the Grass Valley Agency 8, NID Agency 10, Bear Yuba Land Trust Group 2, the California Native Plant Society-Redbud Chapter Group 5, the CEA Objections Group 6-9 and 21, Friends of Banner Mountain Group 11 and 12, the Rudder Law Group- Group 20, the South Yuba River Citizens League Group 25, the Sierra Fund Group 26, the Wells Coalition Group 27/28, and the Wolf Creek Community Alliance Group 29-32, as well as in other objections the record many impacted individual like me seeking to protect their health, welfare, property, environment, and way of life. See also the Nevada Union story on December 15, 2022, "'Without water, my property is worthless:' Well owners want protection from Rise Gold Grass Valley," reporting on the testimony that there were "over 300 properties with wells within 1000 feet of the mines mineral right area" [i.e., including the 2585 acre surface owners above the underground mine], as to which the owners have rights to lateral and subjacent support, including to ground water as demonstrated in the case law cited in my Objections and Exhibit A, but as to which the DEIR and EIR fail to comply with CEQA and other applicable law, as the "Wells Coalition," Tony Lauria, and others complained at that session, following with the Wells Coalition Group 27/28 objection. These authorities and others defeat the EIR/DEIR's disputed, flawed, and misused MINEDW groundwater "model" (Appendix G. X(b)) incorrectly or worse purporting to "predict the projects potential impacts to groundwater" not actually or sufficiently studied.

As noted in the prior objection above and elsewhere, there is no "good faith reasoned analysis" or proof that this disputed EIR "model" applies accurately, reliably, or completely (and with *Gray* "common sense") to the other areas ignored by the disputed EIR. As stated in that Union article on 12/15/22 Rise is gambling (and forcing local victims to gamble involuntarily) on the unknown and unevaluated physical conditions of the mine that will not be known apparently until after the long flooded mine is dewatered (a huge separate environmental impact problem), relying only on such deficient, old documents whose validity, reliability, completeness, and current relevance and accuracy are in dispute and alleged and dispute "comparable" studies of other similar situations elsewhere that are neither comparable nor similar. **The relevant comparable, however, is the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change. See also the Union discussion of comments by hydrology expert Sol Henson.**

While the disputed EIR looks to its disputed and unreliable version of history, what matters is the drier and climate changed future and reality, as addressed in many objections, and recognized not just by applicable California laws but by almost everyone in our community who matters in these disputes. See the importance of climate change explained in the 2018 Guideline Amendments Explanation in section I.C.2. The disputed EIR does not prove that its disputed model is still reliable, valid, and accurate (if it ever was for this area and situation) or will remain valid, reliable, and accurate for 80 years under such 24/7/365 dewatering abuse of the whole

mining operation, especially in new locations around 76 miles of new tunnels in the 2585-acre underground mine competing with thousands of surface owners and users with rights to lateral and subjacent support that include groundwater to prevent subsidence and other environmental impacts. See *Keystone* and *Varjabedian and section I.F.7.* Again, "model" recharge guesses at its East Bennett Road token wells have little, if any, relevance for us surface owners and users whose groundwater is being depleted 24/7/365 for 80 years by the dewatering abuses. Again, such disputed EIR claiming that the model applies accurately in this situation is not proof or "good faith reasoned analysis" with "common sense," and, since EIR/DEIR proposed mitigation is both illusory, unreliable, and unsatisfactory in any event in this case, the County should study closely the inverse condemnation, nuisance and other precedents cited in my Objections. See *Varjabedian* and Objection 254 #'s 3.N, 4, and 14

The fact that the EIR claims its noncompliant and outdated MINEDW and other models (whether from 1998 or 2012 or in use for 30 years, at 2-73) are used by 100 mines around the world (assumed irrelevant for dissimilarities until proven relevant) is much less important than the case study reasons why there are more than 49,000 abandoned and failed California mines in the EPA list that demonstrate how **"mining industry practices"** are no basis for assuming reliability or safety. The horrible mining industry environmental record is never to be considered a standard for environmental compliance. See e.g., # I.D above. "Industry practice" generally in such cases is basically whatever the applicable government allows them "to get away with." This is like making decisions based on the safety claims made by asbestos and tobacco industries, all of which were proven wrong, including in civil damage suits that bankrupted such industries even before they lost their grip on the politicians who finally enacted better safety laws, as what I mean when I mention "law reform." Remember the County is being asked to impose this disputed mine on a massively objecting and resisting local community of potential victims, because their health, welfare, homes, and way of life (not just their property values) could be foolishly gambled away (if approved) by such Canadian miners exploiting our groundwater and other resources and rights for a goal no more beneficial or worthy than speculator/shareholder profits. See Exhibit B and Objection 254 #2 SEC filing excerpts.

Consider the legal and political conflicts that such a flawed model will cause when the abusive dewatering 24/7/365 for 80 years depletes the groundwater in the first 200 feet below the surface above the 2585-acre mine that Rise admits is owned by the surface owners. See section I.F.9. What happens when the defending surface owners sink deeper competing new wells (or join in their neighborhood collective well drilling deeper)? When the surface versus mine owner competition becomes fully engaged, does the County really want the model flaws tested against reality with all those victims saying, "I told you so?" More importantly, does the County want to consider its exposure for its role in giving away the surface owner and users' groundwater to be flushed away down the Wolf Creek (eg, inverse condemnation claims etc.) and leaving massive environmental impacts behind, none of which are addressed in the disputed County Economic Report? See Exhibit A and my other Objections. In any event, the applicable objections are not overcome by the EIR responses to Letter 232, including because that cited history is not proven to be (and is not for climate change and other reasons, including the unreliability of the historical data) predictive of the next 80 years, especially as I demonstrate elsewhere how the disputed ERI/DEIR (ignoring climate change as speculative and the dry years after 2017 in what the dispute EIR/DEIR calls "current") incorrectly alleged groundwater "recharge" for 80 years from that same "current" average rainfall between 1967 and 2017. Moreover, what the EIR cites at 2-74 as its methodology for comparing water levels at the Union Hill Mine, the Brunswick Shaft,

token and nonrepresentative wells, and Wolf Creek flows doesn't prove what the surface owners and users above the 2585-acre underground mine may suffer, especially given the massive 24/7/365 dewatering abuse for 80 years. For example, there is an assumption of groundwater recharge rates based on what happens downhill at those cherrypicked sites, which is not predictive of what happens where I and others live uphill above or around the 2585-acre underground mine, since those downhill test sites may be recharged from many different sources. Because of insufficient investigation as required by CEQA, the EIR/DEIR unsubstantiated assumptions and opinions are just incorrect speculation. Again, the EIR is not offering any credible, "common sense" reason why those of us above or around the 2585-acre mine should feel comforted by anything in the EIR/DEIR considering the patterns and practices of tactical noncompliance (see section I.A.1.d (viii) and I.F.6), especially as to the effect of future and deeper mining. Again, nothing in the history on which the disputed EIR and its models rely addresses the new and different risks created by new and deeper and broader mining in another 76 miles of uncertain conditions into which new tunneling occurs, not to mention the climate change impacts on drier impacts reducing recharge because of less rain in the future. In any event, the tendencies DEIR cited 1984 US Geological Survey study of a small watershed area of "southwestern Nevada County" is not similar or even relevant to this mine dispute here. It's like the EIR/DEIR propounds studies about oranges as if they were similar to apples, i.e., the disputed tactic called "false equivalence." They may both be fruit grown on trees, but little that matters is "similar" or a basis for making predictions for judging the future of an apple from studies of oranges.

Again, at 2-74 the EIR admits it only has old data from 79 wells before 2007 and 30 East Bennett Road properties, none of which matter now and in the next 80 years for predicting the fate of the still undercounted 300 wells the County Economic Report admits (Exhibit A) to exist above or around the 2585-acre underground mine where thousands of us live and have competing groundwater owner rights at least down 200 feet (and we contend further under the circumstances). See Rise SEC 10K admissions in Exhibit B and DEIR Objection 254 #2. Adding a disputed DEIR/EIR "100% margin of error" is pure speculation and not proven to be sufficient for addressing our risks uphill in other places by any "common sense" "good faith reasoned analysis" as required, especially considering the deficient data and many ignored exiting wells, plus all new wells to come, that make the low, starting number a misleading and noncompliant guide when it's doubled. Also remember, as my and other objections demonstrate, all of us surface owners above and around the 2585-acre mine have rights to drill more wells (and vote to change any laws and NID rules) needed to survive in our homes and keep our climate change and drying stress forests from dying and increasing our indisputable fire risks.

What the EIR/DEIR presents is not even a consensus of true and credible/neutral experts addressing comprehensively the risks as to the unique, uncertain, and largely uninvestigated conditions of this particular IM mine, especially the generally ignored 2585-acre underground mine and the new mining along 76 miles of new tunnels into preciously unexplored and deeper area. In a battle of experts, or even when the EIR/DEIR cited experts' reports are read in full (and especially if and when they are cross examined in court) instead of just interpreted with cherrypicked parts of their reports by the EIR/DEIR, the question is not certainty or even (as the EIR prefers to say "likely"), but the level of risk to be legally tolerated or not impacts. Generalizations from what the disputed EIR/DEIR incorrectly calls "similar" (and we objectors consider distinguishable) conditions leave us local potential victims at undue risk. If the County is going to attempt to involuntarily impose on thousands of us locals defending our homes,

property values, and groundwater for no sufficient net public local benefits, the ultimate question becomes what level of risk is tolerable and when *Varjabedian v. Madera* type claims arise for us surface owners with *Keystone* type property rights. What my and other objections demonstrate is that the risk being imposed on us locals is intolerable. Even if the disputed EIR were "probably" or "likely" right (which we dispute and would argue instead that they're too wrong, misguided, and speculative to even be considered "possibly" right, much less "likely"), that would be imposing excessive risk on our locally impacted community, especially compared to the lack of local public benefits. As my and other objections prove with controlling court decisions and other authorities, even if there were somehow sufficient benefits to those living at a safe distance from the mine (which we locals also dispute), approval of this EIR mine would impose on the County the same kind of liability to us disproportionately impacted locals as the California Supreme Court in *Varjabedian* considered necessary for compensating those downwind from a public sewer plant whose suffering was likewise intolerable, as well as other nuisance, inverse condemnation, and other claims discussed in my Objections. See, eg, ***Varjabedian v. Madera*** (1977), 20 Cal. 3d 285 (explaining inverse condemnation and nuisance rights of homeowners downwind of the new sewer treatment plant), and other cases cited in my DEIR Objection 254 at #'s 3.N, 4, and 14.

Remember what everyone's shared experience teaches. Climate change dryness is progressive (even with occasional heavy atmospheric river expectations), which is one of many reasons why the disputed DEIR/EIR focus on disputed history (even if they had the unreliable history correct, which we dispute) does not predict the future even in the short term, much less for 80 years of unprecedented 24/7/365 dewatering and new mining along 76 miles of new and deeper tunnels into unknown conditions. I don't recognize the weather anymore, and it's not only wise, but essential, to listen to the science that teaches us that such dry fate will only get worse progressively during the next 80 years while this mine is so flushing away our precious community groundwater down the Wolf Creek somewhere else and gambling foolishly on outdated and worse recharge and other disputed "model" assumptions. As discussed above and in my and incorporated objections, the purported EIR/DEIR mitigations (eg, Mitigation Measure 4.8-2(b)) are all disputed and either grossly flawed, illusory, or insufficient, especially regarding outdated and disputed groundwater recharge and quality assumptions, particularly as applied to the surface impacts above and around the 2585-acre underground mine. (If the EIR is mistakenly approved, I suspect discovery may prove was one of the reasons why the DEIR/EIR only seriously (but still deficiently) analyzed its wholly owned sites and the adjacent East Bennett Road properties.

There is no sufficient substantiation for disputed claims throughout the DEIR/EIR as if what applied to that nonrepresentative fraction of the mining operation somehow also applied to the 2585-acre underground mining deficiently addressed (or worse) and threatening and impacting the thousands living on the surface above and around that operation with massive depletion and quality impacts of our owned groundwater. Again, as addressed in Exhibits A and B and my Objection 255 and 254, mitigation is not credible if the miner cannot afford it, since it is not then feasible. While the EIR/DEIR incorrectly argue that CEQA does not allow consideration of financial feasibility or miner financial condition (see, e.g., section I.C, Exhibit B and DEIR Objection #2), that miner argument does not apply to such proposed and noncompliant EIR/DEIOR mitigation (much less the other EIR mitigations required for incorrectly ignored significant impacts). See section I.E and I.F. To make a point with less exaggeration for effect than one might imagine compared to the nonsense some project proposals imagine as mitigation,

if a development has a water depletion or quality impact problems under CEQA, the project developer cannot just say, as here, in effect, "don't worry, if necessary the project will build a desalinization plant and solve the problem with ocean water, ignoring [besides legal/regulatory issues] that the developer could not afford to do so and that it would not be economically feasible by its own admitted project financial data.) See section I.C, D, E, and F.

Also, as so demonstrated, consider what small part, if any, of those EIR/DEIR cited studies (and vaguely cited Appendices) dealt with this situation and our conditions, where the underground mining is so impacting so many uniformly objecting surface owners and users. See section I.F.9. In any event, all these disputed EIR/DEIR cited experts and reports are basing their disputed opinions on many erroneous assumptions or disputed information from Rise or about imagined similarity of our mining conditions and circumstances to those in studies of what are distinguishable different mines or even new places in this 2585-acre underground area (e.g., the false equivalence tactic that: (i) the same disputed results/impacts/studies should apply to such underground mining below thousands of competing surface owners and users that apply to mining wholly owned miner Brunswick land; (ii) disputed history predicts recharge and other groundwater issues the future for 80 years despite unprecedented and progressive climate change dryness; and (iii) the studied other mining places are "similar," despite lack of proof by "good faith reasoned analysis" and many common sense" key differences.)

As noted in my introduction, the EIR chooses to scramble it "Master Responses" relating to objections to groundwater errors, omissions, and abuses (and some others as well) without a unifying and informative Table of Contents at the Master Response level, rather than consolidating them in a more coherent manner. That is usually a sign in eir disputes of a miner seeking to evade confronting serious problems for which the absence of a persuasive response is too obvious, so that the miner instead chooses an exhausting, scrambled confusion tactic (section I.A.1.d (viii) and I.F.5) , instead of consolidated clarity that better reveals those errors, omissions, and noncompliance. See, eg, the common and overlapping groundwater issues addressed in scattered, disputed, **direct** Master Responses 13 (Historic Hydrologic Assessments (with deficient maps), 14 (Adequacy of Groundwater Model), 15 (Adequacy of Groundwater Monitoring Wells (with deficient maps and addresses), 16 (Drought and Climate Change), 29 (Near Surface Workings And Subsidence), 33 (Groundwater Dependent Vegetation), 35 (Discharge to South Fork Wolf Creek), and 36 (Flows in South Fork Wolf Creek) or disputed, indirect Master Responses where groundwater issues were mixed with other issues, such as 1 (Quality of Life), 2 (Social and Economic Impacts), 3 (Operator Responsibility), 6 (Wildfire Impacts), 7 (Location of Future Mining Areas, eg, mixing "Potential Groundwater Effects From Underground Mining" with "Blasting, Vibrations, and Noise), 8 (Mine Waste Characterization, eg, mixing Water Code and 80 year dewatering issues with various others), 9 (Historical Mine Waste at Centennial Site), 10 (Explosives, Reagents and Brunswick Fill, eg, mixing toxic materials and mineral processing issues with others), 11 (Engineered Fill Utilized in Local And Regional Construction Markets, eg, mixing mine waste arguments with erroneous discussions of Water Code compliance), 17 (Meteorological Data Used in HRA, eg, diverting hexavalent chromium water pollution issues into air pollution issues, but with unintended useful admissions in Vol. IX, Appendix R, which buries or ignores what should have been disclosed in #'s 17—19 water pollution discussions), 20 (Conservatism of Metal Assumptions, eg, "fugitive dust" not consistent with #'s 17—19 and Appendix , which should deal with hexavalent chromium as a key water pollution issue), 24 (Project Construction Schedule (mixing dewatering with other

issues), 29 (Temperature of Mine Water Discharges) and 39 (Discharge to South Fork Wolf Creek.

R. Objection to Master Response 15 (part 1) –Adequacy of Groundwater Monitoring Wells Comments (at 2-76): New Additions For EIR Health Risk Assessments for Previously Ignored Hexavalent Chromium As An Air Quality Issue (Like The Newly Added Nitrogen Dioxide Impact) But Still Ignoring The More Serious Water Impacts Raised In My Objection 254 As A Water Impact (Remind Rise To Go See Erin Brockovich Again, Following the Court Case About That Water Pollution Killing The Town of Hinkley, CA. And Many of Its Residents.)

1. General Situation Is Not Presented Accurately.

By denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such overlooked, understated, or noncompliant impacts. Besides my incorporated water related comments in sections P, Q, R, S, T, AF, AJ, AL, and AM, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. My objections in these sections rebutting EIR Master Responses to groundwater depletion, quality impacts, and hazardous risks, and other adverse impacts are incorporated here to minimize duplication, although the EIR's substantial duplication incites some illustrative responses here. As so described and as demonstrated in my four Objections and others in my Table of Incorporated by Reference Objections and Exhibit D, the noncompliant EIR/DEIR fails and must be revised and recirculated. See sections I.F as to impacts, I.E as to mitigations, and I.D, C, and A as to CEQA and other authorities.

Thus, for example, the EIR continued to hide its hexavalent chromium menace in obscure places with nonresponsive errors, omissions, and noncompliance, as described herein (see, e.g., section I.F.1), refusing even to address those rationally indisputable threats in the DEIR section 4.7 Hazards And Hazardous Materials' EIR revisions (at 3-69), apparently to attempt to evade the need to revise and recirculate the EIR (see section I.C. Instead, the EIR continues only to mentions hexavalent chromium in discussions of mining techniques (addressed below) with an obscure and outrageous effort to brush off concerns by characterizing the only issue as a non-significant **air quality issue**, **without acknowledging my toxic water pollution/human health threat Objections, supported by massive EPA web posted studies and my cited case study of how hexavalent chromium water pollution killed the town of Hinkley, CA, and many of its residents, as depicted in the movie, "Erin Brockovich." See also below my objections to the two disputed Itasca commentaries attached to the EIR as Volume IX Appendix Q and O [and in Appendix R as to air pollution from CR6 dust], which reveal not only more useful exposures of errors, omissions, and noncompliance in the EIR they are supporting, but they also create inconsistencies with the EIR itself. See section I.F.1 and Exhibit C.**

As noted in my introduction the EIR chooses to scramble it "Master Responses" relating to objections to groundwater errors, omissions, and abuses (and some others as well) without a unifying Table of Contents at the Master Response level, rather than consolidating them in a more coherent manner. That is usually a sign in eir disputes of a miner seeking to evade

confronting serious problems for which the absence of a persuasive response is too obvious, so an exhausting, scrambled confusion is the chosen tactic, instead of consolidate clarity that better reveals those errors, omissions, and flaws. See, eg, the common and overlapping groundwater issues addressed in scattered, disputed, **direct** Master Responses 13 (Historic Hydrologic Assessments (with deficient maps), 14 (Adequacy of Groundwater Model), 15 (Adequacy of Groundwater Monitoring Wells (with deficient maps and addresses), 16 (Drought and Climate Change), 29 (Near Surface Workings And Subsidence), 33 (Groundwater Dependent Vegetation), 35 (Discharge to South Fork Wolf Creek), and 36 (Flows in South Fork Wolf Creek) or disputed, indirect Master Responses where groundwater issues were mixed with other issues, such as 1 (Quality of Life), 2 (Social and Economic Impacts), 3 (Operator Responsibility), 6 (Wildfire Impacts), 7 (Location of Future Mining Areas, eg, mixing "Potential Groundwater Effects From Underground Mining" with "Blasting, Vibrations, and Noise), 8 (Mine Waste Characterization, eg, mixing Water Code and 80 year dewatering issues with various others), 9 (Historical Mine Waste at Centennial Site), 10 (Explosives, Reagents and Brunswick Fill, eg, mixing toxic materials and mineral processing issues with others), 11 (Engineered Fill Utilized in Local And Regional Construction Markets, eg, mixing mine waste arguments with erroneous discussions of Water Code compliance), 17 (Meteorological Data Used in HRA, eg, diverting hexavalent chromium water pollution issues into air pollution issues, but with unintended useful admissions in Vol. IX, Appendix R, which buries or ignores what should have been disclosed in #'s 17—19 water pollution discussions), 20 (Conservatism of Metal Assumptions, eg, "fugitive dust" not consistent with #'s 17—19 and Appendix , which should deal with hexavalent chromium as a key water pollution issue), 24 (Project Construction Schedule (mixing dewatering with other issues), 29 (Temperature of Mine Water Discharges) and 39 (Discharge to South Fork Wolf Creek.

2. The New Air Pollution Dispute Triggered by New Data In the EIR, Still Evading the Bigger Toxic Water Pollution Threat.

Instead of engaging in any reasoned debate and disclosure with the required "common sense" and "good faith reasoned analysis," the disputed EIR attempts evasion by what it admits being new air quality data on this topic (again requiring recirculation for material changes and glaring omissions, as discussed in I.A.1.c). T**he EIR/DEIR continues to ignore my DEIR Objection 254 almost entirely about the adverse water impacts of using hexavalent chromium in the mine. (The EIR also added a new reference to nitrogen dioxide (NO-2), which will be addressed elsewhere in the air quality dispute discussion and unintegrated Appendix R.) See CEQA Guidelines 15088.5. The EIR's disputed, new Health Risk Assessment (the "HRA") is buried at the back of the document in vol. IX Appendix R (a disputed one page memo from DUDEK), which states that the purpose of such memo is "to address the potential health risk associated with exposure to two additional toxic air contaminants (TACs) that were not included in the original analysis of the proposed Idaho-Maryland Project (project), namely hexavalent chromium in cement [for mine shoring in the 2585-acre underground mine below or near thousands of impacted surface residents] and nitrogen dioxide (NO-2) from the combustion of ammonium nitrate fuel oil (ANFO)."**

FIRST, note that this omission was not because the DEIR did not know of the mine's use of that highly toxic hexavalent chromium, because its use in the mine paste was described in a buried back DEIR section discussing the disputed mine shoring process

intended (and grossly failing) to reassure the thousands of surface residents above and around the underground mine about shoring against subsidence and other mining risks. As my DEIR Objection 254 (which this EIR significantly ignores) explained and Exhibit C hereto illustrates, there are many EPA website documents and concerns demonstrating water pollution health impacts requiring this to be a featured headline Hazardous Materials discussion (where it has been wrongly ignored entirely in the DEIR/EIR). SECOND, because this toxin is in the groundwater below objecting surface residents and at least 300 wells (by the still undercount in the County Economic Report—see Exhibit A), this not only poisons humans and their property, but even its stigma depresses property values, and therefore property taxes, among other economic impacts ignored in the County Economic Report, which seems unaware of this hazard popularized in the movie Erin Brockovich about how such hexavalent chromium in the groundwater killed Hinkley, CA, and many of its residents. See Exhibit C. (I suggest that the County's economic analyst do study what happened to property values and taxes in Hinkley.) THIRD, the disputed new EIR air pollution cancer risk discussion is mysterious, about the accuracy and correctness of how it was determined to be below the safety thresholds set by the Northern Sierra Air Quality Management District, but no analysis or mention is made of the water pollution threat. Compare unintegrated Appendices Q and R. Therefore, because none of these material/significant impacts/issues are properly addressed in the noncompliant EIR/DEIR, the EIR must be redone and recirculated for this and other reasons stated in my and other objections. See section I.A.1.c.

This example also illustrates another credibility problem with the EIR/DEIR, and another reason in Exhibit A why it was a mistake for the County Economic Report to accept the EIR/DEIR as if it were true when any cursory reading of my Objections or any of hundreds of other objections to the DEIR would have revealed that the data was materially incorrect, incomplete, and worse. (As the computer people say, garbage in creates garbage out.) Previously in the DEIR, this serious issue was not identified as a hazardous substance problem with lethal human consequences in water (as well as air, which the EIR now incorrectly attempts to address), but instead an unrevealing mention buried in the back where this new Appendix Q cites to it in DEIR page 4.8-47. See Appendix R. That credibility problem is now compounded by a new one, where the EIR evasion is by a technique that is known as the bait and switch, i.e., the EIR briefly adds an insufficient and incorrect discussion (a single short paragraph) about air pollution from hexavalent chromium to distract from the much more serious water pollution, health hazards, and related impacts. See section I.F.1. For example, and this is a key example of another bait and switch in the DEIR/EIR, a discussion of mitigation (eg, Appendix R cites to Mitigation Measure 4.8-2(a)) of the air pollution by hexavalent chromium is not at all satisfactory mitigation of the lethal water pollution by hexavalent chromium that is entirely ignored by the EIR (apart from unheralded Appendix Q, despite my not only discussing that lethal risk in my DEIR Objection 254 (e.g., #'s 3.D, E, F, M and N, 4, 5, 6 and 14), but also by my three minute comment at the public County Planning Department hearing on the DEIR which earned a line in the related "Nevada Union" story.

And what is the environmental comfort to be taken even with the briefly addressed air pollution EIR "reassurance?" Consider what Appendix R says on the hexavalent chromium cancer threat after giving unsubstantiated and disputed air pollution dust estimates: "Hexavalent chromium has inhalation cancer risk and chronic reference

exposure levels, but no acute non-cancer effects are associated with exposure. … Hexavalent chromium and NO-2 were evaluated in the HRA consistent with the methodologies presented in the DEIR. In summary, there would be no change in the cancer impacts with and without mitigation as shown in the DEIR [which ignores the subject and makes this disputed statement incomprehensible, wrong, and worse.]" As to the air pollution impacts remember our experience with asbestos, which had a similar history of prolonged evasion until it became clear through many bankruptcies (in which I was frequently a significant bankruptcy lawyer player) that there were no safe thresholds. See DEIR Objection 254 #'s 3.J and 10.

As to the unaddressed water pollution, again watch the movie again, read the court files on the Hinkley, CA, suits, and then read section I.F.1, Exhibit C hereto, and the many EPA website study horror stories. [The EIR at 2-77 describes how the dewatering process interacts with the blasting and mining underground and states: "Thus, any water that contacts those [underground] components would be present only withing the [2585-acre underground] mine workings and would then be pumped out of the mine workings by the dewatering system and into the clay-lined pond for further water treatment." Note that even if the locals aren't poisoned by the hexavalent chromium in that process, other people downstream by the Wolf Creek may become victims. Note that the hexavalent chromium that killed Hinkley, CA, and many of its people was also held for such processing in clay lined ponds, which didn't work out well for the victims.]

Then read the disputed EIR dismiss my and other objections as nonmaterial or irrelevant to CEQA concerns. The result is not just that revisions and recirculation are essential (section I.A.1.c), but also that the County should begin to share the community doubts about the credibility of the mine's whole EIR process. See Exhibit A and B. When the County Economic Report notes (see Exhibit A hereto) that most real estate brokers believe the environmental impacts are seriously understated and causing depressed property value predictions, this is an example of a rational and informed reason for such opinions; i.e., unlike the EIR/DEIR advocates, anyone at risk of harm from the mine has considered the hundreds of objections like mine that are filled with such objections about the errors, omissions, and insufficiencies in the DEIR/EIR and worse things politely described as credibility problems with the DEIR/EIR. See Nevada County Association of Realtors Group Letter 15.

I mention such credibility concerns because without transparent independent regulatory oversight of all aspects of the mining operation and proposed (and hopefully upgraded and more complete) mitigations, nothing in the disputed EIR/DEIR will be credible to the potential victims like me (much less potential buyers and their mortgage lenders and appraisers. For example, the EIR incorrectly asserts a speculation (at 2-76) without substantiation that: "Mitigation measures are achievable, enforceable, and capable of reducing the Project's impacts." Not only is that EIR noncompliant claim repeatedly proven wrong, but that EIR sentence must be allowed to be rebutted by the admitted facts in its own SEC filings (see Exhibit B and my Objection 254 #2) that Rise cannot afford even the insufficient mitigation it proposes (eg, here at Mitigation Measure 4.8-2, replacement water for depleted or contaminated existing wells, but nothing for new wells), thereby making its statement false that its mitigation is "achievable," "enforceable [by the County, not the victims who then must turn to legal remedies]," or "capable of reducing the Project's impacts." See *Keystone, Varjabedian*, and other cited authorities. This Master

Response incorrectly argues this is just an East Bennett Road problem with at most 30 wells, when the County Economic Report admits there are at least 300 existing wells at risk above and around the 2585-acre underground mine (still an undercount as explained at Exhibit A), totally ignoring the issue of the new wells those of us impacted surface owners above and around the 2585-acre underground mine will be compelled to drill to save our health, welfare, forests, environment, and properties. See section I.F.2, 3, 4, 5, 6, 7, 8, and 9, and (as to mitigation issues) I. D and E. To quote the disputed EIR (at 2-77): "As discussed in the GMP 30 groundwater monitoring wells will be installed at 15 locations. The locations of the monitoring wells are strategically placed between the mining and domestic wells to monitor the potential drawdown extent as the result of mining and assess the potential impact on domestic wells. … Qualified hydrologists [notice they don't say independent and trustworthy] would evaluate the data from groundwater monitoring." There is nothing in the noncompliant EIR/DEIR or the process so far that inspires any confidence by us potential victims that any of this EIR aspirations will be timely achieved as promised by a miner which admits in its SEC filings (Exhibit B and DEIR Objection 254 #2) it lacks the financial resources needed for even such proposed accomplishments, as distinguished from what will ultimately be required by CEQA and applicable law in any future compliant EIR. We local potential victims would insist, among other things, on knowing the plans in detail in advance, not later, plus having on total transparency, data collection and analysis by reliable experts, many more monitoring wells where they matter most (eg, above the 2585-acre underground mine where currently thousands of surface resident objectors and at least 300 wells exist and in the next 80 years many more will follow in reaction to climate change dryness), and much more discussed in this and my other Objections and those of many others. See applicable CEQA prohibitions on deferrals of impact analysis or mitigations, e.g., *Richmond v. Chevron* and section I.C and E.

One last example of credibility problems for the disputed EIR/DEIR (at 2-76) is the delay in planning, disclosure, and mitigation until after approval, as distinguished from after approval and "at least 12 months in advance per Mitigation Measure 4.8-2(a)." Id. Why the delay to set the base level for future decisions? Perhaps (besides the fact that Rise cannot afford to do much of anything on time as admitted in its SEC filings—see Exhibit B and my Objection 254 #2), they are stalling because the EIR admits that: "No groundwater level measurements have been completed since 2007." But the sooner they start investigating/measuring (as CEQA requires), the sooner that they will have to confront the inconvenient truths that their historical models are wrong and noncompliant, preventing the miner and its advocates from ignoring key facts and climate change do not work already, and promise to become more incorrect progressively for the next 80 years of 24/7/365 dewatering and mining, as explained in this and other objections.

3. **The Disputed EIR Also Evades The Hexavalent Chromium Threat by Revealing Discussions of Its Mining Techniques in Volume IX, Appendix Q, That Is Damning Not Only By Its Errors, But Also By Its Material Omissions That Should Have Been Addressed In Its DEIR Section 4.7 The Hazards And Hazardous Materials And EIR Revisions (at 3-69).**

    a. **Illustrating An Example of How the Noncompliant EIR "Hides The Ball" For Hexavalent Chromium Impacts on Groundwater Compounded by**

Deferred Analysis And Mitigation Prohibited by CEQA (see section I.C and E above).

In this and other related Objections I have questioned the credibility of the EIR/DEIR for its continued errors, omission, and other noncompliance in dealing with the foregoing known (and I believe irrefutable at least to require CEQA common sense and good faith reasoned analysis about) hexavalent chromium water pollution impact issues. See, e.g., section I.F.1, I.C and D, and (as to mitigation) I.E), plus Exhibit C; DEIR Objection 254 #'s 3.A, B,C, E, G, H and 7. This portion of my objections attempts to use what "significant new information" the (still noncompliant) EIR has added further to expose those problems and to insist on EIR revisions and recirculation (#I.A.1.c). Before getting into the more technical matters, I direct attention to certain "tactical" EIR additions and revisions to the disputed EIR section 4.8 Hydrology And Water Quality (at 3-70-73) and the addition of the Itasca "Desktop Study of Cemented Paste Backfill" in Volume IX, Appendix Q. While the EIR/DEIR's greatest sins are of omission, I also focus here on what the EIR does say, because in that context it makes the EIR not only grossly deficient but misleading or worse. See section I.A.1.d(viii) addressing improper EIR tactics, such as illustrated herein.

Begin by studying the purportedly insignificant EIR revisions (at 3-72) to DEIR Chapter 4.8 [Hydrology and Water Quality]in the final paragraph of Section 4.8.4 and in the related Mitigation Measure 4.8-2(a), which adds that the miner "shall implement the Groundwater Monitoring Plan (GMP) prepared by Itasca Denver, Inc (February 2021), as approved by the /county. Implementation of the GMP shall be initiated prior to the dewatering of the mine and on an ongoing basis…" That GMP involves "a network of monitoring wells [that] shall be installed to the satisfaction of the Nevada County Environmental Health Department," with "Groundwater level and groundwater quality information ... obtained from the project ground watering monitoring wells and collected on a quarterly basis" and submitted to that Department etc. The revised text of 4.8-1(e) states that: "The applicant shall submit a RoWD and obtain WDRs from the Central Valley RWQCB for construction of the engineered fill areas… prior to initiating any engineered fill placement activities … [with] [p]roof of coverage …provided to the Nevada County Public Works Department." That revision adds that RWQCB "will determine the appropriate mining waste classification" for the engineered fill. "The RoWD must also include a report on the physical and chemical characteristics of the waste, in compliance with Water Code section 13260(k), that could affect its potential to cause pollution or contamination as well as a report that evaluates the potential of the discharged of the mining waste to produce over the long term, acid mine drainage, the discharge or leaching of heavy metals, or the release of other hazardous substances." [That should require disclosure of the hexavalent chromium threat as a hazardous substance, as many EPA website posted studies confirm and Exhibit C illustrates, but there is no such warning in the noncompliant EIR.] "The applicant will prepare and implement a Waste Characterization Plan (Characterization Plan) which will be incorporated into the approved WDR." [However, since the EIR is already hiding the hexavalent chromium threat and, ignoring that harm, has incorrectly classified the pasted mine material as nontoxic Group C benign mine waste, it is essential that such a plan be addressed now in advance of approval.]

Why is that timing so important? See section I.C and E above discussing deferred analysis and mitigation prohibited by CEQA, such as interpreted in *Richmond v. Chevron* and other authorities. It is not just that CEQA requires such impact and mitigation matters to be disclosed and analyzed fully before EIR approval, i.e., prohibiting such deferrals, but also because, if these many serious mine disputes have to be litigated, that should occur in one consolidated process, not in many successive dispute processes as Rise (or its successor behind the curtain in a "flip" about which many speculate after any EIR approval (which would be an unjust mistake). Slowly unveiling various future operation impacts and action/mitigation plans deferred until after further governmental decisions is not appropriate or compliant, all of which should be done before EIR approval. Note also that, as addressed elsewhere, the insufficient and mislocated monitor wells and other mitigations (including those added in EIR revised Mitigation Measure 4.8-2(c)) are focused on the East Bennett Road and wholly owned Centennial and Brunswick sites, as if hoping that will distract everyone from the bigger legal and environmental problems in the mine risks, threats, and harms to the thousands of us surface owners and users above and around the 2585-acre mine, since (as admitted in Rise's SEC filings—see Exhibit B and DEIR Objection 254 #2) the miner cannot hope to afford to mitigate the harms disputed EIR mining will do to those surface owners like me, much less cure the impacts and problems the mine is creating for others.

Before addressing **the Itasca Appendix Q issues** in detail, please note the following among the many disputes and flaws with what the EIR/DEIR is doing in its described provisions in the previous paragraph. **First,** to evade dealing with (or even properly mentioning) substantive risks, threats, and harms **now** when required by CEQA and other applicable law (e.g., *Richmond v. Chevron*), the disputed EIR defers the substance to a **future process after the EIR is mistakenly approved (assuming the worst case)**, when it is too late for many purposes except to attempt to clean up the mess that will exist from starting the mining and then having the courts, law reform, or political remedies stop it. Also, these disputes should be consolidated for cost-efficiency and speed of final resolution. Otherwise, there may be multiple litigations occurring at different times as current and deferred disputes become "ripe" for adjudication. **Second,** such delayed, essential planning and decisions (to which I and others object with such ample authorities, including *Richmond v. Chevron*) make it impractical to have a factual debate on the detailed merits, since the EIR miner could just claim that (after EIR approval and commencement of harmful impacts) the mining will adapt to some such future governmental or court requirements, denying us potentially impacted victims the opportunity most effectively to rebut and contest such EIR, such as to feasibility and other challenges the disputed EIR is attempting to evade. Trying to litigate standards theoretically or in the abstract before such governmental approval process results creates many extra costs and problems for us victims as well as the risk of irreparable harm and illusory of deficient mitigations, which may be why what the EIR attempting to do in delaying key significant information until after approval of the insufficient EIR (still full of many errors, omissions, and other noncompliance) is forbidden by CEQA and other applicable laws. See e.g., *Richmond v. Chevron*; section I.C and D, and (as to mitigation and illustrations I. E. and F. ***Third,*** while government is supposed to do certain such prescribed things in the future to protect us local victims (eg, monitor test well results, classify waste, etc.), nothing in the EIR/DEIR fairly warns those governmental authorities of noncompliantly disclosed risks and menaces, such as, for example, (i) the toxic hexavalent chromium water and air pollution, so they can specifically watch out for such water pollution

problems that killed Hinkley, CA, and many of its residents (see "Erin Brockovich"), and (ii) correct the EIR's misclassification of the mine waste (aka rebranded as misleading "engineered fill"), and (iii) more importantly for the thousands living on the surface above the 2585-acre underground mine being dewatered 24/7/365 for 80 years (past such toxic hexavalent chromium cement paste in the shoring) why the insufficient test wells are misplaced and not predictive of the risk to us objectors and our undercounted existing wells and our ignored new future wells. See, e.g., sections I.D, E, and F. (Also, the County should examine closely for the undisclosed hexavalent chromium and other threats the supposedly treated water flushed down the Wolf Creek elsewhere that may spread that pollution [NID customers there beware].)

Many other issues are addressed throughout these and other objections, but this illustrates some of the problems. See, e.g., applicable objections incorporated from my Table of Incorporated by Reference Objections, such as the California Dept. of Parks And Recreation Agency Letter 1, California Dept. of Fish And Wildlife Agency Letter 3, Grass Valley Agency Letter 8, Wells Coalition Group Letter 27/28, CEA Objections Group Letters 6-9 and 21, Friends of Banner Mountain Group Letter 11 and12, Bear Yuba Land Trust Group Letter 2, Sierra Fund Group Letter 25, South Yuba River Citizens League Group Letter 25, and Wolf Creek Community Alliance Group Letters 29-32.

To purport to provide some of what (though insufficient, incorrect, and otherwise noncompliant) is significant new information on these disputed subjects, the disputed EIR attaches (in an unheralded and unintegrated way at the end of the EIR) in **Volume IX, Appendix Q, a disputed, short "Technical Memorandum" dated 2/24/2020, entitled, "Desktop Study of Cemented Paste Backfill." See also Appendix R with the same issues as to air pollution.** Note that I address the Appendix O update of this disputed study in the next subsection below. This is apparently designed as backup data in case someone like me notices that the relevant data in the EIR is not adequately described in compliance with CEQA and other applicable law (see, e.g., Exhibit C), not to mention containing other errors, omissions, and noncompliance. Itasca describes at the start of the Technical Memo that it is a "desktop study of cemented paste backfills (CPB) use and its potential impacts on water quality and site-specific considerations for IMM." Note that there is no effort to reconcile the inconsistencies between that disputed memo (and therefore the EIR) and the DEIR (which almost totally ignored, and never provides any "good faith reasoned analysis" of hexavalent chromium), which the EIR leaves unresolved as if they did not exist. See Exhibit C and section I.F.1. However, I note that those noncompliant conflicts are material and in need of clarification with a revised and recirculated EIR. See section I.A.1.c. For example, among others that are apparent from contrasting the DEIR and my Objection 254 (e.g., #'s 3.A, B, C, E, G, H, 7, and 15) thereto versus the disputed EIR (and especially that Technical Memo Appendix Q) versus this Objection, the DEIR only deals with hexavalent chromium vaguely as added in the cement paste for shoring (as CR6+) and one obscure and unexplained reference in a long list of hazardous materials versus the EIR/Technical Memo dealing with hexavalent chromium in the Portland cement (Cr(VI)). Although both may exist as hazards, the CR6+ in the cement as a water polluter and the CR(VI) as also an air polluter in Appendix R (e.g., as dust from delivery and use on the surface before being injected into the mine), as described in the DEIR versus the EIR.

To begin for context and to clarify variance from the noncompliant DEIR description, the Technical Memorandum describes the "cemented paste backfills (CPB)" as a means of improving "geotechnical stability by backfilling mined stopes (voids) and allow[ing] the recovery of the ore body to be maximized." In essence, CPB is "formulated on the surface" by

mixing tailings "with cement and water, although other additives or mined materials are sometimes included" (apparently, if the disputed DEIR were correct, like hexavalent chromium), and that mixture is then pumped into the underground mine to shore up places that are deemed to need it. **Throughout the Technical Memo discussion are qualifications and warnings about the proper preparation and "curing" of the CPB before exposed to dewatering, which is another way of saying that the homes, property values, and groundwater of us potential victims above and around the 2585-acre underground mine are at risk of at least human error by those preparing this toxic brew for shoring beneath us where there is no EIR proposed monitoring until it is too late and the harmful impacts begin before surface owner or governmental discovery "the hard way," especially considering that the insufficient monitor system is not designed to be applicable or effective to detect such CR6 problems timely. See Exhibit C. Under a heading called "Potential Water Quality Issues With CPS" (which like all the rest of this Technical Memorandum should be inserted in the related EIR "Hazards And Hazardous Materials" discussion and should be recirculated for proper debate as required by CEQA and other applicable law) the following data is revealed, beginning with the admission that: "There are some potential water quality related issues with CPB if it is not implemented correctly." Part of that admitted hazard is inherent in the "specific composition of the tailings materials used in the CPB," and another admitted part is that the "CPB does not set properly or is not strong enough to remain intact in the mine environment."**

Thus, the Technical Memorandum (unlike the main EIR itself which incorrectly ignores or dismisses all such concerns without sufficient identification of the issues or proof) admits (at 2 and 3 of 8, EMPHASIS ADDED):

> **A VARIETY OF SITE-SPECIFIC FACTORS CAN AFFECT THE ABILITY OF CPB TO SET AND ITS LONG-TERM STRENGTH. FOR EXAMPLE, INSUFFICIENT BINDER CONTENT, EXCESSIVE WATER CONTENT, OR WATER WITH HIGH SULFATE CONCENTRATIONS (EG, FROM HIGH-SULFIDE TAILINGS) CAN DECREASE CPB STRENGTH OR INHIBIT PROPER SETTING. IF CPB DOES NOT SET PROPERLY, IT MAY BE LESS EFFECTIVE AT REDUCING THE MOBILITY OF CHEMICAL CONSTITUENTS [IE, ADMITTED, TOXIC HEXAVALENT CHROMIUM], AND THERE IS THE POTENTIAL FOR THE BINDER MATERIAL TO BE LEACHED FROM THE CPB MIXTURE [IE, SUCH HEXAVALENT CHROMIUM POLLUTES OUR GROUNDWATER AND ULTIMATELY THE WOLF CREEK]. ADDITIONALLY, HIGH SULFIDE-CONTENT TAILINGS THAT ARE ACID GENERATING AND HAVE ELEVATED METALS CONCENTRATIONS CAN RESULT IN METALS LEACHING FROM CPB AND CAN DEGRADE CPB STRENGTH.**
>
> **BECAUSE CEMENTS AND GROUTS ARE ALKALINE IN NATURE, SOME STUDIES HAVE NOTED THAT THE POTENTIAL EXISTS FOR THESE MATERIALS TO PREFERENTIALLY LEACH FROM CPB AND CAUSE ELEVATED PH VALUES IN GROUNDWATER AND/OR RELEASE CONSTITUENTS FROM THE CEMENT OR OTHER ADDITIVES [EG, HEXAVALENT CHROMIUM].**

THUS, THE EFFECT OF NONCOMPLIANT EIR IS TO FORCE US LOCAL VICTIMS TO GAMBLE ABOUT LETHAL HEXAVALENT CHROMIUM HAZARDS THAT ARE ADMITTEDLY DEPENDENT ON MINE WORKERS' SKILL, DILIGENCE, AND CARE IN DEALING WITH THESE UNACKNOWLEDGED RISKS AND ON UNANALYZED MINE MATERIAL CONDITIONS, WITH NO RELEVANT MONITORING OR MITIGATIONS SUFFICIENT TO PROTECT THOSE OF US ABOVE OR AROUND THE 2585-ACRE MINE AND OTHERS WHEREVER THE THEN POLLUTED WOLF CREEK FLOWS. SEE EXHIBIT C. YET, THE EIR DARES TO CLAIM THERE ARE NO SIGNIFICANT ISSUES OF CONCERN WITH THE DEIR, SO THE EIR DOES NOT NEED TO BE REVISED OR RECIRCULATED. THAT IS OUTRAGEOUS AND NONCOMPLIANT, ESPECIALLY CONSIDERING WHAT CANCER THREAT THE EIR NOW ADMITS FROM HEXAVALENT CHROMIUM AIR POLLUTION IN APPENDIX R. (ALTHOUGH THAT WAS IN THE CONTEXT OF AIR POLLUTION, RATHER THAN WATER POLLUTION, THE MANY EPA WEBSITE STUDIES OF THIS CANCER-CAUSING TOXIC SHOULD BE SPECIFIC ENOUGH TO BE TAKEN SERIOUSLY. SEE EXHIBIT C. NO ONE CAN DOUBT THAT ANY PURCHASER OF IMPACTED SURFACE PROPERTY WILL TAKE THIS SERIOUSLY AND LIKELY WILL ASSUME THE WORST CASE, AS EXPLAINED IN EXHIBIT A HERETO.

The Technical Memorandum (at 5 of 8) also addresses a dispute study by ACZ Laboratories involving tests on four flotation tailing samples for "acid digestion" that us objectors consider not CEQA compliant or representative or predictive of the problems of us local victims above and around the 2585-acre underground mine. For those and other reasons the disputed study from cherry-picked purported expert and EIR chosen locations do not persuade anyone at risk. Indeed, the study's conclusion is full of noncompliant qualifiers that invite our dispute, such as (again based on what the EIR selected for its own benefit in a tiny sample) this contractor said (emphasis added) that "it is LIKELY that the CPB used in the IMM will have very low solute release rates and will be GENERALLY environmentally benign." However, consider the following "Conclusion" (at 6 of 8), stating that: "However, it is clear from case studies and theoretical behavior of CPB that there are a variety of site specific factors that could affect the potential for water-quality impacts…" for which the memo suggests specific suggested protective actions and cautions, none of which are appropriately added to the EIR, presumably because it prefers not to call attention to these risks which CEQA and other applicable laws require the EIR to address now with "common sense," "good faith reasoned analysis," in accordance with applicable law, such as *Gray, Banning, Vineyard, and Costa Mesa.*

Again, there is the debate as to what exposure levels of such cancer causing toxic hexavalent chromium are safe, but, rather than have that debate on the merits, the EIR dares to ignore the risks, threats, and harms in the EIR/DEIR and seek advance approval for its nondetailed concept, with the details hiding their Devil to be revealed in some future time after EIR approval when much harm has already been done. See Exhibit C and the EPA website commentaries and studies. Incidentally, since Rise arranged all this testing that is referenced in the Technical Memorandum and EIR/DEIR, where is it? Why not include the foundational source material with more balanced commentary? Why has Rise not attached that data in the EIR Appendices instead of irrelevant studies of purportedly "similar" situations that we dispute and contend are not similar at all (false equivalence tactics), and, in any event, contain errors, omissions, or other noncompliance.

If the EIR advocates attempt to continue to evade and dismiss these risks, threats, and impacts, they cannot be allowed to do so without adequate CEQA and other disclosures and recirculation of their disclosed position so that it can be fully disputed on the merits. See section I.A.1.c. The EIR cannot rely on the Technical Memorandum to save itself from reforms and recirculation (i.e., the EIR cannot ignore these identified and admitted risks, threats, and impacts), since this is a "desktop study" where these purported, cherry-picked experts simply relied on what Rise told them, admittedly without any investigation of the facts on the ground. Given the Rise credibility problems (see section I.A.1.d(viii) and DEIR Objection 254 #3.E) and other issues raised in my and other objections and the lack of compliant documentation and disclosure of what Rise told Itasca, there is no reason for disregarding the worst-case assumptions from these admitted risks, threats, and impacts. Consider another admission in the Technical Memorandum (at 3 of 8):

> **The presence of chromium in cement has been identified as a potential water-quality concern related to the use of CPB (Hamberg et al 2018). Hexavalent chromium (Cr(VI)) is an oxidized form of chromium that is more soluble and mobile in the environment than reduced forms of chromium. … Thus, selecting a supplier with low Cr(VI) content cement and ensuring the CPB is not inundated [eg, confronting dewatering] before it sets can minimize the potential for issues with Cr(VI) leaching.**

None of this is addressed in the DEIR, so this new data should require full and compliant disclosure and opportunity for debate in the context of a recirculated and revised EIR, especially since failure to prevent a repeat of the Hinkley, CA, horrors will leave all those accountable here, even worse than the Michigan Governor's team who allowed lead leaching in water pipes to devastate Flint, Michigan, because this would be an "I told you so" crisis. I mention that analogy not as a gratuitous provocation, but as a real-life, well-known example of how even supposedly well-meaning officials can create atrocities (not to mention foreign miners in admittedly distressed financial circumstances and from an industry with a history of chronic environmental violations, because its primarily focused on maximizing profits for speculative shareholders, rather than the local community they expect to leave as soon as the mine ceases to promise exploitive riches). See, e.g., Exhibit B and DEIR Objection 254 #2 admitting in Rise SEC filings the speculative and risky nature of this project, in effect warning investors about things the noncompliant EIR/DEIR failed to warn the County and us potential victims. See also Richmond v. Chevron and section I.D.3 confirming that such SEC admissions cannot be dismissed by the EIR/DEIR as irrelevant rebuttal or impeachment, since objectors in that key court eir decision prevailed on the basis of such SEC admissions.

4. Some Further EIR Flaws Exposed By the Updated Itasca Admissions in Vol. IX, Appendix O, Following Up on Its Earlier Appendix Q Report Disputed In the Previous Subsection Above.

EIR Appendix O, the Itasca update dated 6/17/2022 to the "Technical Memorandum" (App. Q) disputed in the prior subsection above, describes itself as a "clarification" in response to various objections. None of those updates or "clarifications"

addresses my four Objections or rescues the disputed EIR from the errors, omissions, or noncompliance addressed in this Objection. See my relevant rebuttals above and elsewhere in sections I, II, and III herein, including to my rebuttals in section III to the disputed EIR "Responses" to my DEIR Objection 254 #'s 3.D, E, F, M, and N, 5, 6, and 15. Therefore, I will just briefly expose some errors, omissions, and flaws in that noncompliant update. By denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such overlooked, understated, or noncompliant impacts. Besides my incorporated water related comments in sections P, Q, R, S, T, AF, AJ, AL, and AM, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute.

However, it should be of great concern to the County that, rather than confront such key objections on the merits with "common sense" and "good faith reasoned analysis" as required by CEQA and other laws, that update (like the disputed EIR generally) improperly ignores the issues, impacts, and problems or incorrectly dismisses them as speculative, irrelevant, or premature because the EIR wishes to evade debate by claiming disputed, deferred, and uncertain mitigations after approval of the EIR or fails to provide any mitigations for the many significant impacts it has ignored, dismissed, or evaded. See my objections to deferral of disclosures and mitigations in section I.C and *Richmond v. Chevron.*

Admitting that the EIR ignores in its erroneous "groundwater flow model" for dewatering what Itasca calls "[c]consumptive water uses from individual wells, Itasca dismisses the concern without compliant "common sense," "good faith reasoned analysis," competent proof, or sufficient investigation as too "small, relative to regional groundwater flow," relying on what it claims to be the "low permeability of the rock mass" and "generally low pumping rate," which without such compliant analysis, investigation, or proof seems to be an unsubstantiated opinion based on incorrect speculation and false assumptions. **First,** it is again not clear whether these comments purport to cover the whole 2585-acre underground mine below thousands of us surface owners and users, or only the East Bennett Road area on which the DEIR/EIR was almost wholly focused on this issue. Indisputably, the EIR/DEIR never addresses our surface competing property rights down at least 200 feet or other issues Rise admits in its SEC filings (Exhibit B and DEIR Objection 254 #2) to warn its investors without inclusion in the EIR/DEIR as required disclosure for the County and us impacted surface neighbors. See my DEIR Objection 254 and my comments above, such as, for example, on the obvious fallacy of lacking "common sense" of just assuming our higher ground areas (people call my "Banner Mountain" high ground's main road Banner Lava Cap Road for a reason that does not apply downhill to the Brunswick flat lands; i.e., another example of false equivalence tactics) are subject to the same relevant underground conditions, risks, and issues as those downhill East Bennett Road conditions where Rise concentrates its monitoring systems. Also, this disputed updated EIR commentary assumes that, despite climate change, science, and reason, whatever conditions exist now will continue for the next 80 years, despite climate change, 24/7/365 dewatering, and massive underground mining in new, uninvestigated, and deeper areas along 76 miles of new blasted tunnels, that no greater surface owner use demands will apply. The reality is that consistent with objector offers of proof and as has proven true everywhere else in California where surface owners are confronting drought conditions by tapping more groundwater, is surface owners and users will exercise our legal rights to increase new wells and groundwater

usage, especially since that groundwater belongs to us, not just to the mine. See *Keystone, Gray,* and section I.F as to impacts, I.E and D as to mitigations, and I.C as to CEQA compliance and the 2018 Guidelines Amendments Explanations confirming the relevance and importance of climate change.

Indeed, during the next 80 years, when NID cuts back water supplies in the future, before local surface owners abandon their homes and suffer their drying forest to die from lack of the groundwater flushed away down the Wolf Creek by mine dewatering, us surface owners and users individually (or likely banding together in well collectives) will compete and battle in the courts and political arena against the mine's water wastes and the taking of our owned groundwater. See *Keystone* and *Gray*. That reality dooms such incorrect, unsubstantiated, and flawed assumptions on which the disputed EIR/DEIR (including those disputed Appendix O opinions) rely. Also, note that many of us do have sewers, countering the (in effect) "don't worry, just recharge using your septic tank water comments here," as well as "landscape irrigation" (which ignores NID's likely rationing rules imposed on us, while the mine flushes away our owned groundwater down the Wolf Creek.) See also my discussions above of the EIR's waste of NID water on frequent daily watering of toxic fugitive dust which the NSAQMD Agency Letters 12 (at 12) and 11 insist continue despite NID drought rationing to save us from the lethal assault of asbestos and other toxins (including I would add CR6).

I defer to the more expert groundwater objectors to deal with the **flawed Itasca attempts to rehabilitate its model's simulations addressed in that Appendix O**. See Exhibit D. But again, we confront the issue of when these commentaries purport to address the whole area above and around the 2585-acre underground mine or only the East Bennett Road area downhill, a flaw that by itself should require revision and recirculation (see section I.A.1.d(viii) and I.F.5), especially since there is no sufficient proof that the disputed EIR/DEIR comments on the downhill, wholly owned mine and East Bennett Road area apply equally to the surface area above and around the 2585-acre mine where thousands of us objectors live; i.e., the EIR/DEIR false equivalence tactic. See, e.g., applicable objections incorporated from my Table of Incorporated by Reference Objections and Exhibit D, such as the California Dept. of Parks And Recreation Agency Letter 1, California Dept. of Fish And Wildlife Agency Letter 3, Grass Valley Agency Letter 8, Wells Coalition Group Letter 27/28, CEA Objections Group Letters 6-9 and 21, Friends of Banner Mountain Group Letter 11 and12, Bear Yuba Land Trust Group Letter 2, Sierra Fund Group Letter 25, South Yuba River Citizens League Group Letter 25, and Wolf Creek Community Alliance Group Letters 29-32.

Once again, **the attempts of Itasca to justify exclusion of comparisons to other local mines (eg, Empire) for the disputed Itasca model must fail on the merits. But also see another relevant comparable discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line. Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk, now different and larger because of changes over time and climate change. See also the Union discussion of comments by hydrology expert Sol Henson.** Among the many flaws in such disputed EIR/DEIR reasoning are that the conditions in this long flooded and closed mine have not been adequately investigated subject to "good faith reasoned analysis" with "common sense," and there is no merit to the incorrect EIR/DEIR speculation either that those disputed assumptions will continue to apply for 80 years, despite 24/7/365 dewatering and

mining and new competing wells by us surface owners, or that such assumptions will apply to the new and deeper mining contemplated in the EIR/DEIR along 76 miles of blasted new tunnels. Guesswork and speculation, such as when such experts accept disputed and unreliable miner data as if such disputed miner hypotheticals were true, should not be permitted to risk the future health, welfare, environment, forests, and property in our local community. For example, one such flawed Itasca argument for excluding Empire Mine comparisons is that "[t]here is no direct flow from these historical mines to the future Rise Mine working" and that there is a block by low permeability rock masses between the historical mines and the future Rise Mine. Besides disputing any reliable basis for that insufficiently substantiated opinion (e.g., noting the lack of reliable historical documents and data, with the foundation of such disputed opinions being excluded by objector evidentiary motions in any court disputes), I object because the disputed EIR/DEIR has not adequately investigated this long flooded and closed mine and its new mining areas for that issue during the next 80 years, to some extent so admitted in the Rise SEC filings addressed at Exhibit B and DEIR Objection 254 #2. See *Richmond v. Chevron* and section I.D above. Also, please note that my and other objections complain about the EIR/DEIR cherry-picking favorable (but irrelevant) studies and opinions involving false support claims based on much less comparable and distant places are alleged to "similar;" i.e., the false equivalence tactic. In fact, those EIR/DEIR false comparables are much similar and relevant than the Empire and other mines cited in objections and incorrectly dismissed without fair consideration on the merits by Itasca. See my Table of Incorporated by Reference Objections and Exhibit D.

I also defer to more expert objections as to the seismic errors and omissions regarding the "simulations" in the disputed "groundwater flow model" relating to the "Idaho Fault system." However, this Itasca update admits that it ignored "the modeling of these minor faults" [22, 20, 11, and 20C of the Idaho Fault Zone) because "most of this area is already modelled as mining voids," another disputed contention on various bases. For example, those "minor faults" can be a material menace to those living around the 2585-acre underground mine, even if they don't damage distant towns. The merit of objections does not depend on a massive horror (e.g., No Name City, aka Nevada City, falling into the mine pit from lack of lateral or subjacent support in the "Paint Your Wagon" movie), since a smaller number of impacted wells in *Gray* than are at risk here was enough to defeat the mine's eir in *Gray*. How many of us locals must be sacrificed before it matters "materially" that the miner triggers a "minor fault" and damages our properties (also another reason for depressing property values)? Why dismiss "minor faults," when there is ample data on the local harms they can cause when triggered? Note also that groundwater depletion, reallocation, and dewatering for fracking has caused devastating earthquakes causing material local harm in Oklahoma or Pennsylvania, where no one could ever remember any earthquakes before. Similar problems are alleged in other fracking sites where groundwater is similarly manipulated. See my prior references to the Supreme Court's *Keystone* case and other authorities were us surface owners' rights of lateral and subjacent support includes groundwater to avoid subsidence and, we contend, also induced earthquakes on even "minor faults." See section I.F above.

S. Objections To Further Respond to Master Response 15 (part 2)—Adequacy of Groundwater Monitoring Wells (EIR at 2-76): Additional Comments.

By denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations

insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such overlooked, understated, or noncompliant impacts. Besides my incorporated water related comments in sections P, Q, R, S, T, AF, AJ, AL, and AM, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. I have generally identified objections to such groundwater issues, well issues, and monitoring in various other places herein and in my Objections 254 and 255, and I will not repeat them all here, because I incorporate them by reference, including everything in the prior paragraphs P, Q R, S, and T, including **incorporations from my Table of Incorporations by Reference Objections and Exhibit D. See, e.g., applicable objections incorporated from my Table of Incorporated by Reference Objections, such as the California Dept. of Parks And Recreation Agency Letter 1, California Dept. of Fish And Wildlife Agency Letter 3, Grass Valley Agency Letter 8, Wells Coalition Group Letter 27/28, CEA Objections Group Letters 6-9 and 21, Friends of Banner Mountain Group Letter 11 and12, Bear Yuba Land Trust Group Letter 2, Sierra Fund Group Letter 25, South Yuba River Citizens League Group Letter 25, and Wolf Creek Community Alliance Group Letters 29-32.**

Incorrectly claiming (at 2-76) that massive, 24/7/365 dewatering of our groundwater for the mine to flush it away down the Wolf Creek is only of concern to a few wells downhill in the East Bennett Road area qualifies as one of the worst, most dangerous, and outrageous falsehoods in the EIR/DEIR (next to the concealment of the toxic hexavalent chromium hazards, which risks our health and lives as well as our forests, environment, and property). Also note that, once again as in most "Master Responses," the disputed EIR only addresses (usually unsatisfactorily) part of the identified objections and ignores the rest, as if somehow CEQA could be interpreted to only require the EIR to address what here is called "the majority of concerns." See section I.C discussing CERA obligations and section I.A.1.d (viii) discussing objectionable EIR/DEIR tactics, as illustrated in I.F and (as to mitigations) I.E. Because many objections are interactive and support each other, such attempts to fragment and separate objections are noncompliant (see, e.g., section I.F.5 and I.A.1.d(viii), even if (which is not always the case in this EIR/DEIR) the disputed EIR responds somewhere else to the evaded portions of the related objections, and they usually contain errors, omissions, and other noncompliance.

Among my personal annoyances with the EIR/DEIR's noncompliance with CEQA and other applicable law (see the principles in section I.C illustrated in I.D, E, and F) are that (except for the East Bennett Road and the 337 properties listed as eligible for "domestic well monitoring" in Table 3 starting at 2-83) most of us potential victims living above or around the 2585-acre underground mine cannot find our individual properties in relation to that mine by our street addresses or other recognizable landmarks. This is true on Banner Mountain above the mine, such as where I live one property above the Wolf Creek and two properties and a ridge away from Idaho Maryland Road that does appear on EIR maps. Among the many reasons for that to matter is that we each need to be able to plan our own mitigations and defenses/counters and to tell any buyer (or mortgage lender or appraiser) where each of our surface properties is relative to the 2585-acre underground mine, the old, mined area, and the planned new mining area. That application here includes the right to new, future wells and monitoring wells for our properties, whether individually or in a neighborhood collective. Remember that, as proven in my DEIR Objection 254 and consistent with admissions about the underground mining in the SEC 10K filings by Rise as to mining rights not beginning until 200 feet below the surface (see Id. at #2 and also Exhibit B hereto), we surface objectors own the groundwater beneath us that is being flushed away by mine dewatering down the Wolf Creek, and our legal rights to lateral and

subjacent support, including by groundwater, must be able to prevent subsidence, as defined in the Supreme Court's *Keystone* mine ruling.

Therefore, this is not just a matter of replacing water supplies at those 335 properties with monitoring wells, but rather this is a matter of protecting (for 80 years of progressing drying from climate change) sufficient groundwater for everyone who owns it, which includes thousands of surface owners on Banner Mountain. Also, since Rise's SEC filings admit and prove that it cannot afford adequately to accomplish any such mitigations (see my Objection 254 #2 and Exhibit B hereto), the admitted EIR problems (not to mention the much larger ignored problems) are infeasible for Rise to mitigate and, thus, unreliable, and noncompliant. As stated above by analogy, this is like a real estate developer claiming a future mitigation plan for destalinization water supplies that are not legally or economically feasible. Such unreliable and worse mitigation promises are not mitigation for CEQA purposes or otherwise, especially as here where the mitigation plans are to be improperly deferred into to the future after approval of the EIR (e.g., section I.C, I.E.3, 4, and 5) assuring not only unnecessarily complex and expensive litigation, but creating a mess for the County when it must ultimately deal with the realities of a miner who cannot feasibly perform the EIR and seeks rights opposed by all of us now objecting to the mine, plus more who will discover their perils if the noncompliant EIR is approved and some impacts and harms begin.

As noted in my introduction to this section the disputed EIR chooses to "scramble" its "Master Responses" relating to objections to groundwater errors, omissions, and abuses (and some others as well) without a useful and unifying Table of Contents at the Master Response/Exhibit D level, rather than consolidating them in a more coherent manner. That is usually a sign in eir disputes of a miner seeking to evade confronting serious problems for which the absence of a persuasive response is too obvious, so an exhausting, scrambled confusion is the chosen tactic, instead of consolidate clarity that better reveals those errors, omissions, and flaws. See, eg, the common and overlapping groundwater issues addressed in scattered, disputed, **direct** Master Responses 13 (Historic Hydrologic Assessments (with deficient maps), 14 (Adequacy of Groundwater Model), 15 (Adequacy of Groundwater Monitoring Wells (with deficient maps and addresses), 16 (Drought and Climate Change), 29 (Near Surface Workings And Subsidence), 33 (Groundwater Dependent Vegetation), 35 (Discharge to South Fork Wolf Creek), and 36 (Flows in South Fork Wolf Creek) or disputed, indirect Master Responses where groundwater issues were mixed with other issues, such as 1 (Quality of Life), 2 (Social and Economic Impacts), 3 (Operator Responsibility), 6 (Wildfire Impacts), 7 (Location of Future Mining Areas, eg, mixing "Potential Groundwater Effects From Underground Mining" with "Blasting, Vibrations, and Noise), 8 (Mine Waste Characterization, eg, mixing Water Code and 80 year dewatering issues with various others), 9 (Historical Mine Waste at Centennial Site), 10 (Explosives, Reagents and Brunswick Fill, eg, mixing toxic materials and mineral processing issues with others), 11 (Engineered Fill Utilized in Local And Regional Construction Markets, eg, mixing mine waste arguments with erroneous discussions of Water Code compliance), 17 (Meteorological Data Used in HRA, eg, diverting hexavalent chromium water pollution issues into air pollution issues, but with unintended useful admissions in Vol. IX, Appendix Q, O, and R, which buries or ignores what should have been disclosed in #'s 17—19 water pollution discussions), 20 (Conservatism of Metal Assumptions, eg, "fugitive dust" not consistent with #'s 17—19 and Appendix , which should deal with hexavalent chromium as a key water pollution issue), 24 (Project Construction Schedule (mixing dewatering with other issues), 29 (Temperature of Mine Water Discharges) and 39 (Discharge to South Fork Wolf Creek.

T. Objections to Master Response 16: Drought And Climate Change (EIR at 2-92).

1. The Disputed EIR Is Incorrectly Ignoring Drought And Climate Change Impacts That Increase The Significance of Environmental Impacts Of Its Mining Related Activities, As Demonstrated By Many Objections. (Well And Other Consequences Are Discussed in Later Subsections Below.)

It should be indisputable that climate change created dryness and drought is a progressive menace to our community during the next 80 years and beyond, since trees are already dying in our local forests from lack of water (or related maladies, such as insect pets attacking drought weakened trees.) Rather than repeat lessons on climate change, I will stand on my and other objections, and focus primarily here (and in Master Response #33) on the only slightly less preposterous of the disputed EIR arguments (eg, the EIR's erroneous recharge and surface water interactions, e.g., DEIR Objections 254 #'s 3.D, E, F, M and N, 5 and 6 and sections I.D, E, and F), rather than the EIR's disputed and preposterous claim that climate change is too speculative to be an issue for CEQA. **See, e.g., the 2018 Guidelines Amendments Explanations and section I.C explaining how climate change is an important part of CEQA.** Since the EIR/DEIR continues failing to respond comprehensively to my such DEIR Objection 254 and others and the EIR/DEIR again separates their partial Master Response statements into the prior #'s 13, 14, and 15, as well as several other Master Responses more distant from in the EIR (eg, #'s 29 and #33, 35, and 36), this objection deals with both related, uncured errors and omissions. See, e.g., and incorporate, the common and overlapping groundwater issues addressed in scattered, disputed, **direct** Master Responses 13 (Historic Hydrologic Assessments (with deficient maps), 14 (Adequacy of Groundwater Model), 15 (Adequacy of Groundwater Monitoring Wells (with deficient maps and addresses), 16 (Drought and Climate Change), 29 (Near Surface Workings And Subsidence), 33 (Groundwater Dependent Vegetation), 35 (Discharge to South Fork Wolf Creek), and 36 (Flows in South Fork Wolf Creek) or disputed, indirect Master Responses where groundwater issues were mixed with other issues, such as 1 (Quality of Life), 2 (Social and Economic Impacts), 3 (Operator Responsibility), 6 (Wildfire Impacts), 7 (Location of Future Mining Areas, eg, mixing "Potential Groundwater Effects From Underground Mining" with "Blasting, Vibrations, and Noise), 8 (Mine Waste Characterization, eg, mixing Water Code and 80 year dewatering issues with various others), 9 (Historical Mine Waste at Centennial Site), 10 (Explosives, Reagents and Brunswick Fill, eg, mixing toxic materials and mineral processing issues with others), 11 (Engineered Fill Utilized in Local And Regional Construction Markets, eg, mixing mine waste arguments with erroneous discussions of Water Code compliance), 17 (Meteorological Data Used in HRA, eg, diverting hexavalent chromium water pollution issues into air pollution issues, but with unintended useful admissions in Vol. IX, Appendix R, which buries or ignores what should have been disclosed in #'s 17—19 water pollution discussions), 20 (Conservatism of Metal Assumptions, eg, "fugitive dust" not consistent with #'s 17—19 and Appendix , which should deal with hexavalent chromium as a key water pollution issue), 24 (Project Construction Schedule (mixing dewatering with other issues), 29 (Temperature of Mine Water Discharges), and 39 (Discharge to South Fork Wolf Creek.

This disputed EIR response (including the DEIR and its Appendix K.3 and related mitigation measures) begins with irrelevant history that ignores the progressive effects of

climate change in favor of incorrectly (or worse) relying on prior water history assumed to continue indefinitely, such as assuming the average "current" rainfall between 1967 and 2017 [which is not "current" because it excludes the most current dry years after 2017] ignores climate change drying out our lands with added 24/7/365 dewatering for 80 years and more well competition; e.g.; (at 2-93) "However, it is also possible that mountain recharge rates will remain unchanged or increase in response to climate change (citing various "possible" theories by Earman written in 2012 and now superseded by more than a decade of contrary experience and data.) … As such, an assumption that climate change will result in reduced recharge and groundwater availability in the Project area is speculative and need not be analyzed in an EIR." Note the misleading language in the EIR compared to its cited (and disputed) authority (emphasis added): "However, CURRENT understanding of groundwater recharge and storage in mountain watersheds is insufficient to predict with reasonable confidence the manner and rate at which discharge from mountain aquifers will respond to changes in climate (EARMAN 2012)." Likewise, the Itasca recharge theories based on irrelevant and misleading historical data have no proven application to conditions in the next 80 years for the area above and around the 2585-acre mine and there is no sufficient basis for claiming its 50% margin (or the 100% margin in DEIR Appendix K.3 and 4.8) is sufficient for that future. By comparison, for example, the EIR/DEIR admits (eg, EIR at 2-92-930 that by comparison "the private wells have seasonal fluctuations that may range from 10 to 50 feet between wet and dry times of the year," which is a variance of 500% (not just 50 or 100%), and over the progressively drier 80 years that 500% could be much more as the mine dewatering lowers the surface and water table with disastrous consequences, as everyone has already seen by groundwater depletion from fracking or from wells in the central valley draining groundwater for agriculture.

2. **The Disputed EIR Again Tries to Evade Objections By Ignoring Whatever The Incorrectly Interprets To Be Outside The Unprecedented CEQA Environmental Impact Boundary the EIR Invents, Even When Objections Are Rebutting False, Misleading, Or Other Noncompliant EIR Claims Outside That Same Disputed CEQA Boundary, And Other Objectionable Tactics To Evade Inconvenient Truths That Expose EIR/DEIR Errors, Omissions, Noncompliance, And Worse.**

As explained herein and in various other places (e.g., section III, I.A.1, C, D, E, and F) and in my DEIR Objections 254 and 255, and other incorporated objections, the EIR falsely claims in these Master Responses (as in even worse offending EIR "Responses" addressed in section III) that the EIR can assert any disputed positions (whether inside or outside of its unprecedented CEQA border), but us local objectors cannot respond, even by rebuttals or impeachment to what the disputed EIR incorrectly claims (or even admits in Rise SEC filings, such as exposed in Exhibit B), because (it incorrectly claims) the EIR can ignore whatever objections, replies, or comments the EIR interprets to be excluded by it imaginary narrow CEQA environmental impact limits. See my complaints about such improper tactics especially in section III, where these noncompliant EIR violations of objector rights are most extreme and obvious, as well as in sections I.A.1.d(viii) and I.F.5. Incredibly, that means the disputed EIR is claiming, in effect, that somehow (i) it is allowed to assert (or even admit in SEC filings or even in the DEIR/EIR, such as at DEIR 6-14)

whatever the EIR wants, but then somehow (ii) the EIR has immunity from disputes, criticisms, or any need to reply, because the EIR claims it can ignore, dismiss, or evade us objectors' rebuttals, impeachment, and counters whenever the disputed EIR incorrectly alleges us to be communicating outside what the EIR claims is the permitted scope boundaries of CEQA (which rules, if that were correct, which we dispute, would have to be equally true of the EIR claims we are rebutting, impeaching or countering). Such EIR claims are not the correct interpretation of CEQA (even Guideline #15384, which is both misinterpreted by the EIR, and, if not, is contrary to CEQA itself) and is contrary to other applicable law, including the law of evidence that the courts will certainly apply even if the County mistakenly does not.

Even worse, as explained elsewhere in this Objection (e.g., section I.A.1.b and I.C) and incorporated others, in another incorrect, unprecedented, and disputed claim the noncompliant EIR incorrectly reallocates the burden of proof and persuasion (e.g., section I.A.1.b) on us potential victims. Again, in effect, the disputed EIR is arguing that it can force potential victims to suffer whatever risks the EIR incorrectly claims are "speculative," "unsubstantiated," or false assumptions, even when it admits (as here as to climate change) that its position is equally (or usually worse) as "speculative," unsubstantiated, or wrongly assuming something we must dispute for truth, accuracy, completeness, and reality. Applicable law does not grant such mining gamblers who violate their CEQA duty of investigation and hide their eyes from facts or information in their control any benefit of the doubt on these disputed issues, especially when any such doubt is because they declined to investigate adequately or chose alternate reality over actual reality, and especially when it's not just CEQA at issue for the public, but also all laws applicable to the personal legal and political rights of us surface owners and users living above and around the 2585-acre underground mine. Such evasive, disputed, and one-sided EIR tactics are not proper or compliant, and our rebuttals, impeachment, and counters must prevail. All this presents legal question which, if necessary, the courts must resolve de novo, which means the certain defeat of these EIR tactics, regardless of what mistaken "accommodations" the County may mistakenly tolerate for such disputed EIR/DEIR theories. See section I.A.1.d, I.C, and I.F.5.

1. **Examples of How Climate Change/Drought Impact Wells And Expose Noncompliant, Omitted, And Illusory EIR Mitigations, Which Include Unconstitutional "Takings" (e.g., Allowing the Miner To Ignore Mitigation of the First 10% of the Impacted Wells' Water.)**

By denying the significant groundwater impacts that are demonstrated by my and other objections, not only are the disputed EIR's alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such overlooked, understated, or noncompliant impacts. Besides my above incorporated water related comments in sections P, Q, R, S, T, AF, AJ, AL, and AM, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. Consider the alleged fallback Mitigation Measure in #4.8-2(a) and (b), which I and others dispute as a wild, unsubstantiated guess by the EIR (note that what little and disputed/inapplicable data the EIR/DEIR has cuts off at 2040) that is clearly noncompliant. Even worse, Rise has shown no proof it can afford to replace the depleted water, even under its own disputed standards and even as to undercounted

existing well (as distinct from all relevant existing and future wells as the courts will ultimately require, if the EIR were mistakenly approved), considering its distressed financial condition admitted in its SEC filings. See, eg, Exhibit B and my Objection 254 #2. Also see *Richmond v. Chevron* (where objectors used the EIR applicants SEC filings to prevail) and section I.C.

Even worse than that, this EIR mitigation asserts the right to "take" (in the sense of condemnation or inverse condemnation and "takings" prohibited by the Fifth Amendment and the California Constitution) at least **10% of the well water owned by us surface owners above and around the 2585-acre mine, since we have groundwater ownership rights at least down 200 feet (the EIR and SEC 10K filings admit such legal "surface" above any Rise mineral rights, and we claim more, since groundwater is not a "mineral" owned by Rise, and since we also have legal rights to lateral and subjacent support that include groundwater support [which is prohibited as a type of "subsidence"], as the Supreme Court ruled in *Keystone*.) See, eg, sections I. my DEIR Objection 254 #'s 3.N, 4, and 14, my counters to Master Responses P, Q, R, S, T, AF, AJ, AL, and AM, and others' incorporated similar objections from my Table of Incorporated by Reference Objections. See also the EIR admission (at 2-95) discussed below that the Wolf Creek water level will drop by at least "724-acre feet per year" (the EIR number which we suspect understates the problem) as evidence of such depletion of my Banner Mountain community just uphill from that creek. What the mine proposes to do is deplete our precious groundwater to flush it away down the Wolf Creek as "dewatering" waste, and the EIR disputed recharge theory is wrong and worse, as will be proven, if necessary, at trial as property rights violations and torts (see, e.g., wherever I discuss *Varjabedian* and in section I.F, especially I.F.9), even if the disputed EIR incorrectly refuses to address climate change as too "speculative" for CEQA reporting, which we dispute. (Ask yourself what would happen if the mine drilled a tunnel into my surface owned 200 feet for gold or anything else, as to which the mine has no property rights there. Those same trespass, conversion, inverse condemnation, and other claims should equally apply to taking my groundwater there.)**

The EIR admits (at 2-95) that "The Project is expected to be a "net producer of water through its discharge of approximately 1,371 acre-feet per year of treated mine water to the South Fork of Wolf Creek" [i.e., exceeding the admitted mine "building" "demand" of "approximately 121-feet per year"], none of which is of any benefit to us locals. See, e.g., Varjabedian (forbidding such inverse condemnation and nuisances where locals sacrifice disproportionately for the benefit of the less impacted public). Considering the many objections and disputes about such water quality in my Table of Incorporated by Reference Objections, it is hard to imagine any benefit to anyone else down the Wolf Creek. If us informed locals wouldn't trust that water quality, why should others once they study the risks? See also what dangerous levels of [unreported by the DEIR and only now deficiently addressed in the disputed EIR as an air pollution issue and in unheralded, unintegrated, and disputed Appendices Q, O, and R] hexavalent chromium [plus other toxins] could be added to the list of toxins included in that dewatered groundwater for purported "treatment" with such deficient and noncompliant descriptions of such treatment process). See section I.F.1-4 above and Exhibit C.

Note that the EIR also admits that its mining and dewatering will reduce the local water by, for example: "base flows in South Fork Wolf Creek and Wolf Creek would be reduced from mine dewatering b approximately 1 cfs, which is approximately 724-acre feet per year" (again part of what is flushed downstream in the 1,371-acre feet total.) Lacking

the data, the disputed and noncompliant EIR chose not to disclose, we can estimate that much of that 724-acre feet is from our local owned groundwater that the mine is depleting and to which we object. As my four Objections demonstrate the EIR/DEIR have not proven our groundwater will be recharged as they claim for 80 years by supposedly "current" average rain from 1967 to 2017 recurring despite climate change and drought, especially considering 24/7/365 dewatering abusive depletion (and violations of our property rights as discussed herein.) Note also that such average rainfall is not "current" because it ignores the dry years after 2017.

Likewise, as demonstrated in I.F.9 and elsewhere (including DEIR Objection 254 #'s 3.A, D, E, F, M and N, 4, 5, 6, 8, and 14 and many such incorporated objections from my Table of Incorporated by Reference Objections), impacted surface owners like me personally all have competing property rights to use BOTH EXISTING AND FUTURE WELLS to use our owned groundwater before the mine depletes it, which is especially critical to save our forests even if the disputed EIR were correct in its disputed Master Response 33 about "most" trees' having shallow roots and other purported evasions of responsibility for the dropping water table, which I rebut in my counter thereto. See, e.g., my mining cases like *Keystone and Gray* and my Constitutional property right cases like *Varjabedian.* AS EXPLAINED IN MY OBJECTION TO THE DISPUTED EIR'S MASTER RESPONSE #33 (AT 2-130) BELOW (EG, "MOST VEGETATION IN THE PROJECT ARE [SIC]NOT GROUNDWATER DEPENDENT."), ALL VEGETATION IS WATER DEPENDENT in ways the disputed EIR/DEIR wishes to disregard. (In any case as *Keystone* explains, surface owners personally have groundwater property rights that cannot be evaded by miners as they seek to do with the general public focused too narrowly on CEQA issues. Just as the nut tree and fruit farmers in valley drill wells to save their trees, we will eventually have to do the same, or else we will all end up living in a dead forest just waiting for the next fire to ruin us. Also, while different vegetation roots have different depths (eg, the trees the EIR cherry picks to name with shallow roots are not all the trees on my property, and many have deep roots that need my owned groundwater.) What the EIR fails to address (and that we surface owners dispute) here or in Master Response #33 is that new wells for our owned groundwater become the only solution to preserve our vegetation as the ground dries up from climate change (and cited EIR causes) making an outrageous mockery of both the EIR's disputed groundwater recharge claims and its disputed claims that it can take all our groundwater it wants because the resulting adverse consequences are too "speculative" to require any response.

Note that the EIR (at 2-95) ignores much of the most important and relevant parts of its "selected" [i.e., selfish and flawed] citations from "the NID 2020 Urban Water Management Plan," addressing water restrictions in "stages 1 through 5 of the NID Drought Plan only impose restrictions to outdoor irrigation on treated water customers and stage 6 of the NID Drought Plan maintains health and safety use of water for treated water customers." But see NSAQMD's Agency Letters 12 (e.g., at 12) and 11, demanding that the frequent daily NID watering of its toxic (e.g., asbestos and, I worry, hexavalent chromium) fugitive dust must continue without regard to drought rationing. Consider both the legal and political consequences of the County making us watch the miner so watering such toxic dust 24/7/365 (especially in the summer, says the NSAQMD) during NID rationing, further reducing the water we need. That is another reason why all of us impacted locals who can afford to do so will drill defensive wells while we continue to resist

the mine with our legal, law reform, and political remedies. As to the NID WSA see its Agency 10.

EIR Master Response 16 also adds a disputed subsection called "Groundwater and Surface Water Interaction" (at 2-94), and I rely upon the more expert objectors I incorporated on the subject. Nevertheless, among other errors, that response focuses on EIR Appendix K.3/Figure 4-5 contention (at 2-94-95) that (i) "the regional groundwater flows westerly past the Project site" and into the mine workings origin[ating] from the entirety of the approximately 4000 ft vertical thickness of the rock mass," and (ii) other contentions about "the groundwater flow from the deeper rock units to the mine workings will not impact the shallow groundwater level." HOWVER, THAT EIR ADMITS THAT THE "GROUNDWATER FLOW FROM THE SHALLOWER ROCK UNIT TO THE MINE WORKINGS COULD LOWER THE WATER LEVEL OF THE SHALLOW GROUNDWATER SYSTEM IN THE VICINITY OF THE MINING ZONE." (Emphasis added) FIRST, this ignores our many local issues (i.e., above and around the 2585-acre underground mine where we live and own such groundwater, as distinct from the mine site DOWNHILL where they pump out the water) about which we complain in our objections. SECOND, the alleged, misleading, and incorrect justification for this depletion of our local groundwater is that this somehow produces a "BENEFICIAL USE AT SURFACE (RATHER THAT FLOWING UNDERGROUND)" [emphasis added]. Stated another way, this disputed EIR erroneously claims that we LOCAL OBJECTORS SHOULD BE GRATEFUL BECAUSE OUR LOCAL GROUNDWATER BECOMES SURFACE WATER FLOWING DOWNSTREAM IN THE WOLF CREEK TO SOME OTHER COMMUNITY. See my dispute of that bogus claim above and elsewhere, including where I demonstrate that we locals own that groundwater (e.g., *Keystone*) and so gifting our property away to some distant community creates both inverse condemnation and other claims (e.g., *Varjabedian)* in favor of us locals and predictable increases in future competing wells for reaching our now harder to access local groundwater. So, when the EIR claims dewatering as a benefit, the question is benefit to whom? Clearly, not to us locals, but also, I argue not to those at a safe distance because ultimately us locals are entitled by the State and Federal Constitutions to such compensation for our losses. Because the EIR miner cannot flush away our local groundwater downriver from the mine pump out on the surface somewhere else CEQA requires (e.g., section I.C) full disclosure of all the impacts, which the EIR not only fails to do, but in ignoring our loss it brags in a misleading way about the benefit of the gifts the miner made elsewhere with our local groundwater. Again, this constant, noncompliant EIR "bait and switch tactics," manipulation, and confusion is outrageous. Regardless of the disputed EIR's misdirection, keep focused regarding the unexplained differences between (i) the Rise wholly owned mining project land downhill (i.e., the Brunswick and Centennial sites), and (ii) the surface land and groundwater in, above, and around the 2585-acre underground mine where thousands of us live uphill, including on Banner Mountain. THIRD, even if the source of the EIR's disputed Appendix K.3 were qualified, credible, current, and relying on relevant data, that is not only (a) inconsistent with some of the other disputed EIR analyses (eg, talking about the fractured rock paths of the water, as contrasted here with a description that makes it sound like there are solid rock dams that totally prevent water flows), but also (b) not a substitute for the actual data from the relevant areas that the EIR has declined to investigate, analyze, and study directly in the right places (including the new, uncertain, and deeper mining areas

along 76 miles of new blasted tunnels). Apparently, the disputed EIR prefers to exploit often incorrect, outdated, or irrelevant theoretical models and inapplicable studies, instead of considering the more relevant realities that would be available to any such investigator whose goal was discovering such actual realities without fear of discovering the "inconvenient truths" that the EIR should be revealing in compliance with its neglected duties of investigation and disclosure. See I.C, I.A.1.d(viii), and I.F.5.

Thus, the disputed Mitigation Measures in #4.8 fail to address such core issues, which is that all of us potential mine victims have groundwater rights (e.g., I.F.9 and *Keystone*), including the rights of all of us to drill new wells (NID and other governmental permit issues can be debated elsewhere and, in any event, have legal, law reform, and political solutions that our local resident voters can solve.), as well as the rights to lateral and subjacent support that includes such groundwater. See Id. and EIR at 2-95, stating by citation to Appendix K.9 that "property owners may also choose to retain and continue using their water well in addition to NID potable water if they desire." All of us local objectors who need to save our forests around our homes can be expected to dig new wells that, at least until the relevant decisionmakers realize that the mine is the problem, not our local objecting community. As my objections and others keep saying, the issue is not just the East Bennett Road and some other undercounted existing wells, but also all the existing wells above and around the 2585-acre mine (part of what the County Economic Report also undercounts but as 300 wells; see Exhibit A hereto), plus all the new added well that will become necessary to save our trees and vegetation from becoming dead firetraps. See section I.F, including discussion of County General Plan 17.12 (section I.F.3) and the above water related objection incorporated from my Table of Incorporated by Reference Objections or Exhibit D.

There are thousands of us residents and users just on Banner Mountain alone above and around the 2585-acre mine. Whether we use existing or new individual wells or share community wells, the ultimate choice is that gamble the EIR proposes to force on us without compliant, "good faith reasoned analysis" (e.g., *Banning, Vineyard, and Costa Mesa*) and "common sense" (e.g., *Gray*), because the disputed EIR incorrectly claims our objections are too "speculative" for CEQA, ignoring our rights to complain about violation of our property rights (e.g., I.F.9) and to rebut, impeach, and counter EIR errors, omissions, and noncompliance (when those EIR charges apply much more to the EIR/DEIR itself, which have the burden of proof (I.A.1.b) and the CEQA duty of investigations and disclosure (e.g., I.C). Consider this from our victim perspective: either (i) the disputed EIR recharge works for 80 years despite 24/7/365 abusive dewatering to flush our groundwater away down the Wolf Creek, or (ii) the only thing that will save us from living in a dead forest firetrap the mine helped create will be our existing and new competing wells that mitigation or litigation will impose on the mine and which Rise admits in its SEC filings and elsewhere that it could not afford. See Exhibits B and A, as well as my DEIR Objection 254 #3.D, E, F, M, and N, 4, 5, 6, and 14, noting, for example, that the DEIR (at 6-14) admits that the mine would not be economically feasible even if approval conditions or later law reform or political remedies cut its hours from 24/7/365 to normal hours (as voters can be expected to do if the mine is approved.) See also Grass Valley Agency Letter 8, CEA Objections Group Letters 6-9 and 21, and Wells Coalition Group Letter 27/28. To anyone who may oppose our following the new well drilling survival defense example of the desperate tree farmers in the valley (or from NID drought rationing

made worse by the daily fugitive dust watering that the NSAQMD Agency Letters 12 (at 12) and 11 insist have priority), I ask what is our alternative? It is certain (not "speculative") that the forest in which our Nevada County lives needs water to survive, that climate change means dry stresses for us, and that to avoid becoming a massive firetrap, a problem that is not "speculative," because we can see the first phase already happening with dry trees dying in our forests here, we need wells for the groundwater we objectors own. If climate change dryness is worsened by 80 years of abusive 24/7/365 dewatering, and not saved by illusory "recharge" theories from the EIR/DEIR, what is our alternative? Clearly, nothing the disputed EIR compliantly contemplates, analyzes, or mitigates such obvious risks, threats, or impacts, and us potential victims all contend the EIR mining increases such risk, threats, and impacts as described in our such objections, without any net benefit to anyone besides this Canadian miner's shareholders. How then can any responsible government dare force such risks, threats, or impacts on us resident property/groundwater/existing or new well uses, voters, and potential victims with remedies to tolerate that gamble?

2. Some Other Climate Change Impacts.

As discussed in my climate discussion in section I.A.1.a(vii), this project has a significant adverse impact on energy use and GHG, and by itself obstructs the County's goals and plans. See, e.g., *Richmond v. Chevron* and other cases addressed in I.C and D, such as *League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2022), 75.Cal. App. 5th 63 ("**Save Lake Tahoe**") (finding the eir's greenhouse gas **[GHG]** mitigation measure was inadequate because it **deferred** determination to an unknown future time, requiring the applicant to mitigate impacts IF the project conflicted with relevant future emissions targets adopted by the state, relying on performance standards that do not yet exist and may never exist so that any determination of the impact's significance is deferred to an unknown time and where neither the county nor the applicant were committed to mitigating any such impact. Also, the eir **failed properly to consider whether renewables could be incorporated into the Project in the energy impact discussions,** as noted below.) According to Save Lake Tahoe, to be compliant the CEQA analysis of energy impacts requires both whether renewables can be incorporated into the project, and (if significant impacts) whether renewables would reduce the impact. Also, for significant impacts, the EIR must consider all feasible mitigation measures. The EIR fails these tests, among other things, by such deferrals, by such lack of analysis and denials of such climate change matters, and by ignoring the renewables issues.

As to confirming the "significance" of these energy issues that Grass Valley calculated in its Agency Letter 8-18: "The [IMM] Project's annual energy use would represent an increase of approximately 15 percent in County-wide electric usage for a single industrial use." As Grass Valley said (at Id.): "This energy use should be recognized as a significant impact of the proposed project and mitigation should be incorporated to reduce this impact." That by itself not only defeats the Nevada County Energy Action Plan (EAP), but it depresses any willingness of mine opponents to sacrifice in their own energy usage, because our sacrifices would benefit this objectionable mine instead of our environment. Indeed, as I explain in detail with my rebuttal of the EIR/DEIR on its unrealistic and grossly understated generator use to cover PG&E PSPS, system failures, weather events, and other causes of blackouts increasing with progressive climate change

impacts, the EIR's projected energy use in incorrectly analyzed. See, e.g., my objections in section II to EIR Master Responses 16, 25, and 26-28 and my objections in section III to EIR Response to Ind. 254-84.

U. Objection to Master Response #17—Meterologial Data Used in HRA [Health Risk Assessment for air pollution] (EIR at 2-96).

My DEIR Objection 254 addressed various such EIR/DEIR issues, including their key fallacy that the mine can pollute the air as much as it wants as long as it is far enough away from the closest applicable "weather station for AERMOD" "pre-processed met data" to avoid detection. Why is the burden on us local victims to prove local air pollution by AERMOD, rather than the burden of the EIR to prove there is no local cause for concern about air pollution. See section I.A1.b confirming the burden of proof is on the disputed DEIR/EIR. In other words, rather than trust unreliable and irrelevant data from distant AERMOD sites that are not relevant (i.e., Blue Canyon, Auburn, or Beale Air Force Base 17-22 miles away), why not compel the EIR to find some reliable alternative means of addressing the threat, especially where, as here, there are compelling concerns about dangerous conditions? Even it if the case (which we dispute) that we victims had to suffer the unknown risk for lack of a nearby AERMOD weather station, that should not eliminate such obvious concerns when there are other solutions to improve relevant data and expose inconvenient truths that they EIR wishes away (once again) as too "speculative" for CEQA consideration. Stated another way, no responsible government should force its potential victim residents to gamble on such suspected but not AERMOD proven health risks for a no net benefit (to them) private mine or to suffer the consequences of unknown dangers that should be the miner's burden to prove it has eliminated. Here the EIR (at 2-96-97) celebrates the alleged nonresponse of NSAQMD (as distinct from a reasoned approval) as permission to pollute without sufficient monitoring in unauthorized reliance (by nonresponse) on the irrelevant and inapplicable Blue Canyon site data no one should tolerate as sufficient.

For example, as discussed above in my objections to hexavalent chromium as a water pollutant (Exhibit C hereto, and sections I.F.1 and I.E.1-4), unheralded and not integrated in the EIR air pollution discussion Vol. IX, Appendix R admits that hexavalent chromium is an air pollutant from the fugitive dust released in the process to create that toxic cement pastes to shore up the underground mine and possibly pollute the dewatered water flushed into the Wolf Creek, s debated with respect to Appendix Q and O. (Note that nowhere in the main DEIR/EIR text does it even analyze the toxic hexavalent chromium water pollution as a threat (or sufficiently as an air pollution threat) except buried at the end of this long EIR in Vol. IX, Appendix Q, O, and R, a fatal omission for the EIR that is supposed to clearly address all this (and fails to do so) in its Hazards and Hazardous Materials section with "good faith reasoned analysis" and "common sense" (e.g., *Banning, Vineyard, Costa Mesa, and Gray*), as I demonstrated in DEIR Objection 254 #'s 3.A, B, C, E, G, H, and 7 as to water, and 3.J and 10 as to air, citing many damning studies in Exhibit C hereto and on the EPA website and illustrated by that hexavalent chromium killing the town of Hinkley, CA, and many of its residents, as shown in the movie "*Erin Brockovich*.") Will Rise warn its workers that handling the containers of toxic hexavalent chromium is like handing bags of asbestos? Will they wear respirators? If ask because, in my considerable experience, often when a foreign mine employer does not even protect its employees from such risks, history shows that such employers often abandoned the mine or filed bankruptcy to cover their retreat to avoid paying their liabilities to their victims. See also the

exposures discussed in *Varjabedian* and other cited cases regarding any violation of the property rights of us surface owners above and around the 2585-acre underground mine. Even if Rise were willing to pay them, its admitted SEC filings (Exhibit C and DEIR Objection 254 #2) shows that it has insufficient financial capacity to satisfy its mine related obligations, much less any additional liabilities, especially as they aggregate over 80 years. Also, hexavalent chromium is just one of the dangerous chemicals at issue, and I defer to other objecting experts as to the others, which I suspect follow the same objectionable patterns. See my incorporation of related comments in the Master Responses, including 18, 19, and 20 below.

Also see my earlier objections to the frequent daily watering 24/7/365 of the toxic fugitive dust to suppress such air pollution of concern to the NSAQMD Agency Letters 12 (e.g., at 12) and 11, among other incorporated objections from my Table of Incorporated by Reference Objections or Exhibit D. While the EIR/DEIR purports to claim that it will suffer the same NID drought rationing as the rest of us neighbors, that NSAQMD objection 12 (at 12) makes it clear that such dust suppression of asbestos and other toxins must have priority. As to NID WSA see NID Agency 10. However, in such cases us local victims can fashion some other court remedies that do not empower the EIR miner to take our share of the rationed water to suppress its deadly dust. This is also another reason why it is not speculative to expect us surface owning locals impacted by the EIR dewatering and mining to drill new wells to compete for the groundwater we own. None of this is sufficiently investigated, analyzed, or mitigated by the disputed EIR/DEIR.

V. Objection to Master Response 18—Air Quality Thresholds (EIR at 2-97).

I incorporate here what was just stated in my objection to Master Response 17 above and to 19 and 20 below, and sections I.E.1.c and 7, and as well as my Objection 254 #'s 3.J and 10. More importantly, I have detailed my objections to the EIR's addition of "significant new information" at it Appendix R on hexavalent chromium air pollution (and water pollution) in my objections below to the EIR's Response to Comments Ind. 254-1 and elsewhere, including as to the many studies on the EPA website warning about that carcinogen. See also my Exhibit C hereto. Because the EIR is trying (and failing) to cover up that hexavalent chromium threat I raised in my DEIR Objection 254 (e.g., #'s 3.A, B, C, E, G, H, and J, 7, and 10), the EIR fails to substantiate the disputed opinions it cites on the topic in its Response To Comments Ind. 254-1 and elsewhere.

I defer again to the more expert objectors on this technical subject which I have incorporated by reference. See my Table of Incorporated by Reference Objections, including NSAQMD Agency Letter 12 and 11, where we all face a toxic air pollution calamity unless the mine's toxic (e.g., asbestos and CR6) dust is suppressed by frequent daily NID watering, even during droughts. Also, as Rise has admitted in its SEC filings (see Exhibit A hereto and DEIR Objection 254 #2), this miner has insufficient resources to achieve its EIR aspirations, causing me and others reasonably to ask the same question raised by the going concern qualifications to its financial statements: what is the impact if the miner is unable to function because of inadequate working capital?

Also, what I know and offer to prove is this: no one will buy any home at any fair price that is located above or around the 2585-acre underground mine based on this EIR/DEIR, especially where it says, in effect as here, don't worry your cancer or other health risk is below the threshold that they consider dangerous for a 30 year exposure period, which they claim (and

we dispute) is the average residency for 90 to 95% of exposed victims. See Exhibits A and C and even the otherwise disputed County Economic Report survey of many local real estate brokers who predicted loss of property values, as well as Nevada County Association of Realtors Group Letter 15. (Apparently, the rest of those victims here longer, whether 10% or more, will just have to suffer the longer cancer and other risks without even disputed reassurance for the benefit of the miner's shareholder profits.) The problem, of course, is that within the next 80 years we will discover the hard way, as was true of asbestos and many other such toxins, that such thresholds and time periods are wrong, and, like many miners in my experience, when the victims claims (typically uninsured) become too many and burdensome to stall or payoff, the foreign miners take their profits and retreat across the border, either with or without a bankruptcy filing here (or with a Canadian CCAA insolvency filing and a US Chapter 15 proceeding to force US creditors to defer to the foreign insolvency proceeding.) See my DEIR Objection 254 (e.g., #1 and 2).

W. Objection to Master Response 19—NSAQMD Criteria Pollution Thresholds During Operations (EIR at 2-102).

Again, I incorporate my objections and others to this Master Response which overlaps with the foregoing Master Responses 17, 18, and 20, my objections in sections I.E.1.c and 7, as well as my Objection 254 #'s 3.J and 10. Again, I defer to the more expert objectors for the technical issues that I so incorporated by reference. However, I note that the EIR "Conclusion" here states: "The Project requires the mandatory NSAQMD mitigations," although I and others dispute the claim that such impacts of "emissions of criteria pollutants [are] … less than significant after mitigation after implementation of mitigation." (at 2-104). See section I.D. Also, as discussed throughout these objections I object to the EIR mitigations claims (see section I.E), including about disputed EIR claims far more speculative and unsubstantiated than my objections on which the EIR objects on that basis. See section I.F. 5 and 6.

X. Objection to Master Response 20—Conservativism of Metals Assumptions [in the HRA for Air Pollution] (EIR at 2-104).

Again, I incorporate my objections and others to this Master Response which overlaps with the foregoing Master Responses 17, 18, and 19, and sections I.E.1.c and 7, as well as my Objection 254 #'s 3.J and 10. Again, I defer to the more expert objectors for the technical issues that I incorporated by reference. **However, once again this Master Response 20, like the DEIR Hazards and Hazardous Materials section, fails even to mention hexavalent chromium in its listing of relevant toxic substances, much less to address my DEIR Objection 254 thereto, including #'s 3. A, B, C, G, and H, and 7. See Exhibit C hereto. Even worse, hidden away (i.e., noncompliant with CEQA disclosure requirements I addressed above and in DEIR Objection 254 #3.E [and section I.A.1.d(viii)] that forbid such "hiding the ball" tactics) EIR Vol. IX, Appendix R addresses hexavalent chromium (with asbestos and others) as one of the air pollutant in "fugitive dust" (although incorrectly, as we dispute its threshold analysis), requiring frequent daily watering to suppress such toxic dust, as discussed in NSAQMD Agency Letters 12 and 11. However, the disputed EIR fails to address such impacts here or elsewhere in the main body of the EIR, even as to hexavalent chromium water pollution risks on which I especially focused in my public hearing comments and DEIR Objection 254 (e.g., #'s 3.A, B, C, E, G, and H, and 7.) See also my**

objections to EIR Response To Comment Ind. 254-1 below and Exhibit C hereto. Under the circumstances, this EIR omission and concealment of such "significant new information" in Appendix R can now only raise more serious credibility challenges for the whole EIR, especially when added to all the other credibility issues I address. See CEQA requirements for revision and recirculation in section I.A.1.c herein. Insisting (e.g., in its conclusion at 2-105) that the EIR/DEIR analysis is "conservative" is incorrect and misleading at best.

Of course, as explained in the previous air pollution discussions, I continue to object to the disputed EIR's response to the continuing issues regarding "Arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium." As discussed above the EIR/DEIR "selective" (perhaps cherry-picking) sampling is insufficient to prove its safety, even with a 100% "bioavailable" margin. Also, throughout the disappointing and worse relevant history of environmental noncompliance by the exploiting mining industry, there is also a parallel hazard of "human error" causing many disasters for their local communities. From what I have seen and learned from my long experience in the resulting bankruptcies and mine abandonments (eg, leading to the more then 49,000 CA abandoned mines on the EPA list, as discussed in my DEIR Objection 254), the County should add in a larger margin for error just on account of that contributing risk factor alone.

Y. Objection to Master Response #21—Conservatism of Silica Assumptions (at 2-105).

Again, I incorporate my objections and others into this Master Response, which overlaps with the foregoing Master Responses 17, 18, 19, and 20. Again, I defer to the more expert objectors for the technical issues that I incorporated by reference. Many of my concerns about asbestos in #22 apply here as well to silica and are also incorporated herein.

Z. Objection to Master Response #22—Conservatism of Asbestos Assumptions (at 2-107).

Again, I incorporate my objections and others to this Master Response, which overlaps with the foregoing Master Responses 17, 18, 19, 20, and 21Again, I defer to the more expert objectors for the technical issues that I incorporated by reference. See my Table of Incorporated by Reference Objections. Many of my concerns about silica in #21 apply here as well to asbestos, although what is unique about my objections to the disputed EIR/DEIR discussion of asbestos is that I know from intimate, extensive, first-hand bankruptcy experience the horrors of asbestos and how and why it has bankrupted not only the asbestos mining industry, but many in every industry including asbestos as a material portion of its products. Indeed, even minor (below EIR threshold amounts) have bankrupted or broken companies selling products or services with even minor amounts of asbestos, such as, for example, including asbestos in car brakes, on painter tape, etc. Massive buildings have been gutted and reconstructed in their interiors because of the presence of even asbestos on beams or other materials inside sealed walls. The point is that this extremely lethal, although slow acting, cancer causer is by its presence in any amount perceived by most people and almost all businesses and insurers as unsafe at any level and, in any event, also as lethal as a factor in valuing property where it is (or even may be, such as by blowing fugitive dust) present. Indeed, my extensive experience in insurance insolvencies has enabled me also to address how asbestos has forced many insurers

(even the once formidable Lloyds of London, restructured as Equitas) into rehabilitations, insolvency proceedings or liquidations.

Not only did the mass of injured plaintiffs find experts to prove their asbestos cases to juries, but those victims won enough cases at such huge defense costs to cause not only all those corporate bankruptcies, but also to put many casualty insurers out of business and force even Lloyds of London to restructure as Equitas. Meanwhile, as was the case with cigarettes, asbestos continued to be sold without being banned by regulators long past the time when juries were uniformly awarding massive damages to victims and causing such bankruptcies.

Also, as discussed above and elsewhere in many objections, the 42 samples from 19 gold exploration drill holes from "various lithologies" "at the Idaho-Maryland Mine Project" (not clear where, but apparently not where it matters most for us in the 2585-acre underground mine) reportedly were tested by PLM and TEM to produce results that cannot be reliable predictors of future asbestos impacts. Samples mentioned in this Master Response are also insufficient to support the EIR/DEIR predictions, especially since their sources and relevance are not clear or relevant, since the biggest impact threat is from the new mining areas that (apparently) were not tested and cannot be assumed to be uniform with those tests, since according to the EIR there are to be more than 72 miles of tunnels to such new mining areas, as one indication of the probability of change from the old mine.

As I mentioned in my introduction, and as illustrated with such asbestos, it is wrong and worse for the disputed EIR/DEIR to assume that such samples reveal the threats, threats, and impacts we face. Without acknowledging that reality, but apparently appreciating the EIR/DEIR's faulty analysis, AFTER APPROVAL and before underground gold mining (apparently, as distinguished from commencement of 76 miles of tunneling to reach the new mining areas, which seems to be a dangerous and objectionable safety loophole), the EIR promises (at 2-110) "intensive PLANNING EFFORTS will be conducted as required by the ASUR Plan and as required to meet state and federal requirements and achieve safety, environmental, and economic goals," citing ASUR Plan 6.0 at DEIR Appendix E.2. I and other objectors dispute the adequacy of the ASUR Plan and protest delaying such testing **UNTIL AFTER SUCH APPROVAL. That deferral is not compliant with CEQA (see section I.C above) as well as the authorities that I cite like Richmond v. Chevron in section I.D, I.E.3, and throughout illustrations in I.F.**

Please consider what happens then, even NSAQMD catches onto the asbestos impacts, if Rise **"or any potential successor in interest to the mine" (see the objections to Rise's possible "flip" plans to "someone behind the curtain," because Rise's SEC filings admit an insufficient financial ability to accomplish any of its material promises or mitigations; see Exhibit C and DEIR Objection 254 #2) has to stop or redirect the mining when it finds the prohibited asbestos. See my DEIR Objection #'s 255, 254, and Exhibit A, B, and C hereto. The health, welfare, and property values of our community, and especially those living on the surface above and around the 2585-acre underground mine, would already be forever changed and harmed by what the disputed EIR activities occur before the predictable asbestos (and other toxic) discoveries (assuming the laws are obeyed and enforced) stop or change the mining plans. Consider what happens if this mining creates another Centennial toxic mess. See, e.g., NSAQMD Agency Letters 12 and 11 describing the air risk of asbestos and other fugitive dust that needs to be suppressed by frequent daily watering, besides the bigger water pollution risks addressed by many objectors in my Table of Incorporated by Reference Objections and Exhibit D.**

How could this Canadian miner's greed for shareholder profits justify allowing them to gamble, despite all our objections, on such noncompliant, deferred, and dangerous post-approval planning and testing maneuvers? Remember that by the time the asbestos or other compliance or mitigations begin, all the hazardous and impactful initial work will have begun (eg, massive dewatering, reshoring the mine with toxic hexavalent chromium cement paste, and earlier preparation admittedly in EIR Vol. IX Appendix R, creating such fugitive dust that we also consider a menace), and other objectionable activities, risks, and impacts. By the time such deferred, "good faith reasoned analysis," impacts, and insufficient mitigations expose the need to stop this mining, many risks, threats, and harms will have already trashed our property values with stigmas and worse, and negatively impacted the lives of everyone in our community, especially those of us living on our surface properties above and around the 2585-acre underground mine. If the mining stops, how will Rise afford to remediate the harms it has caused, even if it was willing to do so? This is one reason why there are more than 49,000 abandoned California mines on the EPA list and so many historical mining bankruptcies to evade those victims who pursue political and legal remedies. See my other complaints herein and in my DEIR Objections 254 and 255, where the EIR/DEIR seeks to defer planning, testing, mitigation, and other promised actions until after approval, basically "hiding the ball" (section I.A.1.d(viii)) on "significant new information" that should defeat the disputed EIR, unless it were substantially revised and recirculated (section I.A.1.c and I.C), and then, after full and proper testing, somehow tolerable, a result no one seems to expect, but which may explain all these deferral delaying maneuvers in the disputed EIR/DEIR. E.g., *Richmond v. Chevron* and section I.D.

AA. Objection to Master Response 24—Project Construction Schedule (EIR at 2-111).

I object to any schedule that requires disputed EIR approval BEFORE presenting to objectors the information, plans, and evidence that should be provided in the disputed EIR BEFORE such approval, not after. As explained in the prior objections to Master Responses 22 and 23, for example, delaying/deferring the testing, analysis, mitigation, and monitoring of asbestos and similar delays in revealing toxic or hazard information, risks, and threats is intolerable, as well as "hiding the ball" (section I.A.1.d(viii)) on "significant new information" that should defeat the disputed EIR, unless it were substantially revised and recirculated (section I.A.1.c and I.C). E.g., *Richmond v. Chevron* and section I.D, as well as other objections herein or in my Objections 254 and 255 and those of other potential victims I incorporate herein or in my Objections 254 and 255 and those of other potential victims I incorporate. Such EIR deferrals are an inappropriate or worse means of avoiding such meritorious EIR objections. How can there be a "good faith reasoned analysis" with "common sense," as required by CERA (section I.C. and D and DEIR Objection 255) and the courts (e.g., *Gray, Banning, Vineyards, and Costa Mesa),* if the disputed EIR can evade accountability by such delays until after approval? This disputed EIR tactical misuse (section I.A.1.d(viii)) of delay/deferral appears designed to obstruct our opportunity to make informed objections BEFORE APPROVALS that could impact our self-defense rights from this dangerous mine, both as CEQA citizens and as surface property owners above and around the 2585-acre underground mining. Considering the many disputed EIR errors, omissions, noncompliance, and objectionable tactics, it is essential that we have a

full opportunity to explain to the County what they need to know before they mistakenly approve the disputed EIR and trigger all the resulting challenges that we should all wish to avoid.

Consider the following illustration, only slightly exaggerated to make the point. Assume that this EIR had said, in effect, "(1) We believe the DEIR is sufficient, correct, and compliant with CEQA and that all objections thereto will be solved by this great plan and related mitigations we'll get approved by the applicable authorities AFTER the County approves the EIR, (2) those deferred plans and mitigations must satisfy the legal requirements, and, as such, future governmental decisions will eventually confirm what needs to be done as a condition to the implementation of the relevant future mining actions and mitigations, and (3) we'll do whatever we are required to do in the future in accordance with those future governmental approvals." That improper deferral is how this noncompliant EIR is often improperly handling the difficult compliance issues raised in our many EIR/DEIR objections. See, e.g., section I.C and D (e.g., Richmond v. Chevron), I.E.1-5, and illustrations in I.F and from my Table of Incorporations by Reference Objections, such as noted in Exhibit D. The EIR deals with some issues in disputed EIR responses to DEIR objections, and then they defer other matters to some future process after EIR approval, apparently, whenever the EIR has no even plausible response, mitigation, or excuse, such as by falsely claiming that our objections or issues are too speculative, unsubstantiated, or uncertain or too far outside the scope of CEQA to require (in their erroneous opinion) an EIR response (which we constantly dispute in each specific case in section III as indicated, based on our legal foundation set, for example, in sections I.A.1.b and d, I.C. I.D, and I.E3 and 4, I.F.5.). Deferral cannot satisfy the EIR's burden of proof now. See section I.A.1.b. Revision and recirculation is essential. See, e.g., section I.A.1.c and I.C.

Why are such deferrals of required EIR analyses, data, mitigation and other plans, and actions noncompliant and such a problem? One of the many reasons, besides that it is not compliant with CEQA (see section I.C and D) and other applicable law, is that such deferrals prevent us potential victims from alerting the County about all the reasons it should deny such approval to the mine and EIR/DEIR as written. See Richmond v. Chevron. In effect, in defiance of CEQA, which is supposed to allow us potential victims to make FULLY informed environmental evaluations of a proposed mine plan and mitigations, this disputed EIR deferral scheme would disable us potential victims from being able to make FULLY informed objections and, thereby, would eliminate us victims from the process. That shift from public rights to object at the core of CEQA is not satisfied by deferrals in favor of governmental officials, who often won't share our pain and see the issues the same way, forcing us potential victims to legal, law reform, and political exercise remedies to prevent this evasion and violation of our rights, a divisive path best avoided and highly inefficient, slow, and expensive. Another reason to resist deferrals is that this EIR miner knows (as admitted in Rise's SEC filings, see Exhibit A and B and my DEIR Objection 254 #2) that it cannot afford to accomplish any of the material things and mitigations to which it aspires in the EIR/DEIR. Therefore, if Rise wishes to get an approval now, subject to later governmental conditions, so that it can "flip" the approved Project to someone else (i.e., presumably, consistent with selfish, industry risk management practices, another financially irresponsible, "shell" company, such as a subsidiary of a major foreign mining company perhaps already "hiding behind the

curtain;" perhaps one that has reasons to play behind the scenes.) One such industry practice that creates such practical risks for communities like ours includes the following strategy: (i) the shell subsidiary (often a Nevada corporation for strategic miner defense reasons) only owns the disputed mine and whatever investment funds the parent company (often foreign again for strategic defense reasons) gradually doles out to cover current expenses until the parent decides to stop, (ii) when the mine is no longer attractive, whether because it's not sufficiently profitable, it's subject to burdensome litigation claims, government investigations, or other "complications," the parent stops funding and the mining stops, (iii) depending on their risk assessment the parent (and, if under attack, the subsidiary) retreats and deploys the usual bankruptcy and cross-border insolvency tactics as needed, such as use of Chapter 15 to make US courts defer to the "home court" foreign insolvency proceeding, and (iv) the mine is abandoned as a liability, leaving local mine victims and their community much worse off than when the project started. Maybe Rise is an exception, but they have done nothing to reassure any critics. See, e.g., objections like section I.A.1.d(viii) raising credibility questions about disputed EIR/DEIR tactics.

Besides the already mentioned example of asbestos in the previous objections to Master Response 22 and 23, consider how this works in practice. One example is addressed in my objections above to Master Responses 13-16, 29, 33, and 35 (and in my Objections 254 and 255 and those of other potential victims and surface owners and users above and around the 2585-acre underground mine), such as regarding groundwater depletion/supply concerns, deficient and financially infeasible mitigations, and water and air quality and hexavalent chromium (which the EIR/DEIR generally ignores and obscures, except to a limited and insufficient extent as an lethal air [not water except in disputed and deficient Appendices Q and O] pollutant in unheralded Appendix R). The disputed EIR/DEIR has ignored the needed additional monitoring wells in more places, plus more feasible replacement well water offers for everyone like me living above or around the 2585-acre underground mine, including those who will want to tap the groundwater they own with future wells in competition with the mine when climate change droughts combined with massive 24/7/365 dewatering for 80 years, and wasting of NID water on toxic dust suppression during droughts, all making such new wells necessary to save our forests from dying and becoming a firetrap (as the tree farmers have been doing in the central valley). Reality will make the already economically infeasible mine become more infeasible, thereby making all the "aspirational" safety accomplishments and mitigations illusory, not to mention those additional ones that will be required by the courts if this EIR were approved.

However, if those disputed EIR/DEIR issues are so deferred until after EIR approval, by the time those issues are resolved as resistance continues, the mine will have been dewatered and flushed somewhere else down the Wolf Creek and the impacts will have already begun. For example, the toxic hexavalent chromium paste in the mine shoring will already be in the mine as our dewatered groundwater passes by. See my Exhibit C (and other DEIR Objection 254 #'s 3.A, B, C, E, G, H, 4, 7, and 14) discussions of the hexavalent chromium water pollution that killed Hinkley, CA and many of its residents, as illustrated in the movie, "*Erin Brockovich,*" a sad lesson that this EIR mine seems determined not only to repeat, but not even timely to debate as part of the EIR approval process, incorrectly neglecting and dismissing the topic in disputed EIR Response Ind. 254-1 and obscured Appendices Q, O and R. Indeed, because the DEIR insisted on ignoring

such hexavalent chromium water pollution entirely, and the noncompliant EIR evades without "common sense" "good faith reasoned analysis," even after my detailed DEIR Objection 254 complaints about its errors, omissions, and noncompliance in the DEIR, it seems that the EIR prefers evasion to attempted compliance (like many other disputed EIR/DEIR flaws), thus, if the EIR is approved, forcing that issue (and many others) to be addressed with legal, law reform, and political remedies, without even being properly debated before the County decision-makers.

BB. Objection to Master Response 25—Nevada County Energy Action Plan (EIR at 2-112).

I defer to other incorporated objections on this subject, including by more informed and expert objectors in my Table of Incorporated by Reference Objections. See also *Richmond v. Chevron a*nd section I.C and D for the standards that should apply to require more and better impact and other disclosure and mitigation than exist in the disputed EIR/DEIR. For example, rather than debate on the merits the EIR/DEIR's incorrect dismissal of climate change and other impacts for which it has no credible, appropriate, or compliant answer, the EIR/DEIR asserts incorrect legal excuses, such as that no such EI/DEIR response is required on such "speculative" or unknowable matters. To counter such legal errors, I focused at length in section I.C (see also my DEIR and EIR Objections 255) on the 2018 Guideline Amendments Explanation, where the Guideline authors explain how and why climate change and other such EIR noncompliant issues cannot be excused from such full CEQA required analysis under applicable law. However, here, as in many other places in the disputed EIR/DEIR, the EIR incorrectly asserts its unsubstantiated and disputed opinions (typically just EIR/DEIR speculations or assumptions with no sufficient foundation) that it is entitled just to dismiss such issue in dispute, which the noncompliant EIR/DEIR announces without the "good faith reasoned analysis" and "common sense" required by the applicable authorities, such as *Gray, Banning, Vineyard, and Costa Mesa*. Besides such errors, omissions, and other noncompliance in this Master Response, there are also failures to respond not just to my relevant objections, questions, and concerns throughout my four Objections, but also to respond to those of others' objections which I have so incorporated.

Consider the disputed "Conclusion" of this EIR Master Response, for example, that: "the compliance of the Project with EA strategies has been analyzed [by whom with what qualifications and evidence?] and the Project found to be consistent with the EAP [says who? and why?]; therefore, the Project complies with Section VI(b) of the Appendix of the CEQA Guidelines." Saying that doesn't make it so, especially when that is all rebutted by meritorious objections and there was no such "common sense," "good faith reasoned analysis" and other compliance. See the many applications on this subject in my section I, including examples applying ***Gray, Banning, Vineyards, and Costa Mesa, and*** section I.C, and D, as well as my illustrations throughout my sections II and III of how these legal principles rebut such claims, often combatting quotes and admissions from the disputed EIR/DEIR with meritorious counters from my such incorporations from others with relevant subject matter expertise.

As discussed in my climate discussion in section I.A.1.a(vii), this project has a significant adverse impact on energy use and GHG, and by itself obstructs the County's goals and plans. See, e.g., *Richmond v. Chevron* and other cases addressed in I.C and D, such as *League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2022), 75.Cal. App. 5th 63 ("**Save Lake Tahoe**") (finding the eir's greenhouse gas **[GHG]** mitigation measure was

inadequate because it **deferred** determination to an unknown future time, requiring the applicant to mitigate impacts IF the project conflicted with relevant future emissions targets adopted by the state, relying on performance standards that do not yet exist and may never exist so that any determination of the impact's significance is deferred to an unknown time and where neither the county nor the applicant were committed to mitigating any such impact. Also, the eir **failed properly to consider whether renewables could be incorporated into the Project in the energy impact discussions,** as noted below.) According to Save Lake Tahoe, to be compliant the CEQA analysis of energy impacts requires both whether renewables can be incorporated into the project, and (if significant impacts) whether renewables would reduce the impact. Also, for significant impacts, the EIR must consider all feasible mitigation measures. The EIR fails these tests, among other things, by such deferrals, by such lack of analysis and denials of such climate change matters, and by ignoring the renewables issues.

As to confirming the "significance" of these energy issues that Grass Valley calculated in its Agency Letter 8-18: "The [IMM] Project's annual energy use would represent an increase of approximately 15 percent in County-wide electric usage for a single industrial use." As Grass Valley said (at Id.): "This energy use should be recognized as a significant impact of the proposed project and mitigation should be incorporated to reduce this impact." That by itself not only defeats the Nevada County Energy Action Plan (EAP), but it depresses any willingness of mine opponents to sacrifice in their own energy usage, because our sacrifices would benefit this objectionable mine instead of our environment. Indeed, as I explain in detail with my rebuttal of the EIR/DEIR on its unrealistic and grossly understated generator use to cover PG&E PSPS, system failures, weather events, and other causes of blackouts increasing with progressive climate change impacts, the EIR's projected energy use in incorrectly analyzed. See, e.g., my objections in section II to EIR Master Responses 16, 25, and 26-28 and my objections in section III to EIR Response to Ind. 254-84.

CC. Objection to Master Response 26—Life Cycle GHG Emissions (EIR at 2-114).

This objection is the same as to the precious Master Response 25 incorporated herein.

DD. Objection to Master Response 27—Greenhouse Gas Thresholds (EIR at 2-115).

This objection is the same as to the precious Master Response 25 incorporated herein.

EE. Objection to Master Response 28—Greenhouse Gas Credits (EIR at 2-116).

This objection is the same as to the precious Master Response 25 incorporated herein.

FF. Objection to Master Response 29—Near Surface Workings and Subsidence (EIR at 2-121).

By denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for many such "significant," overlooked, understated, or noncompliant impacts. Besides my incorporated water related comments in sections P, Q, R, S, T, AF, AJ, AL, and AM above, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. My objections in the relevant sections rebutting EIR Master Responses to groundwater depletion, quality and other harms, and other adverse impacts (eg, #'s 13-16, 29, 33, 35, and 36) are incorporated here to minimize duplication, although the disputed EIR's substantial duplication merits some responses here. See also objections to other Master Responses which mix groundwater and other issues, such as #'s 1-3, 6-11, 17, 20, 24, 29, and 35.

Also, despite my extensive discussion of such legal, environmental, and other issues in my DEIR Objection 254 from the perspective of potential victims with violated property rights to become at issue for us owners and users of surface lands (at least down to 200 feet) above and around the 2585-acre underground mine, the disputed EIR ignores those issues and rights entirely. See section I.F.9 and 8. As stated in various such objections, those objections cannot be limited by the disputed EIR/DEIR interpretations of CEQA (see my corrections in section I.C and D), and they must be considered compliantly, analyzed, and mitigated, because such EIR property rights violations will trigger many legal property disputes regarding surface owners' and users' competing and shared rights to the groundwater and other environmental impacts at issue, as well as to rights of lateral and subjacent support to prevent "subsidence," which as the Supreme Court explains in Keystone, includes support from our groundwater. As so described and as demonstrated herein, the disputed EIR/DEIR fails to overcome my objections and those of others in my Table of Incorporated by Reference Objections.

Remember this Project is not to start a new mine using modern analysis, tools, techniques, and other methods, but rather to reopen, expand (e.g., with 76 miles of new blasted tunnels and related mining and dewatering), and presumably shore up (using toxic hexavalent chromium cement paste without proper CEQA and Prop 65 warnings and analyses) a mine flooded and closed in 1956, which is in an unknown (e.g., what is imagined is based on unreliable, complete, and disputed historical records), uninvestigated, and untested condition, because (I suspect) the miner may not have wanted to know the inconvenient truths, but preferred the disputed EIR/DEIR's abstract theories, models, and comparisons to supposedly "similar" mines (which we dispute as false equivalence tactics.) Even if the EIR/DEIR wanted to claim some analysis of the existing mine that was closed and flooded in 1956, it did not analyze the actual conditions there to achieve useful knowledge, but instead sifted through incomplete, unreliable, and often erroneous historical records about the mine to support its chosen narrative. As noted elsewhere, that house of cards would not long survive evidentiary motions in court where evidence must comply with rules to assure credibility, accuracy, and admissibility.

There is an extensive body of law that has been developed over many years as to the competing rights in disputes between surface owners and users versus underground miners beneath or near them. See, e.g., *Keystone*; *Gray*. While my DEIR Objection 254 addressed such issues (at #'s 3,N, 4, and 14) because they will also have impacts on the mine's environmental compliance, mitigation, and feasibility, the EIR erroneously (and apparently willfully) ignores that here by reducing our many disputes down to a different, but related, dispute where I begin, which is dewatering causing "subsidence," i.e., the use of groundwater to support the surface and protect the surface owners' and users' property there. See *Keystone*. This could be the scene in

the old Clint Eastwood/Lee Marvin movie "Paint Your Wagon" about Nevada City (therein called No Name City), where the miners digging under the saloons and stores for gold dust falling between the cracks in the floorboards caused the whole town to collapse into the mining holes. However, one does not need to cause that kind of crisis or even earthquakes (e.g., like well depletion of groundwater in the Central Valley dropping the surface and breaking the surface infrastructure in the process, or like the fracking depletion of groundwater is doing to cause earthquakes in Oklahoma, Pennsylvania, and elsewhere where they never existed before) to trigger surface owner remedies. It is enough that surface infrastructure is so damaged, as one now sees throughout our central valley (eg, Bakersfield) where, for example, tree farmers are pumping groundwater to save their trees, and dropping the surface level as much as six feet (so far), and thereby harming homes, roads, utility pipes, and other infrastructure by resulting, differential settlement of such surface areas. That threat was enough to inspire disputed EIR Mitigation Measure 4.6-3(c) "to close six near surface mine features," as if somehow that solved the problem, which it does not do. The deeper mining can still have adverse surface consequences, and no persuasive case is made in this EIR Master Response to the contrary with common sense and good faith reasoned analysis; the disputed EIR just asserts that this is a "near surface work" risk, because that is all they reportedly had NV5 study in its disputed "Geotech Review of Near Surface Features" (Table 1 of Appendix H.6 cited in the EIR at 2-122). (Again, the EIR is focused on the Brunswick shaft area, rather than our objectors' surface above and around the 2585-acre underground mine where thousands of us live.)

The US Supreme Court has addressed in objectors' favor such surface owner versus underground miner disputes in cases I address here and in my DEIR Objection 254 #3.N (as well as in my #'s 4 and 14), such as ***Keystone Bituminous Coal Ass'n v. DeBeneditis,*** 480 U.S. 470 (1987)(rejecting "taking claims by miners against laws protecting surface owners' property rights to lateral and subjacent support, including by groundwater, to prevent "subsidence," including loss of groundwater support), where surface owners were allowed to require underground miners to preserve their surface rights of subjacent and lateral support (and protect against subsidence, which includes leaving groundwater support) by leaving 50% of the coal to support the surface. *Accord*, ***Smith v. County of LA*** (1986), 214 Cal. App. 3d 266 (essential county road repairs created landslide conditions destroying local homes, triggering nuisance, inverse condemnation, and other claims, both for damages for diminution in the value of real property and for annoyance, inconvenience, and discomfort, including mental distress as part of the loss of quiet enjoyment rights as a property owner.) **As noted herein, the admitted lack of currently available financial resources by the miner to perform its EIR safety, mitigation and other obligations (see Exhibit B and Objection 255, addressing discussed Rise admissions in SEC filings, and in the DEIR, e.g., at 6-14 admitting to financial infeasibility unless the EIR is approved "as is") is not just a CEQA problem, but it also enables us victims to take proactive defensive mitigation actions on our own at the expense of the miner (and, depending on the facts, the County).** See, e.g., my DEIR Objection 254 #' 4 and 14, including my legal authority counters herein to the disputed EIR Response To Comment Ind. 254-54 to 60

Instead of sufficient testing and analysis for the actual 2585-acre underground mining threat, both deep and shallow, the disputed EIR gambles (once again) us surface owners' fates on its highly qualified and disputed general theories, usually qualified with subjective (therefore, vulnerable to misleading extreme interpretations) words like "generally" or "likely." For example (with emphasis added), our surface owner and user property rights are vulnerable

whenever we're an exception to the EIR/DEIR's general, unverified and disputed assumptions, such as (at 2-122): (1) "near- surface features are **GENERALLY** more susceptible to subsidence and collapse than deeper mine workings, because the near-surface features **MAY BE l**ocated in weaker materials (soil and weathered rock); whereas the deeper mine workings are **COMMONY LOCATED** in competent bedrock; (2) "underground mine workings focused on removal of quartz vein materials that are **GENERALLY** narrow, so the collapse of a deep (100 feet bgs) mine feature is NOT LIKELY to be expressed at the ground surface;" and (3) being conservative and considering 100 feet below ground surface (bgs") to be "deep," [but the property rights of us surface owners to the "surface" is admitted in the Rise SEC 10K filing to be 200 feet down; see Exhibit B and DEIR Objection 254 #2] "NV5 believed that collapse of features even closer than 100 feet **ARE UNLIKLEY** to be expressed on the surface." [But, again, that surface is legally at least 200 feet down] Despite all those qualifications (with such disputed, subjective standards giving exaggerated effects) and our many objections somehow, despite lacking the data needed for more reliable data, the disputed EIR then incorrectly and misleadingly concludes that: "therefore underground working that have potential to cause subsidence at the surface have been thoroughly analyzed in the DEIR."

The County decision makers should ask how a surface owner can expect to sell a house or protect its property values with such disputed "general" qualifications, lack of sufficient study/investigation, and exaggerated, subjective "latitude" for dangerous exceptions. (Literally a surface seller would have to tell the buyer or its mortgage lender or appraiser, in effect: "don't worry, disputed experts have produced a widely disputed EIR full of demonstrated errors, omissions, and objectionable tactics that says you GENERALLY don't have to worry about 'subsidence and collapse' of the surface improvements and land as a LIKELY result of the 24/7/365 blasting, dewatering, tunneling, mining, and other protested activities beneath your house.") Also, one of many signs that this disputed overstatement (lacking any of those qualifications in the cited premises on which such conclusion is based) applies to the wholly owned Brunswick site, but not to the 2585-acre underground mine below our surface, is that our surface ownership above and around that underground mine goes down at least 200 feet, so there is no mining at all above that 200 feet of our "surface" property, or, if you believe the disputed EIR's self-restraint plan, 500 feet.

When the EIR addresses the new underground mining activity in its section explaining the tunneling and mining methods (citing DEIR 3-19), consider the following examples of where the EIR chooses to miss the point of even the "subsidence" part of our many EIR ignored objections. Here, for example, the EIR leaps incorrectly to the unproven, false, and disputed assumption that only "near surface" mining causes dangerous subsidence (in the only portion of the mining it chooses to discuss, whatever that is, because the EIR/DEIR is never clear about that location, consistently using false equivalence assumptions that everything is the same as whatever part it considered specifically). With some unsubstantiated, "aspirational," not enforceable (or affordable/feasible considering Rise's SEC filed financial distress admissions in Exhibit B and DEIR Objection 254 #2), everyone should be at least skeptical comments about future aspirations to use "best mining practices" which is a low bar standard, sort of like saying "best hockey practices" (an analogy chosen because rule breaking and penalty box time are accepted parts of that sport, sort of like tamer "best cage fighting practices.") Nothing in such disputed EIR/DEIR aspirations are reliable, compliantly described/analyzed, or proven, which recall involves new blasting, tunneling, dewatering, and mining into unknown and uninvestigated conditions underground that Rise has not explored or evaluated (i.e., this is the kind of "best

mining practices" to be expected from such speculating gamblers at the risk of us surface owners above or around the mine.)

The result of this disputed EIR discussion is this additional, unsubstantiated, unproven, and disputed conclusion (at 2-122, emphasis added): **"Therefore, it is UNLIKELY that any new underground openings would produce a fall of ground or collapse that would affect the integrity of the mine." Notice that it only speaks to the "integrity of the mine," but not to subsidence or the safety of the thousands of us living on or using the surface (and the next at least 200 feet) above and around the 2585-acre mine (a clever "bait and switch" evasion/nonresponse too common in this disputed EIR/DEIR). And again, this qualified (i.e., UNLIKELY) subjective standard will never satisfy any buyer or its lender or appraiser, even if they trusted the source of the opinion and the basis for that conclusion, both of which are doubtful insufficient at this point, especially considering all the credibility issues with the widely EIR/DEIR.** See my Table of Incorporated by Reference Objections.

Likewise, the overall EIR "Conclusion" also does such a "bait and switch" by opining (at 2-123, emphasis added) with this even less reassuring and disputed opinion: "**The DEIR's evaluation of the potential for dewatering to result in collapse of surface materials is legally adequate" (a disputed reference to the EIR's disputed and incorrect CEQA standard (see, e.g., sections I.C and D), not the legal standard for protecting surface owner and user rights from such underground mining (see, e.g., *Keystone* and similar authorities.) Stated another way, the disputed EIR is NOT ASSURING US OF SAFETY, but rather claiming that the EIR miner claims it has a credible legal defense when the mine causes harm. First,** notice that dewatering is only one possible cause of loss of the required lateral and subjacent support resulting in subsidence, and blasting in the wrong place or conditions and others also can be causes for violations of surface rights to be free of subsidence, e.g., changing the course of underground water flows. **Second,** the subsidence violations can still exist from property/environmental harms much less severe and dramatic than "collapse," although mine cave-ins are not uncommon events. **Third,** the vague and ambiguous "legally adequate" standard is subject to dispute, because I am certain us surface owners and users above the 2585-acre mine will disagree with the miner about what is and is not "legally adequate." See my Supreme Court *Keystone* decision above and others.

GG. Objections to Master Response 30—Biological Study Technical Adequacy (at EIR 2-123).

This objection is the same as to the precious Master Response 25 incorporated herein.

HH. Objections to Master Response 31—Rare Plants (EIR at 2-124).

This objection is the same as to the precious Master Response 25 incorporated herein.

II. Objections To Master Response 32—Temperature of Mine Water Discharges (EIR at 2-126).

This objection is the same as to the precious Master Response 25 incorporated herein.

JJ. Objections to Master Response #33—Groundwater Dependent Vegetation (EIR at 2-129).

By the disputed EIR/DEIR denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such "significant," overlooked, understated, or noncompliant impacts. See, e.g., besides my incorporated water related objections in section II. P, Q, R, S, T, AF, AJ, AL, and AM to EIR Master Responses, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. **I also addressed many of these issues in my objection to the EIR's overlapping Master Response #16 (which incorporates many groundwater related objections, including to direct Master Responses 13, 14, 15, 16, 29, 33, 35, and 36, as well as more mixed topics including groundwater disputes in 1, 2, 3. 6, 7, 8, 9, 10, 11, 17, 20, 24, 29, and 35.) My DEIR Objection 254 #'s 3.D, E, F, M, and N, 4, 5, 6, and 14 still apply. If a reader finds it difficult to track all such separate or disaggregated objections, blame the EIR for its fragmentation of the topics, presumably to try and escape the realities and needs for more EIR revisions and recirculation (see section I.A.1.c), because such disputed EIR "significant new information" and changes compared to the disputed DEIR are not just minor, "amplifications" or "clarifications" (terms whose meaning the EIR exaggerates to excess of tolerable standards), but are material, "significant," and "new," especially when considering the related errors, omission, and other continuing noncompliance by the EIR/DEIR.**

As an alleged fallback Mitigation Measure in #4.8-2(a) and (b), which I and others dispute as a wild, unsubstantiated guess by the noncompliant EIR (note that what little and disputed data the EIR/DEIR presents cuts off at 2040), without adequate "good faith reasoned analysis" and "common sense" as required by CEQA and controlling court decisions like Gray, *Banning, Vineyards, and Costa Mesa.* Even worse, Rise has shown no proof that it can afford to replace the depleted water even under its own disputed standards and undercounted and overlooked existing wells, not to mention the coming new wells by us local surface residents above and around the 2585-acre underground mine, considering Rise's admittedly distressed financial condition admitted in its SEC filings. See, eg, Exhibit B and my Objection 254 #2. Even worse than that, that purported EIR mitigation asserts the right to "take" at least (in the sense of condemnation or inverse condemnation and the Fifth Amendment/CA Constitution equivalent) the top **10% of the well water owned by us surface owners above and around the 2585-acre mine, since we have personal groundwater ownership rights at least down 200 feet (the EIR and SEC 10K filings admit what is so defined as the legal "surface" above any Rise mineral rights, and we claim more, since groundwater is not a "mineral" owned by Rise, and we also have legal rights to lateral and subjacent support that include groundwater support.) See, e.g., *Keystone* and my objection herein to Master Responses 7, 13, 14, 15, 16, 17, 29, 33 and 35, my DEIR Objection 254 sections noted above (plus #'s 3.N, 4, and 14 legal decisions and hard questions in #'s 15, 3.L, and 1.G and H), and others' similar objections that I incorporate from my Table of Incorporated by Reference Objections.**

Also see, the EIR admission (at 2-95) discussed above that the Wolf Creek water level will drop by at least "724-acre feet per year" (the EIR number which we suspect

understates the problem) as evidence of such depletion of my Banner Mountain community just uphill from that creek. What the mine proposes to do is deplete our precious groundwater to flush it away down the Wolf Creek as "dewatering" waste. The EIR's disputed recharge/balancing theory is wrong and worse, as will also be proven at trial as property rights violations and torts (e.g., *Keystone* plus *Varjabedian*), even if the disputed EIR refuses to address my climate change and other objections as too "speculative" for CEQA reporting, which erroneous interpretation I and others not only dispute, but I counter (e.g., section I.C and D.) by proving that the EIR/DEIR statements we are opposing are even more speculative, unsubstantiated, and worse than its complaints about mine. See my objections to direct groundwater disputes with Master Responses 13-16 and 19, as well as indirect disputes with Master Responses 1-3, 6-11, 17, 20, 24. 29, 33, 35, and 36. Note that this dispute is not just over what the EIR/DEIR does with its groundwater, but also what it proposes to do with the groundwater owned by us surface owners above and around the 2585-acre mine. (Ask yourself what would happen if the mine drilled a tunnel into my surface owned 200 feet for gold or anything else, as to which the mine has no property rights there. Those same trespass, conversion, and other claims should equally apply to taking away my groundwater there.)

Likewise, objectors like me living above and around the 2585-acre underground mine all have competing property rights to use new and deeper wells to tap our own groundwater before the mine dewatering depletes it, which is especially critical to save our forests even if the EIR were correct about "most" trees' shallow roots. See my objection to EIR Master Response 33. AS EXPLAINED IN MY OBJECTION TO THE DISPUTED EIR'S MASTER RESPONSE #33 (AT 2-130) (E.G., "MOST VEGETATION IN THE PROJECT ARE [SIC]NOT GROUNDWATER DEPENDENT."), ALL VEGETATION IS WATER DEPENDENT. Just as the nut tree and fruit farmers in the Central Valley drill wells to save their trees, we will eventually have to do the same here or we will all end up unable to live in our homes that will then be vulnerable in a dead forest just waiting for the next fire to take us. Also, while different vegetation roots have different depths (e.g., the trees the EIR cherry picks to name with shallow roots are not all the trees on my property, and many have deep roots that need my owned ground water. What the EIR fails to address (and that we dispute) here or in Master Response #33 is that new wells for using our owned groundwater become the only solutions to preserve our vegetation as the ground dries up from climate change and mining abuses, making an outrageous mockery of both the EIR's disputed groundwater "recharge" and "balance" claims and the EIR's disputed claims that it can take all our groundwater it wants because the EIR/DEIR wrongly claims that the resulting adverse consequences are too "speculative" for it to have to address. Even if the disputed EIR were correct in its interpretation of CEQA(which it is not, see I.C and D), the EIR's cited CEQA excuse does not provide any immunity or excuse in this competing property rights conflict over groundwater between us surface owners and the underground mine. See *Keystone* and *Varjabedian*.

Thus, the disputed Mitigation Measures in #4.8 fail to address the core issues, which include that all of us potential mine victims have personal groundwater property rights, including the rights of all of us to drill new and deeper wells. See the Wells Coalition Group Letter 27/28 and the CEA Objections Group Letters 6-9 and 21. (NID and other governmental permission issues can be debated elsewhere and, in any event, we have political/law reform solutions that our local resident votes can solve), as well as the rights to

lateral and subjacent support that *Keystone* defines to include such groundwater. See disputed EIR at 2-95 stating by citation to Appendix K.9 that "property owners may also choose to retain and continue using their water well in addition to NID potable water if they desire." All of us who need to save our forests around our homes can be expected to do that, at least until decisionmakers realizes that, as my objections and others keep saying, the issue is not just the East Bennett Road and some other existing wells (grossly undercounted by the EIR/DEIR), but also all the existing wells above and around the 2585-acre mine (e.g., part of what the County Economic Report calls 300 wells ignored by the EIR and still undercounts; see Exhibit A hereto), plus all the new added wells that will become necessary to save our trees and vegetation from becoming dead firetraps.

There are thousands of us residents and users just on Banner Mountain alone above and around the 2585-acre mine. Whether we use existing or new individual wells or we share community wells, the ultimate choice is that gamble the EIR proposes to force on us without any required "good faith reasoned analysis" or "common sense" (e.g., *Gray, Banning, Vineyards, and Costa Mesa*), because the disputed EIR claims it is too "speculative" for CEQA, ignoring our surface owner rights to complain about inverse condemnation, trespasses, and other violations of our property rights. See the many places herein and elsewhere where I (and others) rebut disputed EIR errors, omissions, and noncompliance: either (i) the disputed EIR recharge works for 80 years of 24/7/365 abusive dewatering to flush our groundwater away down the Wolf Creek (which recharge is speculation and unsubstantiated by the EIR/DEIR or worse, incorrectly ignoring climate change and the dry years after 2017 that should be included in that "current" averaging, and betting on the disputed average rainfall between 1967 and 2017 continuing for 80 years to recharge what is depleted by dewatering 24/7/365 during climate change drying out of our environment), or (ii) the only thing that will save us from trying to live without sufficient water in a dying from drought forest firetrap that the mine helped create, will be our competing existing and new competing wells that mitigation or litigation will impose on the miner and which such mitigation Rise admits in its SEC filings and elsewhere that it could not afford. See Exhibits B and A, as well as my DEIR Objection 254 (#'s 2, 4, 3.N, 4, 5, and 14) citing, for example, that the DEIR admits (6-14) that the mine project would not be economically feasible if objectors or decisionmakers cut its hours from 24/7/365 to normal hours or the years to less than 80 (as us objecting neighbor voters can be expected to seek to do if the mine is approved with political and law reform solutions.)

To NID and others who may oppose our well drilling, survival defense example of the desperate tree farmers in the Central Valley, I ask what is the alternative? It is certain (not "speculative") that the forest in which our community (and most of the County) lives needs groundwater to survive and avoid becoming a massive firetrap, a problem that is not "speculative" because we can see the first phase already happening with dry-stressed trees dying in our forests here. If such emerging climate change dryness, worsens by 80 years of abusive 24/7/365 dewatering, and is not saved by such illusory "recharge" or balancing theories from the EIR/DEIR's disputed historical averages, what is the alternative? Clearly, none of us surface owners above or around the 2585-acre mine intend to sacrifice our homes and forests for the greater glory of this Canadian miner's shareholder profits; not without exhausting all of our legal, law reform, and political remedies. Nothing the disputed EIR contemplates or helps that obvious risk. All of us objecting, potential victims contend the disputed EIR mining increases that risk, without any net benefit to us locals or

anyone else besides this Canadian miner's speculator/shareholders. How then can any responsible government dare force that risk on us resident voters and potential victims to tolerate that doomed gamble?

KK. Objections to Master Response 34—Resident Fish (EIR at 2-131).

This objection is the same as to the precious Master Response 25 incorporated herein.

LL. Objection to Master Response 35—Discharge to South Fork Wolf Creek (EIR at 2-132).

By denying the significant groundwater and water related impacts that are demonstrated by my and other objections, not only are the disputed EIR's purported analyses and alleged mitigations insufficient, noncompliant, and worse, but there are often no mitigations proposed at all for such overlooked, understated, or noncompliant impacts. Besides my incorporated water related section II objections to EIR Master Responses P, Q, R, S, T, AF, AJ, AL, and AM, also see section I.E as to mitigations, section I.F as to illustrations, and I.A, C, and D as to applicable law and requirements in dispute. **I expect to prevail by addressing as I already have done regarding many of these issues in my objection to the EIR's overlapping Master Response #16 (which incorporates many groundwater related objections, including to my opposition directly to Master Responses #'s 13, 14, 15, 16, 17, 29, 33, 35, and 36, as well as more mixed topics including groundwater disputes in 1, 2, 3. 6, 7, 8, 9, 10, 11, 17, 20, 24, 29, and 35.) I dispute this EIR response claiming that the EIR's proposed water treatment is not only compliant, but also will "exceed the existing water quality levels of the surface water" in the creek. The idea of the described water treatment method meeting "drinking water quality standards" seems preposterous, especially considering the undisclosed hexavalent chromium toxin threats. See my section I.F.1 above, DEIR Objection 254 #'s 3.A, B, C, E, G, H, and 7, as well as my objections herein to EIR's Response To Comment Ind. 254-1 and others. As I demonstrated herein (Exhibit C) and in my DEIR Objection 254, for example, the DEIR ignored almost entirely the toxic hexavalent chromium in the mine cement paste for shoring up the underground mine, where dewatering will expose that toxic substance to water passing through the mine to be flushed away down the Wolf Creek. The EIR tried and failed to cover up that toxic problem as described in Exhibit C hereto and my objection herein to EIR Response to Comment Ind. 254-1 and others. Since the EIR/DEIR fails to address that threat with the required "good faith reasoned analysis" with "common sense" (e.g., *Gray, Banning, Vineyards, and Costa Mesa*), the EIR can hardly claim that its deficiently analyzed water treatment process is sufficient to save our community (and those downstream along the Wolf Creek) from that same water pollution that is savaged in Exhibit C, in many EPA website studies, and in the case example of Hinkley, CA, illustrated in the movie, "*Erin Brockovich."* It should not be necessary to allow the miner to poison the creek before CVRWQCB catches the problem and revokes the mines permits, if it ever grants them. See also Exhibit C hereto.**

MM. Objections To Master Response 36—Flows in South Fork Wolf Creek (EIR at 2-137).

My objections in the prior objection #35 also apply to this Master Response incorporated herein.

NN. Objections To Master Response 37—Birds and Raptors (EIR at 2-138).

This objection is the same as to the precious Master Response 25 incorporated herein.

OO. Objection To Master Response 38—Foothill Yellow Legged Frog and California Red Legged Frog (EIR at 2-143).

This objection is the same as to the precious Master Response 25 incorporated herein.

III. My Objections to Disputed EIR "Responses To Comments Ind. 254-1 through 101" (starting at 2-6003) To My Individual Letter 254 (marked at 2-5843) (my "DEIR Objection 254" to the DEIR).

I incorporate by reference here my opening section II.A to my objections above to the EIR's Master Response, because the same objectionable tactics, patterns, and practices in play there are even more applicable in these more obscure "Responses" which (as I demonstrate below and elsewhere) are all noncompliant, as well as often evasive, deficient, and otherwise nonresponsive. Indeed, the organization of the EIR often seems to be part of the disaggregation/scattering of "significant new information" (some in the EIR text, some in the Master Responses, and some in these "Response," as if perhaps attempting to evade the EIR's neglected duty to revise and recirculate the DEIR as so explained above in that Master Response introduction and in section I.A.1.c above. See section I.A.1.d(viii) discussing various objectionable EIR tactics. In any case, that EIR/DEIR disaggregation requires me to object as I have to each such disaggregated part, as I do here.

However, to avoid suffering/rewarding such evasions of EIR/DEIR compliance, I remind the reader of my internal automatic and other cross-referencing among my sections I, II, and III, so that every relevant objection, rebuttal, and counter that I assert (including incorporations) in any section of this or my other Objections also automatically applies everywhere it is relevant. That means I do not have to repeat or specifically cross reference each of my objections to the scores of places where it would be relevant to such scattered EIR/DEIR statements, omissions, and other noncompliance. Because it would be an unduly burdensome nightmare for me to have to link my objections that are disaggregated to match the EIR/DEIR scattered contents, this Objection (and my others) should be read as if the EIR/DEIR had consolidated each of its statements topic by topic in one convenient places so I could match that with my consolidated objections; e.g., each of my well related comments in sections I, II, or III should be read as if they were all consolidated together in one integrated commentary without my having to link specifically each sentence on that topic with every other relevant sentence that I have had to separate to match the EIR/DEIR's disaggregated content on that topic.

Whenever I cite a DEIR provision or topic, the reader should automatically consider that I dispute them in my DEIR Objection 254 (and, when applicable there, in my DEIR Objection 255 as well) and incorporate my rebuttals and Objections thereto. Thus, whenever this EIR Objection 254 of mine cites to one of my DEIR Objection 254 section or topic cites, that automatically includes and incorporates a cite to my rebuttal in this EIR Objection 254 to my

related cite in section III herein to the corresponding EIR "Response" to my such DEIR Objection 254 i.e., to such EIR Response numbered Ind. 1 to 101 that corresponds to my DEIR Objection 254 section. (That can be confusing, as the disputed EIR apparently intended when it persisted in cutting up my integrated table of contents sections with heading titles into arbitrary fragments the EIR re-labeled Ind. 254-1 to 101 Responses, to which I have objected herein in section I.F.5 and I.A.1.d.(viii).) Stated another way, since the EIR incorrectly objects to each of my DEIR Objections 254 with a tracking EIR "Response" thereto, and since I object here to each such EIR Response and reassert by such objections, whenever I refer to a section of my DEIR Objection 254, that automatically should be understand to include from this section III both my supplemental defense of that DEIR Objections 254 section plus whatever else I add in this section III on that topic to counter, rebut, or contest that particular EIR Response on an item-by-item basis.

If I sometimes go to the trouble of matching my DEIR Objection 254 table of contents sections to the disputed EIR's renumbered "Response" fragments it so re-labels Ind. 1 to 101, that is only for emphasis for any reader, and the absence of any such Ind. 254-1 to 101 cite does not affect my automatic objection references in my system, as distinguished from the EIR's disputed renumbered system. The same automatic objection arrangement applies with respect to the disputed EIR's Master Responses, with even more importance, because such EIR Master Responses use labels that are not fully or even adequately informative about their often-mixed subject topics. It is often not feasible even to try to match those idiosyncratic Master Responses to my Objection topics, except by confirming my objections to such EIR content with my general, automatic cite to my Objections (including from my Table of Incorporated by Reference Objections). Stated another way, my four Objections (including such incorporations) present the relevant realities, as contrasted with the many alternate realities created by EIR/DEIR errors, omissions, and noncompliance.

Therefore, I object automatically to whatever is contrary to or inconsistent with my such Objections with only one limited exception. As I note in many places DEIR 6-14 admits that the project is economically infeasible unless it can operate 24/7/365 for 80 years in the objectionable way proposed by the EIR/DEIR. I (and other incorporated objectors) agree that the project is economically infeasible, especially for someone with a financial condition like Rise admits its SEC filings (Exhibit A and DEIR Objection 254 #2), although the same would be true for even less prolonged and less intense operations. Apart from that, I consider that DEIR/EIR admission to be a comprehensive confession of economic infeasibility, since there are too many disputed proposals in the DEIR/EIR that must be defeated (or omitted impacts, or added or improved mitigations, that by that DEIR admission, the project cannot be feasible. While the disputed EIR/DEIR claims that CEQA doesn't care about such feasibility (and the County Economic Report mistakenly tolerates that erroneous claim, despite being refuted in Exhibit A and authorities in my Objections), section I.A.1.b and I.C, D, E, and F proving why we objectors must prevail because ultimately the courts will certainly allow our truths to rebut and impeach every false, misleading, and otherwise noncompliant statement and omission in the EIR/DEIR, whether or not within the incorrect boundaries that the EIR/DEIR tries to impose on CEQA objections. See, e.g., section I.C (and my DEIR Objection 255) where I more correctly address the CEQA compliance issues, including by reliance on the 2018 Guideline Amendments Explanation where the CEQA authors explain the meaning and effect of Guidelines that the DEIR/EIR misconstrue, misinterpret, or ignore in favor of their own disputed claims.

Throughout my objections to the noncompliant EIR "Responses" I complain that the EIR keeps evading my objections here and elsewhere by claiming incorrectly that they are too speculative, insufficiently explained or details, or otherwise unworthy of a response on the merits. My consistent rebuttals to such bogus excuses are based on legal principles articulated in section I, in my DEIR Objection 254, and in my EIR and DEIR Objections 255, such as, for example, the following. The EIR/DEIR fails to perform its **CEQA "duty to undertake all reasonable investigation" of environmental impacts and mitigation**, especially mitigations, which are almost always deficient or worse therein. Indeed, as provided in **Guideline #15145**, **an EIR cannot (as this disputed EIR/DEIR does scores of times) simply label an issue "speculative" and then "decline to address it." E.g., Napa *Citizens for Honest Gov't v. Napa County Bd. Of Supervisors* (2001), 91 Cal. App. 4th 342, 373. To the contrary, the EIR applicant must undertake a "thorough investigation" of these potential impacts before concluding that they were too "speculative," which the EIR/DEIR continuously refuses to do. E.g., *Citizens to Preserve the Ojai v. County of Ventura (*1985), 176 Cal. App. 3d 421, 430 (requiring the county to "set forth and explain" the basis for its conclusions that analysis of cumulative emissions impacts was "speculative."); San Joaquin *Raptor/Wildlife Rescue Ctr. V. County of Stanislaus* (1994), 27 Cal. App.4th 713, 728 (rejecting the EIR's analysis of the project setting because the EIR "did not reflect even minimal investigation" into the disputed raptor issues.) Again, among the most common deficiencies and worse in the disputed EIR/DEIR are that they "ignore or assume a solution" to a problem or claims that the missing information "will be provided in the future." *Vineyard* at 40 Cal.4th at 429, 431, prohibiting such deferred analysis or mitigation. See my CEQA discussions and authorities below, such as at I.A.1.d.(v), I.C, I.D, and I.E.4.**

A. My Objection to EIR "Response [at 6003] to Comment Ind. 254-1 (i.e., to my meritorious introductory comments in my DEIR Objection 254) at EIR 2-5843, Including To The Disputed EIR's Repeated False And Misleading EIR Attempts, For Example, Both (1) To Evade Disclosures About Groundwater Impacts/Problems, And (2) To Pretend That the DEIR Presented A "Good Faith Reasoned Analysis" With "Common Sense," When Instead the DEIR Evaded Hexavalent Chromium Threats In Water And Air Pollution As To Which the Disputed EIR Repeatedly Added "Significant" "New" Errors, Omissions, And Other Noncompliance That I Further Rebut.

1. Beware Objectionable EIR Tactics, Such As Disaggregating, Fragmenting, Or Scrambling An Integrated Section of My Table of Contents Commentary Into Isolated Fragments Mistreated By the EIR Responses, Such As By Each Fragment Ignoring the Others As A Bogus Basis for EIR Complaints.

This disputed EIR Response contains "significant" errors, omissions, and noncompliance as explained in my Objections and those of others in my Table of Incorporated by Reference Objections. The EIR is sometimes also noncompliant, nonresponsive, and objectionable in various other ways, none of which are cured by the EIR's citation to the also disputed EIR Master Responses exposed as objectionable in the previous section II in a tactic I called "scrambling" or "disaggregating." For example, this and such other disputed EIR Responses do not fully or correctly provide any "good faith reasoned analysis" with "common sense" as

required by CEQA and other applicable laws regarding the relevant sections of my DEIR Objection 254 (e.g., #'s 3.A, B, C, E, G, H, and 7). See *Gray, Banning, Vineyard, and Costa Mesa.* Instead, such noncompliant EIR "Response" is not only incorrect, deficient, or objectionable on the merits it purports to address, but such Response also improperly ignores or dismisses some of my positions and data without the CEQA required response, often by rewriting or recasting some objections in a way that does not fairly express my concerns and applicable realities the same way I did or would. See, e.g., such corresponding objections herein or in DEIR Objection 254. Rarely, is any such Response comprehensive, and, therefore, I contend (as would be the case with an EIR answer to my complaint in approval challenge litigation) what the EIR does not properly deny in my objections should be deemed admitted. Also, as explained below and in section #I.A.1.d and I.F.5 above, I protest the way that the disputed EIR has fragmented, chopped up, and isolated my integrated objection comments in its nonresponsive "Responses" (each ignoring my comments in such other fragments and then complaining my objection was deficient); for example, separating for different numbered Responses, what was one entitled commentary listed in my Table of Contents for my DEIR Objection 254. See also my EIR Objection 255 where the EIR deployed the same objectionable practice.

In each of my objections to each such EIR fragmented "Response" (i.e., Ind. 254-1 to 101), I incorporate my similar objections to such other related "Response" fragments, including about the disputed EIR's such tactics in which the EIR arbitrarily fragmented my integrated objection comments in my designated Table of Contents sections into the disputed EIR's less coherent "Response" Ind. 254-1 to 101 divisions. In short, it is the EIR's fault from such "fragmenting" (aka scrambling), if my replies, counters, and citations objecting to each fragment also seem both fragmented and less persuasive and (the disputed EIR seems to think) may be more vulnerable to the EIR's incorrect claims that my explanations are too unclear, unexplained, or insufficient to merit a meaningful EIR response (after such EIR fragmentation). For example, my DEIR Objection 254 #3.A (dealing with certain CEQA and other legal disputes) is cut up by the EIR Response into Ind. 254-6, -7, -8, -9, and -10, and those isolated fragments (within my original, larger, integrated comment section) are less coherent or effective by themselves. So, each of my objections herein to each such EIR cut fragment must be read together (with all my cross-referenced and incorporated objections) for the full/comprehensive coherence, effects, and completeness as I originally wrote for that integrated section, thereby exposing and defeating that disputed EIR's tactic for creating a pretext for the EIR incorrectly to claim that its isolated fragments fail adequately to explain my objections or (as so sabotaged) are otherwise deficient. For a quick survey of such disputed EIR evasions by disaggregation, please compare the following sections of this EIR Objection 254 to their EIR fragment/cuts and my corresponding objections thereto. E.g., my Objection 254 # 3.A (EIR cuts 254-6 to 10), my such #3.B (EIR cuts 254-11 to 13), my such #3.C (EIR cuts 254-14 to 15), my such #3.D (EIR cuts 254-16 to 19), my such #3.E (EIR cuts 254-20 to 31), my such #3.F (EIR cuts 254-34 to 35), my such #3.J (EIR cuts 254-39 to 42), my such #3.K (EIR cuts 254-43 to 45), my such #3.L and M (EIR cuts 254-46-49), my such #3.N (EIR cuts 254-50 to 53), my such #4.A (EIR cuts 254-54 to 60), my such #4.B (EIR cuts 254-61 to 63), my such #4.C (EIR cuts 254-64 to 65), my such #5.A (EIR cuts 66 to 70), my such #9 (EIR cuts 254-78 to 79), my such #13 (EIR cuts 254-87 to 88), and my such #15.B (EIR cuts 96 to 99).

Because the disputed EIR has divided/cut up my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary fragments within a section or subsection of my DEIR Objection 254, these EIR "Responses" make my such fragmented objection appear more vulnerable to dispute than was the whole, original objection. That is especially true when (as that tactic consistently and improperly does) the EIR ignores the other related fragments and the whole original objections. For example, if such disputed EIR Responses had followed my presentation of the topics (which objections were replying to match the disputed DEIR), my more comprehensive objections would have provided more detail, explained more, and seemed less redundant. However, it seems that the disputed EIR prefers such confusion and worse it is creating tactically by how it chose to split up my chosen and cross-referenced topic sections in my original document, in which, again, my objections were replying to match the disputed DEIR.

2. How These Objections Counter Such Disputed EIR Tactics.

In any event, because this particular, disputed EIR Response Ind. 254-1 addresses my "coming attractions" in this Objection's introduction, I will generally defer most of my initial comments to my more substantive objections in the body of this document. However, since the disputed EIR chooses this least detailed, introductory segment for its principal rebuttal effort (which I dispute and refute in detail throughout these 101 objections countering such nonresponsive EIR "Responses" Ind. 254-1 to 101), I begin my counters here as to what such EIR has incorrectly claimed herein, especially regarding its noncompliance with respect to hexavalent chromium (see Exhibit C) and certain other matters requiring rebuttal here at the outset.

Since I have objected herein both to every Master Responses in section II and to every EIR Response in this section III, I will reduce duplication by countering Responses here with express objections to EIR Master Responses (as distinct from all incorporated objections) only in some cases when the EIR cites those Master Responses herein. Otherwise, my objections to Master Responses, like my DEIR Objections 254 and 255 and my Exhibit A rebuttal to the often incorrect County Economic Report (which erred, among other things, by assuming without sufficient independent analysis or investigation that the DEIR was correct and that its exclusion of feasibility and other objections could be excluded, when my objections demonstrates many errors, omissions, and other noncompliance throughout the DEIR and now throughout the EIR, as well as by the devastating admissions by Rise in its SEC filings, including those excerpts attached hereto as Exhibit B. See *Richmond v. Chevron,* discussed in I.D above, where such SEC admission evidence won the eir dispute for objectors.) I include objections here to each substantive Response, ignoring only those (like Response 254-2) that present only non-substantive comments of no material consequence. In other words, like the DEIR, this noncompliant EIR makes no "good faith reasoned analysis" with "common sense" and fails to even attempt to resolve any of my or others' objections. Apparently, the EIR is not trying to convince its many objectors (including us surface owners living above or around the 2585-acre underground mine, whose objections the noncompliant DEIR/EIR generally attempt to evade in their discussions by trying [and failing] to imply/assume/speculate that what the EIR/DEIR claims to apply to the Rise owned property (e.g., the Brunswick and Centennial sites) somehow also applies to that 2585-acre underground mine, always ignoring the property rights of us surface owner/objectors, such as those discussed in I.F,9, in section II objections to EIR Master

Responses 1.2.7,13,14,15,16,17,29, 30 and 33, and DEIR Objection 254 #3.N, 4, and 14. See also *Keystone* below.

What the disputed EIR Response 254-1 (like others of the 100 Responses that follow) basically does is offer its erroneous translation of my concerns (often garbled and fragmented by it cutting my integrated presentation into fragments) and then cites me back to the DEIR or EIR sections that I have already disputed on the merits and to which I continue to object. In this nonresponsive Response the disputed EIR generally does not really debate the merits of my disputes, but instead it just states what it selectively chooses to say about some its claims and some (not all) of my counters. Therefore, as with the EIR Master Responses above, we have a comprehensive deadlock. The disputed EIR announces its continuing positions, and I stand on all my continuing objections, because I find the EIR's disputed Responses wrong, deficient, and unconvincing at best, often as just a repeat of the disputed DEIR speculations, unsubstantiated opinions, and false assumptions that are far less than any required "good faith reasoned analysis" with "common sense" on the merits with relevant, credible, and responsive evidence. *See Gray, Banning, Vineyard, and Costa Mesa*. What follows illustrates that deadlock with (in some cases for illustration) my useful additions for guidance to my details in my other objections and those of other objector experts on particular subjects also rejected by the disputed EIR, following the same pattern as my objections to the disputed EIR Master Responses above.

Any County decision maker who is attempting to understand this continuing deadlock should consider the following examples of irreconcilable positions that will have to be litigated if the EIR is mistakenly approved. The disputed EIR seems to contend that the miner somehow has the right to do whatever it claims that CEQA will tolerate, as long as the disputed EIR provides what it incorrectly considers sufficient (sometimes with proforma, deficient, and noncompliant documentation, such as with irrelevant, disputed, and worse models and theories to cover what is not known about this mine or is based on purportedly similar or comparable situations, conditions, or circumstances that are not either similar or comparable). Even worse, the EIR/DEIR incorrectly claims sufficient CERA compliance for approval now, even though many purported mitigations and other essential performances are improperly deferred until after EIR approval, often not just as to implementation, but also as to the planning details and future imagined governmental permits or approvals that may never occur or may be more conditional or less feasible than the EIR/DEIR imagined. See, e.g., *Richmond v. Chevron* and section I.C and D, as well as sections I.E.1-4 and I.F. This is functionally like the EIR declaring that it intends to solve in the future all the mining environmental impact issues consistent with CEQA in a ways that will be later resolved with the applicable governmental authorities, leaving us objectors having less to complain about now (besides that general deferral/evasion) so that (as it repeatedly does in such disputed Responses) the disputed EIR can complain that our objections lack sufficient detail or explanations to merit a detailed response, when the fault for that is on the disputed EIR, which is the one with the burden of proof to provide the "good faith reasoned analysis" now, up front, and in compliant detail; i.e., with required "good faith reasoned analysis" with "common sense" on the merits with relevant, credible, and responsive evidence. *See Gray, Banning, Vineyard, and Costa Mesa*. **The project proponent has the burden and responsibility for that result. *Sierra Club*, 6 Cal.5th at 513-14. As I keep protesting about the constant effort by the disputed EIR/DEIR to shift the burden of proof to objectors and to demand more explanations and substantiation from me and other objectors, the CEQA burdens for analysis and reporting fall on the EIR applicant, not on the objectors. E.g.,**

Kings County Farm Bureau v. City of Hanford **(1990), 221 Cal. App. 5th 814, placing the burden of producing the relevant environmental data on the agency, not the public.**

3. Some Judicial Precedents And Other Authorities Ignored By the Disputed EIR/DEIR.

As among the thousands of potential victims already residing on the surface above or around the 2585-acre underground mine, other objectors and I refuse to allow the disputed EIR mine to violate not only our rights under CEQA, but also our competing property rights as owners of such "surface" down at least 200 feet and groundwater deeper. See Rise admissions in its SEC 10K filing referenced in Exhibit B and DEIR Objections 254 #2. While the disputed and evasive EIR/DEIR purports to make a partial, but deficient or worse, attempt at CEQA compliance, it makes no attempt at all to deal with our surface owner property rights, including as to our owned groundwater. The EIR/DEIR also ignores our proof of significant impacts, inconvenient truths, and risks, because the EIR incorrectly either asserts to the right to evade them as "too speculative," too unsubstantiated or unexplained, or too unknown and otherwise somehow outside its duty to investigate or disclose anything. In effect, the disputed EIR asserts a right to gamble with us potential victims and other property owners as the involuntary losers when the disputed EIR/DEIR is proven wrong, such as when we suffer the harms we predicted and it's too late but for our remedies that will then be inadequate.

That intolerable result is especially prohibited by applicable law, because Rise admits in its SEC filings and financial statements (subject to its own accountant's "going concern" doubts) [see Exhibit B and my Objection 255] that it lacks the resources to afford to accomplish even its deficient EIR safety and other promises and mitigations, much less the greater obligations required by applicable law under the realities of the situation, especially as the underground miner owing us competing surface property owners legal duties far beyond CEQA disclosures. E.g., ***Keystone Bituminous Coal Ass'n v. DeBeneditis,*** 480 U.S. 470 (1987) ("*Keystone*") (rejecting "taking" claims by miners as to laws protecting surface owners' property rights to lateral and subjacent support, including by groundwater, to prevent subsidence and loss of groundwater support), where surface owners were allowed to require underground miners to preserve their surface rights of subjacent and lateral support (and protect against subsidence, which includes leaving groundwater support) by leaving 50% of the coal to support the surface. *Accord,* ***Smith v. County of LA*** (1986), 214 Cal. App. 3d 266 (essential county road repairs created landslide conditions destroying local homes, triggering nuisance, inverse condemnation, and other claims, both for damages for diminution in the value of real property and for annoyance, inconvenience, and discomfort, including mental distress as part of the loss of quiet enjoyment rights as a property owner.) See DEIR Objection 254 #'s 3.N, 4, and 14.

Disputing each of the various impact issues in the disputed EIR's "Response" order as to my continuing (and deficiently addressed in the EIR) groundwater example related disputes, I note that the EIR's many related errors, omissions, and noncompliance, especially as to disputed, often deferred, and infeasible mitigations and future plans (improperly deferred or delegated to regulators or governmental authorities for future approvals contrary to CEQA (e.g. I.C, D, and F. and other applicable law, e.g., *Richmond v. Chevron*), are demonstrated in my DEIR Objections 254 and 255 (which should all still prevail) as well as in my and others' incorporated objections herein to the EIR's relevant section II Master Responses. E.g., **my direct groundwater related objections to Master Responses 13, 14, 15, 16, 29, 33, 35, and 36, as well as indirect**

objections to more mixed topics, including groundwater disputes in 1, 2, 3. 6, 7, 8, 9, 10, 11, 17, 20, 24, 29, and 35.); my following Objection to EIR's Response to Comments Ind. 254-1 et seq. The noncompliant EIR/DEIR has made a comprehensively deficient presentation, which I then rebutted on the merits in my Objections 254 and 255, which then the disputed EIR purported to oppose, dismiss, or ignore in its above Master Responses and specific section III Responses, and which I have comprehensively rebutted herein and in my similar objections to such disputed EIR responses to my DEIR and EIR Objections 255. That pattern has been continued as to all the contested impacts, disputes, and issues between me and the noncompliant EIR/DEIR.

Among the worst examples of affirmative misleading or worse statements in the EIR (a failure of CEQA requirements for "common sense," "good faith," and "reasoned analysis") are those in the third, fourth, and fifth paragraphs of EIR Response Ind. 254-1 at 2-6003-6004 (as well as in EIR Response Ind. 254-14 and elsewhere). See Exhibit C. There, the noncompliant EIR pretended that it had responsively already sufficiently addressed earlier in the disputed DEIR my hexavalent chromium objections in my DEIR Objection 254 (e.g., #'s 3.A, B, C, E, G, H, and 7), but DEIR did not ever do so, as demonstrated herein (e.g., I.F.1, I.E.1-4, and I.A.1.d). Even worse, those (still deficient) disputed EIR objectionable water pollution "significant new information" additions are in conflict with the disputed EIR's own additions in Vol IX, Appendices Q, O, and R addressed above in respect of EIR's flawed Master Responses admitting hexavalent chromium toxic issues for air and water pollution purposes, although wrongly claiming without sufficient, credible evidence (or factual or legal foundation with "good faith reasoned analysis" with "common sense") that the threshold for danger has not been met for CEQA purposes in the case of this mine. See Exhibit C. This disputed and obscured EIR data do not appear as an amendment to the EIR/DEIR's main "Hazards and Hazardous Materials" discussion, where CEQA required it to be disclosed (and where hexavalent chromium was never properly mentioned there in the DEIR or even in sufficient warnings elsewhere in the obscure and seemingly innocuous DEIR previous descriptions of that toxin's use in cement paste for shoring up the underground mine. [Compare what is stated in the disputed EIR to what is stated in the wrong section of the disputed DEIR (at 4.8-47—48) and treated not as the dangerous toxin they knew or should have known it to be, but instead just treated it as if it were an innocuous ingredient in the cement shoring. See Exhibit C.]

4. Obscuring the EIR's Belated And Noncompliant Attempt To Address Hexavalent Chromium Air And Water Impacts Without Admitting the Need For Revision And Recirculation For The Necessary "Significant New Information."

In other words, the disputed DEIR failed to comply with its CEQA and other significant impact disclosure obligations, and now the disputed EIR is trying to add that essential missing (and still disputed) "significant new information" for the first time, again in the wrong and noncompliant places (buried here on page 2-6003-04 or obscured in the last Appendices without sufficient introductions). Instead, the DEIR/EIR evades properly debating this toxic water/air pollution threat about which many EPA website and Exhibit C studies warn and that killed the town of Hinkley, CA, and many of its residents, as

illustrated in the movie, "*Erin Brockovich.*" (Also consider the reasons hexavalent chromium is banned for various uses in the EU.) Why would the EIR gamble on being caught in this coverup of such DEIR omissions and evasions? Apparently, it seems as if the EIR preparers figured that they could not dare risk continuing to pretend such ignorance of the hexavalent chromium threat (as they had done in the DEIR). However, the disputed EIR still could not admit that the noncompliant DEIR had knowingly omitted the threat discussion, since (i) that would be admitting "new information" of "significance" being added to the disputed EIR, and (ii) that would require more adequate debate and evidence that (iii) in turn, would require recirculation of a revised EIR (e.g., I.A.1.c). Perhaps to avoid so complying with CEQA and other applicable law and then having to admit to "significant new information," I assume instead that the disputed EIR attempted to provide some lesser and more obscure addition. However, such insufficient, disputed, and incorrect new information cannot be considered compliant, especially here in this obscure and unheralded Ind 254-1 Response, particularly as it ignores many important parts of my objections and others, and even the EIR's own added and inconsistent (a) air pollution admissions obscured in Vol. IX, Appendix R, and (b) water pollution admissions in Appendix Q and O, all at the end of the very long EIR document without any practical way to find them without reading more than 7000 pages as I did looking for such evasions.

Now that the disputed EIR finally begins (although noncompliantly) to discuss the hexavalent chromium impact threats for the first time, I note that EIR comments here are unsupported by any competent authority, legal or evidentiary foundation, or credible data; i.e., there is insufficient "good faith reasoned analysis" with "common sense" as required by cases like *Gray, Banning, Vineyards, and Costa Mesa. As to their* such foundation for the incorrectly claiming the EIR to have a competent basis for those disputed, incorrect, and unsubstantiated opinions, I have demonstrate such EIR to contain many errors, omissions, and other flaws. See Exhibit C and section I.F.1 herein and DEIR Objection 254 #'s 3., B, C, E, G, H, and N, 4, 7 and 14. Also, I cited EPA and other water pollution threats (supported by compelling authorities) that the EIR/DEIR has ignored or evaded, adding its disputed EIR hexavalent theory for the first time (it was never sufficiently presented before in the DEIR.) See Id. Those failings are lethal to the disputed EIR under these circumstances, where such DEIR's noncompliance with CEQA on these lethal issues now seems more than a mistake, because what seems to be a disputed DEIR coverup still continues to a large extent in the noncompliant EIR. Why else now attach unreferenced Appendices Q, O, and R at the end of the EIR and purport to address CR6 impacts in this obscure EIR Response Ind. 254-1 that no one who matters to me will probably have an adequate chance fully to read and consider, unless and until this is all litigated or addressed in political and law reforms. If, as the EIR now seems to claim in its rewrite of its history of such purported CEQA compliance attempts, these theoretical EIR excuse claims had any merit and were intended to be properly revealed in the DEIR/EIR, why was such "significant new information" not properly analyzed on the merits in the DEIR's "Hazards And Hazardous Materials" section or even in a compliant EIR amendment thereto? If more were revealed in the DEIR as required, I could have been more detailed in my EIR objections.

For example, because of all those objectionable errors, omission, and flaws, the EIR compounds those errors, omissions, and noncompliance as to related topics, such as the disputed EIR/DEIR's purported water treatment/cleaning system that is supposed to

remove all water pollutants in the water flushed into the Wolf Creek. [The disputed EIR at 2-6003 argues, without sufficient evidence or support, that there is nothing to worry about, because the dewatering supposedly will flush these toxins out of the mine to be cleaned and then dumped into the Wolf Creek, apparently to become the risk and problem for NID and others downstream (as if somehow that didn't matter here). However, my main, personal concern is to the threat of the groundwater quality underneath the surface above and around the 2582-acre mine, despite my broader objections, considering both the Wolf Creek flowing by a half mile below my property and the adverse consequences to my community which affect all of us and our property values and the taxes supporting our government services. What happens when the mining stops and the mine floods again with all that water confronting such toxic hexavalent chromium cement paste in the underground shoring?]

What is the insufficient and disputed EIR mitigation-excuse theory (which is not labelled as mitigation, because, again, the EIR does not want these new and significant [but obscured and worse] comments to be recognizable as a reason for further revisions and recirculation of the EIR? See section I.A.1.c and Exhibit C.) It seems to be, in effect, "don't worry because 'in obtaining the Waste Discharge Requirements (WDRs) from the Regional Water Quality Control Board, the Project Applicant would ensure that the leaching of hexavalent chromium would not cause any impact and would meet regulatory standards' (DEIR, p. 4.8-47-48)." (Emphasis added). However, since (as explained in my objections, including Exhibit C) the disputed EIR overstates and incorrectly and deficiently states in such obscure places what was not so disclosed in the DEIR (see my Objection 254 #'s 3.A, B, C, E, G, H, and N, 4, 7, and 14), how would that regulator even know to evaluate the CR6 threats, unless they did what I did since my bankruptcy experience with miners has made me cynical, i.e., read all the thousands of pages of evasive "fine print" (including Appendices Q, O, and R at the end of the EIR) looking for hints of such errors, omissions, and noncompliance? If the disputed EIR is intended to warn the government as CEQA requires, why not properly amend the DEIR/EIR in the right places for CEQA purposes to make sure everyone focused on the right issues for evaluation and then have a "good faith, common sense, reasoned" debate on the merits?

B. My Objection To Response (at 2-6004) to Comment Ind. 254-3 (EIR at 2-5853).

1. This Disputed EIR Response Not Only Suffers From Many Errors, Omission, And Noncompliance, But It Ignores Or Omits To Address Key Objections, Sometimes Citing Erroneous Excuses, But Sometimes Offering No Excuses, Just Evasions Or Nonresponses.

The disputed, brief, and deficient EIR Response contains only partial responses to my 22 pages of related data from my 150 pages of DEIR Objection 254 presentation (plus more data and objections incorporated by reference). Those disputed EIR Responses are countered here (and elsewhere when incorporated herein by reference.) Note that the EIR reaffirms, and, therefore, shares, the errors, omissions, and noncompliance of the DEIR, as well as adding more errors, omissions, and flaws in the EIR's disputed attempts to supplement the inadequate DEIR with "significant new information" that the EIR incorrectly labels as mere and insignificant "embellishments" and "clarifications." Notice that this Response incorrectly assumes that its

DEIR was correct and sufficient, when I have demonstrated that it was neither and worse. Thus, when here (as frequently is the case throughout the disputed Responses to my DEIR Objection 254) the EIR merely restates or refers back to its DEIR section to which I already objected without any meaningful EIR response or even clarification on the merits of our disputes, the EIR Response adds nothing at all (but for the isolated times when the disputed EIR realizes it needs to add some new and significant information, such as regarding hexavalent chromium in the previous section , to which I have objected with counters). Why not be candid to spared us all the burden of such useless repetitions by just saying that the EIR disagrees for good faith stated reasons and stands on the disputed DEIR.

The disputed EIR also continuously claims that somehow my 150 pages in Objection 254 [and the lengthy Objection 255] often fails to "explain how the DEIR is inadequate," which is ironic since the EIR continuously not only ignores many of my objections, but, even when it purports to address them, typically fails to provide any reasoned or substantiated debate on the merits of such subjects; in effect, incorrectly arguing that the DEIR/EIR has sufficiently done what it was required to do by CEQA (but actually ignoring other applicable laws and its own disputed allegations beyond its own (disputed) CEQA "boundaries," erroneously claiming that my lengthy and detailed rebuttals are insufficient to counter such deficient DEIR/EIR presentations.) As to the EIR's many omissions, evasions, and other failures to respond to my such objections, I contend they are deemed admissions by the EIR, just as would be the case if the EIR omissions were failures to respond to a complaint disputing the EIR/DEIR. That pattern here and elsewhere should entitle us to EIR revisions consistent with my unrebutted claims and EIR recirculation in accordance with my sections I.A.1.c and I.C. The EIR Response also incorrectly claims that I do not "specify how the DEIR is inadequate" in my 22 pages of detailed illustrations introducing my concerns in that Ind. 254 section 1.A—H, which served the preliminary roles I specify in my such rebuttals to the DEIR in my following 128 of 150 pages (plus others incorporated by reference), which carry over into the EIR that continues generally repeats and relies on the same errors, omissions, and noncompliance, while adding more of its own for me to object to herein.

My DEIR Objection 254 #3.A (dealing with certain CEQA and other legal disputes) is cut up by the EIR Response into Ind. 254-6, -7, -8, -9, and -10, and those isolated fragments (within my larger integrated comment section) are less coherent by themselves. So, each of my objections herein to each such EIR cut fragment comments must be read together for the full coherence and completeness that I originally wrote in that integrated section, thereby exposing and defeating that disputed EIR's tactic for creating a pretext for the EIR incorrectly to claim that its isolated fragments fail adequately to explain my objections. Because the EIR has divided my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary divisions within a section or subsection of my DEIR Objection 254, these EIR Responses make my Objection appear less impressive, whereas if the EIR Responses followed my ordering of the topics, my original section objections would make more sense and be less vulnerable. However, the EIR seems to prefer the confusion it is creating by how it fragments/splits up my document. (Each of these disputed Response issues is addressed repeatedly in these objections, because of the EIR's arbitrary divisions of my DEIR Objection 254, but I try to avoid repetition as I go deeper into my document, having sufficiently illustrated the EIR's objectionable such tactic.) Also, note that throughout my introductory objections I specify cross-references to specific discussions in the rest of my DEIR Objection 254, thus revealing how I incorporated the details that the EIR incorrectly claims are missing.

(The EIR cannot complain about that practice of my providing a general discussion with cross-references to more specific following details, because the EIR/DEIR does the same thing, including with the disputed Master Responses cited by these EIR Comment Ind. 254 Responses.) If my such objections are too general, it is because they address DEIR/EIR that are themselves unsubstantiated or general claims that are mere unsubstantiated opinions/speculations/assumptions or otherwise were sufficiently answered proportionately in kind; e.g., when the DEIR/EIR states an incorrect opinion without a admissible, relevant, and competent supporting foundation in facts, as it often does, the burden cannot be on me as a potential victims to invest in hiring the experts to provide the correct foundation for my counters, since the burden of proof must be on the EIR/DEIR and not on us potential objections. See section I.A.1.b above.

Moreover, as explained and demonstrated elsewhere in my objections, the disputed EIR/DEIR tries incorrectly to exclude anything in objections it considers outside the allegedly narrow scope of CEQA or somehow "too speculative" or uncertain to address (typically where the EIR chose not to investigate and possibly expose inconvenient and damning truths). For example, consider the EIR/DEIR's outrageous demand for the right to deplete groundwater 24/7/365 for 80 years based on disputed "recharge" theories, while only offering its such disputed and flawed guesses about the future consequences of dewatering versus "recharge" with objectionable data only through 2040, incorrectly arguing that somehow CEQA excuses them from considering climate change and providing such future data for the whole 80 years because that is too uncertain or speculative; i.e., the EIR wrongly contends that somehow CEQA forces us potential victims (and the government that is supposed to protect us) to guess about the future, but excuses the EIR from even attempting to address those future impacts of its mining and groundwater depletion. My section I.C and D exposes that fallacy with a more correct analysis of CEQA and the Guidelines, such as with the 2018 Guideline Amendments Explanations revealing the importance of climate change in eir analysis. See also my DEIR Objection 254 (at 2-5857) discussing laws and regulations requiring businesses to address future climate change impacts, such as in their SEC filings. (That is one of many reasons why I stress the importance of our competing surface owner rights to groundwater (see *Keystone*), since such "speculation" arguments won't save the miner from any violations of our groundwater property rights, whether called Fifth Amendment takings, inverse condemnation, nuisance, trespass, conversion, or many other kinds of tort claims, as discussed in *Varjabedian* and other authorities.) In any case, my Objections must be allowed to rebut errors, omissions, and noncompliance in what the EIR/DEIR itself states, whether or not within the scope of CEQA under its disputed standard it fails to apply to itself. See, e.g., section I.F.5 and I.A.1.d(viii).

The disputed EIR Response somehow incorrectly both (a) dismisses or ignores many of my such objections as insufficiently identifying EIR/DEIR "inadequacies," and (b) incorrectly reduces my such objections to mere (and badly summarized) complaints (detailed later in my Objection or its incorporations) about either : (i) the scope of the Project (i.e., the DEIR's failure sufficiently to address the issues regarding the 2585-acre mine in contrast to the DEIR primarily only seriously addressing the East Bennett Road and Brunswick areas) and the Centennial remediation [which I insist is an integrated part of the single CEQA project, as I demonstrated with my DEIR Objection 254 legal counters and section I.B above], (ii) the undercounted, under analyzed, and insufficiently mitigated existing wells impacted by the project, plus disregarding all future wells that us surface owners above and around the 2585-acre underground mine have property rights (e.g. I.F.8 and 9) to drill (see, e.g., I.F); (iii) outdated, incorrect, or dissimilar

hydrological data in view of "drought" and climate change harming the area vegetation (see my objection above to Master Response 33 and others cited therein) by dewatering [actually, my comments concerned both dryness and drought from climate change effects ignored by the DEIR/EIR, as well as dewatering depletion, plus the DEIR ignored rights of us surface owners above and around the 2585-acre mine to lateral and subjacent support to avoid subsidence (see *Keystone*), which the EIR partly begins insufficiently to address with errors, omissions, and noncompliance exposed throughout this Objection, including my objections to EIR Master Responses 13, 14, 15, 16, and 33. See Wells Coalition Group Letters 27/28, CEA Objections Group Letters 6-9 and 21, Bear Yuba Land Trust Group Letter 2, California Dept. of Parks And Recreation Agency Letter 1, and Grass Valley Agency Letter 8, among many others. Note that this introductory disputed Response summary of my objection just referred to "drought," while the sixth paragraph adds "climate change," in effect trying to diminish interest in the introductory "index" to reading my comment, but also adding in a disputed reference to climate change in the buried and flawed, cross-referenced detail that follow near the end. See I.C and D, including the 2018 Guidelines Amendments Explanation requiring climate change.]; (iv) "hazardous constituents such as hexavalent chromium, asbestos, and arsenic," (see I.F.1 and my objections to EIR Master Response 22); and (v) noise and vibration impacts (I.E.6, objections to EIR Master Response 7, DEIR Objection 254 #9), and traffic/road structural impacts (my objections to EIR Master Response 5).

2. The EIR Cannot Hide Behind An Erroneous Claim That Objectors' Inconvenient Truths Are Outside the Scope of CEQA Or Otherwise Can Be Ignored As Speculative, Insufficiently Explained, Or Otherwise Excused From Any Duty By the EIR/DEIR To Comment

The erroneous EIR characterizations of my DEIR Objection 254 at what the EIR labels as Ind. 254-3 does not just evade, diminish, understate, or misstate my such objections, as I show, but it also ignores or dismisses many of my objections either entirely or in relevant part without meritorious cause. Before dealing further below with the lesser omissions, I begin here with one of the most annoying and revealing EIR total omissions: my DEIR Objection 254 #1.E (at EIR 2-5864), where I challenge for legal and practical cause the EIR's (and County staff's) refusal to consider the legal and economic infeasibility of the DEIR/EIR project and even proposed mitigations, both as a whole and as to many of its safety or mitigation assurances that are illusory for such reasons. See also Exhibits A and B hereto, which likewise disputes the County Economic Report, which wrongly assumes the accuracy, sufficiency, and correct scope of the DEIR and ignores Rise's contrary and inconsistent admissions (including in SEC filings that the EIR incorrectly dismisses as inapplicable, despite *Richmond v. Chevron* and my sections I.C and D above to the contrary, thereby joining in that "alternative reality" of the DEIR adopted and enhanced by the EIR, covering up those infeasibility flaws and worse. Whether or not Rise or EIR authors could create a narrow and CEQA compliant EIR that would preclude rebuttals and impeachment beyond what they claim to be the scope of CEQA (which I and others dispute would be possible), this EIR is not so narrow, and it has forfeited any ability to make such an argument. **For example, the DEIR (at 4.3-103-104) contains what it labels its "NON- CEQA RELATED ANALYSIS" (emphasis added), making rebuttals and impeachment essential.** Moreover, even when not so labeled as such "Non-CEQA" comments, the DEIR/EIR is full of statements that fail to comply with the kind of narrow CEQA standard that they try to enforce on

objectors like me. This dispute must have a level playing field with the same rules for each side, including my right to rebut and impeach such errors, omissions, flaws, and worse. See, e.g., section I.C above, my Objection 254 #14, and my Objection 255.

Impeachment and rebuttal to expose falsehoods (and misleading omissions and evasions that render included EIR/DEIR statements false or misleading) must always be permitted for objections, especially where, as here, the disputed EIR "opens the door" with its own false, misleading, or objectionable statements, evasions, and omissions. Without repeating all those Objections, in part because I will address these disputes in more detail in my related rebuttal to the EIR's Response To Comment Ind. 255, where I defend my DEIR Objection 255 on this topic. But I note here to expose such meritless omissions that the DEIR "opened the door" to this feasibility dispute in various ways that not only allow, but require, me to challenge the DEIR/EIR on these grounds. For example, as discussed in the previous paragraph (e.g., such as regarding the DEIR's admitted label of its "Non-CEQA Related Analysis"), I must be allowed to rebut inconsistent DEIR/EIR claims (and expose the importance of EIR cover up omissions and evasions) because the DEIR (and EIR confirming the DEIR without revisions to conform to realities) admits facts inconsistent with any such feasibility being possible, such as, for example: (1) the SEC filings (see Exhibit B hereto and DEIR Objection 254 #2) reveal more, different, and often inconsistent or contrary relevant information than did the DEIR/EIR, such as to the applicable mining risks (eg, mostly unresolved or even unrevealed in the DEIR/EIR), unknowns (e.g., uncertain mine and other conditions, gold reserves, or evidence and other data contrasting with the EIR/DEIR's disputed illusions of safety, thorough study, careful planning, and value), some competing property rights of us surface owners and users above and around the 2585-acre underground mine (which I repeatedly detail in my objections), and economic infeasibility (e.g., limited admitted financial resources, constant losses with huge expenses, and no income expected for many years to come, causing total dependence on new funding for which no commitments were reported, causing the accountant to impose the lack of "going concern" warning qualification on the financial statements, revealing no material assets besides the mine, which is could become a massive liability and, at best, is worth little or nothing unless and until it finds gold on a profitable basis after massive investments for which no source is reported) [see also, eg, Exhibit B and A hereto, DEIR Objection 254].

In essence, those Rise SEC 10K and 10Q filings and other such admitted facts and circumstances would discourage anyone besides a "long shot," speculative gambler from investing in the mine for the high risk, speculative chance of gold profits in future years. Yet, the disputed DEIR/EIR is designed to reassure the County that it is reasonable to assume it can and will accomplish everything it proposes, plus more things to imagine being worked out and approved in the future, purportedly safely and with sufficient mitigation, but without the EIR/DEIR ever revealing the applicable risks, threats, and harms, which it dismisses as "speculation" or uncertainties (that the DEIR/EIR incorrectly contends CEQA allows it to ignore), despite the many legal and political grounds for rebuttal and impeachment of such errors, omission, and worse in the EIR/DEIR. **In effect, the EIR asks the County to gamble the well-being, health, and property values of our community under circumstances that the Rise SEC filings (eg, 10K and 10Q) warn are not appropriate for anyone who is not a "long shot" speculator/gambler. The problem here is that the County would be not just gambling on the EIR with public trust funds and assets, but also gambling (despite admitted high risks in such SEC filings) with the health, welfare, and property values of the impacted citizens, most of all of whom are objecting and will resist with all appropriate legal, law**

reform, and political remedies. See Exhibit B and DEIR Objection 254 #2. Speaking of political or law reform remedies, the DEIR also admits (DEIR at 6-14) that, if it were only allowed to operate normal business hours for a reasonable term, instead of the disputed 24/7/365 for 80 years (for which future predictions are ignored on the disputed theory that CEQA does not require such speculation about even predictable future risks, threats, and harms), the mine would not be economically feasible. See I.C and D.

Thus, the DEIR itself puts the feasibility dispute at issue (i.e., opens the door), both because relevant local voters will use their legal, law reform, and political powers to counter such 24/7/365 operations for 80 years, and because that DEIR admission shows how fragile the economics must be for this mine, if it's only profitable in such extreme conditions certain to be challenged and resisted by us potential victims. As my objections and others note, one problem here for us all, is that, when this mine stops prematurely, whether because the miner recognizes that it ceases to be feasible or economic for any reason (eg, lack of funding or profitable gold, successful opposition legal, law reform, and/or political strategies, recognition that objectors were correct about risks, or etc.), we will all find ourselves in a mess that this Canadian miner has no apparent financial capacity (or, if it is like the many other failed miners causing more than 49,000 abandoned mines in CA to appear on the EPA list, no willingness) to clean up its mess at the mine when it decides to end its gamble.

3. Case Law Confirms My Right to Rebut and Impeach the EIR/DEIR And To Debate the "Common Sense," "Good Faith," And "Reasoned Analysis" of the Disputed EIR/DEIR Under These Circumstances, Especially Regarding the DEIR/EIR Cover Up of the Hexavalent Chromium Menace And Other "Hide The Ball," "Bait And Switch," "False Equivalence," And Other Such Tactics (I.A.1.d(viii).

I have politely described elsewhere the disputed various EIR/DEIR's **credibility problems** and objectionable tactics, but here I am addressing the EIR coverups with regard to the **hexavalent chromium menace,** which was almost entirely ignored in the DEIR (mentioning that lethal toxin only in passing as a benign ingredient in the cement paste for shoring up the underground mine, except for one obscure reference in a long list of toxins not where they needed to be addressed in the "Hazards And Hazardous Materials" section of the DEIR). However, the EIR now attempts disputed (and still deficient) additions of "significant new information" which it tries to pretend were not new additions of significant information and which it concealed in obscure places, such as buried in this disputed EIR Response to Comment Ind. 254-1 (starting at 2-6003), as to water pollution and EIR Vol. IX, Appendix R at the end of the long EIR as to air pollution and Appendices Q and O as to water pollution. **CEQA court decisions are clear that such "hide the ball" EIR tactics and strategic omissions/evasions are prohibited.** E.g., sections I.A.1.d(viii), C and D, F.5 and E.1-5; *Banning Ranch Conservancy v. City of Newport Beach* (2017), 2 Cal. 5th 918-940-41; *Vineyard Area Citizens for Responsible Growth vs. City of Rancho Cordova* (2007), 40 Cal.4th 412.442; each insisting on a "good faith reasonable analysis," and *Gray v. County of Madera,* insisting on "common sense.*"* Rather than such suffer such scattered or buried or unexplained data in such Appendices, as I proved in DEIR Objection 254 #14 and elsewhere, the EIR/DEIR was required to clearly discharge it burden of proof. See, e.g., sections I.A.1.b and d, I.F.5, and I.C and D. Thus, another reason that disputed feasibility must be allowed are the CEQA exceptions that I prove in my DEIR Objections 255

and 254, where the EIR especially demonstrates the basis for a lack of "good faith" in responding to meritorious challenges, among other incorporated objections. Besides what I cite in my objections as what the EIR authors and advocates know or should know are material errors, omissions, noncompliance, and worse, consider this feasibility challenge (a protest to the "emperor has no clothes" analogy) in what the EIR designates as my Ind. 254 at 5866: "If Rise were to say, "Don't worry about any environmental health or safety rules, because I'll just pay any victims to make them whole (an exaggerated versions of the disputed DEIR claim to cover anyone whose well dries up, which my Exhibit B [and DEIR Objection 254 #2] proves is equally illusory or speculative), that implies that Rise had the financial ability to accomplish that false claim of satisfactory mitigation" **CEQA cannot be read to tolerate such "bait and switch" promises that the miner should know cannot be performed with good faith confidence**. See my DEIR Objections 254 and 255, explaining the applications to the DEIR (and equally now to the EIR) in many controlling court decisions, such as, eg, *Sierra Club v. County of Fresno* (2018), 6 Cal. 5th 502; *Concerned Citizens of Costa Mesa, Inc. v. 32nd Dist. Ag Ass'n* (1986), 42 Cal. 3d 929; *POET, LLC v. State Air Resources Bd.* (2013), 218 Cal. App. 4th 681; *Gray v. County of Madera* (2008), 167 Cal. App. 4th 1099.

The most serious errors, omission, noncompliance, and worse concern the disputed Responses fourth paragraph concerning "the DEIR's treatment of hexavalent chromium, asbestos, and arsenic" citing disputed DEIR dealing unsatisfactorily with asbestos in its #'s 4.3-61 and 4.3-80 (see my objections to EIR Master Response 22), and the EIR's catastrophic error, omissions, noncompliance, and worse dealing with hexavalent chromium in air and water as I detail above in many places as one of the worst and most provocative health, water and air quality, property value, and other threats requiring revision and recirculation of the EIR. The EIR covers up this most serious and neglected hexavalent chromium problem by pretending that it was already sufficiently addressed in the DEIR, when it was omitted from any toxic and hazardous materials discussion and simply mentioned in passing as if it were just an innocuous ingredient in the cement paste shoring up the mine and new workings. Not only does this disputed EIR add new and significant information requiring further revision and recirculation of the EIR, but it adds its buried/obscured new commentary in here in Response Ind. 254-1 to my long DEIR Objection 254, where it is less likely to be read, without identifying this new and significant information in the main EIR/DEIR "Hazards And Hazardous Materials" discussion, where CEQA requires it to be disclosed and more thoroughly and correctly analyzed in the toxic materials discussion. Apparently, it's as if the EIR preparers felt guilty about their "hide the ball tactic," so the disputed main EIR did address hexavalent chromium as perhaps less dangerous air (not water) pollution in a buried commentary at the end of the EIR at Vol IX, Appendix R, (with noncompliant and unheralded Appendices Q and O added for water pollution). It is unclear how, if it were even possible, the EIR could reconcile its treatment of hexavalent chromium here in this disputed Ind. Response to my DEIR Objection 254 to water pollution to its disputed Appendix R as to air pollution.

In any event, as I demonstrate above, there is no sufficient and compliant proof at all cited to back up the EIR's disputed opinions regarding hexavalent chromium water pollution (the disputed Appendices Q and O are disqualified and rebutted as described elsewhere. See I.F.1.) in contrast to my DEIR Objection 254 and other objections (including EIR credibility problems) citing Exhibit C and many EPA website studies the EIR ignores, plus the famous case study of how hexavalent chromium killed the town of Hinkley, CA, and many of its residents as illustrated in the movie, "*Erin Brockovich."* Why does this EIR Response to my DEIR Objection

254 not cite any sufficient evidence for its disputed and incorrect opinions on this subject? Perhaps, as I assume, the EIR is trying to bluff that it is not adding "new" or "significant" information, so as to evade revision and recirculation demands like mine (section I.A.1c.), and fears that whatever it cites as authority would seem new, significant, and important, because none of it was contained in the DEIR. Whatever the reason, this issue must be resolved in a meaningful legal dispute on the merits, because otherwise many of the proposed mitigations as to water and air impact issues will be flawed. Notice, for example, how none of the water treatment/cleaning discussion deals with this threat or assures us that any hexavalent chromium in the groundwater will be removed by such promised, but insufficiently described, and disputed treatment process before it is flushed down the Wolf Creek. Instead, as explained above, the Response to me was, in effect, don't worry because it's not your uphill groundwater that is at risk, because the groundwater dewatering will push your groundwater away down the Wolf Creek to make it someone else's problem (who probably would not be able to discover their peril from the kind of narrow focused reading most potential victims will likely give to this massive, yet woefully insufficient, EIR.)

4. Brief Summary of Miscellaneous Other Rebuttals And My Other Ind. 254-3 Issues Ignored/Evaded by the Disputed EIR.

This paragraph #4 addresses what else is ignored or evaded (not specifically debated in other paragraphs above) by that inadequate, incomplete, and disputed EIR summary of my such DEIR Objection 254 #1 introductory comments. Note that my such introduction was intended to address many things in the rest of the 150-page Objection 254 and its incorporations by reference after these 22 pages, as well as to provide foundational guidance and data for readers. What the disputed EIR has chosen to omit, evade, and ignore include the following:

(1) parts of my DEIR Objection 254 **section 1.A** (starting at EIR 5853) that: (a) describe my standing, experiences, and qualifications/expertise for my objections, including by particularizing some of the risks, threats, and harms that this disputed EIR "Response" somehow incorrectly considers not to be sufficient or permissible to identify, explain, or rebut EIR/DEIR what I have so exposed in my DEIR Objection 254. **(That is relevant because I am announcing my qualifications as a witness offering to prove with testimonial and other evidence many things I assert in my objections, a circumstance the disputed EIR ignores without any analysis)**; (b) better, more accurately, and compliantly describe the "surface" areas above and around the 2585-acre underground mine where I live and that is generally ignored or misdescribed in the disputed EIR (or incorrectly assumed to be the same as the downhill East Bennett Road area or the Brunswick or Centennial sites), as well as introducing my competing legal and property rights, plus uncounted wells of neighbors on that surface area above the underground mine, noting the prospect of more to come [e.g., contrary to the applicable facts to be confirmed by me and other witnesses and contrary to CEQA requirements, such as addressed in section I.C and D above, the disputed EIR/DEIR misdescribes the mine Project area as "rural," whereas in reality, for example, thousands of people own and live in traditional suburban homes above and around the 2585-acre underground mine, many of which are neighborhoods [e.g., on Banner Mountain] with high value property with much to lose by such mining and who have the capacity to hold any miner accountable for potential wrongs and damages addressed in objections on the record and in precedents like *Varjabedian];* (c) demonstrate that the deficient

DEIR/EIR maps (which ignore my consistent demands for sufficient surface street detail to identify my property in relation to the mine below me somewhere) fail, for example, to identify such underground mine's surface boundaries by street addresses or other surface landmarks that would enable surface victims to know where their property was located in relation to the 24/7/365 blasting, tunneling, dewatering, and other mining activities that not only cause adverse environmental impacts, but that may violate their surface property rights (issues still never addressed sufficiently by the DEIR/EIR, despite the fact that even the Rise SEC 10K filing has more CEQA compliant information than does its DEIR/EIR) **[Note that this need for compliant mapping is essential for anyone ever trying to sell or refinance a home above or around the underground mine for the next 80 plus years, since that will be every buyer or lender's concern: what is the real mine risk at this home, as distinguished from the EIR/DEIR so many have disputed and distrusted?]**; and (d) (as noted in the prior discussions above) **dispute the EIR's incorrect theory that it can avoid/evade future impact disclosures and consequent mitigations of its future mining on the theory that CEQA excuses it from such "speculations" or uncertainties, but see, e.g. sections I.C and D above) (e.g., the mine's disputed depletion of groundwater owned by us surface residents and users above and around the 2585-are underground mine whether by dewatering 24/7/365 for 80 years or by climate change dryness when the DEIR/EIR's speculation/unsubstantiated opinion claiming to be fact, but just assuming that the purported "current" average rainfall between 1967 and 2017 [which is not "current," because it ignores the current dry years after 2017] will somehow sufficiently recharge the groundwater for the next 80 years.)**;

(2) parts of my **section 1.B** (starting at EIR 2-5857) that: (a) provide more details and discussion on the same issues the EIR overlooked in the previous clause (1) in this sentence, with **special attention to the hexavalent chromium threats** addressed in Exhibit C and my DEIR Objection 254 #'s 3.A, B, C, E, G, H, 4, 7, and 14, as well as section I.F.1 above and elsewhere in this Objection to the relevant Master Responses and these Responses, such as Ind. 254-1. **[Note that, contrary to the disputed EIR incorrectly speculating that its level of hexavalent chromium is tolerable (without the required "good faith reasoned analysis" and "common sense" applied even to its own obscured Appendices Q, O, and R I rebut herein), this objection notes that the EU totally bans hexavalent chromium wisely at any level for various uses and our industry influenced regulators are still studying what level, if any, to tolerate, as described in Exhibit C and section I.F.1, which reminds the reader that juries were regularly awarding massive judgments that bankrupted asbestos and cigarette industry defendants long before government regulation helped];** and (b) addressing the practical rebuttals to what the EIR/DEIR ignore about how the predictable local legal, law reform, and political remedies to resist and counter their mining impacts, especially in holding the miner accountable for its promised safety actions and illusory mitigations, which mitigations (like depleted well replacement) Rise admits facts in the SEC filings (see Exhibits A and B) and elsewhere that prove economically infeasibility and which objecting victims' remedies will make even more infeasible, such as, for example, where the DEIR admits (6-14) that its project is economically infeasible if it cannot operate 24/7/365 for 80 years as proposed in the DEIR, which should be legally impossible to achieve (see many objections herein and in my DEIR Objection 254 at #'s 2, 3.N, 4, 13,14, and 15), but which can be politically prevented in any event, if necessary, such as by us voters by enacting laws limiting such operations to a normal 12 hour day. See Grass Valley Agency Letter 8 discussing its local ordinances already conflicting with the DEIR/EIR. [Note that this is one of those issues on which the EIR incorrectly and

inconsistently insists that our objections cannot expose even its miner's admitted financial problems (as I do in Exhibit B and A, by Rise SEC admissions [see *Richmond v. Chevron* and I.C and D, defeating the EIR/DEIR's incorrect effort to exclude such rebuttal evidence], and in DEIR Objections 254 and 255), even though the DEIR/EIR itself uses economic feasibility allegations to advance its disputed agenda.];

(3) parts of my section 1.C (starting at EIR 2-6862) that provide further details consistent with the matters addressed in the two foregoing #'s 1. A and B to counter this disputed EIR Response, particularly focused on my qualifications to provide the qualified opinions on why my objections correctly predict the infeasibility of such DEIR/EIR mining to accomplish what they propose, including the unaffordable mitigations which (even as to those they admit needing) seem illusory on such matters at issue.

(4) parts of my section 1.D (starting at EIR 2-5862) that provide more details so addressed in my foregoing #'s 1. A, B, and C, including (a) more about our "surface" [at least 200 feet down] property right as surface owners and users above and around the 2585-acre underground mine deficiently addressed and worse in the EIR/DEIR (see, e.g., section I.F.8 and 9, my DEIR Objection 254 #'s 3 [especially 3.N], 4 and 5), as well as (b) the disputed DEIR/EIR's evasion of the duty to respond properly to objections, rather than evading on account of its disputed "speculation" theory that, in effect, "what we don't know won't hurt us," when we all believe it will and that, in any event, it is "better to be safe than sorry;" and (c) explaining, for example, why there can be no net benefit to the mine (e.g., Exhibit A hereto and DEIR Objection 254 #4), because, for example, its undisclosed harms will erase any disproportionately small and disputed tax or jobs benefits, such as by the costs and consequences of starting and stopping the mine or of 50 to 100 heavy trucks abusing our key roads 24/7/365 for 80 years without any existing, enforceable reimbursement agreement (just a vague concept for deferred mitigation, not in compliance with CEQA [see I.C, D, and *Richmond v. Chevron*] of doing something sometime about that in the future), in each case while Rise's SEC filings and other admissions prove it lacks sufficient resources to afford pay for the massive impacts such mine causes and mitigations the law requires. See, e.g., Exhibits B and A, my DEIR Objection #'s 3.N, 8, 12, 13, 14, and 15).

(5) my 1.E (starting at EIR 5864), largely ignored in the disputed EIR, is validated in the previous paragraphs as to EIR infeasibility, wrongful attempts to narrow the scope of permit CEQA objections (e.g., I.C and D), especially to obstruct rebuttals and impeachment of EIR/DEIR comments also outside that disputed scope standard the EIR tries to enforce on others, but not itself (eg, ignoring what the disputed EIR/DEIR labels incorrectly as "speculations," uncertainties, out of bounds feasibility issues, etc.). See section I.A.1.d. and I.F.5.

(6) parts of my section 1.F (starting at EIR 2-5867) that provide more details (beyond that previous #1.E) about my feasibility and related concerns and how my bankruptcy experience and CA mining history (eg, more than 49,000 abandoned CA mines on the EPA list) shows the risks of the County allowing such mining by financially vulnerable miners (e.g., Exhibits B and A, and my DEIR Objection 254 #'s 2, 3.N, 13, 14, and 15), especially relying for mitigation and remediation (see, e.g., section I.E and my DEIR Objection 254 #'s 2, 3.N, 4, 13-15) on those who can retreat across foreign borders, where recovery actions are difficult and expensive for victims, explaining the bankruptcy and other evasive tactics, in this case with special attention to the disputed DEIR claiming our depleted groundwater being "recharged," despite even its disputed data (e.g., gambles that purported, "current" average rainfall history [between 1967 and 2017; improperly excluding more "current" dry years since 2017] before climate change impacts

will continue to be accurate indefinitely) with even purported DEIR data running out in 2040, with no substantiation for the rest of the 80 years of 24/7/365 dewatering abuse. See, e.g., sections I.E and F, and DEIR Objection 254 #'s 3.E, M, and N, 4 and 14.

(7) most parts of my section 1.G posing the hard questions (see DEIR Objection 254 #15 and questions asked herein) and needs for due diligence by the County to adequately appreciate the magnitude, scope, and consequences of the DEIR/EIR's errors, omissions, and noncompliance of the kind that have caused more than 40,000 abandoned CA mines to haunt the EPA list (see, e.g., my DEIR Objection 254 #'s 2. 3.N, 14, and 15), including my concern (I.F.1 and Exhibit C, A, and B) about the mine becoming "another Hinkley, CA" on account of the hexavalent chromium impact threats, because they were ignored in the disputed DEIR, and erroneously, deficiently, and noncompliantly addressed in the disputed EIR with obscured, new, significant and disputed data on hexavalent chromium water and air pollution addressed herein (and as air pollution addressed in EIR Vol. IX, Appendices Q, O, and R); and

(8) parts of my section 1.H follow up on my such hard questions for County due diligence mentioned in previous section 1.G (see also sections I.A.1.d and I.F.5 above), addressing further in my four Objections my "I told you so warnings" on at least the "top 50" concerns against the DEIR/EIR's (a) illogical and disputed methodology (e.g., false assumptions, false equivalences, unsubstantiated opinions or speculations, without credible foundations [applying studies of allegedly similar situations that are not similar or applicable]), (b) applicable speculating, worse than the EIR/DEIR attempts to forbid to us objectors [e.g., that such groundwater recharge and other history will continue to apply indefinitely, despite material changes like climate change and massive dewatering and new mining, and disputing climate change itself as speculative], (c) baseless and implausible wishful thinking [eg, what we don't know about conditions in the closed and flooded mine since 1956 won't hurt us], etc., insisting in boldly stated errors, omissions, and noncompliance that its EIR/DEIR statements must be accepted as if they were true and controlling just because they say so and occasionally cite some disputed and rebuttable studies, and as if somehow they could shift the burden of proof and persuasion from the EIR to us objecting potential victims (but see section I.A.1.b). See, e.g., DEIR Objection 254 #'s 2, 3.D, E, F, M and N, 4-8, 14, and 15, Exhibit A and B hereto,

As to other rebuttal issues, in its first substantive EIR Response (the second) paragraph, insufficiently addressing its such disputed characterization of my groundwater issues, the disputed Response simply cites to its disputed DEIR #4.8 (in which my DEIR Objection 254 exposed in detail many errors, omissions, and noncompliance ignored in this EIR "Response" and the EIR's Master Responses 13, 14, and 15 to which I have objected in detail in each such case above. Likewise, in the second substantive EIR Response (the third) paragraph insufficiently addressing its disputed characterization of my Centennial and 2585-acre underground mine issues, the disputed Response adds nothing useful, simply citing to its disputed above EIR Master Responses 4 and 7, whose errors, omissions, and flaws I expose and counter in detail above. Likewise, in the fourth substantive EIR Response (the fifth) paragraph insufficiently addressing its disputed characterization of my noise and vibration issues, the disputed Response adds nothing useful, simply citing to its disputed DEIR #'s 4.10 and 4.12 (and thereby again ignoring my DEIR Objection 254 and the issues raised herein, such as in section I.E.6 above), and then, as to the subsidence issues generally ignored in the DEIR, the disputed EIR cites to its Master Response 29, whose errors, omissions, and noncompliance I expose and counter in detail above. See, e.g., *Keystone* and DEIR Objection 254 #3.N, 4 and 14. Likewise, in the fifth substantive EIR Response (the sixth) paragraph insufficiently addressing its disputed

characterization of my climate change and drought/depletion, and other groundwater issues, the disputed Response adds nothing useful, simply citing to its disputed DEIR #'s 4.10 and 4.12 (and thereby again ignoring my DEIR Objection 254), and then, as to the subsidence issues generally ignored in the DEIR, the disputed EIR cites to its Master Response 29, whose errors, omissions, and noncompliance I expose and counter in detail above, as well as all the other direct and indirect groundwater issues mentioned above. See, e.g., sections I.C.2, D, E.1-5, and F.1-4 and 7-9, my direct groundwater related objections to Master Responses 13, 14, 15, 16, 29, 33, 35, and 36, as well as indirect objections to more mixed topics, including groundwater disputes in 1, 2, 3. 6, 7, 8, 9, 10, 11, 17, 20, 24, 29, and 35.) Finally, in the last paragraph of that disputed EIR Response, regarding what in incorrectly minimizes as objections merely as to Rise's "financial status" and the mine's "potential adverse impacts to real estate values," the EIR merely refers to its disputed Master Response 2, whose errors, omissions, and noncompliance I have not only countered above with Rise SEC filing admissions (Exhibit B) and in both my DEIR Objections 254 and 255 (as well as my Exhibit A hereto objection to the disputed County Economic Report). In my Exhibit B hereto, which addresses Rise admissions in its SEC filings that are inconsistent with its DEIR/EIR, I demonstrated (I.E.,5) that such DEIR/EIR mitigation and other promises are illusory, among other things because they are not affordable.

C. Objection to EIR Response (at 2-6005) to My Comment Ind. 254-4 (marked at EIR 2-5874).

I incorporate as my introduction here my section III. A and B introductory comments above to reduce repetition of a continuing objection to the EIR "Responses" to my DEIR Objection 254 that continue throughout this section III. My DEIR Objection 254 incorporated the DEIR objections filed by various objecting persons, entities, and groups by name or other designation, because until the EIR filing I did not have a EIR designated label for cross-reference. I attach the Table of Incorporated by Reference Objections identifying some of those third-party objections still incorporated by reference to their EIR number designations. I incorporate as well as any follow up objections those objectors that are filed against or regarding the EIR to defend or advance such incorporated DEIR Objections (or to defend them from the EIR), as I am doing here. I find the EIR Responses to those objections subject the same kinds of errors, omissions, and noncompliance as I have asserted in this Objection to EIR Responses to my DEIR Objections 254 and 255, as well as incorporating other objections that such objectors may assert for themselves.

In each case all such incorporations are subject to my rules stated in my Table of Incorporations by Reference Objections, such as how to prioritize my personal objections so as to avoid or reconcile conflicts with other objections. For example, while I generally agree with Grass Valley Agency Letter 8, it is more generous than I would be in suggesting compromise mitigations. My such rules would avoid my such incorporations from implying my tolerance for any such compromises with the EIR/DEIR.

D. Objection to EIR Response (at 6005) to Comment Ind. 254-5 (marked at 2-5874).

I incorporate as my introduction here my section III. A and B introductory comments above to reduce repetition of a continuing objection to the EIR "Responses" to my DEIR Objection 254 that continue throughout this section III, especially as to how the disputed EIR has

divided/scrambled/disaggregated my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary fragments within a section or subsection of my DEIR Objection 254. See, e.g., section I.F.5 and 6, I.A.1.d(viii), and I.C and D. As demonstrated above in this objection (eg, in my introduction and #'s 1. A, B, C, D, E, F,G), elsewhere herein (e.g., Exhibit A), in my DEIR and EIR Objections 255, and in my DEIR Objection 254 (e.g., my #'s 2, 3.E, M, and N, 4, 13, 14 and 15), this disputed EIR "Response" is wrong, noncompliant, and worse on many bases, including the following three of many examples, plus my incontrovertible right to explain why the EIR/DEIR is itself not in compliance, whether (a) by failing to identify mandatory CEQA disclosure impacts and problems, or (b) by claiming infeasible, incomplete, or insufficient mitigations, or (c) by claiming legally improper excuses for omissions, errors, or noncompliance (eg, failing to reveal data needed to prevent its EIR/DEIR statements from being false, misleading, incomplete, or worse).

For example, the EIR often improperly evades responses by claiming truths in objections are too speculative or uncertain or deficiently explained (while then itself insisting on speculating and gambling on uncertainties or evasive or insufficient explanations in the DEIR/EIR), such as generally omitting critical data about the impacts on us. See section I.F.5, 8, and 9 above. Us surface owners and users above and around the 2585-acre mine and our property rights are correct in our meritorious objections (including about the EIR/DEIR ignoring the fact that, unlike the usual battle where the mine dispute is only about operations on its wholly owned property impacting surrounding/outside properties generally, this is also a legal property rights conflict between us competing surface owners above and around the 2585-acre underground mine versus that mine. That conflict includes competition over groundwater owned by our surface properties (see, e.g., section I.F.2, 3, 4, 5, DEIR Objection 254), and that is one indisputable reason why property values are relevant (see *Varjabedian*), since that is how the court decisions cited in my DEIR Objections 254 (e.g., at #14, 4, and 3.N) and 255 calculate or award damages and other relief for such property right violations (eg, whether as Fifth Amendment takings, inverse condemnation, nuisance, trespass, conversion, or other such torts addressed in *Varjabedian*).

Consider the following applications of those principles. **First**, we disagree as to the legal and factual scope/application of CEQA and its Guidelines to these circumstances (e.g., I.C and D), such as by assertions so infeasible and worse as to violate the good faith reasoned analysis with common sense requirements (e.*g., Gray, Banning, Vineyard, and Costa Mesa*) the courts impose on CEQA impacts (eg, my introductions, and DEIR Objection #'s 1.A, E, F above), including the "hiding the ball" tactics (e.g., section I.A.1.d(viii) and I.F.5 above), as well as gross errors, omissions, and worse regarding toxic hexavalent chromium impact threats in water and air (e.g., #I.C and D, I.F.1 and 5 above, addressing, among other things, my DEIR Objection 254 at #'s 3.C, E, G, and H, and 7). **Second**, because the EIR/DEIR itself does what it claims I cannot do (eg, both violating its own alleged CEQA "boundaries" [even with a DEIR section labeled "NON-CEQA Related Analysis" below) and asserting disputed contentions and data which I must be allowed to rebut and impeach), including, among other such noncompliance with its own disputed standards, in such extremes that the DEIR (at 4.3-103-104, rebutted in DEIR Objection 254 #3.K and N and elsewhere) labelled them **"NON-CEQA RELATED ANALYSIS"** (emphasis added) and the DEIR's argument (at 6-14) that its DEIR/EIR mine is not economically feasible unless it is allowed to operate on that abusively extreme (my words) 24/7/365 basis for 80 years. **Third,** Rise cannot be allowed, whether by CEQA or otherwise, to make admissions in SEC filings (eg, 10K's and !0Q's; see Exhibit B hereto; and DEIR Objection

254 #2) that contradict or are inconsistent with its disputed claims in the EIR/DEIR (eg, #I.F above and DEIR Objection 254 #3), which conflict and occur both at a specific fact level (eg, disputes as to groundwater and hexavalent chromium) and at the general dispute level (see, e.g., my DEIR Objection 254 #'s 3 and 4, where, among other things, I argue that there is no "net benefit" to the mine (DEIR Objection 254 #4) in rebuttal to the errors, omissions, and noncompliance in the "promotional commentary" of the disputed DEIR/EIR about alleged benefits and illusory mitigations.)

Note that, if the County approves this disputed EIR and that is litigated as is customary in such cases, all my such objection data and evidence (which the EIR is keeping from consideration by the County) will indisputably be allowed at trial to rebut and impeach the errors, omissions, and noncompliance in the EIR. See, e.g., section I.C and D above, and DEIR Objection 254 #'s 5 and 12, as to CEQA. **Remember CEQA is not the law of evidence that will apply in any court challenge to approval. Why, therefore, would the law excuse the EIR now from having to confront evidence of these "inconvenient truths" before the County decisionmakers that the EIR will then have to confront at trial, if the County mistakenly approves the EIR?**

As to the disputed EIR Master Responses 15 and 16 about dewatering and drought/climate change, I counter with my many specific objections thereto herein, both in those sections and above.

E. Objection to EIR Response (at 6005) to Comment Ind. 254-6 (marked in EIR at 5882)

I incorporate as my introduction here my section III. A and B introductory comments above to reduce repetition of a continuing objection to the EIR "Responses" to my DEIR Objection 254 that continue throughout this section III, especially as to how the disputed EIR has divided/scrambled/disaggregated my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary fragments within a section or subsection of my DEIR Objection 254. See, e.g., section I.F.5 and 6, I.A.1.d(viii), and I.C and D. I refer to and incorporate my objections to the other improper ways many such disputed EIR "Responses" evade my rebuttals in this section III. See section I.F.5 and my introductory objections in section II and III. As is the situation discussed above and throughout my objection to these disputed EIR Responses, such Response, without adding anything new or useful (which is ironic, because the EIR falsely keeps claiming that my lengthy and detailed objections do "not explain how the DEIR is inadequate"): (1) merely cites back to its disputed EIR and/or DEIR and its disputed Master Responses above. This not doing anything to advance the disputes, which therefore continue as before as described in my comprehensive DEIR Objections 245, 255, and herein; (2) ignores many of my stated issues and concerns, while recharacterizing and diminishing their full scope and content, and I dispute those nonresponsive approaches; and (3) fails on the merits even as far as it overlaps with my actual objections, thus leaving us deadlocked as to our original positions, without the EIR accomplishing anything. To the extent that such EIR Response is partly responsive to my objections, it is also wrong on the merits. Thus, for example, while ignoring the legal property rights of us surface owners above and around the 2585-acre underground mine (see, eg, my section 1.B and D above and my DEIR Objection 254 #'s 1.A and D, 3.A, D, E, F, M, and N, 4, 5, 6, 14, and 15), the EIR/DEIR both (a) cites to its disputed Master Response 7 that I have rebutted above, and (b) incorrectly assumes facts not in evidence

without any such sufficient foundation or analysis, such as assuming that the uphill well, groundwater, and other conditions above the underground mine uphill are the same as those it addresses on EIR/DEIR downhill, wholly owned mine sites and the East Bennett Road area.

Likewise, the disputed EIR stands on its Master Response 4 incorrectly dealing with the Centennial site as a separate CEQA site, while declining to debate my related legal and other objection details and my rebuttals above to that Master Response. See my section I.B Centennial rebuttal above. However, that nonresponse is important to illustrate a general flaw in the EIR/DEIR, because it shows an example of my explaining the problem (with legal authority and reasoned arguments), applying various interactive flaws and errors in the DEIR/EIR. For example, without restating my incorporated DEIR Objection 254 #1.D, 3.A-E, and H, 7, and 14) and my EIR Master Response 4 rebuttal, the Centennial site is indispensable to the feasibility of the mine Project (and, thereby, both practically and economically integrated with it). For example, the disputed DEIR/EIR incorrectly claims/speculates/assumes that others will pay for that mine material (rebranded by the EIR as "engineered fill," but really just waste rock) that the EIR otherwise plans to dump on Centennial (or, if necessary, Brunswick). However, many of us objectors dispute that EIR/DEIR speculation, expecting instead that imagined buyers will suspect that rock waste to be hazardous material, in which case the EIR miner will ultimately have to pay a hazardous waste cite to accept it, especially when the buyers imagined by the EIR/DEIR realize the controversies and attention that such a dumping alliance will focus on their uses and sources. (While there is more to that hazardous material problem addressed in my such objections than the hexavalent chromium menace, that CR6 toxin adds a new element not sufficiently addressed in the DEIR/EIR as explained herein, since no place, even a dump or gravel buyer, should want to be associated with the risk of becoming or causing another Hinkley, CA, or being featured in the next *Erin Brockovich* remake.)

As to the disputed EIR Master Responses 14 and 15 about its flawed and worse groundwater model and groundwater adequacy, I counter with my objections thereto and throughout this Objection (e.g., sections I.E.1-5, I.F.2-4 and 6-9) and DEIR Objection 254 #'s 3.D, E, F, M, N, 5 and 6.

F. Objection to EIR Response (at 6006) to Comment Ind. 254-7 (EIR marked at 2-5882).

I incorporate as my introduction here my section III. A and B introductory comments above to reduce repetition of a continuing objection to the EIR "Responses" to my DEIR Objection 254 that continue throughout this section III, especially as to how the disputed EIR has divided/scrambled/disaggregated my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary fragments within a section or subsection of my DEIR Objection 254. See, e.g., section I.F.5, I.A.1.d(viii), and I.C and D. I refer to and incorporate my objections to the other improper ways many such disputed EIR "Responses" evade my rebuttals in this section III. See section I.F.5 and my introductory objections in section II and III. Thus, for example, while ignoring the legal property rights of us surface owners above and around the 2585-acre underground mine (see, eg, my section 1.B and D above and my DEIR Objection 254 #'s 1.A and D, 3.A, D, E, F, M, and N, 4, 5, 6, 14, and 15), the EIR/DEIR both (a) cites to its disputed Master Response 7 that I rebutted above, and (b) incorrectly assumes facts not in evidence without any such sufficient foundation or analysis, such as assuming that the uphill

well, groundwater, and other conditions above the underground mine are the same as those it addresses on its downhill wholly owned mine sites and the East Bennett Road area.

As to the disputed EIR Master Responses 14, 15, and 33 about their noncompliant and worse groundwater model, groundwater adequacy/depletion, and adverse impacts on trees and other vegetation, I counter with my objections thereto and in section I.F.2-4 and 7-9, and I.E.1-4 herein.

G. Objection to EIR Response (at 2-6006) to My Comment Ind. 254-8 (marked by EIR at 2-5883).

I incorporate as my introduction here my section III. A and B introductory comments above to reduce repetition of a continuing objection to the EIR "Responses" to my DEIR Objection 254 that continue throughout this section III, especially as to how the disputed EIR has divided/scrambled/disaggregated my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary fragments within a section or subsection of my DEIR Objection 254. See, e.g., section I.F.5 and 6, I.A.1.d(viii), and I.C and D. I refer to and incorporate my objections to the other improper ways many such disputed EIR "Responses" evade my rebuttals in this section III. See section I.F.5 and 6 and my introductory objections in section II and III. As to the disputed EIR Master Responses 1, 2, 7, 4, and 29 about its noncompliant and worse characterizations of its selected parts of my objections the EIR/DEIR describe as mineral rights boundaries, the Project description, SEC filings, the Centennial site exclusion and cleanup, destabilizing the surface above the underground mine, and property value depressions, I counter with my objections thereto and herein.

As noted above, as merely one example, of EIR omissions and misconstructions of my objections, my property rights analysis of EIR violations describes (including with court decisions) our surface owners' rights of lateral and subjacent support (see *Keystone*), which includes our ownership of the groundwater the mine proposes to convert and flush away somewhere else down the Wolf Creek (creating the recognized risk of "subsidence" like what I report is being suffered throughout the Central Valley) after purported EIR treatment of hazards whose menace the EIR/DEIR underestimates (and, even in the case of the DEIR, refused to report in the case of the toxic threats of hexavalent chromium, as described herein).

H. Objections to EIR Response (at 2-6006) to My Comment Ind. 254-9 (marked by EIR at 2-5885).

I incorporate as my introduction here my section III. A and B introductory comments above to reduce repetition of a continuing objection to the EIR "Responses" to my DEIR Objection 254 that continue throughout this section III, especially as to how the disputed EIR has divided/scrambled/disaggregated my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary fragments within a section or subsection of my DEIR Objection 254. See, e.g., section I.F.5 and 6, I.A.1.d(viii), and I.C and D. I refer to and incorporate my objections to the other improper ways many such disputed EIR "Responses" evade my rebuttals in this section III. See section I.F.5 and 6 and my introductory objections in section II and III. As to the disputed EIR Master Responses 1, 7, 14, 15, and 29 about its flawed and worse characterizations of its selected parts of my objections the EIR/DEIR describes as groundwater and well problems above or around mineral rights boundaries, SEC filings, subsidence/destabilizing the surface above the underground mine, and property rights violations,

I counter with my objections thereto and herein. As noted above, as merely one example of EIR omissions and misconstructions of my objections, my property rights analysis of EIR violations describes (including with court decisions) our surface owners' rights of lateral and subjacent support (see *Keystone*), which includes our ownership of the groundwater the mine proposes to convert and flush away somewhere else down the Wolf Creek, creating the recognized risk of "subsidence" like what I report is being suffered throughout the Central Valley, after purported treatment of hazards whose menace the EIR/DEIR underestimates (and which the DEIR refused to report in the case of the toxic impact threats of hexavalent chromium as described herein).

To illustrate how absurd are these evasions of the facts and issues that I raise in my related objections, consider that this Response notes that surface ownership goes down 200 feet as admitted in the Rise SEC filings, but that this Response claims that, because the EIR/DEIR will only deplete the groundwater by mining (and presumably) dewatering below 500 feet, that depletion cannot be a problem. Wrong and defying" common sense" required by *Gray*, as illustrated by the fact that when you punch a hole in the bottom or lower side of a bucket of water, the surface water at the top vanishes out the bottom or side, as will happen here.

As I demonstrated with *Keystone* and other case law regarding subsidence in objections cited herein (and case studies about how the surface of the Bakersfield nut farms areas drop 5 or 6 feet when the groundwater is pumped out to water the trees and other crops), the subsidence does not need to be a collapse. Any differential settlement will break the surface improvements and infrastructure, creating impacts and problems ignored in the DEIR/EIR. Also, to make these Responses even more absurd, this Response claims that it does not matter what Rise says in its SEC filings because the only thing that matters for CEQA is what the EIR/DEIR says. *Richmond v. Chevron* and other authorities (see section I.C and D above and as discussed in my DEIR Objections 254 and 255 and similar objections herein), the EIR/DEIR cannot ignore or evade the fact that those Rise SEC filings are admissions that can be used to impeach, rebut, and counter such errors, omissions, and flaws in the EIR/DEIR (even including inconsistencies and better SEC filing descriptions of risks, CEQA required data, and other things omitted from the DEIR/EIR). See Exhibit B and DEIR Objection 254 #2.

I. Objections to EIR Response (at 2-6006) To My Comment Ind. 254-10 (marked at EIR 2-5886).

I incorporate as my introduction here my section III. A and B introductory comments above to reduce repetition of a continuing objection to the EIR "Responses" to my DEIR Objection 254 that continue throughout this section III, especially as to how the disputed EIR has divided/scrambled/disaggregated my integrated commentary of related issues and facts in my DEIR Objection 254 in somewhat arbitrary fragments within a section or subsection of my DEIR Objection 254. See, e.g., section I.F.5 and 6, I.A.1.d(viii), and I.C and D. I refer to and incorporate my objections to the other improper ways many such disputed EIR "Responses" evade my rebuttals in this section III. See section I.F.5 and 6 and my introductory objections in section II and III. As to the disputed EIR Master Responses 1, 2, 29, and 33, as well as Response to Comment Ind. 254-1 above, about SEC admitted financial incapacity to perform the EIR/DEIR (see *Richmond v. Chevron* and section I.C and D above), the EIR/DEIR's noncompliant and worse characterizations of their selected parts of my objections they describe as groundwater and wells problems above or around mineral rights boundaries (including impacts to vegetation and fire risks enhanced by dewatering depletion), subsidence/destabilizing

the surface above the underground mine *(Keystone)*, and property rights violations depressing values (*Varjabedian*), and the hexavalent chromium menace (section I.F.1 and Exhibit C), I counter with my many stated objections thereto and herein.

J. Objection to EIR Response (at 2-6007) to My Comment Ind. 254-11 (marked in EIR at 2-5888), Including Omissions To Rebut My New Mining/Tunneling Objections.

My objection above to EIR Responses to my Comment Ind. 254-10 and earlier Ind. 254 disputes to the DEIR/EIR also apply and are incorporated here, including answering only my second EIR selected paragraph 254-11 as to "daily" rock "production amounts" as to what the EIR calls mining objections within the 2585-acre underground mine it calls its "mineral rights boundary." Now we know for sure that the DEIR at 3-19 reports 500 tons of "barren rock" plus the SEC 10K filing report of 1000 tons of "mineralized material" to be "produced" "daily." That creates a sense of scale for all the other related and objectionable mining impacts cited in my Objections and not addressed here, including, for example, the impacts 50 to 100 heavy truck loads daily exporting such rock and materials and breaking down the two lane public roads not meant for such abuse and disruption, resulting massive cost, chronic one land operation during one lane alternating repairs with risk of lacking reimbursement from the miner admittedly lacking sufficient financial resources according to its SEC filings. See *Richmond v. Chevron* and I.C and D above confirming that the EIR/DEIR is wrong to attempt to exclude such SEC filings from evidence. Notice, as I have complained repeatedly above and elsewhere, the EIR continues to ignore the entirety of more important portions of my Objections that the EIR has fragmented, such as here the opening paragraph on a different topic I address in my following, restated complaint about this as another "bait and switch" evasion. See section I.A.1.d(viii) and I.F.5.

My broader and more critical mining objection the EIR labeled 254-11, to which there was no EIR Response, focused on the massive tunneling "system" data at DEIR 4.7-2 in what is an "estimated 72.8 miles" of 7.5 x 8.5 feet tunnels. Drive that many miles in every direction from the Brunswick site center and you will discover massive changes in above and underground conditions. Yet, the DEIR/EIR not only refused to examine seriously and report on the conditions of the existing underground mine that was in abandoned and flooded in 1956, but the EIR now compounds that chosen, self-serving, and dangerous uncertainty by not sufficiently analyzing that new 24/7/365 underground mining for 72.8 miles not previously explored for CEQA problems objected to by me and others, something that is especially important because of the serious concerns I and others have raised about the accuracy, relevance, or completeness of the suspect "historical" documentation on which the DEIR/EIR has selected to rely from a period when mining data was even less accurate, scientific, and credible than now (which in my experience with failed and bankrupt mines is still unreliable or worse). As my incorporated and unanswered DEIR Objection 254 explains (see my cited #'s 3.D, E, F, M, N and S therein), the DEIR/EIR does not comply with CEQA or other applicable law in addressing the impacts of that new mining and needed mitigations, especially impacts on those of us living on and using the surface above and around the 2585-acre underground mine where that new mining occurs, especially as to disputed groundwater "recharge" and "balancing" from expanded dewatering risks, threats, and harms. See sections I.E and F above and DEIR Objection 254 #'s 3.D, E, F, M, N, 4, 5, 6 and 7. How many times can such noncompliance occur in the EIR before it becomes proof of willful noncompliance and intentional evasion? Considering the massive extent of the

omissions and other objectionable commentary in the disputed DEIR, this EIR non-responsiveness itself is grounds for rejecting the EIR/DEIR.

K. Objection to EIR Response (at 2-6007) to My Comment Ind. 254-12 (marked in EIR at 2-5888), Including Issue Evasions.

The EIR evasions on important issues here are not answered by reference to its disputed Master Response 1 or its disputed DEIR Mitigation Measure 4.12-6(b), with my objections thereto continuing to have unrebutted merit. For example, a vague assurance of some nonspecific, uncommitted, future road "maintenance" agreement that this miner cannot afford (eg, as demonstrated by Rise's own SEC admissions, see Exhibit B and DEIR Objection 254 #2) does not assure anyone of actual or sufficient mitigation, especially as improperly deferred. See *Richmond v. Chevron* and section 1.C and D above. Moreover, contrary to my objections, this EIR Response entirely ignores the fact that, even if there were full "maintenance" cost reimbursement by the mine not (just for abuse of the main road, but also to the evacuation or alternative routes the 100 heavy trucks a day would abuse and the EIR evades by totally ignoring that harm), the disputed EIR (at DEIR 6-13 and 14, instead of where those comments should be found) fails to respond to my objection to the constant repair of that critical two lane highway would make chronic one lane traffic a serious problem 24/7/365 for 80 years. See my Objection 254 #'s 8, 9, 2, and 13.

L. Objection to EIR Response (at 2-6007) to My Comment Ind. 254-13 (marked in EIR at 2-5888), Including Issue Evasions.

The EIR evasions on important issues here are not answered by reference to its disputed Master Response 15, 16, or 29, or its disputed DEIR App. K.3 p.24, Fig.5-4, with my objections (here and citing to Objection 254 #3.M, 3.D, 3.F, 4, 5, 6, and 14) continuing to have unrebutted merit. Among such noncompliance is that the EIR/DEIR speaks vaguely to that disputed Itasca **THEORY as if it were a STUDY from investigating the actual mine, which has been abandoned and flooded since 1956 without any sufficient, reliable studies by the EIR team or any satisfactory reason to even assume that what disputed mysteries applied to the old mine could predict accurately the conditions and risks associated with the new, deeper, and different area mining, even without taking into account (as would be required for accuracy) the changes caused by time, climate change, drought, climate change, and 24/7/365 blasting for 80 years.**

Also, the miner may be willing to gamble on disputed, incomplete, and unreliable historical records and other unknowns based on such disputed theories, qualified for admitted possible exceptions with EIR words like "primarily," "typically" "little or no potential" and the like. However, none of us potential victims above or around the 2585-acre underground mine (or any buyer or lender) can be expected to tolerate any such risks and burdens for such a dangerous mine with no net benefit to them (see DEIR Objection 254 #4), especially such a mine that trashes their property values and quiet enjoyment of their property 24/7/365 for 80 years, with massive dewatering to deplete our groundwater during progressively greater climate change. Rather than further debate the merits of such disputed Itasca theories here, I note that their stated and disputed (the actual DEIR 4.8-51) "logic" fails on its face, i.e., lacks "common sense" under the *Gray* standard, such as where

it would force us involuntarily to join in its gambles on alleged safety margins "due primarily to the lack of open fractures because of the large pressures exerted by the overlying rock mass (i.e., the lithostatic pressure.)" FIRST, Itasca did not sufficiently investigate those conditions to determine what effect all that new 24/7/365 blasting, tunneling, dewatering, and other mining would have on opening fractures there or expanding fractures already open. SECOND, that Itasca/EIR guess lacks any sufficient foundation to reassure us living above and around that underground mining that our property rights to lateral and subjacent support (including being supported by our owned groundwater) were respected as expected by *Keystone* and other authorities. THIRD, no feasible and sufficient mitigation is proposed, economically feasible, or sufficient to protect us surface owners and users from such risks. See sections I.E and F above.

M. Objection To EIR Response (at 2-6008) To Comment Ind. 254-14 (marked at EIR 2-5890), Including False And Misleading Claims And Omissions About HEXAVALENT CHROMIUM I Rebutted Herein (e.g., I.F.1 and Exhibit C), Including in My Objections to EIR Master Responses 15 and 35, and to EIR Response To Comment Ind. 254-1 on Which This EIR Response 254-14 Wrongly Relies.

As I demonstrated above (at #III.A) in my Objections to the EIR's disputed Response To My Comment Ind. 254-1, Master Responses 15 and 35, and other various places herein and in my DEIR Objection 254 (e.g., #'s 3.A, B, C, E, G, H, 4-7 and 14), this disputed EIR repeatedly tries and fails to cover up (and retroactively correct) the DEIR's failure to address hexavalent chromium in any compliant way as any kind of air or water risk, threat, or hazardous substance, treating it only in passing as just an innocuous ingredient in the cement paste used to shore up the underground mine. See sections I.E and I.F.1 and 8, plus my objections above to EIR Master Responses 15 and 29. Why? Presumably, the EIR makes these false and misleading claims and omissions/evasions to avoid the reality that, contrary to its false assurances, there is material, "significant new information" added by the EIR to the DEIR requiring revision and recirculation. See section I.A.1.c, I.C and D, and I.F.8. This creates a damning credibility problem for the EIR, as explained in many of these objections in addition to the DEIR Objection 254. Also, as so explained that disputed new information added by the EIR itself contains material errors, omissions, and noncompliance.

For example, compare my Objection 254 section headline at #3.C at pages 38-40 (EIR at 5890 marked and split as Response to DEIR Objection Ind. 254-14 and 254-15), entitled "Admitted (But Obscured) Use of Hazardous Chromium Without Warning Of Analysis [see more detailed discussion in later subsections G and H below]" (see also my internal cite therein to my #7), which section 3.C the EIR split for no legitimate reason between its EIR Comment Ind. 254-14 versus 254-15, so in each paragraph it could (incorrectly) complain that my explanation of DEIR inadequacy was insufficient. See my objections to those tactics and contents in section I.A.1.d (viii) and I.F.1 and Exhibit C. Moreover, before my such DEIR Objection 254 #3.C discussion the EIR split up my introductory lead comments (eg, 3.A and B) to that discussion, so that it could complain about such insufficient discussion of such inadequacy at what the EIR labelled as Comment Ind. 254-6 to 254-13.

I consider these various disputed EIR statements regarding hexavalent chromium among the worst examples of affirmative misleading or worse statements in the disputed

EIR (such as at the third, fourth, and fifth paragraphs of EIR Response to Comment Ind. 254-1 at 2-6003-6004). There the EIR incorrectly pretends that it had already responsively addressed my hexavalent chromium objections in my DEIR Objection 254 when it did not do so. See section I.F.1, Exhibit C, and elsewhere. Even worse, those disputed EIR objectionable, noncompliant, and nonintegrated water pollution "significant new information" (Appendix Q and O) are in conflict with its own air pollution additions in Vol IX, Appendix R addressed above. Such EIR's flawed Master Responses admit for the first time (i.e., never analyzed as any kind of hazard in the DEIR) hexavalent chromium toxic issues for air pollution purposes (at Vol. IX, Appendix R), although (also as here) wrongly claiming without sufficient credible evidence that the threshold for such toxic danger has not been met in the case of this mine. Why does this objection not appear as an amendment to the EIR/DEIR's main "Hazards and Hazardous Materials" discussion, where CEQA required it to be disclosed? See sections I. C and D and Exhibit C. (Hexavalent chromium was never properly mentioned in the DEIR or even in adequate warnings elsewhere, such as in the obscure and seemingly innocuous brief descriptions of that toxin's use in cement paste for shoring up the underground mine. Ask the EIR team if the mine is going to post Prop 65 warning notices, as discussed in Exhibit C, and, if so, why not say that in the EIR now?) [Compare what is stated in the disputed EIR to what is stated in the wrong section of the DEIR (at 4.8-47-48) and treated not as the dangerous toxin they knew or should have known it to be, but instead just treated it as if it were an innocuous ingredient in the cement. See Exhibit C.]

In other words, the DEIR totally failed so to comply with its CEQA disclosure obligations in the DEIR regarding hexavalent chromium. See section I.C and D, I.F.1 and Exhibit C. Therefore, now the EIR is improperly trying to add that essential missing (and still disputed) significant new data for the first time by the EIR, again in the wrong and noncompliant place here (buried on page 2-6003-04 and in disconnected Appendices Q, O, and R), instead of properly debating this toxin impact threat (with "good faith reasoned analysis" and "common sense" required in *Gray, Banning, Vineyard, and Costa Mesa*) to warn against in many EPA website/Exhibit C studies and that killed the town of Hinkley, CA, and many of its residents as illustrated in the movie, "*Erin Brockovich."* Why gamble on being caught in this wrongdoing? Apparently, it seems as if the EIR preparers figured from DEIR objections that they should not dare risk continuing so to ignore the hexavalent chromium hazard risks, threats, and harms entirely (as my DEIR Objection 254 demonstrated they had done in the DEIR), but they nevertheless could not bring themselves to admit that they had knowingly omitted that threat discussion in the DEIR, since that would be admitting "new information" of "significance" being added to the EIR (Appendices Q and O, as to water, R as to air) about which CEQA would require more adequate debate and evidence and would require recirculation of the EIR in accordance with sections I.A.1.c and I.F.1. To avoid so complying with CEQA and other applicable law (see I.C and D), the EIR here attempts to provide some insufficient, disputed, and incorrect information in obscure places, ignoring many important parts of my objections and those of others, and even the EIR's own added and inconsistent air pollution admissions hidden in Vol. IX, Appendix R at the end of this very long document.

Now that the disputed EIR finally for the first time begun somewhat (noncompliantly) to address the hexavalent chromium impact threat, I note that EIR Response comments here are unsupported by any competent good faith reasoned analysis

based on common sense, authority, or evidence. Thus, there is no sufficient legal or factual foundation for the EIR having a competent foundation for those disputed EIR opinions/speculations/assumptions. Also, I cited EPA and other water pollution threats (Exhibit C), that the EIR/DEIR has entirely ignored, even though adding its disputed CR+3 air pollution theory for the first time (i.e., it was never mentioned before in the DEIR hazards and hazardous materials discussions.) Those failings and significant new information are lethal to the EIR under these circumstances, especially where the DEIR's noncompliance with CEQA (section I.C and D, I.F.1, and Exhibit C herein) on these lethal issues now seems possibly more than an innocent mistake, because what seems to be a coverup continuing in the EIR.

If, as the disputed EIR now seems to claim in its rewrite of DEIR history, these theoretical excuse claims had any merit and such toxic impacts were intended to be exposed and debated on the merits, why were they not properly disclosed in the DEIR (or even properly now in the EIR)? If such disclosures were provided with good faith reasoned analysis and common sense, then there could have been some reasoned debate on the merits, and so I and others could have been more detailed in DEIR/EIR objections. Now, we have many challenges besides the EIR/DEIR lack of merits and failure to satisfy their burden of proof (I.A.1.b), such as noncompliance with CEQA in presenting significant impacts and proper mitigations (I.C, D, E and F), lack of good faith discussions and tactics I.A,1.d.(viii) and I.F.5), and massive omissions of essential information on significant impacts and the required mitigations that must be provided therefor. As to the lack of good faith reasoned analysis, also consider where the information that should be revealed as significant impacts is obscurely placed, such as in these individual obscure EIR Responses to individual DEIR objections that no one who matters to objectors will probably read and consider, unless and until this is all litigated, and, when justice then prevails, such EIR/DEIR evasions must cease under the force of the rules of evidence and civil procedure that then govern and prevent misuse of misinterpretations of CEQA. See section I.C and D.

For example, besides all those general objectionable errors, omission, and noncompliance, the EIR/DEIR has compounded more topic specific errors, omissions, and noncompliance, such as the disputed EIR/DEIR's deficient analysis and description of the purported water treatment/cleaning system that must remove all water pollutants in the groundwater flushed into the Wolf Creek, even those like hexavalent chromium they incorrectly assume away. [The EIR at 2-6003 argues without compliant evidence or support that, in effect, there is nothing to worry about, because the EIR/DEIR dewatering will flush these toxins out of the mine to be cleaned and then dumped into the Wolf Creek, apparently to become the risk and problem for NID and others downstream (as if somehow claiming that didn't matter to the EIR/DEIR, because my main concern was to the threat of the groundwater quality and supply underneath the surface above and around the 2582-acre mine, despite my broader objections and the Wolf Creek flowing past a half mile past my property and the consequences to my community, which affects all of us and our property values (and the related taxes supporting our government services.)]

The insufficient and disputed EIR mitigation theory (but not labelled as mitigation, because, again, the EIR does not seem to want these new and significant [but obscured, deficient, and worse] comments to be recognized as a CEQA reason for further revisions and recirculation of the EIR, as discussed in section I.A.1.c and I.F.1 and 8 and Exhibit C), seems to be, in effect, don't worry because "in obtaining the Waste Discharge

Requirements (WDRs) from the Regional Water Quality Control Board, the Project Applicant would ensure that the leaching of hexavalent chromium would not cause any impact and would meet regulatory standards (DEIR, p. 4.8-47-48)." (Emphasis added). However, since (as explained herein and in my other Objections) the EIR overstates and incorrectly and deficiently states in this obscure place what was so disclosed in the DEIR (see my DEIR Objection 254), how would that regulator even know to evaluate the threatened impacts, unless they did what I did, i.e., read all the more than 7000 pages of "fine print" looking for hints of such errors, omissions, and flaws, because my bankruptcy experience with miners has made me cynical? If the EIR intended to warn the government, why not properly amend the DEIR/EIR in the right places for CEQA compliance to make sure everyone focused on the right issues for investigation, analysis, and evaluation?

Also, the EIR cross-reference to disputed Master Response 16 evades and ignores my objections regarding what the EIR over-simplifies to "drought and climate change," as my objections to that Master Response demonstrate. See sections I.C and D, including the 2018 Guideline Amendments Explanation in which the Guideline authors explain the importance of climate change for CEQA analysis and presentation. A review of my unmolested DEIR Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR into its Ind. 254- 20 to 33) comprehensively already has rebutted this nonresponsive, noncompliant, and disputed EIR "Response."

N. Objection To EIR Response (at 2-6008) To My Comment Ind. 254-15 (marked by the EIR at 5890), Which EIR Response Duplicates the Disputed EIR Response To My Comment Ind. 14 Above And ,Therefore, Which Is Subject To The Same Objections.

Besides incorporating my Objection in paragraphs III. L, A and B above, which should dispose the EIR's erroneous, noncompliant, and worse EIR Response here, I demonstrate more errors, omissions, and flaws. For example, as so explained the only pretext the EIR has to complain about my alleged "failure to explain the details of the EIR's inadequacy on this topic" is because the EIR again first cheats by chopping my Objection 254 into this fragment of my integrated commentary, so that it states the problem, but omits the rest of my originally integrated commentary for a separate EIR Response (which each read as if the other did not exist). And, of course, because I have objected sufficiently to Response To Comment Ind. 254-1 above, there is no need to repeat all that incorporated objection again here. A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) comprehensively already has rebutted this nonresponsive, disputed Response.

However, for example, see my objections herein (e.g., I.F.1) about how my DEIR Objection 254 (e.g., #3.C, G, and H, and 7) highlighted the mine's hexavalent chromium water pollution threat in integrated explanations with ample details, including with table of contents headlines that the EIR divided/disaggregated into Comment Ind. 254 fragments thereof designed to scramble my analysis, so the EIR could attempt to complain that within that fragment there was an insufficient description of inadequacy. E.g., compare my Objection 254 section headline at #3.C at pages 38-40 (EIR at 5890 marked and split as Ind. 254-14 and 254-15), entitled "Admitted (But Obscured) Use of Hazardous Chromium Without Warning Of Analysis [see more detailed discussion in later subsections G and H below]" (see also my internal cite therein to my #7), which section 3.C the EIR split for no legitimate reason between its EIR Comment

Ind. 254-14 versus Ind. 254-15, so that in each paragraph the disputed EIR could (incorrectly) complain that my explanation of DEIR inadequacy was insufficient. Moreover, before my such #3.C discussion the EIR split up my introductory lead ins (e.g., 3.A and B) to that discussion, so that, again, the EIR could try to complain about such allegedly insufficient discussion of such inadequacy at what the EIR labelled as Comment Ind. #'s 254-6 to 254-13.

Nevertheless, even without regard to that disputed EIR fragmentation of my such #3.C, my fragment designated Comment Ind. 254-15 by itself was ample to defeat the EIR and expose errors, omissions, and noncompliance regarding hexavalent chromium, especially since it also cited to my Objection 254 #'s 3.G and H and to 7. I demonstrated in how in the EIR's disaggregation/cut in its Response to Comment Ind. 254-14 for DEIR at 4.3-58 entitled "Earthwork And Materials Handling," the EIR ignored the hexavalent chromium menace, while such DEIR at 4.3-61 entitled "Health Risk Assessment" also ignored hexavalent chromium entirely, containing instead only an inadequate discussion of asbestos impacts, despite the DEIR at 4.3-62 admitting that "Blasting and crushing would also result in emissions of heavy metal, TAC's including arsenic, beryllium, cadmium, copper, lead, manganese, mercury, nickel, selenium, and vanadium," but ignoring hexavalent chromium in Ind. 254-14. However, in disputed EIR Response To Comment Ind. 254-15 the EIR editor appeared to have revealed an insufficient hint of the menace by adding a reference to DEIR EIR Mitigation Measure 4.8-1(a) at 4.8-52 in repeating that toxic list that admits that it would have to add hexavalent chromium to that long list of toxins "of potential [water pollution] concern." Query, how does the EIR reconcile this obscured admission that it must at some future time after mine approval warn the Central Valley Regional Water Quality Control Board of this hexavalent chromium threat which the EIR dismisses as trivial? What about future Prop 65 notices at the mine? See Exhibit C and section I.F.1 above. Since everywhere else in obscure places in the DEIR that even bother to include a rare passing reference to hexavalent chromium treat it as if it were "environmentally benign," I assume that some DEIR editor may have overlooked this one admission while someone scrubbed away or chose to omit the other required references that CEQA demands be "good faith reasoned analysis" with "common sense." *See Gray*, *Banning*, *Vineyard*, *and Costa Mesa.* In any case, whatever the DEIR process, the fact is that there is no analysis whatsoever in the DEIR of the hexavalent chromium impact threats in air or water, especially where required by CEQA in the "Hazards And Hazardous Materials" discussion where it would be noticed by readers (who otherwise would be unlikely to even spot the issue), which the disputed EIR adds as "new," "significant" (and disputed and still deficient) information, while incorrectly claiming the EIR was just repeating for "clarification" something from the DEIR (but that was not ever there.) See also DEIR 4.11, which I note discusses cemented paste backfills where "water is needed to transport and bind the cemented paste backfill underground" (at 4.11.-7 at 4.11-36-37) without revealing the hexavalent chromium in that cement paste for impact threats. See Exhibit C and section I.F.1 above.

Notice all the important details of hexavalent chromium threats I reveal in this Ind. 254-15 disaggregated cut that the EIR continues to ignore and not even debate in its insufficient, erroneous, and noncompliant "new" "significant" information. See section I.A.1.c above. For example, at Ind. 254-15 at what EIR marked at 2-5891 (my Objection 254 at 39) I explained that the EU totally banned hexavalent chromium for some uses, and the EPA website details the menace in many cited studies (as in Exhibit C) rebutting EIR/DEIR's errors, omissions, and noncompliance on this topic. Indeed, buyers of local real estate will be terrified by following my suggestion of a simple Google search of hexavalent chromium or again watching the "*Erin*

Brockovich" movie (now on Netflix), illustrating my Exhibit C referenced case study of how that water pollution killed Hinkley, CA and many of its people. See the Hinkley website that discussed how they are still trying to remediate that groundwater menace after all these years. Moreover, as demonstrated here in N and S in my Objection 254 at #3.M, the EIR/DEIR cannot assume/speculate that the future will duplicate the past. For example, the DEIR admits it's (dangerously mistaken) reasoning at 4.8-51 that (emphasis and comments added): "The water… from the underground workings IS ANTICIPATED [by whom? why? based on what?] to have SIMILAR QUALITY [says who/ by what standard?] to the water that currently discharges from existing drains … Therefore, THE CONDITION AFTER MINING is completed would be like the existing, or baseline, conditions, such that seeps … WOULD NOT REPRESENT A POTENTIALLY SIGNIFICANT IMPACT UNDER CEQA …[says who? based on what?]" But that again ignores the addition of hexavalent chromium (as well as the impact of new mining and many other changes, not to mention the EIR errors at the start). Besides the ongoing menaces from the mining operations, whenever the mining is abandoned, the County should expect a mess, since one cannot expect this miner to remediate problems it wrongly refuses to admit or mitigate and works so hard to obscure and evade, assuming that, unlike the miners abandoning the other 40,000 CA mines on the EPA list, this miner is even willing to try to perform remediation work that its SEC filings (Exhibit B and DEIR Objection 254 #2) show the miner seems unlikely to afford now or under many foreseeable circumstances.

O. Objection To EIR Response (at 2-6008) To My Comment Ind. 254-16 (marked by the EIR at 2-5892), Which EIR Response Duplicates Overlapping EIR Responses To My Comment Ind. 1 and 15 And, Therefore, Which Is Subject To The Same Objections.

Besides incorporating my applicable objections above to the EIR Response to Ind. 254-15 and in DEIR Objection 254 to disputed DEIR 4.8 and the errors, omission, and noncompliance regarding such hydrology and water quality claims (e.g., DEIR Objection 254 #'s 3 and 7), I especially focus on my objection above to the disputed EIR Master Response 1 on which this disputed EIR Response attempts to rely. Also, as so explained, the only pretext the EIR has to complain about my alleged "failure to explain the details of the EIR's inadequacy" on this topic is because the EIR again cheats by disaggregating/chopping my DEIR Objection 254 into this fragment of my integrated original commentary, so that that cut part states the problem but omits the rest of my related commentary; i.e., the wrongful tactics and problems discussed in my introduction of these Responses and illustrated by these disputed EIR Responses **splitting my integrated DEIR Objection 254 section 3.D. into the EIR's Responses to Comment Ind. 254-16, 254-17, 254-18, and 254-16** (just as in my previous complaint about the EIR splitting in Responses To Comments Ind. 254-13, 14, and 15 what is integrated in my preceding 3.C in my DEIR Objection 254.) A review of my unmolested original DEIR Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) comprehensively already has rebutted this nonresponsive, disputed EIR Response. Nevertheless, even without regard to that EIR fragmentation of my such #3.D, my fragment designated Comment Ind. 254-16 by itself was ample to defeat the EIR and expose errors, omissions, and flaws regarding hexavalent chromium, especially since it also cited to my prior Objection 254 #'s 3.A, B, C, D, E, F, G, H, and M and to 5, 6, 7, 13, and 14. See Exhibit C and section I.F and E above.

However, for example, see my objections herein about how my DEIR Objection 254 highlighted the errors, omissions, and flaws regarding the water supply and quality and related mine threats in integrated explanations with ample details with table of contents headlines that the EIR divided into Response Comment Ind. 254 fragments thereof designed to scramble my analysis, so the EIR could complain that within that fragment there was an insufficient description of inadequacy. E.g., compare my DEIR Objection 254 section headline at #3.D at pages 40- 45 (EIR at 5892 marked and split as Ind. 254-16 to 254-19), entitled "An Introduction To DEIR Admitted Water Data, While Also Concealing Massive Unaddressed Issues, Errors, And Artificial Limitations On Which the DEIR Bases Many Flawed Conclusions, Contentions, And Assumptions We Dispute." (See also my internal cite therein to other DEIR Objection 254 sections), which section 3.D the EIR split for no legitimate reason between its EIR Comment Ind. 254-16 versus 254-17--19, so in each paragraph it could (incorrectly) complain that my explanation of DEIR inadequacy was insufficient.

This Ind. 254-16 fragment of my #3.D addresses one example of a "bait and switch" tactics (see section I.A.1.d(viii) and I.F.5) regarding water shortage threats in the disputed EIR #4.11 "Public Services And Utilities," where I bracketed key credibility issues in the DEIR quoted subsection called "Projected Water Supplies." As that demonstrated, there must be a reconciliation between DEIR admissions that support my concerns and other disputed DEIR claims that are inconsistent with, or contrary to, those admissions. See my DEIR Objection 254 #3.D citing its #14 and court precedents therein like *Gray*, *Banning*, *Vineyard*, *and Concerned Citizens*, but the applicable "punch lines"/conclusions for those objections are in the rest of my #3.D that the EIR cut into Ind. 254-17,18, and 19.

P. Objection To EIR Response (at 2-6008) To My Comment Ind. 254-17 (marked by the EIR at 2-5893).

Since these EIR comments cite back to the EIR Response in the previous paragraph marked Ind. 254-16, I refer equally to and incorporate my objections above to that EIR Response. Likewise, this is another example of how the EIR's complaint about my objections' "lack of explanation" is a function of how the EIR cut up my integrated, original discussion of the topic. E.g., compare my DEIR Objection 254 section headline at #3.D at pages 40- 45 (EIR at 5892 marked and split as Ind. 254-16 to 254-19), entitled "An Introduction To DEIR Admitted Water Data, While Also Concealing Massive Unaddressed Issues, Errors, And Artificial Limitations On Which the DEIR Bases Many Flawed Conclusions, Contentions, And Assumptions We Dispute." (See also my internal cite therein to other DEIR Objection 254 sections), which section 3.D the EIR split for no legitimate reason between its EIR Comment Ind. 254-16 versus 254-17--19, so in each paragraph it could (incorrectly) complain that my explanation of DEIR inadequacy was "insufficient." That disputed EIR tactic is particularly offensive here, where I analyze in detail a disputed DEIR quote full of false DEIR/EIR comparisons and other errors, omission, and bait and switch tactics, and other noncompliance, as well as the disputed DEIR/EIR's chronic attempt to impose its disputed CEQA interpretation limits on me when it is the DEIR/EIR making errors, omissions, and other noncompliance beyond its own alleged limits and without regard to my right to rebut and impeach those errors, omissions, and noncompliance. See section I.A.1.b, regarding the EIR/DEIR burden of proof discussion and their wrongful attempt to shift those burdens to me and other objectors

Without repeating everything in my prior DEIR Objection 254 (all of which remains applicable and meritorious) the disputed EIR/DEIR attempts to justify its projected water supply issues REGARDING **GROUNDWATER** RECHARGE FOR 80 YEARS by a false, incorrect, and worse comparison to the NID study of **SURFACE** WATER SUPPLIES THROUGH ONLY 2040. See my protest of such "bait and switch," false equivalence and other tactics in sections I.A.1.d(viii) and I.F.5 above. (The EIR at 2-6008 attempts to rely on the NID climate change supply models are an even worse error, misrepresentation, and noncompliance when the disputed EIR tries to apply them to this groundwater depletion/recharge situation, especially because the disputed EIR then tries to bootstrap to a future cited NID planning process for future climate water deficiencies at 2-6008, which also only has data until 2040—not 80 years.) As my DEIR Objection 254 (and those of others I incorporate—see Exhibit D) demonstrate, the EIR/DEIR recharge, balancing, and climate change claims for dewatering depletion of our **groundwater** cannot be justified by this disputed "bait and switch" false comparison to the **surface** water issues. That is especially true when the whole disputed DEIR/EIR theory is based on predicting future rainfall effects by false comparison to average "current" rainfall between 1967 and 2017 (in a different and broader area with different dynamics than our 2585-acre underground mine groundwater sources, and ignoring the more current, dry years after 2017). The NID Water Supply Assessment is not determinative, material, or even applicable or relevant to our groundwater depletion impact from mine dewatering, and, even if it were, the disputed EIR/DEIR attempts to extrapolate not only from obsolete historical (1967-2017) "current" average rainfall data, which (because of climate change and other factors) is no longer applicable and, in any event, such disputed rainfall projections cut off in the NID analysis in 2040. Therefore, such disputed EIR/DEIR assumptions for the rest of the 80 years thereafter for groundwater supplies and recharge a compounding of misinformation that is not in compliance with CEQA and fails the essential requirements for such evidence to be admissible. See section I.C above, including the 2018 Guidelines Amendments Explanations confirming the need for climate change considerations. (Note also that the disputed EIR's bogus attempted excuse for its absence of data after 2040 is that it blames NID for choosing that cut off, as if the EIR had any right to misuse that nonmaterial/irrelevant NID surface water data for its groundwater projection in the first place, which it does not have.) Even worse, the disputed EIR (at 2-6009) tries to further confuse the situation by citing vaguely to disputed DEIR Appendix K, which it claims (and us objectors dispute) **"SUGGESTS"** (emphasis added) that mine dewatering somehow "will not lead to significant incremental drawdowns as the mining progresses because the mining activities occur in deep, low hydraulic conductivity rocks" citing to the disputed EIR's Master Response 14 that this objection rebuts above. See also Exhibit D and my Table of Incorporated by Reference Objections on this topic, such as from the Wells Coalition Group Letter at 27/28, the CEA Objections at Group Letters 6-9 and 21, the Bear Yuba Land Trust Group Letter 2, and the Wolf Creek Community Alliance Group Letters 29-32.

Moreover, while the disputed DEIR/EIR purports to address "legal limitations" regarding NID water supplies for comparison, the EIR/DEIR ignores the legal limits applicable to the legal and property rights of us surface owners above and around the 2585-acre underground mine. See *Keystone* and sections I.F.8 and 9, and I.E. In any event, NID has many options for water protections (eg, massive water storage, water purchases from other water agencies, etc.), none of which are available to those of us on the surface when our groundwater is depleted. This is another bait and switch/false comparison by the disputed EIR/DEIR. An illusory (e.g., unaffordable by Rise based on its admitted lack of financial resources in its SEC filings; Exhibit

B), vague, (as to many of us not included in the Rise water supply proposal for some existing wells, as distinct from future wells we surface owners each have a right to drill to compete for our own groundwater) nonexistent, and always insufficient EIR/DEIR mitigation gesture does not comply with CEQA or justify approval of the mining. See section I.E and I.C and D.

A review of my unmolested, original DEIR Objection 254 #3.D (i.e., what is not so improperly disaggregated by the EIR) has already comprehensively rebutted this nonresponsive, disputed EIR Response. Indeed, all my groundwater related objections in this EIR Objection 254 and in my previous DEIR Objection 254 rebut and impeach the many erroneous, insufficient, and noncompliant DEIR/EIR attempts to justify groundwater depletion or imagine recharges, always ignoring the fact that this is not just a CEQA dispute about environmental impacts, but this is also a property law dispute about the property rights (e.g., for lateral and subjacent support, including by groundwater, and to the groundwater itself) of us surface owners above and around the 2585-acre underground mine. See, e.g., *Keystone* and sections I.F. 8 and 9 and I.E above.

Q. Objection To EIR Response (at 2-6009) To My Comment Ind. 254-18 (marked by the EIR at 2-5894).

This EIR Response is subject to the same objections I made in the previous sections above where the disputed EIR cut up/disaggregated my integrated objections into fragmented parts it disconnected to support meritless claims. What the disputed EIR calls a "Response" to Ind. 254-18 is just part of the same objectionable DEIR quote I disputed in what the EIR calls a "Response" to Ind. 254-17 and to its disputed Appendix K (and in my other water related objections). Everything I have said in rebutting that EIR Response to Ind. 254-17 in the previous section applies equally here, which I incorporate that here, rather than repeating it. **However, I note that the EIR denies my "bait and switch" charge by compounding that wrong by mischaracterizing my objection (eg, making it sound like I was only complaining about competition for NID potable water) and further mixing up the NID/surface water versus our groundwater issues. As explained above, NID STUDIES DEAL WITH SURFACE WATER SUPPLIES, never our groundwater recharge and supply. Although my objections include a concern about NID drought cut backs on potable water to worthy customers that would be made worse by competition from this mine my and other objections show to have no net benefit (see Exhibit A and DEIR Objection 254 #4), (with one exception in the next sentence) my strongest objections concern the waste of groundwater by dewatering in accordance with the EIR, especially considering its disputed, illusory, or worse mitigation theories**. See my prior discussions about the EIR's frequent daily watering with NID water to suppress toxic (asbestos and others) fugitive dust of such great concern to the NSAQMD in its Agency Letters 12 (see p.12) and 11 that it insists that NID water be prioritized in that use during droughts to save us from otherwise lethal air pollution, as I discuss elsewhere. (I understand that the EIR claims here it will be using both our depleted groundwater for nonpotable uses, and NID water for potable uses, but, in this zero-sum climate drying threat, any mine use should have less priority than our residential and beneficial commercial uses, whether potable or non-potable. And the mine EIR approval should be denied so us locals do not have to suffer more than necessary in the many climate change droughts to come because the mine needs to use our share of water to suppress its toxic dust with NID water.)

A review of my unmolested, original DEIR Objection 254 #3.D (i.e., what is not so improperly disaggregated by the EIR) comprehensively already has rebutted this nonresponsive,

disputed Response. The previous subsection addresses flaws in the disputed EIR trying (and failing) to justify its such groundwater depletion by reliance on NID surface water data (which also only exists for a fraction of the 80 years of 24/7/365 mining.) Now, **this disputed EIR Response to Ind. 254-18 dismisses my objections by making the following irrelevant pronouncement, as if it were responsive and dispositive (but it entirely misses my point) with this quote (citing "DEIR p.4.11-9"): "NID does not utilize groundwater as an existing or planned source of water due to limited groundwater availability." First,** that DEIR quote (reaffirmed here in the EIR) **admits** there is already a "limited groundwater availability" problem even before considering the coming mine dewatering depletion 24/7/365 for 80 years (and the above discussed such constant daily waste of NID water to suppress toxic fugitive dust of concern to the NSAQMD in its Agency Letters 12 [see p.12] and 11). NID's such well-informed groundwater concern by itself is sufficient reason to reject the mine EIR. **Second,** the NID surface water adequacy forecast data through 2040 (far short of the 80 years of mine dewatering) is irrelevant to prove groundwater adequacy/recharge even until 2040, because the EIR makes the unproven and disputed assumption, defying "common sense" required in *Gray,* that what is true for NID surface water is true of our groundwater. (Clearly, since NID does not depend on groundwater, NID's water supply analysis was not intended to support the disputed EIR groundwater claims.) ***Third,*** while NID may choose to use other sources of water than groundwater to deal with drought and climate change (and NID has more alternative supply options/choices than us mine victims), those of us surface owners living above and around the 2585-acre underground mine have competing ownership rights (see *Keystone*) to the groundwater being flushed away 24/7/365 for 80 years by the EIR dewatering plans, and we will all need that groundwater as climate change impacts worsen progressively. Thus, the issue is not just mine conflicts with **existing wells** (including the many wrongly ignored in the EIR mitigation), but also the **new wells us surface owners have the right to drill in the future compete to save our homes and forests. See, e.g., sections I.F.1-5, 8, and 9, and I.E.**

R. Objection To EIR Response (at 2-6009) To My Comment Ind. 254-19 (marked by the EIR at 2-5895).

Again, like the previous disputed EIR Responses to my water related objections (e.g., to my Comments Ind. 254-17 and 18), this disputed Response is another EIR disaggregated/cut up of my rebuttal objections to long quotes from the DEIR on this subject. My previous objections in those two prior subsections are incorporated and applicable herein as well. Those objections rebut the DEIR/EIR incorrect and worse rewrite of my objections as to various water issues. Although the disputed EIR mistranslates all that into my alleged failure to "provide any evidence that groundwater wells may be impacted besides those identified in the EIR" (in the context of my undivided, original objections, I complained both about the negative impacts of 24/7/365 dewatering for 80 years on existing and future wells above and around the 2585-acre underground mine, including wells that will be drilled by us surface owners having ownership interests in those groundwater rights. See Keystone and sections I.F.1-5, 8, and 9 and I.E). A review of my unmolested, original Objection 254 #3.D (i.e., what is not so improperly disaggregated by the EIR) comprehensively already has rebutted this nonresponsive, disputed EIR Response.

Unlike those other disputed EIR Responses, this time the EIR also tries (and fails) to rebut my objections by incorrectly dismissing them as mere "speculation," incorrectly relying

CEQA Guideline 15384 (which the disputed EIR erroneously claims empowers it to ignore my and other objections as "argument, speculation, unsubstantiated opinion or narrative" and which here applies to the EIR applicant, not my such objections) for disqualified evidence (i.e., "clearly erroneous or inaccurate," or "of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment.") Among the many flaws in that incorrect EIR argument are: (1) it ignores the fact that such EIR/DEIR statements (which I often quote for rebuttals) are themselves much worse such speculation, argument, bogus assumptions, "unsubstantiated opinion or narrative," and "clearly erroneous or inaccurate" than those of mine. That means my objections can properly respond as I have by so exposing such errors, flaws, and noncompliance in the DEIR/EIR and by countering as best I can, whether it's with my wiser "speculation" and better "opinions" or, as I contend, fully compliant objections, for contrast and rebuttal to explain those EIR flaws. [Stated another way, my rebuttals and disputes exposing such DEIR/EIR errors, omissions, and speculations, etc. must be allowed, since it is absurd and worse for the EIR to claim, in effect, as it does here, that somehow objectors must use what the disputed EIR calls CEQA qualified evidence to counter what such objections show to be the EIR's worse, noncompliant such speculation, argument, bogus assumptions, unsubstantiated opinion or narrative, or clearly erroneous or inaccurate statements]; (2) what the EIR mislabels as "speculation" about its overlooked and potential new wells is not "speculation," since, among other things, I have exposed existing and future wells the EIR has overlooked in my local area (eg, comparing what is stated in the EIR/DEIR to what I can see and what my neighbors with wells tell me and are contingency planning). Therefore, if the EIR were mistakenly approved, at trial I can produce myself and other local witnesses who are interested at the appropriate time (eg, when necessary as we predict) in competing against the mine with new or deeper wells (either individually or collectively) and holding the miner accountable for any violation of our groundwater ownership rights. See *Varjabedian*. [Stated another way, the disputed EIR/DEIR incorrectly argues that it is "speculation" when my objections expose what vast case study experience and legislative studies reveal in other (already impacted by drought and climate change) groundwater depleted places as to how surface owners compete for groundwater to save their crops and homes. However, it cannot be "speculation" when us potential victims of such dewatering depletion of our groundwater advise the County in DEIR/EIR objections that we will enforce our groundwater rights as necessary to prevent the harmful impacts we consider to be inevitable from 24/7/365 dewatering for 80 years during progressive climate change]; and (3) much what the disputed DEIR/EIR cites in support of its false, erroneous, or noncompliant (e.g., omitting or misconstruing essential data) claims will (if necessary) be the subject (e.g., in massive "motions in limine") in any court challenge to exclude those EIR claims as inadmissible, rebutted, or noncredible (i.e., we will prove such EIR claims not to be supported by CEQA sufficient "substantial evidence," and the County decisionmakers should take that into account as they evaluate this situation.) [Since the County process is not a court trial, but rather a limited process in we objectors have unduly limited time [three minutes] to state our many objections to the more than 7000 pages of EIR/DEIR we dispute, what else can we do now but make our objections as an offer of proof for consideration by the County decision-makers and any revieing courts?]

What is the record to show for that disputed EIR process? Among other things, such County decision-makers should see both: (i) what we objectors are offering to prove, if necessary, in the court challenge process, where the law of evidence will both (a) allow our rebuttal and impeachment evidence ignored so far in the EIR process, especially Rise/EIR/DEIR

admissions (e.g., section I.C, D and I.A.1.b and d; *Richmond v. Chevron, allowing SEC admissions by EIR applicant to enable the objectors to prevail*); and (ii) how much the disputed EIR/DEIR has omitted, evaded, or failed properly present with "good faith reasoned analysis" and "common sense" as required by CEQA and authorities like *Gray, Banning, Vineyard, and Costa Mesa,* including for example where the EIR incorrectly refused to address meritorious objections incorrectly dismissed by the EIR/DEIR as "speculation" or lacking sufficient "explanations, or other bogus claims, especially where the EIR/DEIR incorrectly attempts to shift the burden of proof (section I.A.1.b) from themselves to the objectors, or where the issue begins with noncompliance by the EIR/DEIR which I dispute with rebuttals, impeachments, or other counters.

When those legal/evidentiary flaws and inadequacies in the EIR/DEIR are confirmed in any relevant court process, at least we can say that "we told you so" in whatever happens next, if the ultimately defeated EIR attempts another try. What the DEIR/EIR incorrectly assumes (and they refuse to consider any other possibility) is that approval means the miner can do whatever the EIR would allow without consequences, when the reality is that us local victims will resist, challenge such mistakes, and defend our property and other rights with legal, law reform, and political remedies, especially as to the groundwater in which we surface owners above or around the 2585-acre underground mine each personally own property interests. See *Keystone, Varjabedian,* and similar authorities. See sections I.F.8 and 9, and I.E. For example, taking such property rights of us surface owners (e.g., such as allowing the mine to deplete the first 10% of exiting well water before mitigation, or ignoring impacts on future wells of us surface owners) creates Fifth Amendment (and CA Constitutional equivalents), inverse condemnation, and other claims, as illustrated in *Varjabedian, Gray,* and sections I.F.1-5, 8, and 9, including the applications of County General Plan 17.12. No one I know will forbear to drill individual or collective wells to maintain sufficient water to preserve our homes and forests during the progressive climate change dryness (recognized by the 2018 Guidelines Amendments Explanation discussed in section I.C) made worse by 24/7/365 dewatering depletion without the bogus EIR recharge claim falsely assuming/speculating that the average "current" rainfall between 1967 and 2017 (which is not "current," because it ignores dry years after 2017) will continue for 80 years (for which false assumption it relies on inapplicable NID data that ceases in 2040, leaving everyone to guess thereafter).

While the disputed EIR resists some of my challenges to the disputed EIR's **"bait and switch"** or "false equivalence" tactics (sections I.A.1.d(viii) and I.F.5), the EIR generally ignores many objections entirely. For example, the disputed DEIR (and, therefore, the EIR, which ratifies and does not correct the erroneous DEIR) asserts that the **DEIR admitted (although understated) NID shortfalls (eg, at Table 4.11.5 and 4.11-40-43] I address in my Ind. 254-19 (at 5895) [eg, "Water demand within NID's service area is expected to exceed the District's supplies by mor than 45% from 2025 to 2040 {when NID projections stop, but the EIR continues erroneously to assume continuation of that pattern with blatant and erroneous speculation} in Single Dry Years and by less than 10% from 2025 to 2040 during the first and second years of a Multiple Dry year period."] Then the DEIR incorrectly argues that no one should worry about the (underestimated) mine uses making that admitted shortage worse by the false and worse "switch"/speculation, where the disputed DEIR states (and disputed EIR ratifies):**

"However, this project is not expected to exacerbate NID's water supply shortages during dry years and the project will supply water [i.e., the groundwater taken by dewatering from beneath surface owners above and around the 2585-acre underground mine with competing ownership interests in such groundwater] into the South Fork Wolf Creek and into the NID conveyance system, at volumes exceeding the project demand for potable water from NID."

In effect, the EIR claims that us local NID existing and future residential and beneficial commercial customers above and around the 2585-acre mine should suffer well depletion and NID cut backs for the benefit of the mine providing no net benefits to us locals, because some other, distant customers in the NID system (supposedly safe from mine impacts) will get the alleged benefit our local groundwater depleted by dewatering the mine and (after purported and deficiently described EIR treatment we dispute, and many will doubt as to quality) flushed away in the Wolf Creek. As I demonstrated in my objections that the EIR/DEIR fails to rebut, nowhere does the EIR demonstrate that us local surface owners and users above and around the 2585-acre mine will not be worse off in that de facto trade of our owned groundwater for whatever extra, if anything, we may somehow get in exchange from NID. That theory exposes the EIR miner and County to inverse condemnation and other claims under *Varjabedian, Gray, and Keystone*. See also DEIR Objection 254 #'s 3, 4, 5, 7, and 14.

Also, once they realize what my and other objections demonstrate on the subject (see my comments in this document on the subject and in my DEIR Objection 254, citing, for example, to the massive studies on the EPA website and Exhibit C about the toxic dangers of hexavalent chromium that caused it to be banned entirely for various uses in the EU, as illustrated by the case study of such water pollution killing the town of Hinkley, CA, and many residents, as illustrated in the movie, "*Erin Brockovich*" and, according to www.hinkleygroundwater.com, which what's left is still struggling to remediate), NID customers may revolt at getting Wolf Creek water containing such hazardous hexavalent chromium from the mine dewatering process where the miner adds that toxin into the mine shoring cement paste, and many will be skeptical or more cynical about water quality from this mine's vague and disputed "treatment process." The disputed EIR can try (erroneously or worse) to claim that its toxin will be at a safe level, relying on regulators to deal with any "issues," but what NID customer downstream is going to feel comfortable knowingly drinking that water in reliance on the EIR treatment claim and some after the fact future regulator timely detecting problems. (This is among the reasons the EU banned various hexavalent chromium uses, and this is like the state government officials trying to tell the people of Flint, Michigan, not to worry about the "safe" levels of lead in their water pipes, when the science demonstrates that there is no safe level.

In any case, who will want to take any such risk or suffer any harm or water scarcity for the benefit of such a disputed mine they correctly see as providing them no net benefit. See above discussions and Exhibit A, as well as my prior Objection 254 #4. Remember, even if the County were willing to give the EIR or miner the benefit of the doubt, which would be worse than a mistake (see section I.A.1.b confirming the burden of proof on the EIR applicant) few of us at risk of mine impacts can afford to do so. Even if the disputed EIR were somehow correct about its disputed such assumptions/speculations/safety claims, us potential victims would still rightly be

concerned about the risk of human error in the proper and diligent handling of this toxin and in the water treatment process, especially whenever the mining (or mitigations) stops, such as when funding is exhausted. See Rise SEC filings admitting a financial condition that does not appear to enable it to afford to achieve the EIR aspirations, much less compensate its victims or to cure any problem, even if it were willing to do so, when and if found guilty of causing such harms. See, eg, Rise's SEC filing admissions in Exhibit B and in my DEIR Objections 254 (#2) and 255.) This is not, as the EIR claims, a "less than significant impact."

In another example of a DEIR/EIR misleading "bait and switch," the DEIR states (and EIR ratifies) that: "This project would be subject to any applicable water demand cutbacks during droughts, like other NID potable water customers who are served by NID." However, that ignores the NSAQMD's Agency Letter 12 (at 12) discussed above, where that regulator demands *priority* for frequent daily NID watering of its toxic (asbestos and more) fugitive dust, and rather than breathe such toxic air, locals may have to suffer with less than their fair share of drought rationed water. Whatever the result, that disputed EIR reassurance of shared suffering is false and misleading at best. The reality is that this is a "zero sum game," in which every gallon allocated to this no net benefit mine is one less gallon available to the far more deserving locals. I have yet to meet any locals here above or around the mine who are willing to sacrifice anything for the mine. Almost all informed locals oppose the EIR mine, creating (if the mine is approved) a massive political problem for the County and NID to add to the inevitable legal disputes that will surely catch them in the cross-fire. See DEIR Objection 255 and 254 (eg, #4).

Moreover, the EIR ignores and fails to rebut my detailed presentation on water use (and misuse) in the last long fragment paragraph the EIR disaggregated/cut up and marked at Ind. 254-19 (at EIR 2-5896), which again uses the DEIR/EIR admissions to refute their disputed speculations, opinions, and claims. See the last paragraph in this disputed EIR Response To Comment Ind. 254-19, where any fair comparison would cause any objective reader to conclude that the EIR "Response" was nonresponsive at best and (considering the nature of those EIR errors, omissions, and noncompliance) worse. For example, the EIR attempts (at 2-6009-10) to minimize the water uses for "dust control" as "temporary" during "initial construction" (eg, wrongly claiming that as an excuse for why "those water demands (42,000 gpd) were not included in the buildout water demand projections for the project"), but that is inconsistent with the DEIR admissions addressed in my DEIR Objection 254 and my related objections. See also the previous paragraph here and NSAQMD Agency Letters 12 and 11.

How many more such inexcusable omissions were slipped into the DEIR/EIR and never reported, because it is hard to read these thousands of pages full of errors, omissions, and noncompliance and catch all of such imaged excuses for omissions/evasions/noncompliance. See sections I.C and D, I.F.5. This is important because the purpose of the EIR is to respond to our valid complaints about the DEIR, so the EIR/DEIR can be correctly and sufficiently revised for recirculation. When the EIR attempts to correct the DEIR errors, omissions, and noncompliance, we objectors dispute that attempt by the EIR to claim such "significant new information" was just "clarifications" or "amplifications." See section I.A.1.c. As explained above (e.g., section I.A.1.c and I.F.8), those EIR excuses fail to comply with CEQA (see sections I.C and D) and create more credibility problems that should defeat the EIR approval even without waiting

for a comprehensive rewrite and recirculation. Id. If there is any doubt about the applicable risks of this EIR mining being what such objections state, consider what I recite as EIR/DEIR (or Rise) admissions and, more importantly because they are more revealing, as Rise SEC filing admissions addressed in Exhibit B hereto and my Objections 254 (#2) and 255.

S. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-20 (marked by the EIR at 2-5897).

Again, like the previous disputed EIR Responses to my water related objections (eg, to my Comments Ind. 254-17, 18, and 19), this disputed Response is another EIR disaggregation/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my Objection 254 #3.E is cut up into EIR fragmented "Responses To Comments Ind. 254-20, 21, and 22" as to subpart I, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which is treated as if such EIR selected fragment had to be self-contained and sufficient, when all were part of an integrated, original whole the EIR refused to consider together as presented.) My such objections in all those subsections (i.e., my objections in Ind. 254-17 to 22 and to disputed EIR citing disputed Master Responses 13, 14, 15, and 16) are incorporated and applicable herein, because they are parts of my integrated objection. See generally, my DEIR Objection 254 #'s 3, 5, 6, 14, and 15. Those objections rebut the DEIR/EIR incorrect and worse rewrite of my objections as to such various water related errors, omission, noncompliance, and issues, although the disputed EIR mistranslates all that into my alleged failure to provide sufficiently specific information as to my complaints, such as that the DEIR (and now the EIR) underestimated the number of impacted private groundwater wells, ignored future wells of us surface owners above and around the 2585-acre underground mine, failed to propose sufficient monitoring wells and in all the right places for more effective mitigation, and failed to address the water supply problems beyond 2040, i.e., for the whole 80 years of 24/7/365 dewatering. (When I refer to such objections, I am not just disputing affirmative errors, but also omissions that are clarified by my DEIR Objection 254 #15, which asks the hard questions never sufficiently answered in the DEIR/EIR with good faith reasoned analysis and common sense as CEQA and other applicable law expects (e.g., *Gray*, *Banning*, *Vineyard, and Costa Mesa*), such as trying to justify what I expose as errors, omissions, and noncompliance in the DEIR/EIR, whether or not within the disputed, limited scope the DEIR/EIR incorrectly claims to apply in CEQA for such rebuttals (see section I.C and D), as if somehow the DEIR/EIR can say whatever wrong, false, or misleading things they wish without us objectors being entitled to rebut them with truths, because those truths are incorrectly considered by the disputed EIR/DEIR to be outside that limited CEQA boundary they would incorrectly impose on objections, even on rebuttals using Rise or EIR/DEIR admissions.) A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed Response.

Among the more obnoxious evasions and CEQA violations is the "bait and switch" way that the EIR/DEIR attempts to evade CEQA and other applicable laws by limiting their *groundwater* supply analysis by comparison to NID surface water data and only for the period ending in 2040, rather than for the whole 80 years of abusive 24/7/365 mining and dewatering (plus with deficiently analyzed hazardous hexavalent chromium cement in the underground shoring). Again, the noncompliant DEIR/EIR speculate/assume/imagine

that what they call the "current" average rainfall between 1967 and 2107 [not really current, because they ignore the dry years after 2017] will continue to recharge the groundwater for 80 years on that same basis without regard to 24/7/365 dewatering and climate change. And despite all that, the EIR/DEIR dare to complain about us objectors speculating!

For example, although it has no right to rely upon the disputed and largely inapplicable NID surface water data even through 2040, the EID/DEIR tries to excuse its omissions of proof of safety for the balance of the 80 years by blaming NID for stopping its analysis at 2040, incorrectly arguing that it somehow should be excused from comments beyond 2040, because the "planning horizons" were "not chosen by the Project Applicant," a wholly irrelevant fact (even if true), especially when as discussed herein (eg, my objections to EIR Responses to Comments Ind. 254-17 to 20) the EIR/DEIR fail to prove that the NID surface-only water supply data until 2040 complies with CEQA for the 80 years of EIR dewatering of objectors' groundwater 24/7/365. That irresponsible and worse EIR demand for permission for such 80 years of such dewatering of surface owners' owned groundwater cannot be compliant with CEQA (section I.C and D) and other applicable law (*Keystone)* when the EIR offers no evidence as to the harmful impacts the EIR causes beyond 2040. Indeed, it is worse than ironic that the EIR blames me for "speculation" in my objection, when the real noncompliance is the EIR demanding that we all must guess as to our water supply fate after 2040 under these circumstances, such as there being no competent evidence even as to the starting condition of this mine abandoned and flooded since 1956 and admittedly not adequately investigated by Rise for these purposes (see Exhibit B and DEIR Objection 254 #2), as if it preferred not to have to deal with reality, but rather allows itself alone to speculate/assume/imagine that what it chooses to believe about the past before the climate change impacts became serious will continue to apply progressively for the next 80 years, despite all the evidence to the contrary.

As I noted in such objections and in Exhibit A hereto (which addresses the insufficiency of the County Economic Report), that County Economic Report described at least **300 applicable wells** at risk above or around the mine, compared to the DEIR/EIR's lesser number along East Bennett Road and perhaps several other places, although it's hard to tell from those vague and insufficient DEIR/EIR descriptions. Whereas I and others contend there are many more impacted existing wells now, plus many more future wells to come as the mine dewatering depletion, drought, and climate change force us surface owners to drill new, competing wells to tap the groundwater in which we personally own an interest).

I have proven (and will continue to prove) how the DEIR/EIR underestimates the competing wells at issue and misjudges impact locations. Our objector proof will demonstrate the insufficiency of the miner's illusory mitigation (e.g., that Rise's SEC filing admissions [Exhibit B] and data addressed in Exhibit A and in my Objections 254 and 255 prove the miner cannot afford even if it were willing to do what is required to admit and cure all the harms it causes.) While the EIR/DEIR claims that this is not a "significant" CEQA problem, what the EIR/DEIR really are saying is that the EIR miner can handle the small, acknowledged portion of the relevant water shortages as the EIR incorrectly defines such problems to be in the EIR's disputed "alternative reality," rather than what we objectors reveal such impact problems really are. However, the EIR mitigations are insufficient, even if the EIR were only required just to justify the effects of its own admissions, as distinguished from full compliance with CEQA and the other applicable law which disallows the EIR/DEIR's disputed evasion tactics. If there is any

doubt about the applicable risks of this EIR mining being what such objections state, consider what I recite in my objections as EIR/DEIR admissions, and, more importantly because they are more revealing, as Rise's SEC filing admissions addressed in Exhibit B hereto and my Objections 254 and 255.

T. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-21 (marked by the EIR at 2-5898).

Again, like the previous disputed EIR Responses to my water related objections (eg, to my Comments Ind. 254-17, 18, 19, and 20), this disputed Response is another EIR disaggregated cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my DEIR Objection 254 #3.E is cut up into EIR Responses To Comments Ind. 254-20, 21, and 22 fragments as to subpart I, as well as to fragments Ind. 254-20 to 33, as to all of my such #3.E), each of which fragments is treated as if such EIR selected portion had to be self-contained and sufficient, when all were part of an integrated, original whole the EIR improperly refused to consider together as I wrote them.) My such objections in all those subsection fragments (i.e., my objections in Ind. 254-17 to 33 and to disputed EIR citing disputed Master Responses 13, 14, 15, and 16) are incorporated and applicable herein, because they are parts of my indivisible, integrated DEIR Objection 254 #3.E. See generally, section I.F.5 above, my DEIR Objection 254 #'s 3, 4, 5, 6, 7, 14, and 15, and my introductions to sections II and III. Those objections rebut the DEIR/EIR's incorrect and worse rewrite of my objections as to such various water related errors, omission, noncompliance, and multidisciplinary issues. If there is any doubt about the applicable risks of this EIR mining being what such objections state, consider what I recite as EIR/DEIR admissions (which cannot be denied by them) and, more importantly because they are more revealing, as Rise's SEC filing admissions addressed in Exhibit B hereto and my DEIR Objections 254 and 255. My unmolested, original DEIR Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed EIR Response.

As in the similar, disputed EIR Response to Comment Ind. 254-19 and 20 (as well as 22-33), all incorporated herein, the disputed EIR again tries (and fails) to rebut my objections by incorrectly dismissing them as mere "speculation" or otherwise deficient, incorrectly relying on CEQA Guideline 15384 (which the disputed EIR erroneously claims empowers the EIR/DEIR to ignore in my and other objections as "argument, speculation, unsubstantiated opinion or narrative," i.e., disqualified evidence (i.e., "clearly erroneous or inaccurate," or "of social or economic impacts which do not contribute to or are not caused by physical impacts on the environment"). That Guideline and other applies to the EIR/DEIR, which has the burden of proof and fails to satisfy it, blaming me instead for such EIR/DEIR failures when the reverse is the case. If the EIR presentation is deficient and otherwise noncompliant, that must excuse the objections from having to cure those flaws before rebutting them. Here, the EIR incorrectly claims that I assert, "without evidence, that it is a certainty that additional property owners with groundwater wells will be impacted by the project," which again misstates my objections and my evidence, including as more accurately what was recited in my objections to EIR Responses Ind. 254-17 to 33 and in Objection 254 #3.E, which the EIR attempts to disaggregate.

As so demonstrated by me there and elsewhere, I have provided both evidence (including, for example, from the County Economic Report counting more impacted wells to be mitigated than the EIR/DEIR—see Exhibit A) and EIR and Rise SEC admissions in Exhibit B

and DEIR Objection 254 #2 (which admissions are the best kind of fatal evidence against such EIR, because, unless the EIR can escape objectors' notice as it continues to attempt to do, the EIR cannot deny such admissions without serious adverse consequences, especially from the Rise SEC filings, which I assume is why Rise is more revealing and accurate in the SEC filings than in the EIR/DEIR. See *Richmond v. Chevron*, where the objectors used such SEC admissions to prevail in defeating that eir. In any case, as demonstrated, the EIR's claims at issue are often themselves even worse speculation, argument, unsubstantiated opinion or narrative, or clearly erroneous or inaccurate or lacking in the required "common sense" and "good faith reasoned analysis" E.g., *Gray, Banning, Vineyard, and Costa Mesa*. In any event, besides the overlooked relevant existing wells, my objection includes evidence in the form of witness testimony by me and others impacted by the EIR mining that we contemplate protecting our homes and property from climate change and mine impacts by drilling new wells to tap the groundwater in which we each have property ownership interests that the EIR/DEIR entirely ignores. See *Keystone.* (There is a difference between (i) the rights of a Nevada County resident generally, and (ii) someone like me owning the surface above or around the 2585-acre underground mine, who personally has additional property rights, such as for lateral and subjacent support, including by and from groundwater, as demonstrated in *Keystone* and other court cases cited in my DEIR Objection 254 #'s 3.N, 4, and 14 and in my 255.) What I (and others) do to defend my home and forest from the mine impacts is not "speculative," especially when it is in mitigation of my damages from *Varjabedian* type claims as explained elsewhere herein. What is speculative is the illusory mitigation offered by the EIR for even the wells it acknowledges, considering the fact that the SEC filing admissions show Rise cannot afford such mitigation (Exhibit B and DEIR Objection 254 #2), much less the many uncounted existing wells and all the future new wells to come above and around the 2585-acre mine.

Among the many additional flaws in that EIR "speculation" argument are: (1) it ignores that **the EIR/DEIR statements I am disputing are themselves worse such speculation, argument, false assumptions, "unsubstantiated opinion or narrative," and "clearly erroneous or inaccurate," as well as so lacking in the required "common sense" and "good faith reasoned analysis" E.g., *Gray, Banning, Vineyard, and Costa Mesa*. That means my objections can properly respond as I have by so exposing such flaws and noncompliance in the DEIR/EIR and by countering what is stated or omitted or evaded as best I can, even if it's just with more "common sense" and "good faith reasoned analysis," with my wiser "speculation," and with better "opinions" for counters and rebuttals to explain those EIR/DEIR errors, omissions, and noncompliance.** [Stated another way, my rebuttals and disputes exposing such DEIR/EIR errors, omissions, and speculations, etc. must be allowed, since it is absurd and worse for the EIR to claim, in effect, as it does here, that somehow objectors may only use what the disputed EIR incorrectly calls limited CEQA-qualified evidence to counter what our such objections show to be the EIR's worse such speculations, arguments, bogus assumptions, unsubstantiated opinions or narratives, or clearly erroneous or inaccurate statements]; (2) what the EIR mislabels as speculation about its overlooked and contested rights for potential new wells is not "speculation," since, among other things, I have exposed existing and future wells the EIR has overlooked in my local area (eg, comparing what is stated in the EIR/DEIR to what I can see and what my neighbors with wells tell me), so at trial I can produce myself and other local witnesses, including me and others who are interested at the appropriate time (eg, when necessary as we predict) in competing against the mine with new or deeper wells (either individually or collectively) and holding the miner accountable for any violation of our

groundwater ownership rights. [Stated another way, the disputed EIR/DEIR incorrectly argues that it is "speculation" when my objections expose what vast case study experience and legislative studies reveal in other (already impacted by drought and climate change) groundwater depleted places as to how surface owners compete for groundwater to save their crops and homes. However, it cannot be "speculation" when us potential victims of such dewatering depletion of our groundwater advise the County in DEIR/EIR objections that we will enforce our groundwater rights as necessary to prevent the harmful impacts we consider to be inevitable from 24/7/365 dewatering for 80 years]; and (3) much what the disputed DEIR/EIR cites in support of its false, erroneous, or flawed (eg, omitting essential data) claims will (if necessary) be the subject (eg, in massive "motions in limine") in any court challenge to exclude those claims as inadmissible, rebutted, or noncredible (i.e., we will prove such EIR claims not to be supported by CEQA sufficient "substantial evidence," and the County decision-makers must take that into account as they evaluate this situation.) [Since the County process is not a court trial, but rather a limited process in which we objectors have unduly limited time [three minutes] to state our many objections to the thousands of pages of EIR/DEIR we dispute, what else can we do now but make our objections as an offer of proof for consideration by the County decision-makers? What is the record to show for that process?)

U. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-22 (marked by the EIR at 2-5899).

Again, like the previous, disputed EIR Responses to my water related objections (eg, to my Comments Ind. 254-17, 18, 19, 20 and 21), this disputed EIR Response is another EIR disaggregated cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my Objection 254 #3.E is cut up into fragments the EIR calls "Responses To Comments Ind. 254-20, 21, and 22" as to subpart I, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which is treated as if such EIR selected portion had to be self-contained and sufficient, when all were part of an integrated, original whole the EIR refused to consider together as written by me.) Because of that disputed EIR failure to address my whole #3.E objection, the EIR improperly cited to its disputed Master Response #1 (and which I refute above), and the EIR incorrectly concludes: "Because the commentator [me] does not articulate a clear criticism of identify and inadequacy with the DEIR, no further response is necessary." This is worse than wrong, especially given the fact that my objection set up those allegedly missing, detailed objections with admitted facts for context. **For example, my objection quoted the following from DEIR at 4.11-37 for a reason: "Once the initial dewatering is completed approximately 1,224 million gpd (850 gpm) are estimated to be pumped to the surface and treated at the on-site WTP on an on-going basis to maintain the dewatered mine." Among the reasons for citing that admission of such a massive, constant depletion of our local groundwater flushed away down the Wolf Creek 24/7/365 for 80 years is that it both (i) rebuts the speculations and omissions of proof by the EIR/DEIR that there is nothing to be concerned about, and (ii) also confirms my concerns as rational and worthy of investigation, even under the CEQA Guidelines I explain in section I.C and D and my DEIR Objection 255. See my objections preceding these concluding paragraphs in what the EIR has disaggregated/cut up and labeled Ind. 254-20 to 22.** A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed Response.

My such objections in all those subsections (i.e., my objections in Ind. 254-17 to 33 and to disputed EIR citing disputed Master Responses 13, 14, 15, and 16) are incorporated and applicable herein, because they are parts of my integrated Objection 254 #3.E. See generally, my Objection 254 #'s 3, 4, 5, 6, 7, 14, and 15. Those objections rebut the DEIR/EIR's incorrect and worse rewrite of my objections as to such various water related errors, omission, noncompliance, and issues. If there is any doubt about the applicable risks of this EIR mining being what such objections state, consider what I recite as Rise/EIR/DEIR admissions and, more importantly because they are more revealing, as Rise SEC filing admissions addressed in Exhibit B hereto and my DEIR Objections 254 and 255.

V. Objection To EIR Response (at 2-6010) To My Comment Ind. 254-23 (marked by the EIR at 2-5900).

Again, like the previous disputed EIR Responses to my water related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, and 22) and to the EIR's rebutted above Master Comments 13, 14, 15, 16, and 35, this disputed EIR Response is another EIR disaggregated/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my DEIR Objection 254 #3.E which is cut up into EIR fragments for Responses To Comments Ind. 254-23, 24, 25, and 26 as to subpart II, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which is treated as if such EIR selected portion had to be self-contained and sufficient, when all were part of an integrated, original whole the EIR refused to consider together as I wrote it.) Since this disputed EIR Response concludes with a cross-reference to it Response to Comment Ind. 254-17, I emphasize my incorporated objection above to that disputed Response. As this Response again incorrectly complains about my alleged failure to provide evidence and examples, I also repeat my complaint that it cannot get away again with that bogus claim by cutting off my integrated evidence and examples in my whole Objection 254 #3.E, which provides ample evidence and examples. For example, as I keep reminding the EIR authors, evidence can be provided by my neighbors and I with ourselves and others as witnesses for what I have said, making this an offer of proof which has to be sufficient for now, since there is no other practical need or way now to provide my and others trial testimony in the EIR process before we challenge any mistaken EIR approval in the usual court process that would follow. Instead of refusing to respond to such objections, the EIR is expected by CEQA (see section I.C and D) to address them instead of ignoring or evading them, which the EIR too often does, especially when I am using the Rise/DEIR/EIR's own admissions against the EIR, since such admissions are among the most lethal kinds of evidence against the EIR. See Exhibit B and DEIR Objection 254 #2. A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed Response.

Also, (again) the disputed EIR chooses to misconstrue my objection as the mine "pitting the local residents against each other," which misses the point. As demonstrated above in debating the water supply and quality issues in my objections to disputed EIR's Responses to Comments Ind. 254-17 to 21, the water shortage supply situation is a "zero sum game" in which us local potential mine victims are united in refusing to suffer losses of our groundwater to this disputed mine providing no net benefits to any of us (DEIR Objection 254 # 4) and causing all the impacts about which we complain. Furthermore, as an objector/potential victim at risk from the EIR mine, I do not always need to prove with evidence what is the true basic reality, i.e., what *Gray* calls "common sense," because I must be able to defeat the EIR merely by exposing

its errors, omissions, and noncompliance. Moreover, because many disputed EIR claims are themselves just worse examples of speculation, unsubstantiated opinion or narrative, argument, or other erroneous or inaccurate claims, I must be entitled not only to expose that, but also to provide more credible competing theories, even if they were also only better speculation, opinions, arguments, etc. For example, since the disputed DEIR/EIR is largely focused on its speculations, unsubstantiated opinions, and other bogus (eg, inapplicable theories, false comparisons, etc.) thinking about conditions in a mine closed and flooded since 1956 which Rise has not properly or sufficiently investigated or evaluated directly (see Exhibit B admissions from the Rise SEC filings), much of the disputed EIR/DEIR is just that kind of unreliable speculation which risks harm to us locals from resulting errors, omissions, and noncompliance. In such circumstances those of us at risk are entitled to express our rational concerns about such flawed bases for the EIR imposing those impacts and risks on us. Even worse, the disputed EIR/DEIR ignores/denies escalating climate change impacts (see section I.C and D above for my rebuttal) and recklessly speculates that the average "current" rainfall data between 1967 and 2017 will continue to recharge the groundwater for the next 80 years, despite the fact that such average is not "current" when it ignores the dry years after 2017 and the EIR disputes any impact of such 24/7/365 dewatering. That EIR puts all us local surface owners above and around the 2585-acte underground mine at risk of dangerous and disputed EIR groundwater theories, demanding that our County government irresponsibly gamble away for this no net benefit mine our local surface property rights (*Keystone)* and welfare betting that nothing will change for the worse during climate change while they deplete our groundwater 24/7/365 for 80 years (when even their inapplicable and disputed interpretations of NID data projections cease in 2040, eliminating any purported, rational basis for EIR/DEIR projections thereafter.) [Again, the disputed EIR mitigations are illusory and not feasible because, for example, as the miner's SEC filings show (see Exhibit B) Rise could not afford timely and compliantly to supply adequate mitigation replacement water as required by applicable case law (see *Gray*, sections I.E and F, and my DEIR Objection 254 #'s 3.N, 4, and 14). That means, for us surface owners living above or around the 2585-acre underground mine, that our government's approval over our objections forces us either to suffer that reckless gamble against such objections and concerns of man in the Table of Incorporated by Reference Objections and Exhibit D or to enforce our legal, law reform, and political rights to resist, including by mitigating our damages (e.g., *Varjabedian, and Smith v. LA,* supra) with new wells. That is an easy, but sad, choice for us impact victims.]

The inapplicable to objectors here CEQA Guideline 15384 argued by the EIR does not prevent us from exposing such errors, omissions (including evasions), and other noncompliance by the EIR, which includes impeachment and rebuttal, none of which is contrary to #15384, especially if my objections addressed admissions and if they were evaluated as written in their original, integrated manner, rather than so improperly cut up by the EIR team into less comprehensive or convincing fragments. That is especially true when the EIR mischaracterizes and evades my and other objections as to the consequences of mine dewatering, as discussed above, even using the EIR's own words (and its cited NID water supply data) against it. See, e.g., my DEIR Objection 254 #'s 3.N, 4, 14 and 15, and DEIR Objection 255.

W. Objection To EIR Response (at 2-6011) To My Comment Ind. 254-24 (marked by the EIR at 2-5901).

This disputed EIR Response asserts an incorrect legal theory (see, e.g., DEIR Objection 254 #14 and more to come), and its proposed mitigation is not only deficient, insufficient, and noncompliant, but also is directly contrary to *Gray*. The EIR/DEIR have exposed their flawed theory for demanding that everyone must gamble on the absence of even disputed water supply data after 2040, in effect compelling us local potential victims to assume the risk of the impacts on us of both climate change and 24/7/365 dewatering for the full 80 years without any credible proof by the EIR of sufficient recharge or mitigation, especially after 2040. **This is another obvious "bait and switch," on top of the earlier bait and switch addressed in the preceding sections explaining why the disputed EIR's incorrect theory that NID SURFACE water supply data satisfies the CEQA requirements for depletion of our GROUNDWATER supplies by such dewatering. See, eg, my objections to disputed EIR Responses Ind. 254-17 to 23, and my related DEIR Objection 254 groundwater discussions and judicial precedents in #3,N, 4, and 14, as well as in DEIR Objections 255.**

However, even if the NID data until 2040 were material to this debate, the EIR is worse than wrong here to claim that the disputed NID data (and a disputed future "Idaho-Maryland Mine WSA") excuse the EIR conduct, whether pursuant to Water Code #'s 10912 or 10910 or otherwise, and especially from having to address its groundwater depletion impacts after 2040. See NID WSA discussion in its Agency 10. This is not the place for fully briefing that legal dispute, but here are some examples. FIRST, THE NID AND WATER CODE CITES APPLY TO SURFACE WATER—NOT TO GROUNDWATER UNDER THESE CIRCUMSTANCES. AS FAR AS I KNOW AND CERTAINLY THE DEIR/EIR DOES NOT PROVIDE THAT DATA AS IT CLAIMS; IE, I DISPUTE IN MANY WAYS HEREIN AND IN DEIR OBJECTION 254 THAT THIS 20 YEAR ANALYSIS LIMIT APPLIES AT ALL HERE, AND, EVEN IF IT DID SOMEHOW APPLY, I DISPUTE THE UNSUBSTANTIATED EIR CLAIM THAT "THE IDAHO-MARYLAND MINE WSA ADDRESSES THESE THREE HYDROLOGIC CONDITIONS THROUGH THE YEAR 2040" SUFFICIENTLY. SECOND, THE DEWATERING OF THE MINE WITH OBJECTOR GROUNDWATER HAS NOTHING TO DO WITH NID SUPPLYING POTABLE WATER TO THE PROJECT, WHICH IS THE FOCUS OF THE WATER CODE AND NID DATA. THIS IS ANOTHER "BAIT AND SWITCH" EXPOSED ABOVE, WHERE THE EIR ITSELF ADMITS THAT NID ONLY SUPPLIES POTABLE WATER TO THE MINE FOR LIMITED PURPOSES (E.G., SUPPRESSING TOXIC FUGITIVE DUST), AND GROUNDWATER DEWATERING IS NOT WATER BEING SUPPLIED BY NID IN ANY EVENT (SEE, EG, EIR ADMISSION AT DEIR 4.11-9). INSTEAD, SUCH GROUNDWATER IS BEING TAKEN FROM US SURFACE OWNERS ABOVE AND AROUND THE 2585-ACRE MINE OVER OUR OBJECTIONS AND, WE CONTEND, IN VIOLATION OF OUR PROPERTY RIGHTS. THIRD, UNDER SUCH CIRCUMSTANCES THE WATER CODE PROVIDES NO EXCUSE FOR THE CEQA AND OTHER LEGAL REQUIREMENTS FOR EIR DATA FOR THE ENTIRE 80 YEARS, WHICH DOES NOT EXIST IN THE EIR/DEIR AND IS ANOTHER FATAL NONCOMPLIANCE. SEE DEIR OBJECTION 254 #'S 3.N, 4, AND 14 (RELEVANT LEGAL AUTHORITIES) AND #15 (SOME OF THE MANY HARD QUESTIONS THAT THE DEIR/EIR EVADES OR IGNORES, BUT STILL MUST ANSWER IF THEY WISH AN EIR TO COMPLY WITH CEQA AND OTHER LAW. SEE SECTION I.C AND D.)

A review of my unmolested, original DEIR Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed Response. As demonstrated above my objections herein thereto defeat the EIR's excuses for ignoring both climate change in the EIR's Master Response 16 (and elsewhere)[see section I.C and D], and the hexavalent chromium menace in my objections above to EIR Response To Comment Ind. 254-1 and elsewhere herein (e.g., section I.F.1) and in my DEIR Objection 254 #'s 3. A, B, C, E, G, H, 4, 7, and 14. Among the many reasons that I discuss water supplies and hexavalent chromium together is that the disputed DEIR/EIR incorrectly cites the flushing of our objector groundwater into Wolf Creek as somehow a positive contribution to the surface water supply for NID. **First,** for example, that does not help us local groundwater owners to ship such groundwater off to other surface users somewhere else. See *Varjabedian.* **Second,** that incorrectly assumes NID or its customers will trust the either the disputed EIR's analysis of safety levels or its water treatment of such a hazardous substance totally banned in the EU for some uses and denounced in many studies in Exhibit C or posted on the EPA website, for reasons also illustrated in the death of Hinkley, CA, and many of its residents (remember the movie, "*Erin Brockovich").* ***Third***, as described elsewhere, the disputed EIR mitigations are illusory, insufficient, and noncompliant. Speaking of EIR speculations, unsubstantiated opinions, and bogus thinking, after admitting (less than it should have admitted) some water supply problems, the disputed DEIR incorrectly claims (at DEIR 4.11-51), ratified by the EIR, but ignored in this Response to my quoting it in Ind. 254-24): "This [water] supply deficit can be addressed through NID's previously discussed Water Shortage Contingency Plan …" See NID's WSA discussion in Agency 10. See also my discussions above about how NID water is to be used pursuant to the EIR to suppress toxic fugitive dust, even during droughts with the NSAQMD at Agency Letter 12 (at 12) insisting that be a priority water use frequently every day, while the disputed EIR/DEIR incorrectly claims that it will suffer drought rationing like the rest of us.

X. Objection To EIR Response (at 2-6011) To My Comment Ind. 254-25 (marked by the EIR at 2-5904).

Again, like my previous disputes to EIR's Responses to my water (and hexavalent chromium) related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23 and 24) and to the EIR's rebutted above Master Comments, this disputed Response is another EIR disaggregated/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my Objection 254 #3.E is cut up into EIR Responses To Comments Ind. 254-23, 24, 25, and 26 as to subpart II, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which is treated by the EIR/ as if such EIR selected fragment had to be self-contained and sufficient, when all were part of an integrated whole that the EIR refused to consider together as I wrote the objection.) As this Response again incorrectly complains about an alleged failure to provide evidence and examples of EIR/DEIR inadequacies, I also repeat my complaint that the EIR cannot get away with again with that bogus claim by cutting off my integrated evidence and examples in my whole Objection 254 #3.E into such fragments. My original objection provides ample evidence and examples. In any event, I restate by incorporation by reference my various objections to the noncompliant EIR argument misapplying CEQA Guideline #15384, since they all apply here as well.

A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) comprehensively already has rebutted this nonresponsive, disputed Response. As it so often does, the disputed EIR misstates my arguments to make them easier to attempt (and fail) to evade them, claiming that I just complained that "the water treatment system could fail" (as such systems often do, although we have more at risk here because of the hexavalent chromium [among other hazardous substances], which is what killed Hinkley, CA and many of its citizens when similar clay lined ponds failed to contain the menace.) I actually also made a broader charge that this Response entirely evades. (Recall that my DEIR Objection 254 not only proved how the DEIR concealed, evaded, and almost totally ignored the hexavalent chromium menace I demonstrated in detail (and I add more in these objections because the EIR tries to cover up those omissions, noncompliance, and misdirection with an insufficient, noncompliant, and disputed commentary to which I have objected herein.) I contend that the water treatment system was not reported to be designed for hexavalent chromium, which the DEIR did not disclose as a menace in its "Hazards And Hazardous Materials" section, and the EIR still has not proven with any substantiation that its uncertain and insufficiently described water treatment system eliminates hexavalent chromium (note the EU has totally banned it for some uses as having no safe level and which EPA website and Exhibit C studies denounce as vigorously as the movie illustrating the Hinkley, CA, impacts which they are still struggling to clean up as shown on www.hinkleygroundwater.com.) In any case, what this EIR Response cites (i.e., DEIR Impact 4.8-3. -73 and Appendix K.5) are all disputed in my DEIR Objection 254, and the EIR does not overcome those objections, which included case studies of such failed systems. Since the DEIR/EIR wrongly deny/ignore climate change and CR6 effects (see section I.C and D), there is no reason to assume the EIR/DEIR designed their treatment system to deal with such impacts adequately. (As our record winter rain in the midst of record drought just demonstrated, we can have the worst of both impacts, with less rain coming all at once.)

Y. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-26 (marked by the EIR at 2-5904).

Again, like my previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (e.g., to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, and 25) and my objections to the EIR's rebutted above Master Comments (especially #16 as to climate change and drought), this disputed EIR Response is another EIR disaggregation/cut up of my detailed rebuttal objections to the DEIR/EIR on this subject (i.e., my Objection 254 #3.E is cut up into EIR's fragment Responses To Comments Ind. 254-23, 24, 25, and 26 as to subpart II, as well as fragments to Ind. 254-20 to 33 as to all of #3.E), each of which is treated as if such EIR selected fragment had to be self-contained and sufficient, when all were part of an integrated whole the EIR refused to consider together as I wrote the objection.) As this Response again incorrectly complains about an alleged failure to provide evidence and examples of EIR/DEIR inadequacies in my objections, I also repeat my complaint that the EIR/DEIR cannot get away again with that bogus claim by cutting off my integrated evidence and examples in my whole Objection 254 #3.E, which provides ample evidence and examples.

A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed Response. As it so often does, the disputed EIR misstates/minimizes my arguments (omitting key arguments and data cross-references to other sections) to make them easier to attempt (and fail)

to evade them, claiming that I had only complained that dust suppression was wasting water. In this case I asserted another "bait and switch" by my describing, including with DEIR admissions, why either (i) "our precious water will be wasted for such mine 'dust control' [citing at DEIR 4.3-49, an admitted 11 million gallon such waste—see NSAQMD Agency Letters 12 and 11 on this issue] or (ii) our particulate air pollution [again think asbestos] will be 55% worse than projected from the mine, leaving the obvious solution to that dilemma of simply shutting the mine that never should have been reopened in the first place" (citing that same DEIR page admissions regarding "Surface Fugitive Dust Controls" that "active work sites would be watered at least two times daily, resulting in an approximately 55 percent reduction of particulate matter," thus increasing the air pollution by that amount whenever they don't water. However, as explained in the NSAQMD Agency Letters 12 and 11, either our community suffers from less water or more asbestos and other toxins in our air, a "pick your poison" dilemma addressed earlier in this Objection.)

Z. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-27 (marked by the EIR at 2-5904).

Again, like my previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25 and 26) and my rebuttals to the EIR's above Master Comments (especially my rebuttals to the EIR Master Comments #'s14, 15, and 16 emphasized here as to groundwater depletion, climate change, and drought), this disputed EIR Response is another EIR disaggregated/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my Objection 254 #3.E is cut up into EIR's Responses To Comments Ind. 254-27, 28, and 29 as to subpart III, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which is treated by the EIR as if such EIR had selected fragments to be self-contained and sufficient, when all were part of an integrated whole that the EIR wrongly refused to consider together as I wrote it.) As this EIR Response again incorrectly complains about an alleged failure to provide evidence and examples of EIR/DEIR inadequacies, I also repeat my complaint that the EIR/DEIR cannot get away with again with that bogus claim by cutting off my integrated evidence and examples in my whole Objection 254 #3.E (see also #3.M for this particular dispute), which objections collectively provide ample evidence and examples.

A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, noncompliant, and disputed Response. For example, as so demonstrated in my detailed objections, the disputed EIR/DEIR's entire, unsubstantiated, and irrational "less than significant impact" claim depends on their unproven "assumption" that their disputed, cherry picked, selected past model of average "current" rainfall from 1967 to 2017 (i.e., from a high in fall 1967 of 52.81 inches to a low of 18.48 in 1977, but never including the actual and dry "current" years after 2017). What the DEIR/EIR incorrectly call the "current conditions" (i.e., ignoring the many dry years after 2107, when the climate change drought began to have its continuing and current impacts that will increase for 80 years), are imagined in to noncompliant EIR/DEIR to "recharge" and "balance" for the next 80 years despite the significant, harmful impacts of such 24/7/365 EIR dewatering, especially when tunneling, blasting, and mining into new and deeper areas with no sufficient investigations or data about the conditions or results there. (Indeed, the

cherry picking of unreliable, incomplete, and worse historical records before the mine closed and flooded in 1956, don't even allow reliable analysis of the old mine.)

What resident living on the surface above or around the 2585-acre underground mine would bet his or her future welfare and home on that misleading DEIR/EIR claim that such disputed past predicts the future 80 years? No one I know here, and certainly not me and the others who have filed objections to this abuse of our groundwater rights. What this EIR cut up of my #3.E integrated objection fails to address is that its "Simulated Drawdown of Groundwater Levels Under Current Conditions" at DEIR Figure 4.8-8 are not just grossly erroneous and worse, such as by assuming that past predicts the future for such groundwater recharge etc., but such DEIR/EIR theories are also misleading (i.e., another "bait and switch") by mislabeling as "current conditions" what is irrelevant history, especially ignoring the new normal of climate change and **assuming disputed surface water predictions by NID only through 2040 will continue to apply for 80 years of 24/7/365 dewatering. By analogy, that is even worse than falsely assuming (contrary to every insurance company) one could predict the wildfires for the next 80 years by assuming what fires occurred during 1967-2017, which (not coincidently) would ignore the record, "new normal" wildfires that began in 2018 and show little sign of abating.**

AA. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-28 (marked by the EIR at 2-5906).

Again, like my previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, and 27) and to the EIR's rebutted above Master Comments (especially my rebuttals to the EIR Master Comments #'s14, 15, and 16 emphasized here as to groundwater depletion, climate change, and drought), this disputed EIR Response is another EIR disaggregated/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my Objection 254 #3.E is cut up into EIR fragment Responses To Comments Ind. 254-27, 28, and 29 as to subpart III, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which fragments is incorrectly treated as if such EIR selected fragment had to be self-contained and sufficient, when all were part of an integrated whole the wrongly EIR refused to consider together as I wrote the objection.) As this EIR Response again incorrectly complains about an alleged failure to provide evidence and examples of EIR/DEIR inadequacies, I also repeat my complaint that the EIR cannot get away again with that bogus claim by cutting off my integrated evidence and examples in my whole DEIR Objection 254, including #3.E (see also #3.M for this particular dispute), which provides ample objection evidence and examples. A review of my unmolested, original Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed EIR Response.

Again, the disputed EIR misstates and erroneous minimizes (including by omissions) my objections as a mere complaint about water "waste." However, my many actual complaints are both (i) as to noncompliance with CEQA regarding water issues, and (ii) about violations of us surface owners' property rights to our groundwater (e.g., *Keystone*). As to EIR water "waste" Responses, my comments were about competing uses that make this "no net benefit mine" (e.g., DEIR Objection 254 #4) a waste compared to the more important priority uses by us local residents, especially since this is a massive, 24/7/365 depletion and relocation of our groundwater to be flushed away down the Wolf Creek for 80 years. See also the "fugitive dust"

waste that wouldn't be needed but for the toxins disturbed in the mining dirt, as I previously addressed, for example, in my Ind. 254-22 and 26. See also the NSAQMD Agency Letters 12 (e.g., at 12) and 11. In any event, besides my objections herein, my DEIR Objection 254 also disproves for many reasons the disputed DEIR/EIR mitigation theories, claims, and speculations. Those EIR claims/proposals also fail because Rise admits (e.g., see Exhibit B and DEIR Objection 254 #2) in its SEC filings facts proving that it lacks the financial capability to mitigate even the insufficient portion of the existing wells addressed in the DEIR/EIR (as distinct from the full number of impacted wells plus any future wells, which is even worse noncompliance by the DEIR/EIR). As demonstrated elsewhere in my objections, the DEIR/EIR only even attempt to offer the required (but disputed) water data for the portion of their 80-year mining period through 2040 (and the noncompliant EIR/DEIR doesn't even do that correctly or sufficiently, as my objections demonstrate).

BB. Objection To EIR Response (at 2-6012) To My Comment Ind. 254-29 (marked by the EIR at 2-5906).

Again, like the previous disputed EIR Responses to my water (and hexavalent chromium) related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, and 29) and to the EIR's rebutted above Master Comments (especially my rebuttals to the EIR Master Comments #'s 14, 15, 16 and 35 emphasized here as to groundwater depletion, climate change, and drought), this disputed Response is another EIR disaggregation/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my DEIR Objection 254 #3.E is cut up into EIR fragment Responses To Comments Ind. 254-27 to 29 as to subpart III, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which fragments is incorrectly treated as if such EIR selected portion had to be self-contained and sufficient, when all were part of an integrated, original whole the EIR wrongly refused to consider together as I wrote them.) As this EIR Response again incorrectly complains about an alleged failure to provide evidence and examples of EIR/DEIR inadequacies, I also repeat my complaint that it cannot get away again with that bogus claim by cutting off my integrated evidence and examples in my whole DEIR Objection 254, including #3.E (see also #3.M for this particular dispute), which objections provide ample evidence and examples.

A review of my unmolested, original DEIR Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed EIR Response. Again, the disputed EIR misstates and erroneous minimizes (including by omissions) my objections, including my concerns (i) about the admitted (at DEIR 4.8-42) dewatering that initially requires 160 days to remove 385 million gallons, and (ii) about what happens when the mining stops for any of various possible reasons, including as described in my rebuttals to the DEIR's "Non-CEQA Related Analysis" at 4.3-101 to 104. See my DEIR Objection 254 #'s 3.D, E, F, and M, 4, 5, and 14.

CC. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-30 (marked by the EIR at 2-5907).

Again, like the previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, and 28) and the EIR's rebutted above Master Comments (especially my rebuttals to the

EIR Master Responses #'s 7, 14, 15, and 16, and 17 emphasized here as to groundwater depletion, climate change, and drought), this disputed EIR Response is another EIR disaggregated/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my DEIR Objection 254 #3.E is cut up into EIR fragment Responses To Comments Ind. 254-30 and 31 as to subpart IV, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which objections is incorrectly treated as if each such EIR selected fragment had to be self-contained and sufficient, when all were part of an integrated, original whole the EIR wrongly refused to consider together as I wrote them.) As this EIR Response again incorrectly complains about an alleged failure to provide evidence and examples of EIR/DEIR inadequacies, I also repeat my complaint that the EIR cannot get away again with that bogus claim by cutting off my integrated evidence and examples in my whole DEIR Objection 254, including #3.E (see also #3.M for this particular dispute), which objections provide ample evidence and examples.

A review of my unmolested, original DEIR Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) comprehensively already has rebutted this nonresponsive, disputed EIR Response. Again, the disputed EIR misstates and erroneous minimizes (including by omissions) my objections, and incorrectly claims mitigation will reduce the impacts to insignificance (eg, at DEIR 4.8-54). Again, as I have demonstrated in my objections, the disputed EIR/DEIR misleads and confuses by referring to "the project site," without being clear whether that ambiguous reference applied to (a) the Brunswick site, in which case the DEIR/EIR was fatally deficient (as is frequently the case in the DEIR/EIR) for not addressing the full situation at and from the 2585-acre underground mine or affecting surface wells now or in the future other than those few along East Bennett Road, or (b) the whole Project, including that underground mine and (see section I.B) Centennial, in which case my asserted objections to errors, omissions, and other noncompliance still apply. See section I.A.1.a(v) and my DEIR Objection 254 #'s 3.N, 4, 14, and 15, addressing the legal flaws I have exposed and hard questions the DEIR/EIR fails to address correctly, especially regarding disputed DEIR insufficiently citing "groundwater basins," versus water in "fractured bedrock" or "fractured bedrock aquifer." See, e.g., my DEIR Objection 254 #'s 3.D, E, F, and M, 4, 5, and 14.

DD. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-31 (marked by the EIR at 2-5908).

Again, like the previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (e.g., to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, and 28) and the EIR's rebutted above Master Comments (especially my rebuttals to the EIR Master Responses #'s 14, 15, and 16, and 17 emphasized here as to groundwater depletion, climate change, and drought), this disputed EIR Response is another EIR disaggregation/cut up of my detailed rebuttal objections to the DEIR on this subject (i.e., my DEIR Objection 254 #3.E is cut up into EIR fragment Responses To Comments Ind. 254-30 and 31 as to subpart IV, as well as to Ind. 254-20 to 33 as to all of #3.E), each of which is incorrectly treated as if such EIR selected fragment had to be self-contained and sufficient, when all were part of an integrated, original whole the EIR wrongly refused to consider together as I wrote them.) As this EIR Response again incorrectly complains about an alleged failure to provide evidence and examples of EIR/DEIR inadequacies, I also repeat my complaint that the EIR cannot get away again with that bogus claim by cutting off my integrated evidence and examples

in my whole DEIR Objection 254, including #3.E (see also #3.M for this particular dispute), which provides ample evidence and examples.

A review of my unmolested, original DEIR Objection 254 #3.E (i.e., what is not so improperly disaggregated by the EIR) already has comprehensively rebutted this nonresponsive, disputed EIR Response. Again, the disputed EIR misstates and erroneous minimizes (including by omissions) my objections, and incorrectly claims "recharge" and mitigation to reduce the impacts to insignificance (eg, at DEIR 4.8-54). See my DEIR Objection 254 #'s 14 and 15, addressing the legal noncompliance I have exposed and hard questions the DEIR/EIR fails to address correctly. Also, my unrebutted objections are especially important about (a) the deficiencies in the DEIR/EIR data regarding the 2585-acre underground mine and especially the regarding the new mining areas, and (b) the extra property rights of us surface owners and users above and around the underground mine, including for lateral and subjacent support, including groundwater. See *Keystone, Varjabedian,* and also my DEIR Objection 254 #'s 3.D, E, F, and M, 4, 5, 8. and 14.

EE. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-32 (marked by the EIR at 2-5909).

Again, like the previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, and 31) and the EIR's rebutted Master Comments 14, 15, and 33, this disputed EIR Response is nonresponsive to my concerns and my data, as illustrated in my opening objection summary in #1 above. Besides this extensive and comprehensive Objection, my 150 page DEIR Objection 254 (not counting cross-referenced and incorporated data) contains ample authorities and specifics to require a fair response (see also my DEIR Objection 254 #'s 15, asking hard questions and exposing issues evaded by the DEIR/EIR, and #'s 3.N, 4, and 14, exposing legal noncompliance in the DEIR/EIR, as well as my DEIR Objection 255 demonstrating errors, omissions, and noncompliance in mitigations and other illusory assurances of the DEIR/EIR, often admitted in Rise's SEC filings as demonstrated in Exhibit B hereto and DEIR Objection 254 #2). However, somehow the disputed EIR nevertheless incorrectly refuses to consider such objections as insufficient to merit a serious and compliant response, apparently because somehow the EIR does not wish to consider the integrated whole of my objection, but somehow instead expects my objection data to be disaggregated/chopped up in some EIR chosen fragments improperly demanded by the EIR. See my general rebuttal to this disputed EIR tactic in the beginning introduction to these objections and in sections I.A.1.d(viii) and I.F.5 and 5. (In effect, the disputed EIR seems to expect every sentence in my Objection regarding any issue somehow to repeat everything I have said or incorporated anywhere in my Objection. I doubt the EIR would be satisfied (as they should be) even if I added expressly words to every sentence about what is already implied (and already expressed in many cross-references and my detailed Table of Contents), such as "plus all the other details I have provided or incorporated into my Objections 254 and 255." Indeed, to satisfy the disputed EIR's incorrect demands for "sufficiency" of detail in objections, the EIR/DEIR seem to expect more than offers of proof and illustrations (which I already provide or incorporate in abundance throughout my DEIR Objection 254 and herein), but also (and prematurely) my detailed trial brief supported by my trial brief and evidence, including my expert reports, which is only required to come later during trial after any disputed approval of the EIR.

For example, the disputed EIR misstates and erroneous minimizes (including by omissions) my objections, and incorrectly claims "recharge" and mitigation to reduce the impacts to insignificance (eg, at DEIR 4.8-54). See my DEIR Objection 254 #'s 3.N, 4, 14 and 15, addressing the legal flaws I have exposed and hard questions the DEIR/EIR fails to address correctly. Also, my unrebutted objections are especially about (a) the deficiencies and worse in the DEIR/EIR data regarding the 2585-acre underground mine and especially the regarding the new mining areas, and (b) the extra property rights of us surface owners and users above and around the underground mine, including for lateral and subjacent support, including groundwater. See *Keystone.* See also my DEIR Objection 254 #'s 3.D, E, F, M and N, 4, 5, 8, 14 and 15. Of course, as usual, the EIR omitted to address various of the issues in that section #3.E(V), such as "balancing," the compelling logic (which I and others can confirm as witnesses and with my cited case studies about others responding to water shortages with existing and future wells) for combating shortages and other consequences of the mine (eg, NID connection and other costs and volume limitations) with deeper or new wells (whether individually or on a community basis) to compete for our owned groundwater. Id.

I mention "balancing" as one of many examples, because among the many things in the EIR/DEIR that are not just wrong, but also offensive and legally a problem for the EIR parties (e.g., *Varjabedian* and other such precedents for claims under the Fifth Amendment, the CA Constitution, and others, such as inverse condemnation, nuisance, and other wrongs, especially for us surface owners above and around the 2585-acre mine, as addressed in my DEIR Objection 254 at #'s 3.N, 4 and 14). Also, I have elsewhere rebutted the disputed EIR/DEIR claims that taking our local groundwater through dewatering is somehow excused or beneficial, because it's flushed into the Wolf Creek to end up somewhere else in the NID system. Not only does that false logic on "balancing" confuse "recharge" needed locally for our surface owner owned (free) groundwater with replacement surface NID water (e.g., for which customers have to pay NID and also suffer NID drought and other restrictions), but whenever us local suffer disproportionally for what some government considers the broader area "common good" that "taking" will cost both the mine and the County. Eg, ***Varjabedian v. Madera*** (1977), 20 Cal. 3d 285, recognizing both inverse condemnation and nuisance claims, relying on both the Fifth Amendment taking cases, like **Richards v Washington Terminal Co** (1914), 233 U.S. 546, and the broader California Constitution, for local, "downwind" homeowners who suffered disproportionate harms (e.g., smells) from a public sewer plant benefitting the broader community. (I note here the EIR/DEIR has even less right, since this no net benefit mine is not a public project. See DEIR Objection 254 #'s 4 and 14.)

As more examples of the DEIR/EIR's failure to present the "good faith reasoned analysis" with "common sense" required (e.g., by cases like *Gray, Banning, Vineyard, Costa Mesa,* etc. and discussed many times in section I above) under CEQA and applicable law, this part of my DEIR Objection 254 (also with many cross-references for more support elsewhere) disputes DEIR 4.8-58 and its Figures 4.8-11 vs 4.8-8 drawdown of groundwater and related problems lacking sufficient (accessible) credible evidence. See also DEIR Objection 254 #'s 3.D, F, M, and N, 4, 5, 14 and 15. For example, the DEIR/EIR never proves that the average rainfall predictor it uses between 1967 and 2017 is applicable and probative either as the "current condition" (eg, it wrongly ignores the drought years after 2017, as well as the impacts of climate change and greater dryness, which the EIR/DEIR cannot in "good faith" ignore or dispute—see section I.C and D) or as predicting the "recharge" (see, e.g., my DEIR Objection 254 #3.M) and other impacts of 24/7/365 EIR dewatering and new mining for 80 years (most of which period is

after the misused NID data ceasing in 2040 on which the DEIR/EIR incorrectly relies, and, worse, attempts as a false comparison/bait and switch tactic, confusing the NID's surface only water with this groundwater depletion issue). While the EIR/DEIR wrongly dismisses my objections as "speculation" or "unsubstantiated opinion," the EIR/DEIR continually does far worse in its own speculations, unsubstantiated opinions and worse.

Besides those mentioned here and many others exposed throughout my DEIR Objection 254, I also note that how many flaws result from the DEIR/EIR guessing about the conditions in this uninvestigated mine flooded and closed since 1956, and irresponsible reliance on its unreliable and cherry-picked historical mine records from a time when applicable sciences were not well advanced and miner owners had little incentive to report accurately. DEIR/EIR talking about their such "models" or "simulations" is like discussing the old computer data truism that "garbage in produces garbage out." None of that satisfies the need for CEQA compliance (see I.C and D) with actual, current evaluation of the current, real conditions both at the existing 2585-acre underground mine and at where the new mining would occur, which cannot be excused by the DEIR/EIR claiming that we don't need to worry because of what they claim (and we dispute) to be the general controlling dynamics of what they imagine to be our uniform "fractured bedrock system," which to them is all about imagined underground bedrock "dams" and which to me and the others at risk is all about the admitted "fractures" in the "bedrock system," which can escape those dams and cause massive depletion, especially during the new and deeper blasting, tunneling, dewatering, and other mining related activities.

Nowhere does the EIR/DEIR prove there are no (and will not ever suffer any) such existing or future "fracture" leaks that threaten us with the loss of our groundwater like an actual hole in the bottom of a bucket that their model blindly assumes with no sufficient proof has no such holes. **First,** note that the DEIR admits (at 4.8-65) that its disputed model supposedly shows some groundwater level reduction, even using its flawed, unreliable, and disputed historical data and excessively favorable "modeling" of the past and future (emphasis added): "**Numerical modeling also indicates that dewatering could lower groundwater levels sufficiently to reduce the base flow in the South Fork Wolf Creek by as much as 0.1 cfs."** Of course, that is another "bait and switch" illusion, which the disputed EIR/DEIR outrageously claims are fine, because our local groundwater ends up somewhere else downstream in the NID system anyway, which is not solace to those of us suffering the groundwater depletion where we live above and around the 2585-acre underground mine. See *Varjabedian.* How do they reassure us potential victims? They speculate with unsubstantiated, meaningless, and unreliable generalities, such as that their "simulations of [predicting that] rate of groundwater inflow into the **mine generally stabilize over the last 10 to 15 years of the 65 year model analysis**" (emphasis added, DEIR at 4.8-62 regarding the disputed Itasca Report model in its disputed "Potential Future Exploration and Mining" discussion), which by their own admission exposes us local surface owners to being deprived of our groundwater for many years before the situation "stabilizes" in accordance with the DEIR/EIR disputed model. **No where do they reveal what harmful impacts we will suffer when exceptions to that "GENERAL" model projected result occur**. **Second,** in another "bait and switch" (in **disputed DEIR/EIR claim at 4.8-65 "Groundwater Recharge") the disputed model produced this unsubstantiated, misleading, and speculative conclusion we dispute (emphasis added): "Thus, the project would not result in any APPRECIABLE new areas of compacted soils or impermeable surfaces that could SUBSTANTIALLY restrict or otherwise interfere with groundwater recharge."** That incorrectly assumes that such an underground blockage is the only cause at issue, when, to the contrary, there are many potential

threats for groundwater depletion in excess of the disputed recharge model, including 24/7/365 dewatering and new and deeper mining off 72 more miles of blasted tunneling for 8o years. **Third,** as every judge and most lawyers know from experience in other such CEQA and similar battles, project advocates can always find pro mining "experts" who make a living adapting their pro-project "models," reports, and data to suit the needs of their miner clients (or that general constituency), but there are many other and better studies, reports, and data to the contrary. [I make no such accusation in this case, because the clear facts and evidence that should defeat the EIR do not require the inquiry into such matters unless the EIR were mistakenly approved, in which case that question will be resolved in litigation discovery in that case.]

In this case, however, such disputed DEIR/EIR models are exposed to many credibility problems on the merits, because they are applying (extrapolating/generalizing/analogizing) data from dissimilar situations to this mine (while ignoring climate change and depending on irrelevant, incorrect, or unreliable history) without really knowing the actual conditions at and around the mine in the level of detail that makes the difference between crisis in a smaller local environment (eg, above and around the 2585-acre mine) as distinguished from the larger "groundwater basin" area on which the disputed EIR/DEIR prefers to focus and then incorrectly assume uniformity. Moreover, the disputed EIR/DEIR historical mine records (e.g., what they choose to consider from whatever they could still find of paper records from before 1956 when the mine flooded and closed) are not reliable, complete, or consistent with modern science or knowledge, and, like the disputed EIR/DEIR Appendices and Exhibits, they are vulnerable to challenge under the applicable law of evidence. Many of such studies cited by the EIR/DEIR are older and based on obsolete, outdated, or superseded science, especially regarding climate change and current weather prediction models used by every business and government which wants to be more accurate than the "flat earth" people who prefer those now superseded, older studies to support the "alternate reality" pitched to win government approvals for their exploitive ambitions.

FF. Objection To EIR Response (at 2-6013) To My Comment Ind. 254-33 (marked by the EIR at 2-5913) And Correctly Entitled: "DEIR Water Depletion Mitigation Ideas Ignore DEIR Errors, Omissions, And Deficiencies And Fail Even Under Their Own Disputed Terms."

Again, like the previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (e.g., to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, and 32) and to the EIR's rebutted Master Comments 2, 14, 15, and 16, this disputed EIR Response is nonresponsive to my objections, concerns, and data, as illustrated in my opening objection summary in DEIR Objection 254 #'s 1, 3.N, 4, and 14 herein and my related objections in section I above and to such disputed EIR Master Responses and disputed Responses to Comments Ind. 254-1 and 14 to 33 on this subject. This disputed EIR Response (like many others herein) misstates, evades, or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits some other objections entirely. Besides this massive Objection and my EIR Objection 255, my 150 page DEIR Objection 254 (not counting cross-referenced and incorporated data) contains ample authorities and specifics to require a fair, "good faith reasoned analysis" with "common sense" EIR response (see also my DEIR Objection 254 # 15, asking hard questions and exposing issues evaded by the DEIR/EIR, and #'s 3.N, 4, and 14, exposing legal noncompliance in the

DEIR/EIR, as well as my DEIR and EIR Objections 255, demonstrating errors, omissions, and noncompliance in mitigations and other illusory assurances of the DEIR/EIR, often admitted in the Rise SEC filings shown in Exhibit B hereto and DEIR Objection 254 #2.)

Without repeating all my still valid and meritorious four Objections, I rebut some of the disputed EIR Response's complaints to illustrate why such Response (and the EIR as a whole) must be rejected. I explain some reasons why in my counter to such Response #1 at the start of these section III objections, relying on court decisions cited therein like *Gray, Banning, Vineyards, and Costa Mesa,* which require a "good faith reasoned analysis" with "common sense" in the EIR and which prohibit the kind of "hide the ball," *"*bait and switch," false equivalence, and other such prohibited tactics (see section I.A.1.d. (viii). As I also explain in my counter to such Response #1 above and in my rebuttal to the disputed EIR's Master Response 16 regarding the DEIR's refusal to properly address climate change realities (e.g., incorrectly relying on historical "current" average rainfall between 1967 and 2017 as the "current" baseline, which ignores all the dry years after 2017 and which incorrectly assumes those old days before the impact of climate change will reliably predict groundwater recharge and balancing for the next 80 years, despite 24/7/365 dewatering and new and deeper mining around 72 miles of new, blasted tunnels deeper into unknown areas of the underground mine.) See my section I.C and D, including the 2018 Guidelines Amendments Explanation confirming the importance of climate change analysis in eirs. Also, as demonstrated in my objections to disputed EIR Response to Comments Ind. 254-20-33, the disputed DEIR first admits that there may be significant depletion, but then incorrectly insists that it can be mitigated. However, I then demonstrated why that mitigation is illusory, deficient, and worse, and why the EIR/DEIR well monitoring system fails to include many of the existing wells and all of the future competing wells which each of us surface owners above and around the 2585-acre underground mine have a legal right to tap for our owned groundwater as needed to preserve our homes, forests, environment, and welfare, including from keeping our forests from drying out, dying and becoming fire traps.

In summary, somehow the disputed EIR incorrectly refuses to consider my four interactive and collective Objections as sufficient to merit a serious EIR response, apparently because somehow the disputed EIR does not wish to consider the integrated whole of my objections, but somehow instead expects my objection data to be sufficient in each chopped up EIR chosen fragment improperly demanded by the noncompliant EIR. See my general rebuttals to this disputed EIR tactic, such as at the beginning introduction to these objections. Also, everything in my previous Comment Ind. 254-31 and 32 (and 20-33) applies here as well, plus more, e.g., both (i) as to the issues vaguely recognized (but inadequately described, minimized, or mischaracterized for EIR complaints in this disputed Response for insufficient specifications) as "groundwater supplies," "inconsistent DEIR discussions of groundwater," "negative impacts on tourism and economic values in the community," and "failing to acknowledge climate change and drought," and (ii) as to the other issues I addressed in this part of my four Objections as to which there was no EIR Response, such as, for example, the legal disputes over our surface owner property rights down 200 feet (and related *Varjabedian* type inverse condemnation, takings, nuisance, trespass, and other claims, including on account of the noncompliant DEIR/EIR's inadequate, infeasible, and illusory mitigation and monitoring proposal exposed in Rise's SEC filings admitting facts demonstrating that Rise cannot afford such EIR performance anyway, and much more as explained in section I and II at a more general level.

Please note that my objections herein and in (or incorporated in) my DEIR Objections 254 and 255 call attention to DEIR (and now EIR) admissions, which (while still deficient,

insufficient, and disputed for various reasons) excuse me as a matter of law at having to prove what is stated in those admissions, allowing me to expose greater and other errors, omissions, and flaws from that admitted foundation. Thus, when, for example, the EIR makes its common (and always disputed, incorrect, and worse) complaints that my objections are too nonspecific, unsubstantiated, speculative, or otherwise defective, the EIR never addresses the admissions I quote that are, although always understated, a sufficient foundation for my uses of them in those and further related objections. For example, in my Objection 254 #3.E (VI) at 61 (which the EIR marked as Comment Ind. 254-33 at its 2-5913) I quoted the EIR concluding (at 4.8-66, capitalization emphasis added): **WITHOUT IMPLEMENTATION OF A GROUNDWATER MONITORING PROGRAM AND WELL MITIGATION PLAN, THE PROJECT COULD RESULT IN A SIGNIFICANT IMPACT TO GROUNDWATER SUPPLIES.**" See also the rest of my DEIR Objection 254 #3.E, properly entitled "'Hiding the Ball' in the DEIR Is Not Compliance With CEQA And Other Applicable Laws, And That Practice, Especially As To Water and Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DIER Tries To Obscure By Distracting Attempts To Limit the CEQA 'Project' And The Related Water Issues." [I quote this because this section of the objection referenced other substantive sections of DEIR Objection 254 for many details besides examples that illustrate such objectionable evasions by the DEIR, as my objections herein illustrate to the disputed EIR Responses to Comment Ind. 254-14 to 33.]

Among other things, that preceding paragraph discussion in this subsection means all my complaints about relating groundwater supplies and quality, monitoring, and mitigation must be fully addressed in EIR responses, and not evaded as they now are. What remains to be debated is that, based on that admitted (and now beyond EIR dispute) foundation of the danger of groundwater supply impacts from the project, whether the groundwater monitoring and well mitigation plan is compliant, feasible, sufficient, and otherwise satisfactory (which it is not, for many reasons, including that it ignores many existing mines [even those admitted by the County Economic Report to exist; see Exhibit A hereto], many more areas in need of monitoring, and many potential additional competing wells that will be drilled as needed above and around the 2585-acre underground mine by us surface owners and users to tap into the groundwater we own. For example, we are rightly concerns to about reliable access to groundwater not just for our homes, but for our local environment, such as to save our forest from being a dead fire hazard for lack of water. See my rebuttal to disputed EIR Master Response 33.

While the EIR incorrectly disputes and refuses to respond to that projection of future wells as speculative, that EIR evasion ignores my offer of proof from myself and other witnesses, as well as cited case studies and incorporated objections (see Exhibit D) of how groundwater is being used throughout the State to combat surface dryness from climate change the disputed DEIR/EIR incorrectly refuses to address as speculative and for other disputed theories. See section I.C and D, confirming that CEQA requires climate change to be considered.] Also, I dispute that even any better monitoring and mitigation that might be legally and practically sufficient and otherwise satisfactory is not feasible for "implementation" and otherwise for many reasons. See, eg, my attached Exhibit B and citations to my Objections 254 and 255 that use Rise SEC admissions to prove that none of what is promised or contemplated by the DEIR/EIR is affordable or economically feasible and, hence, is illusory or worse. See *Richmond v. Chevron*, confirming the importance of SEC filings and other admissions to defeat such EIR's. Indeed, as I have proven, even what the disputed DEIR/EIR offers as mitigation and

monitoring is insufficient, deficient, illusory, and otherwise unsatisfactory not feasible, as I explained in that DEIR Objection 254 #3.E (VI), as well as illustrated in #I.E and F above.

A similar EIR admission attempts to cover up the disputed DEIR omissions of the hexavalent chromium water and air pollution threats I addressed in DEIR Objection 254 #'s 3.C, F, G, H, M and N, 4, 5, and 7, and continue to object as to the significant new additions in the EIR Responses to which I still object herein. The facts remain, despite EIR trying to evade that toxic threat that the DEIR failed to mention at all in its "Hazards And Hazardous Materials" discussion and only vaguely mentioned in passing in its back discussion of mining techniques, as I have demonstrated both in those DEIR objections and my objections herein as to such noncompliant discussions of that hexavalent chromium menace made worse by what the EIR added on the subject as explained in my objections thereto (section I.F.1 and I.E) herein (e.g., also my objections to disputed EIR Master Comment 1 and 15, and disputed EIR Responses To Comment Ind. 254-1).

Please also note that my objections herein and in (or incorporated in) my DEIR Objections 254 and 255 call attention to DEIR (and now EIR) admissions, which (while still deficient, insufficient, and disputed for various reasons) excuse me as a matter of law at having to prove what is stated in those admissions, allowing me to expose greater and other errors, omissions, and noncompliance from that admitted foundation. Thus, when, for example, the EIR makes its common (and always disputed, incorrect, and worse) complaints that my objections are too nonspecific, unsubstantiated, speculative, or otherwise defective, the EIR never addresses the admissions I quote that are, although always disputed as still noncompliant, a sufficient foundation for my uses of them and further related objections. For example, in my DEIR Objection 254 #3.E (VI) at 61 (which the EIR marked as Comment Ind. 254-33 at its 2-5913) I quoted the EIR concluding (at 4.8-66, capitalization emphasis added): WITHOUT IMPLEMENTATION OF A GROUNDWATER MONITORING PROGRAM AND WELL MITIGATION PLAN, THE PROJECT COULD RESULT IN A SIGNIFICANT IMPACT TO GROUNDWATER SUPPLIES." See also the rest of my DEIR Objection 254 #3.E (EIR labeled Response to Comment Ind. 254-20 to 33), properly entitled "'Hiding the Ball' in the DEIR Is Not Compliance With CEQA And Other Applicable Laws, And That Practice, Especially As To Water and Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DIER Tries To Obscure By Distracting Attempts To Limit the CEQA 'Project' And The Related Water Issues." [I quote this because this section of the objection references other substantive sections of DEIR Objection 254 for many details, besides examples that illustrate such objectionable evasions by the DEIR, as my objections herein illustrate with respect to the disputed EIR Responses to Comment Ind. 254-14 to 33, including by disputed "bait and switch" EIR/DEIR tactics (e.g., I.A.1.d(viii) and I.F.5 and 6), such as pretending that the only such issues relate to existing wells around East Bennett Road, not even including additional 300 wells addressed in the County Economic Report to which I object in Exhibit A hereto, while many more wells exist or will exist as I offer to prove. See, eg, DEIR 4.8-83 claims to mitigate the water supply problem with NID water to those few wells among the many at risk. Among other things, that evasion of many existing and all future wells makes the DEIR/EIR monitoring and mitigation noncompliant illusory, which is especially serious considering what the DEIR so admits, and the EIR reaffirms, as discussed herein.]

Among other things, that preceding paragraph discussion means all of my complaints about relating groundwater supplies, monitoring, and mitigation must be addressed in EIR

responses and not evaded as they now are. What remains to be debated is that, based on that admitted (and now beyond EIR dispute) foundation of the danger of groundwater supply impacts from the project, even if the groundwater monitoring and well mitigation plan were compliant, feasible, sufficient, and otherwise satisfactory (which it is not, for many reasons, including that it ignores or evades many existing mines [even those admitted by the County Economic Report to exist; see Exhibit A hereto], many areas in need of monitoring (and more often than "quarterly"), and many potential additional competing wells that will be drilled as needed in the future above and around the 2585-acre underground mine by us surface owners and users to tap into the groundwater we own, for example, to save our forests from being a dead fire hazard for lack of water.

While the EIR incorrectly disputes that projection of future wells, that evasion ignores my offer of proof from myself and other witnesses as well as cited case studies of how groundwater is being used throughout the State to combat surface dryness from climate change the disputed DEIR/EIR incorrectly refuses to address as speculative and for other disputed theories, despite evaded CEQA requirements explained in section I.C. and D. Whatever else can be said, that reality matters under the applicable court decisions (see DEIR Objection 254 #'s 3.N, 4 and 14 and section I.F. and E above. Also, I dispute that even any theoretically better monitoring and mitigation that might be legally and practically sufficient and otherwise satisfactory because they are not feasible for "implementation" and otherwise for many reasons. See, eg, my attached Exhibit B and citations to my DEIR Objections 254 and 255 that use Rise SEC admissions to prove that none of what is proposed or contemplated by the disputed DEIR/EIR is affordable or economically feasible and, hence, is illusory or worse. Indeed, as I have proven, even the insufficient, deficient, illusory, and otherwise unsatisfactory and disputed DEIR/EIR's offered mitigation and monitoring is not feasible, as I explained in that Objection 254 #3.E (VI), as well as section I.E and F above.

Another example of a damning DEIR admission was its alleged mitigation for supplying replacement water for wells it dried up, which satisfied neither the requirements in the applicable court decisions cited in my DEIR Objections 254 # 's 3.N, 4, and 14 and 255 (e.g., *Gray* mandating full practical equivalence to what water service was lost). For example, when the DEIR proposes to replace the well water capacity it depletes by more than "10%" (eg, an illusory mitigation that Rise's SEC admissions reveal facts showing it cannot afford, as demonstrated in Exhibit B hereto and my DEIR Objection 254 #2), the DEIR is admitting that that required mitigation will be insufficient. Remember that (as Rise admits in its SEC 10K filings I so quoted) us surface owners above and around the 2585-acre mine own everything down 200 feet, and more as to groundwater (because water is not a mining right "mineral," and we have the property rights to lateral and subjacent support by groundwater as the Supreme Court has confirmed in *Keystone* and as explained in my Objection 254 #'s 4 and 14.) If the County allows the mine to take that 10% of our groundwater, that invites *Varjabedian* type Fifth Amendment (and the CA Constitutional equivalent) taking claims, inverse condemnation claims, nuisance claims, trespass, and conversion claims, and much more. Id.

A similar EIR admission attempts to cover up the disputed DEIR omissions of the hexavalent chromium water and air pollution threats I addressed in DEIR Objection 254 #'s 3.C, F, G, H, and M, 5 and 7 and continue to object as to the new additions in the EIR Responses to which I object herein. See section I.F.1 above. The facts remain, despite EIR trying to evade that toxic threat, which the DEIR failed to mention at all in its "Hazards And Hazardous Materials" discussion and only vaguely mentioned in passing in its back discussion of mining techniques, as

I have demonstrated both in those DEIR objections and my objections herein as to such noncompliant discussion of that hexavalent chromium menace made worse by what significant new information the EIR (e.g., Appendices Q, O, and R) added on the subject as explained in my objections thereto herein.

GG. Objection To EIR Response (at 2-6014) To My Comment Ind. 254-34 (marked by the EIR at 2-5916) And Correctly Entitled: "3. F. One Illustrative Dispute Over Groundwater Depletion by the Mining."

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR EVASION OF MY OBJECTIONS WITHOUT "GOOD FAITH REASONED ANALYSIS" AND "COMMON SENSE" BY COMPARING (1) MY THREE PAGE DEIR OBJECTION 254 #3.F (entitled there and in my Table of Contents as: "One illustrative Dispute Over Groundwater Depletion by the Mining.") TO (2) HOW THE DISPUTED EIR (AT 2-5916) CHOPPED/DISAGGREGATED THAT OBJECTION IN HALF AND THEN SUCCESSIVELY IGNORED EACH HALF WHEN ADDRESSING THE OTHER HALF AS ALLEGEDLY DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR RESPONSE TO COMMENT IND. 254-34 PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR QUOTES (INCLUDING DEFICIENT DEIR AND RISE ADMISSIONS) BUT THEN, IGNORING THE REST OF MY DEIR OBJECTION 254 #3.F, THE EIR CUT FRAGMENT'S LABELED RESPONSE TO COMMENT TO IND. 254-35, INCORRECTLY STATED: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR QUOTES ARE SUFFICIENT, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE SECOND HALF FRAGMENT OF MY #3.F THAT THE EIR CUT OFF AS ITS RESPONSE TO COMMENTS IND. 254-35, AGAIN INCORRECTLY STATING: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE."

THUS, INSTEAD OF ADDRESSING MY THREE-PAGE EXAMPLE AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT MY ANNOTATED EIR QUOTES FROM MY DETAILED REBUTTALS OF THOSE QUOTES, SO THAT THE EIR COULD MANUFACTURE A BOGUS EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS. THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH" (SECTION I.A.1.D(VIII) AND I.F.5 AND 6). THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR/DEIR, DEPENDING ON HOW YOU COUNT THEIR FRAGMENT REPETITIONS, MAKING THIS OBJECTIONABLE TACTIC IMPOSSIBLE TO EXCUSE AS AN ACCIDENT OR OVERSIGHT. IN FACT, ANY TRUTH SEEKER SHOULD RUN A WORD SEARCH IN SUCH EIR RESPONSES FOR THOSE AND SIMILAR WORDS (E.G., "COMMENTER DOES NOT STATE"), BECAUSE EVERY SUCH RESPONSE IS DISPUTED BOTH FOR THE SAME REASON AND LACKING ON THE MERITS. IT IS REVEALING WHICH OF MY OBJECTIONS THE DISPUTED EIR/DEIR CONSIDERED SO DANGEROUS THAT THEY CHOSE TO SO GAMBLE ON EVADING ANY RESPONSE ON THE MERITS IN HOPES THE

COUNTY DECISION-MAKERS WOULD NOT NOTICE OR WRONGLY FORGIVE SUCH NONCOMPLIANCE.

Again, like the previous, disputed EIR Responses to my water (and hexavalent chromium) related objections (e.g., to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32 and 33) and the EIR's rebutted Master Comments 2, 14, 15, and 16, this disputed EIR Response is nonresponsive to my objections, concerns, and data, as illustrated in my opening objection summary to Response #1 herein, DEIR Objection 254 #'s 3.N, 4, and 14, and in my related objections to such disputed EIR Master Responses and Responses to Comments Ind. 254-1 and 14 to 33 on this subject. That disputed EIR Response (like many others disputed herein) misstates or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits or evades some other objections entirely. This Objection is to a disputed EIR Response where I illustrate my detailed objections by reference to rebutting long quotes from the DEIR at 4.8-62 and -54 (reaffirmed by the EIR Response) that reveal many errors, omissions, and noncompliance that cannot properly be evaded and are not defeated by the EIR/DEIR. Like my sections I and II above, my 150 page DEIR Objection 254 (not counting cross-referenced and incorporated data) and the related 255 each contains ample authorities and specifics to require a fair EIR response (see also my DEIR Objection 254 # 15, asking hard questions and exposing issues evaded by the DEIR/EIR, and #'s3.N, 4 and 14, exposing legal flaws in the DEIR/EIR, as well as my Objection 255 demonstrating errors, omissions, and flaws in mitigations and other illusory assurances of the DEIR/EIR, often admitted in the Rise SEC filings and in Exhibit B hereto).

Also, as noted in earlier objections to such disputed EIR Responses to my Comments Ind. 254-1 et seq (especially as illustrated in the Ind. 254-14 to 33), this EIR Response artificially cuts up my Objection 254 #3.F into segments and wrongly treats each of them as if they had to be sufficient as so wrongly treated as self-contained, rather than as integrated parts of the whole objection that I wrote. In addition, as demonstrated in prior objections, that DEIR Objection 254 section 3.F objection uses the DEIR's own quoted admissions against it to prove parts of the foundation for such objections, which admissions (especially because they are used in rebuttal or impeachment) require no further proof and cannot be so dismissed by the EIR as speculative or unsubstantiated or otherwise contrary to CEQA Guideline 15384. See section I.C and D correcting the EIR's erroneous CEQA analysis.

Without repeating all my still valid and meritorious objections, I rebut some of the disputed EIR Response's complaints to illustrate why they (and the EIR as a whole) must be rejected. The first disputed challenge minimizes my objection by limiting it to just a part of my longer integrated objection (including cross-references and incorporations). For example, they characterize my objection as insisting that "the Appendix must be in the DEIR itself." That is not my point, as I explain in my objections to EIR Response #1 at the start of these objections relying on court decisions cited therein like *Gray, Banning, Vineyard, and Costa Mesa,* which require a "good faith reasoned analysis" with "common sense" in the EIR and which prohibit the kind of "hide the ball," *"*bait and switch," and other such prohibited tactics. One of which examples is where the EIR states a speculative, unsubstantiated, or otherwise bogus opinion and then cites vaguely to a massive disputed exhibit (here the DEIR Appendices) for support, in effect telling us objectors that we are supposed to hunt around in a massive technical document to imagine which of its disputed statements they will claim we should rebut as irrelevant, obsolete, or otherwise defective for any of a score of possible reasons. CEQA court interpretations cited in section I above have prohibited that tactic. As I also explain in my

objection to EIR Response #1 above and in my rebuttal to the disputed EIR's Master Response 16 regarding the DEIR's refusal to properly address climate change realities (e.g., relying on historical "current" average rainfall between 1967 and 2017 as the "current" baseline, which ignores all the dry years after 2017 and which incorrectly assumes those old days before the impact of progressing climate change predict future groundwater recharge and balancing for the next 80 years of 24/7/365 dewatering and mining.) Also, as demonstrated in my objection to disputed EIR Response to Comment Ind. 254-33 above, the disputed DEIR first admits that there may be significant depletion, but then incorrectly insists that it can be mitigated. As I then demonstrated that mitigation is illusory, deficient, and worse. Likewise, the disputed and deficient monitoring system fails to include many of the existing wells and all of the future competing wells which each of us surface owners above and around the 2585-acre underground mine have a legal right to tap for our owned groundwater, as needed to preserve our homes, environment, and welfare, including from keeping our forests from drying out, dying, and becoming fire traps.

Just a few other overlooked objections to this disputed EIR Response deserve special mention here. The EIR Response cites the disputed EMK Environmental, Inc study (without referencing adequately any specific data or cites therein, contrary to my cited case law above in section I.C and D and in my objections to EIR Response #1 above). That disputed EIR announces the addition of a "safety factor of 100 percent in calculations the project would not have any significant impact on groundwater supplies" without any proof at all that 100 percent is safe or sufficient, making the DEIR/EIR's whole disputed theory into the kind of speculation and unsubstantiated theory its claims admit is barred by CEQA Guidelines I counter with in section I.C and D above. That EIR guesswork is especially dangerous when it is combined with a deficient analysis that seem focused on places other than where us surface owners live above and around the 2585-acre underground mine (like the small East Bennett Road area below us or some larger area basin.)

In summary, somehow the disputed EIR incorrectly refuses to consider my collective objections as sufficient to merit a serious response, apparently because somehow the EIR does not wish to consider the integrated whole of my objections as written, but somehow instead expects my objection data in such EIR chosen segments improperly demanded by the EIR to be independently sufficient. See my general rebuttal to this disputed EIR tactic, such as at the beginning introduction to these sections II and III objections and section I.F.5 and 6 above. Also, everything in my previous Comment Ind. 254-32 and 33 applies here as well, plus more, both (i) as to the issues vaguely recognized (but inadequately described, minimized, or mischaracterized in EIR complaints for this disputed Response incorrectly alleging insufficient explanations or specifications) as "groundwater supplies," "inconsistent DEIR discussions of groundwater," "negative impacts on tourism and economic values in the community," and "failing to acknowledge climate change and drought," and (ii) as to the other issues I addressed in this part of my Objections as to which there was no EIR Response, such as, for example, the legal disputes over our surface owner property rights down 200 feet (and related inverse condemnation, takings, nuisance, trespass, and other claims [e.g., *Varjabedian*], including on account of the disputed DEIR/EIR giving the first 10% of our locals' well groundwater capacity free to the miner, and other inadequate, infeasible, and illusory mitigation and monitoring proposals as to which Rise admits facts showing Rise could not afford such mitigation anyway, and much more.)

Please note that my objections herein and in (or incorporated in) my DEIR Objections 254 and 255 call attention to DEIR (and now EIR) admissions, which (while still deficient, insufficient, and disputed for various reasons) excuse me as a matter of law at having to prove what is stated in those admissions, allowing me to expose greater and other errors, omissions, and noncompliance from that admitted foundation. Thus, when, for example, the EIR makes its common (and always disputed, incorrect, and worse) complaints that my objections are too nonspecific, unsubstantiated, speculative, or otherwise defective, the EIR never addresses the admissions I quote that are, although still always deficient, a sufficient foundation for my uses of them and further related objections. For example, in my DEIR Objection 254 #3.E (VI) at 61 (which the EIR marked as Comment Ind. 254-33 at its 2-5913) I quoted the EIR concluding (at 4.8-66, capitalization emphasis added): WITHOUT IMPLEMENTATION OF A GROUNDWATER MONITORING PROGRAM AND WELL MITIGATION PLAN, THE PROJECT COULD RESULT IN A SIGNIFICANT IMPACT TO GROUNDWATER SUPPLIES." See also the rest of my DEIR Objection 254 #3.E, properly entitled "'Hiding the Ball' in the DEIR Is Not Compliance With CEQA And Other Applicable Laws, And That Practice, Especially As To Water and Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DIER Tries To Obscure By Distracting Attempts To Limit the CEQA 'Project' And The Related Water Issues." [I quote this because this section of the objection referenced other substantive sections of DEIR Objection 254 for many details besides examples that illustrate such objectionable evasions by the DEIR, as my objections herein illustrate to the disputed EIR Responses to Comment Ind. 254-14 to 33.]

Among other things, that preceding paragraph discussion in this subsection means all my complaints about relating groundwater supplies and quality, monitoring, and mitigation must be addressed in EIR responses in compliance with CEQA (see section I.C and D) and my such objections not evaded or ignored as they now are. What remains to be debated here is that, based on that admitted (and now beyond EIR dispute) foundation of the danger of groundwater supply impacts from the project, even if the groundwater monitoring and well mitigation plan were compliant, feasible, sufficient, and otherwise satisfactory (which it is not, for many reasons, including that it ignores many existing wells [even those admitted by the County Economic Report to exist; see Exhibit A hereto], many areas in need of monitoring, and many potential additional competing wells that will be drilled in the future as needed above and around the 2585-acre underground mine by us surface owners and users to tap into the groundwater we own, for example, to save our forest from becoming a dead fire hazard for lack of water. While the EIR incorrectly disputes that projection of future wells, that evasion ignores my offer of proof from myself and other witnesses as well as cited case studies of how groundwater is being used throughout the State to combat surface dryness from climate change that the disputed DEIR/EIR incorrectly refuses to address, incorrectly claiming it to be speculative and on other disputed theories. See section I.C and D.] Also, I dispute that even any better monitoring and mitigation that might be legally and practically sufficient and otherwise satisfactory is not feasible for "implementation" and otherwise for many reasons. See, eg, my attached Exhibit B and citations to my DEIR Objections 254 and 255 that use Rise's SEC admissions to prove that none of what is promised or contemplated by the DEIR/EIR is affordable or economically feasible and, hence, is illusory or worse. Indeed, as I have proven by four Objections, even the insufficient, deficient, illusory, and otherwise unsatisfactory and disputed DEIR/EIR's offered mitigation and

monitoring is not feasible, as I explained in that DEIR Objection 254 #3.E (VI), as well as its #1.E and F.

HH. Objection To EIR Response (at 2-6014) To My Comment Ind. 254-35 (marked by the EIR at 2-5917) And Correctly Entitled: "3. F. One Illustrative Dispute Over Groundwater Depletion by the Mining."

Because this EIR's disputed Response To my Comment Ind. 254-35 is the second half fragment of my integrated DEIR Objection 254 #3.F to the DEIR that the disputed EIR cut up and disaggregated from my integrated fragment the EIR labeled Ind. 254-34, I incorporate (and will not repeat) what I just said in the preceding subsection objecting to that Ind. 254-34 disputed EIR Response, all of which applies equally to this half of that objection cut and marked by the EIR as fragment Ind. 254-35. Read my first half of my #3.F objection first in the previous objection to what the disputed EIR labelled Response to Ind. 254-34, because that is the annotated quotes (including deficient admissions) from the disputed DEIR that I intended to set up my detailed rebuttals in this second half of the EIR's disputed split of my objection #3.F. Nothing in that EIR Response fragment or in this EIR Response fragment should survive my objections. What the disputed EIR added extra in this Response Ind. 254-35 is also objectionable, and I note the following.

This objection is to a disputed response where I illustrate my detailed objections by reference to rebutting long quotes from the DEIR at 4.8-62 and -54 (reaffirmed by the EIR Response) that reveals many errors, omissions, and noncompliance that cannot be evaded or ignored and that are not defeated by the EIR/DEIR. Besides my section I above, my 150 page Objection 254 (not counting cross-referenced and incorporated data) contains ample authorities and specifics to require a fair and compliant EIR response (see also my DEIR Objection 254 #'s 15, asking hard questions and exposing issues evaded or ignored by the DEIR/EIR, and DEIR Objection 254 #'s 3.N, 4 and 14, exposing legal flaws in the DEIR/EIR, as well as my DIR Objection 255 demonstrating errors, omissions, and flaws in mitigations and other illusory assurances of the DEIR/EIR, often admitted in Rise's SEC filings and in Exhibit B hereto). Also, as noted in the previous objection marked Ind.254-34 and other earlier objections to such disputed EIR Responses to my Comments Ind. 254-1 et seq. (especially as illustrated in the previous subsection Ind. 254-34 and Ind. 254-14 to 33), this disputed EIR Response artificially cuts up my Objection 254 #3.F into fragments and wrongly treats each of them as if they had to be independently sufficient as so wrongly treated as self-contained, rather than as integrated parts of a whole objection. In this case, the first fragment the EIR marked Ind. 254-34 involved my annotated quotes from the DEIR to which I object, and this second part here that the EIR marked Ind. 254-35 presents additional objections.

Also, as demonstrated in prior objections, that DEIR Objection 254 section 3.F objection used the DEIR's own quoted admissions against it to prove parts of the foundation for such objections in both Ind. 254-34 and -35, which admissions (because they are admissions used in rebuttal or impeachment) require no further proof and cannot be dismissed as speculative or unsubstantiated or otherwise contrary to CEQA Guideline 15384. See section I.C and D above. Without repeating all my still valid and meritorious objections, I rebut some of the disputed Response's complaints to illustrate why they (and the EIR as a whole) must be rejected. The first disputed challenge minimizes my objection by limiting it to just a part of my longer integrated objection (including cross-references and incorporations). That is not my point, as I explain in

my objections to EIR Response #1 at the start of these objections relying on court decisions cited therein like *Gray, Banning, Vineyard, and Costa Mesa,* which require a "good faith reasoned analysis" with "common sense" in the EIR and which prohibit that kind of "hide the ball," "bait and switch," and other such prohibited tactics, one of which is where the EIR states a speculative, unsubstantiated, or otherwise bogus opinion and then cites vaguely to a massive exhibit (here the DEIR Appendices) for support, in effect telling us objectors that we are supposed to hunt around in a massive technical document to imagine which of its disputed statements they will claim we should rebut as irrelevant, obsolete, or otherwise defective for any of a score of possible reasons.

Again, like the previous disputed EIR Responses to my water (and hexavalent chromium) related objections (eg, to my Comments Ind. 254-1, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, and 34) and the EIR's rebutted Master Comments 2, 14, 15, 16, and 33, this disputed EIR Response is nonresponsive to my objections, concerns, and data, as illustrated in my opening objection summary in #1 herein, DEIR Objection 254 at #'s 3.N, 4 and 14, and my related objections to such disputed EIR Master Responses and Responses to Comments Ind. 254-1 and 14 to 33 on this subject. That disputed EIR Response (like many others herein) misstates or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits some other objections entirely. This objection is to a disputed EIR response where I illustrate my detailed objections by reference to rebutting long quotes from the DEIR at 4.8-62 and -54 (reaffirmed by the EIR Response) that reveal many errors, omissions, and flaws that cannot be evaded and are not defeated by the EIR/DEIR. Besides my cited authorities in sections I and II above, my 150 page DEIR Objection 254 (not counting cross-referenced and incorporated data) contains ample authorities and specifics to require a fair and compliant response (see also my DEIR Objection 254 #'s 15, asking hard questions and exposing issues evaded by the DEIR/EIR, and Objection 254 #'s 3.N, 4 and 14, exposing legal flaws in the DEIR/EIR, as well as my DEIR Objection 255, demonstrating errors, omissions, and flaws in mitigations and other illusory assurances of the DEIR/EIR, often admitted in Rise's SEC filings and in Exhibit B hereto).

As I also explain in my objections to Response #1 above and in my rebuttal to the disputed EIR's Master Response 16 regarding the DEIR's refusal to properly address climate change realities (eg, relying on historical "current" average rainfall between 1967 and 2017 as the current baseline, which ignores all the dry years after 2017 and which incorrectly assumes those old days before the progressive impact of climate change may be used to predict groundwater recharge and balancing for the next 80 years of 24/7/365 dewatering.) Also, as demonstrated in my objection to disputed Response to Comment Ind. 254-33 above, the disputed DEIR first admits that there may be significant depletion, but then incorrectly insists that it can be mitigated. I then demonstrated why that mitigation is illusory, deficient, and worse, and why the monitoring system fails to include most of the existing wells and all of the future competing wells which each of us surface owners above and around the 2585-acre underground mine have a legal right to tap for our owned groundwater as needed to preserve our homes, environment, and welfare, including from keeping our forests from drying out, dying and becoming fire traps. As one of many examples of objection details the disputed EIR falsely claims to be missing, I demonstrated in my objection (#III at 2-5918) I exposed the flaws inherent in the DEIR's cherry picked downhill, small 30 well sample from an area along East Bennett Road that it does not (and I contend cannot) prove is comparable to (or probative for predicting) what to expect in the future in the more important risk "surface" areas (down at least 200 feet) above and around the

2585-acre underground mine where thousands of us mine objectors live. I also explained why the proposed mitigation and monitoring is insufficient not just in fact, but also as a matter of law, as demonstrated in my DEIR Objection 254 #'s 3.N, 4 and 14 court precedents, besides the *Gray, Banning, Vineyards, and Costa Mesa* precedents discussed above refuting the inapplicable and worse EIR arguments for misapplying CEQA Guideline 15384. See also sections I.C and D above.

II. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-36 (marked by the EIR at 2-5918) And Correctly Entitled: "#3.G The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?)"

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR LACK OF GOOD FAITH REASONED ANALYSIS AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY TWO PAGE DEIR OBJECTION 254 #3.G (paired with my adjacent three page DEIR Objection 254 #3.H entitled there and in my Table of Contents as: "Some Technical Comments About Hexavalent Chromium, Since the Disputed DEIR Fails to Even Discuss the Existence of Controversy, Much Less the Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like me) Who Fear Us Becoming Another 'Hinkley' As Mourned By The *Erin Brockovich* Movie.") TO (2) HOW THE DISPUTED EIR (AT 2-5919) IGNORED/EVADED THAT ADJACENT, RELATED DEIR OBJECTION 254 #3.H WHEN INCORRECTLY CLAIMING MY #3.G TO BE DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-36" PRESENTED A FLAWED SUMMARY OF MY COMMENTS, AND THEN, IGNORING MY RELATED DEIR OBJECTION 254 #3.H, THE EIR'S "RESPONSE TO COMMENT TO IND. 254-36" IGNORED ALL MY CROSS-REFERENCES, INCORRECTLY STATING: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE."

FIRST, THAT EIR CLAIM IS INCORRECT, BECAUSE EVEN MY OBJECTIONS THAT THE EIR INCORRECTLY ISOLATED ARE SUFFICIENT, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE FURTHER DESCRIBED IN MY DEIR OBJECTION 254 #3.H THAT THE EIR IGNORED IN THAT EIR RESPONSE TO IND. 254-37, AGAIN INCORRECTLY STATING: "HOWEVER, THE COMMENTATOR DOES NOT STATE HOW THE DEIR'S DISCUSSION OF IMPACTS TO GROUNDWATER IS INADEQUATE." THUS, INSTEAD OF ADDRESSING MY THREE-PAGE EXAMPLE AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT/DISAGGREGATED MY SUCH RELATED OBJECTIONS IND. 254-36 AND -37 SO THAT THE EIR COULD MANUFACTURE A MERITLESS EXCUSE TO EVADE MY SUCH MERITORIOUS OBJECTIONS.

THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH." SEE SECTIONS I.A.1.D(VIII) AND I.F.5. THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS, MAKING THIS OBJECTIONABLE TACTIC IMPOSSIBLE TO EXCUSE AS AN ACCIDENT OR OVERSIGHT. IN FACT, ANY

TRUTH SEEKER SHOULD RUN A WORD SEARCH IN SUCH EIR RESPONSES FOR THOSE AND SIMILAR WORDS (E.G., "COMMENTER DOES NOT STATE"), BECAUSE EVERY SUCH EIR RESPONSE IS DISPUTED BY ME BOTH FOR THE SAME REASONS IN REVERSE (E.G., LACK OF "GOOD FAITH REASONED ANALYSIS" AND ON THE MERITS. IT IS REVEALING WHICH OF MY OBJECTIONS THE DISPUTED EIR/DEIR CONSIDERED SO DANGEROUS THAT THEY CHOSE TO SO GAMBLE ON EVADING ANY RESPONSE ON THE MERITS IN HOPES THE COUNTY DECISION-MAKERS WOULD NOT NOTICE OR MISTAKENLY FORGIVE THIS NONCOMPLIANCE WITH CEQA AND OTHER APPLICABLE LAW.

I demonstrated in my objection (see my DEIR Objection 254 marked Ind. 254-1 and -14) to the disputed EIR deficient, erroneous, and otherwise evasive attempt in EIR's Response to Comment 254-1, 14, and -17 (and Appendices Q, O, and R) to cover up the inexcusable, almost total omission of any mention of the hexavalent chromium problems in the disputed DEIR, much less the anything satisfying the "good faith reasoned analysis" with common sense standard of court decisions like *Gray, Banning, Vineyard, and Costa Mesa* I discuss herein (e.g., I.F.1) and in my DEIR Objection 254 #'s 3.N, 4 and 14 and DEIR Objection 255. See, e.g., my DEIR Objection 254 at #'s 3.A.II, entitled "Some Key Illustrations of Mining Disputes, Water Depletion, And Quality, Toxic Substances (eg, Hexavalent Chromium, Asbestos, Arsenic, Etc., And Related Issues, Including Financial Feasibility;" 3.C, entitled "Admitted (But Obscured) Use of Hazardous Chromium Without Warning Or Analysis (see more detailed discussion later in subsections G. and H. below);" 3.E, entitled, "'Hiding the Ball' in the DEIR Is Not Compliance with CEQA And Other Applicable Law, And That Practice, Especially As To Water And Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk Of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DEIR Tries To Obscure By Distracting Attempts To Limit the CEQA "Project" And The Related Water Issues;" 3.F entitled, "One Illustrative Dispute Over Ground Water Depletion By Mining;" 3.H entitled, "Some Technical Comments About Hexavalent Chromium, Since the Disputed DEIR Fails to Even Discuss the Existence of Controversy, Much Less the Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like me) Who Fear Us Becoming Another 'Hinkley' As Mourned By The *Erin Brockovich* Movie;" 3.G entitled, "The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?);" 3.J entitled, "Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." See what the EIR buried at the end of Appendix R regarding admitted but flawed discussion of air (as distinct from Appendices Q and O regarding water) pollution by hexavalent chromium; #5 (at the place the EIR labeled at Ind. 254-72); #7 entitled, "The DEIR 'Hazards And Hazardous Materials" Discussion at its #4.7 And Elsewhere Is Deficient, Omitting Entirely At Least One Serious Hazardous Material (Hexavalent Chromium/CR+6 of Erin Brockovich Move Infamy For Turning Hinkley, CA Into a Ghost Town at Great Cost To Local Victims And Property As Explained In My #'s 3.C, G and H);" #10 entitled, "Some Air-Quality Errors And Omissions To Consider From DEIR #4.3 And Elsewhere." See also my many rebuttals and objections on the subject of hexavalent chromium throughout this Objection, such as section I.F.1 and my objections

herein to EIR Response To Comment Ind. 254-1 and to each of the EIR Responses to my such cited objections on this topic.

The only way that the EIR could claim all that data of mine was deficient under the applicable legal standard the EIR misconstrues, misstates, and misapplies, would be to ignore (as I illustrate the EIR frequently doing) my cross-references and incorporated authorities and incorrectly shifting the burden of proof from the EIR/DEIR to me as well as incorrectly imposing CEQA applicant disclosure duties (see section I.C and D) on objectors like me. For example, besides my analysis in section I.F.1 above, I incorporate the many Exhibit C and EPA website studies detailing the hexavalent chromium hazards (as well as even more on Google), such as those explaining why the EU has banned that substance entirely for some applications as having no safe limit, contrary to the unsubstantiated EIR opinion about illusory safe limits with no foundation or evidence, and the EIR ailing (almost as badly as the DEIR it seeks to support without admitting that it is adding significant new material, which it does because there is nothing material discussed on this CR6 topic in the DEIR) to meet the standard the CEQA standard of "good faith reasoned analysis" "with common sense" in court decisions I cite in my DEIR Objection 254 #'s 3.N, 4 and 14 and in DEIR Objection 255, such as *Gray, Banning, Vineyard, and Costa Mesa.*

I also note the following examples of detail to illustrate what was stated even in that part of Ind. 254-36 by itself, even without consulting those cross-references, although I do not intend these examples to be comprehensive, since it should not be necessary to keep repeating myself about what the EIR chooses to ignore or evade of my DEIR objections or others herein. As so shown throughout my DEIR Objection 254 and confirmed in such cited court decisions, the DEIR did not provide any "good faith reasoned analysis" with common sense about the hexavalent chromium menace at all, as required by CEQA and court decisions like *Gray, Banning, Vineyards, and Costa Mesa.* My DEIR Objection *254 #3*.G specifically cited to a variety of facts, all of which are ignored by the EIR, which has a CEQA duty to provide a "reasoned analysis" in "good faith" or to accept my position. For example, there is no EIR rebuttal to my such citations and offers of proof there and in cross-referenced and incorporated proof that: (i) the EU has totally banned hexavalent chromium for some uses, and the EPA website and Exhibit C contain many damning studies about the dangers of hexavalent chromium, and (ii) there was no sufficient analysis in the DEIR at all (and only a deficient, speculative, entirely unsubstantiated, and otherwise disputed opinions in the EIR with no such good faith reasoned analysis or common sense, because the EIR makes no attempt to rebut my analysis and authorities, but just blindly denies any danger level in the mine and obscurely attaches some disputed Appendices (Q, O, and R) at the end without connecting them to any such required EIR analyses. See Exhibit C and section I.F.1.

Consider, for example, my annotated analysis of the DEIR admissions at 4.8-51 (emphasis added) that (in abbreviated part, so readers should study my whole such objection to what the EIR Response marked as my DEIR Objection Ind.254-37): "The water … from the underground mine workings IS ANTICIPATED [by whom? on what basis?] to have similar quality to the water that currently discharges from the existing drains [why, when the mine has been fully flooded already since 1956 and there is no proof or analysis to show where the drain water comes from?]… Therefore, the condition after mining would be like the existing, or baseline, conditions, such that seeps … would not represent a potentially significant impact under CEQA…[says who and why? This is

unsubstantiated speculation, and it ignores my addition of hexavalent chromium impacts and, for example, any analysis of the competing water flows and sources, especially from changes since 1956 and compounded after the new and deeper mining start again now.]" Note also the inconsistent discussion of DEIR dewatering at 4.8-42 to 52, especially at 46-49 (emphasis added), about the miner using "CEMENTED-PASTE BACKFILL" THAT IS INCORRECTLY DESCRIBED AS "ENVIRONMENTALLY BENIGN" [i.e., without sufficient proof, analysis or rebuttal of my contrary cited EPA and Exhibit C validated science], BUT WHICH IS TOXIC HEXAVALENT CHROMIUM. CONTRARY TO THE DISPUTED EIR'S COMPLAINT ABOUT MY OBJECTIONS LACK OF SPECIFICS, ANY READER WOULD LEARN FAR MORE FROM WHAT I STATE AND INCORPORATE THAN FROM THE DEIR/EIR, SUCH AS WHAT I CITE IN THIS PART OF MY OBJECTIONS THAT THE EIR LABELS IND. 254-37 AT 2-5920 TO 5922. See, e.g., my Exhibit C, section I.F.1 above, and the ERPA report I cited in my DEIR Objection 254, "Evaluation of the Potential Carcinogenicity of Chromium And Hexavalent Chromium Compounds" plus my citations to selected others among 29,368 such studies and reports on the EPA website for "hexavalent chromium" when you type in those words, out of which I specifically recommended the work of experts such as Wendy Wagner (at the University of Texas Law School), Steve Gold (at Rutgers University), and Kyla Bennett (who shares my experienced opinion about industry influenced regulators, who recognize the science but, as with lead, asbestos, cigarettes, and many other obvious toxins, have been slow to ban them because of industry pressures, assuming the chemicals to be innocent until proven guilty. However, as I explained, regulators complaining about such toxins from studies without effective action never stopped the science backed tidal waves of successful civil suits from overwhelming the defendant companies and forcing them into bankruptcies, a subject on which my DEIR Objection 254 demonstrated my expertise to support my many offers of proof as a potential witness.) **In any case, to save time my such DEIR Objection 254 suggested a FOCUS ON THE EPA "TRI PROGRAM" BY RELEVANT SEARCHING IN THE EPA'S "TOXIC RELEASE INVENTORY," WHICH BEGINS IN RELEVANT PART (emphasis added): "HEXAVALENT CHROMIUM COMPOUNDS ARE HUMAN CARCINOGENS, CLASSIFIED AS WEIGHT-OF-EVIDENCE GROUP A … UNDER THE EPA GUIDELINES FOR CARCINOGEN RISK ASSESSMENT [EPA 1986A] … ALL THE HEXAVALENT CHROMIUM COMPOUNDS ARE ASSIGNED A "HIGH" HAZARD RATING FOR THE PROPOSED RQ ADJUSTMENT." Perhaps that is one reason the disputed DEIR evaded addressing hexavalent chromium (and why the EIR's commentary is so deficient, incorrect, and noncompliant in its pretense that its significant new information [including the obscured, deficient, and disputed Appendices Q, O, and R buried at the end of the EIR without compliant connections to the Hazards And Hazardous Materials discussion]: the whole EIR/DEIR approval strategy depends on its erroneous Group C classification, which that EPA Group A classification seems to defeat. See, e.g., section I.F.1 and Exhibit C, as well as my DEIR Objection 254 #'s 3.A, B, C, E, G, H, and J, 4, 7, and 10, including what I cited herein. See also www.hinkleygroundwater.com, which explains that after all these years they are still struggling to remediate that dead town's groundwater.**

As to the EIR/DEIR's lack of "good faith reasoned analysis" and "common sense," I note that the DEIR buried a few obscure, passing admissions of the hexavalent chromium not by analysis in the DEIR "Hazards And Hazardous Materials" or other relevant toxic threat discussions themselves, but rather obscured them, such as in DEIR Mitigation Measure 4.8-1(a)

at 4.8-52, where it states: "The NOI [to the Central Valley Regional Water Quality Control Board under the Limited Threat Discharge permit] shall include evaluation of potential constituents of concern, including ammonia, arsenic, HEXAVALENT CHROMIUM [emphasis added by me by capitalization], iron, manganese, pH. total suspension solids, TDS and cis-1.2-DCE." Even if this is some innocent "mistake" (which I suppose is possible even though the EIR does not claim any such excuse. However, instead the EIR enhanced what looks like a cover up after I exposed the CR6 problem by pretending the DEIR already contained what the EIR newly added as still noncompliant "significant new information," such as its still deficient, noncompliant, and disputed partial EIR comments my objections above expose in the EIR's disputed Response To Comment Ind. 254-1 and like the EIR's buried Appendices at its end).

To a cynic, this may appear as if someone on the EIR team intended to address hexavalent chromium as the problem it is, and then someone else editing decided to cut out such CR6 disclosure and analysis, but either failed to delete all these references or decided to leave them in vaguely in obscure places in case someone like me actually read the fine print and recognized that obscured danger. (Such suspicions will be resolved in discovery should court challenges be required to overturn any mistaken EIR approval.) However, pushing this off with deferred disclosure, analysis, and mitigation after EIR approval to the future regulator of water DISCHARGES does not comply with CEQA, especially since mine shoring within the underground mine occurs BEFORE DISCHARGE. See. e.g., *Richmond v. Chevron* and sections I.C and D (as to CEQA prohibiting such deferrals), I.E.1-4, and I.F as to deferral examples. For example, the disputed EIR's new claim is just expressing its unsubstantiated opinion, speculation, and worse that the toxic addition to the water only flows out of the mine to the treatment plant (which it never adequately describes or proves is prepared to eliminate hexavalent chromium). They didn't even analyze and report CR6 as a hazard in the DEIR Hazards And Hazardous Materials section (but now the EIR just claims its clarifying that hexavalent chromium will somehow be at a safe level without any compliant good faith reasoned analysis, common sense, or adequate evidence at all, presumably because the EIR does not want to admit what it is doing: adding "significant" "new" data requiring correction and then recirculation of the DEIR. See section I.A.1.c, I.C and D, and I.F.1 above, and my DEIR Objection 255.

JJ. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-37 (marked by the EIR at 2-5919) And Correctly Entitled: "#3.H The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?)"

Because this EIR's disputed "Response To my Comment Ind. 254-36" is the second part of my integrated DEIR Objections 254 #3.G. and H. to the DEIR that the disputed EIR disaggregated from my integrated parts the EIR labeled Ind. 254-36 and -37, I incorporate (and will not repeat most of) what I just said in the preceding subsection objecting to that disputed EIR Response to Comment Ind. 254-36, all of which applies equally to this part of that objection division and marked by the EIR as Response To Comment Ind. 254-37. Read (and incorporate herein) my #3.G objection first in connection with my previous objection to what the disputed EIR labelled Response to Ind. 254-36, because that is the introduction (including use of deficient omissions deemed admissions from the disputed DEIR) in which I intended to set up my detailed rebuttals in this second part of my objection #3.H to the disputed DEIR/EIR evasion of my

hexavalent chromium objections. Nothing in that EIR Response to Comment Ind, 254-36 or Response to Comment Ind. 254-37 should survive either my separate or my combined objections. What is added extra in this objection to EIR Response to Comment Ind. 254-37 is also indefensible, as I prove also in the many sections cross-referenced herein.

For example, **I have demonstrated in my objection (see my DEIR Objection 254 marked Ind. 254-1 and -14) to the disputed EIR's deficient, erroneous, and otherwise evasive attempt in its Response to Comment Ind. 254-1, 14, and -17 (and Appendices Q, O, and R) to cover up the inexcusable, almost total omission of any useful mention of the hexavalent chromium problems in the disputed DEIR, much less the anything satisfying the "good faith reasoned analysis" with "common sense" standard of court decisions like *Gray, Banning, Vineyards, and Costa Mesa* I discuss in my DEIR Objection 254 #'s 3.N, 4 and 14. See, eg, my Objection 254 at #'s 3.A.II, entitled "Some Key Illustrations of Mining Disputes, Water Depletion, And Quality, Toxic Substances (eg, Hexavalent Chromium, Asbestos, Arsenic, Etc., And Related Issues, Including Financial Feasibility;" 3.C, entitled "Admitted (But Obscured) Use of Hazardous Chromium Without Warning Or Analysis (see more detailed discussion later in subsections G. and H. below);" 3.E, entitled, "'Hiding the Ball' in the DEIR Is Not Compliance with CEQA And Other Applicable Law, And That Practice, Especially As To Water And Hexavalent Chromium Issues, Destroys Any Hope of Credibility For the DEIR Or Mine With Us Thousands At Risk Of Water Impacts Living Above Or Around the 2585-Acre Underground Mine That the DEIR Tries To Obscure By Distracting Attempts To Limit the CEQA "Project" And The Related Water Issues;" 3.F entitled, "One Illustrative Dispute Over Ground Water Depletion By Mining;" 3.H entitled, "Some Technical Comments About Hexavalent Chromium, Since the Disputed DEIR Fails to Even Discuss the Existence of Controversy, Much Less the Ugly Realities And Toxic Risks And Stigmas To Thousands of Neighbors (Like me) Who Fear Us Becoming Another 'Hinkley' As Mourned By The *Erin Brockovich* Movie;" 3.G entitled, "The DEIR's Disputed Errors, Omissions, And Deficiencies Also Include Water Quality, Especially Relating to Hexavalent Chromium (Remember *Erin Brockovich*?);" 3.J entitled, "Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates." See what the EIR buried at the end of Appendices Q, O, and R regarding admitted but flawed discussion of air and water pollution by hexavalent chromium; #5 (at the place the EIR labeled at Ind. 254-72); #7 entitled, "The DEIR 'Hazards And Hazardous Materials" Discussion at its #4.7 And Elsewhere Is Deficient, Omitting Entirely At Least One Serious Hazardous Material (Hexavalent Chromium/CR+6 of Erin Brockovich Move Infamy For Turning Hinkley, CA Into a Ghost Town at Great Cost To Local Victims And Property As Explained In My #'s 3.C, G and H);" and #10 entitled, "Some Air-Quality Errors And Omissions To Consider From DEIR #4.3 And Elsewhere." See also my many rebuttals and objections on the subject of hexavalent chromium herein, beginning with my objections herein to EIR Response To Comment Ind. 254-1 and to each of the EIR Responses to my such cited DEIR Objection 254 about this topic.**

The only way that the EIR could hope to claim all that data of mine was deficient under the applicable legal standard the EIR misconstrues, misstates, and misapplies, would be to ignore (as I illustrate the EIR frequently doing) my cross-references and incorporated authorities. For example, I incorporate the many EPA website and my Exhibit C studies detailing the hexavalent chromium hazards (as well as even more on Google), such as those explaining why the EU has banned that substance entirely as having no safe limit for

various uses, contrary to the unsubstantiated EIR opinion about disputed safe limits with no foundation or evidence and failing (almost as badly as the DEIR it seeks to support without admitting that the EIR is adding "significant" "new information," which it does because there is nothing material discussed on this topic in the DEIR) to meet the standard the CEQA standard of "good faith reasoned analysis" with common sense in court decisions I cite in my DEIR Objection 254 #'s 3.N, 4 and 14 and DEIR Objection 255.

KK. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-38 (marked by the EIR at 2-5919) And Correctly Entitled: "#3.I A Brief Plea For Responsible Government And For Environmental Security And Peace For Our Community."

Again, like the previous, disputed EIR Responses to my water (and hexavalent chromium) related objections and others (eg, to my Comments Ind. 254-1 to 37) and all of the EIR's rebutted Master Comments, this disputed EIR Response is nonresponsive to my objections, concerns, and data, as illustrated in section I.F.1, in my opening objection summary herein, in court decisions and law cited in Objection 254 #'s 3.N, 4 and 14, and my related objections to such disputed EIR Master Responses and Responses to Comments Ind. 254-1 on this subject. This disputed Response (like many others herein) misstates or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits and evades some other objections entirely, especially by again ignoring my cross-references (e.g., to DEIR Objection 254 #'s 3.N, 4 and 14) and my incorporations by reference. I won't repeat what has already been said sufficiently about my other groundwater related and hexavalent chromium objections, because my DEIR Objections 254 and 255 also address scores of other errors, omissions, and flaws in almost every part of the DEIR (and by the EIR failing to correct hardly anything in the disputed, noncompliant, and deficient DEIR, the EIR as well, which EIR also adds more errors, omissions, and flaws on its own.)

Here, for example, the EIR ignores most of my objections (including again my cross-references [e.g., to Objection DEIR 254 #'s 3.N, 4, and 14] and my incorporations by reference) by mistreating this section as only a "general objection" to this "no net benefit" project, citing to disputed EIR Master Response 1 which I have already refuted. What the noncompliant EIR never addresses includes fundamentals, for example, such as the mischaracterization of the mine area as "rural" and implying a small number of affected residents, apparently thinking only of the Brunswick and Centennial owned sites, while ignoring what I pointed out are thousands of us surface residents in the areas above and around the 2585-acre underground mine, as well as various commercial areas and an airport.

My such objections also ask the hard questions that the DEIR/EIR evades from what I incorporated from my DEIR Objection 254 #15 and section I.A.1.a(v), as well as the obvious policy questions I ask here, such as about: (i) the EIR's folly of trying to predict the new normal future by ignoring climate change (contrary to CEQA as discussed in section I.C above, especially the 2018 Guideline Amendments Explanation) and assuming the EIR's cherry picked past (e.g., misusing for groundwater recharge claims purported "current" average rainfall between 1967 and 2017 as the "current" base for predicting the impacts of the next 80 years of 24/7/365 dewatering, which "current" data ignores the drought years after 2017 and any compliant analysis of the impact of such 24/7/365 dewatering and mining for 80 years during progressive climate change drying); (ii) the opportunity cost created by this "no net benefit

mine" (DEIR Objection 254 #4) that exhausts our competing environmental stress (e.g., pollution tolerance) margins for businesses and other uses, and thereby prevents more beneficial business and residential uses of our community land and resources for another 80-years; and (iii) the folly in suffering the "no net benefit mine" to operate 24/7/365 for 80 years (which the disputed DEIR claims at 6-14 is essential to the mine's financial feasibility, thereby admitting its financial condition is too vulnerable to make its expensive mitigation and safety claims feasible), thus maximizing the harms to our community when few if any, beneficial businesses are allowed to operate 24/7/365. See, e.g., incorporated Grass Valley Agency Letter 8. I also ask again, why would the County government want to pick this legal and political battle for the benefit of this Canadian miner's shareholders' profits against the thousands of local voting residents who will resist to protect their homes and way of life from such an obvious environmental and economic menace? Certainly, nothing in the EIR/DEIR reassures or satisfies the concerns of any objectors I know. Indeed, the EIR/DEIR record is full of meritorious objections to such disputed and noncompliant EIR/DEIR's approval, especially because the EIR so repeatedly evades meritorious objections to the DEIR and continues to fail to provide the CEQA required "good faith reasoned analysis" with "common sense"? For example, again, the EIR does not even properly address objections that relate to serious risks and problems admitted in Rise's SEC filings (see, eg, Exhibit B) but improperly evaded in the DEIR/EIR, as well as the admitted financial problems of Rise that make its mitigation and other safety promises illusory. While so far, the County process has accommodated the disputed EIR/DEIR and incorrectly refused to consider such SEC admissions of economic infeasibility, *Richmond v. Chevron* and other authorities cited at section I.C and D above will certainly prevail in any court that considers this disputed EIR, just as the objectors used such SEC filing admissions to defeat the eir in that case.

LL. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-39 (marked by the EIR at 2-5923) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates."

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR'S LACK OF GOOD FAITH REASONED ANALYSIS WITH COMMON SENSE AND THE EIR'S EVASION OF MY OBJECTIONS BY COMPARING (1) MY Four PAGE OBJECTION 254 #3.J TO (2) HOW THE DISPUTED EIR (AT 2-5923) DISAGGREGATED/CHOPPED THAT OBJECTION IN FOURTHS AND THEN SUCCESSIVELY IGNORED EACH FRAGMENT WHEN ADDRESSING THE OTHER FRAGMENTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR'S RESPONSE TO COMMENT IND. 254-39 to 42 PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR QUOTES (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254 #3.J, THE EIR FRAGMENT LABELED "RESPONSE TO COMMENTS TO IND. 254-39 to 42," INCORRECTLY COMPLAINED THAT I DO "NOT EXPLAIN HOW THE DEIR IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR QUOTES ARE SUFFICIENT, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER THREE PARTS OF MY #3.J THAT THE EIR CUT OFF AND IGNORED. THUS,

INSTEAD OF ADDRESSING MY FOUR-PAGE EXAMPLE AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT MY ANNOTATED EIR QUOTES AND COMMENTS FROM MY DETAILED REBUTTALS OF THOSE OTHER FRAGMENTS SO THAT THE EIR COULD MANUFACTURE A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS. THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS DISPUTED TACTIC HAPPENS SCORES OF TIMES THROUGHOUT THE NONCOMPLIANT EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS, MAKING THIS INTOLERABLE TACTIC IMPOSSIBLE TO EXCUSE AS AN ACCIDENT OR OVERSIGHT. IN FACT, ANY TRUTH SEEKER SHOULD RUN A WORD SEARCH IN SUCH EIR "RESPONSES" FOR THOSE AND SIMILAR WORDS (E.G., "COMMENTER DOES NOT STATE/EXPLAIN"), BECAUSE EVERY SUCH NONRESPONSIVE EIR "RESPONSE" IS DISPUTED BOTH FOR THAT SAME REASON AND ON THE MERITS. IT IS REVEALING WHICH OF MY OBJECTIONS THE DISPUTED EIR/DEIR CONSIDERED SO DANGEROUS THAT THE EIR CHOSE TO SO GAMBLE ON EVADING MY OBJECTIONS WITHOUT ANY COMPLIANT "RESPONSE" ON THE MERITS IN HOPES THAT I OR THE COUNTY DECISION-MAKERS WOULD NOT NOTICE.

Again, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR Response incorrectly so claims that I have failed to explain how the DEIR is inadequate and how the EIR Response is also nonresponsive in various other ways to my objections, concerns, and data, as illustrated in my opening objection summary in #1 herein and court decisions and law cited in DEIR Objection 254 #'s 3.N, 4 and 14, and my related objections to disputed EIR Master Responses and Responses to Comments Ind. 254-1 et seq. with similar evasions. This disputed Response (like many others herein) misstates or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits or evades some other objections entirely, especially by again falsely accusing me of not being sufficiently specific, both by ignoring my cross-references (e.g., to DEIR Objection 254 #'s 3.N, 4, and 14) and my incorporations by reference and by ignoring even what is stated in my objection. I won't repeat what has already been said sufficiently in my related objections, because the EIR cannot ignore my cross-reference and incorporations (on which techniques the EIR/DEIR itself extensively relies), and my DEIR Objection 254 also addresses scores of other errors, omissions, and noncompliance in almost every material part of the DEIR (and by the EIR failing to correct hardly anything in the disputed DEIR, the EIR as well, which EIR also adds more errors, omissions, and noncompliance on its own.)

The EIR seeks to evade my use of its admissions (even though understated), especially for rebuttal or impeachment, because the disputed EIR erroneously claims that they will be mitigated or resolved in some (improper) future deferred regulatory process. See sections I.C and D, I.A.1.d(iv), I.E.1-5, and I.F. (Among the evasive tactics common in the disputed EIR, besides ignoring my cross-references and incorporations by reference, is that the disputed EIR claims illusory, infeasible, and insufficient mitigations, as if the EIR does not need to defend them from my such objections to such disputed mitigations.) See section I.E, I.A.1d(v), and I.C and D. There is also nothing "speculative" (as the EIR incorrectly claims) about impacts from asbestos, toxic fugitive dust, wildfire smoke, air pollution, and water shortages and pollution (many even admitted in other parts of the DEIR/EIR), and my objections to the EIR's disputed Response To Comment 254-17 should prevail. Besides considering the EPA website's many cites to asbestos

studies, **as to wildfire smoke I also cited a Princeton/NOAA study publicized in the San Francisco Chronicle 3/29/22, which stated, "California wildfire smoke may rise to practically unendurable levels in next decades" (eg, increasing by 50% by 2050) and that does not even include the addition to the fires from the trees in our surface owner forests above and around the 2585-acre underground mine at risk of death on account of the 24/7/365 dewatering depletion of our groundwater about which I complain in my DEIR Objection 254 and herein.** Also, I note that (as discussed also in the previous objection) approval of the mine air pollution will exhaust the capacity for more beneficial businesses and uses, especially as regulations become stricter in the future. See NSAQMD Agency Letters 12 and 11. (The trend for tighter pollution regulations cannot be ignored as "speculative," but corresponds to better science, progressive climate change, and other factors that are indisputable and consistent with CEQA as confirmed section I.C and D and the 2018 Guidelines Amendments Explanations.) See the hard questions in my DEIR Objection 254 #15 and section I.A.1.a(v) that the DEIR/EIR ignores or evades because I believe they lead to what for the mine/EIR would be "inconvenient truths." Also, as my objections repeat from what was noted in the objections filed by those who also spoke at the March 24, 2022, public hearing Nevada County already ranks poorly (an "F" grade) in air quality, which means that there is already little margin for more such pollution, regardless of purported good deeds in distant places that the EIR claims below as an excuse for disregarding climate changes. See also my discussions in this Objection of the toxic fugitive dust watering suppression concerns of the NSAQMD Agency Letters 12 (at 12) and 11.

MM. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-40 (marked by the EIR at 2-5924) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates."

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR LACK OF GOOD FAITH REASONED ANALYSIS AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY Four PAGE DEIR OBJECTION 254 #3.J, TO (2) HOW THE DISPUTED EIR (AT 2-5924) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN fourths AND THEN SUCCESSIVELY IGNORED EACH FRAGMENT WHEN ADDRESSING THE OTHER PARTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-39 to 42" PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR QUOTES (INCLUDING EIR/RISE ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254 #3.J, THE EIR "RESPONSE TO COMMENT TO IND. 254-39 to 42 INCORRECTLY COMPLAINED THAT I DO "NOT EXPLAIN HOW THE EIR IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR QUOTES ARE SUFFICIENT, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER THREE PARTS OF MY #3.J THAT THE EIR CUT OFF. THUS, INSTEAD OF ADDRESSING MY FOUR PAGE EXAMPLE AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT MY ANNOTATED EIR QUOTES AND COMMENTS FROM MY DETAILED REBUTTALS OF THOSE OTHER FRAGMENTS SO THAT THE NONCOMPLIANT EIR COULD WRONGLY ARGUE FOR AN EXCUSE TO EVADE MY MERITORIOUS

OBJECTIONS. THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. THIS TACTIC IS IMPOSSIBLE TO EXCUSE AS AN ACCIDENT OR OVERSIGHT. IN FACT, ANY TRUTH SEEKER SHOULD RUN A WORD SEARCH IN SUCH EIR RESPONSES FOR THOSE AND SIMILAR WORDS (E.G., "COMMENTER DOES NOT STATE/EXPLAIN"), BECAUSE EVERY SUCH NONRESPONSIVE EIR "RESPONSE" IS DISPUTED BOTH FOR THOSE SAME REASON AND ON THE MERITS. IT IS REVEALING WHICH OF MY OBJECTIONS THE DISPUTED EIR/DEIR CONSIDERED SO DANGEROUS THAT THE EIR CHOSE TO SO GAMBLE ON EVADING ANY RESPONSE ON THE MERITS IN HOPES THAT I OR THE COUNTY DECISION-MAKERS WOULD NOT NOTICE OR THAT THE DECISION MAKERS WOULD FORGIVE THAT NONCOMPLIANCE (WHICH NO CHALLENGE COURT COULD OR WOULD DO.)

Again, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR Response incorrectly claims that I have failed to explain how the DEIR is inadequate. That EIR Response is also nonresponsive in various other ways to my objections, concerns, and data, as illustrated in my opening objection summary in #1 herein and in court decisions and law cited in DEIR Objection 254 #'s 3.N, 4, and 14, and my related objections to disputed EIR Master Responses and Responses to Comments Ind. 254-1 containing similar evasions. This disputed EIR Response (like many others herein) misstates or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits or evades some other objections entirely, especially by again falsely accusing me of not being sufficiently specific, both by ignoring my cross-references (e.g., to DEIR Objection 254 #'s 3.N, 4, and 14 and DEIR Objection 255) and my incorporations by reference and by ignoring even what is stated in my objection. I won't repeat what has already been said sufficiently in my related objections, because the EIR cannot ignore my cross-references and incorporations (on which techniques the EIR/DEIR itself extensively relies). My Objection 254 also addresses scores of other errors, omissions, and noncompliance in many parts of the DEIR (and by the EIR failing to correct hardly anything in the disputed DEIR, the EIR as well, which EIR also adds more errors, omissions, and noncompliance on its own.)

Some of the disputed EIR evasions of its CEQA and other disclosure obligations are both constantly repeated throughout the EIR/DEIR and are shocking in their incorrect interpretations of applicable law. See sections I.C and D addressing such rules and I.E and F applying the correct interpretations. See also DEIR Objection 254 at #'s 3.N, 4, 14, and 15 and DEIR Objection 255. **For example, as illustrated in the disputed EIR Response To Comment Ind. 254-40 regarding air pollution (which is typical for many disputed responses throughout the EIR), the disputed EIR's answer was: "The DEIR determined these impacts to be less than significant after mitigation." But see, e.g., NSAQMD Agency Letters 11 and 12 among many others incorporated in my Table of Incorporated by Reference Objections. However, there was no "good faith reasoned analysis" with "common sense" as to how or why the DEIR made that such disputed "determination," so I cannot be expected to rebut such unexplained EIR theory, but can rebut and denounce it as noncompliant, speculative, unsubstantiated, and contrary to my and incorporated contrary data on the issue.** That bogus concluding EIR declaration seems to contend that somehow all the EIR has to do is announce another unsubstantiated, even unspecified, opinion about illusory mitigation to

eliminate any need for compliance with CEQA and applicable law, which is worse than wrong as a matter of law and public policy. See Id, and sections I.C and D above. See also Exhibits A and B. By that absurd EIR logic, all it needs to do to entirely evade CEQA is to say, in effect, there may be environmental impacts and other problems about which potential victims may complain, but ignore them, because the EIR will somehow mitigate them to be not "significant," and that purported mitigation cannot be disputed, even by the miner's admissions in Rise's SEC filings showing that it cannot afford much mitigation and by its accountants' qualifying Rise's financial statements by doubts as to whether the miner will even remain a "going concern." Id.

Even more shocking is the way that the disputed EIR here evades climate change, which is a massive "bait and switch" and "hide the ball," causing both many EIR/DEIR errors and worse in its purported analyses and should defeat the disputed EIR/DEIR's illusory claims for mitigation. **See sections I.C and D, including the confirmation of the importance of climate change in 2018 Guideline Amendments Explanation and *Richmond v. Chevron.* When I objected to the DEIR's carbon offsets (DEIR at 4.3-96 plus) in other places as claimed mitigation, the EIR's noncompliant response was: "climate change is a global issue, and unlike criteria pollutant effects, is not localized. Thus, offsetting GHG emissions elsewhere in California is an entirely appropriate an industry standard approach to mitigating GHG emissions." First,** mitigation is never based on "mining industry standards," which in my considerable experience are among the worst and least environmentally appropriate of all industries and are not the legal standard for this or other compliance issues. **Second**, this kind of flawed policy is in effect asking permission to create a problem locally here (e.g., the climate change dryness and drought that make all the disputed EIR/DEIR groundwater recharge and balancing theories illusory, like relying on "current" average rain between 1967 and 2017 to set the "current" baseline and to assume will be replicated for the next 80 years of 24/7/365 dewatering abuses, also not even being "current' because that average ignores the dry years after 2017.) There is also no basis for claiming such dewatering is beneficial because they'll improve someone else's surface water needs somewhere else with our local owned groundwater. See, e.g., *Varjabedian v Madera* (1977), 20 Cal.3d 285 (relying on the Fifth Amendment holding in *Richards v. Washington Terminal Co*., 233 U.S. 546 (1914), and the broader California Constitution to allow nuisance and inverse condemnation claims for victims downwind of the new city sewer plant who suffered a disproportionate, direct and peculiar burden for that public benefit [and here this is a private project with no net public benefit mine]). **Third**, the air pollution at this EIR mine is admitted involving more than GHG omissions, such as asbestos and other toxins, even finally (although deficiently) with the EIR admitting the air pollution by hexavalent chromium in it buried at the end in Appendix R. (Consider, for example, how this concentrated pollution exhausts the margin of error for pollution by more beneficial land uses locally.)

NN. Objection To EIR Response (at 2-6015) To My Comment Ind. 254-41 (marked by the EIR at 2-5924) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates."

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR LACK OF GOOD FAITH REASONED ANALYSIS AND EIR'S EVASION OF MY OBJECTIONS BY COMPARING (1) MY Four PAGE OBJECTION 254 #3.J, TO (2) HOW THE

DISPUTED EIR (AT 2-5924) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN fourths AND THEN SUCCESSIVELY IGNORED EACH FRAGMENT (as well as cross-references and incorporations) WHEN ADDRESSING THE OTHER PARTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-39 to 42" PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR QUOTES (INCLUDING EIR/RISE ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254 #3.J, THE EIR CUTS ITS "RESPONSE TO COMMENT TO IND. 254-39 to 42," INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW THE EIR IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR QUOTES ARE SUFFICIENT, AS I HAVE EXPLAINED IN THIS DOCUMENT. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER THREE PARTS OF MY #3.J THAT THE EIR CUT OFF (as WELL AS IN CROSS-REFERENCES AND INCORPORATIONS THE EIR IGNORES). THUS, INSTEAD OF ADDRESSING MY FOUR PAGE EXAMPLE AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT MY ANNOTATED EIR REBUTTALS AND COMMENTS SO THAT THE EIR COULD MANUFACTURE A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS. THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS.

IN ANY CASE, AS ELSEWHERE ILLUSTRATED, THE DISPUTED EIR/DEIR CANNOT EVADE MY OBJECTIONS BY SUCH DISPUTED EIR CLAIMS THAT THEY ARE "SPECULATIVE" OR "UNSUBSTANTIATED" UNDER CEQA GUIDELINE 15384 WHEN THERE IS NO "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE" COMPLYING WITH CEQA. In this case the EIR claims that **"human error"** is such speculation or unsubstantiated risk which can be safely ignored as a worry, but wherever there are dangerous conditions supposedly being mitigated, such as asbestos (and now, per EIR Appendix R, hexavalent chromium) air pollution, **avoiding human error is an essential part of any mitigation plan**. And, since watering is essential to prevent the toxic dust from harming local victims, responsible operations should require contingency plans. See section I.E.7, NSAQMD Agency Letters 12 and 11, and my other related objections above. Remember that, when the progressive climate change droughts become serious and NID limits water use, and when local objections or EIR noncompliance result in stopping or regulating the dewatering (both of which separate events are likely to occur concurrently), the EIR creates a "pick your poison" choice between toxic air or deficient groundwater and NID water, which dilemma is foreseeable and wrong for government to impose on local victims. Id. Deeper new mining into unknown conditions never adequately investigated by the EIR/DEIR may create various significant impacts and problems, but without the required CEQA compliance by the EIR/DEIR, my concerns would just again be incorrectly dismissed by the EIR as speculation, when the real speculation is by the EIR/DEIR's unsubstantiated assumption that no impacts or problems exist, because they chose not to look for or consider any. (Among the problems of victims' legal remedies and nuisance, inverse condemnation, and other claims is that Rise admits in its SEC filings a financial condition where collecting a judgment seems challenging. See Exhibit B and DEIR Objection 254 #2.)

Again, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR Response incorrectly claims that I have failed to explain how the DEIR is inadequate and that EIR Response is also nonresponsive in various other ways to my objections, concerns, and data. The disputed DEIR "Asbestos Dust Mitigation Plan" is not adequate or sufficient mitigation, for many reasons as illustrated in my opening objection summary in #1 herein and court decisions and law cited in Objection 254 #'s 2, 3.N, 4, 10, and 14, in section I.E.7, and in my related objections to disputed EIR Master Responses and Responses to Comments Ind. 254-1 with similar evasions. This disputed Response (like many others herein) misstates or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits or evades some other objections entirely, especially by again ignoring falsely accusing me of not being sufficiently specific, both by ignoring my cross-references (e.g., to DEIR Objection 254 #'s 3.J and N, 4, 10, and 14) and my incorporations by reference and by ignoring even what is stated in my objection. I won't repeat what has already been said sufficiently in my related objections, because the EIR cannot ignore my cross-reference and incorporations (on which techniques the EIR/DEIR itself extensively relies). My DEIR Objection 254 also addresses scores of other errors, omissions, and noncompliance in many parts of the DEIR (and by the EIR failing to correct hardly anything in the disputed DEIR, the EIR as well, which EIR also adds more errors, omissions, and noncompliance on its own.)

OO. Objection To EIR Response (at 2-6016) To My Comment Ind. 254-42 (marked by the EIR at 2-5924) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#3.J Illustrative Air Quality Concerns That the DEIR Ignores Or Underestimates."

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR LACK OF GOOD FAITH REASONED ANALYSIS AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY Four PAGE OBJECTION 254 #3.J, TO (2) HOW THE DISPUTED EIR (AT 2-5924) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN fourths AND THEN SUCCESSIVELY IGNORED EACH PART (as well as cross-references and incorporations) WHEN ADDRESSING THE OTHER FRAGMENTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-39 to 42" PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254 #3.J, THE EIR CITES ITS "RESPONSE TO COMMENT TO IND. 254-39 to 42," INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW THE IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR QUOTES ARE SUFFICIENT, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER THREE PARTS OF MY #3.J THAT THE EIR SPLIT OFF (and in cross-references and incorporations it ignores.) THUS, INSTEAD OF ADDRESSING MY FOUR PAGE EXAMPLE (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLIT MY ANNOTATED EIR QUOTES AND COMMENTS FROM MY DETAILED REBUTTALS

OF THOSE OTHER PARTS (and cross-reference and incorporations) SO THAT THE EIR COULD ARGUE A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS. See the same issues affecting the following, related objection in my DEIR Objection 254 #3.K (i.e., Ind. 254-43 to 45.) THIS IS AN EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS.

In this specific situation, for example, the disputed EIR complains that I do not explain why its speculative, 100 hour a year emergency generator use is a gross underestimate. See also my related objection in my DEIR Objection 254 #3.K (i.e., Ind. 254-43 to 45.) However, I explain in detail in that objection why I know that number to be at least 5 times higher, including by my own experience in tracking my own emergency gas generator in the same area plus my supporting citations to PG&E power losses from PSPS power cuts, from wildfire risks, from weather or falling trees, and from other predictable causes from experience. I support my detailed commentary with a specific offer of proof by citing to the specific record with which (as a bankruptcy lawyer) I am personally familiar of the relevant PG&E admissions, hearings, and events from the relevant (i) CPUC proceedings, (ii) the PG&E Chapter 11 case, and (iii) the PG&E criminal probation case, each of which informs blackout threats from my specified causes, including human error, ancient and defective equipment and infrastructure, defensive or dysfunctional PG&E practices to reduce exposure to liability for staring fires, and other things. As explained in that record, for example, PG&E's deficient compliance and worse with respect to vegetation practices in our high fire risk County has resulted in massive forest growth in our foothills near more than 10,000 miles of wires where no such vegetation is allowed by law within six feet, especially not the 50 foot plus trees that PG&E claimed to the probation judge will require a decade to remove. There is no possible good faith basis for the EIR to dismiss my such reasoned analysis without the "good faith reasoned response" and common sense required by CEQA under cases *like Gray, Banning, Vineyard, and Costa Mesa.* See also my objections to EIR Master Response 33.

As an attorney intensely involved in the PG&E bankruptcy case, I also offer to so proof that the EIR/DEIR underestimates use of air polluting mine generators that the EIR/DEIR claims must keep electricity on 24/7/365 for 80 years whenever power service ceases for any reason including the PSPS blackouts added to the increasing bad weather and old equipment failures which are an indisputably much bigger problem than the DEIR/EIR acknowledges. I can prove from the following relevant public records which I incorporate herein (and to which I can cite from my experiences in): the dockets in (i) the pending PG&E Chapter 11 Case No. 19-30088 (DM) bankruptcy commenced in 2019 in the Northern District of California, including what was cited in my PSPS related proof of claim disputes with PG&E, (ii) the various related CPUC proceedings dealing with the PG&E issues during that pending bankruptcy, including all PSPS related proceedings, and (iii) Judge Alsup's criminal probation proceedings, including what was cited to that docket in my PSPS related proof of claim disputes with PG&E. PG&E's service problems clearly will disrupt the mine more often than history would suggest both as a result of climate change, increasingly bad weather threats, illegal vegetation still growing in dangerous proximity to uninsulated PG&E gear and more than 10,000 miles of dangerous fire risk wires, the "run it until it breaks" PG&E use of dangerous gear, and other causes of greater blackouts than

in the past. What is speculative and false is the EIR/DEIR theory that the past predicts the future as to those risks and threats, which are progressive and cumulative, both because of increasing fire risks, worsening climate change impacts, and chronic and cumulative PG&E operating difficulties, such as ancient equipment that cannot be replaced, upgraded, and made safe quickly enough to counter such threats.

Even worse, as discussed throughout my four Objections, the DEIR has admitted (at DEIR 6-14) that its entire mining project is not economically feasible if it were limited to working less than a 24-hour day every day like much more beneficial businesses are required to do, instead of 24/7/365 as it demands. See Grass Valley Agency Letters 12 and 11. I point out that the thousands of mine objectors have the right, power, and motivation to cause law reforms or initiatives to impose a normal, 12-hour five day a week plus holidays limit on such disruptive/exploitive businesses. Such local victim, property defense-political protections against the mine are not speculative on the basis of the many serious objections on the record in this disputed DEIR/EIR matter. Thus, it is also not speculative to ask what happens when the mine's dust control ceases when its admittedly no longer economically feasible mining plan stops, especially since there is no adequate mitigation for any such remediation or safety needs.

IN ANY CASE, AS ELSEWHERE ILLUSTRATED, THE DISPUTED EIR/DEIR CANNOT EVADE MY OBJECTIONS BY SUCH DISPUTED EIR CLAIMS THAT THEY ARE "SPECULATIVE" OR "UNSUBTANTIATED" UNDER CEQA GUIDELINE 15384, WHEN THERE IS NO "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE" AS THE EIR/DEIR FAILS TO COMPLY WITH CEQA. See section I.C and D, as well as *Gray, Banning, Vineyard, Costa Mesa* and other authorities in section I.A.1.b and d, I.E. and I.F.5 and 6. In this case the EIR claims that human error is such speculation or unsubstantiated risk which it can ignored, but wherever there are dangerous conditions supposedly being mitigated, such as asbestos/toxic dust that must be frequently watered during every day to satisfy the NSAQMD Agency Letter 12 (at 12) (and now, per EIR Appendix R, hexavalent chromium) human error contingency planning is an essential part of any mitigation plan. And, since watering is essential to prevent the toxic dust from harming local victims, responsible operations should require such contingency plans. Id. Remember that, when the drought becomes serious and NID limits water use, and when local objections or EIR noncompliance result in stopping or regulating the dewatering (both of which events are likely to occur concurrently), the EIR creates a "pick your poison" choice for us locals between toxic air or deficient groundwater and NID water, which dilemma is foreseeable and wrong for government to impose on us local victims. See *Varjabedian* and *Keystone*. Deeper mining into new areas with unknown conditions never adequately investigated by the EIR/DEIR may create various impact problems without the required CEQA compliance by the EIR/DEIR. My such concerns cannot be dismissed by the EIR as speculation, when the real speculation is by the EIR/DEIR's unsubstantiated assumption that no impacts or problems exist, because they did not investigate for any. (Among the problems of victims' legal remedies and nuisance, inverse condemnation and other claims is that Rise admits in its SEC filings a financial condition where collecting a judgment seems challenging. See Exhibit B.)

Again, like many other disputed EIR "Responses" and EIR's rebutted "Master Responses," this disputed EIR "Response" incorrectly claims that I have failed to explain how the DEIR is inadequate. However, my four Objections amply prove that EIR Response is nonresponsive in various ways to my objections, concerns, and data, as illustrated in my opening

objection summary in #1 above and court decisions and law cited in DEIR Objection 254 #'s 3.N, 4, and 14, in DEIR Objection 255, and in my related objections to disputed EIR Master Responses (eg, #'s 1 and 14-16) and Responses to Comments Ind. 254-1 with similar evasions. This disputed EIR Response (like many others herein) misstates or mischaracterizes some of my objections to make them seem less meritorious, and (without any meritorious excuse) the EIR evades or omits some other objections entirely, especially by again falsely accusing me of not being sufficiently specific or explanatory, a bogus claim that ignores my cross-references (e.g., to DEIR Objection 254 #'s 2, 4 and 14) and my incorporations by reference and by ignoring even what is stated in my objection. Id.

PP. Objection To EIR Response (at 2-6016) To My Comment Ind. 254-43, -44 and -45 (marked by the EIR starting at 2-5926) And FRAGMENTED PARTS OF MY INTEGRATED OBJECTION Correctly Entitled: "3.K Because the DEIR Fails To Comply in Many Ways (see, eg, my #14) The Strange DEIR "Non-CEQA Related Analysis" (#4.3-103*) Is A Reveling Admission About Some of What the DEIR Should Have Disclosed About What Happens When The Mine Starts And Then Stops, Whether From Lack of Funding Or Gold, From Our Local Legal Or Political Resistance And Law Reforms, Or Otherwise."

CONSIDER CLOSELY THIS TYPICAL EXAMPLE OF SUCH EIR LACK OF "GOOD FAITH REASONED ANALYSIS: WITH "COMMON SENSE," AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY Four PAGE DEIR OBJECTION 254 #3.K, TO (2) HOW THE DISPUTED EIR (AT 2-5926) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN thirds AND THEN SUCCESSIVELY IGNORED EACH PART (as well as cross-references and incorporations, especially to my overlapping previous subsection #3.J) WHEN ADDRESSING THE OTHER PARTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR RESPONSE TO COMMENT IND. 254-43 to 45 (and its cross-referenced Ind. 254-39 to 42 in my #3.J) PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY OBJECTION 254-3.K (and my cross-referenced #3.J), THE EIR CUTS ITS "RESPONSE TO COMMENT TO IND. 254-43 to 45" (and as to related Ind. 254 39 to 42), INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW THE IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS IN SUCH DEIR OBJECTIONS ARE SUFFICIENT, AS I HAVE EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER THREE PARTS OF MY #3.K (and related #3.J) THAT THE EIR IMPROPERLY CUT OFF (and in other cross-references and incorporations the EIR ignores.) THUS, INSTEAD OF ADDRESSING MY FOUR PAGEs OF EXAMPLES (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLITS MY ANNOTATED EIR OBJECTIONS AND COMMENTS FROM MY DETAILED REBUTTALS OF THOSE OTHER FRGMENTED PARTS (and cross-reference and incorporations), SO THAT THE EIR COULD MANUFACTURE A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

WHILE IN RESPONDING TO EACH SUCH EIR "CUT" FRAGMENT OF MY DEIR OBJECTION 254 SECTIONS ABOVE TO REBUT THOSE PREVIOUS, DISPUTED EIR/DEIR PARTIAL "RESPONSES," I AM NOW SHIFTING TO A COMBINED OBJECTION FROM MY WHOLE INTEGRATED SECTION THE WAY I WROTE THE OBJECTION. AT THIS STAGE IN MY OBJECTION TO SUCH EIR "RESPONSES," I SHOULD HAVE PROVEN MY POINT SUFFICIENTLY ABOUT THIS IMPROPER EIR TACTIC. IT IS MORE EFFICIENT NOW TO IGNORE THE EIR'S ARTIFICIAL SEPARATIONS OF MY INTEGRATED OBJECTIONS AND TREAT SUCH EIR "RESPONSES" ON THE UNIFIED BASIS THAT SHOULD HAVE BEEN USED BY THE DISPUTED EIR. HOWEVER, ANYONE CAN STILL SEE THAT THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. EVEN WORSE, SINCE THE EIR REFUSES TO RESPOND MEANINGFULLY ON THE MERITS TO ANYTHING IT INCORRECTLY CONSIDERS OUTSIDE OF THE SCOPE OF CEQA, HOW CAN THE EIR/DEIR ADMITTEDLY COMMENT OUTSIDE CEQA (I.E., IN A DISPUTED EIR SECTION CALLED "NON-CEQA RELATED ANALYSIS"), WHILE DENYING ME THE RIGHT TO REBUT ITS "NON-CEQA RELATED ANALYSIS" ON THE MERITS? SEE SECTION I.C AND D ABOVE.

In this specific situation, for example, the disputed EIR complains that I do not explain why my objections based on PG&E PSPS is too speculative, ignoring these electric supply issues I cross-referenced in a detailed analysis in the previous subsection rebutting EIR Responses To Comments Ind. 39-42 (i.e., my DEIR Objection 254 #3.J). However, I explain in detail in both this and that objection, including from my own experience in tracking PSPS requiring use of my own emergency gas generator in the same area. As an attorney intensely involved in the PG&E bankruptcy case, I also offer to so proof that the EIR/DEIR underestimates use of air polluting mine generators that the EIR/DEIR claims must keep electricity on 24/7/365 for 80 years whenever power service ceases for any reason including the PSPS blackouts added to the increasing bad weather and old equipment failures which are an indisputably much bigger problem than the DEIR/EIR acknowledges. I can prove from the following relevant public records which I incorporate herein (and to which I can cite from my experiences in): the dockets in (i) the pending PG&E Chapter 11 Case No. 19-30088 (DM) bankruptcy commenced in 2019 in the Northern District of California, including what was cited in my PSPS related proof of claim disputes with PG&E, (ii) the various related CPUC proceedings dealing with the PG&E issues during that pending bankruptcy, including all PSPS related proceedings, and (iii) Judge Alsup's criminal probation proceedings, including what was cited to that docket in my PSPS related proof of claim disputes with PG&E. PG&E's service problems clearly will disrupt the mine more often than history would suggest both as a result of climate change, increasingly bad weather threats, illegal vegetation still growing in dangerous proximity to uninsulated PG&E gear and more than 10,000 miles of dangerous fire risk wires, the "run it until it breaks" PG&E use of dangerous gear, and other causes of greater blackouts than in the past. What is speculative and false is the EIR/DEIR theory that the past predicts the future as to those risks and threats, which are progressive and cumulative, both because of increasing fire risks, worsening climate change impacts, and chronic and cumulative

PG&E operating difficulties, such as ancient equipment that cannot be replaced, upgraded, and made safe quickly enough to counter such threats.

Even worse, as discussed throughout my four Objections, the DEIR has admitted (at DEIR 6-14) that its entire mining project is not economically feasible if it were limited to working less than a 24-hour day every day like much more beneficial businesses are required to do, instead of 24/7/365 as it demands. See Grass Valley Agency Letters 12 and 11. I point out that the thousands of mine objectors have the right, power, and motivation to cause law reforms or initiatives to impose a normal, 12-hour five day a week plus holidays limit on such disruptive/exploitive businesses. Such local victim, property defense-political protections against the mine are not speculative on the basis of the many serious objections on the record in this disputed DEIR/EIR matter. Thus, it is also not speculative to ask what happens when the mine's dust control ceases when its admittedly no longer economically feasible mining plan stops, especially since there is no adequate mitigation for any such remediation or safety needs.

Likewise, what is speculative in this dispute is the EIR/DEIR's disputed assumptions that the new mine conditions are the same as the old mine conditions when it flooded and closed in 1956. What is speculative and unsubstantiated by the EIR/DEIR are the current conditions of that closed and flooded mine after all these years and impactful events, as well as the uninvestigated mysteries of the new and deeper mining the EIR projects in the future, not just including climate change, but also direct physical and environmental impacts. See Exhibit B admissions by Rise in its SEC filings, which can be determinative here as they were in *Richmond v. Chevron*, see section I.C and D above. Indeed, since I dispute for good cause the alleged starting base case for the conditions of that long closed and flooded mine based on the EIR's unreliable, incomplete, and otherwise disputable historical "records" (see Id.), especially those created before modern science and serious regulatory compliance in a predatory mining industry where the old saying generally applied that 'it's better to ask for forgiveness [if you get caught] than for permission." In any event, the disputed EIR/DEIR approach seems to be that it can do whatever it wants as long as it complains that the foreseeable problems to which us locals object are "speculative" or that our potential victim objections to the disputed EIR/DEIR's unsubstantiated claims and opinions are unsubstantiated (although our objections include a better and "good faith reasoned analysis" generally lacking in the EIR/DEIR, which has the burden of proof. See section I.A,1.b).

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR Response incorrectly keeps claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and flaws based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the disputed EIR/DEIR ignores or evades. EIR Response is also nonresponsive in various other ways to my objections, concerns, and data, as illustrated in my opening objection summary in #1 herein and court decisions and law cited in DEIR Objection 254 #'s 2, 4 and 14, and my related objections to every one of the EIR's Master Responses and Responses to Comments Ind. 254-1 with similar evasions. For example, this disputed Response (like many others herein) misstates or mischaracterizes some of my objections to make them seem less meritorious and (without any meritorious excuse) omits some

other objections entirely, especially by again ignoring falsely accusing me of not being sufficiently specific, both by ignoring my cross-references (e.g., to DEIR Objection 254 #'s 2, 3,N, 4, and 14) and my incorporations by reference (eg, to specific court case records and SEC filings, like addressed in Exhibit's B and A hereto) and by ignoring even details that are clearly stated in my objection.

QQ. Objection To EIR Response (at 2-6017) To My Comment Ind. 254-46 (marked by the EIR starting at 2-5929) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "3.L [and the first part of #3.M] Consider What The DEIR Is Not Disclosing (eg, my #3.E and M and 14) And The Questions That The DEIR Is Not Answering, Because Those Of Us impacted Or At Risk Will Assume Nondisclosures And Answers Require Continuous Resistance To the Mine (See my #'s 3.N, 4, and 14).

As demonstrated in relevant objections above, I repeat my many hexavalent chromium related objections above (and in Exhibit C and section I.F.1) and in my DEIR Objection 254 (especially #'s 3.A, B, C, E, F, G, H, J, M, and N, 4, 5, 7, 10, 19, and 14), none of which are overcome by the disputed EIR/DEIR, which lacks "good faith reasoned analysis" and "common sense" on this subject, especially in the disputed EIR's Response to Comment Ind. 254-1 to which I have objected above. What the disputed EIR dismisses as my "legacy contaminant concerns," citing to EIR's Response to another's Comment Grp 25-30, I reject for the reasons in my objections and Comment Grp 25-30 and its follow up rebuttal to such disputed Response. (Since the EIR chooses not to be specific in its objection, I see no compulsion to be more specific in my rebuttal.) Likewise, without identifying any specific issue against the three pages that the EIR labeled as Response to Comment Ind. 254-46, I stand generally on my objections to the EIR's abstract cite to its disputed Response to Comment Ind.-254-17 and Master Response 16.

In particular, I open my DEIR Objection 254 #3.L (EIR marked Ind. 254-46) with cross-references to my #'s 3.E., I, J, M and N, 4, 14, and 15, all of which I have defended on the merits herein against the EIR's disputed Responses (and Master Responses) thereto on grounds that apply here as well. My such objections should prevail. While EIR's disputed Response To Comment Ind. 254-46 includes the first part of my Objection 254 #3.M, I will address that in the next subsection, where I rebut in one place the whole of the EIR's disaggregation/cut up of my such integrated objection # 3.M into disputed EIR "Response" fragments To Comment Ind. 254-46 to -49.

RR. Objection To EIR Response (at 2-6017) To My Comment Ind. 254-46 to 49 (marked by the EIR starting at 2-5930) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: 3.M "Among the Biggest DEIR Disputes Is About the Timing of Facts When Making This Decision About And 80 Year Plus Future Impact, Risk, And Burden, When We Know That The Past Is A Faulty And Largely Irrelevant Guide To Predicting The "New Normal," Which the Disputed DEIR Fails To Do So Either (i) By Its Almost Exclusive Focus On That Unhelpful Past Data, Or (ii) Its Limitation To (At Most) Occasional And Deficient Looks At The Fantasy The DEIR Imagines In The Next 20 Years (Or Until 2040), Ignoring That the EIR/DEIR is demanding the right without CEQA

compliance and evidence for an adequate "good faith reasoned analysis" with "common sense."

CONSIDER CLOSELY THIS ADDITIONAL EXAMPLE OF SUCH EIR LACK OF "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE" AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY seven PAGE OBJECTION 254 #3.M TO (2) HOW THE DISPUTED EIR (AT 2-5930) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN fourths AND THEN SUCCESSIVELY IGNORED EACH FRAGMENTSED PART (as well as cross-references and incorporations, especially to my overlapping previous subsection #3.L) WHEN ADDRESSING THE OTHER FRAGMENTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-46 to 49" (and my other cross-referenced or incorporated objections) PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254-3.M (and my other cross-references), THE EIR CUTS UP ITS "RESPONSE TO COMMENT TO IND. 254-46 to 49," INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW [THE DEIR] IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR OBJECTIONS ARE SUFFICIENT, AS I HAVE REPEATEDLY EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER FOUR FRAGMENTS OF MY #3.M (and related #3.L) THAT THE EIR CUT OFF (and in other cross-references and incorporations the EIR ignores.) THUS, INSTEAD OF ADDRESSING MY SEVEN PAGEs OF EXAMPLES (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTION THAT THEYARE, THE DISPUTED EIR SPLITS MY ANNOTATED EIR OBJECTIONS AND COMMENTS FROM MY DETAILED REBUTTALS OF THOSE OTHER PARTS (and cross-reference and incorporations) SO THAT THE EIR COULD ASSERT A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

IN RESPONDING TO EACH SUCH EIR "CUT" OF MY DEIR OBJECTION 254 SECTIONS ABOVE TO REBUT THOSE PREVIOUS, DISPUTED EIR/DEIR PARTIAL "RESPONSES," I AM NOW SHIFTING TO A COMBINED OBJECTION FROM MY WHOLE INTEGRATED SECTION THE WAY I WROTE THE OBJECTION. AT THIS STAGE IN MY OBJECTION, I SHOULD HAVE PROVEN MY POINT ABOUT THIS IMPROPER EIR TACTIC. IT IS MORE EFFICIENT NOW TO IGNORE THE EIR'S ARTIFICIAL SEPARATIONS OF MY INTEGRATED OBJECTIONS INTO FRAGMENTS. HOWEVER, ANYONE CAN STILL SEE THAT THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. EVEN WORSE, SINCE THE DISPUTED EIR REFUSES TO RESPOND MEANINGFULLY ON THE MERITS TO ANYTHING (I.E., WITH A COMPLIANT "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE") THAT THE EIR INCORRECTLY CONSIDERS OUTSIDE OF THE SCOPE OF CEQA, HOW CAN THE

EIR/DEIR ITSELF ADMITTEDLY COMMENT OUTSIDE CEQA (I.E., SUCH AS IN A DISPUTED EIR SECTION CALLED "NON-CEQA RELATED ANALYSIS), WHILE DENYING ME THE RIGHT TO REBUT ITS "NON-CEQA RELATED ANALYSIS" ON THE MERITS?

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR Response incorrectly keeps claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since the EIR is now becoming even vaguer than before about what it is disputing, my general rejections now need only match the disputed EIR's generality. Thus, as to my DEIR Objection 254 #3.M (i.e., what the EIR labelled as fragment Ind. 254-46) I cite to my objection herein to what the EIR cited as its Response to Comment Ind. 254-17 and 254-1, to its Master Response 16, and to its Response to Grp 25-30. As to my Objection 254 #3.M (EIR labelled as Ind. 254-47) I also cite to my objection herein to what the EIR cited as its "Response to Comment Ind. 254-17." As to my DEIR Objection 254 #3.M (i.e., what the EIR labelled as fragment Ind. 254-48) I cite to my objection herein to what the EIR cited as its "Response to Comment Ind. 254-18 and -19." As to my DEIR Objection 254 #3.M (i.e., what the EIR labelled as fragment Ind. 254-49) I cite to my objection herein to what the EIR cited as its "Response to Comment Ind. 254-19" and its Master Responses 13 and 16. In other words, I have learned nothing in the disputed EIR that inspires me to abandon or concede any of my material objections to the EIR/DEIR.

Note also that, while the EIR complains that some of my objections here overlap with prior my objections, that occurs for several good reasons, including (depending on which objection is at issue) my adding more detail here for an enhancement of an objection previewed earlier, or my use of the same DEIR quote or admission and my related concern stated earlier again here for a different point or objection, or others reasons, such as for context or support for a new point or objection. As my quoted DEIR Objection #3.M title indicates, the primary thrust of this objection is to expose (often with examples of my substantive objections on objectionable impacts) how the flawed DEIR/EIR analysis fails to meet the "good faith reasoned analysis" with "common sense" standard and otherwise to comply with CEQA and other applicable laws. For instance, elsewhere I have demonstrated the errors, omissions, and other noncompliance in the DEIR/EIR cherry picking the purported "current" average rainfall between 1967 and 2017 to set the "current" base line for predicting future "recharge" and "balancing" of groundwater, clearly ignoring the more "current" drought years after 2017 and then for the EIR to assume the "current" number used for predicting the average rain still applies during the next 80 years, as if that disputed data and ignoring of climate change and 24/7/365 dewatering allowed that obsolete past to predict that future for the next 80 years with unreliable, incomplete, and disputed mine data. Worse, as I have demonstrated, the disputed EIR/DEIR doesn't even try to provide a "good faith reasoned analysis" with "common sense" and compliance with CEQA and other applicable laws, trying instead inappropriately or worse to brand such objections about the future 24/7/365 mine dewatering impacts for the rest of the 80 years after 2040 as "too speculative" to require a prediction or to justify an objection.

In effect, once again, and often when they refuse to investigate adequately or at all, the EIR/DEIR incorrectly brands my and other objections as "speculation" and as an alleged excuse to do whatever they want and for attempting to shift the impact of such pretended unknowns (and, in effect, the burden of proof) to us local victims. But that EIR/DEIR tactic cannot transfer the burden of proof from the mine to us victims. See section I.A.1.b. The consequences of the noncompliant EIR/DEIR not being able to predict impacts on our environment, including our groundwater, especially as to those impacts on us objectors living on the surface above and around the 2585-acre underground mine (and owning the groundwater being dewatered and flushed away somewhere else down the Wolf Creek 24/7/365 for 80 years), is not to shift the risk of such unknowns to the victims, but to deny the EIR as too risky and noncompliant. Trying to say that depletion of our local groundwater can be justified as improving surface NID water supplies somewhere else is not mitigation or permissible "balancing," but instead is a cause for the kinds of claims by us surface owner victims addressed in my DEIR Objection 254 #'s 3.N, 4, and 14 (e.g., trespass, conversion, nuisance, inverse condemnation etc.) See, eg, *Varjabedian v. Madera (*1977), 20 Cal.3d 285 (inverse condemnation and nuisance claims allowed for residents downwind of a new sewer plant suffering a disproportionate impact for the public benefits in other places) and Keystone. Consider the earlier objections to the DEIR admissions (e.g., the EIR mine taking 10% of each well's depleted water before they have to begin their illusory mitigation the miner's SEC filings admit facts showing that it cannot afford, even before considering all the undisclosed, existing and future wells the EIR mining and dewatering will impact. Indeed, if Rise also tries to achieve any of its announced project objectives which also seem unaffordable, I don't know how Rise could afford to mitigate even the smaller number of wells the EIR/DEIR acknowledges as if this EIR impact were just an issue for the East Bennett Road area, rather than the much greater problem involving all of the thousands of us surface owners and users living above and around the 2585 acre underground mine.

SS. Objection To EIR Response (at 2-6017) To My Comment Ind. 254-50 to 53 (marked by the EIR starting at 2-5937) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: 3.N "Political Dynamics, Law Reforms To Protect the Community, And Consequences From Starting the Mine Before We Stop It And More Risks, Impacts, And Harms Occur, Even Some Admitted By The DEIR, Although, As Usual, In An Obscure Place at 4.3-103-04 Called the Non-CEQA Related Analysis."

CONSIDER CLOSELY THIS ADDITIONAL EXAMPLE OF SUCH EIR LACK OF GOOD FAITH REASONED ANALYSIS AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY five PAGE DEIR OBJECTION 254 #3.N, TO (2) HOW THE DISPUTED EIR (AT 2-5937) DISAGGREGAGTED/CHOPPED THAT UNIFIED OBJECTION IN fourths AND THEN SUCCESSIVELY IGNORED EACH FRAGMENTED PART (as well as cross-references and incorporations, especially to my overlapping previous subsections) WHEN ADDRESSING THE OTHER PARTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-50 to 53" (and my other cross-referenced objections) PRESENTED A FLAWED EIR SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING

THE REST OF MY DEIR OBJECTION 254-3.N (and my other cross-references), THE EIR CUTS ITS "RESPONSE TO COMMENT TO IND. 254-50 to 53," INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW [THE DEIR] IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO MY SUCH DEIR OBJECTIONS ARE SUFFICIENT, AS I HAVE REPEATEDLY EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER FOUR PARTS OF MY #3.N (and my related objections) THAT THE EIR CUT OFF (and in other cross-references and incorporations the EIR ignores or evades.) THUS, INSTEAD OF ADDRESSING MY five PAGES OF EXAMPLES (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLITS MY ANNOTATED EIR OBJECTIONS AND COMMENTS FROM MY DETAILED REBUTTALS IN THOSE OTHER FAGMENTS (and cross-reference and incorporations) SO THAT THE EIR COULD ASSERT A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

IN RESPONDING TO EACH SUCH EIR "CUT" FRAGMENT OF MY DEIR OBJECTION 254 SECTIONS ABOVE TO REBUT THOSE PREVIOUS, DISPUTED EIR/DEIR PARTIAL "RESPONSES," I AM NOW SHIFTING TO A COMBINED OBJECTION FROM MY WHOLE INTEGRATED SECTION THE WAY I WROTE THE OBJECTION. AT THIS STAGE IN MY OBJECTION, I SHOULD HAVE PROVEN MY POINT ABOUT THIS IMPROPER EIR FRAGMENTATION TACTIC. IT IS MORE EFFICIENT NOW TO IGNORE THE EIR'S ARTIFICIAL SEPARATIONS OF MY INTEGRATED OBJECTIONS. HOWEVER, ANYONE CAN STILL SEE THAT THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. EVEN WORSE, SINCE THE EIR REFUSES TO RESPOND MEANINGFULLY ON THE MERITS TO HARDLY ANYTHING (I.E., WITH A "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE") THAT THE EIR INCORRECTLY CONSIDERS OUTSIDE OF THE SCOPE OF CEQA, HOW CAN THE EIR/DEIR ITSELF ADMITTEDLY COMMENT OUTSIDE CEQA (I.E., SUCH AS IN A DISPUTED EIR SECTION CALLED "NON-CEQA RELATED ANALYSIS"), WHILE DENYING ME THE RIGHT TO REBUT EVEN ITS "NON-CEQA RELATED ANALYSIS" ON THE MERITS?

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, these disputed EIR "Responses" incorrectly keep claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since these EIR fragments are now becoming even vaguer than before about what they are disputing, my general rejections now can match the disputed EIR in generality. Thus, as to my DEIR Objection 254 #3.N (i.e., the fragment the EIR labelled as Ind. 254-50), I cite to my objection herein to what the EIR cited as its Master Response 1. As to my DEIR Objection 254 #3.N (the fragment the EIR labelled as Ind. 254-51), I cite to my objection herein to what the EIR cited as its Master Response 1. As to my DEIR Objection 254 #3.N (i.e., what the EIR

labelled as Ind. 254-52), I cite to my objection herein to what the EIR cited as its Master Response 1. As to my DEIR Objection 254 #3.N (i.e., what the EIR labelled as Ind. 254-53), I cite to my objection herein to what the EIR cited as its Master Responses 1. In other words, I have learned nothing in the disputed EIR that inspires me to abandon or concede any of my material objections to the EIR/DEIR.

More importantly, nothing in the EIR cited in its "Responses" addresses my key objections in DEIR Objection 254 #3.N with the required "good faith reasoned analysis" with "common sense," and my key legal and political disputes have witness (like me) offering to prove our such issues are not "speculative." For example, the DEIR admits (at 6-14) that the project is not feasible if it must operate less than daily 24/7/365 for 80 years, which is probable since the Rise SEC filings demonstrate the precarious financial condition of the miner that render it unable to afford many of its DEIR/EIR safety and mitigation assertions, much less also the project objectives, as demonstrated in Exhibit B hereto and Objections 254 #2 and the whole of 255. However, the disputed EIR/DEIR fails to address the consequences of that or other economic feasibility issues. For example, because the County should expect approval of the EIR will inspire some defensive initiative/law reforms, such as limiting (in suburban communities like ours) such exploitive businesses (i.e., those not serving the public but depleting local resources) to 12 hours a day and to business days, the EIR/DEIR must deal with the safety and other consequences, impacts, and problems resulting from starting the mining and then shutting down for lack of sufficient operating cash flow.

Indeed, there are a whole series of law reforms that will be needed to protect us locals, if the EIR were approved, so as to mitigate for the benefit of us victims as many of the objectionable impacts of the mine as possible. For example, if the EIR is approved, there will be locals enforcing legal, law reform, and political remedies, especially over the 24/7/365 dewatering for 80 years that depletes groundwater owned by us surface owners above and around the 2585 acre mine and flushes it away down the Wolf Creek. Such law reform initiatives will be designed to protect those property rights as well as the environment. See *Keystone* and *Varjabedian.* What happens to the EIR mine economics and safety/mitigation assertions then? The EIR/DEIR argument is that this is too speculative, but the indisputable fact is that that we objectors would have no choice but to enforce our legal, law reform, and political rights, unless us potential victims are willing to sacrifice passively for this no net benefit (and worse) mine (DEIR Objection 254 #4) our home values, our water and other property rights, and our way of life.

The US Supreme Court has addressed in objectors' favor us surface owners versus underground miner disputes in cases I address here in my DEIR Objection 254 #3.N (as well as in my #'s 4 and 14), such as ***Keystone Bituminous Coal Ass'n v. DeBeneditis,*** 480 U.S. 470 (1987)(rejecting "taking claims by miners as to laws protecting surface owners' property rights), where surface owners were allowed to require underground miners to preserve their surface rights of subjacent and lateral support [and protect against subsidence, which includes leaving groundwater support] by leaving 50% of the coal to support the surface. The same principles apply to what law reforms locals here can require. Given the admitted fragile financial condition of the miner (eg, Exhibit B) and the environmental impacts of suspending safety and mitigation efforts (another issue ignored by the EIR/DEIR as too "speculative"), that issue is essential for CEQA consideration, even if only as rebuttal to errors, omission, and worse in the DEIR/EIR. See section I.C and D above. While such new local victim legal protections would have impacts on the EIR mining, it is essential to remember that this is more than about how the miner uses the

property it owns. This is about us surface owners and users protecting our own property and groundwater rights we own at least down 200 feet above and around the underground mine that has been closed and flooded since 1956, as admitted by Rise in its SEC 10K. See Exhibit B addressing risks Rise admits to the SEC and its investors but not to the County or public in the EIR/DEIR. If the County approves anything that harms our surface owners' property rights for the benefit of this disputed mine, such as the EIR/DEIR plan to deplete 10% of our owned well water before the (illusory) mitigation replacement kicks in on the small portion of the total existing and future wells so impacted and recognized by the EIR/DEIR for mitigation), that is certain to trigger law reforms and claims under the Fifth Amendment and California Constitutional for taking, inverse condemnation, nuisance, trespass, conversion, and other claims. See, e.g., *Varjabedian*; ***Vaquero Energy, Inc. v. County of Kern*** (2019), 42 Cal. App, 5th 312, allowing surface owner legal protections against underground oil and gas miners. The commonsense analysis is this: This speculator, Canadian miner is seeking EIR approvals that will harm our local surface owners' property values and rights (and more) for the benefit of their distant shareholders. Any incidental net benefits for County residents (which net benefits I and others dispute as nonexistent, as demonstrated in Exhibit A hereto and my DEIR Objection 255) do not extend to us impacted local surface owners, who are certain to defend themselves and our property rights by appropriate legal, law reform, and political means as so described.

TT. Objection To EIR Response (at 2-6018) To My Comment Ind. 254-54 to 60 (marked by the EIR starting at 2-5941) And FRAGMENTED PARTS OF AN INTEGRATED OBJECTION Correctly Entitled: # "4. There Is No Net Benefit To Justify Approving This Mine Or Its DEIR, Especially Where One Gives Appropriate Weight To the Objections Of The Burdened And Harmed Locals At Risk Of Worse;" And "4 A. A General Discussion of Some of the Many Negatives Decreasing Any Imagined Benefits From the Mine, Applying Some Legal And Political Self-Defense Rights And Counters Expected From Those Of Us At Risk Living Above Or Around the 2585-Acre Underground Mine."

CONSIDER CLOSELY THIS ADDITIONAL EXAMPLE OF SUCH EIR LACK OF GOOD FAITH REASONED ANALYSIS AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY eight PAGE DEIR OBJECTION 254 #4.A, TO (2) HOW THE DISPUTED EIR (AT 2-5941) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN sevenths AND THEN SUCCESSIVELY IGNORED EACH FRACTIONAL PART (as well as cross-references and incorporations, especially to my overlapping previous subsections) WHEN ADDRESSING THE OTHER PARTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-54 to 60" (and my other cross-referenced objections) PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254-4.A (and my other cross-references and incorporations), THE EIR CUTS ITS "RESPONSE TO COMMENT TO IND. 254-54 to 60" INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW [THE DEIR] IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR OBJECTIONS ARE SUFFICIENT, AS I HAVE

REPEATEDLY EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER FRAGMENTED PARTS OF MY #4.A (and my related objections) THAT THE EIR CUT OFF (and in other cross-references and incorporations the EIR ignores.) THUS, INSTEAD OF ADDRESSING MY eight PAGES OF EXAMPLES (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLITS MY ANNOTATED EIR OBJECTIONS AND COMMENTS FROM MY DETAILED REBUTTALS IN THOSE OTHER PARTS (and cross-reference and incorporations) SO THAT THE EIR COULD ASSERT A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

IN RESPONDING TO EACH SUCH EIR DISAGGREGATED "CUT" OF MY DEIR OBJECTION 254 #4.A SECTIONS ABOVE TO REBUT THOSE PREVIOUS, DISPUTED EIR/DEIR PARTIAL "RESPONSES," I AM NOW SHIFTING TO A COMBINED OBJECTION FROM MY WHOLE INTEGRATED SECTION THE WAY I WROTE THE OBJECTION. AT THIS STAGE IN MY OBJECTION, I SHOULD HAVE PROVEN MY POINT ABOUT THIS IMPROPER EIR TACTIC. IT IS MORE EFFICIENT NOW TO IGNORE THE EIR'S ARTIFICIAL SEPARATIONS OF MY INTEGRATED OBJECTIONS. HOWEVER, ANYONE CAN STILL SEE THAT THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. EVEN WORSE, SINCE THE EIR REFUSES TO RESPOND MEANINGFULLY ON THE MERITS (IE, WITH A "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE") TO ANYTHING THAT THE EIR INCORRECTLY CONSIDERS OUTSIDE OF THE SCOPE OF CEQA, HOW CAN THE EIR/DEIR ITSELF ADMITTEDLY COMMENT OUTSIDE CEQA (I.E., SUCH AS IN A DISPUTED EIR SECTION CALLED "NON-CEQA RELATED ANALYSIS"), WHILE DENYING ME THE RIGHT In My Cross-Referenced Objection 254 #3.N TO REBUT ITS "NON-CEQA RELATED ANALYSIS" ON THE MERITS?

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, these disputed EIR Responses incorrectly keep claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since these EIR fragment parts at issue are becoming even vaguer than before about what they are disputing, my general rejections now can match the disputed EIR in generality. Thus, as to my DEIR Objection 254 #4.A (what the EIR labelled as Ind. 254-54), I cite to my objection herein to what the EIR cited as its Master Response 4, noting that this separate Centennial site dispute is a question of law for the courts on which the EIR is in error. See my section I.B above. As to my DEIR Objection 254 #4.A (what the EIR labelled as Ind. 254-55, 56, 57,58, 59, and 60), I cite to my objection herein to what the EIR cited as its Master Responses 29, 33, 35 and 36, as well as to EIR "Responses To Ind. 254-1 and 17," noting my extensive analysis of many aspects of the (i) hexavalent chromium threats (see, eg, Exhibit C and my DEIR Objection 254 #'s 3.A, B, C, E, F, G, H, J, M, and N, 4, 5, 7, 19, and 14 and my

counters herein to the disputed EIR's "Responses" and "Master Responses" thereto) ignored herein by only a disputed and limited Master Response 35, (ii) the groundwater depletion drying out of vegetation creating bigger fire hazards, among many other groundwater related objections ignored herein only a disputed and limited Master Response 33 (see, e.g., my DEIR Objection 254 #'s 3.A, B, D, E, F, K, M, and N, 4, 5, 11, 14, and 1514 and my counters herein to the disputed EIR's "Responses" and "Master Responses" thereto), (iii) climate change impacts (see section I.C and D above), and (iii) nuisance and inverse condemnation, as well as what the EIR "Response" to my Ind. 254- 59 inadequately summarizes as "subsidence, liquefaction, or landslides" and which ignores all of my other discussion of other victim claims in my DEIR Objection 254 #'s 2, 3.N, 4, and 14 and my counters herein to the disputed EIR's "Responses" and "Master Responses" thereto. See, eg, how the US Supreme Court has addressed in objectors' favor these surface owner versus underground miner disputes in cases I address here in my DEIR Objection 254 #3.N (as well as in my #'s 4 and 14), such as ***Keystone Bituminous Coal Ass'n v. DeBeneditis,*** 480 U.S. 470 (1987)(rejecting "taking claims by miners as to laws protecting surface owners' property rights to lateral and subjacent support, including by groundwater, to prevent subsidence and loss of groundwater support), where surface owners were allowed to require underground miners to preserve their surface rights of subjacent and lateral support (and protect against subsidence, which includes leaving groundwater support) by leaving 50% of the coal to support the surface. *Accord*, ***Smith v. County of LA*** (1986), 214 Cal. App. 3d 266 (essential county road repairs created landslide conditions destroying local homes, triggering nuisance, inverse condemnation, and other claims, both for damages for diminution in the value of real property and for annoyance, inconvenience, and discomfort, including mental distress as part of the loss of quiet enjoyment rights as a property owner.) **As noted herein, the admitted lack of currently available financial resources by the miner to perform its EIR safety, mitigation, and other obligations (see Exhibit B and DEIR Objection 255, addressing discussed Rise admissions in SEC filings and in the DEIR (e.g., at 6-14) is not just a CEQA impact problem, but it enables us victims to take proactive defensive mitigation actions on our own at the expense of the miner (and, depending on the facts, the County).**

The same principles apply to what law reforms locals here can require. Given the admitted, fragile financial condition of the miner (eg, Exhibit B) and the environmental impacts of suspending safety and mitigation efforts (an issues ignored by the EIR/DEIR as too "speculative"), that issue is essential for CEQA consideration, even if only as rebuttal to errors, omission, and worse in the DEIR/EIR. While such new local victim legal protections would have impacts on the EIR mining, it is essential to remember that this is more than about how the miner uses the property it owns. This is about us surface owners and users protecting our own property and groundwater rights we own at least down 200 feet above the underground mine that has been closed and flooded since 1956, as admitted by Rise in its SEC 10K. See Exhibit B and DEIR Objections 254 #2. If the County approves anything that harms our surface owners' property rights for the benefit of this disputed mine, such as the EIR/DEIR plan to deplete 10% of our owned well water before the (illusory) mitigation replacement kicks in on the small portion of the total existing and future wells so impacted recognized by the EIR/DEIR for mitigation), that is certain to trigger law reforms and claims for Fifth Amendment and California Constitutional taking, inverse condemnation, nuisance, trespass, conversion, and other claims. See, e.g., *Varjabedian*; ***Vaquero Energy, Inc. v. County of Kern*** (2019), 42 Cal. App, 5th 312, allowing surface owner legal protections against underground oil and gas miners.

While the EIR/DEIR constantly misuses in disputed ways the concept of mitigation to purport to cure objectionable environmental impacts, typically without any "good faith reasoned analysis" with "common sense" about the adequacy/sufficiency, feasibility, or likelihood of being able timely to accomplish such asserted mitigation. See Exhibit B evidencing admissions from the Rise SEC filings to question feasibility. Not only do those disputed EIR/DEIR mitigation claims fail to comply with CEQA and other applicable law (see sections I.C, D and E), but those failures trigger a right by us victims to undertake our own mitigations to minimize our damages for our such nuisance, inverse condemnation, and other claims as discussed in *Varjabedian.* My such DEIR Objection #4.A include an example of our such local victim mitigation (Comment to Ind. 254-58) that is ignored in the disputed EIR Response, which involves us surface owners competing for our owned groundwater with deeper and new wells and watering systems and charging the mine and County for that mitigation cost as allowed by many controlling court decisions. See, e.g., ***Ahlers v. County of LA*** (1965), 62 Cal.2d 250 (road construction caused landslides, entitling the threatened property owners to recover, among other things, the mitigation costs of constructing 25 shear pin caissons to hold back the landslide); ***Shefft v. County of LA*** (1970)(3 Cal. App.3d 720, 741-42 (when water diversion from subdivision and road construction caused damages the victims were entitled to recover the costs of protecting their property with mitigation infrastructure.)

As to my DEIR Objection 254 #4.A (what the EIR labelled as Ind. 254-54 to 60) I note that I apply court precedents to the facts of this disputed EIR/DEIR in important ways that are totally ignored without any "good faith reasoned analysis" or "common sense" in those disputed EIR Response. While I suppose the EIR evaded my many #4.A issues to avoid drawing the County decisionmakers' attention to such important legal problems for the mine and for the County, if it approves the EIR, I urge those County decision makers to consider those legal objections and claims now, because approval means challenges on those same bases among many others. Among the many flaws in the County Economic Report (see my Exhibit A and my DEIR Objection 255 rebuttals), the County should consider its own exposures for enabling this mine by approving this flawed EIR. E.g., ***Uniwill v. City of LA*** (2004), 124 Cal. App. 4th 537 (both the private party and the approving government can be jointly liable in inverse condemnation). See generally ***Varjabedian v. Madera*** (1977), 20 Cal. 3d 285 (explaining inverse condemnation and nuisance rights of homeowners downwind of the new sewer treatment plant).

For example, please read my EIR ignored analysis of ***County of San Diego v Bressi*** (1986), 184 Cal. App. 3d 112, where an aviation easement was imposed on homes at the end of a runway with approved authority for hugely abusive (although unlikely) uses (eg, not only jumbo jets but also "any other contrivance yet to be invented for flight in space"), the court rejected the defense claim to limit liability to the current use burden of small planes. The Court ruled that "just compensation" for such taking is based on what the owner/victim has lost, rather than on what the taker gained, and that the jury must "once and for all fix the damages, present and prospective, [and the jury] must consider the most injurious us of the property reasonably possible … consider[ing] the entire range of used permitted…", which there included jumbo jets and space craft. See also ***Coachella Valley Water District v. Western Allied Properties*** (1987), 190 Cal. App. 3d 969 (refusing to limit the "before condition" valuation to the government' desired plan and allowing the jury to consider the value of the victim's property without being limited to the defendant's idea of solutions or consequences of doing things the defendant's way.) The more abusive impacts we surface owners and users have to endure from the EIR on such a theoretical, "worst case" basis for 80 years (e.g., 24/7/365 dewatering, groundwater and

[existing and future] well depletion, vegetation loss and fire risk from dryness, hexavalent chromium and other toxic water and air pollution, and all the other nuisances, risks, and harms to which I have objected (or incorporated from others' objections) that depress victim property values (and inflict pain and suffering on us), the higher the victim compensation must be. In this case, many victims could be seeking to recover the pre-mine value of their homes plus other damages.

UU. Objection To EIR Response (at 2-6018) To My Comment Ind. 254-61 to 63 (marked by the EIR starting at 2-5949) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "#4.There Is No Net Benefit To Justify Approving This Mine Or Its DEIR, Especially Where One Gives Appropriate Weight To the Objections Of The Burdened And Harmed Locals At Risk Of Worse;" And "B. Some Other Ways To Illustrate And Calculate Examples Of The Many Risks, Burdens, And Detriments That Reduce Any Alleged Mine Benefits."

CONSIDER CLOSELY THIS ADDITIONAL EXAMPLE OF SUCH EIR LACK OF "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE" AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY three PAGE DEIR OBJECTION 254 #4.B, TO (2) HOW THE DISPUTED EIR (AT 2-5949) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN thirds AND THEN SUCCESSIVELY IGNORED EACH FRAGMENTED PART (as well as cross-references and incorporations, especially to my overlapping previous subsections) WHEN ADDRESSING THE OTHER PARTS AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-61 to 63" (and my other cross-referenced and incorporated objections) PRESENTED A FLAWED SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254-4.B (and my other cross-references), THE EIR FRAGMENTS/CUTS ITS "RESPONSE TO COMMENT TO IND. 254-61 to 63," INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW [THE DEIR] IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR OBJECTIONS ARE SUFFICIENT, AS I HAVE REPEATEDLY EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER PARTS OF MY DEIR OBJECTION 254 #4.B (and my related objections) THAT THE EIR CUT OFF (and in other cross-references and incorporations the EIR ignores.) THUS, INSTEAD OF ADDRESSING MY three PAGES OF EXAMPLES (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLITS MY ANNOTATED EIR OBJECTIONS AND COMMENTS FROM MY DETAILED REBUTTALS OF THOSE OTHER PARTS (and cross-reference and incorporations), SO THAT THE EIR COULD ASSERT A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

IN RESPONDING TO EACH SUCH EIR FRAGMENT/"CUT" OF MY DEIR OBJECTION 254 #4.B SECTION ABOVE TO REBUT THOSE PREVIOUS, DISPUTED

EIR/DEIR PARTIAL "RESPONSES," I AM NOW SHIFTING TO A COMBINED OBJECTION TO MY WHOLE INTEGRATED SECTION THE WAY I WROTE THE OBJECTION. AT THIS STAGE IN MY OBJECTION, I SHOULD HAVE PROVEN MY POINT ABOUT THIS IMPROPER EIR TACTIC. IT IS MORE EFFICIENT NOW TO IGNORE THE EIR'S ARTIFICIAL FRAGMENT SEPARATIONS OF MY INTEGRATED OBJECTIONS. HOWEVER, ANYONE CAN STILL SEE THAT THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. EVEN WORSE, SINCE THE EIR REFUSES TO RESPOND MEANINGFULLY ON THE MERITS (I.E., WITH A "GOOD FAITH REASONED ANALYSIS" AND "COMMON SENSE") TO ANYTHING THAT THE EIR INCORRECTLY CONSIDERS OUTSIDE OF THE SCOPE OF CEQA, HOW CAN THE EIR/DEIR ITSELF ADMITTEDLY COMMENT OUTSIDE CEQA (I.E., SUCH AS IN A DISPUTED EIR SECTION CALLED "NON-CEQA RELATED ANALYSIS"), WHILE DENYING ME THE RIGHT In My Cross-Referenced DEIR Objection 254 #3.N TO REBUT ITS "NON-CEQA RELATED ANALYSIS" ON THE MERITS.

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, these disputed EIR Responses incorrectly keep claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and NONCOMPLIANCE based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since these EIR parts at issue are becoming even vaguer than before about what they are disputing, my general rejections now can match the disputed EIR in generality. Thus, as to the part of my DEIR Objection 254 #4.B (what the EIR labelled as Ind. 254-61), I cite to my objection herein to what the disputed EIR cited as its disputed EIR "Response" as to what it simply labels as property value trashing, air quality, traffic, noise, vibration, subsidence, hexavalent chromium, climate change, and water supply. Then the disputed EIR just refers to its disputed Master Responses 1, 14, 15, 16, and 29, none of which is either a "good faith reasoned analysis" with "common sense," or fully responsive or compliant. As to the part of my DEIR Objection 254 #4.B (what the EIR labelled as Ind. 254-62), I cite to my objection herein to what the disputed EIR cited as its disputed EIR response as to what it simply labels as my desire for more desirable land use and the need to consider a broader groundwater impact zone. Then the disputed EIR just refers to its disputed Master Responses 2 and its unsubstantiated and erroneous claim that my objections can be ignored as "speculative" under CEQA Guideline 15384, none of which presents a good faith reasoned analysis with common sense or is fully responsive or compliant. As to the part of my DEIR Objection 254 #4.B (what the EIR labelled as Ind. 254-63), I cite to my objection herein to what the disputed EIR cited as its disputed EIR Response as to what it simply labels as my concerns regarding air quality and impacts on tourism and business. Then the EIR just refers to its disputed Master Responses 2 and its unsubstantiated and erroneous claim that my objections can be ignored as "speculative" under CEQA Guideline 15384, none of which is a good faith reasoned analysis with common sense or fully responsive or compliant.

For an example of such EIR "bait and switch" and "hide the ball tactics," my traffic complaint was not just about congestion, but rather upon the fact that 50 to 100 heavy mine trucks using Brunswick and other main routes 24/7/365 for 80 years (which were not designed or constructed for that kind of abuse) will constantly break down those key road arteries and will require constant maintenance. However, there is no assurance on any reimbursement from the mine for that extraordinary road expense (not to mention the delays when one lane is constantly closed for repairs) as to which the DEIR/EIR merely proposes vaguely to discuss future compensation knowing from its lack of current resources admitted in Rise's SEC filings and elsewhere that the miner cannot afford fair reimbursement in any case. See Exhibit B and DEIR Objection 254 #2. Even worse, the EIR ignores my detailed objection to the EIR refusing to address the environmental impacts of the most likely case "bad ending" for the mine whenever (after approval and initial work) it ceases operation for any reason, whether because its already insufficient current working capital is exhausted, or because objectors' law reforms (eg, restricting such exploitive business operations to 12 hour normal five day schedules, which the DEIR (at 6-14) admits would make the mine economically infeasible) or defensive litigation stops the EIR mining project, or they don't find sufficient gold compared to their costs, or other reasons why the EIR and related obligations cannot be performed or their objectives achieved (and objectors prevent any waivers or evasions by appropriate political and litigation means.) As I pointed out in DEIR Objection 254 #4.B, there are many reasons why there are more than 40,000 closed and abandoned mines in California on the EPA list. In my substantial experience this EIR mine is at such risk and admittedly has little margin to survive any mine error, Act of God, or other negative event.

Also, misstated and understated in the EIR on this subject is my focus on the zero sum game where our fragile local environment has a limit to how much negative environmental impacts can be tolerated in the aggregate (for simple math, call that aggregate limit on harm to be 100 (e.g., for air pollution, water pollution, etc.) Call the existing business and residential impacts are already 70. Then if the EIR additions are allowed to add to that misery burden (call it 20 for compromise illustration, although we contend the actual mine burdens/harms are much more than that), leaving only 10 for growth from existing people and businesses and for new additions. Does our community want this no net benefit, exploitive mine to crowd out our opportunities for beneficial growth from existing sources and more desirable new people and businesses? No, but that is inevitable if this mine is approved. Moreover, once this undesirable, polluting and exploitive mining is allowed, that will be a magnet to attract dirtier, polluting and otherwise undesirable businesses here, as my DEIR Objection 254 #4 offered to prove happened when Chevron was allowed to operate in Richmond and Valero was allowed to operate in Benicia. Also, on bad air days created by such polluters, residents lose their right to burn leaves or use wood stoves, because the polluters exhausted the local capacity to endure total pollution. Also, any comparison will also reveal what topics this response ignores, including much of what I objected to in the previous subsection dealing with my DEIR Objection 254 #4.A, as well my cross reference to almost all the100 other substantive objections stated by local potential victims at the March 24, 2022, hearing.

VV. Objection To EIR Response (at 2-6019) To My Comment Ind. 254-64 to 65 (marked by the EIR starting at 2-5951) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "4. There Is No Net Benefit To Justify Approving This Mine Or Its DEIR, Especially Where One Gives Appropriate

Weight To the Objections Of The Burdened And Harmed Locals At Risk Of Worse;" And 4.C "Why Imagined Mine Benefits Are Less Than Alleged In The Disputed DEIR Or Illusory."

CONSIDER CLOSELY THIS ADDITIONAL EXAMPLE OF SUCH EIR LACK OF "GOOD FAITH REASONED ANALYSIS" AND "COMMON SENSE" AND EIR EVASION OF MY OBJECTIONS BY COMPARING (1) MY three PAGE OBJECTION 254 #4.C TO (2) HOW THE DISPUTED EIR (AT 2-5951) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN half AND THEN SUCCESSIVELY IGNORED EACH FRAGMENT PART (as well as cross-references and incorporations, especially to my overlapping previous subsections) WHEN ADDRESSING THE OTHER PART AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-64 to 65" (and my other cross-referenced and incorporated objections) PRESENTED A NONCOMPLIANT, DISPUTED, AND INSUFFICIENT SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING ADMISSIONS AND DEFICIENT MITIGATIONS). BUT THEN, IGNORING THE REST OF MY OBJECTION 254-4.C (and my other cross-references), THE EIR CUTS ITS "RESPONSE TO COMMENT TO IND. 254-64 to 65," INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW [THE DEIR] IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR OBJECTIONS ARE SUFFICIENT, AS I HAVE REPEATEDLY EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER PARTS OF MY DEIR OBJECTION 254 #4 (and my related objections) THAT THE EIR SEGREGATED/CUT OFF (and in other cross-references and incorporations the EIR ignores.) THUS, INSTEAD OF ADDRESSING MY three PAGES OF EXAMPLES (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTIONS THAT THEY ARE, THE DISPUTED EIR SPLITS MY ANNOTATED EIR OBJECTIONS AND COMMENTS FROM MY DETAILED REBUTTALS OF THOSE OTHER FRAGMENTED PARTS (and cross-reference and incorporations), SO THAT THE EIR COULD ASSERT A NONCOMPIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

IN RESPONDING TO EACH SUCH EIR "CUT" OF MY OBJECTION 254 #4.C SECTIONS ABOVE TO REBUT THOSE PREVIOUS, DISPUTED EIR/DEIR PARTIAL "RESPONSES," I AM NOW SHIFTING TO A COMBINED OBJECTION TO MY WHOLE INTEGRATED SECTION THE WAY I WROTE THE OBJECTION. AT THIS STAGE IN MY OBJECTION, I SHOULD HAVE PROVEN MY POINT ABOUT THIS IMPROPER EIR TACTIC. IT IS MORE EFFICIENT NOW TO IGNORE THE EIR'S ARTIFICIAL SEPARATIONS OF MY INTEGRATED OBJECTIONS. HOWEVER, ANYONE CAN STILL SEE THAT THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. EVEN WORSE, SINCE THE EIR REFUSES TO RESPOND MEANINGFULLY ON THE MERITS (IE, WITH A "GOOD FAITH REASONED ANALYSIS" WITH COMMON SENSE) TO ANYTHING THAT THE EIR INCORRECTLY CONSIDERS OUTSIDE OF THE SCOPE OF CEQA, HOW CAN THE

EIR/DEIR ITSELF ADMITTEDLY COMMENT OUTSIDE CEQA (I.E., SUCH AS IN A DISPUTED EIR SECTION CALLED "NON-CEQA RELATED ANALYSIS," WHILE DENYING ME THE RIGHT In My Cross-Referenced DEIR Objection 254 #3.N, FOR EXAMPLE, TO REBUT ITS "NON-CEQA RELATED ANALYSIS" ON THE MERITS?

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Responses, these disputed EIR "Responses" incorrectly keep claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR (or Rise's SEC filings-Exhibit B) that, like most inconvenient truths, the EIR/DEIR wrongly ignores or evades. See my section I.C and D and *Richmond v. Chevron* (in which the objectors prevailed using applicant's SEC filing and other admissions). For the record, since these EIR fragmented parts at issue are becoming even vaguer than before about what they are disputing, my general rejections now can match the disputed EIR in generality.

Thus, as to the fragmented part of my DEIR Objection 254 #4.C (what the EIR labelled as Ind. 254-64), I cite to my objection herein to what the disputed EIR cited as its Master Response 2 about depressing property values and negative impacts outweighing local mine employment. (Note my actual objection was that the comprehensive impacts of the mine would cost us more local jobs than we would gain and have a net negative economic effect, as discussed in Exhibit A [rebutting the County Economic Report for accepting the DEIR/EIR without independent analysis of key errors and worse] and elsewhere.) The disputed EIR also resisted with a cite to disputed Master Response 4 my objection to treating the Centennial site as a separate project, which EIR's legally incorrect claim I have rebutted again (e.g., section I.B above). Likewise, the disputed EIR "Response" labelled as Ind. 254-65 misstates my concern that "the County will not enforce the Mitigation and Monitoring Plan" and citing to the disputed EIR Master Response–Operator Responsibility, which I have sufficiently rebutted in my objections herein and in DEIR Objection 254. However, my actual objection was more sophisticated in defense of my local community above and around the 2585-acre underground mine, because law reform and legal enforcement remedies by victims (and political counters advocated by victims) will occur until the mining menace stops. See DEIR Objection 254 #'s 4 and 2.

The EIR mining is irreconcilable with our present quality of life that we insist be maintained (or regained, if the mining starts). The government enforcement question includes the need for maximum enforcement, including comprehensive and full transparency as to the evidence from enhanced monitoring and expanded public records access (a key law reform that would be added to objectors' agenda). We hope to avoid political embarrassment of any official mine supporter for "I told you so" situations, but, since there can be no tolerance for this menace to continue a day longer than necessary, my hope is that comprehensive objection rebuttals will persuade decisionmakers to protect us locals at risk from the EIR miner being allowed any unmonitored dangerous activities, excuses, or evasions while the court challenges are processed. Because the courts move slowly and elections are periodic (even with recalls), the key enforcement issues are about speedy accountability for strict enforcement of the law (now and as reformed) versus tolerance or forgiveness of mining noncompliance, which no objector can afford to tolerate or forgive. In my experience with the mining industry, miners too often have an

unfortunate preference for the old saying about "it is smarter to ask for forgiveness than for permission," but us victims need, as soon as possible, to stop such negative EIR impacts on our environment, our homes and property values, and our community way of life as soon as practical.

WW. Objection To EIR Response (at 2-6019) To My Comment Ind. 254-66 to 70 (marked by the EIR starting at 2-5954) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.A An Introductory Overview Illustrating Some of the Many Water Related Objections To the DEIR That Evade The Real Burdens, Risks, And Harms In Our 'New Normal' By Pretending the Past Is A Reliable Guide To the Future (See my #3.M)"

CONSIDER CLOSELY THIS ADDITIONAL EXAMPLE OF SUCH EIR LACK OF "GOOD FAITH REASONED ANALYSIS" WITH "COMMON SENSE" AND EIR'S EVASION OF MY OBJECTIONS BY COMPARING (1) MY seven PAGE DEIR OBJECTION 254 #5.A, TO (2) HOW THE DISPUTED EIR (AT 2-5954) DISAGGREGATED/CHOPPED THAT UNIFIED OBJECTION IN fifths AND THEN SUCCESSIVELY IGNORED EACH PART (as well as cross-references and incorporations, especially to my overlapping previous subsections) WHEN ADDRESSING THE OTHER FRAGMENTED PART AS DEFICIENT. SPECIFICALLY, THAT DISPUTED EIR "RESPONSE TO COMMENT IND. 254-66 to 70" (and my other cross-referenced and incorporated objections) PRESENTED A FLAWED, INCOMPLETE, AND NONCOMPLIANT SUMMARY OF MY ANNOTATED COMMENTS TO SEVERAL DISPUTED DEIR OPINIONS THAT OFTEN DO NOT QUALIFY AS FACTS COMPLIANT WITH CEQA (INCLUDING DEFICIENT ADMISSIONS AND MITIGATIONS). THEN, IGNORING THE REST OF MY DEIR OBJECTION 254-5.A (and my other cross-references), THE EIR DISAGGREGATES/CUTS ITS "RESPONSE TO COMMENT TO IND. 254-66 to 70," INCORRECTLY COMPLAINING THAT I DO "NOT EXPLAIN HOW [THE DEIR] IS INADEQUATE." FIRST, THAT IS INCORRECT, BECAUSE EVEN MY ANNOTATIONS TO SUCH DEIR OBJECTIONS ARE SUFFICIENT, AS I HAVE REPEATEDLY EXPLAINED HEREIN. SECOND, THOSE DETAILS ARE LISTED IN THE OTHER FRAGMENTED PARTS OF MY #5 (and my related objections) THAT THE EIR CUT OFF (and in other cross-references and incorporations the EIR ignores.) THUS, INSTEAD OF ADDRESSING MY seven PAGES OF EXAMPLES (with my specified cross-reference and incorporations) AS THE INTEGRATED WHOLE OBJECTION THAT IT IS, THE DISPUTED EIR SPLITS MY

ANNOTATED EIR OBJECTIONS INTO FRAGMENTS AND COMMENTS FROM MY DETAILED REBUTTALS FROM ALL THOSE OTHER PARTS (and cross-reference and incorporations), SO THAT THE EIR COULD ASSERT A NONCOMPLIANT EXCUSE TO EVADE MY MERITORIOUS OBJECTIONS.

IN RESPONDING TO EACH SUCH EIR "CUT" OF MY DEIR OBJECTION 254 #5.A SECTIONS ABOVE TO REBUT THOSE PREVIOUS, DISPUTED EIR/DEIR PARTIAL "RESPONSES" TO SUCH FRAGMENTS, I AM NOW SHIFTING TO A COMBINED OBJECTION TO MY WHOLE INTEGRATED SECTION THE WAY I WROTE THE OBJECTION. AT THIS STAGE IN MY OBJECTION, I SHOULD HAVE PROVEN MY POINT ABOUT THIS IMPROPER EIR TACTIC. IT IS MORE EFFICIENT NOW TO IGNORE THE EIR'S ARTIFICIAL SEPARATIONS OF MY INTEGRATED OBJECTIONS. HOWEVER, ANYONE CAN STILL SEE THAT THIS IS ANOTHER EXAMPLE OF WHAT I CALL BOTH "HIDING THE BALL" AND "BAIT AND SWITCH," AND THIS HAPPENS SCORES OF TIMES THROUGHOUT THE DISPUTED EIR, DEPENDING ON HOW YOU COUNT THEIR REPETITIONS. EVEN WORSE, SINCE THE EIR REFUSES TO RESPOND MEANINGFULLY ON THE MERITS (IE, WITH A "GOOD FAITH REASONED ANALYSIS" WITH COMMON SENSE) TO ANYTHING THAT THE EIR INCORRECTLY CONSIDERS OUTSIDE OF THE SCOPE OF CEQA, HOW CAN THE EIR/DEIR ITSELF ADMITTEDLY COMMENT OUTSIDE CEQA (I.E., SUCH AS IN A DISPUTED EIR SECTION CALLED "NON-CEQA RELATED ANALYSIS," WHILE DENYING ME THE RIGHT In My Cross-Referenced DEIR Objection 254 #3.N, FOR EXAMPLE, TO REBUT ITS "NON-CEQA RELATED ANALYSIS" ON THE MERITS?

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Responses, these disputed EIR "Responses" incorrectly keep claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since these EIR fragmented parts now at issue are becoming even vaguer than before about what they are disputing, my general rejections now can match the disputed EIR in generality. Thus, as to the part of my DEIR Objection 254 #5.A (EIR labelled as Ind. 254-66), I cite to my objection herein to what the disputed EIR cited as to groundwater "recharge" problems suffered throughout the entire mineral rights boundary, which is addressed in my objections to its cited (and disputed by me) Master Responses 14, 15, 16, and 17, and as to my hexavalent chromium objection as to EIR Response to Comment Ind. 254-1. As to the part of my DEIR Objection 254 #5.A (what the EIR labelled as Ind. 254-67, 68, 69, and 70), I cite to my objection herein to what the disputed EIR cited as to disputed Master Responses 2, 7, and 29, which I have rebutted, as well to my rebuttals regarding subsidence and recharge issues and the infeasibility and worse of disputed EIR mitigation claims (e.g., Keystone, sections I.F.8 and 9 as well as other examples in I.E. and F). [While the EIR also tries to defend against my citing to the Sustainable Groundwater Management Act by noting that it currently applies only to recognized groundwater "basins" which are not present here, as usual the EIR chooses to miss the point. I contest the application of disputed EIR/DEIR studies as likewise inapplicable, but some principles apply with useful analogies to "SGMA."

In any case, to oversimplify for this moment, when you put a hole in the bottom or side of a bucket of water, it will drain out whether there are rocks in the bucket like the EIR/DEIR's referenced "fractured bedrock" {note the word "fractured"} or if it is simply containing water or water in mud. See *Gray* on "common sense." In any case, as my DEIR Objection 254 repeatedly demonstrated (and I have also shown herein), the whole disputed EIR/DEIR "recharge" theory depends on the bogus setting of the "current" baseline from "current" average rainfall between 1967 and 2017 before the impacts of climate change and dryness/drought created a "new normal" that makes that history obsolete in predicting the future. (Note the lack of "good faith reasoned analysis" and "common sense" on these issues is irrefutably evidenced by the EIR cherry picking that **noncurrent** period that cuts off before the drought years after 2017 until now and mislabeling that earlier pre-climate change time as "current" for that baseline.] See section I.C and D above, including the climate change impact inclusions in the 2018 Guidelines Amendments Explanation. Likewise, my other objections above and in corresponding cross-referenced to my DEIR Objection 254 should overcome the disputed EIR/DEIR's allegations about what it briefly and vaguely lists as to subsidence, recharge, hydrology, property values, etc.

I will not repeat all the things I said in my #5.A objection that are improperly so ignored, misstated, or evaded by the EIR. However, I reaffirm my earlier objections herein and to earlier section of my DEIR Objection 254 cross-referenced this section 5 for more comprehensive details and more intensive analysis. Therefore, that section is where a serious reader may wish to begin to address my many groundwater concerns, which also point the way to more intense and comprehensive related concerns. See, e.g., sections I.C.2 and D, E and F; DEIR Objections #3.D, E, F, M, N, 5, 6, and 7.

XX. Objection To EIR Response (at 2-6019) To My Comment Ind. 254-71 (marked by the EIR starting at 2-5960) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.B Admitted DEIR Water Data Conceals Massive Unaddressed Issues, Errors, And Omissions, And the DEIR Fails To Reveal The Underlying Assumptions And Artificial Limitations On Which the DEIR Bases Many Flawed Conclusions, Contentions, And Assumptions We Locals Dispute."

This nonresponsive and disputed "Response" complains (i) that I am just repeating objections the EIR claims were disposed of in the EIR's disputed "Responses To comments Ind. 254-17, 18, and 19," and (ii) about my meritorious complaints that the EIR has mischaracterized (i.e., as about the DEIR being "deliberately organized to be difficult to comprehend"). These section 5 objections of mine were ignored by the EIR because such objections allegedly were not

adequately explained. Without expending too much energy or space on that erroneous EIR claim, allow me to use an example from this dispute as another illustration of why the EIR/DEIR fails to provide the "good faith reasoned analysis" with "common sense" as required by CEQA (see my DEIR Objection 254 #'s 3.N, 4, and 14, as well as my objections herein defending against such disputed EIR "responses" thereto, by my so citing to controlling CEQA interpretations in *Gray, Banning, Vineyards, and Costa Mesa and in sections I.C and D above*). Note also that my such objections were often more detailed, explanatory, and compliant, than the disputed DEIR/EIR statement to which I was objecting, so that, if my objection was deficient, it was because the DEIR/EIR comment which I was disputing was even more insufficient. The primary CEQA burdens of proof and compliance are on the miner, not the victims like me, to provide a "good faith reasoned analysis" with "common sense." See sections I.C and D, *Gray, Banning, Vineyard, and Costa Mesa,* and my DEIR Objection 254 #'s 3.N, 4, and 14. Victims like me can defeat the disputed EIR/DEIR merely by demonstrating that such errors, omissions, and noncompliance therein.

Therefore, consider this brief and oversimplified example of the disputes to illustrate one of the various problems I cited (including as appropriate [and as the EIR/DEIR does] what I cite in my cross-references and incorporations the disputed EIR incorrectly chooses to ignore in is endless and meritless complaints about the sufficiency of my explanations of my objections. The disputed EIR's "Response To Comment Ind. 254-71" (my DEIR Objection 254 #5.B) again chooses to evade the point of both: (i) my DEIR Objection 254 #3.D that the EIR disaggregated/chopped up arbitrarily into its designated fragments Ind. 254-16, 17, 18, and 19 for its disputed "Responses" thereto, and (ii) my DEIR Objection 254 #5.B (for what I assume are disputed EIR tactical games), which the EIR only addresses its nonresponsive "Response" by reference to its disputed fragments Ind. 254-17, 18, and 19; i.e., omitting the introductory fragment the EIR labelled as Ind. 254-16. That follows many such tactical objections illustrated in so many of the aforementioned similar objections that such evasive maneuvers have to be deliberate. Consider my such DEIR Objection #3.D, entitled: "D. An Introduction To DEIR Admitted Water Data, While Also Concealing Massive Unaddressed Issues, Errors, And Omissions, and Failing To Reveal The Underlying Assumptions And Artificial Limitations On Which The DEIR Bases Many Flawed Conclusions, Contentions, And Assumptions We Dispute" (i.e., what the EIR fragments thereof call such Comment Ind.'s 16 plus 17, 18, and 19, but here this EIR Response ignores my Ind. 254-16). Even worse, when the disputed EIR fragments/cuts up my integrated objections in my unitary labelled sections matching my detailed Table of Contents into such artificial EIR fragments, the EIR then wrongly treated each such EIR designated fragment (called an EIR "Response To Comment Ind. 254- 1" et seq) as if the disputed EIR's selected cuts each had to stand on its own. In other words, somehow the EIR wrongly was refusing to consider any of my cross-references or incorporations therein which added more details to what the EIR incorrectly claimed were deficient explanations.

Please note that my objections here had to track the order of error, omission, and noncompliance in the disputed EIR (like I also had to track those in the disputed DEIR, since the EIR basically adopts the whole DEIR with supplements with significant new information, but without the badly needed corrections or reforms addressed in many objections by me and others). See Exhibit D and the Table of Incorporated by Reference Objections. That meant the introductory or earlier general sections of the disputed EIR/DEIR required my noting my corresponding objections as errors, omissions, and, worse, each time they occurred in the disputed EIR/DEIR before reaching the major substantive parts disputed later in the sprawling

EIR/DEIR, where I then again matched their somewhat more detailed (but still insufficient, noncompliant, and disputed) comments with my more detailed objections. In other words, the EIR/DEIR is responsible for the redundancy and the less detailed "coming attraction" type objections early in the documents with cross-references to my more detailed objections to the major disputed substantive topics later in the document.

Thus, my DEIR Objection 254 #3.D addressed such scattered water related errors, omission, and flaws that were apparent at that stage, even before they later cumulated in the disputed DEIR's more composite, substantive discussion that I rebutted comprehensively in my DEIR Objection 254 #5 on the collective water issues and now address again, such as in sections I.C.2 and D and I.E and F. (Likewise, the disputed EIR used the same disputed tactics as to my objections correcting many errors, omissions, and noncompliance regarding toxic hexavalent chromium earlier in the disputed DEIR before such disputes cumulated in the total omission of any discussion of the toxic [remember the movie, *Erin Brockovich*?] hexavalent chromium menace in the "Hazards And Hazardous Materials" section 7 of the DEIR [but see here what the EIR calls its "Response To Comment Ind. 254-1," where the EIR added (as significant new information which it incorrectly denies) a disputed, unsubstantiated, and insufficient addition {see also EIR Appendix Q, O, and R} regarding that hexavalent chromium menace pretending (incorrectly) that discussion was in that DEIR section 7, when there were only passing references to hexavalent chromium later, buried in other scattered sections of the DEIR). See section I.F.1 and I.E.1 above. That EIR tactic cannot excuse the EIR flaws or be blamed on me, since I was matching the disputed EIR/DEIR disputed sentence by sentence.

Also consider what the EIR designated as my Comments Ind. 254-17, 18, and 19, which are largely (but not totally) my annotated quotes from the DEIR that I used in my objections (with adequate explanations) either as damning admissions or as illustrating specific errors, omissions, and noncompliance. Here the disputed EIR just does its usual, incorrect assertion that "commenter does not explain how the DEIR's organization is inadequate (which I do sufficiently both there in #5.B and further at length in my introduction and many other cross-referenced places in this objection document). Then the EIR incorrectly claims to have disposed of my such objections by repeating by incorporation its disputed "Responses To Comments Ind. 254-17, 18, and 19," each of which I have rebutted and countered above (as well as in my Ind. 254-16 ignored by the EIR). Specifically, my applicable criticism of the disputed DEIR/EIR for this objection is explained in the opening paragraph of #5.B with cross-references that the disputed EIR wrongly ignores.

By contrast, my whole DEIR Objection #5 (not just #5.B) demonstrates how the DEIR claims and data are not just wrong (eg, errors, omissions, and other defects), but inconsistent with other DEIR claims and data, i.e., what I called comparing "apples" versus "oranges." See, eg, the first paragraph of #5.B overlooked by the disputed EIR explaining such inconsistencies and worse, which demonstrations include, for example, **contrasting the quoted data from NID (which doesn't use groundwater and only uses surface water data) with disputed DEIR quotes that focus on groundwater. Also, as to water supplies NID focuses on surface water sources and different laws than CEQA (e.g., the Water Code), while the DEIR focuses with disputed data on groundwater "recharge" and CEQA legal issues. For example, the NID data was limited to projected surface water until 2040, but CEQA requires (despite the DEIR/EIR's contrary claims) groundwater data for the full 80 years of EIR mining. For instance, groundwater deficiencies have prolonged effects and slow recharge opportunities,**

while NID surface water deficiencies can be addressed from new surface sources, different surface storage, and cutbacks on supplies to customers.

YY. Objection To EIR Response (at 2-6021) To My Comment Ind. 254-72 (marked by the EIR starting at 2-5964) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.C" entitled: "Nondisclosures, Errors, and Disputes Regarding Future Risks And Problems From New, Expanded, And Deeper Underground Mining Operations in the 2585-Acre Mine Beneath Our Local Surface Objectors."

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR "Response" incorrectly keeps claiming either that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since these EIR fragmented parts now at issue are becoming even vaguer than before about what they are disputing, my general objections now can match the disputed EIR in generality. Thus, as to the part of my DEIR Objection 254 #5.C (what the EIR labelled as Ind. 254-72), I rebut the disputed EIR's attempt to defeat my such objection by citing to EIR's Master Responses 7, 16, and 14, Response To Comment 254-1, and DEIR p. 4.8-54, each of which has been disputed effectively by my corresponding objections herein and in my DEIR Objection 254, including the cross-references and incorporations the disputed EIR wrongly ignores. For example, I cite to my objections herein as to what the disputed EIR cited as its disputed EIR response as to groundwater "recharge" problems suffered throughout the entire mineral rights boundary, which is repeatedly addressed, for example, above and in my objections to EIR's cited (and disputed by me) Master Responses 14, 15, 16, and 17, and as to my hexavalent chromium objections (see also Exhibit C) as to EIR Response to Comment Ind. 254-1.

At last, in this disputed EIR Response, unlike all the others that preceded this one, this EIR "Response to Comment Ind. 254-72" at least attempts (in its second/last paragraph) an explanation, although insufficiently substantiated, disputed, and noncompliant, to explain how new mining explosives supposedly do not "open cracks and fissures [outward in the rock factures] beyond the immediate vicinity of the blast itself," citing to blasting techniques in Appendix M at 4.2 that supposedly "cannot create the extensive cracks or fissures ostensibly envisioned by the commenter." **For example disputes, first,** note that this EIR claim is disputed on the merits, including because without any competent proof it "assumes away the problem" by

incorrectly assuming the unexamined condition of this particular fractured rock, by pure disputed speculation based on disputed assumptions, such as, for example, based on disputed extrapolations from insufficient, incomplete, unreliable, and worse assumptions and inapplicable data either from dissimilar situations incorrectly asserted to be "similar" or from disputed, incomplete/fragmented, and unreliable or worse historical mine records from before this mine closed and flooded in 1956. If this EIR expect any of us surface owners above or around the 2585-acre underground mine to tolerate this waste/depletion of our groundwater, it first needs some proof (absent in the EIR) that overcomes our "common sense" concerns that such fractured rock will leak worse when there is 24/7/365 blasting, 72 miles of new tunneling, dewatering, and mining all around it for 89 years. **Second,** my incorporations from other objectors' objections, data, and case studies, such as from Siskon Gold's North Columbia Diggins mine on the nearby San Juan Ridge (discussed below), rebut this disputed Response claim. **Third,** the insufficiently substantiated EIR theory is contrary to "common sense," such as for instance, oversimplifying for this moment, when you blast a hole in the bottom or side of a bucket of water (from either side), water will drain out, whether there are rocks in the bucket like fractured bedrock {note the key word "fractured" the EIR keeps ignoring} or whether it is simply containing water.

Also, there is no "good faith reasoned analysis" or proof that the disputed EIR "model" applies accurately, reliably, or completely (and with *Gray* "common sense") to the other areas often ignored by the disputed EIR. As demonstrated in that Union article on 12/15/22 Rise is gambling (and forcing us local potential victims to gamble involuntarily) on the unknown and unevaluated physical conditions of the mine that will not be known apparently until after the long flooded mine is dewatered (a huge separate environmental impact problem with noncompliant and objectionable deferrals), relying only on such deficient, pre-1956 mine closure and flooding documents, whose validity, reliability, completeness, and current relevance and accuracy are in dispute here, along with alleged and disputed "comparable" studies of other purported "similar" situations elsewhere that objectors contend are neither comparable nor similar. **The relevant comparable, however, is the example discussed in the Union story in 1995 at the North Columbia Diggins on the San Juan Ridge when Siskon Gold operations ruined many wells by breaching a water bearing fault-line. Furthermore, as the Union article also stated, over 100 well monitoring sites were required in 1996 by the County conditional use permit "to dewater the mine for exploration," in contrast to the EIR and DEIR ignoring that same risk and proposing fewer and misplaced monitoring wells, which impacts and risks are now different and larger because of changes over time and climate change, not to mention the deficiently studies effects of new 24/7/365 blasting, tunneling, dewatering, and mining for 80 years. See also the Union discussion of comments by hydrology expert Sol Henson.**

In any case, as my DEIR Objection 254 repeatedly demonstrated (and I have also shown above herein) the whole disputed EIR recharge theory depends on the bogus setting of the "current" baseline from "current" average rainfall between 1967 and 2017 before the impacts of climate change and dryness/drought created a "new normal" that makes such history obsolete in predicting the future (and the **lack of "good faith reasoned analysis"** with "common sense" on these issues is irrefutably evidenced by the EIR cherry picking that **noncurrent** period that cuts off before the actual, current drought years after 2017 and mislabeling that earlier time as "current" for that baseline.) For example, the disputed EIR/DEIR evades as "speculative" what I assert with sufficient substantiation my rebuttals to the disputed EIR/DEIR claims that are themselves less credible self-serving speculation or unsubstantiated opinions that fail to

discharge the EIR's burden of proof under CEQA (as distinct from what law of evidence applies to my rebuttals thereto or impeachment thereof).

Likewise, my other objections above and in corresponding cross-referenced to my Objection 254 overcome the disputed EIR/DEIR allegations about what it briefly and vaguely lists as objections as to subsidence, recharge, hydrology, property values, etc., by adding useful EIR/DEIR admitted facts such as, for example, where I note DEIR admissions (and also cite case studies from my personal experience as a competent witness) about what happens when climate change and drought cut back on NID water supplies (as has happened before in many places under such circumstances), in which case everyone who can afford to digs new or deeper wells for their groundwater, a reality that is not speculative when it's the intention of those of us living above and around the 2585-acre underground mine and likely the only long term solution to the menace of such 24/7/365 dewatering during progressive climate change dryness. See, e.g., my rebuttal to EIR Master Response 33 about the impacts on surface vegetation and sections I.C.2, E, and F above. (What is more speculative [and far less likely] is the disputed EIR/DEIR's contrary, unsubstantiated, and far less likely assumption that, unlike virtually everyone else in California facing that water shortage, our locals would abandon their property instead of drilling wells to compete with the mine for the groundwater we own.) The EIR/DEIR thus fails entirely to address the environmental impact issues created by such competing local wells that the disputed EIR/DEIR incorrectly assumes will not exist here, which does not seem to be a mistake, since the disputed EIR/DEIR also already improperly ignores many existing wells of us surface owners above and around the 2585-acre underground mine. Even the County Economic Report identifies more existing impacted wells (see Exhibit A) than does the disputed EIR/DEIR.

I will not repeat all the other things I said in the various parts of my DEIR Objection 254 #5 and in my corresponding objections herein with respect to the disputed EIR "Responses" that are improperly so ignored, misstated, or evaded. However, I note that many of my earlier objections herein and to earlier sections of my DEIR Objection 254 cross-referenced this section 5 provide more comprehensive details and more intensive analysis than the DEIR/EIR. Therefore, this section is where a serious reader may wish to begin to address my groundwater, hexavalent chromium, climate change, and other stated concerns, which also point the way to more intense and comprehensive related concerns, especially as to the EIR/DEIR's disputed claims of "mitigation." See section I.E and F, as well as I.C and D. As almost everywhere else, my DEIR Objections 254 and 255 battle the DEIR, and my EIR objections herein battle the EIR and (at least where they overlap because it erroneously assumes without analysis the compliance, correctness, and sufficiency of the DEIR/EIR) the County Economic Report—See Exhibit A). The disputed EIR/DEIR also ignores or evades entirely many of my inconvenient truths, including almost in every case by improperly failing to provide any "good faith reasoned analysis" with "common sense" as required by CEQA court authorities as to situations where it asserts noncompliant and deficient mitigation (almost always without any substantiation) or incorrectly claims my objections are too speculative or unsubstantiated, even when (as is often the case) I quote admissions by the EIR/DEIR or Rise SEC filings (see Exhibit B and *Richmond v. Chevron*, where the objectors prevailed to defeat the EIR based on such SEC filing admissions.) Likewise, in another "bait and switch" the disputed EIR/DEIR continues to insist incorrectly on predicting the future from the obsolete or nonpredictive past or what the EIR/DEIR falsely calls "current" conditions (eg, judging "current" average rain fall from the period between 1967 and 2017, excluding climate change drought years after 2017.) For instance, my DEIR Objection 254 #5.C here disputes DEIR Figure 4.8-8 "Simulated Drawdown

of Groundwater Levels Under Current Conditions," noting, among other things, that besides the new normal of climate change making the EIR/DEIR's disputed history lesson nonpredictive (see my DEIR Objection 254 # 3.M, D, E, and F) there is no proof by the EIR/DEIR that such alleged "current" conditions will remain the same for the next 80 years of 24/7/365 blasting, tunneling, mining, dewatering, etc. in new, expanded, and deeper places, whether it's 500 or 1000 tons a day that is removed.

Moreover, since there is no reliable DEIR/EIR data on how even those existing mining conditions have changed since 1956 when the mine closed and flooded, the disputed DEIR/EIR is just guessing about the current conditions of the mine at the start. That makes the EIR/DEIR's guesses about the impacts of the new mining around 72 miles of new tunneling, blasting, dewatering, and mining even more objectionable, because there is no compliant way to extrapolate from that uncertain and worse data, and to assume that such guesswork about the existing mine conditions applies equally to the new mining conditions. For example, consider the DEIR admission that there will be about 72 miles of new such tunnels, about which logic and common sense supports my disputes and this question: why can the disputed DEIR/EIR be allowed to assume that the relevant underground conditions both are uniform for such 72 miles and are consistent with what the DEIR/EIR imagines to be the disputed conditions of the existing mine (none of which have been adequately investigated, examined, or analyzed by this miner)? I presume because the EIR/DEIR prefer to preserve a mystery they can argue about than have to explain away inconvenient truths that I suspect a meaningful investigation would reveal.

I have considered and rejected the DEIR's assumptions (made by the DEIR/EIR without sufficient investigation of the actual existing and future conditions). No County decisionmakers should expect any of us surface owners above or around the 2585-acre underground mine to bet their homes, property values, health, welfare, way of community life, and more (as the DEIR/EIR, in effect, insists we do) on its such disputed assumptions, speculations, and unsubstantiated opinions, assumptions, and speculations. That would be, as the old saying goes, "heads you win, tails I lose" in the coin flip. For example, no one at risk will bet on such general "lithostatic pressure" principles cited in DEIR 4.8-51 to save us from disaster, especially where the miners will big if they get lucky and us locals (who receive no net benefit from the mine) stand to lose everything if the miners are as wrong as we contend. (Note, however, that such disputed DEIR/EIR theories are based and depend on existing, residential wells being what they call "shallow," which ignores my reasonable prediction (consistent with my own planning and experience everywhere else in California where wells go dry from climate change and drought) that the future means more and deeper wells above and around the mine, as is the right of us local surface owners to tap our own groundwater in competition with the 2585-acre underground mine below or affecting us. See also my DEIR Objection 254 #'s 3.N, 4, and 14 dealing with subsidence, which my cited, controlling court cases (e.g., *Keystone*) hold includes preserving the groundwater we need to support our surface as is without it sinking 4 or 5 feet or more as is happening elsewhere, like in Bakersfield and throughout the valley, breaking the infrastructure in the process.)

I stand on my previously stated hexavalent chromium objections and data, as well as the DEIR's failure to address this *Erin Brockovich*/ Exhibit C, EPA, and EU validated menace that is entirely ignored in DEIR chapter 4.7 where it belongs for comprehensive CEQA good faith reasoned analysis with common sense (and, which CR6 is only mentioned obscurely a few times in passing in easy to overlook places I the DEIR). See sections I.F.1 and 5 above. Note that I have applied that my data about that menace to the dewatering details I dispute at 4.8-42 to 51

and in the disputed EIR Response To Comment Ind. 254-1 (versus my objections to that and other EIR insufficient and disputed excuses to my Objections on this subject, such as to disputed and substantiated EIR claims that this indisputable carcinogen menace levels are too low to be significant, as to which EIR's disputed and unproven opinion data falsely pretends was in the DEIR when there was nothing in DEIR 4.7 and no "good faith reasoned analysis" anywhere else in the DEIR, thus exposing the EIR's "significant new information" on the subject as an attempt to evade the CEQA requirement that such new data requires the revision and recirculation of the DEIR. See section I.A,1.c. and I.C, D, and I.F.1. Such noncompliant and worse attempts by the disputed EIR to claim this significant new data is a mere "clarification" or "embellishment" of the DEIR that barely addresses hexavalent chromium at all is a legal question on which the disputed EIR position deserves no respect whatsoever.

ZZ. Objection To EIR Response (at 2-6021) To My Comment Ind. 254-73 (marked by the EIR starting at 2-5967) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "5. Even the Disputed DEIR's Own 'Hydrology And Water Quality' Admissions (eg, #4.8, and other scattered DEIR data analyzed by my #'s 3.D, E, F, and M, and D, G, and H as to the CR+6 Threats) Illustrate the DEIR's Comprehensive Errors, Omissions, And Deficiencies Regarding Supply, Depletion, 'Drawdown,' 'Recharge,' And Other Water Problems Much More Widespread And Serious That the 30 East Bennett Road Dy Wells: Some Inconvenient Truths The DEIR Ignores About the Dangerous Future 'New Normal' Of Drought And Climate Change Worsened By Underground Blasting, Tunneling, Rock Removal, And Other Mining, And Also By NID Water Waste for 24/7/365 For 80-Years." And As to "5.D" entitled: "Opportunity Costs If the Mine Is Approved And Prevents More Beneficial Community Uses of the Land, Water, And Other Resources, Including New Competing Wells And Air Quality Capacity."

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR "Response" incorrectly keeps claiming either that I have failed to explain how the DEIR is inadequate, or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since these EIR fragmented parts now at issue are becoming even vaguer than before about what they are disputing, my general rejections now can match the disputed EIR in generality. Thus, as to the part of my DEIR Objection 254 #5.D (what the EIR labelled as Ind. 254-73), I rebut the disputed EIR's attempt to defeat my such DEIR objections by citing to EIR's Master Responses 2, 14, and 16, each of which has been disputed effectively by my corresponding objections herein and in my DEIR Objection 254, including the cross-references and incorporations the disputed EIR wrongly ignores. For example, I cite to my objections herein as to what the disputed EIR cited as its disputed EIR response as to climate change (eg, groundwater "recharge") problems suffered throughout "the entire mineral rights boundary," which is repeatedly addressed, for example, above and in my objections to EIR's cited (and disputed by me) Master Responses 2, 14, 15, 16, and 17 and the whole of the parts of my DEIR

Objection 254 #5 (and cross-references and incorporations therein), which must prevail on the merits over the noncompliant EIR/DEIR's contrary positions. Id. at #'s 3.D, E, F, M, N, 5, 6, 7, and 14. Likewise, my air pollution objections (e.g., DEIR Objection 254 #3.J and 10, and my objections herein to such noncompliant EIR/DEIR's errors, omissions, and evasions such air quality impacts; e.g., section I.E.7) illustrate my general concerns that the no net benefit EIR/DEIR mining (DEIR Objection 254 #4) is exhausting our communities capacity for tolerance of water, air, and other types of pollution, in effect preventing more beneficial uses of the land and even competing with the rights of us local residents to burn logs, leaves, and debris, because such additions to local pollution now crowded out by the mine air pollution. (This is like people in the Bay Area [where I lived before I retired here] not being able to use their home fireplaces when the Chevron air pollution in Richmond or the Valero pollution in Benicia made the air too dangerous for any more added abuse.)

Without expending too much energy or space on that erroneous claim, allow me to use an example from this dispute as another illustration of why the EIR/DEIR fails to provide the "good faith reasoned analysis" with "common sense" as required by CEQA (see my DEIR Objection 254 #'s 3.N, 4, and 14, as well as my objections herein defending against such disputed EIR "responses" thereto [e.g., I.C and D, and E and F], by my so citing to controlling CEQA interpretations in ***Gray, Banning, Vineyards, and Costa Mesa***). Note also that my such objections were often more detailed than the DEIR/EIR statement to which I was objecting, so that, if my objection was deficient, it was because the DEIR/EIR comment which I was disputed was even more insufficient and noncompliant. The primary CEQA burdens of proof and compliance are on the miner, not the victims like me, to provide such a "good faith reasoned analysis" with "common sense." See my DEIR Objection 254 #'s 3.N, 4, and 14. Victims like me can defeat the disputed EIR/DEIR merely by demonstrating that such EIR/DEIR errors, omissions, and noncompliance, since the burden of proof is on the miner and its approving authority. See section I.A.1.b.

AAA. Objection To EIR Response (at 2-6021) To My Comment Ind. 254-74 (marked by the EIR starting at 2-5968) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "6. Geology, Soils, And Mineral Resources at DEIR #4.6 Again Ignores the Critical 2585-Acre Underground Mining Issues Over Which Locals Like Me Will Continue to Object."

Again, in summary, like many other disputed EIR Responses and EIR's rebutted Master Comments, this disputed EIR "Response" incorrectly keeps claiming that I have failed to explain how the DEIR is inadequate or that my objections are too speculative or unsubstantiated. My objections in this document (and in my DEIR Objections 254 and 255 and everything incorporated from other supporting evidence and legal authorities) rebut those disputed EIR/DEIR claims, often by citing the errors, omissions, and noncompliance based on specific admissions in the EIR/DEIR that, like most inconvenient truths, the EIR/DEIR ignores or evades. For the record, since these EIR fragmented parts now at issue are becoming even vaguer than before about what they are disputing, my general objections now can match the disputed EIR in generality. Thus, as to the parts of my DEIR Objection 254 #6 (what the EIR labelled as Ind. 254-74), I rebut the disputed EIR's attempt to defeat my such DEIR objections by citing to disputed EIR's Master Responses 4 (incorrectly claiming that Centennial is a separate CEQA project—See, e.g., my DEIR Objection 254 #1.D and 6), 7 (regarding what it calls the mineral

rights area, which I address as the 2585-underground mine to emphasize how it is subject to our surface owner rights down 200 feet, and, even as to those of us around that area, rights to lateral and subjacent support, including by groundwater, as explained herein and in *Keystone*), and 29 (incorrectly claiming those of us above and around the 2585-acre underground mine are safe from subsidence, as I explained in rebuttals herein and in *Keystone).* Each of those EIR/DEIR claims has been disputed effectively by my corresponding objections herein and in my DEIR Objection 254, including the cross-references and incorporations the disputed EIR wrongly ignores. Likewise, my hexavalent chromium objections (e.g., I.F.1 and Exhibit C) overcome the EIR here cited Response to Comment Ind. 254-1, as also do my DEIR Objection 254 #'s 3.A II and (a), B, C, D, E, F, G, H, J, and N, 4, 5, 6, 7, 10, and 14 to which the disputed EIR has no "good faith reasoned analysis" with "common sense" to the contrary (nor does the disputed DEIR which ignores the toxic issues with its hexavalent chromium mine shoring and air pollution except for a couple of vague passing references in the wrong places (eg, with nothing at all mentioned where required in the DEIR "Hazards And Hazardous Materials" section). See generally also my hard questions that the DEIR/EIR never answers in my DEIR Objection 254 #'s 15 and 3.E or herein, including Exhibit B regarding Rise's admissions in SEC filings (which admissions allowed objectors to defeat the eir in *Richmond v. Chevron*) and Exhibit A regarding the objections to the County Economic Report (which incorrectly assumed the truth, accuracy, and sufficiency of the incorrect data supplied by Rise, none of which considered our objections.)

For example, I cite to my objections herein as to what the disputed EIR cited as its disputed EIR response as to climate change (eg, groundwater "recharge") problems suffered throughout "the entire mineral rights boundary," which is repeatedly addressed, for example, above and in my objections to its cited (and disputed by me) EIR Master Responses 2, 4, 7, 14, 15, 16, and 17 and the whole of the parts of my such DEIR Objection 254 #3, 4, 5, 6, 7, and 14 (and cross-references and incorporations therein), which must prevail on the merits over the EIR/DEIR contrary positions. See, e.g., what I said in this #6: "for example, my [DEIR Objection 254] #'s 4, 2, 14 3.A, B, C, D, E, F, G, H, I, J, and L, such as focusing on depleting the NID and groundwater supplies, hexavalent chromium toxic cement in mine shoring, air quality concerns, financial feasibility questions, and the no net benefit nature of the mine." **Also, for example, my #6 quotes the disputed DEIR's "Conclusion" admission at 4.6-47: "Therefore, a significant impact could occur with respect to being located on a geological unit or soil that is unstable or that would become unstable as a result of the project, and potentially result in on or offsite landslide, lateral spreading, subsidence, liquefaction, or collapse, or be located on expansive soil, as defined in Table 18-1B of the UBC." My #6 then reacted by saying: "Since the disputed DEIR does not evaluate the current condition of this mine flooded since 1956 or the underground conditions where the DEIR expects new, expanded, and deeper mining work 24/7/365 for 80 years, the DEIR cannot credibly assure any of us on the surface above or around that 2585-acre underground mine of CEQA or other legal compliance." As my previous objections explained, for example, the 72 miles of new blasted tunnels, dewatering, and mining will venture into areas in which the conditions are unknown and about which the disputed EIR/DEIR only speculates by assuming that they are consistent with what the disputed EIR/DEIR likewise just assumed is the current condition of the old, flooded mine, based on partial, unreliable, and worse, historical documents before that 1956 closure.**

As repeatedly explained in my DEIR Objections 254 (eg, #2) and 255 and again herein in this #6 (what the EIR calls Comment Ind. 254-74), as admitted by Rise in its SEC filings

addressed therein and herein, including in Exhibit B hereto (validated as a type of prevailing evidence in *Richmond v. Chevron*), the disputed EIR/DEIR is too fragile and underfunded to make its mitigation and safety claims either, feasible, compliant, or credible. Not only does the DEIR fail to provide a credible and "good faith reasoned analysis" with "common sense," especially as to imagined, infeasible, and insufficient mitigations, such as in its "Impacts and Mitigation Measures" at 4.6-26 et seq, such as by ignoring climate change and other realities it ignores or dismisses as "speculation" or "unsubstantiated opinion" (which labels often apply instead to the EIR/DEIR). See sections I.C, D, and E. Even the disputed DEIR (and the ratifying EIR) admits the economic fragility of the project, not just in Rise's SEC filings (see Exhibit B) but also in DEIR 6-14, which admits that the whole project ceases to be economically feasible if it cannot operate 24/7/365 for 80 years as provided in the DEIR (now adopted in the EIR). See, e.g., Grass Valley's Agency Letter 8, disputing that timing and other noncompliance. As I explain herein (including Exhibit B), in DEIR Objection 255 (devoted to this issue) and in DEIR Objection 254 #2, objectors will exercise their political, law reform, and legal rights (e.g., by initiative) to restrict the EIR mining operations to less than 24/7/365 on the same basis as limit much more beneficial businesses (e.g., normal business hours.).

BBB. Objection To EIR Response (at 2-6022) To My Comment Ind. 254-75 (marked by the EIR starting at 2-5970) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "7. The DEIR "Hazards And Hazardous Materials" Discussion at its # 4.7 And Elsewhere Is Deficient, Omitting Entirely At Lease One Serious Hazardous Material (Hexavalent Chromium/CR+6 of *Erin Brockovich* Movie Infamy For Turning Hinkley, CA Into a Ghost Town at Great Cost to Local Victims And Property As Explained In My #'s 3.C. G, and H." See Exhibit C.

1. Introduction To the Objections to Hexavalent Chromium Air And Water Pollution Issues (see also Exhibit C).

Throughout this objection (e.g., my rebuttals to disputed EIR Response To Comment Ind. 254-1) and my DEIR Objection 254 #'s e.g., 3.A, B, C, D, E, F, G, H, J, L, and N, 5, 7, and 14 (and my objections here in section I.F.1-5 and to the disputed EIR Responses corresponding thereto) I expose both the failure of the disputed DEIR to provide any "good faith reasoned analysis" with "common sense" to the hexavalent chromium menace and the disputed EIR cover up of that reality by adding "significant new information"(although disputed, erroneous, unsubstantiated and insufficient) claiming without any credible evidence or authority that the amount of such toxin is tolerable (when it's not.) I cited to Exhibit C, EPA, and other scientific and case studies and EU and other regulations and reasons to doubt there is any safe amount, and I illustrate that in Exhibit C.

I consider these various disputed EIR statements regarding hexavalent chromium among the worst examples of many false, misleading, or worse statements in the disputed EIR (such as at the third, fourth, and fifth paragraphs of EIR Response to Comment Ind. 254-1 at 2-6003-6004), where the EIR incorrectly pretends that the DEIR had already responsively addressed my hexavalent chromium objections in my DEIR Objection 254 when it had not do so, as demonstrated herein in multiple ways. See, e.g., section I.F.1 and Exhibit C. As explained herein, the DEIR only mentioned hexavalent chromium briefly in casual passing in a few obscure places without even any attempt at a "good faith reasoned

analysis," "common sense" analysis, or anything compliant that responds to any of my objections. Even worse, those disputed EIR objectionable water pollution additions to cover what is missing from the DEIR are in conflict with EIR's own air pollution additions. See what significant new information is added, but never adequately explained or analyzed in Vol IX, Appendices Q, O, and R buried at the end of the EIR Appendices and each rebutted by me in this Objection. Such EIR's flawed Master Responses admit for the first time (i.e., never before analyzed, explained, or justified as any kind of toxin or even hazard in the DEIR, so all the [still disputed, deficient, and noncompliant EIR additions are significant new information requiring revisions and recirculation] hexavalent chromium toxic issues for air pollution purposes (at Vol. IX, Appendix R—see Q and O for water pollution), although (also as here) the EIR wrongly claims without compliant substantiation or sufficient credible evidence that the threshold for such toxic danger has not been exceeded in the case of this mine, but certainly not refuting any of my meritorious concerns. Why does this objection not trigger an amendment to the EIR/DEIR's main Hazards and Hazardous Materials section discussion, where CEQA required it to be disclosed? (Hexavalent chromium was never properly mentioned there in the DEIR 4.7 or even in good faith warnings and reasoned analysis elsewhere, such as in the obscure and seemingly innocuous brief descriptions of that toxin's use in cement paste for shoring up the underground mine.) [Compare what is stated in the disputed EIR (e.g., Response To Comment Ind. 254-1) to what is stated in the wrong section of the DEIR (at 4.8-47—48) and treated not as the dangerous toxin they knew or should have known it to be (see section I.F.1, Exhibit C, and the EPA website), but instead just treated hexavalent chromium as if it were an innocuous ingredient in the cement paste.]

In other words, the disputed DEIR failed so to comply with its CEQA disclosure obligations regarding hexavalent chromium, and rather than provide that required "good faith reasoned analysis" with "common sense" in response to my meritorious objections, the disputed EIR just tried to evade its CEQA obligations, attempting to revise and recirculate the DEIR. See section I.A.1.c above. Instead of full disclosure, now the EIR is improperly trying to add that essential missing (and still disputed and noncompliant) unsubstantiated, significant new data for the first time by the EIR, again in the wrong and noncompliant places like here (or buried on page 2-6003-04 or obscurely without linkage in Appendices Q, O, and R at the end of the EIR), instead of properly debating this toxin threat that is warned against in many EPA website studies and that killed the town of Hinkley, CA, and many of its residents as illustrated in the movie, "Erin Brockovich." See Exhibit C.

Why would the disputed EIR/DEIR gamble on being caught in this noncompliant "tactical" conduct? Apparently, it seems as if the EIR preparers figured from my DEIR objections that they should not dare risk continuing almost totally to ignore the hexavalent chromium hazard risks, threats, and harms (as my DEIR Objection 254 demonstrated they had done in the DEIR), but they nevertheless could not bring themselves to admit that they had so thoroughly omitted such CR6 threat discussions in the DEIR, since that would be admitting "new information" of "significance" being added to the EIR, about which CEQA would require both more adequate debate and evidence as well as recirculation of the EIR. See section I.A.1.c above. To so evade such compliance with CEQA and other applicable law, the disputed EIR here attempts to provide some insufficient, unsubstantiated, disputed, and incorrect information in this obscure place (Responses to Comment Ind. 254-

1 et seq; i.e., not even in a Master Response other objectors might notice), ignoring many important parts of my objections and those of others, and even the EIR's own added and inconsistent air pollution admissions obscured in Vol. IX, Appendices Q and O, as to water, and R, as to air, at the end of this very long EIR document.

Now that the disputed EIR finally for the first time deficiently begins to address the hexavalent chromium threat, although still failing to respond to my objections and cited authorities, I note that such disputed EIR comments here are unsupported by any legal or factual foundation for the EIR's disputed opinions. See Exhibit C. Also, I cited EPA and other water pollution threats that the EIR/DEIR has almost entirely ignored (except in the still deficient and unlinked Appendices Q, O, and R), even though adding its disputed CR+3 air pollution theory for the first time (i.e., such air pollution was never mentioned before in the DEIR Hazards And Hazardous Materials discussions.) Those failings are lethal to the EIR under these circumstances, especially where the DEIR's almost total noncompliance with CEQA on these lethal issues now seems more than an innocent mistake.

If, as the disputed EIR now seems to claim in its rewrite of history, these theoretical excuse claims about hexavalent chromium had any merit and were intended to be responsive, why were they not properly disclosed adequately in the DEIR (or even properly now in the EIR), so that I could have been more detailed in my DEIR objections, rather than having to reply now with my such objections to the EIR that no one who matters to me will probably have an adequate chance find, fully to read, and consider, unless and until all these disputes are litigated in court where they cannot be evaded. For example, because of all those objectionable errors, omission, and noncompliance, the disputed EIR/DEIR compounded those errors, omissions, and noncompliance as to related topics, such as the disputed EIR/DEIR's purported water cleaning treatment system that is supposed to remove all water pollutants in the dewatered groundwater flushed into the Wolf Creek. [The disputed EIR at 2-6003 argues without proper evidence or support that, in effect, there is nothing to worry about, because the EIR/DEIR dewatering will flush these toxins out of the mine to be cleaned and dumped into the Wolf Creek, apparently to become the risk and problem for NID and others downstream (as if somehow claiming that didn't matter to my EIR/DEIR objections, because my main concern was to the threat of the groundwater quality underneath the surface where I and other objectors live above and around the 2582-acre mine, despite my broader scope objections and both the Wolf Creek flowing by a half mile below my property and the consequences to my community which affect all of us and our property values (and also affected the taxes supporting our government services.]

The insufficient and disputed EIR mitigation theory (but not labelled as mitigation, because, again, the EIR does not seem to want these new and significant [but obscured and worse] hexavalent chromium comments to be recognized as a CEQA reason for further revisions and recirculation of the DEIR/EIR). See section I.A.1.c and I.F.1-5. The EIR message seems to be, in effect, don't worry because "in obtaining the Waste Discharge Requirements (WDRs) from the Regional Water Quality Control Board, the Project Applicant would ensure that the leaching of hexavalent chromium would not cause any impact and would meet regulatory standards (DEIR, p. 4.8-47-48)." (Emphasis added). However, since (as explained herein and in my four Objections) the disputed EIR overstates and incorrectly and deficiently states in this obscure place what was so disclosed

in the DEIR (see my DEIR Objection 254 #'s 3.A, B, C, E, G, H, J, 7, and 10, section I.A.1.c and I.F.1-5, above, and Exhibit C hereto), how would that regulator even know to evaluate the threat, unless they did what I did, i.e., read all the 7000 plus pages of "fine print" looking for hints of such errors, omissions, and noncompliance, because my bankruptcy experience with such miners has made me cynical? If the EIR intended to warn the government and impacted local residents, why not properly amend the DEIR/EIR in the required places for CEQA compliance (i.e., the DEIR Hazards And Hazardous Materials section 4.7) so as to ensure everyone focused on the right issues for evaluation? Why not explain the meaning and effect of Appendices Q, O, and R, rather than just burying them at the back of the EIR.

2. A New Air Pollution Dispute Is Triggered by "Significant New Information" In the Still Noncompliant EIR, But the Disputed EIR Is Still Evading the Toxic Water Pollution Threat Evaded in the DEIR.

Instead of engaging in any "good faith reasoned analysis" with "common sense" debate of my objections and others on the merits and with compliant disclosure, the disputed EIR attempts further evasion by what it admits being new air quality data on this topic (again requiring DEIR revision and recirculation for such material changes and glaring omissions, as described above in section I.A.1.c and I.F.1). T**he EIR/DEIR continues to ignore my DEIR Objection 254 almost entirely about the adverse groundwater impacts of using hexavalent chromium in the mine shoring cement paste, as well as the lack of reliable assurances that it will not pollute the Wolf Creek after being removed from the mine. See section I.F.1-6 and I.E.1-4.**

The disputed EIR also added a new reference to nitrogen dioxide (NO-2), which will be addressed elsewhere in the air quality dispute discussion. See CEQA Guidelines 15088.5. The EIR's disputed, new Health Risk Assessment (the "HRA") is buried at the back of the document in vol. IX Appendix R (e.g., a disputed one page memo from DUDEK), which states that the purpose of such memo is "to address the potential health risk associated with exposure to two additional toxic air contaminants (TACs) that were not included in the original analysis of the proposed Idaho-Maryland Project (project), namely hexavalent chromium in cement [for mine shoring in the 2585-acre underground mine below or near thousands of impacted surface residents] and nitrogen dioxide (NO-2) from the combustion of ammonium nitrate fuel oil (ANFO)." First, note that this omission was not because the DEIR did not know of the mine's use of that highly toxic hexavalent chromium, because it attached (as obscured Appendices Q and O) earlier studies Rise ordered before the DEIR, as well as discussing the use in the mine cement paste in passing in a buried back DEIR section discussing the disputed mine shoring process intended (and grossly failing) to reassure the thousands of surface residents above and around the underground mine against subsidence and other mining risks and about what groundwater treatment would accomplish for what was flushed away downstream in the Wolf Creek.

As my DEIR Objection 254 (which this disputed EIR significantly fails to debate on the merits of this topic) explained (see also section I.F.1-6 and I.E.1-4 and Exhibit C above), there are thousands of EPA website documents and concerns demonstrating water pollution health impacts requiring this to be a featured, headline "Hazards And Hazardous Materials" discussion (where it has been wrongly ignored entirely in the DEIR/EIR).

Second, because this toxin is being introduced into the groundwater below us objecting surface residents and risking at least 300 admitted existing wells (by the still insufficient count in the County Economic Report—see Exhibit A) and many more overlooked existing wells plus future wells to come as the climate change drought impacts inspire us to tap our own groundwater beneath our surface properties, this not only poisons humans and their property, but it depresses property values and, therefore, property taxes, among other economic impacts ignored in the County Economic Report (see Exhibit A hereto), which seems unaware of this hazard popularized in the movie *Erin Brockovich* about how such hexavalent chromium in the groundwater killed Hinkley, CA, and many of its residents. See www.hinkleygroundwater.com, describing their continuing struggle to remediate that groundwater after all these years. (I suggest that the County's economic analyst study what happened to property values and taxes in Hinkley, despite PG&E trying unsuccessfully, like the disputed EIR here, to convince people the levels of the toxin were tolerable and the deaths and health problems were just coincidences. However, rather than risk a jury's judgment on that issue, the polluter settled for a record amount.) Third, the disputed, new EIR air pollution cancer risk discussion is mysterious about the accuracy and correctness of how it was determined to be below the safety thresholds set by the Northern Sierra Air Quality Management District, but no analysis or mention is made of the water pollution threat (apart from the disconnected Appendices Q and O this Objection rebuts elsewhere). Therefore, because none of these material issues are properly addressed in the disputed EIR/DEIR, the EIR must be redone and recirculated for this and other reasons stated in my and other objections. See I.A.1.c, I.F.1-6, and I.E.1-4.

This example also illustrates the general credibility problem with the EIR/DEIR (and another reason why my Exhibit A exposed the County Economic Report's mistake to accept the EIR/DEIR as if it were true without proper analysis of the many meritorious objections). Any even cursory reading of my Objections or any of hundreds of other objections to the DEIR would have revealed that the EIR/DEIR data (on which that Report mistakenly relied) was materially incorrect, incomplete, insufficient, unsubstantiated, noncompliant and worse. (As the computer people say, garbage in creates garbage out.) Previously, this serious issue was not identified as a hazardous substance problem with lethal human consequences in water (as well as air, which the EIR now incorrectly and insufficiently attempts to address), but instead an unrevealing mention buried in the back where this new Appendix R cites to it in DEIR page 4.8-47. That credibility problem is now compounded by a new one, where the disputed evasion is by a technique (common in the DEIR/EIR) that is known as the "bait and switch;" i.e., the EIR briefly adds an insufficient and incorrect discussion (a single short unsubstantiated paragraph) about air pollution from hexavalent chromium to distract from the much more serious water pollution, health hazards, and related impacts. For example, and this is a key example of another "bait and switch" in the DEIR/EIR, a discussion of mitigation (eg, Appendix R cites to Mitigation Measure 4.8-2(a)) of the air pollution by hexavalent chromium is not at all satisfactory mitigation, especially as to the lethal water pollution by hexavalent chromium that is almost entirely ignored by the EIR, despite my not only discussing that lethal risk in my Objection 254, but also by my three minute comment at the public County Planning Department hearing on the DEIR in March which earned a line in the related "Nevada Union" story. See also the problem discussed above from the NSAQMD Agency Letters 12

(at 12) and 11, describing the frequent daily need for NID watering to suppress fugitive dust that is already admittedly full of asbestos and other toxins and now may add CR6.

And what is the environmental comfort to be taken even with the briefly addressed air pollution "reassurance in the disputed EIR?" Consider what EIR Appendix R says on the hexavalent chromium cancer threat after giving unsubstantiated and disputed air pollution dust estimates: "Hexavalent chromium has inhalation cancer risk and chronic reference exposure levels, but no acute non-cancer effects are associated with exposure. … Hexavalent chromium and NO-2 were evaluated in the HRA consistent with the methodologies presented in the DEIR. In summary, there would be no change in the cancer impacts with and without mitigation as shown in the disputed DEIR [which generally ignores the subject and makes this disputed statement incomprehensible, wrong, and worse.]" As to such air pollution impacts, remember our experience with asbestos, which (as I can testify as an experienced bankruptcy lawyer witness to such cases) had a similar history of prolonged evasion and bogus claims of tolerance levels until it became clear through many bankruptcies (in which I was frequently a significant bankruptcy lawyer) that there were no safe thresholds.

As to the unaddressed water pollution, watch the *Erin Brockovich* movie again, read the court files on the Hinkley, CA, suits, visit the www.hinkleygroundwater.com website, and then read the most relevant Exhibit C and EPA website study horror stories. [The disputed EIR at 2-77 describes how the dewatering process interacts with the blasting and mining underground and states: "Thus, any water that contacts those [underground] components would be present only within the [2585-acre underground] mine workings and would then be pumped out of the mine workings by the dewatering system and into the clay-lined pond for further water treatment." This ignores, for example, the problem when the mine stops operating again for many possible reasons, some not only likely, but the goal of the objections by the whole community above and around the 2585-acre underground mine. If continuous dewatering forever is essential to save us locals from the miner adding such toxic hexavalent chromium, CEQA requires such a warning, especially because as Exhibit B and Objection 255 show from Rise's admissions in its SEC filings, the mine mitigation/remediation is not economically feasible and the dewatering is vulnerable to such cessation.

Note that even if the locals aren't poisoned by the hexavalent chromium in that process, other people down the Wolf Creek may become unsuspecting victims. Recall that the hexavalent chromium that killed Hinkley, CA, and many of its people was also held for such processing in such clay lined ponds, which didn't work out well for the victims. Then read the disputed EIR's noncompliant dismissals of my and other objections as nonmaterial or irrelevant to CEQA concerns or too speculative to deserve a response. The result is not just that DEIR/EIR revisions and recirculation are essential (see section I.A.1.c), but also that the County should begin to share the community doubts about the credibility of the mine's whole EIR process. When the County Economic Report admits (see Exhibit A hereto) what most real estate brokers believe, i.e., the environmental impacts are seriously understated and causing depressed property value predictions, this (and Exhibit C) is an example of a rational and informed reason for such opinions; i.e., unlike the EIR/DEIR advocates, anyone at risk of harm from the mine has considered the hundreds of objections like mine that are filled with such objections about the errors,

omissions, and insufficiencies in the DEIR/EIR and worse things politely described as credibility problems.

I mention such credibility concerns because without timely (i.e., not improperly deferred), transparent, independent regulatory oversight of all aspects of the mining operation and disputed, proposed (and, hopefully, massively upgraded by someone with financial feasibility) mitigation, nothing in the EIR/DEIR will be credible to the potential victims like me. For example, the EIR incorrectly asserts (at 2-76) without substantiation that: "Mitigation measures are achievable, enforceable, and capable of reducing the Project's impacts." Says who? On what evidence? Not only is that disputed conclusion repeatedly proven wrong on the merits by objections, but that disputed EIR sentence must be allowed to be rebutted by the admitted facts in Rise's own SEC filings (see Exhibit B and my DEIR Objection 254 #2) that Rise lacks the financial resources to afford even the insufficient mitigation it proposes (eg, here at Mitigation Measure 4.8-2, replacement water for depleted or contaminated existing wells it undercounts and ignoring all future wells), thereby making its statement false that its mitigation is "achievable," "enforceable [by the County, not the victims who then must turn to their legal remedies, e.g., *Varjabedian*]," or "capable of reducing the Project's impacts." Note that the EIR's Master Response argues the problem is just about 30 wells around East Bennett Road, when the County Economic Report admits [see Exhibit A] there are at least 300 existing wells at risk above and around the 2585-acre underground mine, plus (other objectors contend and I contend) more impacted existing wells plus many new ones to come in reaction to climate change droughts. See, e.g., the Wells Coalition Group Letters 27/28, the CEA Objections Group Letters 6-9 and 21, the Wolf Creek Community Alliance Group Letters 29-12 and many others in my Table of Incorporated by Reference Objections.

To quote the EIR (at 2-77): "As discussed in the GMP 30 groundwater monitoring wells will be installed at 15 locations. The locations of the monitoring wells are strategically placed between the mining and domestic wells to monitor the potential drawdown extent as the result of mining and assess the potential impact on domestic wells. … Qualified hydrologists [notice they don't say independent and trustworthy, and, like most EIR/DEIR so called experts, they and their disputed evidence will be challenged in any court process that may become necessary] would evaluate the data from groundwater monitoring." There is nothing in the disputed EIR/DEIR or their process so far that inspires any confidence by us potential victims that any of this will be feasible or timely achieved as promised. See *Gray*, defeating a mine eir with similar such deficient groundwater mitigation. We local potential victims would insist, among other things, on knowing the plans in detail in advance, not later, plus having on total transparency, data collection, and analysis by reliable, independent experts, plus many more monitoring wells where they matter most now and in the future (e.g., above and around the 2585-acre underground mine where currently thousands of us surface resident objectors and (according to the County Economic Report addressed in Exhibit A) at least 300 wells exist and in the next 80 years many more wells will follow in reaction to climate change dryness), and much more discussed in this and my other Objections and those of many others. See Table of Incorporated by Reference Objections.

ONE LAST EXAMPLE OF CREDIBILITY PROBLEMS FOR THE EIR/DEIR IS THAT (AT 2-76) THEIR DELAY IN PLANNING, DISCLOSURE, AND MITIGATION UNTIL AFTER APPROVAL, AS DISTINGUISHED FROM AFTER APPROVAL AND

"AT LEAST 12 MONTHS IN ADVANCE PER MITIGATION MEASURE 4.8-2(A)." WHY THE DELAY TO SET THE BASE LEVEL FOR FUTURE DECISIONS? PERHAPS (BESIDES THE FACT THAT RISE CANNOT AFFORD TO DO MUCH OF ANYTHING ON TIME AS ADMITTED IN ITS SEC FILINGS—SEE EXHIBIT B AND MY OBJECTION 255), THEY ARE STALLING BECAUSE THE EIR ADMITS THAT: "NO GROUNDWATER LEVEL MEASUREMENTS HAVE BEEN COMPLETED SINCE 2007." But the sooner they start measuring, the sooner that they will have to confront the inconvenient truths about their historical models, preventing the miner and its advocates from ignoring key facts and climate change do not work already, and promise to become more incorrect progressively for the next 80 years, as explained in this and other objections. See section I.C and D, including the 2018 Guidelines Amendment Explanations confirming the importance of climate change for CEQA, contrary to the insistence of the disputed EIR/DEIR that denies that reality.

3. **The EIR Also Evades The Hexavalent Chromium Threat by Revealing Discussions of Its Mining Techniques in Volume IX, Appendix Q/O, That Is Damning Not Only By Its Errors, But Also By Its Material Omissions That Should Have Been Addressed In Its Section 4.7 The Hazards And Hazardous Materials Revisions (at 3-69).**

In this and other related Objections I have questioned the credibility of the EIR/DEIR for its continued errors, omission, and other noncompliance in dealing with the foregoing known, and I believe significant and irrefutable, hexavalent chromium water pollution issues. See section I.F.1-6, 8 and 9, I.E.1-6, and I.C and D above, as well as Exhibit C. This portion of my objections attempts to use what the EIR now has added further to expose those problems and to insist on EIR revisions and recirculation. See section I.A.1.c. Before getting into the more technical matters, I direct attention to certain "significant new information" additions and revisions to disputed EIR section 4.8 Hydrology And Water Quality (at 3-70-73) and the addition of the Itasca "Desktop Study of Cemented Paste Backfill" in Volume IX, Appendix Q (see also O and R). While the EIR/DEIR's greatest sins are of omission and evasion, I also focus here on what the EIR does say, because in that context it makes the EIR not only grossly deficient but also misleading or worse.

Begin by studying the purportedly insignificant EIR revisions (at 3-72) to DEIR Chapter 4.8 [Hydrology and Water Quality]in the final paragraph of Section 4.8.4 and in the related Mitigation Measure 4.8-2(a), which adds that the miner "shall implement the Groundwater Monitoring Plan (GMP) prepared by Itasca Denver, Inc (February 2021), as approved by the county. Implementation of the GMP shall be initiated prior to the dewatering of the mine and on an ongoing basis…" That GMP involves "a network of monitoring wells [that] shall be installed to the satisfaction of the Nevada County Environmental Health Department," [a deferral forbidden by CEQA] with "Groundwater level and groundwater quality information ... obtained from the project ground watering monitoring wells and collected on a quarterly basis" and submitted to that Department etc. The revised text of 4.8-1(e) states [in another deferral forbidden by CEQA] that: "The applicant shall submit a RoWD and obtain WDRs from the Central Valley RWQCB for construction of the engineered fill areas… prior to initiating any engineered fill placement activities … [with] [p]roof of coverage …provided to the Nevada County Public Works

Department." That revision adds [in another deferral forbidden by CEQA] that RWQCB "will determine the appropriate mining waste classification" for the engineered fill." "The RoWD must also include a report [in another deferral forbidden by CEQA] on the physical and chemical characteristics of the waste, in compliance with Water Code section 13260(k), that could affect its potential to cause pollution or contamination as well as a report that evaluates the potential of the discharge of the mining waste to produce over the long term, acid mine drainage, the discharge or leaching of heavy metals, or the release of other hazardous substances." [That should require disclosure of the hexavalent chromium threat as a hazardous substance, as many EPA website posted studies confirm, but there is no such warning in the EIR.] As to such prohibited deferrals and noncompliance with CERA, see section I.C and D generally, including *Richmond v. Chevron,* and section I.E.1-6 and I.F.

Continuing, that EIR states: "The applicant will prepare and implement a Waste Characterization Plan (Characterization Plan) [in another deferral forbidden by CEQA] which will be incorporated into the approved WDR." However, since the EIR is already obscuring the hexavalent chromium threat and, ignoring that impact harms, has incorrectly classified the pasted mine material as nontoxic "Group C" "benign mine waste," it is essential that such a plan be addressed now in advance of approval. See section I.C and D generally, including *Richmond v. Chevron,* and section I.E.1-6 and I.F. Why is that timing so important to us victims above and around the 2585-acre mine? It is not just that CEQA requires such matters to be disclosed and analyzed fully before EIR approval, but also because, anyone trying to sell or finance a home mortgage needs to know what he or she must disclose in that process, since we cannot refer them to the disputed EIR no one directly at risk I know trusts or believes. See my four Objections and all those in the Table of Incorporated by Reference Objections. If these many serious mine disputes have to be litigated, that should occur in one consolidated process, not in many successive dispute processes as Rise (or, if any, its successor behind the curtain in the expected "flip" on approval, considering the Rise financial condition admitted in the SEC filings addressed in Exhibit B) slowly unveils its various future operation and action plans and further governmental decisions, all of which must be done before EIR approval. See section I.C and D generally, including *Richmond v. Chevron,* and section I.E.1-6 and I.F.

Note also that, as addressed elsewhere, the proposed monitor wells and other noncompliant mitigations (including those added in EIR revised Mitigation Measure 4.8-2(c)) are focused on the East Bennett Road and wholly owned Centennial and Brunswick sites, as if hoping that will distract everyone from the bigger legal and environmental impact problems in the mine risks, threats, and harms to the thousands of us surface owners and users above and around the 2585-acre mine, since (as admitted in Rise's SEC filings—see Exhibit B and DEIR Objection 254 #2) the mine cannot hope to afford to mitigate the harms it seems to be planning to do to those surface owners like me, much less cure the problems the mine is creating for others.

Before addressing **the Itasca Appendix Q issues** in detail, please note the following among the many disputes and flaws with what the disputed EIR/DEIR is doing in its described provisions in the previous paragraph. **First,** to evade dealing with (or even properly mentioning) substantive risks, threats, and harms **now (**when required by CEQA and other applicable law), the noncompliant EIR improperly defers the substance to a **future process after the EIR is approved**, when it is too late for many purposes except to attempt to clean up the mess that will exist from starting the mining and then having the courts stop it, if the miner's

financial infeasibility, reality economics, law reforms, and political actions don't stop the mining first. See section I.C and D generally, including *Richmond v. Chevron,* and section I.E.1-6 and I.F. Also, these disputes should be consolidated for cost-efficiency and speed of final resolution, otherwise there will be multiple litigations occurring at different times as disputes become "ripe" for adjudication. **Second**, such delayed essential planning and decisions (to which I and others object) make it impractical to have a factual debate on the detailed merits, since Rise will just claim that (after disputed EIR approval and commencement of harms) they will adapt to some such future governmental or court requirements, which considering Rise's admitted lack of working capital seems unaffordable and, therefore, an empty assurance. See Id., Exhibit A and B, and DEIR Objection 254 #2. Trying to litigate standards in the abstract before such governmental actions creates many extra costs and problems, which may be why the disputed EIR is attempting to delay key details until after approval of the insufficient EIR (still full of many errors, omissions, and other noncompliance) is forbidden by CEQA and other applicable laws. See, e.g., *Richmond v. Chevron*, section I.A.1.d, I.E.1-4, and I.F. **Third,** while government is supposed to do certain such prescribed things in the future to protect us local victims (eg, monitor test well results, classify waste, etc.), nothing in the disputed EIR/DEIR fairly warns those governmental authorities of the toxic hexavalent chromium water, so they can specifically watch out for such water pollution problems that killed Hinkley, CA, and many of its residents (see "*Erin Brockovich*") and they can correct the EIR's misclassification of the mine waste, and, more importantly for the thousands living on the surface above the 2585-acre underground mine being filled with toxic hexavalent chromium cement paste (to be discussed herein), why the insufficient test wells are misplaced and not predictive of the risk to us locals. (Also relevant to the County, the supposedly treated water flushed down the Wolf Creek elsewhere, spreading any such pollution [NID customers there should be warned to investigate and beware] should be examined closely for such insufficiently disclosed hexavalent chromium impact threats.) Id.

To purport to provide some (though insufficient, incorrect, and otherwise noncompliant) significant new information on these disputed subjects (requiring revisions and recirculation, as explained in section I.A.1.c), **the disputed EIR attaches (at the end of the EIR) in Volume IX, Appendix Q, a disputed, short "Technical Memorandum" dated 2/24/2020, entitled, "Desktop Study of Cemented Paste Backfill."** This is apparently designed as backup data in case someone like me notices that sufficient, compliant, and relevant data in the disputed EIR is not adequately described in compliance with CEQA and other applicable law, not to mention other errors, omissions, and flaws. Itasca describes at the start of the Technical Memo that it is a "desktop study of cemented paste backfills (CPB) use and its potential impacts on water quality and site-specific considerations for IMM." Note that there is no effort to reconcile the inconsistencies between that memo (and, therefore, the disputed EIR) and the disputed DEIR, which the disputed EIR leaves impact issues unresolved as if they did not exist. However, I note that those conflicts are material and in need of clarification with a revised and recirculated EIR (see section I.A.1.c). For example, among others that are apparent from contrasting (i) the DEIR and my Objection 254 thereto versus (ii) the EIR (and especially this Technical Memo) and this objection, the disputed DEIR deals with hexavalent chromium added in the cement paste (as CR6+) versus the disputed EIR/Technical Memo dealing with hexavalent chromium in the Portland cement (Cr(VI)). Although both may exist as hazards, the CR6+ in the cement is a water polluter, and the CR(VI) as also an air polluter (eg, as dust from delivery and use on the surface before being injected into the mine), as described in the disputed DEIR versus the disputed EIR. See also NSAQMD Agency Letters 12 (at 12) and 11 requiring frequent daily NID

watering to suppress toxic fugitive dust admittedly containing asbestos and now apparently adding the risk of CR6.

To begin for context and to clarify variance from the disputed DEIR description, the Technical Memorandum describes the "cemented paste backfills (CPB)" as a means of improving "geotechnical stability by backfilling mined stopes (voids) and allow[ing] the recovery of the ore body to be maximized." In essence, CPB is "formulated on the surface" by mixing tailings "with cement and water, although other additives or mined materials are sometimes included" (apparently, if the disputed DEIR were correct, like hexavalent chromium), and that mixture is then pumped into the underground mine to shore up places that are deemed to need it. **Throughout the Technical Memo discussion are qualifications and warnings about the proper preparation and "curing" of the CPB before exposed to dewatering, which is another way of saying that the homes, property values, and groundwater of us potential victims above and around the 2585-acre underground mine are at risk of human error by those preparing this toxic brew for shoring beneath us where there is no disputed EIR proposed monitoring until it is too late and the harms begin before surface owners or governmental discovery, especially considering that the insufficient monitor system is not applicable or effective to detect such problems timely. Under a heading called "Potential Water Quality Issues With CPS" (which, like all the rest of this Technical Memorandum, should be inserted in the related EIR hazardous materials discussion for "good faith reasoned analysis: with "common sense" and should be revised and recirculated for proper debate as required by CEQA and other applicable law, as provided in section I.A.1.c above) the following data is revealed, beginning with THE ADMISSION THAT (emphasis added): "THERE ARE SOME POTENTIAL WATER QUALITY RELATED ISSUES WITH CPB IF IT IS NOT IMPLEMENTED CORRECTLY." Part of that admitted hazard is inherent in the "specific composition of the tailings materials used in the CPB," and another admitted part is that the "CPB does not set properly or is not strong enough to remain intact in the mine environment."**

Thus, the disputed Technical Memorandum (unlike the disputed EIR itself which incorrectly ignores or dismisses all such concerns without sufficient identification of the issues or proof or links to these Appendices Q, O, or R) admits (at 2 and 3 of 8, emphasis added):

> **A VARIETY OF SITE-SPECIFIC FACTORS CAN AFFECT THE ABILITY OF CPB TO SET AND ITS LONG-TERM STRENGTH. FOR EXAMPLE, INSUFFICIENT BINDER CONTENT, EXCESSIVE WATER CONTENT, OR WATER WITH HIGH SULFATE CONCENTRATIONS (EG, FROM HIGH-SULFIDE TAILINGS) CAN DECREASE CPB STRENGTH OR INHIBIT PROPER SETTING. IF CPB DOES NOT SET PROPERLY, IT MAY BE LESS EFFECTIVE AT REDUCING THE MOBILITY OF CHEMICAL CONSTITUENTS [I.E., ADMITTED, TOXIC HEXAVALENT CHROMIUM], AND THERE IS THE POTENTIAL FOR THE BINDER MATERIAL TO BE LEACHED FROM THE CPB MIXTURE [IE, SUCH HEXAVALENT CHROMIUM POLLUTES OUR GROUNDWATER AND ULTIMATELY THE WOLF CREEK]. ADDITIONALLY, HIGH SULFIDE-CONTENT TAILINGS THAT ARE ACID GENERATING AND HAVE ELEVATED METALS**

CONCENTRATIONS CAN RESULT IN METALS LEACHING FROM CPB AND CAN DEGRADE CPB STRENGTH.

BECAUSE CEMENTS AND GROUTS ARE ALKALINE IN NATURE, SOME STUDIES HAVE NOTED THAT THE POTENTIAL EXISTS FOR THESE MATERIALS TO PREFERENTIALLY LEACH FROM CPB AND CAUSE ELEVATED PH VALUES IN GROUNDWATER AND/OR RELEASE CONSTITUENTS FROM THE CEMENT OR OTHER ADDITIVES [EG, HEXAVALENT CHROMIUM].

THUS**,** THE EFFECT OF THE DISPUTED EIR IS TO FORCE US LOCAL VICTIMS TO GAMBLE ABOUT LETHAL HEXAVALENT CHROMIUM HAZARDS THAT ARE ADMITTEDLY DEPENDENT ON MINE WORKERS' SKILL, DILIGENCE, AND CARE IN DEALING WITH THESE UNACKNOWLEDGED RISKS AND ON UNANALYZED MINE MATERIAL CONDITIONS, WITH NO RELEVANT, SUFFICIENT, OR TIMELY MONITORING OR MITIGATIONS SUFFICIENT TO PROTECT THOSE OF US ABOVE OR AROUND THE 2585-ACRE MINE AND OTHERS WHEREVER THE THEN POLLUTED WOLF CREEK FLOWS. AND THE DISPUTED EIR DARES TO CLAIM THERE ARE NO SIGNIFICANT ISSUES OF CONCERN WITH THE DEIR, SO (THE DISPUTED EIR CLAIMS) THE EIR DOES NOT NEED TO BE REVISED OR RECIRCULATED. THAT IS OUTRAGEOUS, ESPECIALLY CONSIDERING WHAT CANCER THREAT THE DISPUTED EIR NOW ADMITS FROM HEXAVALENT CHROMIUM IN APPRENDIX R. SEE ALSO APPENDICES Q AND O. (ALTHOUGH THAT WAS IN THE CONTEXT OF AIR POLLUTION, RATHER THAN WATER POLLUTION, THE MANY EXHIBIT C AND EPA WEBSITE STUDIES OF THIS CANCER-CAUSING TOXIN SHOULD BE SPECIFIC ENOUGH TO BE TAKEN SERIOUSLY. SEE SECTION I.F. AND I.E.1-5, AND EXHIBIT C. NO ONE CAN DOUBT THAT ANY PURCHASER OF IMPACTED SURFACE PROPERTY WILL TAKE THIS SERIOUSLY AND ASSUME THE WORST CASE, AS EXPLAINED IN EXHIBIT A HERETO.)

The Technical Memorandum (at 5 of 8) also addresses a disputed study by ACZ Laboratories involving tests on four flotation tailing samples for "acid digestion" that us objectors consider not representative or predictive of the problems impacting us local victims above and around the 2585-acre underground mine. For those and other reasons the disputed study from cherry-picked purported expert and Rise chosen locations do not persuade anyone at risk. Indeed, the study's conclusion is full of subtle qualifiers that invite our dispute, such as (again based on what Rise selected did for its own benefit in a tiny sample) this contractor said (emphasis added) that "it is LIKELY that the CPB used in the IMM will have very low solute release rates and will be GENERALLY environmentally benign." However, consider the **"Conclusion" (at 6 of 8), stating that: "However, it is clear from case studies and theoretical behavior of CPB that there are a variety of site specific factors that could affect the potential for water-quality impacts…" for which the memo suggests specific suggested protective actions and cautions, none of which are appropriately added to the disputed EIR, presumably because it prefers not to call attention to these risks which CEQA and other applicable laws require the EIR to address now—not later in some future negotiation with some regular over mitigations that Rise cannot afford.** See Exhibit B and DEIR Objection 254 #2.

Again, there is the debate as to what levels of such cancer causing toxic hexavalent chromium are safe (see Exhibit C), but, rather than have that debate on the merits, the disputed EIR dares to ignore the risks, threats, and harms in the EIR/DEIR, and instead seeks advance approval for its nondetailed concept, with "the details hiding their Devil" (as the saying goes) to be **revealed in some future time after EIR approval** when much harm has already been done. Incidentally, since Rise would arrange all this testing that is referenced in the Technical Memorandum and EIR/DEIR, where is the "good faith reasoned analysis" with common sense of disclosed data? Why has Rise not attached that data in the EIR Appendix instead of irrelevant studies of purportedly "similar" situations that we dispute and contend are not similar at all, and, in any event, contain errors, omissions, or other noncompliance.

If the disputed EIR advocates attempt to continue to evade these environmental impact threats, they cannot be allowed to do so without a "good faith reasoned analysis" with "common sense" and without adequate CEQA and other disclosures and recirculation of their disclosed position, so that it can be fully disputed on the merits. As proven by the court case cited in section I on this topic, the EIR cannot rely on that buried Technical Memorandum to save it (i.e., the EIR cannot ignore these identified and admitted risks), since this is only a "desktop study" where these purported, cherry-picked experts simply relied on what Rise told them without any investigation of the real facts on the ground. Given Rise's many credibility problems and other issues raised in my and other objections and the lack of adequate documentation and disclosure of what Rise told Itasca (i.e., what litigation discovery will reveal, if the EIR is mistakenly approved), there is no reason for disregarding us objectors' worst-case assumptions from these admitted risks. Consider another admission in the Technical Memorandum (at 3 of 8):

> **The presence of chromium in cement has been identified as a potential water-quality concern related to the use of CPB (Hamberg et al 2018). Hexavalent chromium (Cr(VI)) is an oxidized form of chromium that is more soluble and mobile in the environment than reduced forms of chromium. … Thus, selecting a supplier with low Cr(VI) content cement and ensuring the CPB is not inundated [eg, confronting dewatering] before it sets can minimize the potential for issues with Cr(VI) leaching.**

None of this information is addressed in the disputed DEIR, and little of it is properly disclosed in the disputed EIR (beyond what is quoted herein), so this significant new EIR information requires full disclosure and opportunity for debate in the context of a recirculated and revised EIR that contains a "good faith reasoned analysis" with "common sense." That is especially important, since failure to prevent a repeat here of the Hinkley, CA, horrors will leave all those accountable here with even worse accountability challenges than the Michigan Governor Snyder's team who allowed lead leaching in water pipes to devastate Flint, Michigan, because this would be an "I told you so" crisis. I mention that analogy not as a gratuitous provocation or insult, but as a real-life, well-known example of how even supposedly well-meaning officials can create atrocities (not to mention foreign miners in admittedly distressed financial circumstances and from an industry with a history of environmental violations, because too many miners are focused only on maximizing profits for speculative shareholders, rather than the safety, health, and welfare of the local community they expect to leave as soon as the mine ceases to promise exploitive riches).

4. Some EIR Flaws Are Exposed By the Updated Itasca Admissions in Vol. IX, Appendix O.

Disputed EIR Appendix O, the Itasca update dated 6/17/2022 to the Technical Memorandum (App. Q) disputed above, describes itself as a "clarification" in response to various objections. It is not the "good faith reasoned analysis" with "common sense," because, among other things, it ignores the meritorious objections by me and others. None of those "significant new information" updates (or incorrectly EIR so-called "clarifications") addresses my Objections or rescues the disputed EIR from the errors, omissions, or noncompliance addressed herein. Therefore, I will just briefly expose some flaws in that update as illustrations. However, it should be of great concern to the County that, rather than confront the key objections on the merits with "good faith reasoned analysis" with "common sense" as required by CEQA and other law, that update (like the disputed EIR generally) ignores the necessary issues or wrongly dismisses them as irrelevant, speculative, unsubstantiated, or premature, because the EIR evades debate by claiming disputed, improperly deferred, and uncertain at best mitigations AFTER APPROVAL OF THE EIR, almost always without any good faith reasoned analysis with common sense.

Admitting that the EIR ignores in its "groundwater flow model" for dewatering what Itasca calls "[c]consumptive water uses from individual wells," Itasca dismisses the concern without proof as too "small, relative to regional groundwater flow," relying on what it claims (as disputed speculation or assumptions without investigation or considering our local objections) to be the "low permeability of the rock mass" and "generally low pumping rate." **First,** it is again not clear whether these comments purport to cover the whole 2585-acre underground mine below thousands of us surface owners and users or only the few in the East Bennett Road area on which the disputed DEIR was almost wholly focused on these issues. See my Objection 254 and my comments above, such as, for example, on the disputed, obvious fallacy of assuming the higher ground areas are subject to the same conditions and issues as those East Bennett Road conditions where Rise incorrectly concentrates its monitoring systems. Also, this disputed update commentary assumes that, despite climate change, science, and "common sense" reason, (a) whatever conditions exist now will continue for the next 80 years, despite 24/7/365 blasting, tunneling, dewatering, and mining, and (b) that no new wells or greater surface owner use demands will apply. The reality is that, as has proven true everywhere else in California where surface owners are confronting drought conditions by tapping more of their owned groundwater, surface owners and users will exercise their legal rights to increase new wells and groundwater usage, especially since that groundwater belongs to them, not just the mine. See *Keystone*, section I.F.8 and 9, and DEIR Objection 254 #2. Indeed, during the next 80 years, when NID drought rationing cuts back water supplies in the future, before local surface owners abandon their homes and suffer their forest to die from lack of the groundwater flushed away down the Wolf Creek by mine dewatering, us surface owners and users will likely band together in new well collectives or individually to compete and battle in the courts and political arena against the mine's water wastes. See *Varjabedian.* That reality dooms the flawed assumptions on which the disputed EIR/DEIR (including these disputed EIR opinions) rely. Also, note that many of us do have sewers, countering the (in effect) "don't worry, just recharge using your septic tank water comments here" and "landscape irrigation" (which ignores NID's

likely rationing rules imposed on us while the mine flushes away our owned groundwater down the Wolf Creek.) See my objections to EIR's disputed Master Response 33.

I defer to the more expert groundwater objectors to deal with the **flawed Itasca attempts to rehabilitate its model's simulations addressed in that disputed Appendix O**. See my Table of Incorporated by Reference Objections. But again, we confront the issue of when and if these commentaries purport to address the whole area above and around the 2585-acre underground mine or only the small East Bennett Road area downhill, a flaw that by itself should require massive new "good faith reasoned analysis" with "common sense" and DEIR/EIR revision and recirculation, especially since there is no sufficient proof that the disputed EIR/DEIR comments on the downhill, wholly owned mine and East Bennett Road area apply equally to the surface area above and around the 2585-acre mine, where thousands of us objectors live and intend to defend our homes from such EIR mine menaces.

Once again, **the attempts of Itasca to justify exclusion of comparisons to other local mines (e.g., Empire or on San Juan Ridge) for the disputed Itasca model must fail on the merits.** Among the many flaws in such reasoning are that the conditions in this long flooded and closed mine (since 1956) have not been adequately investigated, and there is no merit to the disputed EIR/DEIR assumption that either that those disputed assumed conditions will continue to apply for 80 years, despite climate change and 24/7/365 dewatering and mining, or that such disputed conditions will apply to the new and deeper mining contemplated in the disputed EIR/DEIR. Guesswork, false assumptions, false equivalences, and speculation, such as when such experts accept disputed and unreliable miner data as if it were true, especially incomplete unreliable historical data from reliable people, should not be permitted to risk the future of our local community. For example, one such flawed Itasca argument for excluding Empire Mine comparisons is that "[t]here is no direct flow from these historical mines to the future Rise Mine working" and that there is a "block" by "low permeability rock masses" between the historical mines and "the future Rise Mine." Besides disputing any reliable and substantiated basis for that opinion (eg, noting the lack of reliable, complete, and accurate historical documents and data) the EIR/DEIR has not adequately investigated this long flooded and closed mine and its new mining areas for such issues arising during the next 80 years. Also, please note that my and other objections complain about the disputed EIR/DEIR cherry-picking favorable (but irrelevant) studies and opinions involving false support claims based on much less comparable and distant places are incorrectly alleged to "similar." In fact, those disputed EIR/DEIR false comparable (the false equivalence tactic) are less similar and relevant than the more similar and relevant Empire and other mines cited in objections and incorrectly dismissed without fair consideration on the merits by Itasca and the EIR without a "good faith reasoned analysis" with "common sense."

I also defer to more expert objections as to the seismic errors and omissions regarding the "simulations" in the disputed "groundwater flow model" relating to the "Idaho Fault system." However, this Itasca update admits that it ignored "the modeling of these minor faults" [22, 20, 11, and 20C of the Idaho Fault Zone), because "most of this area is already modelled as mining voids," another disputed contention on various bases. For example, those "minor faults" can be a material menace to those of us living above or around the 2585-acre underground mine, even if they don't damage more distant towns. How many of us locals can be sacrificed before it matters "materially" that the miner triggers a "minor fault" and damages our properties (also another reason for depressing property values) or drains our exiting or future wells? See Gray, rejecting similar mine mitigations in a similar eir. Why dismiss allegedly "minor" faults, when there is

ample data on the local harms they cause when triggered? Note also that groundwater depletion, reallocation, and dewatering for fracking has caused earthquakes causing material local harm in Oklahoma and Pennsylvania, where no one could ever remember any earthquakes before, and similar problems are alleged in other fracking sites where groundwater is similarly manipulated. See my prior references to the *Keystone* Supreme Court case and other authorities were us surface owners' rights of lateral and subjacent support includes groundwater to avoid subsidence and, we contend, also induced earthquakes on even "minor faults." E.g., *Keystone Bituminous Coal Ass'n v. DeBeneditis*, 480 U. S. 470 (1987) ("*Keystone*").

5. Some Other Issues Mentioned in This Disputed EIR Response.

As explained in my applicable objections herein and in my DEIR Objection 254 #'s 3.A, D, E, F, K, M, N, 4, 5, 6, 7, and 14, the EIR Response To comment Grp 25-30 regarding deep mining is wrong (as explained therein and in their objections to that disputed EIR Response.) Among other things, the disputed and speculating DEIR and EIR have not adequately studied the actual relevant conditions, but instead speculate and rely on incorrect assumptions and ignore the unknowns in their broader and deeper mining that includes 72 miles of new tunnels and adjacent new mining and dewatering areas, which distance prevents any credibility to the EIR/DEIR guessing as it does over such distances. That defies "common sense" required for such mining by *Gray***. Besides the courts (e.g., *Gray, Banning, Vineyards, and Costa Mesa*) requiring a "good faith reasoned analysis" with "common sense" to satisfy CEQA (a test the DEIR/EIR miserably fails on many objection issues), evaluating the impact's "significance" must be based "to the extent possible on scientific and factual data," which means relevant and applicable data to the issue. CEQA section 15064(b).** However, not only does the disputed EIR/DEIR often fail to comply with that requirement on some impacts, mitigations, and issues, merely asserting disputed, speculative, and unsubstantiated opinions (often based on flawed and unstated assumptions), but many disputed EIR/DEIR cited studies are based on disputed and false assumptions, such as that (i) dissimilar, inapplicable, and irrelevant situations are somehow claimed to be similar, applicable, and relevant, or (ii) obsolete, superseded, or otherwise revised science or data is still somehow current and correct. (Recall that industry "science" once claimed that asbestos and cigarettes were healthy.)

We also dispute the attempt by the disputed EIR/DEIR to excuse itself from important and available knowledge that it does not wish to know or have (i.e., inconvenient truths that would impair their quest for EIR approval it should never receive on the merits) on the disputed theory that the EIR/DEIR only has to do "what is reasonable feasible" for purposes of CEQA Guidelines #15364. But see the tests in cases such as *Sierra Club v. County of Fresno* and others discussed in my DEIR Objection 254 #14. That is a question of law (or mixed question of law and fact) on which us objectors insist the disputed EIR/DEIR was wrongly resisting doing what reasonably feasible to avoid having to combat our objections on the merits. For example, many kinds of assessments of the actual condition of the old and new mining are reasonably feasible, but they were evaded by the EIR/DEIR, such as, for example, where it limits its inquiry about "Mine Conditions" to "NVS Phase I/II ESA" for small, Rise owned sites and 10 feet deep trenches, ignoring what matters most to objectors about the 2585-acre underground mine beneath us thousands of surface owners above or around it. See, eg, my Objection 254 #3.E, 4, 8, and 14 and Exhibit B and my Objection 255.

As explained in my applicable objections herein and in my Objection 254 #'s 3.A, D, E, F, and K, 4, 5, 6, 8, 11, and 14, the disputed EIR Master Response 33 regarding groundwater dependent vegetation is wrong as explained in my reply thereto above and such other objections. See sections I.F. and I.E above. Again, as continually ignored by the DEIR/EIR and as explained in my DEIR Objection 254 #3, 4, 5, 6, and 7, us surface owners and users above and around the 2585-acre mine own the groundwater beneath us that is being dewatered and flushed away down the Wolf Creek. See section I.F.8 and 9 and I.E.1-6.

For the record as well, the disputed EIR claims the future mining "would not occur beneath the airport," although at least some of the airport is within the 2485-acre underground mining boundary. Because (as this objection and my DEIR Objection 254 keeps complaining) the maps and descriptions are too vague (eg, aerial photos hiding landmarks under trees without sufficient labeled roads etc.) and do not show the key addresses or other surface landmarks needed for us potential victims to identify relevant locations, we cannot be expected to be precise in our such objections. Nevertheless, notice that the airport can still be at risk from the 2585-acre underground new mining occurring beyond the border of the airport, such as, for example, by "subsidence," whether from depleting the groundwater which supports the airport or other lack of lateral or subjacent support. See, e.g., *Keystone* and my related objections to disputed EIR Master Responses, such as to #7 cited by this disputed EIR "Response," as well as my Objection 254 #'s 3.E, 4, 5, and 14. Indeed, as too often occurs, the DEIR/EIR incorrectly deal with the airport issues as if there were only about the Rise owned Brunswick and Centennial sites, rather than the whole 2585-acre underground mine which does appear to extend under the airport. See, eg, DEIR 4.7-19, 4.7-3 at 4.7-33, and 4.7-5at 4.7-49. Because the DEIR/EIR has not sufficiently studied the actual underground conditions applicable at the new or old mine, there can be no assurance of safety for the airport, which it is the EIR's burden to prove.

As I have repeatedly demonstrated, the disputed legal issue of Centennial as a separate project will be litigated, if necessary. See section I.B above. See my other objections herein thereto (eg, my rebuttal to EIR Master Response #4) and my DEIR Objection 254 #'s 3.N, 4, and 14.

As to other issues not even considered or attempted in this nonresponsive EIR "Response," the disputed DEIR incorrectly describes the "Project Area Conditions" as the mine "surrounded by undeveloped land, industrial, low density residential developments and commercial uses." Although I properly complained about the uninformative maps and data provided by the EIR/DEIR provide insufficient data to allow many of us local residents to locate our homes by comparison to the 2585-acre underground mine, we all know that we are either "above or around" that underground mine in what is either or both an impact zone and a stigma zone. Consider for example that thousands of us on Banner Mountain live on the surface above or around the underground mine, and we live in a normal mid-to high-end suburban community in a forest of huge trees that we fear the mine dewatering will kill (even if just by weakening the trees so the bugs kill them). See, eg, my objections to EIR Master Response 33 and my DEIR Objection 254 # 8 and 3.N. The depression in our property values will reduce our property taxes in amounts that far exceed any net revenue imagined from mine taxes, for instance. See Exhibit A. In any event, despite my such detailed objections (see Exhibit B and DEIR Objection 254 #'s 2 and 4) and the Rise admissions about us local surface owners' rights in the Rise SEC Form 10K filings [Id.](e.g., conceding that our "surface" rights go down at least 200 feet), our other surface owner legal right rights include lateral and subjacent support to prevent subsidence,

which includes the support of our groundwater (which is not a mineral they can mine, but water we own.) See Keystone and section I.F.

CCC. Objection To EIR Response (at 2-6022) To My Comment Ind. 254-76 (marked by the EIR starting at 2-5973) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "8. Land Use And Population And Housing DEIR at #4.9."

Once again, the disputed EIR improperly compresses my broader objections to my correct allegations that "the project is incompatible with the project site" and, again, improperly ignoring what I state and cross-reference or incorporate, the EIR claims my objections lack sufficient detail. Thus, this disputed EIR erroneously claims that "the requested land use approvals" for this disputed mine is "consistent with" the "general plan and zoning of the site," citing EIR Master Response 7, which I correctly disputed above. See also my cross-references ignored by the disputed EIR/DEIR at my DEIR Objection 254 #'s 2, 3.A, D, E, F, M, and N, 4, 5, 7, and 14, as well as my objections herein to the disputed EIR "Response" attempts incorrectly to counter the part of those cited objections it does not ignore or evade. For example, the DEIR/EIR incorrectly describes the "site" as "rural" (again focusing on the owned mine area at the Brunswick and Centennial sites and generally ignoring or mischaracterizing the 2585-acre underground mine above and around which thousands of us surface owners and users live in our forested suburban communities.) Considering all of my cited objections, the DEIR/EIR "Conclusion" at 4.9-24 is worse than wrong when it states: "Overall, the proposed project would not cause a significant environmental impact due to conflicts with land use plan, policy, or regulation … therefore, this impact is less than significant." Notice that, while the DEIR/EIR keeps insisting that we cannot object to any things that are not what the disputed, limiting DEIR/EIR considers an "environmental impact," the DEIR/EIR itself goes beyond those disputed borders in its own commentary, thereby forfeiting the right to object to our countering, rebutting, and impeaching (as I have done, challenging through the such "open doors" in the EIR/DEIR) everything wrong in the DEIR/EIR, regardless of its incorrect claims about CEQA boundaries. See, e.g., my objections above to the DEIR's "Non-CEQA Analysis" at 4.3-103-104, as well as sections I.C and D above and illustrations in E and F, as well as DEIR Objections 255 and 254.

In any case, there is no proper "good faith reasoned analysis" with "common sense" by the DEIR/EIR on this topic, and all my cited errors, omissions, and noncompliance in the DEIR/EIR should prevail undefeated by such disputed DEIR/EIR unsubstantiated and erroneous opinions, claimed CEQA boundary limits, and other evasions of what CEQA and applicable law require. Id. and sections I.F.5 and I.A.1.d(viii). As I cited in this part of DEIR Objection 254, I also cross-referenced my various other sections, especially for this issue #'s 2, 3.A and N, 4, 5, 7, and 14. Since I describe my impacted property and community in detail as a qualified witness, as well as a bankruptcy lawyer experienced with such bankrupt or abandoned mines with such objectionable impacts, it is legally impossible to dismiss my offers of proof as lacking sufficient details. See section I above, where I describe the applicable law and illustrate its application to rebut the errors, omissions, evasions, and noncompliance by the disputed EIR/DEIR.

As to other EIR/DEIR evaded issues about which they have not even attempted a responsive EIR "Response," consider as a common example the foregoing disputes about similar errors, omissions, and noncompliance in DEIR Chapter 4.9 (Land Use and Population and

Housing). The disputed DEIR incorrectly described the "Project Area Conditions" as the mine "surrounded by undeveloped land, industrial, low density residential developments and commercial uses." Although I properly complained in my four Objections about the uninformative maps and data provided by the EIR/DEIR with insufficient data to allow many of us local residents to locate our homes by comparison to the 2585-acre underground mine, we all know that we are either "above or around" that underground mine in what is either or both what I call a direct "impact zone" or an even broader "stigma zone." Consider, for example, that thousands of us on Banner Mountain live on the surface above or around the underground mine, and we live in a normal mid-to high-end suburban community in a forest of huge trees that we fear the mine dewatering will kill (even if just by weakening the trees so the bugs get them), leaving us with an even greater wildfire risk. See, e.g., sections I.E and F above, and my objections to EIR Master Response 33 and my DEIR Objection 254 # 7 and 3.N. The depression in our property values (Exhibit A and DEIR Objection 254 #4) will reduce our property taxes in amounts that far exceed any net revenue imagined from mine taxes, for instance. Id. In any event, despite my such detailed objections and the Rise admissions about us local surface owners' rights in the Rise SEC Form 10K filings discussed in Exhibit B (e.g., conceding that our "surface" rights go down at least 200 feet), our other surface owner legal right rights include lateral and subjacent support to prevent subsidence, which includes the support of our groundwater (which is not a mineral they can mine, but water we own.) See *Keystone*, *Varjabedian*, DEIR Objection 254 #2, and Exhibit B.

DDD. Objection To EIR Response (at 2-6022) To My Comment Ind. 254-77 and 78 (marked by the EIR starting at 2-5974) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "9. 'Noise And Vibration' DEIR at 4.10"

As discussed herein, I am combining my objections in DEIR Objection 254 #9 that the disputed EIR disaggregated/cut into two what the EIR labelled as "Responses To Comments Ind. 254-77 and 78," since my comments are integrated and together defeat that nonresponsive EIR "Response." Thus, the EIR cites its Master Responses 4 and 7 and EIR Response To Comment Grp 21-44, to which I (and the Comment Grp 21-44 objector) have correctly objected on the merits. The Centennial work is NOT a legally separate project as I prove in my objections thereto (see section I.B above), and, if the EIR is mistakenly approved, the courts will resolve that dispute de novo as a matter of law (or at least as a mixed question or law and fact). Likewise, there is a dispute as to the noise and vibration from blasting that remains outstanding. See section I.E.6 above and DEIR Objection 254 #9. My incorporated objections from other parties apply here, as do their objections to the EIR evasions here in this EIR "Response." See my Table of Incorporated by Reference Objections and Exhibit D.

In any case, despite the disputed EIR's cites to DEIR Appendix L and M, there is no relevant and proper "good faith reasoned analysis" with "common sense" by the DEIR/EIR on this topic, and all my cited errors, omissions, and noncompliance in the DEIR/EIR should prevail undefeated by such disputed DEIR/EIR's unsubstantiated and erroneous opinions, which are too vague to comply with CEQA and other applicable law. See sections I.C, D, E.6, and F. As I cited in this part of DEIR Objection 254 at issue here, I also cross-referenced and incorporated my various other sections (e.g., Id.), especially for this issue #'s 1, 2, 3.N, 4, 9, and 14, and other relevant objections. Recall that this is important to those of us living above and around the 2585-acre underground mine, generally disregarded by the DEIR/EIR in favor of their focus on the

Brunswick and Centennial owned sites. **We surface owners need to know what is accurate and credible to say to explain this to any buyer or mortgage lender when we owners warn them: "Oh, by the way, this mine will be blasting, tunneling, dewatering, and mining underneath your house 24/7/365 for 80 years." Also, there was no response to my objection that they omitted the "reception' testers we consider essential under our such surface properties above the 2585-acre underground mine, except for those under the hospital and downtown, since the EIR apparently does not want us to be able to judge this likely threat to our homes above and around the 2585-acre underground mine that is not sufficiently eliminated by ground cover as alleged.** See, besides those herein, disputed DEIR 4.10-52 to 59 (including Figures 4.10 -2 and -3) versus my and others' objections (e.g., in DEIR Objection 254 #'s 3.A to M and 4 to 10, my legal issues at 3.N, 4, and 14, and my hard questions at 15, as well as applying some of the DEIR's own admitted Appendix L and M principles against them.)

EEE. Objection To EIR Response (at 2-6022) To My Comment Ind. 254-79 (marked by the EIR starting at 2-5976) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "10. Some Air Quality Errors And Omissions to Consider From DEIR 4.3 And Elsewhere."

There is no proper "good faith reasoned analysis" with "common sense" by the DEIR/EIR on this topic, and all my cited errors, omissions, and noncompliance in the DEIR/EIR should prevail undefeated by such disputed DEIR/EIR's unsubstantiated and erroneous opinions. As discussed in similar situations cited herein, the EIR/DEIR incorrectly cites again to CEQA Guideline # 15384 to attempt to evade my objections as too speculative etc., but again that ignores the fact that my objections are less speculative and objectionable than such speculations and unsubstantiated opinions of the disputed EIR/DEIR. See sections I.C and D, I.E.1, I.F.5, 5, and 9, as well as DEIR Objection 254 # 3.J. and 10. See also my cited witness case studies for my experience in the San Francisco Bay Area, where, for example, Chevron air pollution in Richmond and other refinery air pollution in Benicia and Martinez resulted in bans on residents burning wood or leaves, etc. or using their home fire places, exposing the DEIR/EIR claim of speculation to be bogus. As above I have explained why in this zero-sum pollution tolerance regulation of air pollution, the more pollution is allowed to the mine (eg, for toxic dust control discussed in the NSAQMD Agency Letters 12 and 11), the less that remains to be tolerated from us residents, such as for our wood stoves and burning leaves and other fire hazard debris. As I cited in this part of DEIR Objection 254, I cross-referenced my various other relevant sections, especially for this issue #'s 2, 3.E and N, 4, 10, and 14. Since I describe my impacted property and community in detail as a qualified witness, my comments cannot be disregarded as the EIR has done. See section I.C and D.

These air pollution problems compound other objections such as my hexavalent chromium objections both using the air pollution admissions by the EIR at Appendix R and other Responses (e.g., Response to Comment Ind. 254 -1 et seq) and regarding water waste to suppress toxic dust (DEIR 4.3-49/see NSAQMD Agency Letters 12 and 11), including an admitted 11 million gallons twice a day to reduce 55% of the at risk particulate matter (thereby confirming the almost doubling the size of the threat when climate change dryness or other reasons stop such watering. Id. The consequences of the failure or suspension of the dust control program are also not satisfactorily addressed in the DEIREIR. See NSAQMD Agency Letters 12 and 11.

FFF. Objection To EIR Response (at 2-6023) To My Comment Ind. 254-80 (marked by the EIR starting at 2-5977) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "11. 'Wildfire" DEIR at 4.13."

There is no proper "good faith reasoned analysis" with "common sense" by the disputed DEIR/EIR on this topic, and all my cited errors, omissions, and noncompliance in the DEIR/EIR should prevail undefeated by such disputed DEIR/EIR's unsubstantiated and erroneous opinions. As discussed in similar situations above, the disputed EIR/DEIR improperly ignores my cross-references and incorporations and incorrectly again attempts to evade my objections as lacking an adequate explanation, as too speculative, etc. However, again, the disputed EIR also ignores the fact that my objections are less speculative, noncompliant, and objectionable than such deficient analysis, speculations, and unsubstantiated opinions of the disputed EIR/DEIR. See, e.g., my cited DEIR Objection 254 #'s 3.A, B, D, E, F, J, K, and M, 5, 8, 10, and 11, as well as the other objections in section I or incorporated from my Table of Incorporations by Reference Objections and Exhibit D. The EIR cites to its disputed Master Response 33, and I refer to my objection thereto and elsewhere herein.

My objections make a sufficient case, not effectively countered by the disputed EIR/DEIR, about how the EIR/DEIR mining increases the fire and fire smoke risks and problems that the thousands of us living above and around the 2585-acre underground mine confront in our drying and pest threatened forests in our subdivisions.

The same is true for the huge EIR/DEIR underestimation of mine generators that the EIR/DEIR claims must keep electricity on 24/7/365 for 80 years whenever power service ceases for any reason, including the PSPS blackouts added to the increasing bad weather and old equipment failures, which are an indisputably much bigger problem than the DEIR/EIR acknowledges. As explained above in my objections to disputed EIR Master Response 6, I have offered to prove from the public records to which I have cited and incorporated from my experiences in the PG&E bankruptcy cases, including as I briefed on that public docket in my proof of claim dispute in that recent Chapter 11 case (and the record in the related CPUC proceedings and PG&E probation case before Judge Alsup), PG&E's chronic service problems clearly will disrupt the mine more often than history would suggest, especially for the next decade. That is both as a result of climate change, increasingly bad weather threats, illegal vegetation growing in dangerous proximity to uninsulated PG&E gear and more than 10,000 miles of wires, "run it until it breaks" PG&E use of dangerous gear, and other causes of greater blackouts than in the past. What is speculative and false is the EIR/DEIR theory that the past predicts the future, because, like climate change and the continuing PG&E system problems, the future is more PSPS and blackouts than are forecast in the DEIR/EIR erroneous modeling. See also my objection disputing the EIR Response to Comment Ind. 254-42.

GGG. Objection To EIR Response (at 2-6023) To My Comment Ind. 254-81 (marked by the EIR starting at 2-5978) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "12. Errors And Omissions As to the 'Statutorily Required Sections' At DEIR #5 and "A. Introduction."

This part of my DEIR Objection 254 #11 is noted without comment as what the EIR dismisses as a "transitional paragraph." However, my such introduction explained the different approach I was taking as to these CEQA Guideline 15126.2 mandatory subjects, since I am

responding to them in the order presented in the DEIR and my objections overlap with my other objections herein, making it essential for the disputed EIR/DEIR to break its habit of improperly ignoring all my cross-references and incorporations, so that the EIR/DEIR can complain (incorrectly) that I did not provide a sufficient explanation.

HHH. Objection To EIR Response (at 2-6023) To My Comment Ind. 254-82 (marked by the EIR starting at 2-5978) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "12. Errors And Omissions As to the 'Statutorily Required Sections' At DEIR #5 and "B. Growth Inducing Impacts" DEIR # 5.2.

The disputed EIR reports part of my objections as to both (i) how the mine will deplete opportunities for more desirable businesses and residents to use the tolerable margin for pollution, and (ii) how that mine will serve as a magnet for more undesirable polluting businesses, as I offered to prove happened when Chevron was allowed to operate as it does in Richmond and other refineries were allowed to operate as they do in Benicia and Martinez. Again, as it does repeatedly elsewhere in the EIR/DEIR, the disputed EIR incorrectly evades the required response not only by misinterpreting CEQA (a legal dispute for the courts), but also by ignoring my right to counter, rebut, and impeach the many errors, omissions, and other untruths in the EIR/DEIR (eg, their disputed "alternative reality") with my "inconvenient" (to the EIR) truths it seeks to evade. See, e.g., section I.C and D explaining the correct interpretations of CEQA and the Guidelines, and I.E and F applying those corrected principles to defeat the noncompliant EIR/DEIR claims, omissions, and evasions. Again, the EIR cites to its disputed Master Response 2, and I counter to that with my objections herein to that disputed opinion and with other objections herein (e.g., I cited DEIR Objection 254 #'s 3.N and 8.)

III. Objection To EIR Response (at 2-6023) To My Comment Ind. 254-83 (marked by the EIR starting at 2-5978) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "12. Errors And Omissions As to the 'Statutorily Required Sections' At DEIR #5 and "C. 'Cumulative Impacts' DEIR at #5.3."

The disputed EIR fails to provide any "good faith reasoned analysis" with "common sense" for the CEQA required "cumulative impacts," especially regarding the impacts on us living above and around the 2585-acre underground mine, as to which the EIR/DEIR are deficient, especially by comparison to all the much greater attention the EIR/DEIR lavishes on the less controversial (but still disputed) Brunswick/Centennial sites and 30 East Bennett Road. As to the CEQA requirement (which the EIR/DEIR admits applies) to "define the relevant geographic area of inquiry," the DEIR/EIR fails compliance in many ways besides those exposed in this Objection, such as I explained in my DEIR Objection 254 #'s 3.A, B, E, and N, 4, 8, and 14, such as especially failing to match our such surface owner landmarks or addresses or road locations/landmarks compared to that underground mine. Also see my valid DEIR Objection 254 (e.g., #'s 2, 3.N, 4, 8, and 14) disputes with the "Project List" at DEIR 5-4-8 and Tables 5-1 and 5-2 versus my impact zone and stigma zone concerns. The disputed EIR Responses do not overcome those objections, nor does the disputed EIR Master Response 7 cited on this topic. The EIR/DEIR keep missing and evading my meritorious concerns. The same is true as to my superior air quality objections and disputes with EIR Master Response 2, such as discussed

above regarding the competition for polluting competitions between beneficial uses (residents vegetation burning and fireplaces and desirable business operation) versus no net benefit exploitive businesses like this mine that will crowd out those better land uses.

Note that the DEIR admits at 5-3 that the "incremental" mining impositions can create "cumulatively considerable, and, thus, significant [impacts] when viewed together with environmental changes anticipated from past, present, and probable future projects." This admission supports my objections as to how the mine will deplete opportunities for more desirable businesses and residents to use the tolerable margin for pollution and how it will serve as a magnet for more undesirable polluting businesses, as I offered to prove happened when Chevron was allowed to operate in Richmond and other refineries were then allowed to operate in Benicia and Martinez. See section 3J and 10 above and DEIR Objection 254 #'s 3.N, 4, and 8. Again, as they repeatedly do elsewhere in the EIR/DEIR, the disputed EIR incorrectly evades the required response not only by misinterpreting CEQA (a legal dispute for the courts—see sections I.C and D as to the correct view of the rules and sections I.E and F illustrating their proper applications), but also by ignoring my right to counter, rebut, and impeach the many errors, omissions, evasions, and other noncompliance in the EIR/DEIR (e.g., their disputed "alternative reality") with my "inconvenient" (to the EIR) truths it seeks to evade. Again, the EIR cites to its disputed Master Response 2, and I counter to that with my objections herein to that disputed opinion and with other objections herein (e.g., I earlier cited, for example, DEIR Objection 254 #'s 3.N and 8.) Stated another way, when (as here) the DEIR/EIR asserts dubious and unsubstantiated opinions and speculations, I must be able to prevail (as I will, if necessary, in court) with my better and more probable counters, impeaching and rebutting that EIR "alternative reality" with truths and common sense.

JJJ. Objection To EIR Response (at 2-6023) To My Comment Ind. 254-84 (marked by the EIR starting at 2-5980) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "12. Errors And Omissions As to the 'Statutorily Required Sections' At DEIR #5 and "D. 'Energy Conservation' at 5.4."

My objection states: "The DEIR comments basically incorporate other DEIR sections, and I, therefore, do the same where I have disputed and objected to those other referenced DEIR commentaries." The EIR Response cannot deny me the same right to incorporate by such reference my objections to what that Response incorporates. Here, even more than in all the other places in the disputed EIR where it incorrectly rejects my alleged failure to "specifically address the adequacy of the DEIR," the fault is on the EIR/DEIR not on me, since this is not a "good faith reasoned analysis" with common sense required of the EIR (not of me or other objectors) by CEQA and other applicable law. See sections I.C and D above as to the correct view of the rules, and sections I.E and F illustrating their proper applications.

As discussed in my climate discussion in section I.A.1.a(vii), this project has a significant adverse impact on energy use and GHG, and by itself obstructs the County's goals and plans. See, e.g., *Richmond v. Chevron* and other cases addressed in I.C and D, such as *League to Save Lake Tahoe Mountain Area Preservation Foundation v. County of Placer* (2022), 75.Cal. App. 5th 63 ("**Save Lake Tahoe**") (finding the eir's greenhouse gas **[GHG]** mitigation measure was inadequate because it **deferred** determination to an unknown future time, requiring the applicant to mitigate impacts IF the project conflicted with relevant future emissions targets adopted by the

state, relying on performance standards that do not yet exist and may never exist so that any determination of the impact's significance is deferred to an unknown time and where neither the county nor the applicant were committed to mitigating any such impact. Also, the eir **failed properly to consider whether renewables could be incorporated into the Project in the energy impact discussions,** as noted below.) According to Save Lake Tahoe, to be compliant the CEQA analysis of energy impacts requires both whether renewables can be incorporated into the project, and (if significant impacts) whether renewables would reduce the impact. Also, for significant impacts, the EIR must consider all feasible mitigation measures. The EIR fails these tests, among other things, by such deferrals, by such lack of analysis and denials of such climate change matters, and by ignoring the renewables issues.

As to confirming the "significance" of these energy issues that Grass Valley calculated in its Agency Letter 8-18: "The [IMM] Project's annual energy use would represent an increase of approximately 15 percent in County-wide electric usage for a single industrial use." As Grass Valley said (at Id.): "This energy use should be recognized as a significant impact of the proposed project and mitigation should be incorporated to reduce this impact." That by itself not only defeats the Nevada County Energy Action Plan (EAP), but it depresses any willingness of mine opponents to sacrifice in their own energy usage, because our sacrifices would benefit this objectionable mine instead of our environment. Indeed, as I explain in detail with my rebuttal of the EIR/DEIR on its unrealistic and grossly understated generator use to cover PG&E PSPS, system failures, weather events, and other causes of blackouts increasing with progressive climate change impacts, the EIR's projected energy use in incorrectly analyzed. See, e.g., my objections in section II to EIR Master Responses 16, 25, and 26-28 and my objections in section III to EIR Response to Ind. 254-84.

KKK. Objection To EIR Response (at 2-6023) To My Comment Ind. 254-85 (marked by the EIR starting at 2-5980) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "12. Errors And Omissions As to the 'Statutorily Required Sections' At DEIR #5 and "E. 'Significant Irreversible Environmental Changes' at #5.5."

Of all the many disputed EIR/DEIR refusals to comply with the CEQA requirement to provide a "good faith reasoned analysis" with "common sense" (*e.g., Gray, Banning, Vineyards, and Costa Mesa)* among the most offensive are the "bait and switch" and "hide the ball" tactics the EIR wrongfully deploys when it tries (and fails) to dispute my proof (and offers of proof) that the EIR/DEIR dewatering of the mine activities will have significant, irreversible environmental impacts and changes, because the disputed EIR incorrectly claims (at DEIR p. 5-8): "while the mine would be dewatered, the groundwater would be treated on-site and pumped back into the South Fork of Wolf Creek. Thus, the dewatering does not constitute a 'large commitment of non-renewable sources.'" FIRST, the groundwater owned by us surface owners above and around the 2585-acre underground mine will be drained from our area, subjected to what we dispute as adequately described and sufficient treatment (especially as to the hexavalent chromium added in cement paste to the mine shoring, protested by me above, such as in section I.F.1, Exhibit C, and DEIR Objection 254), and then flushed away from us elsewhere down the Wolf Creek. Among other such objectionable environmental impacts that deprives us

surface owners of our owned groundwater subject to our rights of lateral and subjacent support from that groundwater to prevent subsidence, for the benefit of others in some distant places. See *Keystone.* Adding more water elsewhere and depleting the groundwater needed for wells and our forest above and around the underground mine is of no benefit to us surface owners, and that creates for us such surface owners trespass, inverse condemnation, nuisance, and other claims as described in my DEIR Objection 254 # 3.N, 4, 8, and 14, such as described in *Varjabedian v. Madera* (1977), 20 Cal,3d 285, citing *Richards v, Washington Terminal Co*, 233 U.S. 546 (1914), and concluding (at 298): "If a plaintiff can establish that his property has suffered a 'direct and peculiar and substantial burden as a result of recurring odors produced by a sewage facility – that he has, as in *Richards,* been singled out to suffer the detrimental environmental effects of the enterprise – then the policy favoring the distribution of the resulting loss of market value is strong – and the likelihood that compensation will impede public construction is slight – and a burden unfairly and unconstitutionally impose on the individual landowner."

In this case us surface owners have an even stronger case than the victims in *Varjabedian,* because this mine is not a public benefit project and because the groundwater belongs to us that is being gifted to others down the Wolf Creek to our prejudice for the benefit of a private foreign miner's shareholders. See, eg, *Keystone Bituminous Coal Ass'n v. DeBeneditis,* 480 U.S. 470 (1987) (upholding the constitutionality of laws limiting the amount of underground coal that could be mined to assure sufficient lateral and subjacent support for the surface owner to avoid "subsidence," including by preserving groundwater as part of that surface support. SECOND, the depletion of our such groundwater creates many cited adverse environmental impacts on our surface areas above and around the 2585-acre underground mine, none of which have been subjected to the required "good faith reasoned analysis" with "common sense" (see Gray, *Banning, Vineyard, and Costa Mesa*). Also, the disputed EIR's proposed mitigation, including replacement water for the undercounted EXISTING wells, but ignoring us surface owners' FUTURE wells for our own groundwater being depleted), is illusory both as to not being either sufficient or economically feasible. See *Gray,* rejecting a similar mine mitigation proposal to replace groundwater. See, e.g., DEIR Objections 254 and 255 and objections herein (including Exhibits A and B). THIRD, the alleged EIR/DEIR recharge and balancing claims to restore our groundwater are wrong and illusory, including by denying climate change effects and erroneously claiming that the "current" average rainfall from 1967 to 2017, sets a "current" baseline (even though it ignores the more current drought years after 2017) and incorrectly claims that such past predicts the future, despite such climate change and 24/7/365 dewatering and mining for 80 years. See DEIR Objections 254 and my objections herein to all corresponding disputed EIR "Responses" thereto, including to EIR Master Responses 14, 15, 16, and 33.

The disputed EIR claims that I failed to describe why the DEIR is inadequate has been refuted in many of my objections herein. See my objections to that disputed EIR's consistent evasion that is frankly absurd, since I provide more data than required for such objections, especially given the nature of the errors, omissions, and noncompliance in the EIR/DEIR that themselves are insufficient, speculative, and unsubstantiated. For example, my objections here cross-reference my DEIR Objection 254 #'s 3.A, B, C, D, E, F, G, H, L, M, and N, 4, 5, 7, and 14, all of which explain the impacts and risks and rebut the bogus claims that more specifics are required from me than from them. Also note that, while most

negative impacts are a matter of releasing or activating existing potential problems at the sites, the addition of toxic hexavalent chromium into the mine cement paste shoring (and into the air in mixing preparation, as the asbestos of concern to the NSAQMD in its Agency Letters 12 (at 12) and 11) is a voluntary, new environmental impact of a carcinogen, risking groundwater below and around the 2585-acre underground mine and wherever the Wolf Creek flows with that toxin in it from dewatering. See, e.g., Exhibit C, sections I.D, E, and F, and DEIR Objection 254 #' 3. A, C, D, E, F, G, H, and N, 4, 7, and 14.

In that context and about CEQA Guideline 15126(c), consider what my Objection on this topic analyzed as admissions in the DEIR that support my concerns and expose why the other DEIR/EIR evasions are not only inappropriate, noncompliant, or worse, but how they also impair any credibility for the disputed DEIR/EIR claims to the contrary, such as the DEIR admitting at 5-8 that it would cause certain "irreversible environmental changes:" MORE IMPORTANTLY, DESPITE THE CONSTANT EVASIONS BY THE DISPUTED EIR/DEIR CLAIMING THAT MY OBJECTIONS CAN BE IGNORED AS TOO SPECULATIVE OR UNSUBSTANTIATED, MY OBJECTION AT ISSUE HERE QUOTES DEIR ADMITTING AT 5-6 THAT THIS "PROJECT INVOLVES USES IN WHICH IRREVERSIBLE DAMAGE COULD RESULT FROM ANY POTENTIAL ENVIRONMENTAL ACCIDENTS ASSOCIATED WITH THE PROJECT." (Emphasis added.) Compare also the DIER/EIR errors, omissions, and noncompliance to DEIR at 5-6 admitting that this "project would involve a large commitment of nonrenewable resources," which I contend should include our groundwater under and around the 2485-acre mine owned by us surface owners and users. Keystone and section I.F.8 and 9.

As cited above in my such DEIR Objection 254 relating thereto, the recharge and balancing claims are worse than wrong. Not only do the DEIR/EIR falsely assume that their average rainfall between 1967 and 2017 is "current" for its CEQA baseline (although they wrongly ignore both the dry years after 2017 in that average and climate change as the "new normal"), but the DEIR/EIR incorrectly also assumes that such past predicts the future for 80 years (even though they offer no sufficient substantiation beyond the inapplicable surface water NID data ending 2040 and present only incorrect/inapplicable data before that). Also, the disputed DEIR at 5-6 admits that "the project would generally commit the future generations to similar uses," which supports my repeated arguments about how the no net benefit mine crowds out more desirable residential and business uses and depresses the value of existing surface properties of objectors, as well as discouraging new construction and repair above and around the mine. See also the discussion of wasteful electrical uses at Id.

LLL. Objection To EIR Response (at 2-6024) To My Comment Ind. 254-86 (marked by the EIR starting at 2-5982) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "12. Errors And Omissions As to the 'Statutorily Required Sections' At DEIR #5 and "F. 'Significant And Unavoidable Impacts' at 5.6."

Again, the disputed EIR improperly evades my objections by claiming that my objections are not sufficiently detailed, specific, or explained to require a response, which requires the EIR ignoring both my cross-references and incorporations as well as much of what I said (and the deficiencies in what the DEIR/EIR said to which I am countering and disputing). See, e.g., my

cited DEIR Objection 254 #'s 2, 3, 4, 5, 8, and 14.The disputed DEIR 5.6 is not compliant with CEQA and other applicable law, and I explain why in that context. See sections I.C and D as to the correct view of the rules, and sections I.E and F illustrating their proper applications. Because the disputed DEIR/EIR fails to provide the required "good faith reasoned analysis" with "common sense," the counters and other objections I have stated must be deemed sufficient. In this nonresponsive EIR "Response" (and my objections to disputed EIR Master Response 33 above) the EIR only references what it calls my objections to dewatering drying out the vegetation as a visual impact, when fire and fire smoke hazards and property value issues (eg, the cost of removing mine impacted dead trees and the other consequences of EIR mining on our surface properties above and around the 2585-acre underground mine) loom as more serious impact threats. (The visual impact, however, is substantial unless one considers the sad sight of living in a dead forest somehow tolerable for an area that Sunset Magazine once [2015?] named one of the 10 best places to retire in California [before climate change, PG&E risks, and other fire risks changed that analysis.]) Similarly, the disputed EIR incorrectly claims I did not explain why traffic would be worse, but (besides incorporating others' objections) I detailed, for example, the crushing impact of the 50 to 100 heavy trucks a day coming and going to the mine on roads not made for that kind of abuse would result in constant road repair that would turn two lane roads into one lane roads during such constant repairs, clearly a worsening situation. I also cited Gray, which rejected a mining eir for such reasons. My noise issues are also underappreciated, because they ignore my cross-reference to others' objections on that topic, as explained above.

As to what else the EIR ignores or evades from my such objections, I (with my cross-references and incorporations) sufficiently explain why the DEIR list is understated and unsatisfactory, with many omissions, especially regarding disputed mitigation claims. That is partly the result of the extraordinary 24/7/365 environmental impacts and abuses for 80 years, and such horrors also follow from the fact that, as admitted in Rises SEC filings (see Exhibit B and DEIR Objection 254 #2), the miner lacks sufficient financial to afford the safety actions and mitigations on which the EIR claims to rely, therefore making them illusory, a rebuttal and impeachment issue that cannot be disregarded by that disputed DEIR/EIR. See DEIR Objection 255 and above. See section I.C and D.

Moreover, the EIR also refuses the safe and affordable mitigations, such as "just saying no" to hexavalent chromium being added to the EIR mine shoring cement, to reduce the dangers from that carcinogen addressed in many parts of my DEIR Objection 254 #'s 3. A, C, D, E, F, G, H, J, M, and N, 4, 7, and 14 and throughout these objections to the disputed EIR. I have also demonstrated above the EIR's misleading attempt to assert that incorrect, deficient, and unsubstantiated opinions the EIR added as significant new information requiring recirculation in accordance with section I.A.1.c (e.g., EIR's Response to Comments Ind 254-1 and Appendices Q, O, and R disputed herein), incorrectly claiming such comments were already in the DEIR (which almost entirely ignored the hexavalent chromium threats) and that the EIR merely clarified or amplified them. See section I.F.1 and I.E. Likewise, although the noncompliant EIR ignores my such comments here, providing no "good faith reasoned analysis" with "common sense" on this subject, my objections note that many adverse environmental impacts could be mitigated by reducing the 24/7/365 mining for 80 years to a more customary, appropriate, and tolerable pace and duration consistent with what hour and duration limits are imposed on normal (and much more beneficial businesses). See Grass Valley Agency Letter 8 making such

proposals. However, the EIR/DEIR stated reason for such extreme hours and duration is revealed at 6-14, which asserts that anything less than 24/7/365 for 80 years would make the project economically infeasible. That is reason enough to deny approval of the EIR, since any business that vulnerable has a low chance of surviving that long, especially considering Rise's lack of financial resources admitted in Exhibit B. See also DEIR Objection 254 #2 and Exhibit A hereto. There is no right to make us local victims to suffer for such extraordinary hours and years to satisfy this foreign miner's shareholder/speculators' profit expectations, especially when there is no compliant EIR remediation or mitigation plans for what happens when, for any reason, the mining stops prematurely. See section I.C and D as well as I.F.1-6 and 8 and 9, plus I.E.

MMM. Objection To EIR Response (at 2-6024) To My Comment Ind. 254-87, 88, and 89 (marked by the EIR starting at 2-5983) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "13. 'Alternative Analysis' DEIR at # 6"

I refer any reader to my DEIR Objection 255, to Exhibit B here, and DEIR Objection 254 #2 (each dealing, among other feasibility issues, with the Rise SEC filings (and DEIR 6-14) admissions proving that Rise lacks the financial resources to reliably afford to accomplish the safety, mitigations, remediations, and other operations to be accomplished in the therefore illusory EIR/DEIR, not to mention the working capital to accomplish its own project goals. The disputed EIR here incorrectly refuses to respond compliantly to, or even allow discussion of, those admissions and issues to preserve its disputed illusions in the incorrect "alternative reality" that it has crafted in the DEIR/EIR. However, notice that the disputed EIR/DEIR inconsistently purport to rule out superior, less controversial, and more feasible alternatives to the mine for economic feasibility reasons. In effect, the EIR is claiming that it can veto others' alternatives on that economic feasibility basis, but no one can veto this EIR/DEIR mine on that same basis, despite Rise's such admitted lack of financial resources to accomplish what it states needs to be accomplished. See Exhibits B and A, and my many discussions of this dispute throughout this and my other Objections, particularly DEIR and EIR Objections 255.

In short, the disputed EIR/DEIR fails, misinterprets, and defies the "rule of reason" it cites to CEQA Guideline 15126.6. See my analysis of the CEQA/Guideline rules in sections I.C and D that I illustrate with applications in sections I.E and F. (Since my clarity far exceeds the noncompliant DEIR/EIR claims, assuming that one reads the whole objection and its cross-references and incorporations, I reject again the disputed EIR continuing evasions on the lack satisfaction with my clarity or specifics. For the record, again, the commercial business/warehouse alternative is obviously superior to this and any other mining alternative. Please read the many page analysis of my detailed concerns specifically challenging the disputed EIR/DEIR refusals to engage "in good faith" with my many pages of "reasoned analysis" and "common sense" here, as well as what I incorporated by reference, such as my DEIR Objection 254 #1, 2, 3, 4, 5, 7, 8, 13, 14, and 15, as well as my DEIR and EIR Objections 255 and Exhibits A, B, C, and D hereto.

This admittedly economically fragile EIR mining (Id.) would trigger continuous legal and political conflicts with the thousands of local objectors who correctly regard this mining is incompatible with the best interests of our suburban community and our local property rights and values at risk and worse from this EIR mine for all the reasons stated

in my and hundreds of other objections. That lack of Rise resources and working capital means that the mine will likely stop prematurely for some cause predicted by objections (creating more environmental impacts, since the noncompliant EIR refuses to discuss that situation as "speculation" or otherwise with no tolerable excuse). Among other things that could cause that cessation of operations (e.g., the success of objections in court, law reform, or political remedies, lack of funding, higher mine related costs, finding less gold, regulatory impositions and costs, road and other governmental reimbursements, expensive mine mistakes, accidents, and other predicted problems for which the EIR made no contingency plans, etc.), the DEIR at 6-14 admits that the mine is not economically viable if it cannot operate 24/7/365 for 80 years in accordance with the disputed EIR/DEIR plans. Like Grass Valley at Agency Letter 8, many of us objectors contemplate law reforms, legal objections, and more community conscious officials than anyone approving the mine, each of which would be contrary to the EIR's such "wish list." While the EIR/DEIR considers that speculation, it is less speculative than what Rise admits in its SEC filings are its whole speculative mining ambitions. See Exhibit B and Objection 254 at # 2 and DEIR and EIR Objections 255.

As discussed herein, I am combining my objections to EIR Responses to these Comments Ind. 254 87 to 89 (e.g., to my DEIR Objection 254 #13 that the disputed EIR disaggregated/cut into thirds that it labelled as "Responses To Comments Ind. 254-87, 88, and 89," since my comments are integrated and together defeat those nonresponsive EIR "Responses." Thus, the EIR cites its Master Responses 1 and 7, Response To Comment Ind. 388-6, and EIR Response To Comment Grp 7-82, to which I (and the Comment Grp 7-82 and Ind. 388-6 objectors) have objected on the merits, both initially to the DEIR and (at least in my case) now to this EIR. My incorporated objections from other parties apply here, as do their objections to the EIR evasions here in this disputed EIR Response. See my Table of Incorporated by Reference Objections.

There is no rational mining alternative, but continuing to preserve the status quo since 1956, while limiting the property to safe and appropriate non-mining commercial surface uses. Besides proving that Rise cannot afford to accomplish its disputed and largely illusory EIR project goals, much less what the applicable law will ultimately require for safety, CEQA compliance, and mitigations/remediations, the Rise SEC filing admissions also prove that the shareholders are speculators warned of the many high risks of their investments in the mine. Eg, Exhibit B hereto, DEIR Objection 255, and Objection 254 #'s 2, 3.E and N, 4, 14 and 15. That means, even as a matter of fairness, if not applicable law, it is more important to protect us local residents living above and around the 2585-acre underground mine and who have relied on the closed and flooded mine since 1956 staying inactive, contrasted with those EIR speculators knowingly gambling on the County mistakenly betraying the best interests of their local at-risk voting residents and other resisters.

Among the most absurd on its face DEIR/EIR claims (among many in the EIR/DEIR's disputed "alternative reality") is the disputed DEIR/EIR's incorrect and worse conclusion (at 6-13) to dismiss all less controversial industrial or commercial surface uses, because in their unsubstantiated and incorrect opinion those industrial or commercial surface uses would be "MORE INTENSE" than 24/7/365 EIR blasting, tunneling, mining, dewatering, and otherwise disputing with us surface owners above and around the 2585-acre underground mine who are trying to preserve, among other things, our property values, groundwater, air quality, forests, and rights, way of life, and environment against the real threats to which we have objected and will continue to object. Thus, at the end of

the disputed DEIR discussion (at 6-42) the DEIR correctly concludes (and EIR admits) that: "Based on the preceding alternatives analysis, the Project (No Build) Alternative would be the environmentally superior alternative." But the DEIR/EIR then insists that frees them to choose the next best "environmentally superior alternative," which the disputed DEIR/EIR absurdly claims to be their disputed EIR mining plan, because the commercial/industrial surface alternatives are "TOO INTENSE" (DEIR at 6-13, emphasis added). (The idea of dropping the Centennial alternative plan won't work, because under applicable law as my objections prove (see section I.B), the Centennial plan is not a separate project.)

As my Objection 254 #13 also demonstrates (see EIR at 2-5985-88), the DEIR methodology for "Selection of Alternatives" (6-8 et seq) fails by its own tests when CEQA Guidelines 16126 are honestly applied. See section I.C and D above and DEIR Objection 255. In any case, despite the disputed EIR's speculation and debates, there is no relevant and proper "good faith reasoned analysis" with "common sense" by the DEIR/EIR on this topic (see, e.g., *Gray, Banning, Vineyards, and Costa Mesa*). Therefore, all my cited errors, omissions, and noncompliance in the DEIR/EIR should prevail and remain undefeated by such disputed DEIR/EIR's unsubstantiated and erroneous opinions, speculations, and false assumptions, which are too vague, deficient, and unsubstantiated to comply with CEQA and other applicable law.

Recall that this topic is important to those thousands of us living above and around the 2585-acre underground mine, generally disregarded by the DEIR/EIR in favor of their focus on the Brunswick and Centennial owned sites, because us surface owners need to know what is accurate and credible to say to explain this controversy to any buyer or mortgage lender. What can we surface owners say, for example, to a buyer or mortgage lender? One simple speech might be: "There is a complex and fierce dispute about this the merits and demerits of the EIR and this previously closed and flooded mine since 1956. According to the miner and any relevant minority of voting supporters of the EIR claim there are no problems of concern after the EIR's proposed mitigation to the local community, as alleged in the many thousands of pages of disputed DEIR/EIR data. The great majority of the local community, among others, has and continuously objected (often formally) to the mine, the disputed the DEIR/EIR, and its proponents' disputed claims, including by objectors' citing Rise's many admissions in its SEC filings about Rise's lack of resources and working capital to accomplish its EIR project objectives, projected results, or any of its aspirational mitigations or remediations. See Exhibit B and my Objection 254 #2. If approved, the EIR can be expected to trigger both continuous objector legal challenges and political and law reform efforts to address the concerns in the many objections of us locals who fear soon becoming, as we predicted, victims of not just environmental impacts, but also of health and welfare impacts (see, e.g., Exhibit C regarding the hexavalent chromium menace and danger of our community becoming (or perceived as) another Hinkley, California, of the *Erin Brockovich* movie tragedy, and many other predicted problems causing a depression of relevant home values and our local economics generally. See, e.g., besides the foregoing objections herein, Exhibit A and Objection 254 # 2, 3.N, 4, 14, and 15.

These disputes can be expected to continue until the mining stops, because (i) those competing goals of the two sides are irreconcilable (i.e., profit for the Canadian miner's shareholders versus preservation of our local environment, way of life, health, welfare, and property values), and (ii) us local victims know from science, law, and common sense that the truths concerning us objectors will become confirmed as reality as such harms occur over time as

we predicted and cease to be anything the EIR supporters can ignore or call "speculative." As to such commonsense harms, imagine you are one of the thousands of us local sellers of a home on the surface above or around the 2585-acre underground mine. What do you expect the reaction to be when the seller says, 'Oh, by the way, this mine will be blasting underneath your house 24/7/365 for 80 years, constantly depleting groundwater by dewatering for the mine to flush it away down the Wolf Creek, and they'll be shoring up the mine beneath you with toxic hexavalent chromium cement paste. But our community is resolved to enforce our legal, law reform, and political remedies to stop the EIR mine project." What do we say when they ask, what happens when the mining stops? There is no sufficient answer to that question in the EIR/DEIR." However, the EIR proponents try to spin their alternative reality, normal buyers and lenders have no interest in assuming that kind of risk and even less reason than those of us potential local victims.

NNN. Objection To EIR Response (at 2-6025) To My Comment Ind. 254-90 (marked by the EIR starting at 2-5989) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "14. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "14.A. Some Reasons For the County As Lead CEQA Agency To Reconsider And Accept My Objections As Consistent With CEQA, Even As To The DEIR's Economic Infeasibility, And A Preview of Some Rebuttals To The CEQA Interpretations To Come In a Supplemental Objection" [Which Came As What the EIR Calls Objection 255].

The DEIR incorrectly interprets CEQA too narrowly in its disputed effort to exclude and evade many relevant and essential rebuttals and counters in this Objection. See, e.g., my objections herein to the EIR Master Response 1 and the EIR Response To Comment Ind. 254-1. As has become an unfortunate and evasive pattern throughout the disputed DEIR/EIR, those EIR mine documents continue to ignore or evade the main thrust of my objections, in this case basically contending that the disputed DEIR/EIR can say whatever they want, without regard to (and beyond) their disputed CEQA boundary claims, but that somehow us objectors are not allowed by CEQA to object and rebut that. That error and evasion by the EIR/DEIR are worse than wrong and have resulted in the refusal of the EIR/DEIR to address the many errors, omissions, and noncompliance that I have exposed that specifically counter disputed EIR/DEIR claims, especially as this EIR Response To Comment Ind. 254-90 notes as to my economic feasibility and hexavalent chromium objections. I have insisted on the DEIR/EIR addressing with the required "good faith reasoned analysis" with "common sense" my many objections (like those herein), citing to controlling CEQA authorities such as *Banning, Vineyard, and Costa Mesa. See also Sierra Club v County of Fresno (2018), 6 Cal. 5th 502; POET, LLC v State Air Resources Bd. (2013), 218 Cal. App. 4th 681; and Gray v. County of Madera (2013), 167 Cal. App. 4th 1089 ("Gray").*

Indeed, I often expose such EIR/DEIR errors, omissions, and noncompliance by citing to Rise's own conflicting admissions both in those EIR/DEIR documents and in Rise's SEC filings, as illustrated in *EXHIBIT B* hereto and DEIR Objection 254 #2. The applicable laws, including CEQA, require truth, accuracy, and correctness of everything

said or implied in the DEIR/EIR, and, therefore, that always allows the EIR/DEIR errors, omissions, and noncompliance to be countered by objectors like me, such as in rebuttal or impeachment. The disputed EIR/DEIR simply cannot hide from the inconvenient truths they deny or evade and that I expose in my four Objections or those from my Table of Incorporated by Reference Objections. More importantly, Rise cannot be allowed (as it improperly does repeatedly) to tell the SEC and its speculator/investors something more revealing, impactful, and different than stated in the EIR/DEIR. When the disputed EIR/DEIR tries to forbid me from exposing that claiming economics are irrelevant and beyond the CEQA limits, the EIR/DEIR are violating CEQA and applicable law. See, e.g., section I.C and D explaining the rules, and I.E and F applying those rules to this controversy.

Likewise, the DEIR and EIR must be (but often are not, as I expose) internally consistent. For example, the disputed DEIR/EIR insists that my objections can be ignored whenever they exceed the disputed, limited boundary they set for what they call CEQA interpretations. However, the EIR/DEIR insert disputed claims that the DEIR (and EIR) even calls "Non-CEQA Related Analysis" (DEIR at 4.3-103+). How can they admit asserting such "Non-CEQA Related Analysis" that I dispute, but refuse respond to my counters to such errors, omissions, and noncompliance? See, e.g., section I.C and D explaining the rules, and I.E and F applying those rules to this controversy. See also my DEIR Objection 254 #3.K, and my objection herein to EIR Response To Comment Ind. 254-43.

Similarly, the DEIR admits (at 6-14) that the EIR project is not economically feasible unless it is allowed to operate 24/7/365 for 80 years consistent with its EIR/DEIR plans, i.e., a normal business 12-hour 5 day a week and holidays off schedule imposed on normal (and much more beneficial) businesses would be fatal to this no net benefit project demanding the right constantly to abuse its neighbors and our environment on that extraordinary schedule. See, e.g., Grass Valley's Agency Letter 8 echoing that concern of mine. However, when the disputed DEIR/EIR incorrectly chooses itself among the competing alterative land uses (DEIR #6), as I demonstrated in my Ind. 254-87/Objection 254 #13, the DEIR "opened the door" to examination of this project's economic infeasibility by the DEIR/EIR incorrectly claiming superiority to other uses it claimed were less economically feasible.

OOO. Objection To EIR Response (at 2-6025) To My Comment Ind. 254-91 (marked by the EIR starting at 2-5992) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "14. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "14.B. Supplement To Brief Rebuttals To DEIR Or Miner Incorrect Interpretations of CEQA Or Other Applicable Laws And Open Offer For Further Briefing."

This disputed EIR's "Response to Comment Ind. 254-91" simply acknowledges the fact that the EIR and I each dispute the other's interpretation and violations or not of CEQA under the disputed facts and circumstances. The EIR just cited to its Master Response 1, which I have refuted above and in other objections, including my DEIR and EIR Objections 255. The purpose

of this paragraph objection was to make an offer of proof and further legal briefing for my side of these dispute. The previous subsection (incorporated herein) in which I rebutted the EIR Response to Comment Ind. 254-90 demonstrates why I must prevail (and why the EIR must fail) in such disputes.

PPP. Objection To EIR Response (at 2-6025) To My Comment Ind. 254-92 (marked by the EIR starting at 2-5992) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "14. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "14.B. Supplement To Brief Rebuttals To DEIR Or Miner Incorrect Interpretations of CEQA Or Other Applicable Laws And Open Offer For Further Briefing." And "14.C. Some Other CEQA Noncompliance By the Disputed DEIR, Including As Merely One Example, the Massive Underestimation of Dry Wells And the Illusory And Impractical DEIR Mitigation To Which Even NID Objects."

This disputed EIR's "Response to Comment Ind. 254-92" simply acknowledges the fact that the flawed DEIR/EIR and I each dispute the other's interpretation and violations or not of CEQA under the disputed facts and circumstances. The disputed EIR just cited to all its Responses To Comments Ind. 254-1 through 91, each which I have already refuted above and in other objections, including my DEIR and EIR Objection 255. The purpose of this paragraph objection was to make an offer of proof and further legal briefing for my side of these dispute. The previous subsection (incorporated herein) in which I rebutted the EIR's "Response to Comment Ind. 254-90" demonstrates why I must prevail (and why the EIR must fail) in such disputes.

What that disputed EIR evasion also does is to ignore the examples that I mention here for the EIR/DEIR "alternate reality" claims constructed by what I demonstrate to be errors, omissions, noncompliance (including illusions, false assumptions and equivalences, wishful thinking, "bait and switch" and "hide the ball" evasions, and other objectionable tactics and conduct that form a "pattern and practice" that should doom any pretense of legal compliance by the EIR/DEIR). See my appropriate meritorious objections throughout this Objection with proper cross-references, cited admissions, and quotes that the noncompliant EIR again, as usual, improperly ignores or evades. E.g., DEIR Objection 254 # 3.D, E, F, M, and N, 4, 5, and 8. As I also demonstrated in my Comment Ind. 254-90 above and my objections to the disputed EIR Responses thereto, the EIR/DEIR cannot escape its own admissions (e.g., at 6-14 admitting that the project is economically infeasible any time it cannot constantly (i.e., 24/7/365 for 80 years) risk, impact/abuse, and harm us local neighbors, our property values and rights, our health and welfare, and our environment. For reasons repeatedly explained above and in my other Objections, the disputed EIR/DEIR also cannot escape the groundwater depletion that climate change realities will not recharge and balance as they predict (as distinguished from the illusion that past rainfall "current" averages between 1967 and 2017 are a "current" baseline [ignoring the more current drought years after 2017] for predicting impact of the next 80 years of 24/7/365 dewatering). Similarly, the EIR/DEIR never proves its claimed mitigation will work with the required "good faith reasoned analysis" with "common sense" (e.g., *Gray, Banning, Vineyard, Costa Mesa,* etc.), but instead just present their unsubstantiated, incorrect, and noncompliant

opinions, assumptions, and speculations (often based on unstated, but highly disputed assumptions and admissions I expose and rebut). For example, as I demonstrated in my DEIR Objection 254 and herein, the DEIR/EIR ignores the much broader dry well threat risks (as to both existing and future wells) to us surface owners and users above and around the 2585-acre mine, rather than being limited to the small number of wells along East Bennett Road. See, eg, Exhibit A, which addressed the extra 300 existing wells admitted in the disputed County Economic Report (which is still an insufficient count). As I have explained herein and in my DEIR Objection 254 #'s 2 and 4 (and as admitted in Rise's SEC 10K filings, see Exhibit B hereto), us surface owners have rights down at least 200 feet above and around that 2585-acre mine, and we own the groundwater that is being depleted by the EIR dewatering, which means this is not just a CEQA problem for the mine, but a competing property rights dispute in which us surface owners and users must prevail as described in *Keystone* and Objection 254 #'s 3.N, 4, and 14.

QQQ. Objection To EIR Response (at 2-6026) To My Comment Ind. 254-93 (marked by the EIR starting at 2-5993) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "14. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "14.D. Examples of the Disputed DEIR's Failure To Address the Predictable Future Contradictions To DEIR's Incorrect, False, Or Misleading Alleged 'Facts,' Opinions, And Assumptions On Which the DEIR Purports To Be Justified."

This disputed EIR's "Response to Comment Ind. 254-93" simply acknowledges the fact that the noncompliant DEIR/EIR and I each dispute the other's positions as to the EIR's deficiencies and about hexavalent chromium under the disputed facts and circumstances. The disputed EIR just cited to all its Responses To Comments Ind. 254-1 through 92, each which I have already refuted above and in other objections, including my DEIR Objection 254 #'s 3.C, G, H, and M and 7, as well as my DEIR and EIR Objections 255. The purpose of this paragraph objection was to illustrate certain of my grievances in more detail, which this so called EIR "Response" fails to address, instead referring to such earlier disputed and deficient EIR Responses (and the DEIR) that complained about my lack of specifics, as to which I cited to this DEIR Objection 254 #14 (Ind. 254-90 to 94).

RRR. Objection To EIR Response (at 2-6026) To My Comment Ind. 254-94 (marked by the EIR starting at 2-5994) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "14. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "14.E. Miscellaneous Other Legal Considerations For Defeating the DEIR."

This disputed EIR's "Response to Comment Ind. 254-94" simply acknowledges the fact that the flawed DEIR/EIR and I each dispute the other's positions as to the DEIR's claimed

liability immunity, about the hexavalent chromium menace, and about groundwater depletion under the disputed facts and circumstances. See my DEIR Objection 254 cross-references (wrongly ignored by the EIR) at #'s 3.C, D, E, F, G, H, and M and 5. While the EIR incorrectly claims that I have not provided enough information, I have supplied much more than the deficient DEIR/EIR. The disputed EIR cites its disputed Master Responses 14, 15, and 16, each of which I have refuted above.

Ignoring or evading the applicable court decisions I cite throughout this Objection, disputed EIR cites to *Building Industry Association* v. *Bay Area Quality Management District* (2015), 92 Cal. 4th 369, that I dispute, regard as subject to my contrary cited cases and authorities, and distinguish as inapplicable here, among other things because the EIR ignores the key distinction (at 377-78) that "when a proposed project risks exacerbating those environmental hazards on future users … [that] compels an evaluation of how the future residents or users could be affected by the exacerbated conditions." Here the mine that was closed and flooded in 1956 is exacerbating objectionable risks merely by reopening, shoring with toxic hexavalent chromium cement paste, dewatering 24/7/365 for 80 years to deplete our groundwater by flushing it down the Wolf Creek, and other objectionable activities, plus the new mining menaces, all of which are analyzed. Therefore, that kind of inapplicable precedent will not save the disputed EIR mine from such liability. See also *Keystone* and *Varjabedian*, which focus on the property rights of us surface owners above and around the 2585-acre underground mine ignored by the EIR/DEIR. Moreover, that EIR precedent has no application to block such inevitable claims of surface owners and users above and around the 2585-acre underground mine whose property rights are being violated (eg, as described in Id. and DEIR Objection 254 #'s 3.N and 4), triggering claims for trespass, inverse condemnation, nuisance, etc.

SSS. Objection To EIR Response (at 2-6026) To My Comment Ind. 254-95 (marked by the EIR starting at 2-5995) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "15. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "15A. "How To Achieve Clarity About This Disputed DEIR That Has the Effect of Obscuring Important Truths: Some Reasons For Considering Example Questions Like These As A Means of Organizing The Mass of Useful Objections By Many Impacted Locals On Their Respective Unique Concerns About The Many DEIR Errors, Omissions, And Deficiencies."

This section introduces many hard questions that the DEIR/EIR should have answered if its goal was to comply with CEQA and other applicable law instead of evading them to craft a disputed "alternative reality" with errors, omissions, and other noncompliance. Again, the disputed EIR inappropriately (in this and every other similar evasion in this wrongful pattern and practice) "noted" its disputed "take" on my objections (e.g., understating or misstating some and ignoring or evading others) without any meaningful response and never responding with "good faith reasoned analysis" with "common sense" as required by CEQA (e.g., *Gray, Banning, Vineyard, and Costa Mesa*). I have incorporated my announced supplemental DEIR and EIR Objection s255 and many other objections in my Table of Incorporated by Reference Objections of other potential victims, including beginning from the County hearing on March 24, 2022, and their follow up objections to the DEIR and EIR, and which the EIR wrongly ignores just as it

wrongly ignores my internal cross-references. See, e.g., DEIR Objection 254 #'s 2, 3.E and N, 4, and 14, as well as my objections herein and Exhibits hereto. Such EIR vaguely "noting" some of my such objections is worse than useless because it implies there was nothing of importance at issue when the opposite is true. This also explains some of the many ways that the DEIR/EIR fail to comply with CEQA and other applicable laws. See sections I.C and D stating the rules and E and F applying them to particular examples of EIR/DEIR noncompliance or worse.

TTT. Objection To EIR Response (at 2-6026) To My Comment Ind. 254-96 (marked by the EIR starting at 2-5996) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "15. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "15.B. Examples of Some General Operating Questions About The DEIR And Miner, Reflecting What Locals Distrust As Errors, Omissions, Or Deficiencies," And at "(1) Fact Based Questions Regarding Local Resistance (see my #3.N)." and at "(2) Fact Base of Question Regarding Surface Owner Rights." [Part 1 of 4 as fragmented/cut by the EIR]

This section asks many "hard" questions (framed with relevant context attempting, but so far failing, to prevent EIR/DEIR evasion to most of them) that the DEIR/EIR should have answered if their goal was to comply with CEQA and other applicable laws instead of evading them to craft a disputed "alternative reality" with errors, omissions, and other noncompliance. The responses are worse than disappointing, because the EIR refusal to engage on my such questions is provocative and a violation of CEQA and the applicable laws requiring truth, reality, and consistency in such EIR's. Again, the disputed EIR inappropriately (in this and every other similar evasion in this wrongful EIR/DEIR pattern and practice) "noted" its disputed "take" on my objections (eg, understating or misstating some and ignoring others) without any meaningful response and never responding with "good faith reasoned analysis" with "common sense" as required by CEQA (e.g., *Gray, Banning, Vineyard, and Costa Mesa*). The disputed EIR/DEIR attempts to defend their adequacy by citing to EIR's "Responses To Comments Ind. 254-1 through 254-91, but that accomplished nothing since, as I demonstrated in my objections herein thereto, those "Responses" are nonresponsive, deficient, and worse. That is why I asked these DEIR Objection 254 #15 questions in hopes (which the EIR dashed) of inspiring some more meaningful discussion.

That is especially a problem with the way the DEIR/EIR don't attempt to prove the adequacy of their mitigation, remediation, or other alleged plans or problem solving, but the EIR just repeats what the DEIR said as if "saying it makes it so," when it never does. Sadly, while the EIR vaguely and partially acknowledges some of what it calls my primary objections (e.g., groundwater supply and quality, hexavalent chromium impact, discharges into Wolf Creek, air quality, and (what it calls "the true scope of the project" and what I describe as the evasion of the most important impacts on those of us surface owners and users above and around the 2585-acre underground mine), the EIR continues to ignore and evade our surface owner property rights and values, as well as my authorities for requiring responses the EIR/DEIR evades or refuses to attempt, thus raising many questions in this DEIR Objection 254 #15. EIR's Master Response 2 was overcome by my objections above thereto. The EIR citing to Response To Comment Ind.

254-1 and Master Response 35 also accomplished nothing, because my objections above to those cites should have eliminated them from consideration. Likewise, the cited EIR's Master Response 16 fails to overcome my objections thereto or answer these #15 questions.

One illustration of those EIR failings and evasions on the merits with special focus as a repeated outrage is how the EIR/DEIR willfully disregards my repeated explanations for why I am allowed by applicable law to compel the EIR to respond to my such rebuttals, impeachments, and counters using the SEC filings (eg, Exhibit B hereto and DEIR Objections 254 #2 and 255) and to fully address all of the many Rise or EIR admissions I cite that are contrary to, or in conflict with, its disputed EIR claims. It is simply legally impossible for the EIR or Rise to "have it both ways," such as making claims in one place in the EIR/DEIR that are inconsistent with or contrary to what was stated in those Rise SEC filings (e.g., Exhibit B) or elsewhere in the EIR/DEIR. That is why my objections so frequently quote the EIR/DEIR back at them, since they seem to have made little effort to try and be consistent.

UUU. Objection To EIR Response (at 2-6026) To My Comment Ind. 254-97 (marked by the EIR starting at 2-5996) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "15. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "15.B. Examples of Some General Operating Questions About The DEIR And Miner, Reflecting What Locals Distrust As Errors, Omissions, Or Deficiencies," And at "(2) Fact Base of Question Regarding Surface Owner Rights." [Part 2 of 4 as disaggregated/cut by the EIR]

The context evaded by the disputed EIR to this important question is that I dispute the DEIR/EIR for incorrectly (ignoring the new normal of climate change and the impact of such mining) claiming that the "current" average rainfall between 1967 and 2017 (which it incorrectly chooses as a "current" baseline [ignoring the dry years after 2017]) for the disputed EIR/DEIR's failed attempts to predict the future "recharge" and "balancing" during the next 80 years of 24/7/365 dewatering and mining. Instead of answering the questions about a sensitivity analysis for miscalculation, e.g., what impacts (including subsidence) occur if the recharge were only 80%, 60%, 40%, or 20% of what was incorrectly projected, the EIR dismisses any serious response to that question by just reciting the disputed and nonresponsive EIR Master Response 29, again evading the issue, as my objection to such Master Response 29 already proved.

Also, once again the EIR has cut up my integrated questions in this section #15 for its own disputed tactical purposes. While I will address this last group of nonresponsive EIR "Responses" as it has divided them, I note again that this objectionable EIR tactic cannot be allowed to give any credibility to its constant, bogus claim that such individual divisions of my integrated section lack sufficient detail or explanation, because my comments and questions should be read together (with all incorporations and cross references) as I wrote them.

VVV. Objection To EIR Response (at 2-6026) To My Comment Ind. 254-98 (marked by the EIR starting at 2-5998) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "15. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the

Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "15.B. Examples of Some General Operating Questions About The DEIR And Miner, Reflecting What Locals Distrust As Errors, Omissions, Or Deficiencies," And at "(2) Fact Base of Question Regarding Surface Owner Rights." [Part 3 of 4 as cut by the EIR]

The context evaded by the disputed EIR is that any County approval would be gambling with the health and welfare of us local potential victims, as well as the property rights and values of us owners and users of the surface property above and around the 2585-ace underground mine (which "surface" is admitted by Rise to include at least the first 200 feet down in the EIR and its SEC filings, and we contend groundwater ownership is without limit). Those risks and harms are based on also admitted and other uncertainties as to the conditions in and around the whole mining operation, including those which only exist at such high risk levels because Rise chose not to investigate adequately or claimed that it was not required to "speculate" on the potential risks, threats, and harms, especially as to us surface owners and users above and around the 2585-acre underground mine whose individual property rights may be violated (an issue that cannot be evaded by claims that is beyond CEQA's scope or evaded by incorrectly claiming that disputed uncertainty must be endured by us potential victims). In effect, for no net benefit to the local community above and around the underground mine (and, we contend, the whole County, which will end up suffering for any approval when the mine causes violations and harms as we predict), the County is being asked by this financially risky miner (see Exhibits B and A, as well as Rise's admissions of financial incapacity and EIR infeasibility in its SEC filings, see my Objection 255) to choose between the health and welfare of its residents and their property values and rights (and, consequently, the ultimate financial wellbeing of the County) versus the Canadian miner's shareholder profits (plus some new jobs that are fewer in number than those that would be lost if the mine were approved, especially in businesses relating to the real estate impacts from depressed property values above and around the underground mine and the rest of its operations. See Exhibit A and Objection 255.)

As to the question the disputed EIR has deficiently addressed, all the EIR does is refer me again to the DEIR provisions and Master Responses 7, 14, and 15 to which I have already sufficiently objected above and in my Objection 254. Again, there is no "good faith reasoned analysis" as required by CEQA as confirmed by the controlling case law, such as *Banning, Vineyards, and Costa Mesa.*

Also, once again the EIR has cut up my integrated questions in this section #15 for its own disputed purposes. While I will address this last group of nonresponsive EIR "Responses as it has divided them, I note again that this objectionable EIR tactic cannot be allowed to give any credibility to its constant, bogus claim that such individual divisions of my integrated section lack sufficient detail or explanation, because my comments and questions should be read together as I wrote them.

WWW. Objection To EIR Response (at 2-6026) To My Comment Ind. 254-99 and 100 (marked by the EIR starting at 2-5998) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "15. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "B. Examples of Some General

Operating Questions About The DEIR And Miner, Reflecting What Locals Distrust As Errors, Omissions, Or Deficiencies," And at "(2) Fact Base of Question Regarding Surface Owner Rights." and "(3) Fact Base of Question Regarding Local Law Reforms (See my #3.N) To Clarify And Limit What Constitutes A Nuisance Or Other Wrongs." And at "15.C. Fact Basis of Examples of Specific Questions About the Financial Feasibility of the DEIR Miner Accomplishing the Mitigations Or Other Protections for Neighbors And the Shared Environment Assumed Or Represented In the DEIR, Including As Mitigation" And "15.D. Examples of Specific Questions About the margin For Mine DEIR Assumptions Or Contention Errors And For Changes in Applicable Laws, Regulations, And Circumstances Affecting the Mine." [Part 4 of 4 as cut by the EIR].

As to these questions, the disputed EIR has simply and incorrectly refused to respond, incorrectly declaring my questions to be irrelevant "to the adequacy of the DEIR" or as too "speculative" to require any response. See section I.C, D, E, and F above. Among the many reasons that does not comply with CEQA, as I have explained, is that the DEIR/EIR insists on everything both being approved and continuing as assumed for 80 years exactly as requested and foolishly expected by them, such as, for example (in DEIR admissions at 6-14), approval of mining 24/7/365 for 80 years or else the mine is not economically feasible. Since it is even more speculative and absurd to expect nothing assumed or predicted is to change for 80 years during 24/7/365 mining and dewatering and climate change under continuous opposition by the suffering locals, my so-called questions about changes deserve answers. No responsible business would plan and operate without a contingency plan for change, and my assumption as to why this EIR/DEIR refuses to have any such plan (much less a compliant remediation plan) is that they have no safe alternative, especially with no feasible mitigations.

My questions also ask, in effect, what happens when such essential DEIR/EIR assumptions and expectations are wrong or the conditions or circumstances change, as most objections predict? In effect, if the conditions for any reason (and I have suggested various likely such reasons) do not match what the DEIR/EIR assumes, we need to know what the consequences will be. For example, if they start the mine and then the mining stops, what are the environmental impacts and other consequences? Again, there is no "good faith reasoned analysis" with common sense as required by CEQA as confirmed by the controlling case law, such as *Banning, Vineyards, and Costa Mesa.* Also, since the NSAQMD insists (Agency Letters 12 at 12, and 11) on frequent daily watering to suppress the toxic fugitive dust, what happens when they shut down that operation?

Likewise, EIR approval depends on acceptance of disputed "mitigation" commitments that are demonstrated by my objections to be false, insufficient, deficient, illusory, unfeasible, or otherwise not compliant, credible, reliable, continuous, or achievable. My questions offer the DEIR/EIR an opportunity to explain themselves, but they refuse and, instead, stand on their objectionable and unsubstantiated claims, which means there is no such mitigations to support approval of the DEIR and EIR. Also, even if the EIR/DEIR were to ignore my substantive questions, they cannot ignore the risk of what impacts result when change occurs, and their assumed conditions and mitigations no longer exist on which the EIR/DEIR tried to rely as continuously unchanging for 24/7/365 for 80 years, when that is preposterous, and not just for

climate change, changes in applicable laws sought by us potential victims, but for any other reason.

Also, once again the disputed EIR has disaggregated/cut up my integrated questions in this section #15 for its own disputed tactical purposes. While I will address this last group of nonresponsive EIR "Responses" as it has divided them, I note again that this objectionable EIR tactic cannot be allowed to give any credibility to its constant, bogus claim that such individual divisions of my integrated section lack sufficient detail or explanation, because my comments and questions should be read together as I wrote them.

XXX. Objection To EIR Response (at 2-6027) To My Comment Ind. 254-101 (marked by the EIR starting at 2-6001) And PART OF AN INTEGRATED OBJECTION Correctly Entitled: "15. Some Additional Legal Issues For Follow-Up Consideration By DEIR Decisionmakers in Addressing Disputes Between the Mine Versus Those of Us Living Above Or Around the 2585-Acre Underground Mine." And at "15.E. Examples of CEQA Related Questions About Deficiencies And Noncompliance."

As to the question the disputed EIR has deficiently addressed, all the EIR does is refer me again to the DEIR provisions and Master Response 29, to which I have already sufficiently objected above and in my DEIR Objections 254 and 255. Then the disputed EIR refers me to all of its "Responses to Comments Ind. 254-1 through 100," as to each of which I have made meritorious objections above. Again, there is no "good faith reasoned analysis" with "common sense" as required by CEQA as confirmed by the controlling case law, such as *Gray, Banning, Vineyard, and Costa Mesa.*

As to most of these questions, the disputed EIR has simply and incorrectly refused to respond, declaring my questions to be irrelevant "to the adequacy of the DEIR" or as too "speculative" to require any response. Among the many reasons that does not comply with CEQA, as I have explained, is that the DEIR/EIR insists on everything both being approved and continuing as assumed for 80 years exactly as requested and foolishly expected by them, such as, for example (at DEIR at 6-14), approval of mining 24/7/365 for 80 years or else the mine is not economically feasible. Since it is even more speculative and absurd to expect nothing assumed or predicted in to change for 80 years during 24/7/365 mining under continuous opposition by us suffering locals, my so-called questions about changes deserve answers. No responsible business would plan and operate without a contingency plan for change, and my assumption as to why this EIR/DEIR refuses to have any such plan is that they have no safe alternative, especially no feasible mitigations or remediations.

IV. Instead of Maintaining the Burdens of Proof And Persuasion Where They Belongs on the Miner Applicant (section I.A.1.b), the Disputed EIR/DEIR Would Incorrectly Shift Them To Us Potential Victims, Especially On the Disputed Theory That Whenever the Data Is Allegedly Uncertain There Can Be No "Speculative" Objections Allowed, So That The Miner Somehow Can Insist On Doing Whatever It Wishes Without Responding to Objections With the Required "Good Faith Reasoned Analysis" And "Common Sense" Required By Applicable Law, Even When It Is The EIR/DEIR Itself Speculating, Asserting Unsubstantiated And

Erroneous (Or Worse) Opinions Or Assumptions, Evading Or Contradicting Its Own (Or Rise's) Admissions, Or Otherwise Inviting My Rebuttals Or Impeachment.

My foregoing commentary has illustrated many examples of how any County approval would be gambling with the health and welfare of us local potential victims, as well as harming our property values and rights of us owners and users of the surface property above or around the 2585-acre underground mine (which "surface" is admitted by Rise in its SEC 10K filings to include the first 200 feet down). Despite admitted and other uncertainties, including those which only exist at such high risk levels because Rise has chosen not to investigate adequately or has claimed that it was not required to "speculate" on the potential risks, threats, and harms, especially as to impacts on us surface owners and users above and around the 2585-acre underground mine whose individual property rights would be violated (an issue that cannot be evaded by claims that is beyond CEQA's scope or evaded by incorrectly claiming that disputed uncertainty must be endured by us potential victims and that our legal and political remedies can be ignored as speculative). See *Keystone* and *Varjabedian.*

In effect, for no net benefit to the local community above and around the underground mine (and, we contend, the whole County, which will end up suffering for any approval when the mine causes violations, impacts, and harms as we predict), the County is being asked by this financially risky miner (see Exhibits B and A, as well as Rise's admissions of financial incapacity in its SEC filings addressed in my DEIR Objection 254 #2) to choose between the health and welfare of its residents (and, consequently, the ultimate financial wellbeing of the County) versus the Canadian miner's shareholder profits (plus some new mine jobs that are fewer than those that would be lost if the mine were approved, especially lost in businesses relating to the real estate impacts from depressed property values above and around the underground mine and the rest of its operations. See Exhibit A and DEIR Objection 254 #4.) Also, note that most of the disputed EIR/DEIR purported "expert" opinions are either (i) based on incorrect, speculative, or otherwise flawed foundations or assumptions (and are subject to objections under the law of evidence in the litigation following any disputed EIR approval), or (ii) qualified by impermissible standards like "generally" or "likely" that leave us potential victims at material risk, especially to subjective pro-mine standards of magnitude, or that are flawed by incorrect, unsubstantiated, or worse assumptions, opinions, or theories, such as about what is "similar" or what may be true in one place at issue (e.g., the lower elevation, wholly owned mine or East Bennett Road area, versus the even more critical, higher areas above or around the 2585-acre underground mine where us surface owner-objectors live. See, eg, my objections above to the related Master Responses and to specific responses to those parts of my Objections.

Even more importantly, Rise admits in its SEC filings (eg, Exhibit B and my Objection 254 #2) that it lacks the financial resources needed for capacity fully and timely to perform the EIR project goals and the mitigation aspirations therein, making all its safety and other reassurances illusory. Such Rise financial vulnerability that makes mitigation and other safety commitments illusory is also apparent in the DEIR at 6-14, when it admits that the whole project is economically infeasible if it cannot operate as it proposes in the DEIR/EIR 24/7/365 for 80 years. (Note that above the EIR/DEIR also refuses to address as speculative and irrelevant my objections, questions, and concerns about all of the many likely changes and other reasons that likely could prevent such 24/7/365 mining for 80 years, as most of us impacted local may cause

by advocating by our legal, law reform, and political remedies to defend ourselves and our property from the impacts to which we are objecting.) The disputed County Economic Report (see, e.g., Exhibit A and my DEIR Objection 254) accepts the erroneous Rise theory that any miner who replaces it (eg, the Rise "flip" miner some suspect has been or will be "behind the curtain,") will accomplish what the EIR/DEIR incorrectly expects Rise to somehow be able to do, despite its admitted lack of resources. However, that replacement miner will likely follow the standard tradition in the mining industry, especially with foreign miners, of using "shell" mining subsidiaries which (like Rise) have no material assets besides the disputed mine, so they can evade accountability when they abandon the exhausted or failed mine in or outside of bankruptcy, a reality on which I can provide competent testimony from my long personal experience as a bankruptcy lawyer with all the needed qualifications addressed in section 1 of my DEIR Objection 254.

I will not repeat all the other things I said in the various parts of my DEIR Objection 254 #5 and in my corresponding objections herein with respect to the disputed EIR "Responses," since those objections so improperly so ignored, misstated, or evaded by the disputed EIR/DEIR are more than sufficient to prevail over the EIR/DEIR. As almost everywhere else in my EIR/DEIR objections and DEIR Objections 254 and 255, my EIR/DEIR objections battle the EIR (and, at least where they overlap, my objections to the County Economic Report—See Exhibit A), because the County Economic Report erroneously assumes without analysis the compliance, correctness, and sufficiency of the DEIR), the EIR/DEIR ignores or evades entirely many of my inconvenient truths and objections, including almost in every case by improperly failing to provide any "good faith reasoned analysis" with "common sense" as required by CEQA court authorities (e.g., *Gray*, *Banning, Vineyard, and Cost Mesa)* as to situations where the DEIR or EIR asserts mitigation (almost always without any substantiation) or incorrectly claims my objections are too speculative or unsubstantiated, even when (as is often the case) I quote admissions by the EIR/DEIR or Rise SEC filings (see Exhibit B) or where I am exposing an even more speculative or unsubstantiated DEIR/EIR claim. Likewise, in another "bait and switch" tactic, the disputed EIR/DEIR continues to insist incorrectly on predicting the future from the past or what it falsely calls "current" conditions (eg, judging "current" average rain fall from the period between 1967 and 2017, before climate change drought years after 2017.)

V. Rebuttals To Disputed EIR Claims (at 2-1 and elsewhere) That It Does Not Need To Be Revised Or Recirculated, Because The Changes Are Merely "Minor Clarifications Or Amplifications And/or Do Not Constitute Significant New Information." But See Section I.A.1.c, I.C and D, and I.F.8 Above.

That disputed EIR argument in various place (eg, 2.3 at 2-145) is incorrect or worse when it asserts, without satisfying its burden of proof or "good faith reasoned analysis" or "common sense," that: "the changes to the analysis contained in the DEIR represent only minor clarifications/amplifications and do not constitute significant new information." My contrary proof, analysis, and opinions against such disputed EIR claims are especially true as to the many material omissions and evasions of what is required in the EIR/DEIR for compliance with CEQA and other applicable law since any correction of such omissions in the EIR must constitute "significant new information" and be more than "minor clarifications/amplifications." See section I.A.1.c and I.C and D. My foregoing and other objections (including those of others I incorporate) demonstrate why and how material EIR/DEIR revisions were made (or are still

required to be made) that mandate recirculation (Id.), as I stated in an earlier commentary near the beginning of this Objection. The most revealing evasions, revisions, and violations by the EIR/DEIR are those addressed above and in my DEIR Objection 254 regarding toxic hexavalent chromium, which topic the disputed DEIR almost totally ignored (without any mention at all as required in its Hazards And Hazardous Materials section 4.7) and the disputed EIR falsely pretends its attempted and still erroneous, insufficient, and otherwise flawed comments just clarifications from the DEIR. More importantly, the EIR/DEIR still fails to correct many errors, omissions, and other noncompliance addressed in this Objection, my prior DEIR Objections 254 and 255, and those by other objectors (see my Table of Incorporated by Reference Objections below). Note also that many such errors, omissions, and noncompliance on one issue (e.g., groundwater or hexavalent chromium use) will have multiple consequences throughout the EIR/DEIR, because, among other things, the EIR/DEIR splinters a common issue into many parts so as to reduce the appearance of "significance" for an isolated change, error, or omission (often incorrectly labelled by the EIR/DEIR as "minor" or "not significant" or as a "clarification "or "amplification," when it's actually an integrated part of a major revision or otherwise "significant new information" requiring revisions and recirculation. See section I.A.1.c and I.C and D.

Thus, one constant question is whether this disputed EIR added "significant new information" to the disputed DEIR. CEQA #21092.1, Guideline # 15088.5(a); *Laurel Heights Imp. Assn. v. Regents of the University of California* (1993), 6 Cal.4th 1112, 1124. Whether or not the County decides to recirculate the EIR, the required revisions to the EIR/DEIR still may (and would) be challenged with legal, law reform, and political remedies. Not to so revise and recirculate in this case would be an abuse of discretion by the County triggering legal, political, and law reform consequences. E.g., *Banning*, 2 Cal.5th at 942. My rebuttals herein to the EIR demonstrate further reasons for revising and recirculating the EIR/DEIR besides those explained earlier in my DEIR Objections 254 and 255.

Although it was not published by the court, for these purposes the County should consider the wisdom of Protect Our Homes And Hills v. County of Orange, Cal App G054185 filed 10/13/17, because it properly recognized the special circumstances for that subdivision project (as apply here) regarding fire and smoke risks in our high fire/smoke risk environment. As with our disputed EIR/DEIR, that deir claimed that all project impacts would be reduced to less than significant levels after implementation of mitigation. As here, there were thousands of objections to the DEIR, but the County nevertheless just approved the deir as the eir without recirculation on the same incorrect theory alleged here that the changes were merely clarifications, amplifications, elaborations, or minor modifications to the deir. The court required revisions by mandate with respect to the disputed environmental settling, fire hazard mitigation, and water demand and supply. All those eir flaws and noncompliance apply here to this EIR as well. As here, the project setting description was deficient, as ignoring 2300 acres of adjacent CJSP lands and failing to correct the inaccurate and misleading maps so that readers could use them to identify locations at risk. The court also rejected the eir defense that some maps were "historical," noting that some false maps were created for the FEIR. The same is true here, despite my objections and those of others (e.g., the State Department of Parks And Recreation protesting the map errors and omissions relating to its adjacent property like the Empire Mine Park) to the disputed EIR/DEIR not identifying surface streets and addresses so owners would know where their properties were located in relation to the blasting, tunneling, digging, dewatering, and other mining under their homes.

VI. Some Practical Consideration On Why Any EIR Approval Is So Provocative And Intolerable, Besides All the Environmental Impacts.

Also please consider the many practical dilemmas the EIR mining would create for us surface owners above or around that 2585-acre underground mine, For example, any such surface home seller will be obligated to disclose such known risks to any buyer (or to any mortgage lender's appraiser). What do we say? Do we give those assessing such risks a computer thumb drive containing the disputed EIR/DEIR and all its objections and say, "you figure it out?" If the EIR were mistakenly approved, that would not likely salvage our crashing property values or ease the risk stigma we already suffer. See, for example, Exhibits A and D and the incorporated Group Letter 15 from the Nevada County Association of Realtors. If approved, some seller might try to rely on the disputed EIR/DEIR, suggesting, in effect, that the buyer (or mortgage lender or appraiser) trust the County's judgment in approving the EIR, despite all the meritorious objections to the disputed EIR/DEIR and the additional challenges that approval would incite based on not only the existing objections but also on the evidence that would be added through discovery and more expert witnesses being added to the oppositions. However, what buyer (or mortgage lender or appraiser) will dare assess that EIR mining impact risk at zero? It is not unreasonable to expect painful discounts and, if the spooked mortgage lenders won't fund the buyers' purchase prices, the real estate market will freeze. Any inevitable risk discount will harm us surface owners and make this into more than the usual CEQA environmental dispute of the kind addressed in *Gray, Vineyard, Banning, Richmond v. Chevron*, and the other cases discussed herein and in most such environmental conflicts. What is unique is that us objectors include surface owners with competing property rights (as illustrated in my cited *Keystone* Supreme Court decision) and claims (as illustrated in the California Supreme Court case of *Varjabedian v. Madera*).

What makes this dispute almost unprecedented in this context (i.e., more than the usual CEQA dispute) is that, in the face of so many meritorious local objections in such a suburban area, few local governments would ever attempt to impose such an (at best) no net benefit mining menace on thousands of such impacted and righteously objecting surface homeowners and voters (not to mention businesses, a hospital, an airport, churches, and other community members), especially under these speculative, risky, and, at best, uncertain/uninvestigated circumstances, especially with such an admittedly (see Exhibit B), financially challenged Canadian miner. Why force on us such a reopening of a mine in such an (at best) uncertain condition that has been closed and flooded since 1956 (plus the Centennial part of the project that indisputably is confirmed as a toxic dump)? Even if (as so far seems the case) government chooses incorrectly to limit its investigation to a narrow and disputed interpretation of CEQA to give the EIR applicant the undeserved benefit of massive doubts and ignore the EIR applicants burden of proof, EIR approval would at least impose on us local objectors many dangerous and indisputable unknowns, uncertainties, and risks (and objectors have proven, and will continue to prove, much worse impacts, uninvestigated threats, and deficient mitigations and remediations; e.g., remember Hinkley, CA, hexavalent chromium, and Erin Brockovich?), all of which (even just from such stigmas) depress our impacted property values, especially those of us most exposed to the massive 24/7/365 dewatering and mining activities for 80 years beneath the surface where we thousands live or work above or around that 2585-acre underground mine. (Note that, despite demands by me and others in our objections, the EIR still refuses to identify

with adequate maps our specific individual surface locations [e.g., by streets we can see under their forest obscured aerial photos] in relation to the underground mining.)

However, even more damning than the environmental objections to the EIR/DEIR is the fact that, so far, the County has refused to consider the economic infeasibility of this EIR mining as somehow outside the CEQA boundary (even as rebuttal or impeachment to EIR/DEIR statements with Rise SEC and other admissions that will prevail in any court challenges, as shown in *Richmond v. Chevron*, discussed at length herein.) As shown in Exhibit B, the Rise SEC filings and financial statements (with the accountant's "going concern" doubts' qualifications) admit the reality that Rise lacks the financial resources to afford what it aspires to accomplish (or, even more importantly, to mitigate and remediate) in the EIR/DEIR. See Exhibits A (my rebuttal to the County Economic Report contesting its incorrect assumptions, without independent investigation, that the disputed EIR is generally correct) and B (excerpts of the Rise SEC filings admitting many risks, problems, and issues that should have been addressed in the EIR/DEIR but were not.) Everyone most at risk knows that reality (except, apparently, our County government so far refusing to consider that economic feasibility challenge that the courts will certainly consider in our rebuttals to any EIR approval, as the *Richmond v. Chevron* case demonstrates): the disputed EIR incorrectly evades discussing that critical issue, since we will all be worse off, if the project starts, even when it stops for any of the many probable reasons.

Considering both (i) the miner's admitted financial condition and the lack of proven sufficient gold to be recovered (e.g., SEC filing financials and mining/investor risk admissions in Exhibit B), and (ii) the massive startup costs and long delays before sufficient mine revenue, if any, to cover costs, ask yourselves which is more speculative: (a) that the mining stops prematurely for lack of working capital (or for legal, law reform, or political remedy reasons involving objections), or (b) somehow the miner finds the massive amounts of money needed to perform the EIR before any gold is recoverable? Consider my rebuttal to the County Economic Report (Exhibit A), because the County hasn't yet considered such issues on the merits, but instead, so far had evaded them on the astonishing, incorrect, speculative, and disputed theory that, even if Rise cannot afford to perform the EIR, some successor will arrive to do so. As a legal expert on failing mines (see section I.A.2), if this EIR were mistakenly approved, I am confident that any court will admit our rebuttal and impeachment evidence to defeat such EIR attempts to evade the fact that, besides general economic infeasibility, none of the purported EIR mitigation measures (not to mention those that would be required when the significance of all the CEQA impacts are correctly determined in challenges) are economically feasible, either for Rise or, experts can prove, a similar successor. See Exhibits A (including the reality that any successor replacing Rise will also be unlikely to risk mining with a subsidiary capable of funding all the EIR work, because that is not how the mining industry operates in such high risk and speculative situations as are admitting in Rise's SEC filings) and B (Rise's SEC filing admissions I discuss). Even if some financially responsible miner were willing to bet its sufficient assets on this speculative gamble (admitted as such in those Exhibit B SEC filings), which is unsubstantiated, hard to imagine, and a clear example of inadmissible speculation, this mining will still be infeasible when it has to comply with a revised and recirculated EIR that addresses all the many meritorious objections. See for example, what is admitted in the DEIR itself (at 6-14), where it admits the project is not economically feasible if the mining is not permitted 24/7/365 for 80 years in accordance with the disputed EIR/DEIR.

VII. Concluding Comments.

In this Objection, as well as in my incorporated DEIR Objections 254 and 255 (none of which have been cured), I have exposed many relevant errors, omissions, and other noncompliance in the EIR/DEIR, many of which the disputed EIR has refused to address on the merits or at all on the erroneous or worse theory that my objections are too insufficiently explained, unsubstantiated, or speculative to require any response. What I have attempted to do in this objection (and in my DEIR Objections 254 and 255) is to prove (i) what I can of the adverse environmental impacts, recognizing that the miner (and those EIR/DEIR team with whom Rise is collaborating) have exclusive control of (or the sources of) much of the core data and evidence which only becomes available to us potential victim-objectors as discovery in any court challenges that become necessary if and after the EIR is mistakenly approved. In such judicial dispute process circumstances, we potential victims can further enhance our proofs of what should be obvious to any objective reader: our objections must defeat the EIR/DEIR, whose massive errors, omissions, evasions, noncompliance, and worse too often failed to provide sufficient "good faith reasoned analysis," "common sense," and truth to satisfy CEQA and other applicable law.

Among the DEIR/EIR's most common and serious omissions and evasions are the disputed EIR/DEIR claims of mitigation, which generally lack "good faith reasoned analysis" and "common sense," such as demonstrated in the similar mining case of *Gray v. County of Madera,* where (on less compelling facts than exist here) the court rejected the proposed *Gray* mitigation proposal for replacing the neighbors' wells depleted by the mining impacts on groundwater. The disputed EIR/DEIR mitigation proposals are often not just wrong or noncompliant, but unrealistic or worse, and, even more clearly, are much more speculative and unsubstantiated than my objections thereto. Again, while the burden of proof and CEQA compliance are on the EIR applicant (section I.A.1.), this EIR/DEIR tries to shift them to objectors like me, so that the EIR/DEIR incorrectly can dismiss objections with such disputed excuses. Such incorrect EIR/DEIR refusals to present CEQA compliant "responses" should defeat any chance for EIR approval, as well as EIR/DEIR's other noncompliance, errors, and flaws on the merits.

Moreover, even when the EIR/DEIR does purport to "respond" to my objections on the merits of impacts and issues in dispute, too often again the disputed EIR fails to provide that "good faith reasoned analysis" with common sense required under the circumstances by CEQA and other applicable law (e.g., *Gray, Banning, Vineyard, and Costa Mesa). (That applicable law includes the law of evidence that will apply in any court challenge of any mistaken EIR approval, thereby, for example, both allowing rebuttals and impeachment from the objections that the EIR evaded and excluding as inadmissible or otherwise discounting much of what the EIR/DEIR presents as if it were "evidence" instead of disputed assumptions, opinions, or speculations.* Even worse, the EIR/DEIR entirely avoid any of my concerns about the infeasibility of the EIR/DEIR, some of what the EIR/DEIR evades are its own admissions, such as what Rise has admitted in its SEC filings should be added to, analyzed in, and reconciled somehow with conflict with, the DEIR/EIR. See Exhibits B and A hereto and my DEIR Objections 254 and 255. As proven in *Richmond v. Chevron* (as demonstrated in section I.C and D), where such SEC filings enabled the eir objectors to prevail in defeating that eir, the applicable law (that CEQA does not change) always allows such rebuttal and impeachment to expose the truths. That, plus

many objections on the merits and reality, should prevent approval of this EIR. (Exhibit A also challenged much of the County Economic Report, which incorrectly assumed, without investigation or consideration of our objections, that most things in the DEIR were true, complete, and sufficient. Note, however, that occasionally that Report still exposed some DEIR errors that need to be reconciled with the inconsistent EIR/DEIR, such as when the EIR/DEIR lists many more existing wells at risk than the DEIR/EIR analyzes and expects to mitigate, although that Report still finds fewer wells than are now actually at risk and, like the EIR/DEIR, incorrectly ignores all the many future wells that surface owners like me living above or around the 2585-acre underground mine should be expected to drill as needed to save our homes, forests, and, ultimately, our community from both the EIR mining and climate change ignored or denied by the EIR/DEIR but included in CEQA. See section I.C and D above, discussing the 2018 Guideline Amendments Explanations.)

Readers should focus on this key reality to avoid being confused or misled by the EIR/DEIR. The burden of proof is on the EIR (not potential victims like me) to provide a "good faith reasoned analysis" with "common sense" that complies with CEQA and other applicable law, which I demonstrate herein that the EIR repeatedly failed to do, just like my DEIR Objections 254 and 255 demonstrated that the DEIR failed to do. Nothing in the EIR or DEIR defeated any of my material objections, in which objections I am not necessarily required to prove any contrary environmental impacts or the contrary truths rebutting the disputed EIR/DEIR claims. CEQA allows me to defeat the EIR/DEIR merely by proving (as my objections do, while still contesting the impact merits) that the EIR/DEIR fails to satisfy the requirements of CEQA (e.g., see section I.C and D as to the rules, and I.E and F illustrating their applications). I can also do that by demonstrating (as I do in my rebuttals and impeachment) either that the EIR/DEIR is so noncompliant, or that the EIR/DEIR lacks the required "good faith" or "common sense" in its statements, by showing how they are untrue, preposterous, evasive, misleading, deficient, or worse.

Before I retired from a long, national and cross-border bankruptcy practice at Morrison & Foerster in 2016, I had extensive experience with failed and bankrupt mines, both directly in mining cases and indirectly through my insurance insolvency and other work, as I detailed in my DEIR Objection labeled Individual Letter 254. Although that qualifies me as a competent witness in various aspects of these mine disputes, those preparing the EIR (and County Economic Report-see Exhibit A) are generally failing to address my counters and issues. Sometimes the EIR/DEIR "tactical" evasions (as the old saying goes) "would be funny, if they weren't so sad." See Exhibit C and the EPA hexavalent chromium websites for more technical data ignored by the EIR/DEIR, perhaps because of the DEIR's general evasion of the problem and, once exposed in my DEIR Objection 254 (e.g., #'s 3. A, B, C, E, G, H, 7), the EIR seems conflicted between (i) continued evasion of these toxic impacts [see Exhibit C and the EPA websites], and (ii) saying something (which turned out to be the deficient and noncompliant statements I rebut in my objection to the EIR's obscure "Response to Comment Ind. 254-1 above and in my various disputes with the EIR's unheralded Appendices Q, O, and R buried at the end of the 7000 plus page EIR without CEQA compliant linkage and analysis, apparently fearing to attempt a more adequate analysis, because that would add to my and other objectors' arguments for revision and recirculation of the EIR. See I.A.1.c and I.C and D above.) For example, I exposed the way the DEIR obscured the use of toxic hexavalent chromium in the mine shoring cement discussion in the DEIR, instead of in the "Hazards And Hazardous Materials" discussion (4.7) where it belonged under CEQA, assuring (if the EIR were mistakenly approved) a "case

study" replay of how that hazardous substance killed Hinkley, CA, and many of its residents as illustrated by Jane Fonda in the *"Erin Brockovich"* movie. See, e.g., www.hinkleygroundwater.com with links to the story but now still discussing the struggle to remediate that groundwater still after all these years. Now, at the very end of the EIR (Vol. IX, Appendix R- see also Q and O), the EIR adds a disputed, one-page memo weirdly discussing hexavalent chromium as an admitted cancer causing, **air pollution** issue (see NSAQMD Agency Letters 12 (at 12) and 11) and ignoring all the EPA studies that my DEIR Objection 254 cited in its potentially more lethal role in **water pollution**. See Exhibit C.

Such things create massive credibility problems for the EIR/DEIR (see, e.g., sections I.A.1.d and I.F.1-5 above disputing EIR/DEIR tactics and noncompliance). I can only hope that our present elected officials will more carefully consider fully all of the many meritorious objections before it becomes necessary to test the EIR in other forums. See Table of Incorporated by Reference Objections and Exhibit D. Thank you for considering my concerns, which I assure you are shared by virtually everyone I know living above and around the 2585-acre underground mine, although many do not yet fully appreciate their peril, either because they assume government is too wise to approve this EIR or they assume they are at a safe distance. Note: many of us surface owners fearing impacts do not know our precise exposure locations, despite my and many other DIER objections to the inadequate mapping in the EIR/DEIR that fails to identify the surface boundaries of the underground mine by street addresses or other understandable landmarks, which CEQA noncompliance the EIR does not cure (see also the California Dept of Parks And Recreation objections in Agency 1). Whatever else the County decisionmakers do, they should at least insist on precise disclosure for due process notice to all those living above or around the 2585-acre underground mine, including everyone on Banner Mountain whose groundwater, property values, and environment are at risk even if the mineral boundary is slightly below us. Anyone in our community trying to sell or finance his or her property needs to know precisely what to tell the buyer or lender, since the reaction of everyone will be to create a vast mine "stigma area" based on the wise saying that it is better to be safe than sorry when confronting such risks. See Nevada County Association of Realtors Group Letter 15.

In my significant experience with failed or bankrupt mines (and their insurers), de facto or actual self-regulation of mines is worse than unwise. Effective monitoring with public transparency and public monitoring opportunities is essential to avoid "unhappy surprises" and detect dangerous trends to prevent smaller noncompliance to lead to major problems. While there were some predators in that industry, many who caused environmental crises from their mining seemed to be more often gambling on short cuts to save money or to keep mining when their funding is about exhausted. (I use the term "gambling" for two reasons: first, because that speculator passion is inherent in many miners' mindsets and culture; and second, because miners from distant places (i.e., not our local community miners) are less risk adverse gambling with locals' safety and property values, because their own health, safety, welfare is less at risk and they are used to gambling with their high-risk-speculator/investors' money. See my Exhibit B SEC filing comments and ask yourself why a responsible government would risk us to such a situation unsuitable even for normal stock investors (as distinct from high-risk speculators.) Therefore, experience teaches (at least for those like me whose experiences have made them cynical) that government regulators must take special care when they confront the combination of environmentally dangerous mining conditions (or uncertain conditions that

may be dangerous) and financially distressed miners making promises of future mitigation and safety measures they admittedly cannot presently afford (see Exhibits A and B). So far, I see no evidence of such caution by government in this case, and the DEIR/EIR (and County Economic Report) should not give this EIR mine the unearned and unsafe benefit of the doubt and overlook its massive burden of proof, and instead should heed the many meritorious objections, few of which are satisfactorily addressed in the EIR responses, as this and other objections demonstrate. Please protect our community and deny approval of this mine reopening.

Table of Exhibits

A. My Objections To the County Economic Report

B. Selected Admissions From Current Rise Gold Corp SEC Filings

C. Hexavalent Chromium Issues Evaded In the EIR/DEIR For Noncompliance CEQA, And More Foreseeable Harms At And From The Idaho-Maryland Mine

D. Some Illustrations of Issues of Concern To Be Incorporated From Other Objections.

Table of Incorporations By Reference Into My Objections. (See also Ex. D)

After review and consideration, I have incorporated (to the extent explained herein) other persons' and groups' objections into (i) the foregoing "EIR Objection 254," including as to my Exhibit A comments on the County Economic Report, as well as in my three other "Objections;" i.e., (ii) my "DEIR Objection 254" and (iii) "DEIR Objection 255," which the EIR labeled as #'s Comment Ind. 254 and Comment Ind. 255, and my "EIR Objection 255" countering the disputed EIR "Response To Comment Ind. 255. I consider the incorporated parts of such objections to be meritorious and to benefit objectors' collective search for the truth about the EIR/DEIR mine to counter the "alternative reality" presented for County approval by the disputed EIR. In each case I am incorporating what portion of such other's objection describing EIR or DEIR errors, omissions, deficiencies, noncompliance with CEQA or its Guidelines, and other objectionable EIR or DEIR claims, allegations, opinions, speculations, and other purported facts or information, as well as Rise or EIR or DEIR contributors' admissions supporting my objections, including such incorporations. Examples of my incorporated concerns are included in **Exhibit D.**

However, to avoid conflicts and confusion, among other things, the following rules shall apply as to the portion of any such other party objection I incorporate: (a) I incorporate only what I consider to be consistent with, and not in conflict with or contrary to, any of my four Objections; (b) my four Objections in all circumstances shall be paramount and not in any way adversely affected by any incorporated objection or other incorporation activity, and such incorporated matters are subordinate in all respects to my four Objections; (c) nothing so incorporated shall have any direct or indirect adverse effect on any of my Objections, but rather instead shall support or validate any part of my Objections to that extent; and (d) the limitations or qualifications on the incorporated objection are not included, because this is not an effort to resolve a consensus on the ultimate truth, but only to identify all the errors, omissions, and other deficiencies in the EIR/DEIR. See Exhibit D.

Consider this example to guide interpretation of these rules. NID's Group Letter (objection) 10 includes certain correct facts (agreeing with my Objections) that the DEIR/EIR understates and misses the location of many existing wells that would be impacted by the EIR mining operations. However, the NID also understates and mislocates some of such impacted wells (and ignores entirely the issue of future impacted wells that us surface owners above and around the 2585-acre mine will create in exercising our legal rights as owners of such groundwater as needed to protect our homes, property, forest, and way of life from the dual menaces of the EIR mine dewatering 24/7/365 for 80 years and climate change.) Thus, I

incorporate (to such specified extent) what the NID exposes about DEIR/EIR mistakes and worse about such wells without incorporating the NID limits applicable to such mistakes and worse or any other suggested compromises or accommodations by NID. Stated another way, NID and I can agree that the EIR/DEIR is wrong, but there is no necessity for NID and I to resolve the full scope of what is right and true.

What is important is that us thousands of EIR/DEIR mine objectors each have our own special areas of relevant expertise, experiences, information, and evidence. I have briefly described some of mine in my four Objections. Despite my long and intensive experience as a bankruptcy lawyer in dealing with bankrupt or abandoned mines, I clearly know less about most water issues than, for example, NID, and it seems that NID likewise has less to contribute from the areas of my specialties. But to expose the relevant truths here and defeat the EIR/DEIR it is useful to find some way to cumulate our collective data, which is what I am trying to do. NID and I do not need to agree on how many wells are missing or where they are located or what to do about that reality evaded or missed in the EIR/DEIR, because what matters is that in any case the EIR/DEIR is wrong and must be rejected. Why incorporate such others' objections? Among other things, if the EIR were mistakenly approved, to preserve my right in any litigation to assert everything in my Objections, plus what support I can find for them elsewhere, plus whatever else those with other knowledge, data, and expertise discover to be wrong with the DEIR/EIR. This threat is too serious not to assert every possible error, omission, and deficiency that could end the threat. See Exhibit D for examples.

As another illustration of how incorporation works for my four Objections, I refer to the similar and somewhat overlapping objections the EIR labeled "Agcy 1" (aka "Agency") that I incorporated into each of my four Objections from The State of California Natural Resources Agency Department of Parks And Recreations ("State Objection Agency 1"). However, as one might expect from our different location exposures and focuses, our unique knowledge and experiences with the relevant adverse impacts that affect us differently, and our variable disappointments (and worse) from the deficient EIR/DEIR mitigation claims, we each have both common and different concerns and detailed objections. For example, the State's Empire Mine Park and related areas are downhill from the Idaho Maryland Road and Wolf Creek, while my community above and around the 2585-acre underground mine is uphill of that road and creek. Those variations are helpful in many ways, both because of common objections to common problems, but also because of reading my incorporated objections of others together with mine reveals a problematic common pattern and practice by the EIR/DEIR entirely to evade and ignore many of our concerns and objections, such as, often on bogus and disputed theories that us objectors provided insufficiently detailed or otherwise deficient objection content, for instance, because the EIR chopped up our integrated objection commentary into arbitrary parts to which the EIR responded by ignoring the rest of our integrated commentaries, our internal and external cross-references, and our incorporations by reference. Even worse, by failing to comply with CEQA and its Guidelines and other applicable law and other errors, omissions, and deficiencies, the fault for our less detailed or explanatory objections is attributable to the EIR/DEIR not providing the required "common sense," "good faith reasoned analysis," and other required data needed for us to do more than we did in reply and rebuttal. Indeed, with respect to most EIR/DEIR alleged excuses for not properly responding to objections the EIR/DEIR is more guilty than the objections to such EIR/DEIR complaints, such as, for example, when the EIR/DEIR offers disputed speculations and unsubstantiated opinions and then complains when objectors respond in kind. (Note, since the burden of proof and persuasion by CEQA compliance

is on the EIR/DEIR, our objections can be less fulsome at this early stage in the process before the court challenges and discovery entitle us to use the rules of evidence and to rebut and impeach those EIR/DEIR errors, omissions, and worse, based on what is stated or implied by the EIR/DEIR without regard to any need to confine our objections to CEQA boundaries that have first been disregarded by the EIR/DEIR.)

Even more importantly, when (as here) there is a general pattern of the EIR/DEIR deploying improper tactics and practices in the course of noncompliance with CEQA and other applicable law, as well as EIR/DEIR evasion and ignoring of reality, that kind of "hide the ball" tactic become an even more powerful demonstration of a lack of the required good faith. For example, just as the EIR ignored my meritorious complaint about the DEIR/EIR not providing sufficient maps as required of the surface locations of objector's homes above and around the 2585-acre underground mine, the EIR also failed to do so in response to the State's demand for correct and detailed maps showing the Empire Mine Park and other State property. There is no legitimate excuse for that noncompliance with CEQA, but more important is the fact that the EIR/DEIR has made a disputed pattern and practice of this "hide the ball" tactic an objectionable tactic for evading objections by those who do not yet appreciate their peril.

In any case, it is important for decision-makers to respect the rights of objectors to combine their different expertise and knowledge/data bases by such incorporations by reference. For example, the State Parks & Recreation has a very potent set of objections (at State Objection Agency 1) relating to Project Location (3.2), Project Setting And Surrounding Land Uses (3.5), Air Quality And Greenhouse Gas Emissions (4.3), Biological Resources (4.4), Hazards And Hazardous Materials (4.7), Hydrology And Water Quality (4.8), Noise And Vibration (4.10), and Wildfire (4.13). I incorporated all of those. In some cases, I relied substantially on those incorporated objections, while in others I advanced my objections beyond the State's objection. But, despite the bogus, objectionable, and unsubstantiated arguments of the EIR/DEIR that somehow it can ignore incorporations (even though it uses them itself), there is no need for my already massive four Objections to repeat what I have incorporated, and my objections are as sufficient as everything I have said plus everything I have incorporated. In effect, if my Objections are to be regarded as deficient as the EIR/DEIR so often incorrectly claims, then so are those of every governmental, group, and individual objection that I have incorporated. That EIR/DEIR is legally impossible to maintain on the merits, so that such disputed claims must be seen for what they are: a bad faith evasion of the obligations of the EIR/DEIR to respond to all such objections with a common sense, good faith reasoned analysis.

EIR/DEIR disaggregation requires me to object (as I have) to each such disaggregated part, as I do here. However, to avoid suffering/rewarding such evasions of EIR/DEIR compliance, I remind the reader of my internal automatic and other cross-referencing among my sections I, II, and III, so that every relevant objection, rebuttal, and counter that I assert (including incorporations) in any section of this or my other Objections also automatically applies everywhere it is relevant. That means I do not have to repeat or specifically cross reference each of my objections to the scores of places where it would be relevant to such scattered EIR/DEIR statements, omissions, and other noncompliance. Because it would be an unduly burdensome nightmare for me to have to link my objections that are disaggregated to match the EIR/DEIR scattered contents, this Objection (and my others) should be read as if the EIR/DEIR had consolidated each of its statements topic by topic in one convenient places so I could match that with my consolidated objections; e.g., each of my well related comments in sections I, II, or III should be read as if they were all consolidated together in one integrated

commentary without my having to link specifically each sentence on that topic with every other relevant sentence that I have had to separate to match the EIR/DEIR's disaggregated content on that topic.

Now that those other objections of my fellow objectors have numbers designated by the EIR for this record, for consistency and clarity please note that my incorporations include (in and besides my 254 and 255) the following:

1. EIR cited objections by others that are referenced in any of (a) its disputed Responses To Comments Ind. 254-1 et seq., plus (b) those objectors' follow up objections to those disputed EIR Responses, and (c) those in the EIR's Master Responses, plus (d) those objectors' follow up objections to those disputed EIR Master Responses.

2. Agency Comments Nos.:

   A. State Dept. Parks And Recreation Agency Letter 1.
   B. **State Dept Transportation Agency Letter 2**.
   C. State Dept. Fish And Wildlife Agency Letter 3.
   D. D. Central Valley Regional Water Quality Control Board Agency Letters 4 and 5.
   E. State Dept. of Toxic Substance Control Agency Letter 7.
   F. Grass Valley Agency Letter 8 (GV Community Development Dept.)
   G. NID Agency Letter 10 (Nevada Irrigation Dist.)
   Northern Sierra Air Quality Management District (NSAQMD) Agency Letters 11 and 12. [expresses concern and concerning questions without conclusion as to most deficiencies, but see some examples I quote about asbestos, including both air and water issues)

3. **Group Comment Nos.**

   A. Bear Yuba Land Trust Group Letter 2.
   B. Briar Patch Food Coop Group Letter 3 (mislabeled 15 at the top).
   C. Business Owners Group Letter 4
   D. California Native Plant Society Redbud Chapter CNPS Group Letter 5.
   E. CEA Group Letters 6, 7, 8, 9, and 21 (Community Environmental Advocates Foundation/Shute Mihaly Law Firm/Center for Public Participation)
   F. First Church of Christ Scientist, Grass Valley Group Letter 10.
   G. Friends of Banner Mountain Group Letters 11 and 12.
   H. Gold Country Avian Studies Group Letter 13.
   I. Nevada County Association of Realtors Group Letter 15.
   J. Nevada County Chapter of Citizens Climate Lobby/Education (CCL) Group Letter 16.
   K. Nevada County Climate Action Now Group Letter 17.

L. Nevada County Food Policy Council Community Alliance with Family Farmers Group Letter 18.

M. Rudder Law Group LLP Group Letter 20.

N. Shute Mihaly Law Firm/CEA Foundation Group Letter 21 (see CEA Objections Above Where Consolidated).

O. Sierra Foothills Audubon Society Group Letter 22.

P. Sierra Nevada Group of the Sierra Club Group Letter 23.

Q. Sierra Streams Institute Group Letter 24.

R. South Yuba River Citizens League Group Letter 25.

S. The Sierra Fund Group Letter 26.

T. The Wells Coalition Group Letter 27/28.

U. Wolf Creek Community Alliance Group Letters 29, 30, 31, and 32.

Other Incorporations May Be Addressed Directly In My Objections Or in Other Supplemental Objections.

Appendix of Some Objection Related Documents (cross-referenced to public documents or websites—but not attached)

1. "DEIR Objection 254": My DEIR Objection 254 (marked by the disputed EIR as its Response To Comment Ind. 254-1 et seq) and in the record at EIR 2-5847 as a general objection to the DEIR

2. "DEIR Objection 255": My DEIR Objection 255 (marked by the disputed EIR as its Response To Comment Ind. 255-1 et seq) and in the record at EIR 2-6028 as an more specific objection to the DEIR's disputed claims to feasibility and mitigation, as well as to the erroneous legal interpretations of CEQA to exclude economic admissions by Rise in its SEC filings and elsewhere, even as rebuttals and impeachment of inconsistent claims by the DEIR/EIR and even when the DEIR/EIR contains statements that are outside the disputed boundaries the DEIR/EIR seeks to enforce on objectors like me, including where the DEIR even labels its disputed allegations as "NonCEQA" data.

3. "EIR Objection 254": My EIR Objection 254 attached hereto and disputing the EIR "Responses To Comment Letter Ind. 254.

4. “EIR Objection 255”: My EIR Objection 255 disputing the EIR “Responses To Comment Letter Ind. 255.

5. Rise Gold Corp SEC filings, especially 10K annual reports and 10Q quarterly reports. See my Exhibit B hereto and my DEIR Objection 254 #2 quotes.

6. EPA website and other studies listed in these objections or Exhibit C, including the more than 29,000 studies warning about hexavalent chromium, including studies under the “TRI Program” (EPA toxic release inventory) and studies by experts such as Wendy Wagner, Steve Gold, and Kyla Bennett.

7. Cal Water Board website and other studies listed or incorporated in these objections or Exhibit C.

8. CalEPA website and other studies listed or incorporated in these objections or Exhibit C.

9. The Hinkley Groundwater website (e.g., www.hinkleygroundwater.com) and studies listed or incorporated in these objections or Exhibit C.

Re: Objections To And Questions Regarding "Economic Impact of the Proposed Idaho-Maryland Mine Project" (the "Report") dated 11/15/2022 by Robert D. Niehaus, Inc. ("RDN"); RDN Project #320

Dear Mr. Niehaus:

1. Introductory Questions.

Since you have invited questions in advance of the conference regarding your Report, I am presenting you with ten of the more basic questions in the context of my related DEIR objections, so that you can better understand the concerns that inspire such questions. Unless otherwise defined herein, I will use the terms from your Report for ease of comparison. If this Project is ever approved over the hundreds of meritorious written and oral objections presently on record in response to the Draft Environmental Impact Report ("DEIR"), including mine to which I direct your attention, these and many other questions will be at issue on the legal and political disputes by the many area residents who believe the proposed mine activities to be both intolerable and contrary to CEQA and other applicable laws. I believe in preserving what harmony is possible in our community, and that may be improved by narrowing the scope of our

differences regarding this mine controversy to the extent feasible. That begins by the County and its evaluators realistically addressing the real issues of greatest concern to the affected residents (and voters) like me. That requires recognition of the many fatal flaws in the DEIR which the Report chooses to ignore.

Among the greatest objections to the Report is that it incorrectly **assumes**, despite all the evidence and unaddressed concerns to the contrary now in the record, that (1) the DEIR is correct, complete, and compliant with CEQA and other applicable law, and (2) that Rise Grass Valley ("RGV" or, together with its parent company, "Rise") is financially and otherwise capable of performing and intent on accomplishing what it states in the DEIR. By failing to analyze such correctness, completeness, and compliance of the DEIR and the financial feasibility of Rise to complete and operate the Project in compliance with the DEIR and applicable law, your Report may be useless and, worse, support dangerous mining, if your such untested assumption is wrong (as objectors have proven, and will continue to prove, it to be.) Since there is a long history in California of failed mines and miners making unfeasible promises they fail to perform, resulting in more than 49,000 closed or abandoned mines on the EPA clean up list, no mine should be allowed to start (or restart) unless such miner can prove it can accomplish both what it promises to gain approval and what more the applicable laws require. Starting this mining process and then failing to proceed to a satisfactory conclusion as required may create serious economic problems for our community and the whole County. Since the many objections, as well as the Rise SEC financial filings themselves, demonstrate that the Rise effort is highly speculative at best and likely unfeasible, the Report should address the cost to the County of such a failure, rather than simply unwisely assuming success in accordance with the deficient and disputed DEIR.

The evidence and meritorious concerns to the contrary of the DEIR are stated, among other things, in the hundreds of meritorious oral and written objections presented in the record before the County Planning Department, as well as in Rise's own SEC filings (admitting its insufficient financial resources and the speculative nature of the Project and many risks) and DEIR (admitting many vulnerabilities, such as that the Project is economically infeasible unless approved as proposed, including its disputed 24/7/365 operations for 80 years, which disputed timing objectors expect to prevent by legal and political challenges). While there are many record objections to the DEIR and Project that also defeat your Report's "**assumption**" of economic feasibility, I refer you in particular to the two objections that I have filed with the Planning Department on May 30, 2022 (my "**General Objection**") and on April 4, 2022 (my "**Economic Objection**").

My long General Objection explains many deficiencies in the DEIR and many ways in which, if necessary, court and political actions by objectors will impose reforms and additions that would have to occur in order for the Project to be compliant with CEQA and other applicable law and otherwise tolerable to the community of voters that hugely outnumber the theoretical 300 odd workers at the Project (and whatever other support they can muster from distant places in the County that are beyond the adverse effects of this Project.) Those reforms and changes would make the Project even more economically infeasible, even by Rise's own standards.

My Economic Objection contests with cited legal authorities and arguments the incorrect position of the County and Rise (which you and the DEIR seem to follow without independently checking them) that CEQA and other applicable law do not require any showing of economic feasibility or financial or other credibility. As explained in both my General Objection and

Economic Objection (collectively my "**Objections**") incorporated herein (and vice versa), I have substantial and long-term experience as a bankruptcy lawyer with failing mines and mining companies, and I can explain why I believe this Project is at risk of being adding at some future time to the more than 49,000 abandoned or closed or bankrupt mines on the EPA list for cleanup or other remediation. Furthermore, I have extracted from those Objections and placed at the end of this letter various legal and other exposures of the County and Rise that involve costs not addressed in your Report. If this Project is approved and even one of those many stated concerns applies, your Report may be seen as supporting a dangerous illusion or worse. It is not too late to address the true issues and save us all from the miserable mistake approving this Project would be. (I also ask the Planning Department to add this letter to my "Objections" by incorporation by reference (as with other filed objections on the record.)

Question #1: In that context I ask you, what happens if your Report's assumption and reliance about the DEIR and Rise are incorrect? What if the DEIR is incorrect, incomplete, and noncompliant and Rise is financially incapability of performing, as many of us residents contend with evidence in our objections (none of which concerns are rebutted by Rise, nor can they be, since denying the financial and risk admissions information Rise has filed with the SEC would create bigger problems for Rise than its simply inducing you and the County into incorrectly assuming (a) that Rise can accomplish what the disputed DEIR says, despite its own doubts about the risks admitted in its SEC filings, and (b) that what is proposed in the disputed DEIR is correct, complete, compliant, and legally sufficient, when Rise's SEC filings warn of contrary risks?) The harm that is done to our community once the Project has begun may be soon become uncorrectable, even if Rise had the financial resources and willingness to do the necessary corrections (which funding its own SEC filings reveal it lacks and admits it may have risks in accomplishing timely.)

Question # 2: Since Rise admits that it may be financially incapable of accomplishing this Project itself, absent unexpected financing (see my Objections), most of us objectors assume Rise expects to flip this Project after County approval to another miner with more resources. Don't you care about who Rise chooses as the "real," successor miner? Stated another way, if the "flip" buyer from Rise were the kind of miner who would be welcomed by the County, why would it use a financially questionable and controversial applicant like Rise as its "stalking horse?" Therefore, Rise may not be our worst-case adversary in this situation, because the "real," ultimate miner may be even more controversial than Rise. Why is your Report not warning the County against indulging this **financially deficient and controversial Rise miner without testing its performance capabilities** and risking not only nonperformance by Rise but perhaps worse problems from a successor buyer "behind the curtain?" Why expose our community to such risks that your Report does not even attempt to quantify?

2. **The Economic Report Is Premature And Needs To Be Updated After the Disputed DEIR Issues Are Resolved; ie, How can anyone rely on an economic analysis that incorrectly assumes that the disputed DEIR is correct, complete, and compliant, at least without describing the consequences if that assumption is as wrong, as our residents' objections demonstrate?**

There are hundreds of meritorious oral and written objections to the DEIR, including my Objections incorporated herein. The Planning Department must still address those concerns, and, if necessary, the courts, ultimately should agree with most or all those objections. That

means this Report will be based on incorrect assumptions, and, therefore, will be incorrect and not just worthless, but counterproductive by supporting illusions. Even if the Planning Department were to decide that all those objections were somehow wrong, objectors can still be expected to use the political and legal processes to protect their rights and property by all appropriate means, certainly resulting in ordinances and new decision-makers' decisions that are contrary to the assumptions in the Report. For example, according to the DEIR's own admissions, all we need to do is create a law prohibiting such operations 24/7/365 and the Project is (by the DEIR's own admission) no longer economically feasible.

Question #3: How will the Report deal with rulings against the DEIR and such other changing circumstances? Will the Report be updated to reflect corrections for the reality that has always existed and exposing the errors of the Report assuming the disputed DEIR was correct, complete, and compliant? Why does the Report not warn the County of the economic consequences if the DEIR is wrong, incomplete, or noncompliant? Don't the Rise risk admissions in its SEC filing demand such warnings and economic risk analysis by you? Why does the Report not deal with the consequences of the impacted residents exercising their legal and political rights in ways that doom the Project, even by the DEIR's own admissions?

3. How Can the Report Justify Reliance on the DEIR, When Objections Raise So Many Basic Credibility Questions, Including NONDISCLOSURE OF THE HEXAVALENT CHROMIUM MENACE?

Besides such reasons to doubt Rise's financial capacity to perform even the DEIR, much less what more the courts and political process will ultimately require if this Project proceeds, there are many other reasons to question the credibility of Rise and its DEIR. I refer you to the record of objections to the County which demonstrates many errors, omission, and worse in the DEIR. I only refer here to one example of many discussed at length in my Objections, which is illustrated by movie "**Erin Brockovich**" and the case study in the real litigation over the death of the town of Hinkley, CA, and its residents from **hexavalent chromium** poisoning of their ground water. As my Objections show, there are thousands of EPA listed studies showing the lethal nature of such hexavalent chromium in ground water, and, yet, the DEIR fails to report their plan to use that toxic substance in its Hazardous Materials discussion. The only reason we even know about that threat is that it is mentioned in passing in the description of the underground mining techniques in another section of the DEIR, which I assume was a mistake by someone who didn't realize they were exposing a problem that Rise chose not to reveal in the place CEQA required for discussions of such hazardous substances.

As noted in my Objections, because there will be constant dewatering of the mine with the exposed water flushed elsewhere else down the Wolf Creek, touted by the DEIR as if somehow that waste and movement of our ground water from the mine's neighbors to other places downstream were somehow a benefit when (1) no one downstream should want to drink or use such toxic water contaminated with hexavalent chromium, which the DEIR does not promise its cleaner will eliminate (since the DEIR failed even to reveal its existence properly in the deficient hazardous materials analysis), and (2) moving our ground water from the mine neighborhoods to somewhere else is no benefit to us neighbors, an issue as to which there is little and deficient discussion in the DEIR. See the discussion below about depletion of the neighbors'

ground water, not only drying up wells but also depriving our surface lands and forests of essential water and creating greater fire hazards. (As explained at the end of this letter, and in my General Objection in more detail, with court precedents prohibiting what the DEIR proposes to do, the surface owners above the 2585-acre underground mining have competing water rights, including as part of their paramount rights to lateral and subjacent support confirmed in Supreme Court precedent I mention later.) Whether or not such DEIR errors, omissions, and noncompliance with CEQA and other applicable law are intentional or merely negligent (which for the present I leave to others, because the adverse consequences to our community are the same in either case), this creates a huge credibility problem for Rise and the DEIR at a minimum that cannot be safely ignored in your Report.

For more details and examples of the DEIR's other "strategic" errors, omissions, and deficiencies, consider what is exposed in my Objections and for which the DEIR has no good excuse, such as the DEIR occasionally mentioning the use of hexavalent chromium in the mine shoring cement paste without any mention of it or its dangers where required in the DEIR's "Hazards And Hazardous Materials" discussion. See CEQA cases like *Banning Ranch Conservancy v. City of Newport Beach* (2017), 2 Cal.5th 918, 940-41 ("**Banning**") and *Vineyard Area Citizens for Responsible Growth v. City of Rancho Cordova* (2007), 40 Cal.4th 412, 442 ("**Vineyards**"), each insisting on "a good faith reasoned analysis," rather than scattered or buried data, and unexplained data in exhibits. Stated another way, why does the Report inappropriately gives the DEIR the benefit of the doubt that CEQA and the courts will not allow? Why should the Report assume that the DEIR is correct, complete, and compliant, especially when Rise admits in its SEC filings risks that it may not be, and when Rise's accountants add a going concern qualification to the financial statements?

Question #4. If the DEIR credibility is destroyed as to this hexavalent chromium issue, why assume that anything else in the DEIR is correct and compliant? Don't such errors, omission, and noncompliance require the County to enforce some burden of proof on Rise and the DEIR? Why give them the benefit of so many doubts, even when Rise admits them in its SEC filings? Why side with these financially questionable outsiders against the impacted residents who will never willingly accept the mine because we have good cause to believe the DEIR is incorrect, incomplete, noncompliant, or worse? The adverse consequences of incorrectly assuming the DEIR is correct and feasible are much worse to the affected community victims than to Rise, who is merely losing the opportunity to profit while disputing indefinitely with its voting neighbors trying to protect their rights and property from this Canadian miner.

Additionally, as demonstrated in the Objections, there are many other DEIR strategic omissions or misleading statements that devastate the credibility of Rise and the DEIR, and cause the DEIR to fail to comply with CEQA and other applicable law. One simple example is the failure to identify adequately the surface boundaries above the 2585 acres underground mine that are owned by residents who are or (when they realize their peril) will be objectors. (The DEIR maps do not show surface streets and other landmarks that enable us to know whether the underground mine is below us as a real estate seller's disclosure or other threat or just near us as a threat.) The only apparent reason for obscuring such boundary locations is to reduce opposition from surface owners who do not yet realize the extent of their risks. See the discussion below of the effect of the mine on property values, as well as in the legal cases addressed at the end of the letter from my Objections. Such "hide the ball" tactics reflect badly on the DEIR credibility, as the courts have forbidden in cases like *Banning* and *Vineyards* discussed above.

Question #5: How can the Report accurately assess the situation when the thousands who live on the surface above the 2585-acre underground mine do not even yet know their peril? For example, the response of such owners is predictable when they discover what some of us already know; eg, that those surface owner victims will have to tell their buyers or mortgage lenders, for example: "Oh, by the way, there is an old, reopened mine operating 24/7/365 for 80 years underneath this property that is blasting tunnels, digging our ore and rock, draining the local ground water in dewatering ways that imperil your wells, trees, and other rights, as well as shoring up that whole mess beneath us with toxic hexavalent chromium."

Question #6: Why does the Report not address the cost and burdens to the County of all the litigation and extra elections that will result from any such approval of the Project? This is not just about the usual litigation contesting the approval and compliance with CEQA and other applicable law. This is not just about neighbors enforcing their rights to bring appropriate nuisance suits when the risks become manifest and causing new laws and decision-makers to reduce the burdens and risks of the Project on the community. This also includes novel disputes between surface owners and the mine owner (whether Rise or its successor "behind the curtain" to whom it flips the mine, because Rise's SEC filings admit that it may not be able to afford to perform the DEIR and other requirements of applicable law). As described in my Objections, competing surface owners have greater rights that, when enforced, will make the mining economically and otherwise infeasible.

4. Why Does The Report Assume Approval of the Project Is The End, Instead of What Must Instead Become A Perpetual Controversy That Involves Not Only The Courts But The Political Process?

The Report addresses the cost and burdens to the County as if the controversy is over once the Project is approved. However, as discussed in my Objections and at the end of this letter, such a Project is intolerable to those thousands of neighbors adversely affected by the mine. The traditional case studies that your Report should address (and that many expect will be addressed in the litigation that approval would trigger, demonstrating why the three Report case studies are not comparable or useful) are those where the controversies with impacted neighbors endure indefinitely at least until the mine shuts down. See the discussion below of the impact of the Project not only on property values, but on the use and safety of the properties on which thousands of people are living. Few in our community perceive any net value in the mine to us, even if the DEIR's "alternate reality" assumed in your Reort were correct. My Objections describe the controlling legal authorities protecting our community from disproportionate impacts on us for the benefit of people elsewhere in the County who are beyond the local impact zone. For example, the California Supreme Court had upheld nuisance claims for creating even a beneficial project (ie, a public sewer plant) for the locals disproportionately forced to sacrifice for the good of the broader community (ie, owners downwind of the sewer plant driven from their homes by the stench). Eg, ***Varjabedian v. Madera*** (1977), 20 Cal.3d 285 (discussed below and relying on the Fifth Amendment holding in *Richards v. Washington Terminal Co*. (1914), 233 U.S. 546, and noting that our California Constitution offers us even broader protection than the US Constitution). Unlike such cases of public benefit projects, this DEIR Project does not provide sufficient net benefits to our community in such public benefit ways [by refuting the DEIR, we thereby refute the Report], but instead the mine is for private Canadian profits to be shifted away from our community, likely leaving us with a mess like most mines when they

cease to be profitable and then are never properly remediated, as shown on the EPA abandoned mine list.

Question #7: Since the record objections, including my Objections, provide ample grounds for rejecting the Project, why is the County trying so hard to accommodate Rise and create a perpetual controversy in our community at a time when we need to find harmony? Unlike other conflicts that disrupt our community peace, this Project will never have a sufficient constituency of voters (as distinguished, perhaps, from unwise politicians or staffers) to prevail on later votes against mine issues, and that means that perpetual appropriate litigation and exercise of political rights to counter the Project's problems that, if approved, would be an existential menace to our community, especially to those owners above or around the 2585-acreunderground mine.

5. Why Does The Report Assume That (Illusory) Mitigation Rise Cannot Afford Solves All Problems For the County And Only Consider Underestimated Costs of Certain Police And Other Services?

My Objections and others demonstrate that there will be massive net costs to the County not addressed in the Report (eg, the cost of road maintenance for abuse 24/7/365 for 80 years from abuse by heavy trucks on those roads that were not designed to accommodate such burdens). The only reason that the Report ignores such massive costs and burdens is that it **assumes incorrectly** that somehow those costs will be 100% mitigated by Rise, ignoring that there is no existing or feasible expected agreement by Rise, but merely the DEIR's vaguely expressed willingness to "negotiate" something, even though its SEC filings shows it lacks the funds to pay those costs, among many other admitted feasibility risks inspiring Rise's accountant to qualify the financials with a going concern qualificaition.

Question #8: Why doesn't the Report identify all the "mitigations" that it assumes will be paid 100% by Rise, so that everyone can properly evaluate both the feasibility of such mitigations and the consequences of those mitigations not being 100% paid by Rise, such as the road maintenance from constant 24/7/365 abuse by its heavy trucks for 80 years? Why doesn't the Report at least quantify what the public must pay if Rise cannot or will not do so? Why does the Report assume that, even if Rise could afford such mitigations, there will be a satisfactory future agreement when there is not any present agreement? More importantly, why doesn't the Report disclose what the cost to the County or public would be in the absence of any mitigation, so that we can judge the risk of insufficient mitigation? Consider, for example, what the direct and indirect additional cost would be of maintaining those heavy truck access roads abused 24/7/365 for 80 years? If these mitigation issues must become litigated or contested in the political process, you should not be surprised to discover that such net public costs (which the Report assumes away) will far exceed the Report's imagined benefits.

6. Why Does the Report Shift The Burden of Proving the Harms To Property Values From Rise To The Local Homeowner Victims, And Why Not Ask The Real Experts Who the County Will Face When Any Disputed Approval Is Contested In the Courts And the Political Process?

The burden of proving no harm from the Project to our property values (which means overcoming many of the objections on record already with the Planning Department) must be on Rise. Yet, by ignoring such record objections and common sense concerns of the thousands of residents living above the 2585-acre underground mine, and by doing an incomplete and flawed investigation to achieve a disputed conclusion that the Report was unable to confirm lost value, the least that the Report could do is consider why us impacted residents dispute the DEIR and, therefore, the Report. The Report addresses (deficiently) some, but not all such reasons why property values will decline because of the Project, noting that many local businesses from who you sought opinions (especially real estate brokers) declined to address the issue with you because of concern about "controversy." However, if you had asked what about what the "controversy" caused them to decline to respond (and they had chosen to answer comprehensively), you would have discovered (and should have reported) that their reason to decline comments is that, by opining on this subject, they would have made their real estate sales jobs harder. Real estate brokers and sellers are legally required to disclose such risks and problems to the buyers, including what is in the record objections.

Therefore, what the brokers and sellers say to you, they then would have to say to every potential buyer or lender. That would make their job much harder, and that is one powerful reason why they don't tell you what they all know to be true: this Project will devastate both the value and the marketability of the impacted homes, especially those thousand living above the 2585-acre underground mine and those others nearby who will suffer from the loss of their groundwater and other mining problems. Even those other homes in the community more distant from the mining will suffer, because of the consequences of declines in the property values of those more directly impacted homes. Ask yourself, who will invest in maintaining or improving any property that is now suffering from such a stigma, especially when they can no longer borrow against the disappearing equity in their impacted homes, assuming they still can get mortgage or home equity loans at all?

That thought highlights the bigger problem with the Report. Most buyer's purchase their houses with mortgage loans. To qualify for such loans, an appraiser must confirm the relevant value for the "loan to value calculations" for compliance with banking regulations. What everyone expects, but the Report totally ignores, is that these impacted properties will not appraise well. Indeed, unlike the real estate brokers (whose self-interest generally favors being optimistic about property values and market opportunities, making their negativity on this mine issue especially powerful), the real estate appraisers will be more "conservative," ie, realistic, in quantifying the harm done to property values by approval of the Project. (Indeed, Federal laws and regulations arising from excessive valuations in prior real estate bubbles punish appraisers for overvaluations.) When the buyer cannot finance the purchase at the seller's price, either the house doesn't sell (and the owner suffers, without investing more in his or her property, causing more devaluations) or the seller drops the price enough so that the buyer can qualify for loans at the lower appraised value. When one buyer accomplishes that lower price result, that sets the new "comparable" for all other appraisers, and we begin down the "slippery slope" to generally community devaluation. There is ample history of that general decline in such circumstances. Add in the Hinkley, CA, story with the mine's hexavalent chromium and ground water depletion problems, and the expected market value declines can be severe.

Consider what a seller or broker must tell the buyer after the mine approval, and what the bank appraiser must consider in his or her appraisal. "Oh, by the way, there is an old mine that has reopened and is operating 24/7/365 for 80 years underneath [or near] this property. They are

blasting tunnels, digging our ore and rock, draining the local ground water in dewatering ways that imperil your wells, trees, and other rights, as well as shoring up that mess with hexavalent chromium." Etcetera. Even parts of the community more distant from the mine will be impacted, if only by the understandable stigma, the reasonable fears, and the other adverse consequences to the whole community of such harms and risks to the mine exposed areas. All such direct and indirect impacts must be disclosed, and disclosure itself assures devaluation and the harms will linger and spread. The decline in property values impacts the economy in many ways not addressed in the Report. Property tax collections will drop with values. Local construction work and related supplier sales will drop because of chilled investments in such threatened properties. Tourism will also be impacted. Sadly, the harder us locals are forced to resist these abuses of our rights, the worse the stigmas will become in the media.

Question #9: "Why isn't the burden of proof on Rise and the DEIR to prove there will be no impact on property values? Why does the Report, in effect, place that burden of proof on the resident victims instead? Why make our community gamble on the Report's foolish reliance on the disputed DEIR, and thereby assume that such obvious problems will not be as bad as every resident who matters knows them to be? Why does the Report, in effect, say that the author's study failed to prove conclusively that values will decline, so go ahead and mine? Why doesn't the Report state the truth, which is that there are many reasons for the mining and related risks, threats, and stigmas to depress property values, and gambling on the DEIR, Rise, and a problem free Project is not something the impacted residents will ever be willing to suffer voluntarily, but instead can be expected to resist with legally appropriate defenses that the Report should consider?

7. Why Has Someone Discouraged Candidates In Elections From Expressing Their Opinions On the Mine By A Serious Misinterpretation of the Applicable Law, And What Approval of the Project Will Mean For Inevitable Future Political Conflicts?

As reported in the *Union* during public forums in the recent elections, someone has convinced candidates and officials that it is somehow legally improper to announce their position on the mine. That claim is both legally incorrect and bad policy. As the controlling court cases I cite below remind us all, it is not only proper and legally permissible, but essential, that the candidates detail their positions on such important matters, so that voters can make informed decisions on the merit of these critical issues. That is the stated policy reason for the CEQA disclosures. The confusion seems to be that these candidates mistakenly believe they must act like judges (where such limitations apply), rather than candidates (or even elected officials) who can and should freely speak their minds on such matters. Indeed, the purpose of Preliminary Environmental Impact Reports under the California Environmental Quality Act is to provide information needed by voters to express their own views by their votes, as the courts have confirmed. We need more informed voters, not people forced to guess. The most important issue is which candidate has the best policy positions. How can democracy work if our politicians can dodge key issues, so that our votes are uninformed, and we must guess?

If the Project is approved, the result will be extraordinary and protracted political conflict, as well as the usual legal remedies pursued by those of us defending our homes from what harms we know will follow, even though ignored or understated by the disputed DEIR and Report. The next elections will inevitably present candidates who share the views expressed in

my Objections and those of thousands of other impacted residents. Those candidates will not be silenced by the incorrect hesitation shown in the last election, but will speak boldly based on the following quotes from one controlling California Supreme Court decision (which cites therein many other concurring decisions, including US Supreme Court precedents): **Fairfield v Superior Court of Solano County** (1975), 14 Cal.3d 768 (rejecting a shopping center developer's attempts to use civil discovery to support an attack on two councilmen who voted against the use permit application and related environmental impact report they had previously criticized, one as a candidate), stating:

> As we shall show … even if … [the developer] could prove that … [the councilmen] had stated their views before the hearing, that fact would not disqualify them from voting on the application. (at 779)
> ***
> A councilman has not only the right but an obligation to discuss issues of vital concern with his constituents and to state his views on matters of public importance. [citing *Todd v. City of Visalia* (1967), 254 Cal.App.2d 679 … (at 780)
>
> … Campaign statements, however, do not disqualify the candidate from voting on matters which come before him after his election. … "[It] would be contrary to the basic principles of a free society to disqualify the candidate from service in the popular assembly those who had made pre-election commitments of policy on issues involved in the performance of their sworn …duties. Such is not the bias or prejudice upon which the law looks askance. The contrary rule of action would frustrate freedom of expression for the enlightenment of the electorate that is the very essence of our democratic society." (at 781)
>
> … We conclude ... The voters …were entitled to discover the views of the candidates for the city council concerning … variances from zoning requirements, and the candidates were entitled to express those views. (at 782)

Question #10: Why does the Report assume that the County costs will be zero after approval of the mine, when it is certain to be challenged in appropriate ways both legally and in the political process, sadly pitting thousands of existing residents against a far lower amount of mine supporters? Putting aside the substantial costs of extra elections and the litigation the County must then expect, why should the County provoke such a massive, protracted controversy by such an ill-advised gamble that will so seriously harm so many of our residents in the most fundamental and unforgivable ways by threatening the value and quiet enjoyment of their property? If your answer is that distant County residents will benefit from the theoretical taxes referenced in the Report, in effect saying that us locals near the mine should suffer disproportionately for benefit of the County as a whole, why does the Report not address the cost to the County and the impact on Rise (and the already infeasible Project) from the predictable remedies of the local victims? See, for example, the legal issues that will impact the County as explained below. Indeed, why not compare fairly and more accurately the harm us locals will suffer to the imagined benefits gained by such others?

Some Supplementary Legal Data Extracted From My Objections That Give Context And Special Force To My Questions.

There can be no net local benefit rationally expected from this mine to Nevada Country, even if the DEIR were correct, complete, and compliant, which it is not. That "no net benefit" analysis is especially true if one focuses on the thousands of us who live on the surface above and around the 2585-acre underground mine, who are generally ignored by the DEIR, in its erroneous pitch to consider this CEQA "project" generally as if it were only the small Brunswick Industrial Site and 30 or so well properties along the East Bennett Road (and, although the DEIR and Report incorrectly describes it as a "separate" CEQA project, the Centennial Industrial Site). This is all one, integrated CEQA Project that cannot be separated with CEQA discussions limited to just one part. As my Objections demonstrate, the greatest consideration and protection must be given to us locals above and around the 2585-acre underground mine, who could suffer many of the greatest negative impacts, none of which are sufficiently addressed in the DEIR or Report. Any DEIR decisionmakers who may like distant mines that are too far away to cause them personal burdens or risks, should especially consider the contrary leading precedent against such uncompensated, disproportionate impacts: ***Varjabedian v. Madera*** (1977), 20 Cal.3d 285 (relying on the Fifth Amendment holding in *Richards v. Washington Terminal Co*. (1914), 233 U.S. 546, and noting that our California Constitution offers us even broader protection than the US Constitution), involving for our discussion purposes both successful nuisance and inverse condemnation claims (among other claims) of local homeowners against the City of Madera's approved sewer treatment plant**. That court upheld the jury's damages award that was not just for the stink nuisance harms suffered by the downwind locals, but also for the loss of real estate value measured** (at 291) by "the difference between the present fair market value of the property as the same would have been without the construction of the sewage treatment plant… and the present fair market value after said plant was constructed and put into operation." The court rejected all the usual defense arguments that a mine owner might be expected to attempt. **As the Court stated (at 298): "If a plaintiff can establish that his property has suffered a 'direct and peculiar and substantial burden as a result of the recurring odors produced by a sewage facility -- that he has, as in *Richards,* been singled out to suffer the detrimental environmental effects of the enterprise—then the policy favoring the distribution of the resulting loss of market value is strong … and the likelihood that compensation will impede necessary public construction is slight. … and a burden unfairly and unconstitutionally imposed on the individual landowner." See my Objections for further details.**

Some our local harms should also be of broad concern for many other reasons, even to others in the County who may imagine they are too distant to be harmed by this mine. For example, the massive groundwater dumped into the Wolf Creek from the mine's wasteful dewatering goes somewhere else downstream, where those citizens should share our worry about hexavalent chromium and the adequacy and reliability of the mine's cleaning process. While the depletion of our groundwater in ways that add to our mine related miseries may seem local under the disputed DEIR analysis (really just guesses) about our fractured rock aquifer system, the drying out of our surface and its forests by such local groundwater mine depletion and wasteful mine uses (without the illusory "recharge" incorrectly assumed in the DEIR) harms everyone in this "new normal," "zero sum game" of climate change and chronic drought and dryness impacts. Because there is not enough water for everyone in the future, we're all in competition

for an insufficient supply, while the mine is continuously flushing our groundwater down the Wolf Creek somewhere else 24/7/365 for 80 years. (Note that the DEIR does not offer any evidence about depletion and other concerns after 2040.) Also, because the consequent fires and smoke and other air quality threats are not locally contained, even those with sufficient water will end up sharing those adverse consequences of this mining. Those and other problems addressed in my Objections and others need to be placed on the negative side of the balance sheet to compare against the minor alleged benefits of the mine that many residents have already disputed in the record.

I cannot imagine us locals (once adequately informed of the realities and the errors, omissions, and deficiencies of the disputed DEIR) tolerating the mine, especially when presently less informed people discover "the hard way" the burdens, risks, and problems which the DEIR was required to disclose and failed to do so satisfactorily. It should be easy for our governments to avoid conflicts with their voting citizens on this mine, because this mine is unlike most other such conflicts in the case law. Often the challenged CEQA projects involved **public improvement** projects needed by the broader community that hurt smaller impacted groups of citizens, like roads, sewer plants, or other public improvements. Here, this private, exploitive mine has no such material net public benefit, contrary to the Report (which assumes away the problems by accepting the disputed DEIR as if it were correct, complete, and compliant, which it is not.) There is little doubt that our real estate values (like local tax revenue and tourism) will suffer in reality, even from the mere stigma of the mine, because, even if we somehow were all wrong about all the mine related problems (which we're not), no one wants to pay these kinds of real estate prices to gamble on suffering such burdens, risks, and harms, especially if they read Rise's SEC filings admitting risks ignored in the DEIR and, therefore, in the Report. See the transcript (when available) of the March 22, 2022, County hearing and those objectors' follow up written comments. Clearly, no government blessing of the DEIR or mine approval (or your Report) will convince anyone at risk in such impact zones above or around the 2585-acre mine (or any buyer or mortgage lender/appraiser) to accept such risks, especially for no net benefit to their community.

So, sadly, approval of the DEIR and mine would divide our County in one additional way, and I hope that is not our fate. I mention the ***Varjabedian v. Madera*** nuisance claim, not just because such claims (if and when presented) could further affect the economics of the mine and other issues, if and when any victims were to collect nuisance evidence and (under legally appropriate circumstances) to consider the time to be right for accountability. **My primary reason for focusing here on this *Varjabedian* case is the court's discussion of why disproportionate harm suffered by some locals cannot be justified by the benefits to others more distant who can escape that harm**. Those cases (and many others) may create problems for the County in situations like this one, if it were to impose a nuisance (among other things) on such particular victims, **like the *Varjabedian* homeowners downwind from the sewer plant, as a "taking" under the Fifth Amendment and under the California Constitution, potentially creating claims against both the private nuisance maker and the approving governmental authority.** See, eg, *Uniwill v. City of Los Angeles (2004)*, 124 Cal. App. 4th 537 (a private party, here a private utility, and an approving governmental authority can be jointly liable in inverse condemnation for depriving a victim of property rights). As that ***Varjabedian*** Court stated (at 298): "If a plaintiff can establish that his property has suffered a 'direct and peculiar and substantial burden' as a result of the recurring odors produced by a sewage facility -- that he has, as in *Richards*, been singled out to suffer the detrimental environmental effects of the

enterprise—then the policy favoring the distribution of the resulting loss of market value is strong … and the likelihood that compensation will impede necessary public construction is slight. … and a burden unfairly and unconstitutionally imposed on the individual landowner." This policy to avoid disproportionate local harms should be especially powerful here, where the mine is not a public improvement for the common good, but rather a private exploitive business of no net benefit to the public.

More importantly, we are not just talking only about intangible issues like smells (although noise, traffic, air quality margins, and other intangibles may also arise in these disputes, especially since this no net benefit mine is to be granted 24/7/365 operating approval that few of our more beneficial local businesses enjoy as far as I know, without any justification in the disputed DEIR for such continuous operation except its arbitrary profit margin desired by Rise and its Canadian owners) or on account of Rise's admittedly weak financial condition discussed in its SEC filings. Here the conflict also includes our groundwater depletion and hexavalent chromium pollution of commonly owned groundwater (and then flushed down the Wolf Creek), as well as potential interference with the legal property rights of surface owners above and around the 2585-acre mine (eg, for subjacent and lateral support discussed below, etc.) With our water table dropping in the climate change future of dryness and drought, the last thing we need is to increase the risk of trees dying and becoming bigger fire hazards because of that 24/7/365 dewatering for 80 plus years and DEIR's admitted 1.4 million gallons a year NID depletion uses at the mine, plus more issues addressed in my Objections and others. Stated another way, all of us locals impacted by the mine are being asked to sacrifice some of our water, health, property rights and value, and other things mentioned and all grossly understated in the DEIR, but for what? So far, the only credible answer seems to be for a speculative and dangerous private project to export profits to private investors across the Canadian border enjoying their exploitation of us locals, while we suffer those disclosed problems, plus far greater undisclosed burdens, risks, and harms only revealed as cited errors, omissions, and deficiencies in the disputed DEIR. (I discount the Report as unconvincing at best, because it foolishly depends entirely on the DEIR as being correct, complete, and compliant, which my and other objections show it is not, and in any event the Report doesn't even address what risks Rise admits in its SEC filings.)

In considering the scope and nature of any mine approval and its terms and conditions, the government decisionmakers should consider both the nuisance and inverse condemnation court decisions as flip sides of the same coin. (Note: As explained in US Supreme Court cases cited in my Objections and elsewhere, when a government creates or approves a nuisance by a **public** project [like that sewer plant] it is exposing itself to inverse condemnation liability. When a private company does anything that would be such an inverse condemnation if done by a government, then the private company should have equivalent nuisance liability with similar consequences and considerations. That is why I discuss both public and private nuisance and inverse condemnation cases together, for illustration of the common principle they both have that no one can use their property to damage or harm other properties in actionable ways without consequences.)

The damages and "taking" (eg, eminent domain or inverse condemnation) consequences in "taking"/inverse condemnation cases can be similar when a nuisance is imposed on local victims. For example, consider *County of San Diego v. Bressi* (1986), 184 Cal. App.3d 112, where an aviation easement was imposed on homes at the end of a runway with approval authorized for hugely abusive (although unlikely) uses (such as not only jumbo jets, but also

"any other contrivance yet to be invented for flight in space.") *See also Coachella Valley Water District v. Western Allied Properties, Inc* (1987), 190 Cal. App. 3d 969 (where the court ordered a retrial where the trial court mistakenly limited the "before condition" valuation damage expert's evidence about the value before impacts of the flood control alternatives if they varied from the government's desired plan, holding the jury was entitled to consider the value of the plaintiff victim's property without being limited to the defendant's idea of solutions or consequences of doing things the defendant's way.) The *Bressi* court rejected the defense that the government should only have to pay for the less burdensome current uses (ie, only small private planes versus jumbo jets and rocket ships in the permits), holding that "just compensation" to the homeowner is measured (like nuisance damages) based on what the owner has lost, rather than by what the taker has gained. And stated (at 123) that: The jury … must "once and for all fix the damages, present and prospective, that will accrue reasonably from the construction of the improvement and in this connection **(the jury) must consider the most injurious use of the property reasonably possible. …In determining the most injurious use of the property reasonably possible, the jury must consider the entire range of uses permitted under the resolution of necessity." (ie, in that case making a small airport into a hub for first jumbo jets and then spaceships.)** (Emphasis added) Thus, if a dangerous or risky mine were allowed such great powers for massive abuse 24/7/365 for 80 years, any liability would be calculated on that worst case basis. That means current nuisances, trespasses, and other torts that have modest current impact can become a huge liability, because that current harm can be multiplied for 80 years' impacts.

Therefore, to the extent that us locals suffer damages, the County is better off with the narrowest approval imaginable, not the worst (or something vague that the DEIR could exploit with loopholes for which there is then maximum possible exposure with the 80-year multiple.) The government authorities should also consider making any approval not include hexavalent chromium, not allowing 24/7/365 operations (eg, versus the normal 12 hours) and for 80 plus years (but at most the limited period for which they have reliable data, which could never exceed 2040 as the outside date for which the disputed DEIR offers even deficient data on limited topics, especially not extending any period allowed based on some assurance of achieving some arbitrary profit margin), and not allowing such unlimited depletion of our groundwater based on a disputed and preposterous recharge fantasy, ignoring climate change dryness and drought, and not allowing other burdens, risks, and harms to us locals and our property rights. That means any disputed approval which is granted (and I urge that none be granted) must be conditioned on such credible protections for the locals from all such burdens, risks, and harms, especially where the disputed DEIR (and, therefore, your Report that depends on the DEIR) lacks reliable data and just assumes the future will be the same as the past. Otherwise, someone may have to pay us local residents not just for current suffering, but also for the risk for future, "worst case" suffering for 24/7/365 for 80-years, as noted above, even if the mine has no funds or ability to operate that long.

Besides such damages for nuisance and other claims, victim locals in such disputes can also entitled to recover (eg, restitution) **costs of mitigating** the victims' damages for any nuisance and inverse condemnation. Eg, *Ahlers v. County of L.A.* (1965), 62 Cal.2d 250 (when road construction caused landslides, the threatened property owners are entitled, among other things, to recover the cost of minimizing their damages in good faith, as by installing 25 shear pin caissons to try and hold back the landslide); *Sheffet v. County of L.A.* (1970), 3 Cal. App.3d 720,741-42 (water diversion damages from subdivision and road entitle victim to mitigate his or

her damages in good faith and recover the cost of protecting his or her property). While it is premature to address the mitigation cost recoveries from many defensive strategies local victims could elect to protect their properties from the many burdens, risks, and harms that anyone may suffer from a mine like this, one hypothetical example could be that the locals individually or collectively sink their own competing wells into their owned groundwater beneath their properties above and around the underground mine, hoping to save their surface share) of groundwater otherwise lost by plans to dewater, treat, and flush such groundwater downriver in some disputed but depleting amounts. Nowhere does the DEIR or the Report deal with any such competition with locals for water and other resources to which us locals have at least equal rights. (The conflicts that unfortunately creates with NID is a larger subject for another time, but no one should assume that existing laws and NID won't be changed to better protect us victims in the course of these disputes.)

Other issues may also arise in such nuisance and inverse condemnation etc. cases, some of which are analogous to the risk of "subsidence" from this 2585-acre underground mine for those above and around it entitled to subjacent and lateral support, groundwater, and other rights. E.g., *Smith v. County of L.A.* (1986), 214 Cal. App. 3d 266 (county road repairs created landslide conditions destroying homes triggering nuisance, inverse condemnation, and other claims, including both damages for diminution in the value of real property, but also damages for annoyance, inconvenience, and discomfort, as well as mental distress as a part of the loss of enjoyment.) See also my Objections, citing the Supreme Court and California cases allowing voters to protect surface owners from underground mining abuses. **For example, consider again the leading such Supreme Court decision of *Keystone Bituminous Coal Ass'n v. DeBeneditis*, 480 U.S. 470 (1987), where the Court upheld against a coal miner challenge the Bituminous Subsidence And Land Preservation Act (the Subsidence Act as it's called in Pennsylvania and many places where it has been replicated), where mining was limited to prevent "subsidence" (the loss of surface lateral and subjacent support and loss of groundwater or depletion of surface water, which are legal rights we surface residents already have here, but it helps to have more laws to detail specific applications and thereby avoiding the need for expensive defense litigation). That Supreme Court decision defined the "subsidence" concerns (also equally at issue for this DEIR project, especially because of the massive and objectionable groundwater depletion and [even what's so far revealed of] the DEIR's new, deeper, and expanded DEIR blasting, tunneling, rock removal, and other mining activities) as follows (at 474-5):**

> Coal mine subsidence is the lowering of the strata overlying a coal mine, including the land surface, caused by extraction of underground coal. This lowering of the strata can have devastating effects. It often causes substantial damage to foundations, walls, and other structural members, and the integrity of houses and buildings. Subsidence frequently causes sinkholes or troughs in land which make the land difficult or impossible to develop. Its effect on farming has been well documented—many subsided areas cannot be plowed or properly prepared. **Subsidence can also cause the loss of groundwater and surface ponds.** In short, it presents the type of environmental concern that has been the focus of so much federal, state, and local regulation in recent decades. (Emphasis added). [That conclusion about groundwater has a fn 2 which states:]

> Fn2. "Whenever [subsidence effects] extend, damage can occur to buildings, roads, pipelines, cables, streams, water impoundments, wells, and aquifers. Buildings can be cracked or titled; roads can be lowered or cracked, **streams, water impoundments, and aquifers can all be drained into the underground excavations**. Oil and gas wells can be severed, causing contents to migrate into underground mines into aquifers, and even into residential basements. Sewage lines, gas lines, and water lines can all be severed, as can telephone and electric cables. … (emphasis added).

While that subsidence law generally required 50% of the coal to remain for support in strategic places, it did many other things to protect the surface and limit the mining, explaining that the government was entitled to so act "to protect the public interest in health, the environment, and the fiscal integrity of the area," such as by "exercising its police powers to abate activity akin to a public nuisance," although the court made clear that the police power was broader than nuisances. (At 488) Of special note, the Court (at 493-94) noted that this challenge was to the enactment of the law before it was enforced, and that meant that it was premature to complain about how the law might be abused, when the facts of that surface and underground mining competition of rights were not yet established. Citing its own precedent in Hodel v. Virginia Surface Mining & Reclamation Ass'n Inc, 452 U.S, 264 (1981), the Court explained:

> "[The] court ignored this Court's oft-repeated admonition that the constitutionality of statutes ought not be decided except in an actual factual setting that makes such a decision necessary. [citations omitted] Adherence to this rule is particularly important in cases raising allegations of an unconstitutional taking of private property. *** (at 497): [W]here an owner possesses a full 'bundle' of property rights, the destruction of one 'strand' is not a taking because the aggregate must be viewed in its entirety. [The Court then followed that discussion how valid zoning laws always affect without any "taking" property uses with things like setbacks, lot size vs building size, etc.]

Please note that there is nothing in the disputed DEIR to explain why we surface residents above or around the mine need not worry about our legal right to mining contrary to our legal rights to "subjacent and lateral support and protection" from "subsidence" from either defective repair of the old 2585-acre mine that has been closed and flooded since 1956 and would now be blasted, tunneled, rock removed, and otherwise mined 24/7/365 for 80 years. How can we judge our risks when there are no clear standards and timely and effective monitors to protect us (or even reliable evidence)? History shows most often it takes a crisis damage event to trigger effective inspections, and at that point the damage is done, and all that would be left would be to pursue legal remedies against the miner, among others, typically with an insufficient financial condition (see my Objections and the Rise SEC filings) based and managed in a foreign place (eg, here Canada) whose only reported real, material asset shown in its SEC filings is the mine everyone wants to close that just revealed such a problem.

Remember the old Broadway musical that they made into a Clint Eastwood/Lee Marvin movie called "Paint Your Wagon" about Nevada City gold mining? It ends with the whole town collapsing into the miners' underground diggings. I hope that is not prophecy, but it illustrates one more topic in the disputed DEIR where there is no reliable or sufficient information. What is the actual condition of the mine that closed and flooded in 1956 and has not been studied since? How can responsible government assume records from those ancient days are now correct,

complete, and sufficient as to existing conditions that will be discovered when the mine is drained? As to why that matters, besides our peace of mind and safety, consider question: what is your real estate broker going to tell a buyer about when you try to sell your house above or around the 2585-acre underground mine here? I do not think the answer will be, “don’t worry, the DEIR reassures us all.”

Thank you for considering my questions.

Sincerely,

G. Larry Engel

Exhibit B: Selected Admissions From Current Rise Gold Corp SEC Filings

General Admissions from Rise's SEC Form 10Q for the quarter ending 10/31/2022 (Updating from the Prior 10Q Addressed in my DEIR Objection 254 #2). General Admissions About the Speculative Nature of Rise As a Hypothetical "Going Concern" from the Footnotes of Its Current Financial Statements Qualified By Its Accountant.

As described in FN1 to the financial statements reporting the massive financial losses and problems described herein, with 10/31/22 working capital of only $66,526: "The ability of the Company to continue as a going concern is dependent on the Company's ability to maintain continued support from its shareholders and creditors and to raise additional capital and implement its business plan. There is no assurance that the Company will be able to obtain adequate financing in the future or that such financing will be on terms advantageous to the Company. These events and conditions cast significant doubt about the Company's ability to continue as a going concern. The consolidated financial statements do not include any adjustments that might be necessary if the Company is unable to continue as a going concern."

General Financial Data as of 10/31/2022.

Rise reports little cash ($166,805) [even less than compared to the 7/31/22] for the period, and that cash will not be sufficient to fund any of its EIR/DEIR goals, especially those relating to the "aspirational" safety and mitigation issues of concern to the objectors and likely the lesser priorities for the miner once it has obtained its disputed EIR approval and has then begun its meritless defense to the objectors' legal, political, and law reform resistance to protect objectors' homes, groundwater and other property rights and values, our forests and environment, and our way of life in our community above and around the 2585-acre underground mine. Rise's other current assets are not material, and its noncurrent assets are just the speculative mine and equipment that has little value absent massive additional investment needed even to begin mining (e.g., dewatering and updating to a starting position the mine condition from being closed and flooded since 1956, as to which there are insufficient reliable and useful information, many likely dangerous conditions unaddressed by the disputed DEIR/EIR, and massive admitted risks). That is why the disputed $4,149,053 "book value" of the mine (including Centennial, Brunswick, and the underground mine) and $545,783 equipment are qualified by the Rise accountant as dependent on the disputed assumption that Rise remains a "going concern" which the accountant and Rise itself admit is speculative.

Note that the most current reported information on expenses and losses (for the three months ending 10/31/2022, which is comparable to prior periods shown) declares an operating (expense) loss of $702,522 and a Net Loss for the period of $684,538, which losses will continue (and objectors expect to prove would dramatically increase) until at best the start of profitable mining which will be long delayed and may never occur for many reasons, whether for lack of working capital, lack of sufficient accessible gold, objectors resistance and resulting lack of investment or credit, worse than expected mining conditions, and other factors that Rise and its accountant admit cause this to be a highly speculative enterprise, as demonstrated above and in objections to the EIR/DEIR. For example, the 10Q reports for the most current reported three months of "Cash Flows From Operating Activities (showing a "loss for the period" of $684,538

and “net cash used in operating activities” of $305,113) that will quickly exhaust the current cash on hand long before not only any net cash flow is produced by the mining, but also long before the potential value of the long closed and flooded mine can even be evaluated for its actual, potential value. FN 1 reports working capital on 10/31/22 of only $66,526. But see other data on page 19. Note also from FN 1 that its “accumulated deficit” (loss) is $23,693,142. [However, note that on 10Q at p. 18 in the “Results of Operations” discussion of “expenses” for that period ending 10/3/1/2022 there are different numbers reported that are larger but still comparatively small, i.e., $105,570 for consulting, $123,989 for geological, mineral, and prospect costs, and $154,096 for “professional fees.”]

Mining And Other Risk Related Admissions by Rise.

This SEC filing admits various things that are directly or indirectly contrary to or inconsistent with the EIR/DEIR or which support any or all of my four Objections, including the reality that Rise lacks the working capital, financial resources and capacity to perform its material obligations with respect to the mine, especially regarding the CEQA and other safety or mitigation “aspirations” proposed or required by the EIR/DEIR. In effect, if the County were to approve the EIR it would be imposing massive harms, risks, and problems on us local objectors for no net benefit to us that Rise admits are reasons why even voluntary investment in this mine would be a speculative investment for even the most risk tolerant investors. For example, consider the following such 10Q admitted reasons for disapproving the EIR:

a. “As of the date of these consolidated financial statements, the Company has not established any proven or probable reserves on its mineral properties and has incurred only acquisition and exploration costs.” At p.7
b. “Our business, financial condition, and results of operations may be negatively affected by economic and other consequences from Russia’s military action against Ukraine and the sanctions imposed in response to that action.” “Risk Factors at p. 21. [Is this a subtle way of warning us that the suspected real party in interest “behind the curtain” maybe someone/some entity vulnerable to such Russian sanctions?]
c. “We will require significant additional capital to fund our business plan.” Risk Factors at p. 22-23. Consider the detailed admissions that follow that admission:

> We will be required to expend significant funds to determine whether proven and probable mineral reserves exist at our properties, to continue exploration and, if warranted, to develop our existing properties, and to identify and acquire additional properties to diversify our property portfolio. We anticipate that we will be required to make substantial capital expenditures for the continued exploration and, if warranted, development of our I-M Mine Property. We have spent and will be required to continue to expend significant amounts of capital for drilling, geological, and geochemical analysis, assaying, permitting, and feasibility studies with regard to the results of our exploration at our I-M Mine Property. We may not benefit from some of these investments if we are unable to identify commercially exploitable mineral reserves.

Our ability to obtain necessary funding for these purposes, in turn, depends upon a number of factors, including the status of the national and worldwide economy and the price of metals. Capital markets worldwide were adversely affected by substantial losses by financial institutions, caused by investments in asset-backed securities and remnants from those losses continue to impact the ability for us to raise capital. We may not be successful in obtaining the required financing or, if we can obtain such financing, such financing may not be on terms that are favorable to us.

Our inability to access sufficient capital for our operations could have a material adverse effect on our financial condition, results of operations, or prospects. Sales of substantial amounts of securities may have a highly dilutive effect on our ownership or share structure. Sales of a large number of shares of our common stock in the public markets, or the potential for such sales, could decrease the trading price of those shares and could impair our ability to raise capital through future sales of common stock. We have not yet commenced commercial production at any of our properties and, therefore, have not generated positive cash flows to date and have no reasonable prospects of doing so unless successful commercial production can be achieved at our I-M Mine Property. We expect to continue to incur negative investing and operating cash flows until such time as we enter into successful commercial production. This will require us to deploy our working capital to fund such negative cash flow and to seek additional sources of financing. There is no assurance that any such financing sources will be available or sufficient to meet our requirements. There is no assurance that we will be able to continue to raise equity capital or to secure additional debt financing, or that we will not continue to incur losses.

d. ***"We have a limited operating history on which to base an evaluation of our business and prospects." Risk Factors at p.23.*** Consider the detailed admissions that follow that admission and which raise the question: why aren't those additional investigations being required and done in advance of the EIR approval, especially since the EIR/DEIR ignores my demands and those of other objectors for a commentary about the adverse consequences us neighbors fear if the EIR miner dewaters and otherwise creates a mess and then (before any of the mitigation or other safety work) abandons the project as infeasible? Such advance work should include what the 10Q plans for later after approval as follows:

Since our inception, we have had no revenue from operations. We have no history of producing products from any of our properties. Our I-M Mine Project is a historic, past-producing mine with apart from the exploration work that we have completed since 2016 has had very little recent exploration work since 1956. We would require further exploration work in order to reach the development stage. Advancing our I-M Mine Property into the development stage will require significant capital and time, and successful commercial production from the I-M Mine Property will be subject to completing feasibility studies, permitting and re-commissioning of the mine, constructing processing plants, and other related

works and infrastructure. As a result, we are subject to all of the risks associated with developing and establishing new mining operations and business enterprises including:

- completion of feasibility studies to verify reserves and commercial viability, including the ability to find sufficient ore reserves to support a commercial mining operation;
- the timing and cost, which can be considerable, of further exploration, preparing feasibility studies, permitting and construction of infrastructure, mining and processing facilities;
- the availability and costs of drill equipment, exploration personnel, skilled labor, and mining and processing equipment, if required;
- the availability and cost of appropriate smelting and/or refining arrangements, if required;
- compliance with stringent environmental and other governmental approval and permit requirements;
- the availability of funds to finance exploration, development, and construction activities, as warranted;
- potential opposition from non-governmental organizations, local groups or local inhabitants that may delay or prevent development activities;
- potential increases in exploration, construction, and operating costs due to changes in the cost of fuel, power, materials, and supplies; and
- potential shortages of mineral processing, construction, and other facilities related supplies.

The costs, timing, and complexities of exploration, development, and construction activities may be increased by the location of our properties and demand by other mineral exploration and mining companies. It is common in exploration programs to experience unexpected problems and delays during drill programs and, if commenced, development, construction, and mine start-up. In addition, our management and workforce will need to be expanded, and sufficient support systems for our workforce will have to be established. This could result in delays in the commencement of mineral production and increased costs of production. Accordingly, our activities may not result in profitable mining operations and we may not succeed in establishing mining operations or profitably producing metals at any of our current or future properties, including our I-M Mine Property.

e. ***"We have a history of losses and expect to continue to incur losses in the future" Risk Factors at p.23.*** Consider the detailed admissions that follow that admission and which raise the question, under these many admitted uncertain and high-risk circumstances, why is it not the EIR/DEIR that is "speculative" instead my objections, as the disputed EIR/DEIR continues incorrectly to assert. For example, consider these quoted 10Q admissions (emphasis added):

We have incurred losses since inception, have had negative cash flow from operating activities, and expect to continue to incur losses in the future. **We have**

incurred the following losses from operations during each of the following periods:

- **$3,464,127 for the year ended July 31, 2022**
- **$1,603,878 for the year ended July 31, 2021**
- **$5,471,535 for the year ended July 31, 2020**

> We expect to continue to incur losses unless and until such time as one of our properties enters into commercial production and generates sufficient revenues to fund continuing operations. We recognize that if we are unable to generate significant revenues from mining operations and/or dispositions of our properties, **we will not be able to earn profits or continue operations.** At this early stage of our operation, we also expect to face the risks, uncertainties, expenses, and difficulties frequently encountered by companies at the start-up stage of their business development. **We cannot be sure that we will be successful in addressing these risks and uncertainties and our failure to do so could have a materially adverse effect on our financial condition.**

What that implies is not just an unhappy fate for investors, but an worse result for us local surface owners above and around the 2585-acre underground mine, a topic which the EIR/DEIR incorrectly refuses to address as too "speculative," although the reverse is more true; i.e., as so admitted, shortly after the Rise investors and creditors lose hope for their gamble, they will cease supporting Rise and it will collapse, leaving a mess for us neighbors and our bigger community that the EIR/DEIR refuses to discuss but which (as a bankruptcy lawyer with vast experience in such situations) I have seen too many times and can describe for the bankruptcy or other courts that most likely will resolve the disputes that must follow any EIR approval by the County.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

1. "Risks Related to Mining and Exploration."

Consider the detailed admissions that follow that admission and which raise the question, under these many admitted uncertain and high-risk circumstances, why is it not the EIR/DEIR that is "speculative" instead my objections, as the disputed EIR/DEIR continues incorrectly to assert. For example, consider these quoted 10Q admissions (emphasis added):

(i)"The I-M Mine Property is in the exploration stage. There is no assurance that we can establish the existence of any mineral reserve on the I-M Mine Property or any other properties we may acquire in commercially exploitable quantities. Unless and until we do so, we cannot earn any revenues from these properties and if we do not do so we will lose all of the funds that we expend on exploration. If we do not discover any mineral reserve in a commercially exploitable quantity, the exploration component of our business could fail." 10Q at p. 24:

We have not established that any of our mineral properties contain any mineral reserve according to recognized reserve guidelines, nor can there be any assurance that we will be able to do so.

> A mineral reserve is defined in subpart 1300 of Regulation S-K under the Securities Act of 1933, as amended (the "Securities Act") and the Exchange Act ("Subpart 1300") as an estimate of tonnage and grade or quality of "indicated mineral resources" and "measured mineral resources" (as those terms are defined in Subpart 1300) that, in the opinion of a "qualified person" (as defined in Subpart 1300), can be the basis of an economically viable project. In general, **the probability of any individual prospect having a "reserve" that meets the requirements of Subpart 1300 is small, and our mineral properties may not contain any "reserves" and any funds that we spend on exploration could be lost. Even if we do eventually discover a mineral reserve on one or more of our properties, there can be no assurance that they can be developed into producing mines and that we can extract those minerals. Both mineral exploration and development involve a high degree of risk, and few mineral properties that are explored are ultimately developed into producing mines.**
>
> The commercial viability of an established mineral deposit will depend on a number of factors including, by way of example, the size, grade, and other attributes of the mineral deposit, the proximity of the mineral deposit to infrastructure such as processing facilities, roads, rail, power, and a point for shipping, government regulation, and market prices. **Most of these factors will be beyond our control, and any of them could increase costs and make extraction of any identified mineral deposit unprofitable.**

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(ii)"The nature of mineral exploration and production activities involves a high degree of risk and the possibility of uninsured losses." 10Q at p. 24:

> **Exploration for and the production of minerals is highly speculative and involves greater risk than many other businesses. Most exploration programs do not result in mineralization that may be of sufficient quantity or quality to be profitably mined. Our operations are, and any future development or mining operations we may conduct will be, subject to all of the operating hazards and risks normally incidental to exploring for and development of mineral properties, such as, but not limited to:**
>
> - economically insufficient mineralized material;
> - fluctuation in production costs that make mining uneconomical;
> - labor disputes;
> - unanticipated variations in grade and other geologic problems;
> - **environmental hazards;**
> - **water conditions;**
> - **difficult surface or underground conditions;**
> - **industrial accidents;**
> - metallurgic and other processing problems;
> - mechanical and equipment performance problems;
> - **failure of dams, stockpiles, wastewater transportation systems, or impoundments;**
> - **unusual or unexpected rock formations; and**
> - **personal injury, fire, flooding, cave-ins and landslides.**
>
> Any of these risks can materially and adversely affect, among other things, the development of properties, production quantities and rates, costs and expenditures, potential revenues, and production dates. If we determine that capitalized costs associated with any of our mineral interests are not likely to be recovered, we would incur a write-down of our investment in these interests. All of these factors may result in losses in relation to amounts spent that are not recoverable, or that result in additional expenses.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(iii). "Commodity price volatility could have dramatic effects on the results of operations and our ability to execute our business plan." 10Q at p. 25:

> The price of commodities varies on a daily basis. Our future revenues, if any, will likely be derived from the extraction and sale of base and precious metals. The price of those commodities has fluctuated widely, particularly in recent years, and is affected by numerous factors beyond our control including economic and political trends, expectations of inflation, currency exchange fluctuations, interest rates, global and regional consumptive patterns, speculative activities and increased production due to new extraction developments and improved extraction and production methods. The effect of these factors on the price of base and precious metals, and therefore the economic viability of our business, could negatively affect our ability to secure financing or our results of operations.

(iv). "Estimates of mineralized material and resources are subject to evaluation uncertainties that could result in project failure." 10Q at p. 25:

> Our exploration and future mining operations, if any, are and would be faced with risks associated with being able to accurately predict the quantity and quality of mineralized material and resources/reserves within the earth using statistical sampling techniques. Estimates of any mineralized material or resource/reserve on any of our properties would be made using samples obtained from appropriately placed trenches, test pits, underground workings, and intelligently designed drilling. **There is an inherent variability of assays between check and duplicate samples taken adjacent to each other and between sampling points that cannot be reasonably eliminated. Additionally, there also may be unknown geologic details that have not been identified or correctly appreciated at the current level of accumulated knowledge about our properties. This could result in uncertainties that cannot be reasonably eliminated from the process of estimating mineralized material and resources/reserves. If these estimates were to prove to be unreliable, we could implement an exploitation plan that may not lead to commercially viable operations in the future.**

Note that this Rise admission is directly contrary to my objections to the DEIR/EIR on this subject that were dismissed incorrectly as too speculative. But nothing so admitted can be too speculative for CEQA analysis, even if it is just to repeat the admission in the EIR/DEIR so as to correct the misrepresentation therein that there are no such risks or problems, because if there were they would have had to been addressed in the DEIR/EIR in order to comply with CEQA. Stated another way, when Rise admits such risks and problems are applicable by revealing them to investors and the SEC, it is wrong for the EIR/DEIR to ignore them in such presentations for County approval.

(v). "Any material changes in mineral resource/reserve estimates and grades of mineralization will affect the economic viability of placing a property into production and a property's return on capital." 10Q at p. 2:

> **As we have not completed feasibility studies on our I-M Mine Property and have not commenced actual production, we do not have mineralization resources and any estimates may require adjustments or downward revisions. In addition, the grade of**

ore ultimately mined, if any, may differ from that indicated by future feasibility studies and drill results. Minerals recovered in small scale tests may not be duplicated in large scale tests under on-site conditions or in production scale.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists.

(vi). "Our exploration activities on our properties may not be commercially successful, which could lead us to abandon our plans to develop our properties and our investments in exploration." 10Q at p. 25:

Our long-term success depends on our ability to identify mineral deposits on our I-M Mine Property and other properties we may acquire, if any, that we can then develop into commercially viable mining operations. Mineral exploration is highly speculative in nature, involves many risks, and is frequently non-productive. These risks include unusual or unexpected geologic formations, and the inability to obtain suitable or adequate machinery, equipment, or labor. The success of commodity exploration is determined in part by the following factors:

- the identification of potential mineralization;
- availability of government-granted exploration permits;
- the quality of our management and our geological and technical expertise; and
- the capital available for exploration and development work.

Substantial expenditures are required to establish proven and probable reserves through drilling and analysis, to develop metallurgical processes to extract metal, and to develop the mining and processing facilities and infrastructure at any site chosen for mining. Whether a mineral deposit will be commercially viable depends on a number of factors that include, without limitation, the particular attributes of the deposit, such as size, grade, and proximity to infrastructure; commodity prices; and government regulations, including, without limitation, regulations relating to prices, taxes, royalties, land tenure, land use, importing and exporting of minerals, and environmental protection. We may invest significant capital and resources in exploration activities and may abandon such investments if we are unable to identify commercially exploitable mineral reserves. The decision to abandon a project may have an adverse effect on the market value of our securities and the ability to raise future financing.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists.

(vii). "We are subject to significant governmental regulations that affect our operations and costs of conducting our business and may not be able to obtain all required permits and licenses to place our properties into production." 10Q at 26:

Our current and future operations, including exploration and, if warranted, development of the I-M Mine Property, do and will require permits from governmental authorities and will be governed by laws and regulations, including:

- laws and regulations governing mineral concession acquisition, prospecting, development, mining, and production;
- laws and regulations related to exports, taxes, and fees;
- labor standards and regulations related to occupational health and mine safety; and
- environmental standards and regulations related to waste disposal, toxic substances, land use reclamation, and environmental protection.

Companies engaged in exploration activities often experience increased costs and delays in production and other schedules as a result of the need to comply with applicable laws, regulations, and permits. Failure to comply with applicable laws, regulations, and permits may result in enforcement actions, including the forfeiture of mineral claims or other mineral tenures, orders issued by regulatory or judicial authorities requiring operations to cease or be curtailed, and may include corrective measures requiring capital expenditures, installation of additional equipment, or costly remedial actions. **We cannot predict if all permits that we may require for continued exploration, development, or construction of mining facilities and conduct of mining operations will be obtainable on reasonable terms, if at all. Costs related to applying for and obtaining permits and licenses may be prohibitive and could delay our planned exploration and development activities. We may be required to compensate those suffering loss or damage by reason of our mineral exploration or our mining activities, if any, and may have civil or criminal fines or penalties imposed for violations of, or our failure to comply with, such laws, regulations, and permits.**

Existing and possible future laws, regulations, and permits governing operations and activities of exploration companies, or more stringent implementation of such laws, regulations and permits, could have a material adverse impact on our business and cause increases in capital expenditures or require abandonment or delays in exploration. Our I-M Mine Property is located in California, which has numerous clearly defined regulations with respect to permitting mines, which could potentially impact the total time to market for the project.

Subsurface mining is allowed in the Nevada County M1 Zoning District, where the I-M Mine Property is located, with approval of a "Use Permit". Approval of a Use Permit for mining operations requires a public hearing before the County Planning Commission, whose decision may be appealed to the County Board of Supervisors ("County Board"). **Use Permit approvals include conditions of approval, which are designed to minimize the impact of conditional uses on neighboring properties.**

On November 21, 2019 we submitted an application for a Use Permit to Nevada County (the "County"). On April 28, 2020, with a vote of 5-0, the County Board approved the contract for Raney Planning & Management Inc. to prepare an Environmental Impact Report and conduct contract planning services on behalf of the County for the proposed I-M Mine Project.

The Use Permit application proposes underground mining to recommence at the I-M Mine Property at an average throughput of 1,000 tons per day. The existing Brunswick Shaft, which extends to ~3400 feet depth below surface, would be used as the primary rock conveyance from the I-M Mine Property. A second service shaft would be constructed by raising from underground to provide for the conveyance of personnel, materials, and equipment. Processing would be done by gravity and flotation to produce gravity and flotation gold concentrates.

We propose to produce barren rock from underground tunneling and sand tailings as part of the project which would be used for creation of approximately 58 acres of level and useable industrial zoned land for future economic development in Nevada County. A water treatment plant and pond, using conventional processes, would ensure that groundwater pumped from the mine is treated to regulatory standards before being discharged to the local waterways. There is no assurance our Use Permit application will be accepted as submitted. If substantial revisions are required, our ability to execute our business plan will be further delayed.

In 1975, the California Legislature enacted the Surface Mining and Reclamation Act ("SMARA"), which required that all surface mining operations in California have approved reclamation plans and financial assurances. **SMARA was adopted to ensure that land used for mining operations in California would be reclaimed post-mining to a useable condition. Pursuant to SMARA, we would be required to obtain approval of a Reclamation Plan from and provide financial assurances to the County for any surface component of the underground mining operation before mining operations could commence. Approval of a Reclamation Plan will require a public hearing before the County Planning Commission.**

To approve a Reclamation Plan and Use Permit, the County would need to satisfy the requirements of California Environmental Quality Act ("CEQA"). CEQA requires that public agency decision makers study the environmental impacts of any discretionary action, disclose the impacts to the public, and minimize unavoidable impacts to the extent feasible. CEQA is triggered whenever a California governmental agency is asked to approve a "discretionary project". The approval of a Reclamation Plan is a "discretionary project" under CEQA. Other necessary ancillary permits like the California Department of Fish and Wildlife ("CDFW") Streambed Alteration Agreement (if applicable) also triggers CEQA compliance.

In this situation, the lead agency for the purposes of CEQA would be the County. Other public agencies in charge of administering specific legislation will also need to approve

aspects of the Project, such as the CDFW (the California Endangered Species Act), the Air Pollution Control District (Authority to Construct and Permit to Operate), and the Regional Water Quality Control Board (National Pollutant Discharge Elimination System (authorized to state governments by the US Environmental Protection Agency) and Report of Waste Discharge). However, CEQA's Guidelines provide that if more than one agency must act on a project, the agency that acts first is generally considered the lead agency under CEQA. All other agencies are considered "responsible agencies." Responsible agencies do need to consider the environmental document approved by the lead agency, but they will usually accept the lead agency's document and use it as the basis for issuing their own permits. **There is no assurance that other agencies will not require additional assessments in their decision-making process. If such assessments are required, additional time and costs will delay the execution of, and may even require us to re-evaluate the feasibility of, our business plan.**

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(viii). "Our activities are subject to environmental laws and regulations that may increase our costs of doing business and restrict our operations. 10Q at 27:

All phases of our operations are subject to environmental regulation in the jurisdictions in which we operate. Environmental legislation is evolving in a manner that may require stricter standards and enforcement, increased fines and penalties for non-compliance, more stringent environmental assessments of proposed projects, and a heightened degree of responsibility for companies and their officers, directors, and employees. **These laws address emissions into the air, discharges into water, management of waste, management of hazardous substances, protection of natural resources, antiquities and endangered species, and reclamation of lands disturbed by mining operations. Compliance with environmental laws and regulations, and future changes in these laws and regulations, may require significant capital outlays and may cause material changes or delays in our operations and future activities. It is possible that**

future changes in these laws or regulations could have a significant adverse impact on our properties or some portion of our business, causing us to re-evaluate those activities at that time.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(ix). "Regulations and pending legislation governing issues involving climate change could result in increased operating costs, which could have a material adverse effect on our business." 10Q at 27:

> A number of governments or governmental bodies have introduced or are contemplating legislative and/or regulatory changes in response to concerns about the potential impact of climate change. Legislation and increased regulation regarding climate change could impose significant costs on us, on our future venture partners, if any, and on our suppliers, including costs related to increased energy requirements, capital equipment, environmental monitoring and reporting, and other costs necessary to comply with such regulations. Any adopted future climate change regulations could also negatively impact our ability to compete with companies situated in areas not subject to such limitations. Given the emotional and political significance and uncertainty surrounding the impact of climate change and how it should be dealt with, we cannot predict how legislation and regulation will ultimately affect our financial condition, operating performance, and ability to compete. Furthermore, even without such regulation, increased awareness and any adverse publicity in the global marketplace about potential impacts on climate change by us or other companies in our industry could harm our reputation. The potential physical impacts of climate change on our operations are highly uncertain, could be particular to the geographic circumstances in areas in which we operate and may include changes in rainfall and storm patterns and intensities, water shortages, changing sea levels, and changing temperatures. These impacts may adversely impact the cost, production, and financial performance of our operations.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not

speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(x). "Land reclamation requirements for our properties may be burdensome and expensive." 10Q at 28:

> Although variable depending on location and the governing authority, land reclamation requirements are generally imposed on mineral exploration companies (as well as companies with mining operations) in order **to minimize long term effects of land disturbance.**
>
> **Reclamation may include requirements to:**
>
> - **control dispersion of potentially deleterious effluents;**
> - **treat ground and surface water to drinking water standards; and**
> - **reasonably re-establish pre-disturbance landforms and vegetation.**
>
> **In order to carry out reclamation obligations imposed on us in connection with our potential development activities, we must allocate financial resources that might otherwise be spent on further exploration and development programs. We plan to set up a provision for our reclamation obligations on our properties, as appropriate, but this provision may not be adequate. If we are required to carry out unanticipated reclamation work, our financial position could be adversely affected.**

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(xi). "We may be unable to secure surface access or purchase required surface rights." 10Q at 28:

> Although we obtain the rights to some or all of the minerals in the ground subject to the mineral tenures that we acquire, or have the right to acquire, in some cases we may not acquire any rights to, or ownership of, the surface to the areas covered by such mineral

tenures. In such cases, applicable mining laws usually provide for rights of access to the surface for the purpose of carrying on mining activities; however, the enforcement of such rights through the courts can be costly and time consuming. It is necessary to negotiate surface access or to purchase the surface rights if long-term access is required. **There can be no guarantee that, despite having the right at law to carry on mining activities, we will be able to negotiate satisfactory agreements with any such existing landowners/occupiers for such access or purchase of such surface rights, and therefore we may be unable to carry out planned mining activities. In addition, in circumstances where such access is denied, or no agreement can be reached, we may need to rely on the assistance of local officials or the courts in such jurisdiction the outcomes of which cannot be predicted with any certainty. Our inability to secure surface access or purchase required surface rights could materially and adversely affect our timing, cost, or overall ability to develop any mineral deposits we may locate.**

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(xii). "Our properties and operations may be subject to litigation or other claims." 10Q at 28:

From time to time our properties or operations may be subject to disputes that may result in litigation or other legal claims. We may be required to take countermeasures or defend against these claims, which will divert resources and management time from operations. The costs of these claims or adverse filings may have a material effect on our business and results of operations.

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

(xiii). "We do not currently insure against all the risks and hazards of mineral exploration, development, and mining operations." 10Q at 28:

> **Exploration, development, and mining operations involve various hazards, including environmental hazards, industrial accidents, metallurgical and other processing problems, unusual or unexpected rock formations, structural cave-ins or slides, flooding, fires, and periodic interruptions due to inclement or hazardous weather conditions. These risks could result in damage to or destruction of mineral properties, facilities, or other property, personal injury, environmental damage, delays in operations, increased cost of operations, monetary losses, and possible legal liability. We may not be able to obtain insurance to cover these risks at economically feasible premiums or at all. We may elect not to insure where premium costs are disproportionate to our perception of the relevant risks. The payment of such insurance premiums and of such liabilities would reduce the funds available for exploration and production activities.**

Again, these admissions defeat the level of certainty incorrectly implied in the EIR/DEIR to the contrary and wrongly asserted as grounds for ignoring my objections as too speculative or unsubstantiated or unexplained, because such admissions confirm the correctness of my objections, at least to the extent of requiring a meaningful EIR/DEIR good faith reasoned analysis and common-sense risk assessment in the DEIR/EIR where none now exists. In particular, for example, as described in my DEIR Objection254 #'s 2, 4, 14, and 15, it is not speculative (as the disputed EIR incorrectly claims) that us objectors living on the surface above and around the 2585-acre underground mine will enforce our defensive rights to protect our homes and property rights and value, our forests and environment, and our community way of life against this mining menace with not just the usual legal challenges, but also with law reforms and political changes.

Miscellaneous 10Q Admissions Inconsistent With Or Contrary to the EIR/DEIR.

The DEIR claims that there is no viable alternative to the mining of this property, because industrial uses would be too "intense," a bizarre idea that is contrary to "common sense" and for which the DEIR/EIR offers no "good faith reasoned analysis" as demonstrated in my Objections thereto, noting that nothing is worse or more "intense" than such 24/7/365 mining for 80 years with continuous resistance from the local victims of this mining menace. However, the 10Q states at p. 17: "The Company would produce barren rock from underground tunneling and sad tailings as part of the project which would be used for creation of approximately 58 acres if local and useable industrial zoned land for future economic development in Nevada County, which is the alternative rejected by the DEIR/EIR as not viable and too "intense."

Miscellaneous Other Admitted Data from the 10Q.

As discussed at age 8 of the 10Q, Rise closed its purchase of the "Idaho-Maryland Gold Mine" property on 1/25/2017 for $2,000,000. It then purchased the 82-acre surface rights

adjacent thereto for $1,900,000 closing on May 14, 2017. Including those purchase prices and related acquisition expenditures totaling $7,958,346, the Rise cumulative expenditures for this project have been $8,082,335. Thus, Rise's working investment after acquisition has only been modest, such as for that 10Q period $123,989, of which the only CEQA evaluation or risk relevant expenses have been $92,159 for "consulting" $2453 on "engineering," and $1596 for "supplies." No wonder that Rise has so little useful to say about the conditions regarding its mine, because not only has Rise seemed eager to avoid discovering any inconvenient or worse truths or information, but Rise had insufficient working capital to investigate even if it had wished to risk acquiring the information us objectors expect to be true and damning to its EIR/DEIR approval goals.

As discussed at page 10, Rise borrowed $1,000,000 on 9/3/2019 secured by all of its (and its subsidiary's) mine and other assets due in full on 9/3/2023. The 10Q reported current balance is $1,491,308. The substantial warrants and high interest rate on the loan, which confirm the lender's belief in the high-risk nature of that loan against those mining assets (i.e., almost 8 to 1 loan principal to book value of assets plus the stock warrants). Various stock transactions are also described that raised the money already spent.

RISE ADMISSIONS IN ITS FORM 10K FOR THE FISCAL YEAR ENDED 7/31/2022 (FILED 10/31/2022).

2. Admissions Regarding the Mine Property And Basic Context Data.

As stated at 10K pp. 22+ the I-M Mine Project is described as a unified project comprised of "approximately 175 acres … surface land and … 2800 acres … of mineral rights" identified by maps and parcel data without any meaningful surface location data like roads or addresses. (The "Brunswick" 37-acre site, the 82-acre "Mill" site the EIR/DEIR calls the "Centennial" site, and the "mineral rights" area we call the "2585-acre underground mine" are all described in the 10K as parts of one unified mining project, so that the EIR/DEIR is rewriting history and trying to escape its SEC filings admissions by now trying to pretend that the Centennial site is a separate project. As admitted at page 31 as to "Environmental Liabilities," all "environmental studies were completed prior to Rise purchasing the Idaho land [aka Centennial] and the Brunswick land." That means that Rise cannot vouch for the accuracy, completeness, or sufficiency of the studies or any directions (or lack of correct instructions) given by prior owners. As to the Idaho land containing arsenic in the mine tailings and waste berms, the NV5 Draft Final Preliminary Endangerment Assessment and follow up Draft Remedial Action Plan (7/1/2020) is reported still "currently in process" by the Cal EPA. As to the Brunswick & Mill site)at p.31) following a surface Phase 1 assessment by ERRG, "ERRG has recommended further sampling and studies" "to determine if contamination historic mining and mineral processing was present." This is one of several opportunities for investigation that Rise has avoided. Also, in 2006 a Phase II assessment was reportedly done for the Mill Site by Geomatrix (at 32) which found arsenic in the waste rock and Volatile Organic Compounds (VOC) in the groundwater but they were not concerned with "vapor" and relied on the "deed restriction which restricts the use of groundwater for any domestic purpose and the construction of wells for the purpose of extracting water, unless expressly permitted by the Regional Water Board." The significance of these causes of concern have not been investigated or addressed sufficiently by the DEIR/EIR, although NV5

reportedly prepared a "Phase I/II ESA (June 16, 2020) presenting the results of additional investigations and addressing historical conditions identified in previous reports" (at 32). [Stated another way, the wording of the summary results is cleverly ambiguous although drafted in the passive voice (e.g., "mine waste is believed [by whom? based on what?] to have originated from offsite…") and subjective (e.g., arsenic concentrations …were relatively low except for …) [compared to what standard?]

At p. 32 + the 10K provides a general list of permits that might be required under particular summarized circumstances, but the 10K does not apply that general summary to reveal when such permits will be sought for this project or what of the listed factors are expected to trigger that require such permits. I mention this because when the EIR/DEIR lists permits it also does not describe sufficiently such trigger factors or the circumstances where objectors could apply such 10K data and other law to assure ourselves that the miner was planning to seek all the required permits, as opposed to evading them until the miner was "caught" and then seeking such permits and "forgiveness." My four Objections demonstrate why I and other objectors perceive the EIR/DEIR to suffer from credibility problems that make such concerns reasonable.

As to the relevant "history" summarized by the 10K starting at p. 34, using what are described as "available historic records," which I assume means the portion of such historical records which Rise chose to locate, leaving for later litigation discovery the question of which possibly available records Rise chose not to investigate. [While the 10K admits that "[h]istoric drill logs were not available for review and no historic drill core was preserved from past mining operations…" and objectors wonder what **reliable** evidence, if any, serves as the foundation for Rise's (and the EIR/DEIR's) purported analysis and what deficiencies exist to invalidate or discredit such analysis. Another discovery question is whether and to what extent the prior Emgold owner stopped its reported investigation merely (as Rise claims at 34-35) "due to inability to raise necessary funding in the midst of unfavorable market conditions" or whether they may also have been discouraged by negative information or clues of risks that would have to have been addressed in the EIR (if Rise had chosen to investigate them.) For example, the 10K reports that Rise purchased the "Emgold diamond drill program database" as distinct from all the historical documents of Emgold, as Rise did when it purchased from BET Group. In my experience miners tend to be selective about what they want to know and what they avoid because they might not want to know inconvenient truths or worse.

Such issues are important, among other things, because when Rise wants to impress the potential investor readers about the details of the "Geological Setting, Mineralization, And Deposit Types" (10K at 38+), it describes the variable underground data with some precision. However, when the EIR/DEIR addresses those underground conditions to deal with groundwater and related issues, it generalizes and falsely assumes a uniformity of those underground conditions that is rebutted by the 10K variations. (While that variation is relevant for gold opportunities addressed in the 10K that Rise wants to know, the EIR/DEIR does not equally address that variability because its disputed "talking points" sound less problematic for such groundwater and other EIR/DEIR risk disclosure exposures when it assumes uniformity consistent with its apparent desire for what seems to me to be an "alternative reality." Stated another way, should the EIR/DEIR be mistakenly approved, the challenge litigation will impeach the EIR/DEIR description of the underground conditions for groundwater and other risk issues, among other things, based on the contrary or inconsistent variable underground data presented in the 10K. Stated another way, when describing the underground conditions for gold, there are many described exceptions and variations, but the disputed EIR/DEIR's "don't worry about groundwater" theory falsely assumes

or implies uniformity not described in the 10K. For example, in discussing its underground analysis, even the 10K reflects doubts (e.g., at 44): "Although Rise gas carefully digitized and checked the locations and values of drill hole results from level plans and other documents, the absence of drill hole related documentation, such as drill logs, drill hole deviation, core recovery and density measurements, assay certificates, and possible channel sample grade biases, could materially impact the accuracy and reliability of the reported results."

Many inconsistencies appear even within the 10K, although not usually as substantial as the differences between the more detailed 10K and the less significant, more general, and less detailed data in the EIR/DEIR. For example, (at 44) the 10K admits that "Rise has conducted mineral processing and metallurgical testing analysis on the recent drill core from the I-M Mine Property for the purposes of environmental study in conjunction with permitting efforts." Since the disputed EIR/DEIR does not sufficiently reveal those results, that will likely be a subject of intense discovery efforts in any subsequent litigation to determine what was not reported and why? Even if the answer is that the EIR/DEIR did not trust that data, as the 10K admittedly does not trust the historical data, that also rebuts the EIR/DEIR as addressed in my Objections. For the 10K's such doubts, consider, for example (at 44): "No estimates of mineral resources have been prepared for the I-M Mine Property. We are not treating historical mineral resource estimates as current mineral resource estimates. In addition, there are no mineral reserves estimates for the I-Mine Property." Since the 10K (at 44-45) cites and relies on somewhat different authorities than the EIR/DEIR, the question is why? Considering all the many credibility issues with the EIR/DEIR, one wonders if Rise is more cautious about the 10K and other SEC filings because of the more serious consequences of misrepresentations than it is concerned about the accuracy of the EIR/DEIR.

Admissions in Risk Factor Discussion 10K Item 1A at p.6+.

The risk factors admitted in the 10K are the same as those admitted in the more current 10Q that is addressed above. So, I will not repeat them here, but I note that the consistency of those admissions increases their importance as admissions in these disputes.

Miscellaneous Financial Admissions. (Most data here is passed over in favor of the more current 10Q above).

To place the foregoing 10Q financial data in contest and reveal chronic incapacity to perform its EIR/DEIR goals and aspirations, even as limited to what it admits to be required (as distinct from what us objectors expect to be ultimately required if the EIR were ever to be approved), we note the admission at 10K p. 5: "As at July 31, 2022, we had a cash balance of $471,918, compared to a cash balance of $773,279 as of July 31, 2021." However, the 10K financial data for the prior year (starting at 48+) gives one a sense of scale, such as with respect to the "net loss and comprehensive loss for the year [2022]" of $3,464,127, compared to the operating loss of $3,385,107 (ignoring the large "gain on fair value adjustment on warrant derivatives"). Among the key questions is whether the data developed by Rise for the EIR/DEIR is being fully processed for its CEQA compliance as opposed to simply its gold exploration use.

See, e.g., (at 49) where the 10K reports an "Increase in mineral exploration costs to $788.684 (2021- $782,261) related to activities surrounding the Use Permit application."

As admitted (at 49): During the year ended July 31, 2022, the Company received cash from financing activities of $2,392, 998 (2021-$248,198) related to the private placement' that year. But during that year "the Company used $2.694,359 in net cash on operating activities, compared to $2,853, 475 in net cash the prior year…" As to the risk that creates for nonperformance of the EIR/DEIR, please note the following related 10K admission that follows those admissions:

> The Company expects to operate at a loss for at least the next 12 months. It has no agreements for additional financing and cannot provide any assurance that additional funding will be available to finance its operations on acceptable terms in order to enable it to carry out its business plan. There are no assurances that the Company will be able to complete further sales of its common stock or any other form of additional financing. However, the Company has been able to obtain such financings in the past. If the Company is unable to achieve the financing necessary to continue its plan of operations, then it will not be able to carry out any exploration work on the Idaho-Maryland Property or the other properties in which it owns an interest and its business may fail.

The Rise auditors, Davidson & Company, LLP, qualified its financials (starting at 10K p. 53) as follows:

> ***Going Concern***
>
> The accompanying consolidated financial statements have been prepared assuming that the Company will continue as a going concern. As discussed in Note 1 to the consolidated financial statements, the Company incurred a loss of $3,464,127 for the year ended July 31, 2022, and as of that date, had an accumulated deficit of $23,008,604. These events and conditions raise substantial doubt about the Company's ability to continue as a going concern. Management's plans in regard to these matters are also described in Note 1. The consolidated financial statements do not include any adjustments that might result from the outcome of this uncertainty.

Exhibit C. Hexavalent Chromium Issues Evaded In the EIR/DEIR Causing Noncompliance with CEQA, And More Foreseeable Objections For The Idaho-Maryland Mine

I. Introductory Comments.

A. Why The DEIR's Mistakes (And Worse) On These Hexavalent Chromium Issues, Especially Combined With the EIR Evasion Attempts, Must Prevent Approval of the EIR: Some Introductory Illustrations of the Fatal EIR/DEIR Flaws.

1. Some Introductory Context For Use of This Exhibit with Attached Related Objections.

As my attached EIR Objection 254 demonstrates (e.g., my rebuttals to disputed EIR Master Responses and EIR Responses to Comments Ind. 254-1 and the rest of my DEIR Objection 254 dealing with the hexavalent chromium menace, especially my #'s 3.A, C, E, F, G, and H, 4, 5, 7, 14, and 15), the DEIR barely mentioned hexavalent chromium (and only in passing in a few obscure places, but not at all where required in its discussion of "Hazards And Hazardous Materials"[4.7]. (See my attached Objection's analysis of CEQA and its Guidelines and other applicable law that forbid such "hide the ball" tactics and other evasions, demanding instead "common sense" responses with "good faith reasoned analysis" in easy to find and read places. E.g., *Gray, Banning, Vineyards, and Costa Mesa*.). Rather than focus on the less substantive and totally unsubstantiated and speculative EIR opinions purporting to respond to my DEIR Objection 254 and rebutted sufficiently in the attached EIR Objection 254, this Exhibit C will focus at the start on more technical, disputed comments, such as those buried in disconnected EIR Appendices discussed below (without cross-reference links to the disputed substance of the EIR, as if such disputed Appendices were stuck at the end of the EIR just in case such objectionable EIR tactics were exposed and the EIR needed a "fall back," perhaps to appear merely procedurally noncompliant, rather than substantively evasive. How these matters relate to the attached Objection to the EIR will be addressed briefly at the end.

Equally important, as my attached Objection repeatedly demonstrated, I offer to prove from appliable science (as my DEIR Objection 254 cited to on the EPA and the California EPA websites and Google revealed studies) that the unique problems in cleaning this toxic hexavalent chromium from the water is more challenging than I worry the deficiently explained and insufficient EIR/DEIR water "treatment process" can handle. Just ask the utility whose groundwater pollution inspired not just the movie "Erin Brockovich," but also the then record setting litigation settlement for killing the town of Hinkley, CA, and many of its residents. I mention this because, even if some industry defender of this CR6 toxin later (which is already too late) tries to dispute (rather than just evade) the science in that tragedy, as such industry people always seem to try to do to excuse such wrongs, even the CR6 **stigma** was sufficient to kill that town and the property values of every resident. Why? Because no outsider was willing to assume the risk of living in that place, i.e., such stigma is fatal to homeowners because who would trust such an eir? Why would any normal buyer seeking a wise home investment and

place to live do so? Caution would seem wise in such circumstances? In any case, because the DEIR failed even to mention such risks in its Hazards and Hazardous Materials discussion and because the EIR didn't correct that mistake identified in my objections, why would we expect the mitigations and water treatment proposals to be sufficient to treat a toxin that the EIR/DEIR ignored? See some discussion below of CR6 remediation, including the still ongoing Hinkley remediation described at www.hinkleygroundwater.com.

The insufficient and disputed EIR mitigation theory (but not labelled as "mitigation," because, as explained in the attached Objection, the EIR does not seem to want these "new" and "significant" [but obscured and disputed] comments and Appendices to be recognized as a CEQA-reason for further revisions and recirculation of the EIR). The EIR theory seems to be, in effect, don't worry because "in obtaining the future [i.e., deferred] Waste Discharge Requirements (WDRs) from the Regional Water Quality Control Board, the Project Applicant would ensure that the leaching of hexavalent chromium would not cause any impact and would meet regulatory standards (DEIR, p. 4.8-47-48)." (Emphasis added). However, since (as explained herein and in my other Objections) the EIR overstates and incorrectly and deficiently states in obscure places what was not so disclosed in the DEIR (see my DEIR Objection 254), how would that regulator even know to evaluate the threat, unless they did what I did, i.e., read all the thousands of pages of "fine print" looking for hints of such errors, omissions, and flaws, since my bankruptcy experience with miners has made me cynical? Again, if the EIR intended to comply and warn the government and pubic, why not properly amend the DEIR/EIR in the right places for CEQA compliance to make sure everyone focused on the right issues for evaluation?

2. The New Air Pollution Dispute Triggered by New Data Buried In the Disputed EIR Appendix R, But Still Evading the Bigger Toxic Water Pollution Threat.

Instead of engaging in any reasoned debate and disclosure in the proper place in the main EIR, the disputed EIR attempts further evasion by what it should admit being significant new air and water quality information on this topic (again requiring recirculation for material changes. evasions and noncompliance **about the adverse air and water impacts of using hexavalent chromium in and above the mine. (The EIR also added a new reference to nitrogen dioxide (NO-2), which will be addressed elsewhere in the air quality dispute discussion.) See CEQA Guidelines 15088.5 and my related discussion of authorities in my attached Objection, including section I.F.1. and my objections to EIR's Response Ind. 254-1. The EIR's disputed, new Health Risk Assessment (the "HRA") is obscured at the back of the document in vol. IX Appendix R (a disputed one page memo from DUDEK), which states that the purpose of such memo is "to address the potential health risk associated with exposure to two additional toxic air contaminants (TACs) that were not included in the original analysis of the proposed Idaho-Maryland Project (project), i.e., namely hexavalent chromium in cement [for mine shoring in the 2585-acre underground mine below or near thousands of impacted surface residents] and nitrogen dioxide (NO-2) from the combustion of ammonium nitrate fuel oil (ANFO)." FIRST, note that this DEIR omission was not**

because the DEIR did not know of the mine's use of that highly toxic hexavalent chromium, because its use in the mine paste (exposed in dust when mixing on the surface at the site) was described in an obscure back DEIR section discussing the disputed mine shoring process intended (and grossly failing) to reassure the thousands of surface residents above and around the underground mine against subsidence and other mining risks. As my DEIR Objection 254 (which this EIR significantly ignores in its Response Ind. 254-1) explained, there are thousands of EPA and California EPA website documents and concerns demonstrating water and air pollution health impacts requiring this to be a featured EIR headline in the "Hazards And Hazardous Materials" 4.7 discussion (where it has been wrongly ignored or obscured in the DEIR/EIR). SECOND, because this toxin is in the groundwater below objecting surface residents and at least 300 wells (by the deficient count in the County Economic Report—see Exhibit A, but far more than the 30 addressed in the DEIR), this not only poisons humans and their property, but it depresses property values and, therefore, property taxes, among other economic impacts ignored in the County Economic Report, which seems unaware of this hazard popularized in the movie, *Erin Brockovich,* about how such hexavalent chromium in the groundwater killed Hinkley, CA, and many of its residents. See Exhibit A and www.hinkleygroundwater.com. (I suggest that the County's economic analyst study what happened to property values and taxes in Hinkley, instead of the Report's noncomparable purported "comparable." See Exhibit A.) THIRD, this disputed new EIR air pollution cancer risk discussion is mysterious, because it focuses on future events and standards, leaving us to speculate about the accuracy and correctness of how compliance could be determined in advance to be below the safety thresholds set by the Northern Sierra Air Quality Management District, and why no analysis or mention is made of the water pollution threat. Therefore, because none of these material issues are properly addressed in the EIR/DEIR consistent with CEQA and its Guidelines or other applicable laws, the disputed EIR must be redone and recirculated for this and other reasons stated in my and other objections.

As also discussed at the end of this Exhibit is an example illustrating another credibility problem with the EIR/DEIR (and another reason why it was a mistake for the County Economic Report to accept the disputed EIR/DEIR as true without critical analysis, when any cursory reading of my Objections or any of hundreds of other objections to the DEIR would have revealed that the data was materially incorrect, incomplete, lacking in "good faith reasoned analysis" and *Gray* "common sense," and worse. (As the computer people say, garbage in creates garbage out.) Previously, this serious impact issue was not identified in the DEIR as a hazardous substance problem with lethal human consequences in water (as well as air, which the EIR now incorrectly attempts to address), but instead in an unrevealing mention buried in the back where this new Appendix R cites to it in DEIR page 4.8-47 (but not vice versa). That credibility problem is now compounded by a new one, where the EIR evasion is by a technique that is known as the "bait and switch;" i.e., the EIR briefly adds an insufficient and incorrect discussion (a single short paragraph) about air pollution from hexavalent chromium to distract from the much more serious, evaded water pollution, health hazards, and related impacts. This is also a key example of another "bait and switch" in the disputed DEIR/EIR, in the discussion of mitigation (e.g., Appendix R cites to Mitigation Measure 4.8-2(a)) of the air pollution by hexavalent chromium is not at all satisfactory mitigation of the lethal water

pollution by hexavalent chromium that is entirely ignored by the EIR main mitigation discussion, despite my not only discussing that lethal risk in my DEIR Objection 254, but also by my three minute comment at the public County Planning Department hearing in March 2022 on the DEIR, which earned a short line in the related "Nevada Union" story.

3. Deficient Mitigation Examples Of Related Issues Prevent the EIR From Pivoting To New, Disputed Hexavalent Chromium Theories.

And what is the environmental comfort to be taken even with the briefly addressed air pollution EIR "reassurance?" Consider what Appendix R says about the hexavalent chromium cancer threat after giving unsubstantiated and disputed air pollution dust estimates: "Hexavalent chromium has inhalation cancer risk and chronic reference exposure levels, but no acute non-cancer effects are associated with exposure. … Hexavalent chromium and NO-2 were evaluated in the HRA consistent with the methodologies presented in the DEIR. In summary, there would be no change in the cancer impacts with and without mitigation as shown in the DEIR [which ignores the subject and makes this disputed statement incomprehensible, wrong, and worse.]" As to the air pollution impacts remember our experience with asbestos, which had a similar history of prolonged, industry accommodating evasion until it became clear through many bankruptcies (in which I was frequently a significant bankruptcy lawyer) that there were no safe thresholds. See the discussion below about how the asbestos history predicts the coming fate of hexavalent chromium pollution.

As to the noncompliant water pollution, watch the movie again, read the court files on the Hinkley, CA, suits, study what is posted on www.hinkleygroundwater.com and related websites, and then read my technical data below and the most relevant EPA and California EPA website study horror stories. [The EIR at 2-77 describes how the dewatering process interacts with the blasting and mining underground, and that EIR states: "Thus, any water that contacts those [underground] components would be present only within the [2585-acre underground] mine workings and would then be pumped out of the mine workings by the dewatering system and into the clay-lined pond for further water treatment." Note that even if the locals aren't poisoned by the hexavalent chromium in that process, other people down the Wolf Creek may become victims. Note also that the hexavalent chromium that killed Hinkley, CA, and many of its people was also held for such processing in clay lined ponds, which didn't work out well for the victims.] Then read how the EIR dismisses my and other objections as nonmaterial, speculative, or irrelevant to CEQA concerns without any CEQA "good faith reasoned analysis." The result of these disputes is not just that EIR revisions and recirculation are essential, but that the County should begin to share the community doubts about the credibility of the mine's whole EIR process. See Exhibits A and B. When the County Economic Report notes (see Exhibit A hereto) that most real estate brokers believe the environmental impacts are seriously understated and causing depressed property value predictions, this is an powerful example of a rational and informed reason for such opinions; i.e., unlike the EIR/DEIR advocates, anyone at risk of harm from the mine has considered the hundreds of objections like mine that expose errors, omissions, and insufficiencies in the DEIR/EIR and worse things politely described as credibility problems with the DEIR/EIR.

I mention the credibility concerns because without transparent independent regulatory oversight of all aspects of the mining operation and proposed (and, hopefully, upgraded) mitigation, nothing in the disputed EIR/DEIR will ever be credible to the potential victims like me and thousands of other surface owners above and around the 2585-acre underground mine and any potential buyer or lender evaluating our surface properties. For example, the disputed EIR incorrectly asserts (at 2-76) without substantiation that: "Mitigation measures are achievable, enforceable, and capable of reducing the Project's impacts." Not only is that unsubstantiated repeatedly proven wrong, but that EIR sentence must be allowed to be rebutted by the admitted facts in Rise's own SEC filings (see Exhibit B and my DEIR Objection 254 #'s 2 and 4) that Rise cannot afford even the insufficient mitigation it proposes (and *Gray* rejected in a similar case); e.g., here at Mitigation Measure 4.8-2, replacement water for depleted or contaminated wells. Thus, the EIR's statement is false that its mitigation is "achievable," "enforceable [by the County, not the victims who then must turn to legal remedies]," or "capable of reducing the Project's impacts."

Note that a disputed EIR Master Response incorrectly argues this well water supply concern is just an East Bennett Road problem with 30 wells, despite the County Economic Report admits there are at least 300 wells at risk above and around the 2585-acre underground mine, and my objections contend the reality is many more. See Exhibit A and my attached Objection. To quote the disputed EIR (at 2-77): "As discussed in the GMP 30 groundwater monitoring wells will be installed at 15 locations. The locations of the monitoring wells are strategically placed between the mining and domestic wells to monitor the potential drawdown extent as the result of mining and assess the potential impact on domestic wells. … Qualified hydrologists [notice they don't say who or even independent and trustworthy] would evaluate the data from groundwater monitoring." There is nothing in the disputed EIR/DEIR or the process so far that inspires any confidence by us potential victims that any of this will be achieved as promised in the future, even if somehow Rise could afford it, which admissions in the Rise SEC filings (e.g., Exhibit B) cause us to doubt. We local potential victims would insist, among other things, on knowing the plans in detail in advance, not later, plus having total transparency on data collection and analysis by reliable experts, plus many more monitoring wells where they matter most (e.g., above and around surface of the 2585-acre underground mine where currently thousands of us resident objectors live and at least 300 relevant wells exist and in the next 80 years many more new wells will follow in reaction to climate change dryness and the 24/7/365 dewatering and mining), and much more discussed in this and my other Objections and those of many others I have incorporated.

One last example of credibility problems for the EIR/DEIR is that (at 2-76) is the delay in planning, disclosure, and mitigation until after approval, as distinguished from after approval and "at least 12 months in advance [of certain future events] per Mitigation Measure 4.8-2(a)." Why the delay to set the base level for future decisions, especially when that is forbidden by CEQA court decisions cited in my attached Objections? Perhaps (besides the fact that Rise cannot afford to do much of anything on time as admitted in Rise's SEC filings—see Exhibit B and my DEIR Objection 254 #2), they are stalling because the EIR admits that: "No groundwater level measurements have been completed since 2007." But the sooner they start measuring, the sooner that they will have to confront the inconvenient truths that their historical models, preventing the miner and its advocates

from ignoring key facts and climate change do not work already, and promise to become more incorrect progressively for the next 80 years, as explained in this and other objections.

4. The Disputed EIR Also Evades The Hexavalent Chromium Water Pollution Threat by Revealing Discussions of Its Mining Techniques in Volume IX, Appendix Q (see O), That Is Damning Not Only By Its Errors, But Also By Its Material Omissions of What Should Have Been Addressed In the DEIR Section 4.7 ("Hazards And Hazardous Materials") And in EIR Revisions Thereto (at 3-69).

(i) The Introduction to the Hexavalent Chromium Water Pollution Menace Begins With An Understanding of How The CR6 Is Being Used To Cement Mine Shoring And How The EIR/DEIR Obscures The CR6 Content Risk For Both Analysis And Mitigation.

In this EIR Objection 254 and other related Objections I have questioned the credibility of the disputed EIR/DEIR for its continued errors, omission, and other noncompliance in dealing with the known (and I believe irrefutable) hexavalent chromium water pollution issues. This Exhibit C attempts (i) to support my such Objections and expose the deficiencies, omissions, and worse in what the EIR now has added to the even less revealing and more obscure DEIR and, thereby, further (ii) to expose those problems and to insist on EIR revisions and recirculation. HOWEVER, BEFORE GETTING INTO THE MORE TECHNICAL HEXAVALENT CHROMIUM MATTERS IN THE FOLLOWING SECTIONS **BELOW, I DIRECT ATTENTION TO CERTAIN "Significant New Information" ADDITIONS AND REVISIONS TO THE DISPUTED EIR SECTION 4.8 HYDROLOGY AND WATER QUALITY (AT 3-70-73) AND THE ADDITION OF THE ITASCA *"DESKTOP STUDY OF CEMENTED PASTE BACKFILL"* IN VOLUME IX, APPENDIX Q (see O). While the disputed EIR/DEIR's greatest sins often are of omission or evasion, I also focus here on what the disputed EIR does say, because in that context it reveals the EIR as not only grossly deficient, but also misleading or worse. That disputed Appendix Q study buried at the end of the EIR does not dare even address the hexavalent chromium health threat expressly (preferring instead to describe the "cemented paste backfill" ["CPB"] as if that were the issue, rather than the unnamed hexavalent chromium that was the true issue). Instead, Appendix Q focuses on the threat of that CPB mine cement paste as to the risk of it leaking into the ground water, implying it must be a health menace, but not analyzing the hexavalent chromium ingredient itself as the only apparent danger in that cement. As discussed in the attached Objection, this tactic is called "hide the ball" or "bait and switch."**

Begin the technical analysis by studying the purportedly "insignificant" disputed EIR new revisions (at 3-72) to DEIR Chapter 4.8 [Hydrology and Water Quality] in the final paragraph of Section 4.8.4 and in the related Mitigation Measure 4.8-2(a), which adds that the miner "shall implement the Groundwater Monitoring Plan (GMP) prepared by Itasca Denver, Inc (February 2021), as approved by the county. Implementation of the GMP shall be initiated prior to the dewatering of the mine and on an ongoing basis…"

Again, as demonstrated in the attached Objection, that kind of deferral is forbidden by CEQA and controlling court decisions I cite there. That GMP involves "a network of monitoring wells [that] shall be installed to the satisfaction of the Nevada County Environmental Health Department," with "Groundwater level and groundwater quality information ... obtained from the project ground watering monitoring wells and collected on a quarterly basis" and submitted to that Department etc. The revised text of 4.8-1(e) states that: "The applicant shall submit a RoWD and obtain WDRs from the Central Valley RWQCB for construction of the engineered fill areas… prior to initiating any engineered fill placement activities … [with] [p]roof of coverage …provided to the Nevada County Public Works Department." As demonstrated in the attached Objection's analysis of the Guidelines and relevant case law (e.g., *Gray, Richmond v. Chevron, sections I.E.1-4, I.D, and I.A.1.d*), that mitigation will fail to meet those legal requirements.

That disputed EIR revision adds more prohibited future and deferred events to the DEIR that RWQCB "will determine the appropriate mining waste classification" for the engineered fill. "The RoWD must also include a report on the physical and chemical characteristics of the waste, in compliance with Water Code section 13260(k), that could affect its potential to cause pollution or contamination as well as a report that evaluates the potential of the discharged mining waste to produce over the long term, acid mine drainage, the discharge or leaching of heavy metals, or the release of other hazardous substances." [That should require disclosure of the hexavalent chromium threat as a hazardous substance, as many EPA website posted studies confirm, but there is no such warning about hexavalent chromium in the EIR. See also below the discussion of Prop 65 disclosures. That is like having a coroner test for poison in a crime victim without the investigator telling him about the unique poison you found contaminating the food at the crime scene, and somehow expecting the coroner to find that unknown in his or her general testing.] "The applicant will prepare and implement a Waste Characterization Plan (Characterization Plan) which will be incorporated into the approved WDR." [However, since the disputed EIR is already still obscuring or hiding the hexavalent chromium threat and, ignoring that harm, plus has incorrectly classified the cement paste mine material as nontoxic, Group C benign mine waste, it is essential that such a plan be addressed now in advance of any EIR approval. As demonstrated in my legal and court decision analysis in EIR Objections 254 of the CEQA and Guideline disclosure requirements, that deferred mitigation and safety process is not sufficient or satisfactory. See section I.C and D.

Why is that timing so important? It is not just that CEQA requires such matters to be disclosed and analyzed fully before EIR approval, but also because, if these many serious mine disputes have to be litigated, that should occur in one consolidated process, not in many successive dispute processes as Rise (or any successor "behind the curtain" in the suspected "flip" on approval) slowly unveils its various future operation and action plans and further requested governmental decisions, all of which should be done before EIR approval.] CONSIDER, FOR EXAMPLE, THAT AS EXPLAINED BELOW, HEXAVALENT CHROMIUM IS ONE OF THE LISTED CARCINOGENS (ALSO WITH REPRODUCTIVE TOXICITY) THAT MUST BE DISCLOSED BY THIS MINER PURSUANT TO PROP 65, BUT THERE IS NO ALERT THAT SUCH WARNINGS WILL BE FORTHCOMING. IN EFFECT, THIS DISPUTED EIR IS REFUSING TO GIVE THE COUNTY NOTICE NOW BEFORE EIR APPROVAL THAT THE MINER WILL HAVE TO NOTICE TO EVERYONE AFTER APPROVAL PURSUANT TO

PROP 65. WHY THE DELAY? WHY NOT DO WHAT IS REQUIRED BY CEQA AND NOW PROVIDE THE *GRAY* AND OTHER COURT REQUIRED COMMON SENSE/GOOD FAITH REASONED ANALYSIS? WHY NOT REVEAL THIS REALITY NOW, SO THAT THE DECISION-MAKERS AND PUBLIC CAN MAKE UP THEIR OWN MINDS ABOUT THE EXTENT OF THE CR6 THREAT AND THE ADEQUACY OF THE PURPORTED MITIGATION AND TREATMENT, SINCE REMEDIATION FOR HEXAVALENT CHROMIUM IS NOT THE SAME AS OTHER TOXINS SUPPOSEDLY ADDRESSED IN THE DEIR/EIR WATER TREATMENT PROCESS? IN EFFECT, THE EIR IS ASKING THE COUNTY, WITHOUT ADEQUATE DISCLOSURE ON THESE MATTERS, TO DEFER MITIGATION TO THE REGULATORS, WHICH I HAVE CITED COURT DECISIONS TO PROVE IS EXPRESSLY FORBIDDEN BY CEQA AND ITS GUIDELINES AS PROPERLY INTERPRETED AND APPLIED.

Note also that, as addressed elsewhere, the insufficient, proposed, monitor wells and other mitigations (including those added in EIR revised Mitigation Measure 4.8-2(c)) are focused on the 30 or so East Bennett Road and wholly owned Centennial and Brunswick sites, rather than the County's (and NID's) larger but still insufficient well count, as if the EIR/DEIR were hoping that deficient, token testing will distract everyone from the bigger legal and environmental problems in the mine risks, threats, and harms to the thousands of us surface owners and users above and around the 2585-acre underground mine. That is especially important to monitor fully such risks, threats, and harms, since (as admitted in Rise's SEC filings—see Exhibit B) the mine lacks the resources to afford to mitigate such risks, threats, and harms to which it will expose those surface owners (like me), much less to cure the problems the mine is creating for others who will be impacted. See my discussion of *Gray* and other authorities in my DEIR And EIR Objections 255, DEIR Objection 254 #'s 2, 3.N, 4, and 14, and the attached EIR Objection 254.

Before addressing **the Itasca Appendix Q issues** in detail, please note the following among the many disputes and flaws with what the EIR/DEIR is doing in its described provisions in the previous paragraphs. **First,** to evade dealing with (or even properly mentioning) substantive risks, threats, and harms **now before EIR approval,** when required by CEQA and other applicable law, the disputed EIR improperly defers the substance to a **future process and deferred regulatory approvals after the EIR is approved (see my legal briefing on this in the attached EIR Objections 254 and 355)**, when such information is too late for many purposes except to attempt to remediate/clean up the mess that will exist from starting the mining until the courts stop it. Also, these disputes should be consolidated for cost-efficiency and speed of final resolution, otherwise there will be multiple litigations occurring at different times as disputes become "ripe" for adjudication. ***Second,*** such delayed essential planning and decisions (to which I and others object) make it impractical to have a factual debate on the detailed merits, since Rise will just claim that (after EIR approval and commencement of harms) they will adapt to some such future governmental or court requirements. Trying to litigate standards in the abstract before such governmental actions creates many extra costs and problems, which is why what the disputed EIR is doing by delaying disclosure of key details until after approval of the insufficient EIR (still full of many errors, omissions, and other noncompliance) is forbidden by CEQA and other applicable laws. **Third,** while government is supposed to do certain such prescribed things in the future to protect us local victims (e.g., monitor the insufficient and misplaced test well results, classify waste, etc.), nothing in the disputed EIR/DEIR fairly warns

those governmental authorities of the toxic hexavalent chromium water, so they can specifically (a) watch out for, treat/remediate, and mitigate such water pollution problems that killed Hinkley, CA, and many of its residents (see the movie, "Erin Brockovich" and my various commentaries here and in my Objections), and (b) correct the EIR's misclassification of the mine waste Group A, not Group C benign. Also, and more importantly for the thousands living on the surface above and around the 2585-acre underground mine being filled with toxic hexavalent chromium cement paste, decisionmakers must appreciate why the insufficient test wells are misplaced and not predictive of the risks to them. (Also relevant to the County, the supposedly treated water flushed down the Wolf Creek elsewhere will spread that pollution [NID customers there, beware] and should be examined closely for the insufficiently disclosed hexavalent chromium threats and faulty "treatment.") Many other issues are addressed throughout the attached and other objections, but this illustrates some of the problems.

(ii). Exposure of the Disconnected Appendix Q Issues And Objectionable EIR/DEIR Conduct And "Hiding The Ball."

To purport to provide some (though insufficient, incorrect, and otherwise noncompliant) data on these disputed subjects (i.e., "significant new information" for CEQA purposes that the EIR incorrectly claims was just clarifying and embellishing the DEIR, hoping thereby the evade the CEQA duty to revise and recirculate), **THE DISPUTED EIR ATTACHES (AT THE END OF THE EIR) IN VOLUME IX, APPENDIX Q, A DISPUTED, SHORT "TECHNICAL MEMORANDUM" DATED 2/24/2020, ENTITLED, "DESKTOP STUDY OF CEMENTED PASTE BACKFILL."** This is apparently designed as backup data in case someone like me notices that the relevant data in the EIR is not adequately described in compliance with CEQA and other applicable law, not to mention other errors, omissions, and noncompliance. Itasca describes (at the start of the Technical Memo) this as a "desktop study of cemented paste backfills (CPB) use and its potential impacts on water quality and site-specific considerations for IMM." Note that there is no effort to reconcile the inconsistencies between that memo (and, therefore, the EIR) and the DEIR, which the disputed EIR leaves unresolved, as if the noninformative DEIR no longer needs to be considered on this topic. However, I note that those conflicts are material and in need of clarification with a revised and recirculated EIR. For example, among others that are apparent contrast: (i) the DEIR and my DEIR Objection 254 thereto, versus, (ii) the EIR (and especially this Technical Memo) and this objection. THE DEIR DEALS WITH HEXAVALENT CHROMIUM ADDED IN THE CEMENT PASTE (AS CR6+) VERSUS THE EIR/TECHNICAL MEMO DEALING WITH HEXAVALENT CHROMIUM IN THE PORTLAND CEMENT (CR(VI)). ALTHOUGH BOTH MAY EXIST AS HAZARDS, THE CR6+ IN THE CEMENT IS A WATER POLLUTER AND THE CR(VI) IS ALSO AN AIR POLLUTER (E.G., AS DUST FROM DELIVERY AND USE ON THE SURFACE BEFORE BEING INJECTED INTO THE MINE), as described in the DEIR versus the EIR.

To begin for context and to clarify variance from the disputed DEIR description, that disputed Technical Memorandum describes the "cemented paste backfills (CPB)" as a means of improving "geotechnical stability by backfilling mined stopes (voids) and allow[ing] the recovery of the ore body to be maximized." (Like the Harry Potter villain, the EIR/DEIR is afraid to name the menace hexavalent chromium.) In essence, CPB is "formulated on the surface" by mixing tailings "with cement and water, although other additives or mined materials are sometimes included" (apparently, if the disputed DEIR were correct, like hexavalent

chromium), and that mixture is then pumped into the underground mine to shore up places that are deemed to need it. **Throughout the Technical Memo discussion are qualifications and warnings about the proper preparation and "curing" of the CPB before exposed to dewatering, which is another way of saying that the homes, property values, and groundwater of us potential victims above and around the 2585-acre underground mine are at risk of human error by those preparing this toxic brew for shoring beneath us, where there is no EIR proposed monitoring until it is too late and the harms begin before surface owner or governmental discovery, especially considering that the insufficient monitor system is not applicable or effective to detect such problems timely in many places where it is needed. Under a heading called "Potential Water Quality Issues With CPS" (which like all the rest of this Technical Memorandum should be inserted in the related EIR's Hazards And Hazardous Materials discussion [4.7] and should be recirculated for proper debate as required by CEQA and other applicable law) the following data is revealed, beginning with the admission that: "There are some potential water quality related issues with CPB if it is not implemented correctly." Part of that admitted hazard is inherent in the "specific composition of the tailings materials used in the CPB," and another admitted part is that the "CPB does not set properly or is not strong enough to remain intact in the mine environment." In other words, we are all at risk if those handling this dangerous material are careless, untrained, missing in action, or worse.**

EIR Appendix Q, the Itasca update dated 6/17/2022 to the Technical Memorandum (App. Q) disputed above, incorrectly describes itself as a "clarification" in response to various objections, when it is obviously significant new information for CEQA analysis. None of those updates or "clarifications" addresses my Objections or rescues the EIR from the errors, omissions, or noncompliance addressed above. Therefore, I will just briefly expose some flaws in that update. However, it should be of great concern to the County that, rather than confront the key objections on the merits as required by CEQA and other law, that update (like the EIR generally) ignores the issues or dismisses them as irrelevant or premature because it evades debate by claiming disputed and uncertain mitigations after approval of the EIR.

Admitting that the EIR ignores in its "groundwater flow model" for dewatering what Itasca calls "[c]consumptive water uses from individual wells, Itasca dismisses the concern without proof as too "small, relative to regional groundwater flow," relying on what it claims to be the "low permeability of the rock mass" and "generally low pumping rate." **First,** it is again not clear whether these comments purport to cover the whole 2585-acre underground mine below thousands of surface owners and users or only the East Bennett Road area on which the DEIR was almost wholly focused with respect of this issues. See my DEIR Objection 254 and my comments in the attached Objection, such as, for example, about the obvious fallacy of assuming the higher ground areas are subject to the same conditions and issues as those downhill East Bennett Road conditions where Rise concentrates its monitoring systems. Also, this disputed EIR updated commentary incorrectly assumes that, despite climate change, science, and reason, whatever conditions exist now will continue for the next 80 years and that no greater surface owner groundwater use demands will apply. The reality is that, as has proven true everywhere else in California where surface owners are confronting drought conditions by tapping more groundwater, surface owners and users will exercise their legal rights to increase wells and groundwater usage, especially since that groundwater also belongs to them, not just the

mine. Indeed, during the next 80 years, when NID cuts back water supplies in the future, before local surface owners abandon their homes and suffer their forest to die from lack of the groundwater flushed away down the Wolf Creek by 24/7/365 mine dewatering, us surface owners and users will likely band together in well collective to compete and battle in the courts and political arena against the mine's water wastes. That reality dooms the flawed assumptions on which the disputed EIR/DEIR (including these disputed opinions) relies, such as Itasca above ignoring competing water use by massively more wells than in its false assumption. Also, note that many of us do have sewers, countering the (in effect) "don't worry, just recharge using your septic tank water" comments here and "landscape irrigation" (which ignores NID's likely rationing rules imposed on us while the mine flushes away our owned groundwater down the Wolf Creek. See also the NSAQMD Agency 12 (at 12) and 11 priority use of even NID rationed water to suppress its toxic (already asbestos and now CR6+) fugitive dust

I defer to the more expert groundwater objectors to deal with the **flawed Itasca attempts to rehabilitate its model's simulations addressed in that Appendix Q**. See my Table of Incorporated By Reference Objections and Exhibit D. But again, we confront the issue of whether and when these commentaries purport to address the whole area above and around the 2585-acre underground mine or only the East Bennett Road area downhill, a flaw that by itself should require EIR revision and recirculation, especially since there is no sufficient proof that the disputed EIR/DEIR comments on the downhill, wholly owned mine and East Bennett Road area apply equally to the uphill surface area above and around the 2585-acre mine where thousands of us objectors live. This is the disputed false equivalence tactic again at play. Who is more guilty of noncompliant speculation? It must be EIR with the burden of proof and CEQA investigation and disclosure duties, not us potential victims whose objections are impaired by the EIR's noncompliance.

Once again, **the attempts of Itasca to justify exclusion of comparisons to other local mines (e.g., Empire) for the disputed Itasca model must fail on the merits, as I prove in the attached Objection.** Among the many flaws in such reasoning are that the conditions in this long flooded and closed mine have not been adequately investigation, and there is no merit to the EIR/DEIR assumption that either that those disputed assumptions will continue to apply for 80 years or that they will apply to or after the new and deeper 24/7/365 mining and dewatering contemplated in the EIR/DEIR. Guesswork and speculation, such as when such experts accept disputed and unreliable EIR or miner data as if it were true, should not be permitted to risk the health, welfare, environment, and future of our local community. For example, one such flawed Itasca argument for excluding Empire Mine comparisons is that "[t]here is no direct flow from these historical mines to the future Rise Mine working" and that there is a "block" by "low permeability rock masses" between the historical mines and the future Rise Mine. Besides disputing any reliable foundation or basis exits for that disputed and unsubstantiated opinion (e.g., noting the lack of reliable historical documents and data. The EIR/DEIR has not adequately investigated this long flooded and closed mine [1956] and its new mining areas for that issue during the next 80 years. Also, please note that my and other objections complain about the EIR/DEIR cherry-picking favorable (but irrelevant) studies and opinions involving false supporting claims based on much less comparable and distant places are alleged to "similar." In fact, those EIR/DEIR false comparables are much less similar and relevant than the Empire and other mines cited in objections and incorrectly dismissed without fair consideration on the merits by Itasca.

I also defer to more expert objections as to the seismic errors and omissions regarding the "simulations" in the disputed "groundwater flow model" relating to the "Idaho Fault system." However, this Itasca update admits that it ignored "the modeling of these minor faults" [22, 20, 11, and 20C of the Idaho Fault Zone) because "most of this area is already modelled as mining voids," another disputed contention on various bases. For example, those "minor faults" can be a material menace to those living around the 2585-acre underground mine, even if they don't damage distant towns. How many of us locals must be sacrificed before it matters "materially" that the miner triggers a "minor fault" and damages our surface properties (also another reason for depressing property values)? Why dismiss "minor" faults, when there is ample data on the local harms they cause when triggered? Nowhere does the EIR/DEIR prove that a "minor fault" is a "safe fault," as distinct from a fault that is only dangerous to the locals? Note also that groundwater depletion, reallocation, and dewatering for fracking has caused earthquakes causing material local harm in Oklahoma and Pennsylvania, where no one could ever remember any earthquakes before, and similar problems are alleged in other fracking sites where groundwater is similarly manipulated. See my prior references to the *Keystone* Supreme Court case and other authorities were us surface owners' rights of lateral and subjacent support includes groundwater to avoid subsidence and, we contend, also induced earthquakes on even "minor faults."

(iii). The Appendix Q Technical Memorandum Admits That The Level of Risk, Threat, And Harm From CR6 Water Pollution Depends On Variables That Are Not Sufficiently Addressed In the EIR/DEIR.

Thus, the Appendix Q Technical Memorandum (unlike the disputed main EIR itself, which incorrectly ignores or dismisses all such concerns without sufficient identification of the issues or proof) admits (at pp. 2 and 3 of 8, EMPHASIS ADDED):

> **A VARIETY OF SITE-SPECIFIC FACTORS CAN AFFECT THE ABILITY OF CPB TO SET AND ITS LONG-TERM STRENGTH. FOR EXAMPLE, INSUFFICIENT BINDER CONTENT, EXCESSIVE WATER CONTENT, OR WATER WITH HIGH SULFATE CONCENTRATIONS (EG, FROM HIGH-SULFIDE TAILINGS) CAN DECREASE CPB STRENGTH OR INHIBIT PROPER SETTING. IF CPB DOES NOT SET PROPERLY, IT MAY BE LESS EFFECTIVE AT REDUCING THE MOBILITY OF CHEMICAL CONSTITUENTS [IE, ADMITTED, TOXIC HEXAVALENT CHROMIUM], AND THERE IS THE POTENTIAL FOR THE BINDER MATERIAL TO BE LEACHED FROM THE CPB MIXTURE [IE, SUCH HEXAVALENT CHROMIUM POLLUTES OUR GROUNDWATER AND ULTIMATELY THE WOLF CREEK]. ADDITIONALLY, HIGH SULFIDE-CONTENT TAILINGS THAT ARE ACID GENERATING AND HAVE ELEVATED METALS CONCENTRATIONS CAN RESULT IN METALS LEACHING FROM CPB AND CAN DEGRADE CPB STRENGTH.**
>
> **BECAUSE CEMENTS AND GROUTS ARE ALKALINE IN NATURE, SOME STUDIES HAVE NOTED THAT THE POTENTIAL EXISTS FOR THESE MATERIALS TO PREFERENTUALLY LEACH FROM CPB AND CAUSE ELEVATED pH VALUES IN GROUNDWATER AND/OR RELEASE**

CONSTITUENTS FROM THE CEMENT OR OTHER ADDITIVES [EG, HEXAVALENT CHROMIUM].

THUS**,** THE EFFECT OF the DISPUTED EIR IS TO FORCE US LOCAL VICTIMS TO GAMBLE ABOUT DEFICIENTLY DISCLOSED LETHAL HEXAVALENT CHROMIUM HAZARDS THAT ARE ADMITTEDLY DEPENDENT ON MINE WORKERS' SKILL, DILIGENCE, AND CARE IN DEALING WITH THESE UNACKNOWLEDGED RISKS AND ON UNANALZED MINE MATERIAL CONDITIONS, i.e., this Appendix Q admits that this mine paste can be mishandled, so as to be a more serious threat to water than its best case claims under ideal circumstances that may or may not exist. Therefore, there is risk and a need for better, RELEVANT MONITORING OR MITIGATIONS SUFFICIENT TO PROTECT THOSE OF US ABOVE OR AROUND THE 2585-ACRE MINE AND OTHERS WHEREVER THE (THEN AT RISK OF POLLUTION) WOLF CREEK FLOWS. THE DISPUTED EIR DARES INCORRECTLY TO CLAIM THERE ARE NO SIGNIFICANT ISSUES OF CONCERN WITH THE DEIR, SO THE EIR DOES NOT NEED TO BE REVISED OR RECIRCULATED. THAT IS OUTRAGEOUS, ESPECIALLY CONSIDERING WHAT ADDITIONAL CANCER (AND REPRODUCTIVE HEALTH) THREATS THE DISPUTED EIR NOW ADMITS FROM HEXALENT CHROMIUM AIR POLLUTION IN APPRENDIX R. (ALTHOUGH THAT WAS IN THE CONTEXT OF AIR POLLUTION, RATHER THAN WATER POLLUTION, THE MANY EPA WEBSITE STUDIES OF THIS CANCER-CAUSING TOXIC SHOULD BE SPECIFIC ENOUGH TO BE TAKEN SERIOUSLY. NO ONE CAN DOUBT THAT ANY PURCHASER OF IMPACTED SURFACE PROPERTY WILL TAKE THIS SERIOUSLY AND ASSUME THE WORST CASE, AS EXPLAINED IN EXHIBIT A (AND IN DEIR OBJECTION 254 # 2, 3.N, 4, AND 14).

The Technical Memorandum (at 5 of 8) also addresses a dispute study by ACZ Laboratories involving tests on four flotation tailing samples for "acid digestion" that us objectors consider not representative or predictive of the problems of us local victims above and around the 2585-acre underground mine. For those and other reasons the disputed study from Rise/EIR chosen contested "experts" and locations do not persuade anyone at risk (or anyone considering buying or financing that surface property at risk.) Indeed, the study's conclusion is full of dangerous qualifiers that invite our dispute, such as (again based on what Rise selected and did for its own benefit in a tiny sample) this contractor said (emphasis added) that: "it is LIKELY that the CPB used in the IMM will have very low solute release rates and will be GENERALLY environmentally benign." However, consider the "Conclusion" (at 6 of 8), stating that: "However, it is clear from case studies and theoretical behavior of CPB that there are a variety of site specific factors that could affect the potential for water-quality impacts…" for which the memo suggests specific suggested protective actions and cautions, none of which are appropriately added to the EIR for compliant disclosure and "good faith reasoned analysis" with "common sense," presumably because the EIR prefers not to call attention to these risks which CEQA and other applicable laws require the EIR to address now.

Again, there is the debate as to what threshold levels of such cancer causing toxic hexavalent chromium are safe, but, rather than have that debate on the merits, the disputed EIR dares to ignore the risks, threats, and harms in the EIR/DEIR and seek advance approval for its nondetailed concept, with "the details hiding their devils" to be deferred until after EIR approval and revealed in some future time when much harm may have already been done. Incidentally, since Rise arranged all this Itasca testing that is referenced in the Technical Memorandum well

before the EIR/DEIR, where is it? Why has Rise not attached more meaningful data in the EIR Appendix, instead of irrelevant studies of purportedly "similar" situations that we dispute and contend are not similar at all, and, in any event, contain errors, omissions, or other noncompliance?

If the EIR advocates attempt to continue to evade these risks and threats, they cannot be allowed to do so without adequate CEQA and other disclosures and recirculation of their disclosed position, so that it can be fully disputed on the merits. The EIR cannot rely on the Appendix Q Technical Memorandum to save it (i.e., the disputed EIR cannot ignore these identified and admitted risks, threats, and harms), especially since this is just a "desktop study," where these purported EIR/Rise experts simply have largely relied on what Rise told them about imagined/assumed conditions without any apparent investigation of the actual facts on (or under) the ground. Given Rise's various credibility problems and other issues raised in my and other objections, as well as the lack of documentation and disclosure of what Rise told Itasca, there is no reason for disregarding the worst-case assumptions from these admitted risks. Consider **another admission** in the Appendix Q Technical Memorandum (at 3 of 8) where the CPB finally mentioned the words hexavalent chromium (emphasis added):

> **The presence of CHROMIUM in cement has been identified as a potential WATER-QUALITY CONCERN related to the use of CPB (Hamberg et al 2018). HEXAVALENT CHROMIUM (CR(VI)) is an oxidized form of chromium that IS MORE SOLUBLE AND MOBILE IN THE ENVIRONMENT than reduced forms of chromium. … THUS, SELECTING A SUPPLIER WITH LOW CR(VI) CONTENT CEMENT AND ENSURING THE CPB IS NOT INUNDATED [E.G., CONFRONTING DEWATERING] BEFORE IT SETS CAN MINIMIZE THE POTENTIAL FOR ISSUES WITH CR(VI) LEACHING.**

None of this is addressed in the DEIR, so this significant new data should require full CEQA disclosure and opportunity for debate in the context of a recirculated and revised EIR, especially since failure to prevent a repeat of the Hinkley, CA, horrors will leave all those accountable here looking even worse than the Michigan Governor's team who allowed lead leaching in water pipes to devastate Flint, Michigan. This would be an "I told you so" crisis, which I mention with that analogy not as a gratuitous insult, but as a real-life, well-known example of how even supposedly well-meaning officials can create crises (not to mention foreign miners in admittedly distressed financial circumstances and from an mining industry with a history of environmental violations because they are too often focused only on maximizing profits for speculative shareholders, rather than on safety for the local community they expect to leave as soon as the mine ceases to lure them with the hope of exploitive riches).

In conclusion, by an analogy to an even more serious situation to illustrate the point with more power, this disputed EIR/DEIR is like one for an explosive's storage, where the initial and noncompliant deir treated the explosives more like fireworks than lethal munitions. And, when objections from potential victims demanded more and compliant disclosure and mitigation, the eir added some long-disconnected reports ending at an Appendix for the proposition that, things would be tolerably safe, as long as everything was done consistent with its recommended best practices as determined in the future by some regulator. However, my legal analysis in my Objections demonstrates that such mitigation

cannot be deferred and delegated to regulators as attempted in this disputed EIR, for example, both because the mitigation defies "common sense" (e.g., *Gray*) and offers no "good faith reasoned analysis" (e.g., *Banning, Vineyards, and Costa Mesa*) and because the basis and foundation are not sufficiently described to even begin to assess the risks and the adequacy of such disputed mitigation. Indeed, while human error or worse (e.g., intentional or reckless indifference to risk to save costs, or abandonment of the site) creates legal risks for handling both hexavalent chromium and such analogous explosives, no government would take the risk of such human error for explosives, and the same should be true for such CR6 carcinogens and reproductive toxins. I didn't even see any EIR/DEIR reports on any insurance or surety bonds.

B. While Everyone Will Recognize The "Erin Brockovich" Menace of Hexavalent Chromium, The County Decision-Makers Should Also Focus On The Asbestos Litigation And Regulatory Comparison Not Just For the Disputes About the Science, But Also Because Of The Litigation, Political, And Stigma Consequences That Will Not (And Should Not) Wait For The Industry Intimidated Regulators To Catch Up.

In my several Objections, I explain, among other things, by examples from asbestos analogies and the Hinkley, CA, hexavalent chromium case study (i.e., the "*Erin Brockovich"* case) why the menace will exist as a lethal stigma, regardless of how the scientific debate is resolved in this mine case. For example, industry influenced politicians and regulators may indulge in wishful thinking and leave the public with lethal risks in the context of disputes over the applicable science. But there can be no credible dispute about hexavalent chromium being a dangerous carcinogen, as confirmed by the EPA and California EPA regulators. What the cement industry and its mining (and other) customers want to dispute is how much of that toxin the human body can tolerate. There is no "common sense" or "good faith reasoned analysis" of that issue in the EIR/DEIR, as required by CEQA. Just as with occurred with asbestos, the courts in civil litigation will conclude with honest science that there is no safe level of exposure relevant here, and, belatedly, the timid industry harassed regulators will eventually catch up with the reality, after too many casualties and the predictable consequences of massive civil judgments for personal injuries, wrongful death, and property damage, and eventually bankruptcies of those responsible when their insurance is exhausted. That reality understandably scares people with common sense, and that stigma is lethal. If the public has learned not to trust alleged risks in J&J baby powder, no County decision maker can expect anyone to accept the risk of hexavalent chromium in our water or air, regardless of what this miner or EIR may claim or the County may mistakenly tolerate about the risk of hexavalent chromium in the cement used in shoring up this mine subject to 24/7/365 dewatering for 80 years of flushing into the Wolf Creek after supposed "treatment," especially under the circumstances exposed in my and other objections.

Why trust my analysis and evidence? As explained in my EIR Objections 254 (especially #1.F.1, I.C and D, and my objection to EIR Response Ind. 254-1 and 15), my half century of experience as a national and cross-border bankruptcy and insurance insolvency lawyer in relevant mining and other cases qualifies me to prove my predictions and analysis in this Exhibit, and I plan to do so, if necessary, making this an offer of proof. Not only have I specific expertise in failed mines from miner bankruptcies, but I also have the perspective of being involved in the

liquidation of insurers which failed on account of their mining and environmental surety bond and insurance risks. However, I have even more experience and expertise in those same issues that have arisen on an even larger scale in product liability /mass tort related bankruptcies and related insurer insolvencies, especially asbestos on which I will focus here as a compelling and the best-known analogy. What the County decision makers should expect is the same consequences and fate from adding hexavalent chromium into this mine as if they were adding asbestos products into the mine. Just as history proved there was no safe tolerance for asbestos (e.g., what began with the bankruptcies of the asbestos miners/producers/product manufacturers [and their insurers' insolvencies] ended up with bankruptcies of many companies owning buildings with asbestos that had to be removed or that sold products with even minor asbestos components, as remote, for example, as asbestos in painting tape or brake pads). That eventually will prove true as well for hexavalent chromium, although its lesser and more narrow uses than asbestos have resulted in its slower suffering of that same fate.

I say this, among other things, because the science already recognizes that hexavalent chromium is a dangerous carcinogen, although some still argue about levels of tolerance by the human body (just as they have done for asbestos and other toxins protected by politically powerful manufacturers and users, like cigarettes). Long before politicians and timid regulators are willing to act to ban such toxic menaces and admit there is no safe tolerance level, the civil courts and litigators will impose damages and other relief that eventually can overwhelm even the biggest companies when their insurance is exhausted (e.g., if one dislikes my asbestos analogy, consider the current fate of toxic suspect Johnson & Johnson baby powder, which inspired mass tort litigation and a failed effort to bankrupt an affiliate to shield the parent company, or 3M and its armed forces ear protectors trying the same evasion tactics). This is not merely about claims for personal injuries, but also about property damages and relief from nuisance, inverse condemnation, trespass, and other claims. The EPA, California EPA, and other regulators report such threats on websites and propose insufficient restrictions, basically stalled by the politics of those lobbying for such toxins and insufficient "work arounds." But in the meantime, the civil litigation grinds on, and the exposed public, who care little about the toxic protectors' political games, understands and reacts with understandable horror at the risks they do not wish to incur, whether for themselves or their property.

I mention this here because, among the side-effects of all this menace is the stigma effect on the adjacent community, in this case especially those residents and businesses owning property above and around the 2585-acre underground mine. The disputed County Economic Report (see my rebuttals, for example, in companion Exhibit A to this objection) admits overwhelming despair by real estate brokers regarding the impact of the mine on property values. Among the errors in the County Economic Report is the "spin" that those brokers just believed that the DEIR was underestimating the environmental impacts, i.e., as if it were a dispute on the merits of those impacts. In fact, however, the most serious reality is about risk assessment. The potential home buyer does not have to judge the science to make a risk assessment based on common sense and the lacking or uncertain credibility of the DEIR (and now the EIR ratifying the disputed EIR) and miner. This illustrates the stigma of such mining and toxins that depress property values, not just based on proof of the merits of the claims of menace impacts, but on the risk and, even if the buyer had more tolerance, his mortgage lender and appraiser probably will be less tolerant of such risks. Someone investing in a home in our community does not want to

pay top dollar for the risks that are reported in the more than thousand objections on record by the residents like me living on the surface above or around the 2585-acre mine. If those of us already at risk are complaining (and real estate sales laws require disclosure to buyers) why would a potential buyer risk pay a toxic-free and mine-free price high price and suffer those risks? That is the reality that most concerns the realtors. See the objection of the Nevada County Association of Realtors Group 15. Those risks are damning our property values for a no net benefit mine as far as concerns anyone living on the surface above or around the underground or above ground mine. As property values decline from such risk assessments, so will home repairs, new construction, and tourism, and the losses to local businesses will far exceed any minor mining jobs.

II. Propositions 65 Warnings Needed by the Mine for Water And Air Pollution By Hexavalent Chromium.

The disputed EIR now admits obscurely at least some of what the DEIR tried to evade about the dangerous use of toxic hexavalent chromium about which I explained at length in my attached EIR Objection 254, in my DEIR Objection 254 (e.g., #'s 3.A, B, C, E, G, H, J, 4, 7, 10, 12, 14, and 15), and in my comments at the initial March 24, 2022, DEIR public hearing. The DEIR/EIR must admit and notice to all possibly impacted people (i.e., everyone in the Grass Valley and Nevada City area that, as The safe Drinking Water And Toxic Enforcement Act of 1986 (herein as elsewhere called "Proposition 65" or "Prop 65") states. For example, "in the course of doing business …knowingly discharging or releasing a chemical know to the state to cause cancer or reproductive toxicity into water" or into anywhere that feeds a drinking water source. This EIR miner is so "knowingly and intentionally exposing" us to such hexavalent chromium (which is on the state list of such Prop 65 carcinogens) "without first giving clear and reasonable warning." See my discussion of the disputed EIR and its Appendix Q in the initial section above. While Prop 65 is administered by CalEPA's California Office of Environmental Health Hazard Assessment (OEHHA), the notice must be to everyone and the buried, obscure, and hard to find comments in the DEIR/EIR cannot possibly qualify as sufficient notice. See, e.g., my DEIR Objection 254 #'s 3.A, B, C, E, G, H, J, 4. 7, 10, 12, 14, and 15) and corresponding objections in my EIR Objection 254 to the disputed EIR's "Responses thereto (e.g., EIR Response to Comment Ind 254-1 and 15).

While the disputed EIR/DEIR claims that it is not exposing anyone to hexavalent chromium, because the toxic mine shoring paste cement that is exposed to our groundwater through the dewatering process 24/7/365 for 80 years is allegedly "drawn away" from us mine neighbors purportedly to be "treated" and then flushed down the Wolf Creek to be added to the NID water for downstream customers. See my discussions above and elsewhere in my Objections disputing the DEIR/EIR's insufficient analysis, proposed mitigations, and other discussions of relevant matters. However, those ERI/DEIR excuses are not only disputed on the merits, but also because, for example, when the mining and dewatering ceases for any reason, the hexavalent chromium is not so removed by dewatering, so too will the disputed, so-called "treatment" stop (which is not proven to be sufficient for safe use in any event.) Note that Prop 65 standard is whether it presents a 1 in 100,000 risk of cancer assuming a lifetime of exposure (which case law extends to include

that standard for animal victims). That puts the burden on the miner to have to know the relevant science, which includes many studies on the EPA and Cal EPA websites to which I have cited and the EIR/DEIR has so far ignored. How will County decisionmakers feel about approving an EIR based on its disputed "no toxic problems assumption" and then, after approval, the miner plasters the mine with Prop 65 notices?

As Wikipedia explained the consequences of violations, although the law speaks for itself:
